SECTION 1

INTRODUCTION

This Updated Design Plan (Updated Plan) presents background information, design criteria, and a landfill gas (LFG) collection and control system design for the City of Ukiah Landfill (Landfill), in Ukiah, California. The design and installation of a LFG collection and control system is being required to comply with the *Methane Emissions from Municipal Solid Waste Landfill* requirements associated with Title 17 of the California Code of Regulations (17CCR), Subchapter 10, Article 4, Subarticle 6, also identified as Assembly Bill 32 (AB32). Specifically, this submittal has been prepared to address the design plan requirements stipulated in 17CCR, §95464(a)(1) for the design and installation of a LFG collection and control system. Compliance with these requirements was prompted by the detection of methane emissions from the waste management unit (WMU) surface exceeding the 200 parts per million by volume (ppmv) threshold criteria as determined during a field monitoring event conducted on August 8, 2013 (EBA Engineering [EBA], 2013b).

In response to aforementioned emissions findings, the Mendocino County Air Quality Management District (MCAQMD) originally requested in a letter dated August 23, 2013 that the City of Ukiah, Department of Public Works (City) prepare a Design Plan for a LFG collection and control system to comply with AB32 regulations. A Design Plan (EBA, 2013c) was subsequently prepared and submitted to the MCAQMD in October 2013 and included a target completion date for having the LFG collection and control system installed and operational by December 31, 2014. The installation was to be integrated with the final closure construction project for the Landfill, which was scheduled for implementation in the spring and summer of 2014.

Since submittal of the original Design Plan as described above, the Landfill's final closure construction project has been delayed on multiple occasions due to changes to the final cover system design and associated negotiations with California Regional Water Quality Control Board, North Coast Region (RWQCB), California Department of Resources Recycling and Recovery (CalRecycle), and Mendocino County Health & Human Services Agency (Local Enforcement Agency (LEA), as well as the City's decision to prepare an Environmental Impact Report (EIR) as a mechanism to support the project. As part of these efforts, two updated versions of the Design Plan were submitted in August 2015 (EBA, 2015) and May 2016 (EBA, 2016) at different stages of the final cover redesign in order to bring the Design Plan current. Neither of those versions included substantive changes to the original LFG system design.

This version of the Design Plan has been prepared to account for modifications to the Landfill's final cover system that influenced the previous LFG system design. Overall, the revisions presented herein are primarily limited to modifications to the routing and/or locations of collection system piping and condensate drop-outs to compensate for changes in grade breaks and drainage channel configurations. Aside of these changes, the remaining LFG system design components, sizing,

construction materials, monitoring and reporting, proposed alternatives, and temporary mitigation measures are the same as previously outlined in the prior Design Plan versions.

SECTION 2

BACKGROUND INFORMATION

The purpose of this section is to summarize background information used in the development and design of the LFG collection and control system. The primary topics discussed in this section include general site characteristics and findings from previous LFG investigations. Each of these topics is discussed separately in the following subsections.

2.1 SITE LOCATION AND DESCRIPTION

The Landfill is located at 3100 Vichy Springs Road, approximately three miles east of Ukiah in Mendocino County, California. A site location map showing the location of the Landfill is presented as Figure 1 (Appendix A). The Landfill's WMU occupies approximately 40 acres of permitted landfill area on a 283.5-acre parcel having a maximum width of approximately 1,000 feet in the north-south direction and a maximum length of about 3,500 feet in the east-west direction. Existing ground surface elevations for the WMU range from approximately 710 feet above mean sea level (MSL) near the western footprint, to about 970 feet MSL along the southeast footprint. The WMU has been graded to form a series of flat terraces stepping down from south to north. The WMU surface is covered with seasonal grasses. A site plan illustrating the WMU topography and adjoining areas is presented as Figure 2 (Appendix A).

Land adjacent to the Landfill property is zoned primarily as rangeland and is used for grazing. Dwellings within 1,000 feet of the landfill property include a group of structures owned by the Vichy Springs Investment Group that are located within 500 feet of the Landfill's south property line and a single-family residence located approximately 900 feet west of the Landfill's western property boundary. A rural residential development is located approximately ¼-mile west of the Landfill property boundary. A housing development is also located along the south side of Vichy Springs Road and westward of the Vichy Springs Resort. The entire development is approximately 1,000 feet southward of the Landfill property boundary and is separated from the Landfill by an intervening ridge.

It should be noted that the City owns an approximate 97-acre parcel that adjoins a portion of the Landfill's southern property boundary. This property, which has been previously identified as the "Gun Club Parcel", was purchased as a buffer zone to limit future development adjacent to the Landfill. The Gun Club Parcel is a separate parcel and is not considered part of the Landfill property.

2.2 LANDFILL HISTORY AND DEVELOPMENT

Waste disposal operations at the Landfill began in 1955 at the eastern end of the WMU footprint and progressed upslope and westward. Prior to 1971, the Landfill was operated as a burn dump, with most of the burn-dump activities reportedly occurring in areas east of the power lines. After 1971, the method of operation transitioned to a fill and cover approach in a canyon/gully terrain. During the 1970's, the unnamed ephemeral creek was realigned northward to maximize the available fill area, and a soil berm was constructed along the toe of the WMU to separate the waste from the realigned creek channel. The Landfill operated as a nonhazardous Class III solid waste disposal site servicing Ukiah and the surrounding area. The Landfill ceased operations in September 2001.

2.3 PREVIOUS LANDFILL GAS (LFG) INVESTIGATIONS

2.3.1 Perimeter LFG Monitoring

The Landfill has been equipped with a perimeter LFG monitoring system since September 1994. The original system consisted of five LFG monitoring points (GAS-1 through GAS-5), followed by the installation of five additional LFG monitoring (GAS-6 through GAS-10) in September 1996. The locations of the LFG monitoring points are shown on Figure 2 (Appendix A). Each of the LFG monitoring points are equipped with one to four individual monitoring probes constructed of ¾-inch diameter polyvinyl chloride (PVC) casing and capped with labcock valves. The monitoring probes range in depth from approximately 9 to 250 feet below ground surface (BGS).

The LFG monitoring points are monitored on a quarterly basis to fulfill monitoring requirements set forth in Title 27 of the California Code of Regulations (27CCR), §20921. Historical findings from this monitoring initially identified LFG migration in the area of GAS-3 and GAS-4, which prompted the installation of a partial perimeter LFG collection system in 1997 (see following subsection). Following its installation, methane was only detected sporadically in GAS-3 and/or GAS-4, mostly during periods when the partial perimeter LFG collection system was experiencing mechanical or operational issues. However, since the spring of 2017, elevated methane has been consistently detected in GAS-4. The only other historical perimeter methane detections corresponds to GAS-6 (sporadic) and GAS-10 (consistent). However, these detections have been determined to represent gas of natural thermogenic origin and are not related to the Landfill (Lawrence & Associates [L&A], 1998).

2.3.2 Partial Perimeter LFG Collection

As outlined in the previous subsection, subsurface LFG migration was identified along the southwestern edge of the WMU in the area of perimeter LFG monitoring points GAS-3 and GAS-4 following installation of the perimeter LFG monitoring system. Methane concentrations measured in these perimeter LFG monitoring points consistently exceeded the regulatory threshold for methane of 5 percent by volume (%vol). In response to these conditions, a partial perimeter LFG collection system was installed between the southwestern edge of the WMU and the property line in the summer and fall of 1997 (see Figure 2, Appendix A). In general, the system consists of 17 vertical

extraction points installed in native geologic materials and completed at depths ranging from 35 to 133 feet BGS. The extraction points are connected to a buried 6-inch diameter, high-density polyethylene (HDPE) header pipe that leads to a vacuum blower located at the western end of the WMU. The vacuum blower creates a vacuum in the header pipe that draws the LFG from the soil through the extraction points and header pipe, whereupon the collected LFG (diluted) is vented to the atmosphere via a 4-foot tall, 4-inch diameter stack. The system, which was designed by L&A, works on the premise that the extraction well field creates a barrier against migration while simultaneously mixing the collected LFG with "clean" soil pore gas that dilutes the LFG to concentrations that can be discharged directly to the atmosphere.

2.3.3 New Source Performance Standards (NSPS) Monitoring

In July 1999, a Tier 2 sampling program was implemented at the Landfill by EBA to comply with NSPS regulations. The program entailed the advancement of 26 soil borings to depths of five feet BGS along existing benches within the WMU and the collection of LFG samples for chemical analysis. The LFG samples were composited in the laboratory at a 3:1 ratio and analyzed for non-methane organic compounds (NMOCs) using United States Environmental Protection Agency (US EPA) Method 25C. The corresponding results revealed NMOC concentrations ranging from 290 to 2,900 ppmv. Field monitoring for methane from the soil borings revealed concentrations ranging from nondetect to 59 %vol, with an average concentration of approximately 40 %vol. Hydrogen sulfide was also monitored in the field and revealed concentrations ranging from nondetect to greater than 200 ppmv, with an average concentration of approximately 12 ppmv.

The overall purpose of the Tier 2 sampling program was to determine a site-specific NMOC concentration that could be used to calculate the total NMOC emission rate for the Landfill. The corresponding results revealed a total NMOC emission rate of approximately 6 megagrams per year (Mg/yr)(EBA, 1999). As this concentration was well below the regulatory action limit of 50 Mg/yr, installation of a LFG collection and control system was not required under the NSPS regulations.

2.3.4 Assembly Bill 32 (AB32) Emissions Monitoring

AB32 methane emissions monitoring was performed at the Landfill by EBA on August 8, 2013 to comply with 17CCR, §95463(b)(2)(B) and to establish if methane emissions of 200 ppmv or greater are currently being emitted from the WMU surface. The field work was performed using the instantaneous surface monitoring procedures specified in 17CCR, §95471(c)(1) and §95471(c)(2). The corresponding results from this monitoring identified a total of nine locations in which methane was detected above the 200 ppmv threshold. The concentrations detected ranged from 277 to 89,000 ppmv (8.9 %vol) and were primarily located in the southernmost portion of the WMU. Average readings for the remainder of the WMU ranged from approximately 10 to 20 ppmv (EBA, 2013b).

SECTION 3

LFG COLLECTION AND CONTROL SYSTEM DESIGN CRITERIA

Design of a LFG collection and control system is contingent upon a number of parameters ranging from the quantity, composition, and age of the refuse, as well as site-specific subsurface characteristics. Since a substantial portion of LFG parameters can be highly variable and difficult to quantitate, the criteria used for design purposes were based primarily on characteristics observed during previous site investigations and the use of theoretical parameters/models in which reasonable assumptions and calculations could be made based on existing data, available literature, and relative experience. Parameters used to develop design criteria included: refuse composition and quantity; LFG generation rates; LFG quality; LFG condensate generation; and LFG migration characteristics. Further details regarding these parameters are summarized in the following subsections.

3.1 REFUSE COMPOSITION AND QUANTITY

The Landfill was in operation from 1955 to September 2001 and operated as a nonhazardous Class III solid waste disposal site. Composition of the waste reportedly received at the Landfill included paper products, food wastes, glass, metal, wood, plastic, cloth, rubber, synthetics and inert waste such as soil, ashes, rock, etc. No high liquid content wastes, designated wastes, or hazardous wastes were accepted for disposal. Previous estimates of the waste stream by category identified approximately 27 percent of the waste as residential, 32 percent commercial, 14 percent industrial, and 27 percent self-haul (City, 1999). As previously outlined in Subsection 2.2 (*Landfill History and Development*) of this Updated Plan, the Landfill was operated as a burn dump prior to 1971. Thus, it is possible that the bulk of the waste in the WMU prior to 1971 is primarily inert.

Several previous estimates have been reported with regard to the quantity of waste in-place at the Landfill. In a technical memorandum prepared by Pacific Waste Services, Inc. (PWS) for the City in December 2009, the in-place tonnage was estimated at 1,499,300 tons (PWS, 2009). This estimate was not based on any weigh scale records and assumed a constant 550-ton increase per year of waste placement over the period of 1955 through 2001. In June 2013, the City generated a revised estimate as part of the *Landfill Heat Input Capacity Report* that was prepared to comply with AB32 reporting requirements. As part of the City's revised estimate, actual tonnage data was compiled for the period 1990 through 2001. For years prior to 1990, the City reduced the annual waste placement tonnage by 550 tons per year (same incremental rate assumed by PWS) through 1955. The corresponding total in-place tonnage resulting from this revised calculation equated to 1,039,116 tons (City, 2013).

3.2 LFG GENERATION AND RECOVERY ESTIMATES

Several LFG generation models were evaluated to establish LFG generation estimates for the Landfill and to develop design parameters for the LFG collection and control system. These models included the first-order decay model from the 2006 Intergovernmental Panel on Climate Change (IPCC) as required by 17CCR, §95464(a)(1)(F), as well as miscellaneous first order generation models developed by SCS Engineers (1998) for the Solid Waste Association of North America (SWANA). Multiple models and scenarios were employed to evaluate the range of generation rates calculated by the respective models, which in turn was factored into the determination of potential turndown ratios for the flare design. This use of multiple models is considered appropriate to compensate for the number of variables that are difficult to define with any certainty (i.e., historical disposal rates, historical waste composition, waste moisture content, etc.).

As part of the aforementioned models, the two (2) variables that most strongly influence the corresponding results are the methane generation potential (Lo) and/or the methane generation rate constant (k). Lo represents the total amount of methane that a unit mass of refuse will produce if given enough time to fully decompose. The k constant, in turn, corresponds to the fraction of refuse that decays and generates methane in a given year. Based on the average rainfall in the Ukiah area (approximately 38 inches per year), Lo and k values of 1.6 cubic feet per pound of refuse (ft^3/lb) and 0.038/year (IPCC default value for areas with average rainfall between 20 and 40 inches per year), respectively, were selected for modeling LFG generation rates for the Landfill.

Using the resources and information described herein, LFG generation modeling was performed for four (4) different scenarios. These scenarios included the following:

- *Scenario 1:* A total refuse tonnage of 1,499,300 tons placed between 1955 and 2001 as estimated by PWS.

- *Scenario 2:* A total refuse tonnage of 1,039,116 tons placed between 1955 and 2001 as estimated by the City.

- *Scenario 3:* An adjusted refuse tonnage of 1,125,300 tons based on PWS estimate placed between 1971 and 2001 to account for potential inert refuse resulting from former burn-dump operations.

- *Scenario 4:* An adjusted refuse tonnage of 809,644 tons based on City estimate placed between 1971 and 2001 to account for potential inert refuse resulting from former burn-dump operations.

A summary of the LFG generation modeling results is presented in Table 1. Copies of the corresponding spreadsheets and graphs for the respective model results are presented in Appendices B-1 through B-4, which coincide with Scenarios 1 through 4 described above. Please note that the LFG generation rates presented in Table 1 assume a methane composition of 50 percent by volume. In addition, since the collection and control system cannot capture all of the LFG generated in the WMU due to a variety of factors (i.e., WMU geometry, hydraulic conductivity of the cover, degree

of saturation of the refuse, degree to which air infiltration can be tolerated, etc.), a collection efficiency of 75 percent has been assumed for design purposes. This collection efficiency is consistent with the recovery rate stipulated in the AB32 regulations.

TABLE 1
LFG GENERATION ESTIMATES AND RECOVERY
YEAR 2019

Model	*Lo (ft^3/lb)*	*k (1/year)*	*Methane Generation Rate (SCFM)*	*LFG Generation Rate (1) (SCFM)*	*Potential LFG Recovery (2) (SCFM)*
Scenario 1: PWS Tonnage Estimate for Period 1955 -2001					
IPCC Model	----	0.038	----	----	139
Simple First Order - Median (3)	1.6	0.038	93	186	140
Modified First Order (3)	1.6	0.038	97	194	146
First Order Multi-Phase (3)	1.6	0.038	67	134	101
Scenario 2: City Tonnage Estimate for Period 1955 -2001					
IPCC Model	----	0.038	----	----	98
Simple First Order - Median (3)	1.6	0.038	67	134	101
Modified First Order (3)	1.6	0.038	69	138	104
First Order Multi-Phase (3)	1.6	0.038	48	96	72
Scenario 3: PWS Adjusted Tonnage Estimate for Period 1971 -2001					
IPCC Model	----	0.038	----	----	122
Simple First Order - Median (3)	1.6	0.038	82	164	123
Modified First Order (3)	1.6	0.038	86	172	129
First Order Multi-Phase (3)	1.6	0.038	63	126	95
Scenario 4: City Adjusted Tonnage Estimate for Period 1971 -2001					
IPCC Model	----	0.038	----	----	88
Simple First Order - Median (3)	1.6	0.038	59	118	89
Modified First Order (3)	1.6	0.038	61	122	92
First Order Multi-Phase (3)	1.6	0.038	46	92	69

Lo: Methane Generation Potential
k: Methane Generation Rate Constant
LFG: Landfill Gas
ft^3/lb: Cubic Feet per Pound (of refuse)
SCFM: Standard Cubic Feet per Minute
PWS: Pacific Waste Systems, Inc. (2009)
IPCC: Intergovernmental Panel on Climate Change (2006)
City: City of Ukiah, Department of Public Works (2013)

(1): Assumes an average methane concentration of 50 percent by volume.
(2): Assumes a 75 percent collection efficiency.
(3): SCS Engineers, 1998

The current LFG generation rate for the Landfill based on all the modeling scenarios ranges from 92 to 194 standard cubic feet per minute (SCFM), with potential LFG recoveries ranging from 69 to 146 SCFM. As presented in Table 1, the biggest variable influencing the generation rates is the amount of in-place waste. Scenarios 1 and 3 which assume a higher in-place waste tonnage yield LFG generation rates and recoveries ranging from 126 to 194 SCFM and 95 to 146 SCFM, respectively.

In contrast, the lower in-place tonnage assumed by Scenarios 2 and 4 yield LFG generation rates and recoveries ranging from 92 to 138 SCFM and 69 to 104 SCFM, respectively.

As presented in the various methane/LFG generation graphs presented in Appendix B, the Landfill is on the downward side of the generation curve and will continue along this pattern until the generation potential of the refuse is completely exhausted.

3.3 LFG QUALITY CHARACTERISTICS

Table 3 provides a summary of the estimated LFG quality characteristics at the Landfill. This summary is based on field and laboratory test results on LFG samples collected by EBA on September 12 and 16, 2013. The LFG sampling was performed using two (2) shallow hand-augered boreholes (GP-1 and GP-2) completed at depths of approximately six feet BGS, as well as from existing leachate wells LW-1 and LW-2. Please refer to Figure 2 (Appendix A) for the corresponding locations. Dedicated samples were collected from LW-1 and GP-1, while a two-part composite sample was collected using LW-2 and GP-2. In addition to retaining samples for chemical analysis, the respective locations were monitored in the field for methane, oxygen, carbon dioxide, and hydrogen sulfide using portable meters. These results are also presented in Table 3 below. The laboratory testing was performed by K Prime, Inc. (K Prime), a California State-certified analytical laboratory located in Santa Rosa, California. A copy of the Certified Analytical Report (CAR) prepared by K Prime is enclosed in Appendix C.

TABLE 3
ESTIMATED LANDFILL GAS COMPOSITION

Parameter	*Laboratory Test Results*			*Field Monitoring Results*
	LW-1 (Dedicated)	*GP-1 (Dedicated)*	*LW-2 and GP-2 (Composite)*	
Primary Gases:				
Methane	47.8 % vol	55.2 % vol	57.5 % vol	37 to 67 % vol
Carbon Dioxide	33.2 % vol	35.7 % vol	34.9 % vol	33 to 40 % vol
Oxygen	<1.00 % vol	2.48 % vol	<1.00 % vol	3.4 to 6.7 % vol
Nitrogen	18.3 % vol	6.66 % vol	7.22 % vol	NA
Hydrogen Sulfide	NA	NA	NA	0 to 16 ppmv
VOCs:				
Dichlorodifluoromethane	0.572 ppmv	NA	<1.00 ppmv	NA
Dichlorotetrafluoroethane	0.103 ppmv	NA	<1.00 ppmv	NA
Vinyl Chloride	5.83 ppmv	NA	1.54 ppmv	NA
Methylene Chloride	0.147 ppmv	NA	<1.00 ppmv	NA
cis-1,2-Dichloroethene	2.06 ppmv	NA	<1.00 ppmv	NA
Benzene	0.161 ppmv	NA	<1.00 ppmv	NA
Trichloroethene	0.241 ppmv	NA	<1.00 ppmv	NA
Toluene	0.390 ppmv	NA	7.01 ppmv	NA
Tetrachloroethene	0.819 ppmv	NA	<1.00 ppmv	NA
Chlorobenzene	<0.100 ppmv	NA	1.95 ppmv	NA

(Continued)

TABLE 3 *(Continued)*
ESTIMATED LANDFILL GAS COMPOSITION

Parameter	*Laboratory Test Results*			*Field Monitoring Results*
	LW-1 (Dedicated)	*GP-1 (Dedicated)*	*LW-2 and GP-2 (Composite)*	
VOCs *(continued)*:				
Ethylbenzene	<0.100 ppmv	NA	159 ppmv	NA
Xylene (M+P)	0.409 ppmv	NA	123 ppmv	NA
Xylene (O)	0.144 ppmv	NA	136 ppmv	NA
1,3,5-Trimethylbenzene	<0.100 ppmv	NA	6.02 ppmv	NA
1,2,4-Trimethylbenzene	<0.100 ppmv	NA	6.29 ppmv	NA
Total Volatile Hydrocarbons[(1)]	33.7 ppmv	80.6 ppmv	1,120 ppmv	NA

% vol: Percent by Volume
ppmv: Parts per Million by Volume
NA: Not Analyzed

(1): Total Volatile Hydrocarbons is synonymous to Non-Methane Organic Compounds (NMOCs).

It should be noted that the concentrations presented in Table 3 are considered to be conservative in nature and will likely decrease over time. Since LFG has been generating within the refuse mass for at least 40 years, a surplus of highly concentrated LFG may be currently present within the WMU. However, upon removal of this surplus by the active collection efforts, coupled with the age of the refuse and dilution effects resulting from the influx of atmospheric air, it is estimated that methane concentrations could stabilize somewhere in the 35 to 45 percent by volume range. Carbon dioxide and volatile organic hydrocarbon/NMOC concentrations will also likely exhibit similar reductions, whereas nitrogen concentrations will likely increase. Whereas the length of time it will take for such reductions to occur is unknown, prior experience at similar sites suggest that it could occur within two to six months of system start-up.

3.4 LFG CONDENSATE GENERATION ESTIMATES

Condensate generation was approximated based on temperature and vapor pressure differentials of the LFG. Calculations were performed for flow rates of 53 and 210 SCFM, which correspond to the design flow range for the proposed LFG collection and control system (see Section 4 [*LFG Collection and Control System Design*]). In addition, final inlet LFG temperatures of 36°F and 59°F were also considered to simulate extreme and average temperature conditions indicative of the Ukiah area. Results of the condensate generation calculations are presented below in Table 4. Please refer to Appendix D for copies of individual spreadsheets that summarize the respective calculations.

TABLE 4
CONDENSATE GENERATION CACULATIONS

Flow Rate (SCFM)	*Temperature (°F)*		*Vapor Pressure (psia)*		*Average Vacuum Pressure (psia)*	*Condensate Generation (gpd)*
	Initial	*Final*	*Initial*	*Final*		
53	120	36	1.6927	0.0999	13.797	50 to 52
53	120	59	1.6927	0.2561	13.797	45 to 52
210	120	36	1.6927	0.0999	13.797	199 to 207
210	120	59	1.6927	0.2561	13.797	179 to 207

SCFM: Standard Cubic Feet per Minute
°F: Degrees Fahrenheit
psia: Pounds per Square Inch (Actual)
gpd: Gallons per Day

As summarized in Table 4, the condensate generation rate at the site may range from approximately 45 to 210 gallons per day (GPD) based on the given temperature and flow scenarios. Please note that 36 degrees Fahrenheit (°F) corresponds to the average ambient temperature during the coldest month of the year (December), and therefore represents the period of greatest condensate generation. Since the average ambient temperature over the entire year is 59°F, the average volume of condensate generated over the course of 12 months will be less.

3.5 LFG MIGRATION CHARACTERISTICS

The two primary components of LFG migration correspond to surface emissions and subsurface migration through subgrade soils and rock formations. As a general rule, LFG migration can be expected to follow a path of least resistance in response to pressure differentials. Surface emissions typically occur when vapor pressures within the WMU exceed atmospheric pressure and can vary during the course of the day due to fluctuations in atmospheric conditions. Similarly, increased vapor pressures within the WMU can induce lateral and vertical LFG migration through subsurface soils and rock formations, including preferential migration through permeable zones (i.e., sand and gravel deposits, fractures, etc.). Finally, concentration gradients between LFG within the refuse mass and surrounding soil-pore gas in the vadose zone can result in the diffusion of LFG both laterally and vertically.

It should be noted that the surface of the WMU is currently comprised of interim cover soil. However, a low-permeability final cover system will be installed over the entire WMU as part of the final closure construction operations. Since the final cover system will include a geomembrane component, the new final cover system should serve to reduce potential surface emissions on its own. Conversely, the low-permeability nature of the final cover system could increase vapor pressures within the WMU, thereby increasing the potential for lateral and/or vertical LFG migration through the subsurface soils and/or rock formations, similar to what is currently being observed in

the area of GAS-4. Thus, whereas the LFG collection and control system is being mandated to address fugitive surface emissions, it will also serve the dual purpose of mitigating the area of existing migration (GAS-4) and minimizing the potential for increased subsurface LFG migration elsewhere around the WMU.

SECTION 4

LFG COLLECTION AND CONTROL SYSTEM DESIGN

This section presents the various components of the LFG collection and control system design. The design has been developed to meet the requirements of 17CCR, §95464(b). Based on the current and projected LFG recovery rates presented in Subsection 3.2 (*LFG Generation and Recovery Estimates*), the design flow rate for the system has been established at 53 to 210 SCFM (at 50 percent methane). This range covers the highest anticipated LFG recovery rate based on the most conservative generation model. In addition, the design range can accommodate lower flows to account for future operations as the generation rate continues to decreases over time. Overall, the LFG collection and control system will consist of a series of perimeter and interior LFG extraction wells, associated above ground collection system piping, condensate collection provisions, and a flare station. Further details regarding each of these components are summarized in the following subsections.

Construction drawings illustrating the LFG collection and control system design are enclosed in Appendix E. Sheets 600 through 602 provide plan views of the system layout. Sheets 700 through 706, in turn, provide details of the various system components.

4.1 LFG EXTRACTION WELLS

4.1.1 Well Field Layout and Rationale

Since the WMU is comprised mostly of steep slopes, the well field layout is primarily dictated by the location of benches, which provide access by a truck- or track-mounted drilling rig. With that constraint in play, the well field for LFG extraction has been designed to create a series of perimeter and interior extraction well locations. Sheets 600 through 602 (Appendix E) show the proposed well field configuration. As presented on these sheets, a total of 18 extraction wells (EW-1 through EW-18) will be installed as part of the proposed construction. The rationale for the well field layout is as follows:

- The perimeter extraction wells located near the edges of the WMU will be used for migration control in response to the anticipated increase in lateral and vertical pressures induced by the installation of the final cover system;

- The interior extraction wells will be used to collect methane-rich LFG for the purpose of operating the flare and to deplete the LFG generation source;

- The overall extraction well configuration will serve to provide coverage of the entire WMU as a means of minimizing the potential for fugitive surface emissions, including areas of exceedances identified during the August 8, 2013 emissions monitoring event; and

- LFG extraction well EW-9 is intended to target the LFG migration observed in GAS-4, although other LFG extraction wells may also serve this purpose depending upon the migration pathway responsible for the conditions exhibited in GAS-4.

For design purposes, it is assumed that the operating flow rates for the extraction wells will initially range from approximately 5 to 8 SCFM, which equates to a total flow of 90 to 144 SCFM. This flow range encompasses the estimated maximum 2019 LFG recovery rate of 146 SCFM as presented earlier in Subsection 3.2 (*LFG Generation and Recovery Rates*) of this Updated Plan. It should be noted, however, that the actual flow rates will be contingent upon LFG quality at the respective locations. The aggressiveness upon which the well field is operated will be dictated by the extent of atmospheric air intrusion and the ability to attain flows that will not compromise the safety of site operations (i.e., subsurface fires).

4.1.2 Well Completion Depths

The extraction wells will be completed to depths of approximate 10 to 15 feet above the base of refuse. Based on a previous seismic refraction survey performed at the Landfill in 1993 (Norcal Geophysical Consultants, Inc., 1993), it was estimated that the base of refuse ranges from approximately 700 feet MSL (north) to 880 feet MSL (south), with refuse thicknesses ranging from 40 to 65 feet. However, additional refuse was placed in the southern portion of the WMU following the seismic refraction survey, thereby increasing the refuse thickness in some areas to greater than 80 feet. Based on these characteristics, the proposed extraction well depths will range from 25 to 80 feet BGS as measured from the top of the completed final cover system surface, with an overall average depth of approximately 50 feet BGS. Ideally, a minimum perforation depth (i.e., depth to top of perforated interval) of 15 to 20 feet BGS will be maintained to minimize the potential for atmospheric air intrusion during system operations. In the event shallow auger refusal conditions are encountered that do not allow adherence to this specification, consideration will be given to either reducing the minimum perforation depth or adjusting the corresponding well location.

The extraction wells will be drilled using a truck- or track-mounted drilling rig equipped with 24-inch diameter solid stem augers or bucket auger (see following subsection for further details). A qualified drilling contractor with a current C57 contractor's license will provide the drilling services, under the direct supervision of a California Registered Geologist. The field geologist will be responsible for logging the respective boreholes, making determinations in the field regarding the completion characteristics noted above, and preparing well completion logs. This individual will also perform field monitoring during drilling to evaluate individual borehole conditions and for health and safety purposes. The scope of field monitoring will include selected gases (i.e., methane, oxygen, carbon dioxide, and hydrogen sulfide) and volatile organic compounds (VOCs) using a portable LFG analyzer and photoionization detector (PID), respectively. Refuse spoils generated by the drilling operations will either be temporarily stockpiled on visqueen (and covered) or placed in roll-off bins, whereupon the material will be transported off-site to a permitted solid waste disposal facility.

4.1.3 Well Construction Characteristics

The well casings for the extraction wells will be constructed of 4-inch diameter, Schedule 80 polyvinyl chloride (PVC) pipe. As noted in the previous subsection, the perforated interval for each well will start at 15 to 20 feet BGS and extend downward to the completion depth of the well. The annulus around the well casing will be backfilled with gravel pack material consisting of 1- to 2-inch diameter, non-calcareous washed rock and will extend 12 inches above the perforated casing. The gravel pack, in turn, will be capped with a 3-foot-thick hydrated bentonite seal, followed by soil to a depth of 1 foot below the refuse/final cover interface. A second hydrated bentonite seal (1.5 feet in thickness) will then be placed across this interface, followed by compacted soil to the base of the final cover system's geomembrane. Finally, a PVC well bore seal will be placed beneath and across the geomembrane as a protection provision against atmospheric air intrusion during system operations. Please refer to Sheet 700 (Appendix E) for a typical LFG extraction well construction detail and a tabulated summary of the proposed completion characteristics for the respective extraction wells.

4.1.4 Wellhead Completion

The wellheads for the extraction wells will be completed above ground. The wellheads will be equipped with 1.5-inch diameter PVC gate valves and fittings to regulate and control LFG flow. Each wellhead will also be equipped with a sample port, differential pressure ports, and an orifice plate to allow for the monitoring of LFG quality, temperature, vacuum conditions, and flow. PVC flex hose will be used to connect the wellheads to the collection system piping. Please refer to Sheet 700 (Appendix E) for the wellhead completion characteristics.

4.2 COLLECTION SYSTEM PIPING

4.2.1 Piping Layout and Rationale

Extracted LFG will be conveyed to the flare station via above ground collection system piping (i.e., laterals and headers). The proposed layout of the collection system piping is shown on Sheets 600 through 602 (Appendix E). As shown on these sheets, most of the collection system piping is aligned along the outside edges of the benches to allow for future operation and maintenance access. Other design features and considerations include the following:

- The layout has a modified "loop" configuration that allows for a more even distribution of flow throughout the system.

- The system is segmented and equipped with valve assemblies that will allow for portions of the system to be isolated for repair and maintenance while the remainder of the system remains operational.

- The system has been designed for the removal of LFG condensate at various locations within the well field by promoting gravity drainage of the condensate towards low points within the

collection system piping, whereupon the condensate is drained via dedicated drainage lines that convey the collected condensate to an existing leachate drain located along the northern toe of the WMU.

4.2.2 Sizing of Primary Header Pipe

Head loss calculations were performed using the Darcy Formula to determine sizing requirements for the primary header pipe. A copy of the corresponding head loss calculations is presented in Appendix F. Based on a proposed blower vacuum rating of 35 inches of water column ("wc), a desired wellhead vacuum inducement of 10"wc at the extraction wells furthest from the flare station (EW-17 and EW-18), and a maximum flow rate of 210 SCFM, the corresponding head loss for a 8-inch diameter header pipe is approximately 2.2"wc. This translates to an available residual vacuum of 22.8"wc, which should be more than sufficient to compensate for any unforeseen performance losses related to potential surging effects or flow reversals (i.e., LFG versus condensate flow).

4.2.3 Construction of Collection System Piping

The collection system piping will be constructed of Schedule 40 PVC pipe ranging in size from 4 to 8 inches in diameter. The PVC piping and fitting components will be joined using solvent welding methods and painted to provide ultra-violet (UV) light protection. As outlined in the previous subsection, 8-inch diameter pipe is proposed for the primary header pipe to accommodate anticipated flows and promote condensate drainage. Six-inch and 4-inch diameter piping is proposed for selected header and LFG extraction well lateral segments, respectively. Other pertinent components of the collection system piping will include the following:

- Isolation valves will be installed at major junctions and other strategic points within the primary header (see Sheets 600 through 602, Appendix E) to provide for greater flexibility from an operations and maintenance standpoint. This provision will allow sections of the primary header to be isolated while the remaining sections remain operational.

- Flexible couplings will be installed within the header segments to accommodate thermal expansion and contraction of the pipe due to ambient temperature fluctuations.

- Pipe anchors will be installed within the header segments to secure and restrict pipe movement at pertinent points within the system. The majority of the proposed pipe anchor locations will correspond to header-to-header and lateral-to-header connections and condensate drainage lines.

- Pipe supports for selected above ground PVC piping segments will be installed to allow for the passage of surface water drainage beneath the pipe and to adjust pipe slopes where needed.

4.3 CONDENSATE COLLECTION PROVISIONS

LFG condensate generated with the LFG collection and control system will be collected and removed at various points within the collection system piping. Condensate will also be removed at the flare station at a point just prior to the blowers. The locations and type of equipment to be used to remove the condensate can be summarized as follows:

- *Condensate Drop-Outs:* Condensate drop-outs will be installed at various locations within the well field area (see Sheets 600 through 602, Appendix E). The condensate drop-outs are located at various low points within the collection system piping. The condensate drop-outs are designed to collect and convey condensate by gravity flow via dedicated drainage lines to the existing leachate drain located along the northern toe of the WMU. The condensate drainage lines will be comprised of HDPE pipe and will include U-traps to isolate the drainage lines from the LFG stream. The removal of condensate from these areas is necessary to avoid potential problems related to LFG flow blockages and surging effects.

- *Gas-Liquid Separator:* A gas-liquid separator will be installed at the flare station directly upflow from the blowers. The purpose of this component is to remove moisture from the LFG air stream prior to entering the blowers and flare. Removal of the moisture is achieved by centrifugal force created within the gas-liquid separator.

Condensate removed by the drop-outs and discharged to the existing leachate drain will be managed in the same manner that the leachate currently is managed; i.e., the leachate drain discharges to a vault located near the west end of the WMU, whereupon the leachate is pumped to an existing leachate above ground storage tank (AST) for subsequent disposal at the City's publicly-owned treatment works (POTW) facility. Condensate collected by the gas-liquid separator will also be handled in a similar manner. This condensate will either be gravity fed to the aforementioned vault or pumped directly to the existing leachate AST. Provisions will be made to line the vault with a solids epoxy resin-based coating to provide waterproofing, sealing, and corrosion protection.

4.4 FLARE STATION

The major components of the flare station are the blowers and the flare. Other pertinent equipment and features include: a gas-liquid separator for removing condensate and particulates from the LFG stream; LFG flow control and miscellaneous monitoring mechanisms to evaluate flare performance and compliance; and automatic safety control features. Further details regarding each of these components are summarized in the following subsections.

It should be noted that the flare station will be comprised of a skid-mounted packaged combustion system. In general, a packaged combustion system consists of a pre-piped and pre-wired unit in which all the system components (i.e., gas-liquid separator, blowers, flare, control panel, etc.) are mounted on two separate skids. This type of system is proposed as a mechanism to reduce field installation costs. In addition, the packaged combustion system can be trouble-shooted and tested at the factory following fabrication to ensure proper operation.

4.4.1 Gas-Liquid Separator

The gas-liquid separator is designed to remove moisture for the LFG stream prior to entering the blowers and flare. Removal of the moisture is achieved by centrifugal force created within the gas-liquid separator. Free liquids generated by this process are collected at the base of the unit and will be discharged to either the leachate vault or leachate AST as described in the previous subsection. This unit will be located on the packaged combustion system at a point upstream of the blower inlet.

4.4.2 Blowers

The function of the blowers is to induce a vacuum in the LFG extraction wells and collection system piping and convey the LFG generated from these sources to the flare. The desired vacuum for the LFG collection and control system is set at 35"wc. This vacuum will be sufficient to induce a minimum vacuum of 10"wc in the LFG extraction wells furthest from the blower, extract LFG intercepted by the final cover system's gas relief component, and to overcome associated head losses in the collection system piping. As outlined in Subsection 4.2.2 (*Sizing of Primary Header Pipe*) of this report, a residual vacuum of 22.8"wc will be available in the primary header system under the aforementioned conditions. The design flow rates for the entire LFG collection and control system are 53 to 210 SCFM. Two blowers will be installed at the flare, with the second blower intended for secondary standby requirements or to allow for alternating use of the blowers.

The blowers will consist of centrifugal-type blowers equipped with 7.5 horsepower, 3-phase, totally-enclosed fan cooled (TEFC) motors. Flexible connections will be installed on both inlet and outlet sides of the blowers to absorb vibrations during operation. A summary of the blower performance parameters is presented in Table 5.

TABLE 5
BLOWER PERFORMANCE SPECIFICATIONS

Parameter	*Specification*
Fuel	Landfill Gas
Fuel Specific Gravity	0.97 pounds per cubic foot
Fuel Temperature (Range)	100ºF to ambient
Design Flow Rate (Range)	53 to 210 standard cubic feet per minute
Blower Turndown Ratio	4:1
Inlet Vacuum Pressure	35 inches of water column
Discharge Positive Pressure	10 inches of water column

°F: Degrees Fahrenheit

4.4.3 Totally-Enclosed Vertical Ground Flare

A totally-enclosed vertical ground flare (flare) will be utilized for the thermal destruction of LFG collected by the LFG collection and control system. In general, LFG extracted from the LFG extraction wells is diverted to the flare station where it is combusted in the presence of oxygen to carbon monoxide, sulfur dioxide, oxides of nitrogen (NOx), and other related gases. The flare will be specified to meet all requirements of the MCAQMD and AB32 regulations, and will be equipped with a series of operational mechanisms, safety controls and monitoring devices (see following subsections). Table 6 below provides a summary of applicable performance standards for the flare.

TABLE 6
FLARE PERFORMANCE STANDARDS

Parameter	*Specification*
Fuel	Landfill Gas
Fuel Composition (estimated)	Methane (30 to 55 percent) Carbon Dioxide (20 to 45 percent) Nitrogen (5 to 12 percent) Oxygen (0 to 3 percent) Hydrogen (0 to 1 percent) Trace Compounds (<1 percent)
Fuel Specific Gravity	0.97 pounds per cubic foot
Fuel Temperature Range	100ºF to ambient
Design Flow Rate (range at 50 percent methane)	53 to 210 standard cubic feet per minute
Pilot Fuel	Propane
Fuel Pressure to Flare	10 inches of water column
Minimum/Maximum LFG Heating Value	269 to 492 BTU/scf
Minimum/Maximum LFG Heat Release	0.9 to 6.2 MMBTU/hr
Flare Turndown Ratio	4:1
Minimum LFG Retention Time	0.7 seconds
Minimum Combustion Temperature	1,400ºF
Design Operating Temperature	1,400ºF to 1,800ºF
Destruction Efficiency	Overall = >98 percent by weight Oxides of Nitrogen (NOx) = 0.06 lbs/MMBTU Carbon Monoxide (CO) = 0.20 lbs/MMBTU

°F: Degrees Fahrenheit
BTU/scf: British Thermal Units per Standard Cubic Foot
MMBTU/hr: Million British Thermal Units per Hour
lbs/MMBTU: Pounds per Million British Thermal Units

4.4.4 LFG Flow Control and Monitoring Mechanisms

The flare will be equipped with automatic flow control capabilities and miscellaneous monitoring devices. The two primary components of the LFG flow equipment are the flame switch assembly and an actuated LFG inlet valve. The flame switch assembly is the source mechanism for activating the LFG inlet valve and includes such equipment as a UV flame detector and miscellaneous electronic relay components. The LFG inlet valve, in turn, shuts down flow to the flare in case of a system failure or emergency and is controlled by an electric or pneumatic actuator.

The flare station will also be equipped with a variety of sensors and gauges to monitor system parameters, with the most prominent parameters being flow and temperature. Flow will be measured using a differential pressure or thermal mass flow meter. Temperature within the flare will be monitored using thermocouple transducers and temperature sensors. These devices are wired to a flame temperature controller unit that will be capable of regulating flare temperatures (through activation of an automatic damper[s]) and/or shutting down the flare station in cases of minimum/excessive temperatures.

4.4.5 Automatic Safety Control Systems

In addition to the aforementioned safety control measures, the flare will be equipped with a flame arrestor and miscellaneous automatic shutdown devices. The flame arrestor is a safety mechanism designed to stop propagation of the flame. This device is equipped with an internal multi-plate bank assembly that absorbs and dissipates the heat from the LFG, which in turn lowers the temperature of the LFG below its ignition point, thereby quenching the flame. The flame arrestor will be installed in the inlet pipeline, just prior to entering the flare. The automatic shutdown devices, in turn, provide oversight of system operations and terminate operations if pre-set conditions are not satisfied. Conditions to be programmed for automatic shutdown will include, but not necessarily limited to, the following: pilot light failure; low/high temperature conditions; flame-out conditions; high condensate level in gas-liquid separator; and power outage.

4.4.6 Control Station Assembly

The overall collection and control system will be operated by a programmable logic control (PLC) housed inside a self-supporting, weatherproof control panel. The PLC will be responsible for overall system operation and control. In addition to the PLC, the control panel will contain the following control/safety components and features:

- Automatic start/re-start control system
- Pilot gas control system
- Modules for low/high temperature shut-down and automatic temperature controls integrated with the flare's damper system
- Motor starter panels, including variable frequency drive (VFD) provisions
- Power transformer and miscellaneous relay mechanisms
- Indicating lights showing system operation and status
- A continuous chart recorder for temperature and flow

- Autodialer alarm system

The control station assembly will be mounted directly onto the packaged combustor system unit. All electrical components for the control station assembly and flare station will be Underwriters Laboratory (UL) approved.

4.5 PERMITTING

Permitting of the proposed LFG collection and control system will entail the acquisition of an Authority to Construct (ATC)/Permit to Operate (PTO) from the MCAQMD. The ATC/PTO process will be coordinated by EBA with the MCAQMD. Upon issuance of the ATC by the MCAQMD and subsequent installation of the LFG collection and control system, provisions will be made to coordinate a final system inspection with MCAQMD and perform any source testing that may be required to satisfy applicable PTO requirements.

Other local permits that may be required as part of the installation process include a drilling permit for installation of the LFG extraction wells, as well as building and electrical permits. The acquisition of these types of permits (as applicable), and any other local permits that may be required, will be obtained by the construction contractor selected to implement the final closure construction project.

SECTION 5

MONITORING AND REPORTING

The LFG collection and control system will be monitored throughout the course of operation to evaluate the performance and effectiveness of system operations. The proposed scope and frequency of monitoring activities are designed to maintain system efficiency and safety, and to comply with federal, state, and local regulatory requirements, including AB32 regulations. Details regarding the proposed monitoring and reporting provisions are summarized in the following subsections.

5.1 FLARE STATION

Upon commencement of system operations, the flare station will be monitored initially on a daily basis to assure safe and efficient system operations, and to confirm compliance with applicable regulatory performance standards. Since the flare station is responsible for inducing sufficient vacuum pressures for the entire WMU and subsequent combustion of the LFG, it is imperative that the equipment components are operating at optimal efficiency at all times. Upon stabilization of system operations, the frequency of monitoring will be adjusted accordingly. In order to monitor system performance and identify potential hazards, the following parameters will be monitored and recorded:

- Ambient temperature
- Blower inlet vacuum pressure and differential pressure
- Blower operating hours
- LFG inlet temperature and pressure
- LFG flow rate
- LFG quality (methane, carbon dioxide, oxygen and balance [nitrogen] concentrations)
- Flare temperature
- Flame arrestor pressure and differential pressure

The parameters outlined herein will be recorded on an entry log. All completed entry logs will be maintained on file at the City's office and will be made available to the MCAQMD, CalRecycle, and LEA upon either verbal or written request.

5.2 WELL FIELD

LFG parameters will be monitored at each of the wellheads. Data compiled at these locations provide the greatest source of information regarding LFG collection and control system performance. Parameters to be included in the data collection will be as follows:

- *LFG Quality*: Monitoring of the four primary LFG components (methane, carbon dioxide, oxygen and nitrogen) and the associated ratios of these compounds plays an important role with regard to operation of the LFG collection and control system. Methane concentrations provide an indication of the overall decomposition rate of the refuse and the overall health of the methogenic (anaerobic) organisms. Nitrogen and oxygen concentrations, in turn, provide indications of excessive flows and the influx of atmospheric air. The influx of atmospheric air into the WMU can be detrimental to anaerobic decomposition (thereby eliminating methane production), and can also increase the potential for subsurface fires. Individual extraction wells will be adjusted accordingly to maintain the highest methane content as practical, while still maintaining adequate migration and emissions control.

- *LFG Temperature:* Excessive LFG temperatures provide an indication of potential subsurface fires. LFG temperatures typically range from ambient to approximately 130°F. Temperatures approaching the high end of this range will be used as a precautionary warning of potentially adverse operating conditions.

- *LFG Flow:* Flow rates provide an indication of the performance of the respective LFG extraction wells. In addition, individual flow data can be useful in diagnosing problem areas in cases where decreases in overall flow rates are observed at the flare station. Finally, flow data can be used to monitor whether the well field is operating within the LFG generation design parameters.

- *LFG Pressure:* Pressure data is used to evaluate whether an individual LFG extraction well is maintaining a negative pressure (vacuum). In some cases, excessive negative pressure conditions may also provide an indication that the well is clogged or damaged.

Data compiled from the aforementioned monitoring will be used to evaluate conditions in proximity of each source location, and to make necessary flow adjustments at the respective wellheads. The monitoring of LFG extraction wells will be conducted initially on a weekly basis (minimum) until system operations stabilize, whereupon the monitoring frequency will be reduced to either bimonthly or monthly, as appropriate. Consistent with the recording procedures outlined above for the flare station, all data will be recorded on an entry log and maintained on file at the City's office. The corresponding entry logs will be made available to the MCAQMD, CalRecyle and LEA upon either verbal or written request.

5.3 TITLE 27 PERIMETER LFG MONITORING

Monitoring of the perimeter LFG monitoring points will be conducted on a quarterly basis in accordance with 27CCR, §20921 and the Landfill's Final Postclosure Maintenance Plan. In addition to fulfilling the aforementioned regulatory requirements, the monitoring of perimeter probes will provide pertinent information regarding the overall performance of the LFG collection and control system. As previously noted in Subsection 4.1.1 (*Well Field Layout and Rationale*), installation of the final cover system could increase lateral and vertical pressures within the WMU, thereby potentially inducing subsurface migration of LFG. Thus, the perimeter monitoring will assist in

determining whether the LFG collection and control system is providing adequate subsurface migration control, including whether ongoing operation of the existing partial perimeter LFG collection system is necessary if the historical LFG migration in that area can be abated by the new system. In accordance with 27CCR, §20934, the results of the monitoring will be reported within 90 days from when the monitoring was performed and submitted to the LEA, MCAQMD, and RWQCB.

5.4 AB32 MONITORING

5.4.1 Monitoring

The LFG collection and control system and WMU surface will be monitored to comply with AB32 requirements in accordance with 17CCR, §95469. The scope of monitoring will include the following:

- Instantaneous surface monitoring will be conducted on a quarterly basis to determine if surface emissions of 500 ppmv or greater, other than non-repeatable, momentary readings, are present at any location on the WMU surface. The monitoring will be accomplished using a portable gas detector while walking in a designated 25-foot spacing interval pattern where practical (see Section 6 [*Proposed Alternatives*] of this Updated Plan for noted exceptions). As required by the regulations, the WMU surface will be separated into grids approximately 50,000 square feet in size to delineate individual monitoring areas. Please refer to Appendix G for an illustration of the designated grid pattern.

- Integrated surface monitoring will be conducted on a quarterly basis to determine if the average methane concentration within the individual grids exceeds 25 ppmv. The instrumentation and walking pattern will be consistent with those described above for the instantaneous surface monitoring.

- Any components of the LFG control and collection system that are under positive pressure will be monitored on a quarterly basis to determine if any leaks are present at methane concentrations exceeding 500 ppmv. The only components under pressure will correspond to the conveyance piping between the blower and flare, as well as the flame arrestor and automatic block valve. There will be no components under pressure in the well field. The monitoring will be performed using a portable gas detector.

- The wellhead for each extraction well will be monitored on a monthly basis to determine whether the extraction well is being operated under vacuum conditions (i.e., negative pressure). The monitoring will be performed using a Magnehelic pressure gauge. This monitoring requirement is redundant to that previously described in Subsection 5.2 (*Well Field*) of this Updated Plan.

- The flare will be monitored for temperature and flow rate using dedicated instrumentation and the corresponding data documented using a continuous recorder. In addition, the flare will be source tested on an annual basis to verify compliance with emissions and destruction efficiency criteria.

The test methods and procedures employed to perform the respective monitoring provisions outlined above will be in accordance with the applicable subsections of 17CCR, §95471. This includes portable gas meter instrumentation and calibration, emissions monitoring procedures, wind speed data collection, and precipitation documentation (i.e., no measurable precipitation 72 hours prior to emissions monitoring). In addition, in the event that an emissions and/or operating threshold is identified, corresponding corrective actions will be implemented within the time frames specified in the AB32 regulations.

In accordance with 17CCR, §95469(a)(1)(C) and §95469(a)(2)(C), if no exceedances of the 500 ppmv (instantaneous) and 25 ppmv (integrated) emission thresholds are encountered for four consecutive quarters, the quarterly emissions monitoring frequency specified herein will be extended to annually. In addition, if the flare remains in compliance after three consecutive source tests, the annual source test frequency specified herein will be extended to every three years per 17CCR, §95464(b)(4)(A).

5.4.2 Recordkeeping

Records will be maintained for the respective monitoring activities and will be made available for regulatory review at the City's office. The types of records to be maintained will comply with 17CCR, §95470(a) and include the following (as applicable):

- All LFG collection and control system downtime exceeding five calendar days, including individual well shutdown and disconnection times, and the reason for the downtime.

- All LFG collection and control system downtime in excess of one hour, the reason for the downtime, and the length of time the system was shutdown.

- Expected LFG generation flow rate for the applicable calendar year.

- Records of all instantaneous surface readings of 200 ppmv or greater associated with the LFG collection and control system and surface emissions monitoring, including specific details of the findings, corrective actions, and subsequent re-monitoring.

- Records of any positive wellhead gauge pressure measurements, the date of the measurement, the well identification number, and the corrective action taken.

- Results of flare source tests.

- Records describing the mitigation measures taken to prevent the release of methane or other emissions into the atmosphere during periods of shutdown or repair of the LFG collection and control system.

- Records of any construction activities, including description of reason and associated details of the construction and mitigation measures taken to minimize methane emissions and other potential air quality impacts.

- Records of the equipment operating parameters for the flare, including all 3-hour periods of operation during which the average temperature difference was more than 50°F below the average combustion temperature during the most recent source test, as well any other parameter boundaries that were exceeded.

The aforementioned monitoring records will be maintained and be made available for regulatory review for a minimum of five years. In addition, the following records will be maintained for the life of the flare: vendor specifications; expected gas generation flow rate; and percent reduction of methane achieved by the flare.

5.4.3 Reporting

An annual report will be prepared and submitted to the MCAQMD and/or the California Air Resources Board (CARB) by March 15 of each calendar year. The report will cover the period of January 1 through December 31 of the previous calendar year. The contents of the report will include all the information stipulated in 17CCR, §95470(b)(3), including much of the records information outlined in the previous subsection (as applicable).

SECTION 6

PROPOSED ALTERNATIVES

Alternative compliance options to the various requirements stipulated in the AB32 regulations are allowed for consideration under 17CCR, §95468. In this regard, the following sections outline three options as part of this Updated Plan to account for site-specific topographic features and design characteristics of the final cover system.

6.1 ALTERNATIVE WALKING PATTERN

As previously discussed in Subsection 5.4 (*AB32 Monitoring*) of this Updated Plan, 17CCR, §95471(c)(1)(B) requires that the walking pattern for emissions monitoring be no more than a 25-foot spacing interval within each 50,000-square foot monitoring grid. Whereas the uppermost (southern) portions of the WMU surface readily allow for the implementation of this procedure, the majority of the WMU surface is comprised of steep slopes that present safety issues. A formal written request for authorization of an alternate walking pattern was submitted to the MCAQMD on July 18, 2013 (EBA, 2013a). A copy of this request is enclosed in Appendix G of this Updated Plan. As presented in Appendix G, several of the concerns originally raised corresponded to logistical and safety issues associated with the vegetative cover (i.e., need for cutting of vegetation to facilitate emissions monitoring and potential safety hazards related to rattlesnake harborage). These concerns no longer apply based on the nature of the revised final cover system (i.e., synthetic closure turf in lieu of a vegetative cover). However, the safety issue of slip and fall hazards remain due to the steepness of the slopes. The majority of the landfill surface is at a slope of approximately 2.5:1 (horizontal to vertical). Slopes of this magnitude covered by a synthetic surface can be slippery when trying to traverse by foot, regardless if the synthetic surface is wet or dry. This potential hazard is further heightened when considering the sampler is carrying a 30- to 40-pound instrument on his or her back/shoulder and holding the detector probe in one hand, while simultaneously trying to focus on both the monitoring device and the ground surface.

As part of the previous exemption request presented in Appendix G, it was recommended that only those grids with flat or shallow slope conditions (i.e., grids G6, G7, G10, G11, G14, G18, G19, G26, G27, G38 and G39 [see Appendix G]) be subject to the 25-foot spacing interval walking pattern, while surface emissions monitoring for the primary slope areas would target the respective benches. Under this approach, both the inside and outside edges of each bench would be monitored in accordance with the instantaneous surface emissions monitoring procedures described in the regulations. This approach was considered to offer a means of monitoring for surface emissions within the primary slope areas as a whole while promoting a safe monitoring procedure for the individuals responsible for implementing the program in the field. This overall walking pattern was verbally approved by the MCAQMD on July 31, 2013.

Once the LFG collection and control system is installed and operational, it is recommended that the same alternative walking pattern as described above and approved by the MCAQMD be implemented as part of subsequent surface emissions monitoring. While the previous request focused on instantaneous surface emissions monitoring, the same walking pattern is also proposed for the integrated surface emissions monitoring.

Please note that whereas the final WMU grades will be adjusted nominally as part of the final cover system construction, the bench locations and slope angles will generally mimic the existing configurations. Thus, the number, orientation and pattern of the existing grids as presented in the previous submittal (Appendix G) will not change appreciably and is still valid.

6.2 WELLHEAD GAUGE PRESSURE

17CCR, §95464(c) requires that each wellhead must be operated under a vacuum (negative pressure), unless the final cover system is constructed with a geomembrane or synthetic cover. Under this circumstance, an acceptable pressure limit for the wellheads must be specified in the design plan. Since the final cover system for the WMU will include a geomembrane component, the Landfill qualifies for an alternative wellhead gauge pressure limit. In this regard, it is proposed that the maximum wellhead gauge pressure limit be set at +2.0 inches of water column (positive pressure).

Please be advised that the wellhead gauge pressure is indicative of pressure conditions at depth, not at the near surface. Just because a positive pressure exists at a wellhead, it does not necessarily mean that surface emissions will be the result of such conditions. Ideally, the wellhead gauge pressure should be dictated by the LFG quality as inducing too much vacuum can cause in the inducement of atmospheric air into the refuse mass and increase the potential for subsurface fires. Thus, in the absence of surface emissions within proximity of an extraction well, no adjustment to the vacuum is recommended regardless of the wellhead gauge pressure conditions, provided the maximum LFG quality conditions have been attained at that particular extraction well. In fact, it would be better to disconnect and cap the extraction well as opposed to risking a subsurface fire for the sole purpose of maintaining a negative wellhead gauge pressure. Under this scenario, replacement of the disconnected extraction well is not recommended unless surface emissions exceeding the regulatory thresholds are detected, whereupon a new extraction well(s) should be installed within the time frames stipulated in 17CCR, §95469(c).

6.3 PROVISIONAL GAS RELIEF COMPONENT VENTING

The gas relief component associated with the final cover system will be connected to the LFG collection and control system and maintained under vacuum to eliminate the potential build-up of LFG pressure beneath the geomembrane. This provision is important as excessive LFG pressures beneath the geomembrane could compromise the structural integrity of the geomembrane. Whereas the LFG collection and control system is designed to operate on a continuous basis, there may be unforeseen instances where the system shuts down due to equipment failure or power outages. If

such shutdowns last for an extended period of time, temporary mitigation measures will be necessary to avoid excessive pressure build-up beneath the geomembrane. In this regard, the gas relief component will be equipped with pressure relief valves to allow for temporarily venting to the atmosphere LFG that may collect beneath the geomembrane during shutdown periods. The valves will be pressure activated if appreciable pressures buildup beneath the geomembrane. While such conditions may result in point source emissions exceeding the AB32 regulatory threshold of 500 ppmv, such emissions would only be temporary in nature and would cease upon reinstatement of LFG collection and control system operations.

SECTION 7

TEMPORARY MITIGATION MEASURES

Per 17CCR, §95464(a)(1)(D), the design plan must include temporary mitigation measures to prevent the release of methane or other pollutants into the atmosphere during the installation or preparation of extraction wells, piping, or other equipment; during repairs or the temporary shutdown of LFG collection and control system components; or when solid waste is excavated and moved. The following provides a summary of the temporary mitigation measures that will be employed to meet these objectives:

- New LFG extraction wells will be required to be drilled and installed in a single day. Installation must include placement of casing, gravel pack, and surface seal (including lower and upper hydrated bentonite seals). The top of the casing will be capped. Partially drilled or partially installed extraction wells will not be allowed to remain open overnight.

- During the installation or repair of collection system piping, the ends of piping that could be susceptible to emitting LFG will be capped when not actively being worked on. No pipe ends will be allowed to remain open overnight.

- As outlined in Subsection 4.2.1 (*Piping Layout and Rationale*) of this Updated Plan, the collection system piping is segmented and equipped with valve assemblies that will allow for portions of the system to be isolated for repair and maintenance while the remainder of the system remains operational. This provision will minimize the size of areas subject to potential fugitive surface emissions during repairs.

- When practical, any planned shutdowns of the LFG collection and control system will be scheduled for the morning hours when barometric pressure conditions are typically high, thereby minimizing the potential for fugitive surface emissions.

- Other than solid waste excavated during the drilling of LFG extraction wells, the only excavation of solid waste may take place during construction of the final cover system since the Landfill is closed. Under this scenario, any exposed in-place waste will be required to be covered with soil as soon as practical, or at the end of each work day, whichever occurs first. In regards to the solid waste that has been excavated (during final closure construction or drilling), this material will be stockpiled and covered, or placed in a truck or roll-off bin and covered, as soon as practical. No excavated waste will allowed to remain uncovered overnight and will be covered during transport off-site.

SECTION 8

SCHEDULE

Installation of the LFG collection and control system will be conducted as part of the Landfill's final closure construction project that is scheduled to commence in the spring of 2020. The target completion date for having the LFG collection and control system installed and operational is December 2020.

ACCT: 9986
PROJ: 02-907 TASK 8

FROM: Richard A. Kagel, Ph.D. RAK 9/24/2013
Laboratory Director

SUBJECT: LABORATORY RESULTS FOR YOUR PROJECT 02-907 TASK 8

Enclosed please find K Prime's laboratory reports for the following samples:

SAMPLE ID	TYPE	DATE	TIME	KPI LAB #
LFG-LW-1	AIR	9/12/2013	11:32	114282
GP-1	AIR	9/16/2013	14:55	114283
LFG-COMP	AIR	9/16/2013	16:25	114284

The above listed sample group was received on 9/17/2013 and tested as requested on the chain of custody document.

Please call me if you have any questions or need further information.
Thank you for this opportunity to be of service.

APPENDIX D

LFG CONDENSATE GENERATION CALCULATIONS

CONDENSATE GENERATION CALCULATIONS
LOWEST AVERAGE MONTHLY TEMPERATURE AT MINIMUM FLOW RATE
CITY OF UKIAH LANDFILL

Design Parameters:

LFG Temp. at Initial Point (F):	120	
LFG Temp. at Final Point (F):	36	
Vapor Pressure at Initial Temp.	1.6927	(see attached table)
Vapor Pressure at Final Temp.	0.0999	(see attached table)
Average Vacuum Pressure ("w.c.)	25	
Average Vacuum Pressure (psia)	13.797	
Design Flow Rate (scfm):	53	
Conversion Factor:	0.0057	

Method 1 - Detailed Procedure (LANDTEC, 1994)

Xcond = Pw/Plfg = Vcond/Vlfg

where:

Xcond	=	Fraction of liquid gas condensate (assumed to be primarily aqueous water)
Xw	=	Water vapor fraction
Pwater	=	Partial (vapor) pressure of water at LFG temperature determined (psia)
Plfg	=	Total pressure of LFG (psia) (i.e., average pipeline pressure)
Vcond	=	Volue of LFG condensate
Vlfg	=	Volume of LFG

therefore:

Dropped Out Xcond = Initial Xw - Final Xw
Dropped Out Xcond = 0.115

Condensate (gal) per Design Flow (scf) = Dropped Out Xcond x Flow x Conversion Constant
Condensate (gal) per Design Flow (scf) = 0.035

Gallons of Condensate per day = ***50 gal/day***

Method 2 - Conservative Method (Source: LANDTEC, 1994)

Vcond = 5694 x (10^B/Ps)

where:

Vcond	=	Volume of condensate (water) produced (MMcf)
B	=	6.32 - (3081/T+385) = 0.219
T	=	Maximum (initial) gas temperature (F)
Ps	=	System pressure (psia)

Vcond = 683.326 gal/MMcf

Corrected Vcond for Design Flow = ***52 gal/day***

CONDENSATE GENERATION CALCULATIONS
MEAN TEMPERATURE (ANNUAL) AT MINIMUM FLOW RATE
CITY OF UKIAH LANDFILL

Design Parameters:

LFG Temp. at Initial Point (F):	120	
LFG Temp. at Final Point (F):	59	
Vapor Pressure at Initial Temp.	1.6927	(see attached table)
Vapor Pressure at Final Temp.	0.2561	(see attached table)
Average Vacuum Pressure ("w.c.)	25	
Average Vacuum Pressure (psia)	13.797	
Design Flow Rate (scfm):	53	
Conversion Factor:	0.0057	

Method 1 - Detailed Procedure (LANDTEC, 1994)

Xcond = Pw/Plfg = Vcond/Vlfg

where:

Xcond	=	Fraction of liquid gas condensate (assumed to be primarily aqueous water)
Xw	=	Water vapor fraction
Pwater	=	Partial (vapor) pressure of water at LFG temperature determined (psia)
Plfg	=	Total pressure of LFG (psia) (i.e., average pipeline pressure)
Vcond	=	Volue of LFG condensate
Vlfg	=	Volume of LFG

therefore:

Dropped Out Xcond = Initial Xw - Final Xw
Dropped Out Xcond = 0.104

Condensate (gal) per Design Flow (scf) = Dropped Out Xcond x Flow x Conversion Constant
Condensate (gal) per Design Flow (scf) = 0.031

Gallons of Condensate per day = ***45 gal/day***

Method 2 - Conservative Method (Source: LANDTEC, 1994)

Vcond = 5694 x (10^B/Ps)

where:

Vcond	=	Volume of condensate (water) produced (MMcf)
B	=	6.32 - (3081/T+385) = 0.219
T	=	Maximum (initial) gas temperature (F)
Ps	=	System pressure (psia)

Vcond = 683.326 gal/MMcf

Corrected Vcond for Design Flow = ***52 gal/day***

CONDENSATE GENERATION CALCULATIONS
LOWEST AVERAGE MONTHLY TEMPERATURE AT MAXIMUM FLOW RATE
CITY OF UKIAH LANDFILL

Design Parameters:

LFG Temp. at Initial Point (F):	120	
LFG Temp. at Final Point (F):	36	
Vapor Pressure at Initial Temp.	1.6927	(see attached table)
Vapor Pressure at Final Temp.	0.0999	(see attached table)
Average Vacuum Pressure ("w.c.)	25	
Average Vacuum Pressure (psia)	13.797	
Design Flow Rate (scfm):	210	
Conversion Factor:	0.0057	

Method 1 - Detailed Procedure (LANDTEC, 1994)

Xcond = Pw/Plfg = Vcond/Vlfg

where:

Xcond	=	Fraction of liquid gas condensate (assumed to be primarily aqueous water)
Xw	=	Water vapor fraction
Pwater	=	Partial (vapor) pressure of water at LFG temperature determined (psia)
Plfg	=	Total pressure of LFG (psia) (i.e., average pipeline pressure)
Vcond	=	Volue of LFG condensate
Vlfg	=	Volume of LFG

therefore:

Dropped Out Xcond = Initial Xw - Final Xw
Dropped Out Xcond = 0.115

Condensate (gal) per Design Flow (scf) = Dropped Out Xcond x Flow x Conversion Constant
Condensate (gal) per Design Flow (scf) = 0.138

Gallons of Condensate per day = ***199 gal/day***

Method 2 - Conservative Method (Source: LANDTEC, 1994)

Vcond = 5694 x (10^B/Ps)

where:

Vcond	=	Volume of condensate (water) produced (MMcf)	
B	=	6.32 - (3081/T+385) =	0.219
T	=	Maximum (initial) gas temperature (F)	
Ps	=	System pressure (psia)	

Vcond = 683.326 gal/MMcf

Corrected Vcond for Design Flow = ***207 gal/day***

CONDENSATE GENERATION CALCULATIONS
MEAN TEMPERATURE (ANNUAL) AT MAXIMUM FLOW RATE
CITY OF UKIAH LANDFILL

Design Parameters:

LFG Temp. at Initial Point (F):	120	
LFG Temp. at Final Point (F):	59	
Vapor Pressure at Initial Temp.	1.6927	(see attached table)
Vapor Pressure at Final Temp.	0.2561	(see attached table)
Average Vacuum Pressure ("w.c.)	25	
Average Vacuum Pressure (psia)	13.797	
Design Flow Rate (scfm):	210	
Conversion Factor:	0.0057	

Method 1 - Detailed Procedure (LANDTEC, 1994)

Xcond = Pw/Plfg = Vcond/Vlfg

where:

Xcond	=	Fraction of liquid gas condensate (assumed to be primarily aqueous water)
Xw	=	Water vapor fraction
Pwater	=	Partial (vapor) pressure of water at LFG temperature determined (psia)
Plfg	=	Total pressure of LFG (psia) (i.e., average pipeline pressure)
Vcond	=	Volue of LFG condensate
Vlfg	=	Volume of LFG

therefore:

Dropped Out Xcond = Initial Xw - Final Xw
Dropped Out Xcond = 0.104

Condensate (gal) per Design Flow (scf) = Dropped Out Xcond x Flow x Conversion Constant
Condensate (gal) per Design Flow (scf) = 0.125

Gallons of Condensate per day = ***179 gal/day***

Method 2 - Conservative Method (Source: LANDTEC, 1994)

Vcond = 5694 x (10^B/Ps)

where:

Vcond	=	Volume of condensate (water) produced (MMcf)	
B	=	6.32 - (3081/T+385) =	0.219
T	=	Maximum (initial) gas temperature (F)	
Ps	=	System pressure (psia)	

Vcond = 683.326 gal/MMcf

Corrected Vcond for Design Flow = ***207 gal/day***

ALTERNATIVE WALKING PATTERN DOCUMENTATION

July 18, 2013

Mr. Robert Scaglione
Mendocino County Air Quality Management District (MCAQMD)
306 East Gobi Street
Ukiah, CA 95482-5511

RE: REQUEST FOR ALTERNATIVE COMPLIANCE – WALKING PATTERN
CITY OF UKIAH LANDFILL, MENDOCINO COUNTY, CALIFORNIA
EBA JOB No. 13-1953 (TASK 2)

Dear Mr. Scaglione:

This document is being submitted on behalf of the City of Ukiah, Department of Public Works, operator of the City of Ukiah Landfill in Ukiah, California, to request an alternative compliance under Title 17, California Code of Regulations (17CCR), §95468 as it pertains to the required walking pattern stipulated in the Assembly Bill 32 (AB32) regulations for *Methane Emissions from Municipal Solid Waste Landfills*. In general, 17CCR, §95471(c)(1)(B) requires that the walking pattern be no more than a 25-foot spacing interval within each 50,000-square foot monitoring grid. Whereas the uppermost (southern) portions of the landfill surface readily allow for the implementation of this procedure, the majority of the landfill surface is comprised of steep, vegetated slopes that present logistical and safety issues. These issues are as follows:

- The height of the established grass cover on the primary slopes is typically on the order of 12 to 24 inches tall. Based on the 17CCR, §95471(c)(1)(A) requirement that the detector probe must be held within 3 inches of the landfill surface while traversing the grid, the grass would likely have to be cut two to three times over the course of the year in order to meet this criterion. Due to the steepness of the primary slopes, the grass would have to be cut by hand using a "weed wacker". It is estimated that such a provision would take approximately 200 to 300 man-hours to complete per event. This provision is considered to be overly burdensome and costly.

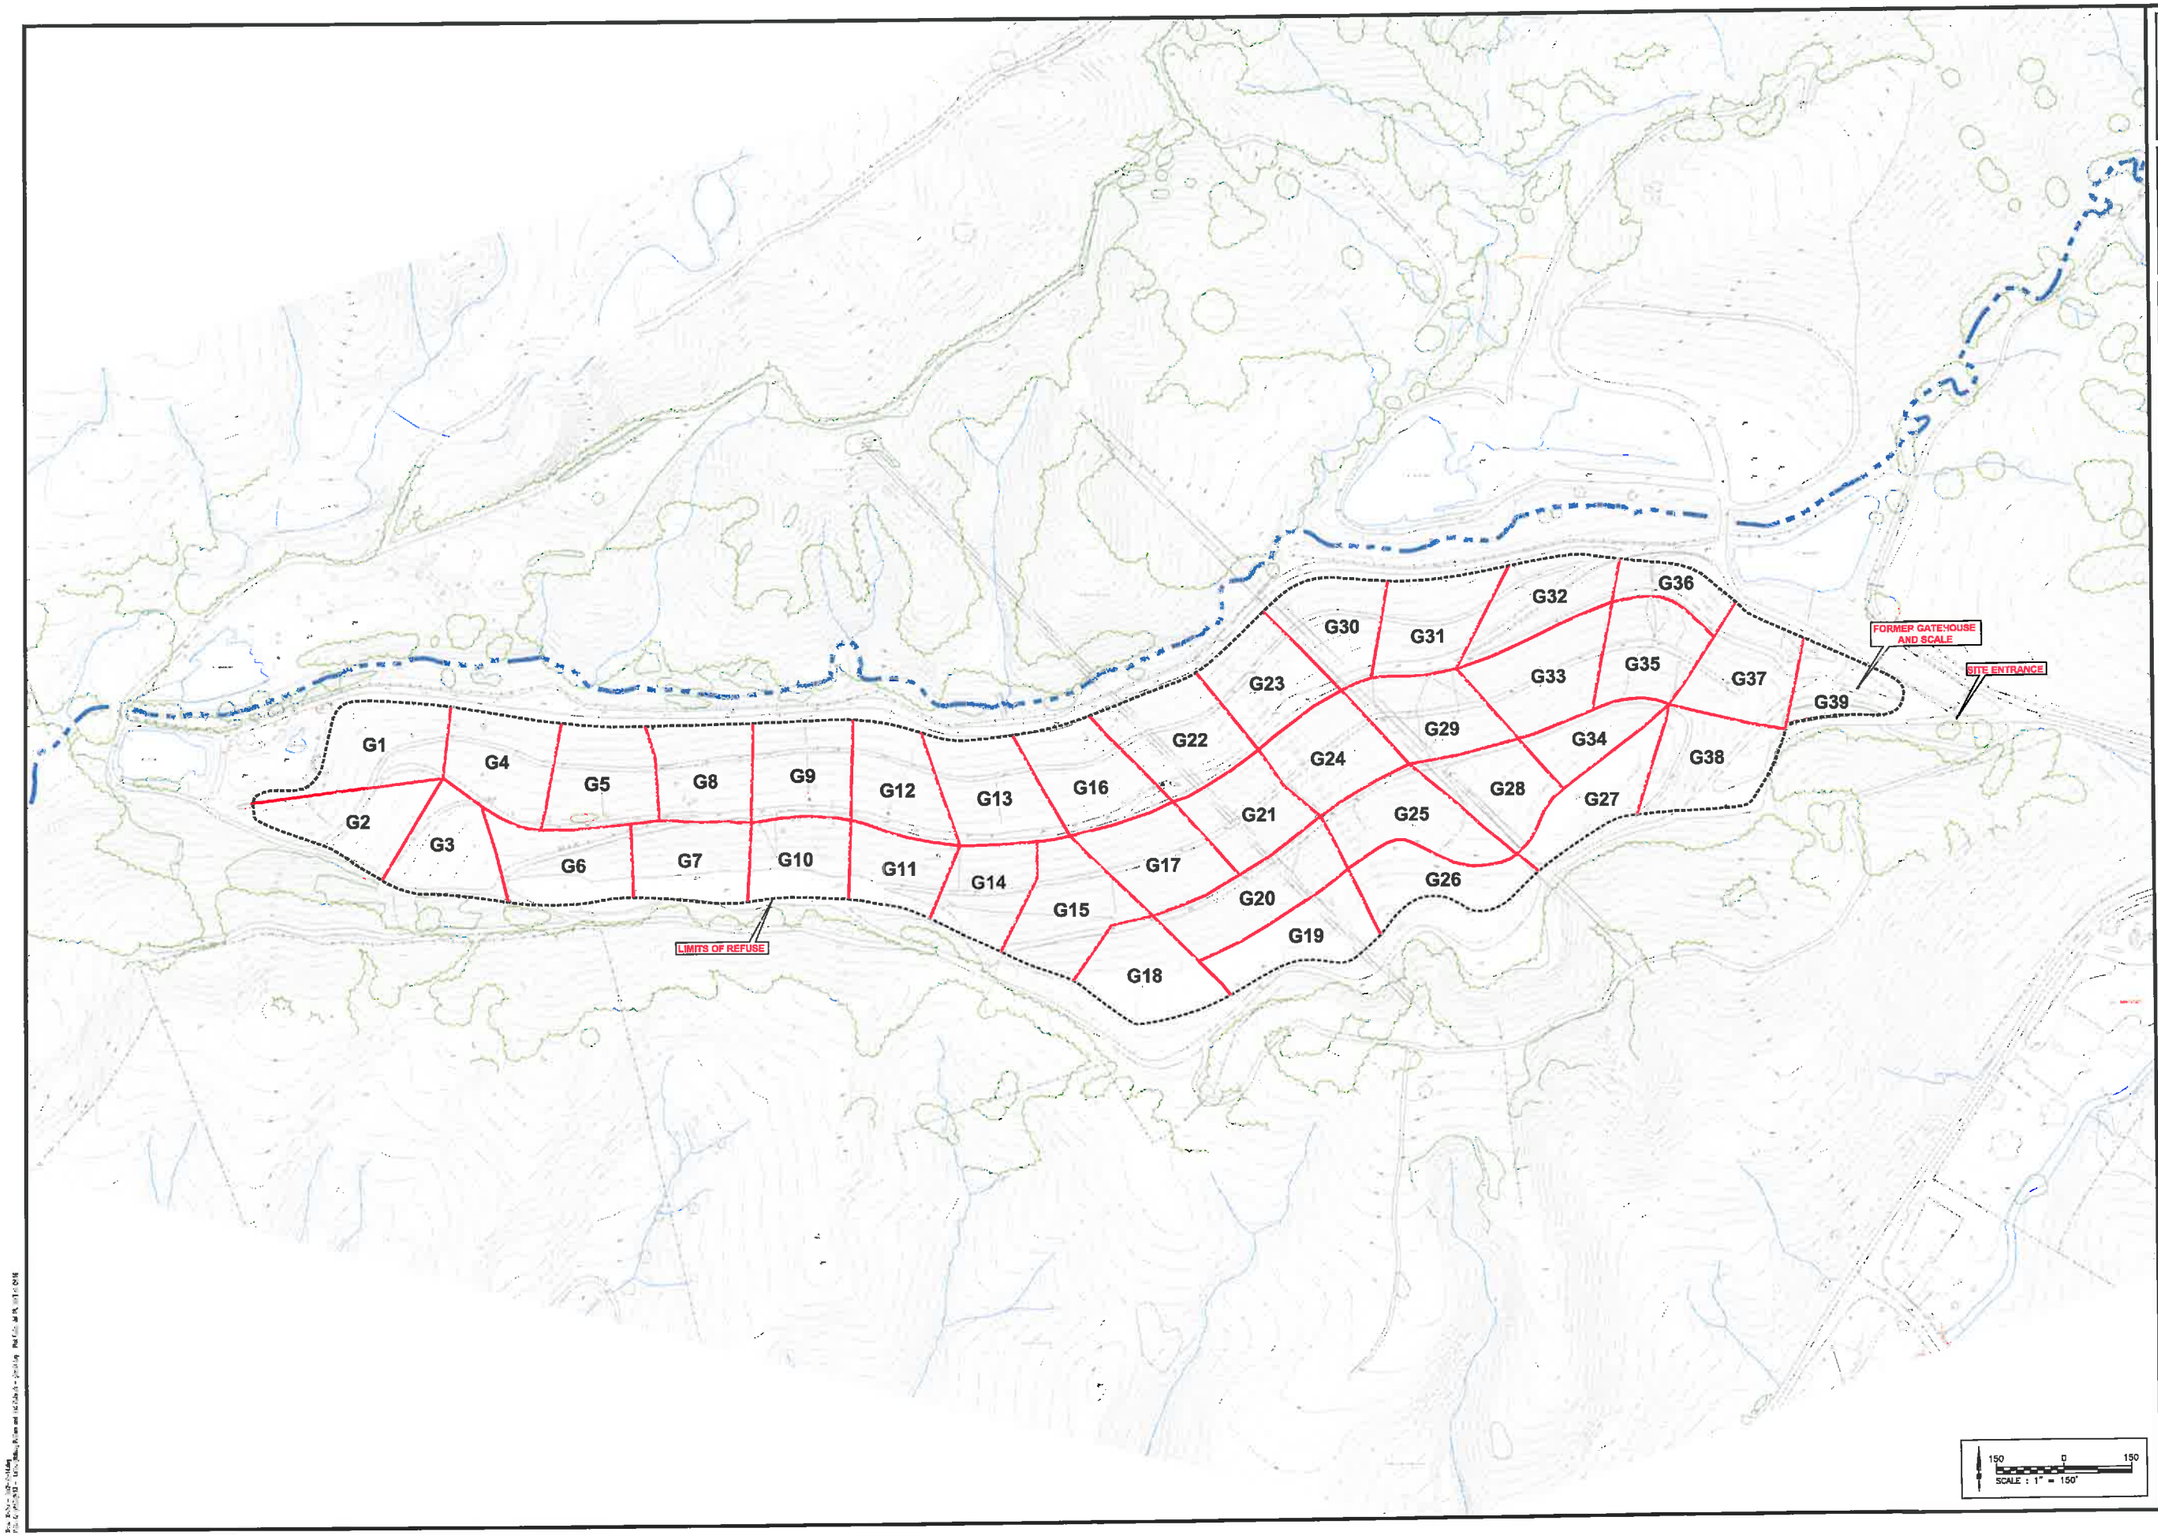
- The grass cover, regardless of its height or moisture content (wet or dry), can be slippery when trying to traverse by foot. In addition, the landfill surface is uneven in places due to the presence of rocks and depressions. Finally, add to this a sampler carrying a 30- to 40-pound instrument on his or her back/shoulder and holding the detector probe in one hand, while simultaneously trying to focus on both the monitoring device and the ground

surface. The combination of these constraints makes for a potential fall hazard and overall safety concern.

- The existing grass cover has been shown to harbor rattlesnakes. Thus, exposure to this potential hazard would be incurred as part of the quarterly surface emissions monitoring, as well as to personnel conducting the grass cutting as described above.

In light of these circumstances, it is recommended that surface emissions monitoring for the primary slope areas target the respective benches. Under this approach, both the inside and outside edges of each bench would be monitored in accordance with the instantaneous surface emissions monitoring procedures described in the regulations. This approach is considered to offer a means of monitoring for surface emissions within the primary slope areas as a whole while promoting a safe monitoring procedure for the individuals responsible for implementing the program in the field.

A site plan illustrating the overall grid network proposed for the site with respect to the monitoring grid required under 17CCR, §95471(c)(1) is attached as Figure 1. Please note that the grid network is not symmetrical in shape, but is instead designed to allow for easy identification and orientation in the field based on prominent site and topographic features. As shown on Figure 1, 39 grids (G1 through G39) have been established for the approximate 40-acre Landfill. This equates to an average grid size of approximately 44,700 square feet, which is compliant with the 50,000-square foot size requirement stipulated in the regulations. As presented in the previous paragraph, the monitoring of benches is proposed for the majority of the grids due to the steep, vegetated slopes. Those grids that include areas that can be monitored using the 25-foot spacing interval include G6, G7, G10, G11, G14, G18, G19, G26, G27, G38 and G39 (see Figure 1).



Thank you in advance for your consideration of this matter. If you should have any questions regarding the information contained herein, please do not hesitate to contact our office at (707) 544-0784.

Sincerely,
EBA ENGINEERING

Mike Delmanowski, C.E.G., C.Hg.
Senior Hydrogeologist

cc: Mr. Tim Eriksen, City of Ukiah, Department of Public Works

GENERAL REQUIREMENTS

SECTION 01010
SUMMARY OF WORK

PART 1 GENERAL

1.01 SUMMARY

A. Project description.

B. Work by Contractor

C. Work by Owner.

D. Work by Others.

1.02 PROJECT DESCRIPTION

A. The Project is titled "City of Ukiah Landfill Final Closure Construction". The City of Ukiah Landfill is located in Mendocino County, California approximately two miles east of the City of Ukiah. The Work site address is 3100 Vichy Springs Road, Ukiah, California 95482 (Sheet 1). The City of Ukiah Landfill was operated as a Class III solid waste disposal facility and is comprised of a single waste management unit that is approximately 40 acres in size. The Final Closure generally consists of the following construction features:

Site Preparation:
- Refuse excavation and relocation.
- Interim cover preparation.

ClosureTurf™ Final Cover System (in ascending order):
- 2-foot thick foundation layer.
- Gas relief/venting system.
- LLDPE geomembrane liner.
- Engineered synthetic turf with specific grade sand infill ballast.

Miscellaneous items:
- Drainage and erosion control measures.
- Access roads.
- General earthwork, including various excavations and fills.
- Leachate overflow collection and storage system, including installation of a leachate underground storage tanks (UST).
- Landfill gas (LFG) collection system, including condensate drainage components.
- Installation of skid-mounted packaged combustion system provided by others.
- Borrow area reclamation.
- Seeding and fertilizing.
- Security fencing.

1.03 WORK BY CONTRACTOR

A. Unless noted otherwise, the Contractor shall perform, or subcontract to perform, all Work shown on the Plans in accordance with the Technical Specifications.

B. The geosynthetics installation subcontractor or Installer and the Installer's foreman must have experience in placing 1,000,000 square feet of geomembrane material on at least three (3) landfill projects and at least on project installing ClosureTurf™.

C. Except as specifically noted, the Contractor shall provide the following Work:
   1. All labor and materials.
   2. All tools, construction equipment, and machinery.
   3. Any water, heat, and utilities required.
   4. All other facilities and services necessary for proper execution and completion of the Work.

D. The Contractor shall pay legally required sales, consumer, and use taxes.

E. The Contractor shall secure and pay for, as necessary for proper execution and completion of the Work, all applicable permits and licenses.

F. The Contractor shall comply with the requirements of all permits.

G. The Contractor shall give all required notices.

H. The Contractor shall comply with all codes, ordinances, rules, regulations, orders, and other legal requirements of public authorities which bear on performance of the work.

I. The Contractor shall within five (5) calendar days, submit written notice to the Design Engineer of observed variance of Contract Documents from legal requirements.

J. The Contractor shall give written notice to the Design Engineer of any conditions encountered at the Work site which are unforeseen, concealed, or materially different from those set forth in the Plans or Technical Specifications, or ordinarily encountered and generally recognized as inherent in the Work. Such written notice shall be given to the Design Engineer within five (5) calendar days of the discovery of any such facts.

K. If any Subcontractor or person employed by the Contractor appears to the Design Engineer to be incompetent or to act in a disorderly or improper manner, he or she shall be discharged immediately at the request of the Design Engineer, and such person shall not again be employed on the Work. This provision does not impose an obligation upon the Design Engineer to ensure proper or orderly behavior on the part of the Contractor's employees or the employees of the Contractor's subcontractors, nor shall the Engineer's failure to make such a request relieve the Contractor of the obligation to require employees and subcontractor employees to refrain from engaging in disorderly or improper conduct.

1.04 WORK BY OWNER

A. All portions of the Work specified to be performed by the "Owner" refers to the responsibilities of the City of Ukiah, Department of Public Works and are not the responsibility of the Contractor.

B. The Owner will award a contract to the Contractor for construction of the project, administer the contract, measure quantities for progress payments and final payment, and manage the contract. Performance of the Work will commence as indicated in the Bid Documents.

1.05 WORK BY OTHERS

A. All portions of the Work specified to be performed by the "Design Engineer", "CQA Officer", "CQA Monitor", "CQA Surveyor", "Soils Testing Laboratory" or "Geosynthetics Testing Laboratory" refer to the responsibilities of EBA Engineering (EBA, or subcontractors to EBA) which have contracted separately and directly with the Owner and are not the responsibility of the Contractor.

END OF SECTION

SECTION 01039
PROJECT MEETINGS

PART 1 GENERAL

1.01 SUMMARY

A. Preconstruction meeting.

B. Progress meetings.

C. Preparatory meetings.

1.02 PRECONSTRUCTION MEETING

A. The Design Engineer will schedule the preconstruction meeting after awarding the Contract to the Contractor. The objectives of this meeting are to:
   1. Clearly define the roles, responsibility, and authority of each organization and individual involved in the project.
   2. Review details of the Construction Quality Assurance (CQA) program.
   3. Establish a foundation of cooperation to achieve quality construction.

B. The following agenda, as related to CQA, will be addressed by the Design Engineer or CQA Officer.
   1. Introduce and discuss role, authority, and responsibilities of each organization and individual involved in the project.
   2. Establish lines of communication.
   3. Review Technical Specifications and Plans.
   4. Distribute of the CQA Plan.
   5. Review of CQA activities to be performed.
   6. Discuss Contractor's construction schedule and workplan.
   7. Discuss Contractor's Construction Quality Control (CQC) procedures and responsibilities.
   8. Discuss submittal review and approval procedures.
   9. Discuss non-conformance and corrective action procedures.
   10. Discuss construction restrictions due to weather conditions.
   11. Discuss and schedule weekly progress meetings.
   12. Discuss health and safety issues.

C. Meeting minutes and items for resolution will be recorded by the Design Engineer and distributed to all parties in attendance.

D. The following representatives from each organization are required to attend the preconstruction meeting.
   1. Owner's Project Manager or representative.
   2. Contractor's Project Manager and on-site Superintendent.
   3. Installer's Project Manager and on-site Superintendent.
   4. Design Engineer's Project Manager and CQA Officer.

E. The Contractor's attendance at the preconstruction meeting is not a payable item. Any costs incurred by the Contractor for attendance at the preconstruction meeting should be included in the Contract Lump Sum Price for "Mobilization".

1.03 PROGRESS MEETINGS

A. In coordination with the Engineer, the CQA Officer will schedule and administer weekly progress meetings. The objectives of these meetings are to: 1) maintain lines of communication; 2) review procedures and results of the CQA program; and 3) maintain and improve the established foundation of cooperation to achieve quality construction. The following agenda will be addressed by the CQA Officer.
   1. Review minutes of previous progress meeting.
   2. Review work progress.
   3. Review and update construction schedule and obtain a schedule from the Contractor, listing the construction activities for the following two (2) weeks.
   4. Discuss CQA and CQC related field observations, testing results, problems, decisions, and conflicts.
   5. Review and update Submittal Log.
   6. Review status of pending Change Orders.

B. Meeting minutes and items for resolution will be recorded by the CQA Officer and distributed to all parties in attendance.

C. The following representatives from each organization are required to attend the weekly progress meetings.
   1. Owner's Project Manager or representative.
   2. Contractor's on-site Superintendent.
   3. Installer's on-site Superintendent (during geosynthetics installation).
   4. Design Engineer's Project Manager and CQA Officer.
   5. Representative of major subcontractors performing work during the week of the weekly progress meeting

D. The Contractor's attendance at the progress meetings is not a payable item. Any costs incurred by the Contractor for attendance at the progress meetings should be included in the Contract Lump Sum Price for "Mobilization".

1.04 PREPARATORY MEETINGS

A. In coordination with the Design Engineer, the CQA Officer will schedule and administer, as needed, informal preparatory meetings prior to construction of the following items.
   1. Refuse excavation and interim cover preparation.
   2. Foundation layer placement.
   3. Gas relief/venting system installation.
   4. LLDPE geomembrane and engineered turf installation.
   6. General earthwork, drainage and erosion control, and access road construction, as needed.
   7. Sedimentation basin improvements.
   8. Leachate overflow collection and storage system installation.
   9. LFG collection system installation.
   10. Borrow area reclamation and seeding and fertilizing.

B. The objective of the preparatory meetings is to establish a complete understanding of the upcoming unit of construction and CQA procedures and testing that will be implemented during construction. To achieve this objective, the following agenda will be addressed by the CQA Officer.
   1. Review "Products" section of the applicable Technical Specifications.
   2. Review "Execution" section of the applicable Technical Specifications.
   3. Discuss any construction and grade control staking needed to complete the Work.
   4. Discuss CQA testing, observation, and surveying to be performed.
   5. Verify that all submittals have been or will be received and approved by the CQA Officer in accordance with the schedule.
   6. Discuss Contractor's CQC responsibilities.
   7. Discuss Contractor's coordination, scheduling, and sequencing of the Work.
   8. Discuss Contractor's proposed equipment and manpower.

C. Meeting minutes and items for resolution will be recorded by the CQA Officer and distributed to all parties in attendance.

D. The following representatives from each organization are required to attend the preparatory meetings.
   1. Design Engineer's Project Manager or representative.
   2. Contractor's on-site Superintendent.
   3. On-site Superintendent of any Subcontractor, as applicable to the unit of construction.
   4. CQA Officer.
   5. CQA Monitor(s), as applicable to the unit of construction.

E. The Contractor's attendance at the preparatory meetings is not a payable item. Any costs incurred by the Contractor for attendance at the preparatory meetings should be distributed and included in the Contract Unit Price for the item for which the meeting is held.

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION (NOT USED)

SECTION 01060
SURVEYING AND FIELD ENGINEERING

PART 1 GENERAL

1.01 SUMMARY

A. Surveying and field engineering. All survey and layout for all improvements are to be provided by the Contractor.

B. Quality assurance.

C. Submittals.

D. Project record documents.

E. Examination.

F. Survey reference points.

G. Survey requirements.

H. Surveying accuracy and tolerances in setting of survey stakes.

I. Surveys for record drawings.

J. Payment.

1.02 RELATED SECTIONS

A. Information Available to Bidders: Topographic survey.

B. Section 01720 - Record Documents.

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION

3.01 DESCRIPTION

A. Reference points: Reference points to be provided by Design Engineer pursuant to the General Conditions will include referenced monuments and elevation benchmarks in the vicinity of the Project. If displaced by Contractor, replacement of these reference points will be at the expense of Contractor.

B. Contractor will furnish all necessary detail surveys including all lines, grades, and elevation appropriate to control construction. At a minimum, construction surveys are required for top of foundation layer.

C. Use by Design Engineer: Design Engineer may at any time use line and grade points and markers established by Contractor. Contractor's surveys are a part of the Work and may be checked by Engineer at any time. Contractor is responsible for any lines, grades, or measurements which do not comply with specified or proper tolerances, or which are otherwise defective, and for any resultant defects in the Work. Contractor will be required to conduct re-surveys or check surveys to correct errors indicated by review of the field notebooks or otherwise detected.

3.02 QUALITY ASSURANCE

A. Employ a Land Surveyor or eligible Engineer registered in the State of California and acceptable to the Design Engineer to perform survey work of this Section.

B. Submit evidence of Land Surveyor's or eligible Engineer's Errors and Omissions insurance coverage in the form of an Insurance Certificate.

C. Provide instruments and other survey equipment that are accurate, suitable for the surveys required in accordance with recognized professional standards, and in proper condition and adjustment at all times. Perform surveys under the direct supervision of a licensed Land Surveyor or eligible Engineer.

D. Record surveys in field notebooks.

3.03 SUBMITTALS FOR REVIEW

A. Submit name, address, and telephone number of Land Surveyor or eligible Engineer before starting survey work.

B. On request, submit documentation verifying accuracy of survey work.

C. Submit a certificate signed by the Land Surveyor or eligible Engineer, that the elevations and locations of the Work are in conformance with Contract Documents.

3.04 RECORD DOCUMENTS

A. Maintain a complete and accurate log of control and survey work as it progresses.

B. Submit record documents under provisions of Section 01720.

3.05 EXAMINATION

A. Verify locations of survey control points prior to starting work.

B. Promptly notify Design Engineer of any discrepancies discovered.

3.06 SURVEY REFERENCE POINTS

A. Contractor to locate and protect survey control and reference points.

B. Control datum for survey is that indicated on the Plans.

C. Protect survey control points prior to starting site work; preserve permanent reference points during construction.

D. Promptly report to Design Engineer the loss or destruction of any reference point or relocation required because of changes in grades or other reasons.

E. Replace dislocated survey control points based on original survey control. Make no changes without prior written notice to Owner.

3.07 SURVEY REQUIREMENTS

A. Provide field engineering services for all proposed improvements. Utilize recognized engineering survey practices.

B. Establish a minimum of two (2) permanent bench marks on site, referenced to established control points. Record locations, with horizontal and vertical data, on record documents.

C. Establish elevations, lines and levels. Locate and lay out by instrumentation and similar appropriate means:
   1. Site improvements including: stakes for grading, fill, slopes, and all site improvements.

D. Periodically verify layouts by same means.

E. Contractor's layout work will include the following:
   1. Slope staking for top of erosion-resistant layer at 50-foot grid and grade breaks.
   2. All as-built surveys as specified here in.
   3. Surveys to measure completed units of Work specified here in.

F. Contractor must perform all additional slope staking, off-setting and other control staking necessary to perform the Work.

3.08 SURVEYING ACCURACY AND TOLERANCES IN SETTING OF SURVEY STAKES

A. Perform control traverse field surveys and computations to an accuracy of at least 1:10,000.

B. The tolerances applicable in setting survey stakes are as set forth below. Such tolerances cannot supersede stricter tolerances required by the Plans or Technical Specifications, and cannot otherwise relieve the Contractor of responsibility for measurements in compliance therewith.

Type of Mark	Horizontal Position	Elevation
Permanent reference points	1 in 10,000	±.01 ft
General excavation and earthwork	1 in 2,000	±.10 ft

C. Tolerances for the thickness of earthen layers shown on Plans and for elevations shown on the Plans are ±0.10 foot unless otherwise specified.

3.09 SURVEYS FOR RECORD DRAWINGS

A. Provide the Design Engineer with as-built record drawings (field surveyed) for items that were revised during construction and differ from the Plans including the following items:
   1. Topography that depicts the top of the foundation layer.
   2. Topography of ditches.
   3. Locations of catch basins.
   4. Alignment, ends, and invert elevations of pipes and culverts.
   5. Topography of storm water retention basins and borrow area.
   6. Locations of LFG collection system components, including collection system piping, LFG extraction wells, above ground condensate drain lines, condensate discharge points, flare station concrete pads, and flare station security fencing.
   7. Location of leachate UST manway.

B. The Design Engineer may perform independent checks.

C. Provide record documents on 24" x 36" size drawings, and on a computer disk in AutoCAD. Use the coordinate system shown on the drawings.

PART 4 MEASUREMENT AND PAYMENT

4.01 PAYMENT

A. Payment for providing all surveying and field engineering is included in the Contract Unit Price paid for the various items of Work for which they are required. No separate or additional payment will be made therefore.

END OF SECTION

SECTION 01300
SUBMITTALS

PART 1 GENERAL

1.01 SECTION SUMMARY

A. Submittal Control Log.

B. Submittal review and approval procedures.

1.02 SUBMITTAL CONTROL LOG

A. All submittals required by the Technical Specifications are included in individual sections. A Submittal Control Log will be maintained by the CQA Officer in coordination with the Contractor during construction. The Submittal Control Log documents: 1) submittal number; 2) referenced specification section; 3) submittal description; 4) submitter; 5) date received; 6) reviewer; 7) action taken determination; and 8) return date.

1.03 SUBMITTALS - GENERAL REQUIREMENTS

A. The Contractor shall submit to the Engineer all submittals required by the Contract Documents and as required herein, or subsequently required by modifications. All such items required to be submitted for review shall be furnished by and at the expense of the Contractor, and any work affected by them shall not proceed without such review. Submittals and their contents shall be properly prepared, identified, and transmitted as provided herein or as the Engineer may otherwise direct. Except for record documents, and instructional manuals for operation and maintenance, each submittal shall be approved before the material or equipment covered by the submittal is delivered to the site.

B. Unless otherwise specified, three (3) sets of printed submittals shall be submitted.

C. Contractor shall allow a total period of not less than two (2) calendar weeks for review and approval of submittals by the Engineer, not including the time necessary for delivery or mailing, and shall cause no delay in the Work. Extension of the Contract Time will not be granted because of the Contractor's failure to make timely and correctly prepared and presented submittals with allowance for the checking and review periods.

D. At the time of the submission, the Contractor shall give notice, in writing, in the submittal, of any deviation from the requirements of the Contract Documents. The deviations shall be clearly indicated or described. The Contractor shall state in writing, all variation in costs occasioned by the deviations, and his assumption of the cost of all related changes if the deviation is approved.

E. The Contractor shall deliver submittals by means of dated, signed, and sequence numbered transmittals on the Engineer provided forms, identifying as to initial or resubmittal status, and fully describing the submittal contents. In each transmittal, the Contractor shall state the Project Number and Name, Name and Address of Contractor, Name and Address of Sub-Contractor, Manufacturer, Distributor, and specification Section (as applicable), Articles, and

paragraphs to which the submittal pertains; accompanying data sheets, catalogs, and brochures shall be identified in the same manner. Where several types or models are contained in the literature, the Contractor shall delete non-applicable portions, or specifically indicate which portions are intended and applicable. Submittal transmittals shall fully index all items submitted.

1. Incomplete Submittals, including those not correctly transmitted, not correctly titled and identified, or not bearing the Contractor's review and approval stamp, will be returned to the Contractor without review.
2. Interrelated Submittals: Except where the preparation of a submittal is dependent upon the approval of a prior submittal, all submittals pertaining to the Work, shall be submitted simultaneously.

F. Every submittal of shop drawings, samples, materials lists, equipment data, instruction manuals, and other submittals upon which the proper execution of the Work is dependent, shall bear the Contractor's review and approval stamp certifying that the Contractor: 1) has reviewed, checked and approved the submittal and has coordinated the contents with the requirements of the Contract Documents, 2) has determined and verified all quantities, field measurements, field construction criteria, materials, equipment, catalog numbers, and similar data, or will do so, and 3) states the Work covered by the submittal is recommended by the Contractor and the Contractor's guarantee will fully apply thereto. Contractor's stamp shall be dated and signed by the Contractor in every case.

G. Submittals will be reviewed only for conformance with the design concept of the Project and with the information given in the Contract Documents. The approval of a separate item, as such, will not indicate approval of the assembly in which the item functions, nor shall approval be construed as revising, in any way, the requirements for a fully integrated and operable system, as specified. The approval of submittals shall not relieve the Contractor of responsibility for any deviation from the requirements of the Contract Documents, or for any revision in resubmittals, unless the Contractor has given notice, in writing, of the deviation or revision at the time of submission or resubmission, and written approval has been given to the specific deviation or revision, nor shall any approval relieve the Contractor of responsibility for errors or omissions in the submittals, or for the accuracy of dimensions and quantities, the adequacy of connections, and the proper and acceptable fitting, execution, and completion of the Work.

H. The Contractor shall make all required corrections and shall resubmit the required number of corrected submittals until approved by the Engineer. The Contractor shall direct specific attention, in writing, to revisions other than the corrections called for on previous submittals, and shall state, in writing, all variations in costs, and his assumption of the cost of related changes. Identify each resubmittal with number of the original submittal, followed by consecutive letters starting with "A" for first resubmittal, "B" for second resubmittal, etc. Note that in addition to any applicable liquidated damages, the Owner reserves the right to deduct monies from the amounts due to Contractor to cover the cost of Engineer's review time beyond the second submission.

I. The Contractor shall check submittals returned to him for correction and ascertain if the corrections result in extra cost to him above that included under the Contract Documents, and shall give written notice to the Engineer within five (5) days, if in his opinion, such extra cost results from corrections. By failing to notify the Engineer or by starting any Work covered by

a submittal, the Contractor waives all claims for extra costs resulting from required corrections.

J. No Work represented by required submittals shall be purchased, or paid for, or commenced until the applicable submittal has been approved. Work shall conform to the approved submittals and all other requirements of the Contract Documents, unless subsequently revised by an appropriate modification, in which case, the Contractor shall prepare and submit revised submittals as may be required. The Contractor shall not proceed with any related Work which may be affected by the Work covered under submittals until the applicable submittals have been approved.

K. Piecemeal submittals will be returned unreviewed. However, for mechanical equipment and the like, separate submittals for embedded items, embedded metal work and anchors, will be reviewed, as applicable.

1.04 OTHER SUBMITTALS.

A. Provide no less than two (2) copies of other submittals such as calculations, manufacturer's certified reports, operational demonstration and system validation reports specified elsewhere in the Contract Documents, one (1) of which will be retained by the Engineer and the rest of which will be returned to the Contractor marked to show the required corrections.

1.05 FORM OF APPROVAL.

A. Copies of submittals which are returned to the Contractor and which are subject to approval will be marked with notations (1), (2), (3) or (4), and may also be marked with notation (6), in which case the action so indicated shall be taken by the Contractor.
   1. No Exceptions Taken.
   2. Furnish as Corrected
   3. Revise and Resubmit.
   4. Not reviewed.
   5. Rejected.

B. Returned copies of drawings marked with either notation (1), or (2) authorize Contractor to proceed with the fabrication, or construction, or any combination thereof, covered by such returned drawings, provided, that such fabrication, or construction shall be subject to the comments, if any, shown on such returned copies.

C. Returned copies of drawings marked with notation (3), (4) or (5) shall be corrected as necessary and a revised submittal shall be submitted in the same manner as before.

D. Returned copies of drawings marked with either notation (3), (4) or (5) shall be resubmitted not later than seven (7) days after date of transmittal by Engineer.

E. The Submittal Control Log will be reviewed and updated in coordination with the Contractor at the weekly progress meetings.

END OF SECTION

SECTION 01500
MOBILIZATION

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall provide all services associated with the mobilization and demobilization of personnel, equipment, supplies, and incidentals to the Work site in accordance with this Section.

B. The Contractor shall supply and implement all construction facilities and temporary controls in accordance with this Section and as shown on the Plans.

1.02 REFERENCES

A. *Caltrans Standard Specifications.* California Department of Transportation, 2010.

B. *Standard Plans Book.* California Department of Transportation, 2010.

1.03 SUBMITTALS

A. At least 14 calendar days prior to mobilizing to the Work site, the Contractor shall submit a Dust Control Plan for approval by the Design Engineer prior to commencement of the Work. The plan shall comply with the requirements of the Mendocino County Air Quality Management District and shall identify procedures to minimize dust related impacts with the intent of eliminating dust nuisance complaints from adjacent areas or regulatory agencies.

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION

3.01 MOBILIZATION

A. The Contractor shall perform preparatory work and operations, including, but not limited to, those necessary for the movement of personnel, equipment, supplies, and incidentals to the Work site; for the establishment of all offices, buildings, and other facilities necessary for execution of the Work; and for all other work and operations which must be performed or costs incurred prior to beginning the Work in accordance with Section 11 of the Standard Specifications.

B. The Contractor shall give written notice to the Design Engineer at least 48 hours prior to transporting oversize and/or overload equipment to the Work site.

3.02 DEMOBILIZATION

A. The Contractor shall perform any work and operations, including, but not limited to, those necessary for the removal of personnel, equipment, supplies, temporary utilities (underground

and above ground), construction facilities, excess, surplus, waste materials and incidentals from the Work site prior to application for final payment.

B. The Contractor shall clean and repair damage caused by installation or use of construction facilities or temporary controls.

3.03 CONSTRUCTION FACILITIES

A. General
   1. Unless noted otherwise within these Technical Specifications or allowed through specific agreement with the Design Engineer, the Contractor shall provide and pay for all labor, materials, tools, equipment, machinery, necessary permits, water, heat, utilities, and any other facilities or services necessary to complete the Work in accordance with these Technical Specifications and as shown on the Plans.
   2. Provision of all construction facilities shall be coordinated with the Design Engineer.

B. Access Roads
   1. The Contractor may construct and maintain any haul road necessary to execute the Work or use existing haul and access roads at the Work site.
   2. The Contractor shall repair any existing roads damaged by the Contractor during construction, as directed by the Design Engineer.

C. Staging Area
   1. The Contractor shall utilize a staging area for equipment and materials storage, and personnel parking. The location of the staging area shall be determined in coordination with the Design Engineer.

D. Temporary Buildings
   1. The Contractor may provide and maintain a weather-tight temporary office trailer, for the use of the Contractor and any Subcontractors, equipped as desired by the Contractor.
   2. The Contractor shall provide a weather-tight temporary office trailer, for the use of the Owner and CQA representatives, equipped with a table, desk, and chairs. The Contractor shall locate the trailer at a location approved by the Design Engineer.
   3. The Contractor's office trailer shall be located adjacent to the CQA office trailer as determined by the Design Engineer.
   4. The Contractor shall install a security fence around their office trailer and the CQA Office, as directed by the Design Engineer. The fences shall be chain link, a minimum 6 feet in height with three strands of barbed wire and a minimum 12-foot-wide gate.

E. Temporary Utilities
   1. Electricity
      a. The Contractor shall provide and pay to connect to electrical power required for construction facilities and execution of the Work including, but not limited to, a temporary electric feeder from electrical service, adequate power outlets with branch wiring and distribution boxes located as required, flexible power cords as required, and main service disconnect and overcurrent protection at convenient location.

b. The Contractor shall provide and pay for the electrical service and all power required for the temporary office trailer for use by the Owner and CQA representatives for the duration of the project.

2. Telephone and Facsimile
   a. The Contractor shall provide, maintain, and pay for separate telephone and facsimile service for the Contractor's office trailer and the CQA Officer's trailer, as needed.
3. Water
   a. Construction Water
      1. The Contractor shall be responsible for developing a water supply for construction water and dust control and delivering and applying water as needed. Full compensation for developing a water supply and delivering and applying water shall be considered as included in the Contract Unit Price paid for the various contract items requiring water.
   b. Drinking Water
      1. Drinking water shall be provided by the Contractor from a potable source so piped or transported as to keep it safe, fresh, and served from single service containers or satisfactory types of sanitary drinking stands or fountains. Drinking water services and facilities shall be furnished in strict accordance with existing governing health regulations.
4. Sanitary Facilities
   a. The Contractor shall furnish, install, and maintain ample sanitary facilities as required for the Contractor's and Design Engineer's employees and for the employees of any Subcontractors.
   b. A sufficient number of enclosed temporary toilets shall be conveniently placed as required by the sanitary codes of state and local government.

3.04 TEMPORARY CONTROLS

A. General
   1. The Contractor shall comply with all codes, ordinances, rules, regulations, orders, or other legal requirements of public authorities, which bear on performance of the Work.
   2. The Contractor shall instruct all personnel and maintain strict control of all Work activities to protect and maintain the integrity of all existing environmental monitoring and control systems for the landfill.

B. Safety
   1. The Contractor shall submit a Health and Safety Plan with an Emergency Contact List to the Design Engineer prior to commencement of the Work and in accordance with Section 01800 (Health and Safety) of these Technical Specifications.
   2. The entire Work site is subject to shutdown, at the discretion of the Design Engineer, due to heavy rain, high winds, or other inclement weather.
   3. The Contractor's equipment and vehicles shall not travel at speeds of more than 20 miles per hour within 200 feet of any active work areas, equipment, or personnel.
   4. The Contractor shall contact PG&E with regard to the overhead power lines and associated health and safety issues prior to the commencement of work.

C. Equipment Fueling and Maintenance

1. The Contractor shall perform equipment fueling and maintenance within a contained area, to be constructed by the Contractor in a location approved by the Design Engineer to prevent any release of fuel or other contaminants. The Contractor shall immediately remediate any leaks, spills, or other release of fuel or other contaminants as directed by the Design Engineer.

D. Drainage Control

1. The Contractor shall provide ample means and devices with which to promptly remove and dispose of all water from any source entering the Work areas and maintain these at all times during execution of the Work and until the final Work has been approved by the Design Engineer.

E. Erosion and Sediment Control

1. Temporary erosion and sediment control measures shall be implemented by the Contractor for all Work areas in accordance with the SWPPP prepared as part of Section 01550 (Storm Water Pollution Prevention) of these Technical Specifications.

F. Dust Control

1. Dust control measures shall be implemented by the Contractor for all Work areas in accordance with the Contractor's approved Dust Control Plan submitted under Section 14-9.02A of the Standard Specifications.

PART 4 MEASUREMENT AND PAYMENT

2.01 MOBILIZATION

A. Payment for mobilization, demobilization, construction facilities and temporary controls including temporary erosion control described in these Technical Specifications is considered as included in the Contract Lump Sum Price paid for "Mobilization" and includes all compensation for providing all materials, labor, equipment, tools, and incidentals required to complete the Work specified herein and as directed by the Design Engineer. No additional compensation will be allowed therefore.

B. Payment for "Mobilization" shall be as follows:

1. When the monthly partial payment estimate exceeds 5% the contract amount, not including any amount paid for Mobilization, 5% of the contract amount or 50% of the amount bid for Mobilization shall be included in the progress payment, whichever is lesser.

2. When the monthly partial payment estimate exceeds 10% the contract amount, not including any amount paid for Mobilization, 7.5% of the contract amount or 75% of the amount bid for Mobilization shall be included in the progress payment, whichever is lesser.

3. When the monthly partial payment estimate exceeds 20% the contract amount, not including any amount paid for Mobilization, 9.5% of the contract amount or 95% of the amount bid for Mobilization shall be included in the progress payment, whichever is lesser.

4. When the monthly partial payment estimate exceeds 50% the contract amount, not including any amount paid for Mobilization, 10% of the contract amount or 100% of the amount bid for Mobilization shall be included in the progress payment, whichever is lesser.

5. After the Engineer determines that the work is substantially complete, any amount bid for Mobilization exceeding 10% of the contract amount will be paid in the final payment.

END OF SECTION

SECTION 01550
STORM WATER POLLUTION PREVENTION

PART 1 GENERAL

1.01 SUMMARY

A. Preparation, implementation, and monitoring of the Storm Water Pollution Prevention Plan (SWPPP) for the purpose of preventing the discharge of pollutants from the Work site into receiving waters. This includes, but is not limited to the prevention of sedimentation from the Work site into storm drains and natural drainages and the prevention of pollution discharges derived from equipment fueling and maintenance/repairs, improper dumping, spills, or leakage from storage tanks or transfer areas.

B. Prohibit illicit discharge (non-rainwater) into the storm drain system or natural drainages.

C. Construct any and all necessary systems to eliminate contaminants from entering the storm drain system or natural drainages.

D. Clean up and control of Work site materials, spoils, and debris.

E. Removal of contaminants produced by the Project.

F. Implement erosion and sediment control measures to prevent discharge of sediment to the storm drain system and natural drainages (see Section 02960 [Temporary Erosion and Sediment Controls] of these Technical Specifications).

G. The Work shall include the provision of all labor, materials, equipment, and apparatus not specifically mentioned herein or noted on the Plans, but which are incidental and necessary to complete the Work specified.

1.02 REFERENCES

A. *California's General Permit for Storm Water Discharges Associated with Construction and Land Disturbance Activities (General Permit) Order No. 2009-0009-DWQ as amended by Order No. 2010-0014-DWQ (NPDES No. CAS000002)*. State Water Resources Control Board, 2010.

B. *California Storm Water Best Management Practice Handbooks:*
   1. Municipal
   2. Industrial/Commercial
   3. Construction Activity

1.03 REGULATORY REQUIREMENTS

A. Contractor shall comply with the State Water Resources Control Board (SWRCB), Regional Water Quality Control Board (RWQCB), county, city, municipal, and other local agency

requirements regarding storm water discharges and management. The State does not obtain local permits.

1.04 STORM WATER POLLUTION PREVENTION PLAN (SWPPP)

A. A SWPPP shall be prepared for the Project by the Contractor. SWPPP preparation includes obtaining SWPPP acceptance, amending the SWPPP, preparing a Construction Storm Water Management Plan (CSMP) and a Storm Water Action Plan (SAP), and monitoring and inspecting Water Pollution Control (WPC) practices at the Work site and shall include:

1. Storm water sampling and analysis including reporting of storm water quality per qualifying rain event. If specified for the risk level, the work includes preparation, collection, analysis, and reporting of storm water samples for turbidity, pH, and other constituents.
2. Preparation of the Storm Water Annual Report including certifications, monitoring and inspection results, and obtaining Storm Water Annual Report acceptance.
3. If specified for the project risk level, preparation of a Rain Event Action Plan (REAP) including preparing and submitting REAP forms and monitoring weather forecasts.

B. The Contractor shall amend the SWPPP, as necessary, during construction showing the best management practices (BMPs) for the prevention and control of pollutants and erosion of the Work site. The SWPPP shall be in accordance with all of the requirements of the General Construction Storm Water Permit (Permit). Contractor is responsible to implement the SWPPP and make revisions to the SWPPP as necessary until completion of the Project. Information on the Permit can be found on the internet at http://www.swrcb.ca.gov/stormwtr/construction.htm. The Contractor shall prepare the Notice of Intent (NOI) to the SWRCB and provide to the Owner for filing at the SWRCB.

1.05 RISK LEVEL

A. The Risk Level for this Project is Level D.

1.06 QUALITY ASSURANCE

A. All work performed under this Contract and all Contractors and their associates and/or employees are required to comply with all applicable storm water regulations and to implement BMPs at all times.

B. A SWPPP shall be provided by the Contractor for the proposed control of contaminants entering the storm water system and natural drainages. The SWPPP must be approved by the Design Engineer prior to commencement of work.

C. All employees and subcontractors shall be trained on the storm water pollution prevention requirements contained in these Technical Specifications.

D. A supply of spill clean-up materials such as rags or absorbents shall be kept readily accessible on-site at all times.

1.07 SUBMITTALS

A. The Contractor shall submit a site-specific SWPPP prepared by a Qualified SWPPP Developer (QSD). The Contractor shall amend the SWPPP when required, prepare a CSMP, and perform water pollution control work under the oversight of a Qualified SWPPP Practitioner (QSP), as specified in the General Permit. All reports and data that must be submitted to the SWRCB will be uploaded by the Contractor's QSP to the Storm Water Multiple Application and Report Tracking System (SMARTS) website for final submittal. Final submittal and certification will be performed by the Owner.

B. Within 14 calendar days of Authorization to Proceed, the Contractor shall submit three (3) printed copies of the SWPPP and Site Map and one (1) electronic copy in a Portable Document Format (PDF) to the Design Engineer for review. The Contractor shall allow five (5) working days for the Design Engineer's review. If revisions are required, the Design Engineer will provide comments, and the Contractor shall revise and resubmit the SWPPP and Site Map in printed and electronic form within five (5) working days of receipt of the Design Engineer's comments. Within three (3) working days of receipt of the Design Engineer's approved SWPPP, the Contractor shall submit three (3) paper copies of the approved SWPPP to the Design Engineer and prepare the NOI and upload all pertinent documentation to SMARTS for final submittal and certification by the Design. The SWRCB will review the NOI and the issue a Waste Discharge Identification (WDID) number for the Project.

C. The Contractor shall not perform work that may cause water pollution until the state has issued a WDID number for the Project. The Design Engineer's review and approval of the SWPPP shall not waive any contract requirements and shall not relieve the Contractor from complying with Federal, State and local laws, regulations, and requirements.

D. The Contractor shall keep a copy of the approved SWPPP at the Work site. The SWPPP shall be made available when requested by a representative of the RWQCB, SWRCB, United States Environmental Protection Agency, or the local storm water management agency. Requests from the public shall be directed to the Owner.

E. The Contractor shall submit a Construction Management Plan that includes proposed provisions to prevent pollution and debris from reaching the water channel and shall include wet weather protection, erosion measures, methods, and location for cleaning tools and equipment dust control, litter prevention, debris collection and removal, location of portable toilets, storm water management controls, and hazardous material (including fuel) management at the Work site.

F. The Contractor shall submit Storm Water Training Records including training dates and subjects for employees and subcontractors including:
   1. Within five (5) working days of SWPPP acceptance for existing employees.
   2. Within five (5) working days following training of all new employees (Contractor and subcontractors).
   3. At least five (5) working days prior to subcontractors starting work for subcontractor's employees.

G. The SWPPP including the CSMP and SAP, SWPPP amendments, training records, REAPs, sampling and analysis results, exceedance reports, visual monitoring reports, inspection reports, BMP status reports, annual reports, and reporting on Storm Water Pollution Control (SPC) practices, shall be prepared and submitted to the Design Engineer under the direction of a QSD.

1.08 PERMIT

A. Within three (3) working days of receipt of the Design Engineer's approved SWPPP, the Contractor shall submit three (3) paper copies of the approved SWPPP to the Owner and prepare the NOI and upload all pertinent documentation to SMARTS for final submittal and certification by the Owner. The SWRCB will review the NOI and the issue a WDID number for the Project.

B. The Owner shall pay required fees and pay annual renewal fees until completion of the Project.

1.09 LIABILITIES AND PENALTIES

A. Review of the SWPPP, amended and finalized by the Contractor from an initiated plan, shall not relieve the Contractor from liabilities arising from non-compliance of storm water pollution regulations.

B. Contractor will be held responsible for paying penalties for violations of permit conditions. In the event of any fines against the City, due to non-compliance by the Contractor, the City shall recover all costs of the fines from the Contractor.

1.10 IMPLEMENTATION

A. The Contractor shall not perform work that may cause water pollution until the SWRCB has issued a WDID number for the Project. The City's review and approval of the SWPPP shall not waive any contract requirements and shall not relieve the Contractor from complying with Federal, State, and local laws, regulations, and requirements.

B. Contractor shall comply with the requirements of the Permit and the SWPPP. Contractor shall update the SWPPP and have the SWPPP map available at the Work site at all times.

C. Contractor shall implement BMPs for control of all pollutants including sediment, fuel and other petroleum and non-petroleum hydrocarbon products, concrete waste, fertilizers, soil amendments and other construction related pollutants.

D. Contractor shall implement an effective combination of erosion and sediment controls by stabilizing all disturbed soil, paying particular attention to exposed slopes. Back up erosion prevention measures with sediment control measures. Ensure all control measures are adequate, in place, and in operable condition.

E. Contractor shall conduct site inspections before, during extended storm events, and after each storm event to identify areas that may contribute to erosion and sediment problems or any other pollutant discharges. If additional control measures are needed, implement them

immediately. Document all inspection findings and actions taken in detailed, site specific inspection reports. These reports must be maintained on site for review.

F. Contractor shall maintain and repair all erosion prevention and sediment control measures throughout the season and until completion of the project. Replacement supplies shall be kept on the Work site.

G. Contractor shall train all site personnel in erosion prevention and sediment control techniques, and the responsibilities under the Permit.

H. Contractor shall conduct weekly training meetings and training for personnel collecting water samples.

I. Contractor shall immediately report to the RWQCB office any instances of sediment or other pollutant discharges from the Work site.

J. Contractor shall obtain services and pay for any sampling, testing, and analysis of storm water as required for compliance with the General Permit and the SWPPP.

K. Contractor shall make the SWPPP available to the RWQCB staff and correct any requirements imposed as a result of their inspections.

1.11 CERTIFICATION AND REPORTS

A. Prior to July 1 of each year during the construction period, submit two (2) copies of the Annual Report that the construction activities are in compliance with the General Permit and the SWPPP to the Design Engineer for review.

B. At Completion of the Project, submit records of all inspections, compliance certifications and noncompliance reports to the SWRCB.

C. Upon Completion of the Project, the Contractor shall file a Notice of Termination with the SWRCB.

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION

3.01 HAZARDOUS MATERIAL/WASTE MANAGEMENT/MATERIALS MANAGEMENT

A. Designated areas of the Work site shall be proposed by the Contractor for approval by the Design Engineer suitable for material delivery, storage, and waste collection as far from catch basins, drainage inlets, and natural drainages as possible.

B. All hazardous materials such as fuels and solvents and all hazardous waste such as waste oil and antifreeze shall be labeled and stored in accordance with State and Federal regulations.

C. All hazardous materials and all hazardous waste shall be stored in accordance with secondary containment regulations, and it is recommended that these materials and waste be covered as needed to avoid potential management of collected rainwater as a hazardous waste.

D. Regular hazardous waste collection shall be arranged for to comply with time limits on the storage of hazardous waste.

E. Granular materials shall be stored a minimum 10 feet from the closest catch basin and drainage inlet associated with the storm drain system. The Contractor shall not allow these granular materials to enter the storm drain system or natural drainages.

F. Warning signs shall be posted in areas containing or treated with chemicals.

G. An accurate up-to-date inventory, including Material Safety Data Sheets (MSDSs) of hazardous waste stored on site shall be kept and available to assist emergency response personnel in the event of a hazardous materials incident.

H. Maintenance and fueling of vehicles and equipment shall be performed in a designated, bermed area, or over a drip pan that will not allow run-off of spills. Vehicles and equipment shall be regularly checked and have leaks repaired promptly. Secondary containment shall be used to catch leaks or spills any time that vehicle or equipment fluids are dispensed, changed, or poured.

3.02 DUST CONTROL

A. The Contractor's Dust Control Plan required under Section 01500 (Mobilization) of these Technical Specifications shall comply with the requirements of the Mendocino County Air Quality Management District, including the acquisition of a Large Area Grading Permit.

B. A minimum of two (2) water trucks with operators shall be in operation at all times during excavation to provide dust control at all excavation, haul road, stockpile and staging areas. If necessary, additional water trucks or other equipment with operators shall be provided and used by the Contractor to maintain these areas in a misted condition at all times during excavation.

C. Access and haul roads shall be watered on a continuous basis to control dust.

D. The Contractor will be restricted from areas where dust cannot be controlled and excessive equipment speeds, which cause dust, may be regulated by the Owner.

E. The Design Engineer will require all excavation activities to cease if the Contractor's dust control efforts do not follow the approved SWPPP, or fail to meet any of the requirements of this Part, until such time that the Contractor can demonstrate a return to compliance.

F. Other methods of dust control and suppression may be used, however; Design Engineer approval must be obtained prior to such use.

3.03 CONCRETE WASTE MANAGEMENT

A. Concrete trucks shall not be washed out into storm drains or natural drainages.

B. Concrete trucks and equipment shall be washed out off-site or in a designated area on-site where the water will flow onto dirt or into a temporary pit or bermed area. The water shall percolate into the soil and the hardened concrete placed in a waste container for disposal. If a suitable soil or bermed area is not available on-site, the wash water shall be collected and removed off-site and disposed of properly.

3.04 EROSION AND SEDIMENT CONTROL

A. Stabilize all denuded areas and install and maintain all temporary erosion and sediment control continuously between October 15th and April 15th of each year, until permanent erosion controls have been installed (see Section 02960 [Temporary Erosion and Sediment Controls] of these Technical Specifications).

B. Divert on-site runoff around exposed areas and divert off-site runoff around the Work site (e.g., swales and dikes).

C. Incorporate provisions for preventing erosion and trapping sediment on-site, such as sediment basins or traps, earthen dikes or berms, silt fences, check dams, storm drain inlet protection, soil blankets or mats, covers for soil stock piles, and/or other measures.

3.05 CONSTRUCTION SITE BMPs

A. Store, handle, and dispose of construction materials and waste properly, so as to prevent their contact with storm water.

B. Control and prevent the discharge of all potential pollutants, including concrete, petroleum products, chemicals, washwater or sediments, and non-storm water discharges to storm drains and natural drainages.

C. Use sediment controls or filtration to remove sediment when dewatering site and obtain all necessary permits.

D. Avoid cleaning, fueling, or maintaining vehicles on-site, except in a designated area where washwater is contained and treated.

E. Delineate with field markers clearing limits, easement, setbacks, sensitive or critical areas, buffer zones, trees, and drainage courses.

F. Protect adjacent properties and undisturbed areas from construction impacts using vegetative buffer strips, sediment barriers or filters, dikes, mulching, or other measures as appropriate.

G. Perform clearing and earth moving activities only during dry weather.

H. Limit and time applications of fertilizers to prevent polluted runoff.

I. Limit construction access routes and stabilize designated access points.

J. Avoid tracking dirt or other materials off-site; clean off-site paved areas using dry sweeping methods.

K. The Contractor shall train and provide instruction to all employees and subcontractors regarding the construction BMPs.

3.06 SITE CLEANUP

A. The cleaning of equipment or materials shall not be performed on-site using soaps, solvents, degreasers, steam cleaning, or equivalent methods.

B. All cleanup must be performed in a designated area that will not allow the cleaning rinse to flow off-site or into on-site storm drains or natural drainages.

3.07 PERFORMANCE REQUIREMENTS

A. The SWPPP is a minimum requirement. Revisions and modifications to the SWPPP are acceptable only if they maintain levels of protection equal to or greater than originally specified.

B. Read and be thoroughly familiar with all of the requirements of the SWPPP.

C. Inspect and monitor all work and storage areas for compliance with the SWPPP prior to any anticipated rain.

D. Complete any and all corrective measures as may be directed by regulatory agencies.

E. Costs: Contractor to pay all costs associated with the implementation of the requirements of the SWPPP in order to maintain compliance with the Permit. This includes installation of all Housekeeping BMPs, General Site and Material Management BMPs, inspection requirements, maintenance requirements, and all other requirements specified in the SWPPP.

PART 4 MEASUREMENT AND PAYMENT

4.01 STORM WATER POLLUTION PREVENTION

A. Measurement and payment for storm water pollution prevention shall be considered as included in the Contract Lump Sum Price paid for "Temporary Erosion and Sediment Controls" addressed in Section 02960 (Temporary Erosion and Sediment Controls) of these Technical Specifications.

END OF SECTION

SECTION 01720
RECORD DOCUMENTS

PART 1 GENERAL

1.01 SUBMITTALS

A. Quality Control Submittals: Written procedures for maintaining and markup of record documents.

B. Contract Closeout Submittal: Submit record documents in accordance with the requirements of this section. Submit prior to application for final payment.

1.02 QUALITY ASSURANCE

A. Furnish qualified and experienced person, whose duty and responsibility shall be to maintain record documents.

B. Accuracy of Records:

1. Coordinate changes within record documents, making legible and accurate entries on each page of Technical Specifications and each sheet of Plans and other documents where such entry is required to show change.
2. Purpose of Project record documents is to provide factual information regarding aspects of Work, both concealed and visible, to enable future modification of Work to proceed without lengthy and expensive site measurement, investigation, and examination.

C. Make entries within 24 hours after receipt of information that a change in Work has occurred.

D. Prior to submitting each request for progress payment, request Design Engineer's review and approval of current status of record documents. Failure to properly maintain, update, and submit record documents may result in delay of Progress Payment made by the Owner.

1.03 DELIVERY, STORAGE, AND HANDLING

A. Maintain record documents completely protected form deterioration, loss, and damage until completion of Work.

B. In event of loss of recorded data, use means necessary to again secure data to Design Engineer's acceptance.

1. Such means shall include, if necessary in Design Engineer's opinion, removal and reconstruction of covering materials, at no cost to Owner.

PART 2 PRODUCTS

2.01 RECORD DOCUMENTS

A. Promptly following commencement of Contract Times, secure from Owner at no cost to Contractor, one complete set of Contract Documents. Plans will be full size.

PART 3 EXECUTION

3.01 MAINTENANCE OF RECORD DOCUMENTS

A. General:
1. Label or stamp each record document with title, "RECORD DOCUMENTS," in neat large printed letters.
2. Record information concurrently with construction progress and within 24 hours after receipt of information that change has occurred. Do not cover or conceal Work until required information is recorded.

B. Preservation
1. Maintain record documents in a clean, dry, legible condition and in good order. Do not use record documents for construction purposes.
2. Make record documents and samples available at all times for observation by Design Engineer.

C. Making Entries on Plans
1. Using an erasable colored pencil (not ink or indelible pencil), clearly describe change by graphic line and note as required.
    a. Color Coding:
        i. Green when showing information deleted from Plans.
        ii. Red when showing information added to Plans.
        iii. Blue and circled in blue to show notes.
2. Date entries
3. Call attention to entry by "cloud" drawn around area or areas affected.
4. Legibly mark to record actual changes made during construction, including but not limited to:
    a. Horizontal and vertical locations of existing and new underground facilities and appurtenances, and other underground structures, equipment or Work. Reference to at least two measurements of permanent surface improvements.
    b. Location of internal utilities and appurtenances concealed in the construction referenced to visible and accessible features of the structure.
    c. Locate existing facilities, piping, equipment, and items critical to the interface between existing physical conditions or construction and new construction.
    d. Changes made by Addenda and Field Orders, Work Change Directive, Change Order, Written Amendment, and Design Engineer's written interpretation and clarification using consistent symbols for each and showing appropriate document tracking number.

5. Dimensions on Schematic Layouts: Show on record documents, by dimension, the centerline of each run of items such as described in the previous subparagraph above.
   a. Clearly identify the item by accurate note such as "cast iron drain," galv. water," and the like.
   b. Show, by symbol or note, vertical location of item ("under slab", "exposed", and the like).
   c. Make identification sufficiently descriptive that it may be related reliably to the Technical Specifications.

D. Make entries in other pertinent record documents as accepted by Design Engineer.

E. If record documents are not accepted by Design Engineer, secure a new copy of that record document from Design Engineer at Design Engineer's usual charge for reproduction and handling, and carefully transfer change data to new copy to acceptance of Design Engineer.

END OF SECTION

SECTION 01800
HEALTH AND SAFETY

PART 1 GENERAL

1.01 SUMMARY

A. Site safety.

B. LFG hazards.

C. Other landfill related hazards.

1.02 SITE SAFETY

A. All safety requirements are applicable to the Work to be performed under the Contract and any subsequent addenda, modifications, alterations, and extensions thereto.

B. The Contractor shall be solely and completely responsible for conditions of the Work site, including the safety of all persons and property during performance of the Work and provision of safety measures on weekends and holidays. This requirement will apply continuously and shall not be limited to normal working hours.

C. The Contractor shall comply with all federal, state, and local safety codes, ordinances, and regulations, including the requirements of the Occupational Safety and Health Agency, and Division of Industrial Safety, State of California, and other such safety measures as may be required by the above mentioned regulatory agencies.

D. Contractor shall be solely and completely responsible for the safety of all construction personnel performing the Work, including all Subcontractors. Contractor shall be ultimately responsible for any and all necessary safety precautions and safety programs.

E. Contractor shall also be held responsible for their own compliance with the provisions of this Section, as well as the compliance of all Subcontractors with the provisions of this Section. Contractor shall be held responsible for any and all violations of the provisions of this Section, as well as violations of any federal, state, and local safety codes, ordinances, and regulations, including the requirements of the Occupational Safety and Health Agency, and Division of Industrial Safety, State of California, and other such safety statutes and requirements which apply to the Work.

F. No act, service, drawing review or construction review by the Owner, Design Engineer, CQA Officer or their Consultants is intended to include review of the adequacy of the Contractor's safety measures in, on, or near the Work site.

G. If a conflict should occur between the safety requirements of the Standard Specifications, these Technical Specifications, the approved Health and Safety Plan, Referenced Standards, or other federal, state, and local safety codes, ordinances, and regulations, the more stringent requirement shall prevail.

H. The Contractor shall contact PG&E with regard to the overhead power lines and associated health and safety issues prior to the commencement of work.

1.03 LFG HAZARDS

A. The Contractor is advised that decomposing refuse produces LFG, which is approximately 50 percent methane and 50 percent carbon dioxide by volume. LFG may be present in the Work area. LFG is colorless, can be odorless, may contain benzene, vinyl chloride, hydrogen sulfide, and other toxic constituents, is combustible, and contains little or no oxygen. LFG can migrate through soil near the surface so the Contractor is therefore advised of the need for precautions against fire, explosion, and asphyxiation when working in or near excavations which are in or near refuse fill areas.

B. The Contractor shall be responsible for informing his or her employees and Subcontractors and their employees of the potential danger of LFG on and near landfills.

C. Smoking shall be prohibited at all times and at all locations within the limits of the Work shown on the Plans.

D. The Contractor shall be familiar with "A Compilation of Landfill Gas Field Practices and Procedures" as prepared by the Solid Waste Association of North America (SWANA).

E. LFG has the potential to create hazardous conditions if not controlled or recognized. Some of the hazards of LFG include:
   1. Fires which may start spontaneously from exposed and/or decomposing refuse.
   2. Fires and explosions which may occur from the presence of methane gas.
   3. Oxygen deficiency in underground trenches, excavations, vaults, conduits and structures.
   4. The potential presence of hydrogen sulfide, a highly toxic and flammable gas.
   5. The potential presence of benzene, vinyl chloride, and other toxic gases which are known to the State of California to cause cancer, birth defects, and reproductive harm.
   6. Water vapor in LFG often becomes over saturated and condenses as a liquid in contained pipes and vessels. This condensate may contain the toxic constituents found in LFG.

1.04 OTHER LANDFILL-RELATED HAZARDS

A. The Contractor is advised that solid waste fills and the decomposing refuse therein may present other unique health and safety considerations. Such considerations include, but are not limited to:
   1. Unstable ground and surface cave-ins due to decomposition and differential settlement of refuse when working over, in, or near refuse fill areas.
   2. Possible caving of trenches and excavations when working over, in, or near refuse fill areas.
   3. Potentially hazardous materials in or near refuse fill areas.

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION

3.01 HEALTH AND SAFETY PLAN

A. Prior to start of construction, the Contractor shall submit a written Health and Safety Plan, to the Design Engineer indicating all proposed safety measures. Said plan shall be prepared in accordance with the requirements of Part 29 of the Code of Federal Regulations (29 CFR) 1910.120.

B. The Health and Safety Plan shall comply with all federal, state, and local safety codes, ordinances, and regulations, including the requirements of the Occupational Safety and Health Administration (OSHA), and Division of Industrial Safety, State of California. The Contractor shall comply with Section 5-1.02A of the Standard Specifications for safety plan requirements for trenches and excavations. Contractor's attention is further directed to Section 6705 of the Labor Code concerning trench excavation safety plans.

3.02 SITE SAFETY MONITOR

A. The Contractor shall provide a person who will be designated as the Site Safety Monitor.

B. The Site Safety Monitor shall be thoroughly trained in rescue procedures, and use of safety equipment and gas detectors as required by the Health and Safety Plan.

C. At a minimum the Site Safety Monitor shall have taken a certified 40-hour OSHA safety course and 8-hour supplementary health and safety supervisor course which meets the requirements of 29 CFR 1910.120. Certificates of participation shall be submitted to the Design Engineer prior to start of construction.

D. The Site Safety Monitor shall have the delegated authority to order any person or worker to follow safety rules related to LFG or other site safety hazards. Failure to observe these rules shall be sufficient cause for removal of the person or worker from the Work site.

E. Supplemental to the Contractor's regular safety program, the Site Safety Monitor shall develop and institute procedures to inform all workers and the public visiting the Work site of the potential for the presence of methane and other landfill gases emanating from the natural decomposition of refuse buried at or near the Work site, and the importance of safety precautions to provide for the safety of workers and the public.

3.03 TRENCH AND EXCAVATION SAFETY

A. Contractor shall comply with all requirements of the trench and excavation safety, including provisions of Section 5-1.02A of the Standard Specifications and all occupational safety and health requirements of the Labor Code. In particular, the Contractor shall:

1. Submit to the Design Engineer at least 14 calendar days in advance of excavation, a detailed plan showing the design of sheeting, shoring, bracing, slopes, or other provisions to be made for worker protection from the hazard of caving ground during excavation. Sheeting and shoring plans shall be designed

and stamped by a Registered Civil or Structural Engineer with experience in shoring design. The Contractor shall be solely responsible for ensuring the safety of any excavation. Shoring and submittal of any plans for sheeting, shoring, bracing, slopes, or other provisions to be made for worker protection shall not relieve the Contractor from this responsibility.

2. If required, obtain a permit from the division of Industrial Safety for the construction of excavations that are 5 feet in depth or deeper and into which a person or persons is (are) required to descend.

B. Contractor shall provide all necessary materials to sheet, shore, brace, or otherwise provide for worker protection in temporary excavations as well as may be required to prevent adjacent surface settlement or damage to public and private property and to ensure safe working conditions at the Work site.

C. Contractor shall remove all sheeting, shoring, bracing or similar structures in accordance with the above requirements and in such a manner as to prevent any damage to the Work.

D. The Contractor shall repair all damages resulting from improper sheeting, shoring, bracing or similar measures, or damages resulting from failure to provide such measures at no expense to the City.

PART 4 MEASUREMENT AND PAYMENT

4.01 HEALTH AND SAFETY

A. Payment for providing all health and safety measures, including preparation of required Health and Safety Plan, is included in the Contract Unit Price paid for the various items of Work for which they are required. No separate or additional payment will be made therefore.

END OF SECTION

DIVISION 2

SITE WORK

SECTION 02200
REMOVAL, REPLACEMENT, AND ADJUSTMENT OF EXISTING FACILITIES

PART 1 GENERAL

1.01 SUMMARY

A. Existing facilities that interfere with the Work shall be removed, reset, relocated, adjusted, or otherwise modified as specified herein, as shown on the Plans, or as directed by the Engineer. The Contractor shall perform all removal, replacement, abandonment, and adjustment of existing facilities in accordance with this Section and at the locations and details shown on the Plans including the following:

1. Adjust three (3) existing groundwater monitoring wells to grade;
2. Adjust two (2) existing leachate wells to grade;
3. Remove existing CMP and HDPE downdrains and drain outlets to creek;
4. Remove and/or abandon existing leachate piping;
5. Adjust of five (5) existing leachate manholes to grade;
6. Remove and replace existing vault boxes;
7. Install G5 traffic vault with checker plate top over existing valve;
8. Adjust existing gas vault to grade;
9. Adjust existing air release valve and vault to grade;
10. Adjust four (4) existing landfill gas perimeter monitoring wells/vaults to grade;
11. Remove existing fencing at site entrance; and
12. Demolish existing scale house structure.

B. The Contractor shall furnish all labor, supervision, tools, materials, equipment, transportation, and incidentals necessary to implement the respective removal, replacement, and adjustment activities outlined above and within this Section.

1.02 REFERENCES

A. *Caltrans Standard Specifications.* California Department of Transportation, 2010.

B. *Standard Plans Book.* California Department of Transportation, 2010.

1.03 SUBMITTALS

A. At least 14 calendar days prior to beginning any replacement work in accordance with the requirements of this Section, the Contractor shall provide three (3) copies to the Design Engineer manufacturer's product data sheets for any new materials used in the replacement or adjustment of existing facilities.

1.04 PROJECT CONDITIONS

A. Except for materials indicated to be stockpiled or to remain the City's property, cleared materials are the Contractor's property. Remove cleared materials from the project site and dispose of in lawful manner.

B. Salvaged Materials: Carefully remove items indicated to be salvaged and store where indicated on Plans or where designated by the City. Avoid damaging materials designated for

salvage.

C. Unidentified Materials:
   1. If unidentified materials are discovered, including hazardous materials that may require additional removal other than is required by the Contract Documents, immediately report the discovery to the City.
   2. I necessary, the City will arrange for any testing or analysis of the discovered materials and shall provide instruction regarding the removal and disposal of unidentified materials.

PART 2 PRODUCTS

2.01 SOIL MATERIAL

A. Backfill excavations resulting from removal operations with onsite or import materials conforming to the specification for compacted engineered fill as described in Section 02224 (Engineered Fill).

2.02 VAULT BOXES

A. New or replacement vault boxes shall be pre-cast boxes with solid concrete or steel lids at the sizes and dimensions as indicated on the Plans. Extension risers shall be used as necessary to raise vault box to grade. Vault boxes shall be Christy boxes or equivalent with traffic rated cover where indicated.

PART 3 EXECUTION

3.01 GENERAL

A. Items demolished or removed that are not to be salvaged or reused in the Work shall become the property of the Contractor and shall be legally disposed of or recycled.

B. Verify that utilities have been disconnected and capped before starting demolition operations.

3.02 DOWNDRAIN AND DRAIN OUTLET REMOVAL

A. Unless indicated on the Plans to remain, all existing aboveground and below ground CMP and HDPE downdrains and drain pipe including any hardware shall be removed within the limits of Work.

B. Backfill trench excavations resulting from removal operations with onsite or import materials conforming to the specification for compacted engineered fill as described in Section 02224 (Engineered Fill). Compact to 90% relative compaction.

3.03 LEACHATE PIPING REMOVAL/ABANDONMENT

A. Cut existing leachate pipe at points shown on the Plans. The pipe cuts shall be square, perpendicular to the center of the pipe. Cap or plug with concrete the ends of the piping where indicated.

B. Unless piping is shown on the Plans to be abandoned in place, excavate and remove piping for disposal per section 1.04A.

C. Backfill excavations resulting from removal operations with onsite or import materials conforming to the specification for compacted engineered fill as described in Section 02224 (Engineered Fill). Compact to 90% relative compaction.

3.04 LEACHATE MANHOLE ADJUSTMENT

A. Frames and covers of existing leachate manholes shall be adjusted to grade with new materials similar in character to those in the original structure in accordance with the provisions of these specifications.

C. After the existing cover and frame has been removed, the top of the structure to be raised shall be trimmed to provide a suitable foundation for the new material.

D. When reconstruction or adjustment of a concrete structure requires partial removal of concrete, sufficient concrete shall be removed to permit new reinforcing steel to be spliced to existing reinforcing steel. Existing reinforcement that is to be incorporated in new work shall be protected from damage and shall be thoroughly cleaned of adhering material before being embedded in new concrete.

E. Concrete removal shall be performed without damage to the portion that is to remain in place. Damage to the existing concrete, which is to remain in place, shall be repaired to a condition equal to that existing prior to the beginning of removal operations. The cost of repairing existing concrete damaged by the Contractor's operations shall be at the Contractor's expense.

F. At the option of the Contractor, raising devices may be used in place of adjusting manholes to grade with new materials similar in character to those in the original structure.

G. The shape and size of the raising devices shall match the existing frame and shall produce an installation which is equal to or better than the existing installation in stability, support and non-rocking characteristics. Each section of the raising device shall be fastened securely to the existing frame.

3.05 DEMOLITION

A. Demolish indicated existing buildings as shown on the Plans. Use methods required to complete the Work within limitations of governing regulations.

B. Use water mist and other suitable methods to limit spread of dust and dirt. Comply with governing environmental protection regulations. Do not use water when it may damage construction or create hazardous or objectionable conditions, such as ice, flooding, and pollution.

C. Proceed with demolition of structural framing members systematically, from higher to lower level.

D. Remove below-grade construction, including footings and foundation walls completely.

E. Remove existing utilities within limits of structure completely. Fill depressions and voids

with onsite or import fill compacted to a relative compaction of 90%.

F. Completely fill below-grade areas and voids resulting from building demolition operations with satisfactory onsite or import fill compacted to a relative compaction of 90%.

PART 4 MEASUREMENT AND PAYMENT

4.01 ADJUST GROUNDWATER MONITORING WELLS TO GRADE

A. Adjustment of groundwater monitoring wells to grade shall be measured by each well that is adjusted. Payment shall be included in the Contract Unit Price per each well adjusted for "Adjust Groundwater Monitoring Wells to Grade" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to complete the adjustment as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.02 ADJUST LEACHATE WELLS TO GRADE

A. Adjustment of leachate wells to grade shall be measured by each well that is adjusted. Payment shall be included in the Contract Unit Price per each well adjusted for "Adjust Leachate Wells to Grade" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to complete the adjustment as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.03 REMOVE EXISTING CMP AND HDPE DOWNDRAINS AND DRAIN OUTLETS

A. Measurement and payment for removal of existing above ground and underground CEP and HDPE downdrains and drain outlets shall be included in the Contract Lump Sum Price for "Remove Existing CMP and HDPE Downdrains and Drain Outlets" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to complete the removal as shown on the Plans, as specified herein, and as directed by the Design Engineer, including pipe removal, excavations, disposal, and trench backfill and compaction. No additional compensation will be allowed therefore

4.04 REMOVE EXISTING LEACHATE PIPING

A. Measurement and payment for removal and abandonment of existing leachate piping shall be included in the Contract Lump Sum Price for "Remove Existing Leachate Pipe" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to complete the removal as shown on the Plans, as specified herein, and as directed by the Design Engineer, including cutting and capping pipe, excavation, pipe removal, and trench backfill and compaction. No additional compensation will be allowed therefore.

4.05 ADJUST LEACHATE MANHOLES

A. Adjustment of leachate manholes to grade shall be measured by each manhole that is adjusted. Payment shall be included in the Contract Unit Price per each manhole adjusted for "Adjust Leachate Manhole to Grade" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to

complete the adjustment as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.06 INSTALL G5 TRAFFIC VAULT WITH CHECKER PLATE COVER

A. Installation of G5 traffic vault with checker plate cover shall be measured by each vault that is installed. Payment shall be included in the Contract Unit Price per each vault removed and replaced for "Install G5 Traffic Vault with Check Plate Cover" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to complete the replacement as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.07 ADJUST EXISTING GAS VAULT TO GRADE

A. Adjustment of gas vault to grade shall be measured by each vault that is adjusted. Payment shall be included in the Contract Unit Price per each manhole adjusted for "Adjust Existing Gas Vault to Grade" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to complete the adjustment as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.08 INSTALL B2436 GAS EXTRACTION VAULT WITH CHECKER PLATE TOP

A. Installation of B2436 gas extraction vault with checker plate cover shall be measured by each vault that is installed. Payment shall be included in the Contract Unit Price per each vault removed and replaced for "Install B2436 Gas Extraction Vault with Check Plate Cover" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to complete the replacement as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.09 ADJUST EXISTING AIR RELEASE VALVE AND VAULT TO BOX GRADE

A. Adjustment of existing air release valve and vault box to grade shall be measured by each valve adjustment that is performed. Payment shall be included in the Contract Unit Price per each vault removed and replaced for "Adjust Existing Air Release Valve and Vault Box to Grade" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to complete the replacement as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.10 ADJUST LFG PERIMETER MONITORING WELLS

A. Adjustment of LFG perimeter monitoring wells to grade shall be measured by each well that is adjusted. Payment shall be included in the Contract Unit Price per each well adjusted for "Adjust LFG Monitoring Wells to Grade" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to complete the adjustment as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.11 REMOVE EXISTING FENCING

A. Measurement and payment for removal of existing fencing shall be included in the Contract Lump Sum Price for "Remove Existing Fencing" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to complete the removal as shown on the Plans, as specified herein, and as directed by the Design Engineer, including cutting and capping pipe, excavation, pipe removal, and trench backfill and compaction. No additional compensation will be allowed therefore.

4.12 STRUCTURE DEMOLITION

A. Measure and payment for the demolition of the existing scale house structure shall be included in the Contract Lump Sum Price for "Structure Demolition" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to complete the demolition as shown on the Plans, as specified herein, and as directed by the Design Engineer, including demolition of structure and foundation, removal of utilities, disposal of materials, and backfill and compaction of voids and depressions. No additional compensation will be allowed therefore.

END OF SECTION

SECTION 02207
AGGREGATE MATERIALS

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall furnish, transport to the Work site, and install all aggregate materials, including aggregate base for the construction of access roads, road crossings, and placement within and around the flare station, sand ballast and hydrobinder infill for the engineered turf, pipe bedding for trenches, rock riprap for lined swales and outfalls, gravel pack material for LFG extraction wells, concrete aggregate, coarse rock for the construction entrance, and tank bedding and backfill for the leachate UST, in accordance with this Section and at the locations and to the dimensions shown on the Plans. The Contractor shall furnish all labor, supervision, tools, materials, equipment, transportation, and incidentals necessary to install the respective aggregate materials.

1.02 REFERENCES

A. *Caltrans Standard Specifications.* California Department of Transportation, 2010.

B. *Caltrans Standard Plans*. California Department of Transportation, 2010.

C. *American Society for Testing and Materials.* Current Edition.

D. *California Test Methods*. California Department of Transportation, Current Edition.

1.03 APPLICABLE STANDARDS AND SPECIFICATIONS

A.	ASTM C 33	Standard Specification for Concrete Aggregates.
B.	ASTM C 136	Sieve Analysis of Fine and Coarse Aggregates.
C.	ASTM D 2434	Standard Test Method for Permeability of Granular Soils (Constant Head).
D.	CTM 229	Method of Test for Durability Index.
E.	CTM 301	Method for Determining the Resistance "R" Value of Treated and Untreated Bases, Subbases, and Basement Soils by the Stabilometer.

1.04 SUBMITTALS

A. At least 14 calendar days prior to beginning any aggregate material installation, the Contractor shall provide three (3) copies of the name and location of the proposed borrow source, and laboratory test results on the aggregate materials from the proposed borrow source to the Design Engineer which show that the aggregate materials have the properties specified in Part 2 of this Section. The Design Engineer will provide the

Contractor with an approval or rejection of the borrow source and aggregate materials within two (2) working days of receipt of the borrow source information and laboratory test results.

1.05 QUALITY ASSURANCE

A. Testing of the aggregate materials shall be conducted in accordance with the CQA Plan.

B. If the Design Engineer's review of Contractor's submittals indicates that an aggregate material(s) does not meet specified requirements, the Contractor shall provide an alternative material(s) and submit corresponding test results to the Design Engineer for approval.

PART 2 PRODUCTS

2.01 GENERAL

A. Each aggregate product shall come from the same source throughout the Work.

2.02 AGGREGATE BASE

A. The aggregate base material shall be clean, hard, sound, durable, uniform in quality, free of any surface coatings, and free of any detrimental quantity of soft, friable, thin, elongated, or laminated pieces, disintegrated material, organic matter, oil, alkali, or other deleterious substance. The aggregate base material may contain Portland cement concrete and asphalt concrete meeting the grading specifications.

B. Aggregate base shall conform to requirements of Section 26 of the Standard Specifications and these Technical Specifications. Aggregate base shall meet the requirements for Class 2, ¾-inch maximum per the Standard Specifications.

2.03 SAND BALLAST INFILL

A. Sand Ballast Infill will meet Particle Size Parameters of ASTM C-33 for fine aggregates as shown in Table 1 below:

Table 1: Sand Ballast Infill ASTM C-33-03 Particle Size Distribution

ASTM C-33-03	
Sieve	Percent Passing
9.5 mm (3/8 in.)	100
4.75 mm (No. 4)	95 to100
2.36 mm (No. 8)	80 to 100

(Continued)

ASTM C-33-03	
Sieve	Percent Passing
1.18 mm (No. 16)	50 to 85
600 µm (No. 30)	25 to 60
300 µm (No. 50)	5 to 30
150 µm (No. 100)	0 to 10

2.04 HYDROBINDER INFILL

A. HydroBinder™ is a cementious product used as the infill component for surface drainage conveyance areas.

B. HydroBinder™ infill Shall be HydroBinder™ Cementitious Infill. The HydroBinder™ infill material may be delivered in either pallet form of 80 lb. bags or 3,000 lb. bulk super sacks.

C. Cement, except as otherwise specified herein, will be a brand of Portland Cement, meeting ASTM C 150 and will be Type I or Type II. Only one brand of cement will be used throughout the duration of this Contract.

D. The cementitious infill mix design will conform to the requirements of ASTM C 387 for high strength mortars.

E. The cementious infill will have a minimum 28 day compressive strength of 5,000 psi.

2.05 PIPE BEDDING

A. Pipe bedding material shall conform to Section 19-3.02E(2) of the Standard Specifications.

2.06 LOOSE ROCK RIPRAP

A. Stone and/or recycled concrete for loose rock riprap shall conform to Section 72-5.02 of the Standard Specifications and the following size requirements:

Screen Size	% (By Weight) Retained Above
4" x 4"	95-100
6" x 6"	75-100
9" x 9"	25-100

2.07 GROUTED ROCK RIPRAP

A. Stone and/or recycled concrete for grouted rock riprap shall be "Light" class rock per Section 72-2.02 of the Standard Specifications.

2.08 GRAVEL PACK

A. Gravel pack material for the LFG extraction wells shall be 1- to 2-inch diameter non-calcareous washed rock.

2.09 CONCRETE AGGREGATE

A. Coarse and fine aggregate for concrete shall conform to ASTM C 33 as determined by the Supplier. All aggregate shall be thoroughly washed. Maximum aggregate size shall be 3/4 inches in diameter.

2.10 COARSE ROCK FOR CONSTRUCTION ENTRANCE

A. Coarse rock for construction entrance shall be 2- to 3-inch crushed stone.

2.11 TANK BEDDING AND BACKFILL

A. Tank bedding shall consist of filter sand.

B. Tank backfill shall be clean naturally rounded aggregate with a mix of particle sizes not less than 1/8-inch or more than ¾-inch (pea gravel) in accordance with the tank manufacturer's specifications.

PART 3 EXECUTION

3.01 GENERAL

A. The Contractor shall provide all construction, grading control, and other staking necessary to construct the aggregate materials to the lines, grades, and thickness shown on the Plans.

3.02 STOCKPILING

A. Materials shall be stockpiled at the Work site at a location(s) designated by the Design Engineer.

B. Stockpiles shall be of sufficient quantity to meet Project schedule and requirements.

C. Surface water shall be directed away from stockpile site(s) so as to prevent erosion or deterioration of materials.

3.03 STOCKPILE CLEANUP

A. Surplus aggregate material stockpiles shall be removed or left in a clean and neat

condition. Stockpile area surface(s) shall be graded to prevent free standing surface water.

3.04 PLACEMENT

A. Aggregate base shall be placed in accordance with the requirements for aggregate base placement in Section 02310 (Access Roads) and Section 15300 (Flare Station) of these Technical Specifications.

B. Pipe bedding shall be placed in accordance with the requirements for backfilling in Section 02225 (Trenching and Backfilling) of these Technical Specifications.

C. Sand ballast infill and HydroBinder infill shall be placed in accordance with the requirements for infill placement, respectively in Section 02773 (Engineered Turf) of these Technical Specifications.

D. Rock riprap shall be placed in accordance with the requirements for placement in Section 02722 (Drainage and Erosion Controls) of these Technical Specifications.

E. Gravel pack material shall be placed in accordance with the requirements for backfilling in Section 15100 (Landfill Gas [LFG] Extraction Wells) of these Technical Specifications.

F. Coarse rock shall be placed at the construction entrances in accordance with the requirements of Section 02960 (Temporary Erosion and Sediment Controls) of these Technical Specifications.

G. Concrete sand shall be placed in accordance with the requirements of Section 02774 (Geosynthetic Clay Liner [GCL]) of these Technical Specifications.

H. Tank bedding and backfill shall be placed in accordance with the requirements of Section 15500 (Leachate Overflow and Collection System) of these Technical Specifications.

PART 4 MEASUREMENT AND PAYMENT

4.01 AGGREGATE BASE

A. Measurement and payment for aggregate base shall be included in the Contract Unit Prices for “Access Roads” addressed in Section 02310 (Access Roads) and “Flare Station” addressed in Section 15300 (Flare Station) of these Technical Specifications.

4.02 SAND BALLAST INFILL

A. Measurement and payment for sand ballast infill shall be included in the Contract Unit Prices for “Engineered Turf ” addressed in Section 02773 (Engineered Turf) of these Technical Specifications

4.03 HYDROBINDER INFILL

A. Measurement and payment for HydroBinder infill shall be included in the Contract Unit Prices for "Engineered Turf" addressed in Section 02773 (Engineered Turf) of these Technical Specifications

4.04 PIPE BEDDING

A. Measurement and payment for pipe bedding shall be included in the Contract Unit Price paid for the various items of Work for which pipe bedding is required.

4.05 LOOSE AND GROUTED ROCK RIPRAP

A. Measurement and payment for loose and grouted rock riprap shall be included in the Contract Unit Price paid for the various items of Work for which loose and grouted riprap is required.

4.06 GRAVEL PACK

A. Measurement and payment for gravel pack shall be included in the Contract Unit Price for "LFG Extraction Wells" addressed in Section 15100 (Landfill Gas [LFG] Extraction Wells) of these Technical Specifications.

4.07 CONCRETE AGGREGATE

A. Measurement and payment for concrete aggregate shall be included in the Contract Unit Price paid for the various items of Work for which concrete aggregate is required.

4.08 COARSE ROCK FOR CONSTRUCTION ENTRANCE

A. Measurement and payment for coarse rock for the construction entrance shall be considered as included in the Contract Lump Sum Price paid for "Mobilization" addressed in Section 01500 (Mobilization) of these Technical Specifications.

4.09 TANK BEDDING AND BACKFILL

A. Measurement and payment for tank bedding and backfill for the leachate UST installation shall be considered as included in the Contract Unit Price paid for "Leachate UST" addressed in Section 15500 (Leachate Overflow and Collection System) of these Technical Specifications.

END OF SECTION

SECTION 02222
EXCAVATION

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall perform all excavation work including clearing, grubbing, stripping, excavation, and grading of the on-site borrow area and construction of the final cover system's foundation layer, drainage and erosion control structures, LFG collection system and condensate drain/discharge components, and leachate UST in accordance with this Section and at the locations and to the dimensions shown on the Plans.

B. The Contractor shall excavate refuse in selected areas and relocate the refuse to the designated refuse relocation area shown on the Plans. Incidental refuse excavation and disposal shall also be performed as part of the installation of drainage, LFG collection system, and condensate drain/discharge components.

C. Excavation to be performed by the Contractor shall also include construction of any necessary haul roads, stockpiling of all excavated materials, hauling and disposal of any excavated refuse, and provisions for temporary dust, erosion, and drainage control measures.

D. The Contractor shall furnish all labor, supervision, tools, materials, equipment, transportation, and incidentals necessary to implement the respective excavation activities outlined above and within this Section.

1.02 REFERENCES

A. *Caltrans Standard Specifications.* California Department of Transportation, 2010.

B. *Caltrans Standard Plans*. California Department of Transportation, 2010.

1.03 SUBMITTALS

A. Temporary erosion and sediment control measures associated with excavation activities shall be addressed in the Work site's SWPPP prepared as part of Section 01550 (Storm Water Pollution Prevention) of these Technical Specifications.

B. The Contractor shall provide the Design Engineer with certified weight tags issued by the permitted transfer station or solid waste disposal facility for all loads of refuse transported off-site for disposal.

1.04 QUALITY ASSURANCE

A. Observation
   1. The CQA Monitor will periodically observe performance of the excavations to verify conformance with the execution requirements in Part 3 of this Section.

2. If any portion(s) of the excavations are determined by the CQA Monitor to not meet the requirements of this Section, the Contractor, at his expense, shall rework or replace that portion(s) to meet the requirements of this Section as directed by the Design Engineer.

B. Surveying

1. The Contractor shall provide all construction staking, grading control, and other staking necessary to construct the excavations to the lines, grades, and dimensions shown on the Plans. The Design Engineer will provide data on existing control points in the vicinity of the Project for use by the Contractor's Land Surveyor or eligible Engineer.
2. All grades and dimensions of completed areas of the excavations shall be verified by the Design Engineer or CQA Monitor by field survey.
3. If it is demonstrated by the CQA field surveying that any portion(s) of the excavations does not meet the required lines, grades, or dimensions shown on the Plans, the Contractor, at his expense, shall rework or replace that portion(s) to bring the deficient area(s) to grade or the proper dimension in accordance with all requirements of this Section. A deduction will be made from the Contractor's compensation (based on standard wage rates) to retest the materials and re-verify the grade or the proper dimension by survey.

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION

3.01 GENERAL

A. Unless provided otherwise within this Section, all excavation activities shall conform to the applicable requirements of Section 16 and 19 of the Standard Specifications.

B. The Contractor shall instruct all personnel and maintain strict control over all excavation activities to protect and maintain the integrity of all existing environmental monitoring and control systems and any other facilities for the existing landfill. The cost of repairing any damage to these existing features will be determined by the Owner and be borne by the Contractor. The total repair cost to be borne by the Contractor will include those for exploration to determine extent of damage, mobilization of work crews, materials, material delivery, CQA testing and observation, and additional design.

3.02 CLEARING AND GRUBBING

A. The existing interim cover soil on the landfill surface and natural ground surface within the limits of the on-site borrow area as depicted on the Plans shall be cleared of all vegetative growth, such as brush, grass, weeds, or other deleterious material.

B. Clearing and grubbing shall be performed prior to beginning excavation in any area.

C. Cleared and stripped topsoil shall be stockpiled separately from excavated material or disposed of in accordance with this Section.

3.03 REFUSE EXCAVATION AND RELOCATION

A. Refuse shall be excavated at the designated locations beneath the existing power lines to the lines, grades and dimensions shown on the Plans.

B. After clearing and grubbing, residual existing interim cover soil overlying the designated refuse excavation areas shall be segregated and subsequently reused as foundation layer material. This material shall be free of refuse and shall be placed and compacted in accordance with Section 02240 (Foundation Layer) of these Technical Specifications.

B. Excavated refuse shall be relocated to the designated refuse relocation area shown on the Plans.

C. Relocated refuse placed within the designated refuse relocation area shall be spread in uniform lifts not to exceed 2 feet in thickness and each lift compacted with a minimum of four (4) passes using a dozer.

D. Relocated refuse lifts shall be covered with a minimum of 6 inches of soil at the end of each working day to minimize vector hazards and odor nuisance.

E. Within five (5) working days of completing the refuse excavation work beneath the existing power lines, the refuse relocation area shall be completely covered with a minimum of 12 inches of prepared and compacted foundation layer material in accordance with Section 02240 (Foundation Layer) of these Technical Specifications.

3.04 INCIDENTAL REFUSE EXCAVATION AND DISPOSAL

A. Refuse shall be excavated as necessary to accommodate the installation of drainage, LFG collection system, and condensate drain/discharge components at the locations and to the details shown on the Plans.

B. Excavated refuse may be temporarily stockpiled on and covered with visqueen at a designated location on-site, or discharged directly into a roll-off bin or dump truck. If temporarily stockpiled, the refuse must be removed by the end of each working day and transferred into a roll-off bin or dump truck for subsequent transport and disposal by the Contractor to a permitted transfer station or solid waste disposal facility. Refuse remaining on-site overnight in a roll-off bin or dump truck shall be covered at the end of each working day. Excavated refuse shall not remain on-site for more than a 48-hour period.

C. The Contractor shall not mix excess, surplus, or waste materials from other general construction activities with the refuse derived from the excavation work described in this Section. Those materials shall be managed and paid for separately under the Contract Lump Sum Price for "Mobilization" as outlined in Section 01500 (Mobilization) of these Technical Specifications.

3.05 SOIL EXCAVATION

A. The horizontal control points and one (1) benchmark shall be provided by the Design Engineer in the vicinity of the Work site. It shall be the responsibility of the Contractor to maintain control points and property line markers and to provide and maintain construction

staking, grading control, or other staking necessary to perform the excavation and construct the stockpile.

B. Control points and property line markers that are removed, damaged, or destroyed by the Contractor shall be reestablished by the Contractor at the Contractor's expense.

C. Boulders encountered by the Contractor during excavation shall be removed, separated by size as directed by the Design Engineer, and stockpiled separately from excavated material or disposed of in accordance with this Section.

D. Excavation for drainage and erosion control structures shall conform to Section 19-1.03E of the Standard Specifications.

3.06 GRADING

A. The excavation shall be constructed in conformance with the lines, grades, and dimensions shown on the Plans; all distances and measurements, except elevations and structural dimensions, shall be made on a horizontal plane unless otherwise stated in this Section.

B. When completed, the grading plane for the drainage channels at any point shall not vary more than 0.10 foot above or below the grade shown on the Plans on slopes less than 10 percent nor vary more than 0.20 foot above or below the grade shown on the Plans on slopes greater than 10 percent.

C. Unsuitable materials, as determined by the Design Engineer, encountered at the subgrade elevation shall be removed and stockpiled separately from excavated material or disposed of in accordance with this Section. If, after removal of the unsuitable materials, a surface in accordance with Part 3 of this Section does not result, overexcavation correction procedures in this Section shall be followed.

D. If any portion of the excavation area is excavated by the Contractor below the design (prepared subgrade) elevations shown on the Plans, the Contractor shall perform overexcavation correction procedures, resulting in a surface which meets the requirements of Part 3 of this Section, as directed by the Design Engineer. Overexcavation correction procedures may consist of excavating, grading, and surface preparation of the entire overexcavated slope, or some portion thereof, to a lower subgrade elevation determined by the Design Engineer; backfilling with engineered fill and compacting to provide a firm and unyielding subgrade in accordance with the requirements of Section 02224 (Engineered Fill) of these Technical Specifications; or as otherwise directed by the Design Engineer. The cost of overexcavation correction procedures, redesign, additional surveying, and other incidental fees resulting from the overexcavation shall be paid by the Contractor, unless the overexcavation is performed at the direction of the Design Engineer to remove unsuitable materials at the subgrade elevation.

3.07 HAUL ROAD CONSTRUCTION

A. The Contractor shall construct and maintain any haul roads necessary to perform excavation.

B. The location of all haul roads proposed for construction and use by the Contractor must be approved by the Design Engineer.

3.08 DUST CONTROL

A. Dust control shall comply with the Contractor's approved Dust Control Plan.

B. A minimum of two (2) water trucks with operators shall be in operation at all times during excavation to provide dust control at all excavation, haul road, stockpile and staging areas. If necessary, additional water trucks or other equipment with operators shall be provided and used by the Contractor to maintain these areas in a misted condition at all times during excavation.

C. The Design Engineer will require all excavation activities to cease if the Contractor's dust control efforts do not follow the approved Dust Control Plan, or fail to meet any of the requirements of this Part, until such time that the Contractor can demonstrate a return to compliance.

3.09 EROSION AND SEDIMENT CONTROL

A. Erosion and sediment control measures shall be implemented by the Contractor in accordance with the approved SWPPP, and as directed by the Design Engineer for all excavation work areas including haul roads and stockpile areas, adjacent areas which have been disturbed, or other affected areas.

B. The Contractor shall maintain erosion and sediment control measures until the final graded surface of the excavation is approved by the Design Engineer. If erosion creates a final subgrade surface which is not in accordance with any requirements of this Section, overexcavation correction procedures in this Section shall be performed by the Contractor, at the expense of the Contractor, including payment of all incidental fees.

3.10 DRAINAGE CONTROL

A. The Contractor shall provide ample means and devices with which to promptly remove and dispose of all water from any source entering the excavation or stockpile area(s) and maintain these at all times during excavation and until the final graded surface of the excavation and stockpile are approved by the Design Engineer. The Contractor shall perform excavation in the borrow source area in a manner that allows for the discharge and retention of storm water that does no conflict with the Contractor's excavation activities in the borrow area.

3.11 ARCHAEOLOGICAL AND PALEONTOLOGICAL RESOURCES

A. The Design Engineer shall serve as the Archaeological and Paleontological Monitor. The Contractor shall notify the Design Engineer in the event that he suspects that an archaeological or paleontological discovery is found during excavation for the Design Engineer's investigation. Should a paleontological or archaeological discovery be made during excavation, the Contractor shall cease work in that area until the discovery is evaluated or recovered. The Contractor may resume work elsewhere on the Work site that does not disturb the discovery until the evaluation or recovery is completed. Should the discovery result in an unavoidable delay to the Contractor, the Contractor shall immediately notify the Design Engineer of the delay in writing. Additional working days will be allowed for such a delay. The Contractor shall not charge the Owner for the delay under Sections 8-1.09 or 8-1.10 of the Standard Specifications until such delay exceeds a total of 20 hours for the Project, after which the Contractor may be entitled to compensation under said sections.

PART 4 MEASUREMENT AND PAYMENT

4.01 CLEARING AND GRUBBING

A. Clearing and grubbing shall be measured by the acre cleared and grubbed. Payment shall be included in the Contract Unit Price per acre for "Clearing and Grubbing" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to complete the clearing and grubbing as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.02 REFUSE EXCAVATION AND RELOCATION

A. Refuse excavation and relocation shall be measured by the in-place cubic yards to be removed and includes all excavation, loading, transport, placement, compaction, and cover soil. Payment shall be included in the Contract Unit Price per cubic yard for "Refuse Excavation and Relocation" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to complete the refuse excavation and relocation as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.03 INCIDENTAL REFUSE EXCAVATION AND DISPOSAL

A. Measurement and payment for incidental refuse excavation shall be included in the Contract Unit Price paid for the various items of Work for which incidental refuse excavation is required.

B. Disposal of refuse shall be measured by the tonnage of refuse disposed of off-site at a permitted transfer station or solid waste disposal facility. Payment shall be included in the Contract Unit Price per ton for "Refuse Disposal" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to dispose of refuse as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.04 SOIL EXCAVATION

A. Measurement and payment for soil excavation associated with construction of the foundation layer, drainage and erosion control structures, LFG collection system and condensate drain/discharge components, and the leachate overflow collection and storage system shall be included in the Contract Unit Price paid for these various items of Work for which soil excavation is required.

END OF SECTION

SECTION 02224
ENGINEERED FILL

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall install all engineered fill including all fill needed for backfilling of the former leachate pond, fill required for conforms outside ClosureTurf™ footprint area, as well as incidental engineered fill placement for access road subgrades, buried header crossings, road crossings, and backfilling anchor trenches and pipe/conduit trenches in the flare station area, in accordance with this Section and at the locations and to the dimensions shown on the Plans. The Contractor shall furnish all labor, supervision, tools, equipment, transportation and incidentals as necessary to prepare the subgrade, excavate, haul, place, moisture condition, compact, and grade the material to install the engineered fill.

1.02 REFERENCES

A. *Caltrans Standard Specifications.* California Department of Transportation, 2010.

B. *Caltrans Standard Plans*. California Department of Transportation, 2010.

C. *American Society for Testing and Materials.* Current Edition.

1.03 APPLICABLE STANDARDS AND SPECIFICATIONS

A. ASTM D 1557 Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Modified Effort (56,000 ft-lbf/ft^3 [2,700 kN-m/m^3]).

1.04 QUALITY ASSURANCE

A. Testing and Observation
   1. Testing and observation of engineered fill shall be conducted in accordance with the CQA Plan.
   2. The Contractor shall cooperate with the CQA Monitor during observation, testing, and collection of samples.
   3. If field and/or laboratory testing by CQA Monitor indicate that any area(s) of engineered fill does not meet compacted moisture content and dry density requirements, the Contractor shall rework the material in that area(s) at his expense until the engineered fill is in conformance with the requirements of this Section. A deduction will be made from the Contractor's compensation (based on standard wage rates) to pay for testing of the recompacted engineered fill material.
   4. Where work is interrupted by rain, operations subject to the moisture and density requirements shall not be resumed until observations and field tests by the CQA Monitor indicate that the moisture content and density of the in-place fill are within the limits specified. This requirement will not preclude the Contractor from disking or aerating the subject materials to achieve acceptable conditions.

B. Surveying

1. The Contractor shall provide all construction staking, grading control, and other staking necessary to construct the engineered fill to the lines, grades, contour lines, and dimensions shown on the Plans. The Design Engineer will provide data on existing control points in the vicinity of the Project for use by the Contractor's Land Surveyor or eligible Engineer.
2. All grades and dimensions of completed areas of the engineered fill may be verified by the Design Engineer or CQA Monitor by field survey.
3. If it is demonstrated by the CQA verification surveying that any portion(s) of the engineered fill does not meet the required lines, grades, or dimensions shown on the Plans, the Contractor, at his expense, shall rework or replace that portion(s) to bring the deficient area(s) to grade or the proper dimension in accordance with all requirements of this Section. A deduction will be made from the Contractor's compensation (based on standard wage rates) to retest the materials and re-verify the grade or the proper dimension by survey.

PART 2 PRODUCTS

2.01 SOURCE

A. On-site material meeting the requirements of this Section and as follows shall be used for engineered fill. The Contractor may need to segregate suitable on-site material for use as engineered fill.

B. Material excavated from within the on-site borrow area and leachate UST excavation meeting the requirements of this Section shall be used for engineered fill.

C. It is expected that sufficient suitable material for engineered fill will be available from the on-site sources described in these Technical Specifications. The Contractor may need to segregate or select material from these sources for use as engineered fill, however the Contractor will not be required to mechanically screen or import material for engineered fill.

2.02 PROPERTIES

A. Engineered fill material shall be soil or soil/rock mixture that is free of organic matter, debris, and/or deleterious or other unsuitable materials.

B. Engineered fill material shall not contain rocks or clods over 6 inches in greatest dimension, and not more than 15 percent by dry weight shall be larger than 2 inches in greatest dimension or as approved by the Design Engineer.

PART 3 EXECUTION

3.01 PLACEMENT

A. Prior to placement of engineered fill on native ground, scarify the exposed soils in-place to a depth of approximately 6 inches, moisture condition to within 1 to 3 percentage points of optimum moisture content, and compact as engineered fill to at least 90 percent of the maximum dry density as determined by ASTM D 1557.

B. General engineered fill shall be placed in 6-inch lifts with a maximum uncompacted thickness of 8 inches. Each layer shall be spread evenly and thoroughly mixed to obtain a near uniform condition in each layer. Engineered fill material shall then be brought to a uniform moisture content within 1 to 3 percentage points of the optimum moisture content, mixed as required to establish uniform moisture, and compacted to a minimum of 90 percent of the maximum dry density as determined by ASTM D 1557.

PART 4 MEASUREMENT AND PAYMENT

4.01 ENGINEERED FILL

A. Engineered fill for backfilling the former leachate pond and the construction of access roads and other improvements outside the ClosureTurf™ footprint area, shall be included in the Contract Unit Price for "Fill (Foundation Layer and Engineered Fill)" addressed in Section 02240 (Foundation Layer) of these Technical Specifications and includes all excavation, transport, placement, moisture conditioning and compaction. The quantity for "Fill (Foundation Layer and Engineered Fill" shall be a final pay quantity as described in Section 9-1.015 of the Standard Specifications and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install engineered fill as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.02 INCIDENTAL ENGINEERED FILL

A. Measurement and payment for incidental engineered fill shall be included in the Contract Unit Price paid for the various items of Work for which incidental engineered fill is required.

END OF SECTION

SECTION 02225
TRENCHING AND BACKFILLING

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall perform all trenching and/or backfilling operations necessary to install corrugated metal pipe (CMP) and high-density polyethylene (HDPE) drainage components, down drains and overflow pipes, sedimentation basin outlet, buried pipes and conduits, anchoring of the ClosureTurf™ (if necessary), and condensate drain lines in accordance with this Section and at the locations and to the dimensions shown on the Plans. The Contractor shall furnish all labor, supervision, tools, materials, equipment, transportation and incidentals as necessary to implement the trenching and backfilling operations.

1.02 REFERENCES

A. *Caltrans Standard Specifications.* California Department of Transportation, 2010.

B. *Caltrans Standard Plans*. California Department of Transportation, 2010.

C. *American Society for Testing and Materials.* Current Edition.

1.03 APPLICABLE STANDARDS AND SPECIFICATIONS

A. ASTM D 1557 Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Modified Effort (56,000 ft-lbf/ft^3 [2,700 kN-m/m^3]).

1.04 QUALITY ASSURANCE

A. Testing and Observation
   1. Testing and observation of trenching and backfilling shall be conducted in accordance with the CQA Plan.
   2. The Contractor shall cooperate with the CQA Monitor during observation, testing, and collection of samples.
   3. If field testing by the CQA Monitor indicates that the moisture content or density of any lift, or portion thereof, of trench and former leachate pond backfill fails to meet the specified requirement, the subject layer or portion thereof shall be re-worked, at the Contractor's expense, until the required moisture and density have been attained. No additional backfill shall be placed until the in-place fill has been inspected and accepted by the Design Engineer.
   4. Where work is interrupted by rain, operations subject to the moisture and density requirements shall not be resumed until observations and field tests by the CQA Monitor indicate that the moisture content and density of the in-place fill are within the limits specified. This requirement will not preclude the Contractor from discing or aerating the subject materials to achieve acceptable conditions.

PART 2 PRODUCTS

2.01 PIPE BEDDING

A. Pipe bedding shall conform to the requirements of Section 02207 (Aggregate Materials) of these Technical Specifications.

2.02 CONDENSATE DRAIN LINE TRENCH BACKFILL

A. Backfill material for the condensate drain line trenches as shown on the Plans shall consist of material excavated from the trench unless specified otherwise by the Design Engineer.

2.03 OTHER TRENCH BACKFILL

A. Backfill material for all other trenches (i.e., utilities, road crossings, ClosureTurf™ anchor trenches, condensate drop-outs/discharge points, etc.) shall conform to the requirements of Section 02224 (Engineered Fill) of these Technical Specifications.

PART 3 EXECUTION

3.01 TRENCH PREPARATION

A. Required points of connection, lines, levels, contours, and datum locations shall be identified by the Contractor. Locations for points of connection that are shown on the Plans are approximate. The Contractor shall locate utilities to best serve the intended use and to avoid mechanical and structural interference.

3.02 TRENCH EXCAVATING

A. Trenches shall be excavated to the lines and grades as shown on the Plans. Water or materials that interfere with the work shall be removed.

B. Soft areas of trench subgrade not capable of compaction in place shall be cut out.

C. The trench bottom shall be firm, continuous, relatively smooth and free of rocks and/or unsuitable material prior to the installation of pipe bedding or trench backfill material.

3.03 SHORING, SHEETING, AND BRACING OF TRENCH

A. The trench shall be braced and supported with sheets when necessary to prevent caving during excavation in unstable material, or to protect adjacent structures, property, and workers.

B. The Contractor shall secure a trench permit from the California Division of Industrial Safety prior to the excavation of any trench over 5 feet in depth.

C. Shoring and sheeting shall be removed as the backfill is completed in a manner that will not damage the pipe or permit voids in the backfill.

D. All sheeting, shoring, and bracing of trenches shall conform to the safety requirements of the federal, state, or local public agency having jurisdiction. The most stringent of these requirements shall apply.

3.04 PIPE/CONDUIT TRENCH BACKFILLING

A. Trenches shall be backfilled to the lines and grades as shown on the Plans.

B. Placement methods shall be employed that do not disturb or damage buried drainage pipes and conduits in the trench.

C. Pipe bedding material shall be placed at trench bottom, level fill materials in one continuous layer not exceeding 6 inches compacted depth and compacted to 90 percent of maximum dry density as determined by ASTM D 1557.

D. Pipe bedding shall be placed around the sides and to the top of the pipe/conduit, tamped in place, and compacted to 90 percent of maximum dry density as determined by ASTM D 1557.

E. Optimum moisture content of pipe bedding material shall be maintained to attain required compaction density.

F. Portion of trench above pipe bedding shall be backfilled with engineered fill in accordance with the requirements of Section 02225 (Trenching and Backfilling) of these Technical Specifications and as shown on the Plans.

G. Jetting of trenches shall not be permitted, unless allowed by the Design Engineer.

H. For buried pipe that does not require pipe bedding or engineered fill (condensate drain pipe), the trench backfill shall be placed in a manner that will not damage the pipe. The trench backfill shall be compacted to a firm consistency consistent with surrounding erosion-resistant layer material.

3.05 ANCHOR TRENCH BACKFILLING (IF NECESSARY)

A. A placement method shall be employed that does not damage the ClosureTurf™ in the trench.

B. The portion of the trench above the ClosureTurf™ shall be backfilled with engineered fill in accordance with the requirements of Section 02225 (Trenching and Backfilling) of these Technical Specifications and as shown on the Plans.

C. Jetting of trenches shall not be permitted, unless allowed by the Design Engineer.

D. Trenches shall be backfilled to the lines and grades as shown on the Plans.

PART 4 MEASUREMENT AND PAYMENT

4.01 TRENCHING

A. Measurement and payment for trenching per this Section shall be considered as included in the Contract Unit Price paid for the various items of Work for which it is required.

4.02 SHORING, SHEETING, AND BRACING

A. Measurement and payment for any shoring, sheeting and trench bracing per this Section shall be considered as included in the Contract Unit Price paid for the various items of Work for which they are required.

4.03 TRENCH BACKFILLING

A. Measurement and payment for backfilling of trenches per this Section shall be considered as included in the Contract Unit Price paid for the various items of Work for which it is required.

END OF SECTION

SECTION 02240
FOUNDATION LAYER

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall prepare all existing interim cover soil to be incorporated into the foundation layer and place all new foundation layer material as necessary in accordance with this Section and at the locations and to the dimensions shown on the Plans. The Contractor shall furnish all labor, supervision, tools, materials, equipment, transportation, and incidentals as necessary to prepare, haul, place and grade soil material to install the foundation layer.

1.02 REFERENCES

A. *Caltrans Standard Specifications.* California Department of Transportation, 2010.

B. *Caltrans Standard Plans*. California Department of Transportation, 2010.

C. *American Society for Testing and Materials.* Current Edition.

1.03 APPLICABLE STANDARDS AND SPECIFICATIONS

A. ASTM D 1557 Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Modified Effort (56,000 ft-lbf/ft^3 [2,700 kN-m/m^3]).

1.04 QUALITY ASSURANCE

A. Testing and Observation
   1. Testing and observation of the foundation layer, including verification of thickness, shall be conducted in accordance with the CQA Plan.
   2. The Contractor shall cooperate with the CQA Monitor during observation, testing, and collection of samples.
   3. If field and/or laboratory testing by CQA Monitor indicates that any area(s) of the foundation layer does not meet compacted moisture content and dry density requirements, the Contractor shall rework the material in that area(s) at his expense until the foundation layer is in conformance with the requirements of this Section. A deduction will be made from the Contractor's compensation (based on standard wage rates) to pay for testing of the recompacted foundation layer material.
   4. Where work is interrupted by rain, operations subject to the moisture and density requirements shall not be resumed until observations and field tests by the CQA Monitor indicate that the moisture content and density of the in-place fill are within the limits specified. This requirement will not preclude the Contractor from discing or aerating the subject materials to achieve acceptable conditions.

B. Surveying
   1. The Contractor shall provide all construction staking, grading control, and other staking necessary to construct the foundation layer to the lines, grades, and dimensions shown on the Plans. The Design Engineer will provide data on existing control points in the vicinity of the Work site for use by the Contractor's Land

Surveyor or eligible Engineer.

2. All grades and dimensions of completed areas of the foundation layer may be verified by the Design Engineer or CQA Monitor by field survey.
3. If it is demonstrated by the CQA verification surveying that any portion(s) of the foundation layer does not meet the required lines, grades, or dimensions shown on the Plans, the Contractor, at his expense, shall rework or replace that portion(s) to bring the deficient area(s) to grade or the proper dimension in accordance with all requirements of this Section. A deduction will be made from the Contractor's compensation (based on standard wage rates) to retest the materials and re-verify the grade or the proper dimension by survey.

C. Foundation Layer Thickness

1. If field testing by CQA Monitor indicates that any area(s) of the foundation layer does not meet the minimum thickness requirements, the Contractor shall place additional foundation layer material at his expense until the deficient area(s) is in conformance with the requirements of this Section. A deduction will be made from the Contractor's compensation (based on standard wage rates) to pay for testing of the new foundation layer placement area(s).

PART 2 PRODUCTS

2.01 SOURCE

A. On-site material meeting the requirements of this Section and as follows shall be used for the foundation layer.

B. Existing interim cover soils removed from the designated refuse excavation areas meeting the requirements of this Section shall be used for the foundation layer.

C. Material excavated from within the on-site borrow area meeting the requirements of this Section shall be used for the foundation layer.

D. It is expected that sufficient suitable material for the foundation layer will be available from the above on-site sources. The Contractor may need to segregate or select material from the borrow area for use as foundation layer material, however the Contractor will not be required to mechanically screen or import material for the foundation layer.

2.02 PROPERTIES

A. Foundation layer material shall be soil or soil/rock mixture that is free of organic matter, debris, and/or deleterious or other unsuitable materials.

B. Foundation layer material shall not contain rocks or clods over 6 inches in greatest dimension, and not more than 15 percent by dry weight shall be larger than 2 inches in greatest dimension or as approved by the Design Engineer.

PART 3 EXECUTION

3.01 SUBGRADE PREPARATION

A. All vegetative growth on existing interim cover soil surfaces shall be removed in accordance

with the "Clearing and Grubbing" procedures presented in Section 02222 (Excavation) of these Technical Specifications.

B. The existing interim cover soils shall be fine graded to eliminate rough or low areas.

C. The existing interim cover soils shall be scarified within the limits shown on the Plans to a depth of approximately 12 inches, moisture conditioned to within 1 to 3 percentage points of optimum moisture content, and compacted to at least 90 percent of the maximum dry density as determined by ASTM D 1557.

3.02 PLACEMENT OF NEW FOUNDATION LAYER MATERIAL

A. In areas requiring additional foundation layer material as shown on the Plans, new foundation layer material shall be placed in 6-inch lifts with a maximum uncompacted thickness of 8 to 12 inches. Each layer shall be spread evenly and thoroughly mixed to obtain a near uniform condition in each layer. Foundation layer material shall then be brought to a uniform moisture content within 1 to 3 percentage points of the optimum moisture content, mixed as required to establish uniform moisture, and compacted to a minimum of 90 percent of the maximum dry density as determined by ASTM D 1557.

3.03 SURFACE GRADING

A. When completed, the surface of the foundation layer shall conform to the grades shown on the Plans after placement and compaction and at no point on the completed grading plane shall the grade vary above the designated grades by more than 0.10 feet.

B. When completed, the surface of all foundation layer slopes greater than 10 percent shall conform to the grades shown on the Plans. At no point on the completed grading plane shall the grade vary below the designated grades measured perpendicular to the slope, nor by more than 0.20 feet above the designated grades as measured perpendicular to the slope.

PART 4 MEASUREMENT AND PAYMENT

4.01 SUBGRADE PREPARATION

A. Subgrade preparation shall be measured by the square foot and includes all fine grading, scarification, moisture conditioning and recompaction. Payment shall be included in the Contract Unit Price per square foot completed for "Subgrade Preparation" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to prepare the subgrade as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.02 NEW FOUNDATION LAYER MATERIAL

A. New foundation layer material comprised of interim cover soil removed from the designated refuse excavation areas shall be measured by the in-place cubic yard installed and includes all excavation, transport, placement, moisture conditioning and compaction. The quantity for "Fill (Refuse Excavation Interim Cover Soils)" shall be a final pay quantity as described in Section 9-1.015 of the Standard Specifications and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install new foundation layer material derived from the designated refuse excavation areas as shown on the

Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

B. New foundation layer material from all other sources shall be measured by the in-place cubic yard installed and includes all excavation, transport, placement, moisture conditioning and compaction. The quantity for "Fill (Foundation Layer and Engineered Fill)" shall be a final pay quantity as described in Section 9-1.015 of the Standard Specifications and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install new foundation layer material as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

END OF SECTION

SECTION 02310
ACCESS ROADS

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall construct all access roads, including grading and subgrade preparation, in accordance with this Section and at the locations and to the dimensions shown on the Plans. The Contractor shall furnish all labor, supervision, tools, materials, equipment, transportation, and incidentals as necessary to prepare and construct the access roads.

1.02 REFERENCES

A. *Caltrans Standard Specifications.* California Department of Transportation, 2010.

B. *Caltrans Standard Plans*. California Department of Transportation, 2010.

C. *American Society for Testing and Materials.* Current Edition.

1.03 APPLICABLE STANDARDS AND SPECIFICATIONS

A. ASTM D 1557 Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Modified Effort (56,000 ft-lbf/ft^3 [2,700 kN-m/m^3]).

1.04 QUALITY ASSURANCE

A. Testing and Observation
   1. Testing and observation of the access roads shall be conducted in accordance with the CQA Plan.
   2. The Contractor shall cooperate with the CQA Monitor during observation, testing, and collection of samples.
   3. If any portion(s) of the access road construction is determined by the Design Engineer to not meet the requirements of this Section, based on either testing or observations, the Contractor, at his expense, shall rework or remove and replace that portion(s) to meet the requirements of this Section as directed by the Design Engineer.
   4. Where work is interrupted by rain, operations subject to the moisture and density requirements shall not be resumed until observations and field tests by the CQA Monitor indicate that the moisture content and density of the in-place fill are within the limits specified. This requirement will not preclude the Contractor from discing or aerating the subject materials to achieve acceptable conditions.

PART 2 PRODUCTS

2.01 REINFORCEMENT GEOTEXTILE

A. Reinforcement geotextile for the access road construction shall conform to the requirements of Section 02771 (Reinforcement Geotextile) of these Technical Specifications.

2.02 AGGREGATE BASE

A. Aggregate base for the access road construction shall conform to the requirements of Section 02207 (Aggregate Materials) of these Technical Specifications.

2.03 ENGINEERED FILL

A. Engineered fill for the access road construction shall conform to the requirements of Section 02224 (Engineered Fill) of these Technical Specifications.

PART 3 EXECUTION

3.01 GENERAL

A. The Contractor shall provide all construction, grading control, and other staking necessary to construct the access roads to the lines, grades, and dimensions shown on the Plans.

3.02 SUBGRADE

A. Where access roads are not constructed on engineered fill, the subgrade for the access roads shall be scarified a minimum of 6 inches, uniformly moisture conditioned to within 1 to 3 percentage point of optimum moisture content and compacted to at least 90 percent of the maximum dry density as determined by ASTM D1557.

B. Where access roads are constructed on engineered fill, the engineered fill shall be placed and compacted in accordance with the requirements of Section 02224 (Engineered Fill) of these Technical Specifications.

C. Where access roads are constructed on the installed engineered turf, the following precautions and requirements shall be implemented:
   1. Vehicle and equipment access on the installed engineered turf during the access road construction shall conform with applicable provisions outlined in Section 02772 (Geomembrane) of these Technical Specifications. This requirement no longer applies once a minimum of 12 inches of material has been placed atop the engineered turf.
   2. The initial lift of engineered fill placed atop the installed engineered turf shall be well graded and shall not contain rock or clods over 1 inch in greatest dimension.
   3. Damage to the underlying engineered turf resulting from the access road construction operations shall be repaired at the Contractor's expense and in accordance with applicable repair procedures outlined in Section 02772 (Geomembrane) of these Technical Specifications.

3.03 REINFORCEMENT GEOTEXTILE

A. Prior to placing geotextile on the subgrade for access roads, the stability of the subgrade shall be checked in the presence of the CQA Officer by proof rolling with a roller or loaded water truck. Areas which are not suitable shall be allowed to air dry until stable or shall be over-excavated and backfilled with aggregate base, at the Contractor's expense.

B. Reinforcement geotextile shall be installed over the access road subgrade and seamed as specified in Section 02771 (Reinforcement Geotextile) of these Technical Specifications, as shown on the Plans, and in accordance with the manufacturer's instructions.

C. Reinforcement geotextile panels shall be installed (unrolled) in the direction of traffic (longitudinally).

D. Reinforcement geotextile panels shall be overlapped a minimum of 2 feet on sides and ends.

E. Trucks and other construction equipment shall not drive on reinforcement geotextile prior to covering with the full thickness of aggregate base.

3.04 AGGREGATE BASE

A. Prior to placing aggregate base on subgrade for access roads, the stability of the subgrade shall be checked in the presence of the CQA Officer by proof rolling with a roller or loaded water truck. Areas which are not suitable shall be allowed to air dry until stable or shall be over-excavated and backfilled with aggregate base, at the Contractor's expense.

B. Trucks shall back-dump aggregate base onto the reinforcement geotextile, driving on previously dumped aggregate base to progress.

C. The aggregate base shall be spread in uniform loose lifts not exceeding 8 inches in thickness.

D. The aggregate base shall be moisture conditioned to within 1 to 3 percentages points of optimum moisture content, and compacted to a minimum of 95 percent of maximum dry density per ASTM D 1557.

E. Access roads shall be "proof rolled" in the presence of the Design Engineer or their representative with a heavy wheel-load vehicle, such as a loaded water truck, to identify weak areas. Weak areas shall be reworked to the Design Engineer's satisfaction without additional compensation.

PART 4 MEASUREMENT AND PAYMENT

4.01 ACCESS ROADS

A. Access roads constructed over engineered turf shall be measured by the square foot in place as determined by the actual length constructed by the actual width constructed and includes all engineered fill (supply and installation), subgrade preparation, reinforcement geotextile and aggregate base. Payment shall be included in the Contract Unit Price per square foot installed for "Access Roads over Engineered Turf" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the access roads as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

B. All other access roads shall be measured by the square foot in place as determined by the actual length constructed by the actual width constructed and includes all grading, subgrade preparation, reinforcement geotextile and aggregate base. Payment shall be included in the Contract Unit Price per square foot installed for "Access Roads" addressed in this Section and

shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the access roads as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

END OF SECTION

SECTION 02722
DRAINAGE AND EROSION CONTROLS

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall furnish and install (including necessary excavations) all drain inlets, drain pipes, sedimentation basin outlet structures, side slope drainage channels (grading only), earthen and lined swales, rock riprap swales, rock riprap outfalls and inlets, and erosion control materials in accordance with this Section and at the locations and to the dimensions and grades shown on the Plans. The Contractor shall furnish all labor, supervision, tools, materials, equipment, transportation, and incidentals as necessary to prepare and construct the various drainage and erosion control features.

1.02 REFERENCES

A. *Caltrans Standard Specifications.* California Department of Transportation, 2010.

B. *Caltrans Standard Plan*. California Department of Transportation, 2010.

C. *American Society for Testing and Materials.* Current Edition.

1.03 APPLICABLE STANDARDS AND SPECIFICATIONS

A. ASTM D 1557 Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Modified Effort (56,000 ft-lbf/ft3 [2,700 kN-m/m3]).

1.04 SUBMITTALS

A. At least 14 calendar days prior to beginning any drainage or erosion control construction in accordance with the requirements of this Section, the Contractor shall provide three (3) copies to the Design Engineer of the name and location of material sources, laboratory test results and/or material data sheets conforming with relevant details shown on the Plans.

B. The Contractor shall provide the name and location of source, laboratory test results, and product data sheets (mix design) for the concrete to be used showing that the material meets or exceeds the product requirements. If more than one (1) concrete mix is to be used, mix designs for each area shall be submitted and clearly marked as to the area of Work that the mix is intended for.

C. At least 14 calendar days prior to delivery of materials to the Work site, the Contractor shall submit the following to the Design Engineer for approval:
   1. Samples, manufacturer's product data sheets, and manufacture's installation guidelines for the following materials to verify that the materials meet or exceed the corresponding product requirements:
      a. CMP, HDPE, fittings, anchor assembly stakes and hardware.
      b. Turf reinforcement mat (TRM) and anchorage stakes.

c. Erosion control netting and anchorage staples.

1.05 QUALITY ASSURANCE

A. Testing and Observation
1. Testing and observation of the drainage and erosion control structures shall be conducted in accordance with the CQA Plan.
2. The Contractor shall cooperate with the CQA Monitor during observation, testing, and collection of samples.
3. If any portion(s) of the drainage and erosion control structures is determined by the CQA Monitor to not meet the requirements of this Section, based on either testing or observations, the Contractor shall, at his expense, rework or remove and replace that portion(s) to meet the requirements of this Section as directed by the Design Engineer.

B. Surveying
1. The Contractor shall provide all construction staking, grading control, and other staking necessary to construct the drainage components to the lines, grades, and dimensions shown on the Plans. The Design Engineer will provide data on existing control points in the vicinity of the Work site for use by the Contractor's Land Surveyor or eligible Engineer.
2. All lines, grades and dimensions of installed drainage components may be verified by the Design Engineer or CQA Monitor by field survey.
3. If it is demonstrated by the CQA verification surveying that any portion(s) of the drainage components does not meet the required lines, grades, or dimensions shown on the Plans, the Contractor, at his expense, shall rework or replace that portion(s) to bring the deficient area(s) to grade or the proper dimension in accordance with all requirements of this Section. A deduction will be made from the Contractor's compensation (based on standard wage rates) to retest the materials and re-verify the grade or the proper dimension by survey.

PART 2 PRODUCTS

2.01 DRAIN INLETS

A. Drain inlets shall be as shown on the Plans. Drain inlets shall be manufactured of cast in place concrete or prefabricated reinforced concrete or approved steel equivalent to the dimensions set forth in the Plans.

B. Concrete for the drain inlets shall conform to the requirements of Section 03300 (Concrete) of these Technical Specifications.

2.02 PIPE AND FITTINGS

A. The CMP for the drain pipe shall be of 16 gauge continuous helical lock corrugated steel pipe conforming to the requirements of Section 66 "Corrugated Metal Pipe" of the Standard Specifications. All CMP and standard assembly fittings required for complete assembly shall be galvanized conforming to the requirements of Section 66-1.02 E(1) of the Standard Specifications for zinc coated steel.

B. HDPE pipe shall be Type S corrugated polyethylene pipe with smooth interior and shall conform to the requirements in AASHTO Designation M294. The pipe shall be manufactured from high-density polyethylene virgin compounds.

C. Pipe (including all couplings and fabricated fittings) shall be supplied from the source approved by the Design Engineer based on the submittal requirements in Part 1.04 of this Section.

D. Anchor assembly stakes and hardware for above ground CMP shall conform to Section 75-1.02 of the Standard Specifications. All hardware shall be galvanized after fabrication. All pipe stakes shall be either galvanized after fabrication, or be fabricated from pre-galvanized pipe. If pre-galvanized pipe is used, weld areas shall be cleaned and painted with zinc-rich primer.

2.03 PIPE BEDDING

A. Pipe bedding shall conform to the requirements of Section 02207 (Aggregate Base) of these Technical Specifications.

2.04 BACKFILL

A. Backfill above the pipe bedding shall consist of material excavated from the trench/excavation unless specified otherwise by the Design Engineer.

2.05 EROSION MATTING

A. Erosion matting as shown on the Plans for erosion mat lined swales shall be lined with TRM and shall be made of thermally-welded PVC monofilaments in a two-dimensional web as manufactured by Greenstreak and distributed as "PEC-MAT," or approved equivalent.

B. Anchorage for the TRM shall be wooden survey stakes, 1 inch by 4 inches in dimension, and approximately 10 to 12 inches in length.

2.06 FILTER GEOTEXTILE

A. Filter geotextile shall conform to the requirements of Section 02771 (Geotextile) of these Technical Specifications.

2.07 ROCK RIPRAP

A. Loose and grouted rock riprap for the swales and outfalls shall conform to the requirements of Section 02207 (Aggregate Materials) of these Technical Specifications.

2.08 CONCRETE

A. Concrete for the drain inlets, sedimentation basin outlet structure foundations, and grouted riprap outfalls shall conform to the requirements of Section 03300 (Concrete) of these Technical Specifications.

2.09 EROSION CONTROL

A. Straw for erosion control shall be certified weed free.

B. Erosion control netting shall be lightweight polypropylene having an approximate 0.50-inch x 0.50-inch mesh.

C. U-staples to anchor the netting shall be 0.50-inch by 10-inch U-staples as recommended by the netting manufacturer or as approved by the Design Engineer.

2.09 WOOD POSTS AND RAILING

A. The wood used for the posts and railing at the drainage inlets shall be construction common or better grade redwood. The wood shall be painted with two coats of premium quality exterior grade flat white latex paint approved by the Engineer. Nails used to fasten the rails to the posts shall be galvanized box gauge.

2.10 STEEL GRATE

A. The steel grate on the drainage inlet shall be made of #6 reinforcing bars at a 12 inch spacing. The bars shall be shop welded to form the grate per Plans. The ends of the bars in the upper mat shall be bent downward ¾ inch so that they will rest flat on the bottom of the notch at the top of the drainage inlet. The steel in the reinforcing bars may be Grade 40 or 60.

PART 3 EXECUTION

3.01 GENERAL

A. The Contractor shall provide all construction, grading control, and other staking necessary to construct drainage and erosion control structures to the lines and grades shown on the Plans.

3.02 STOCKPILING

A. The Contractor shall stockpile drainage and erosion control materials in an area(s) approved by the Design Engineer.

3.03 EXCAVATION

A. Excavation for drainage and erosion control structures shall be in conformance with the requirements specified in Section 02222 (Excavation) of these Technical Specifications.

3.04 DRAIN INLETS AND DRAIN PIPE

A. Trenching for drain inlets and buried drain pipe shall be in conformance with the requirements specified in Section 02225 (Trenching and Backfilling) of these Technical Specifications.

B. Placement of drain inlets/buried drain pipe and associated bedding and backfill material shall be in conformance with Section 66-1 of the Standard Specifications and Section 02225 (Trenching and Backfilling) of these Technical Specifications.

C. Above ground drain pipe shall be placed and anchored in conformance with Section 66 of the Standard Specifications and as shown on the Plans.

3.05 SEDIMENTATION BASIN OUTLET STRUCTURES

A. Vertical slots shall be cut in the sedimentation basin drainage risers to the dimensions, orientation and frequency as shown on the Plans.

B. Trenching for the drainage riser foundations shall be in conformance with the requirements specified in Section 02225 (Trenching and Backfilling) of these Technical Specifications.

C. Minor concrete for the drainage riser foundations shall be installed as shown on the Plans and placed in conformance with Section 03300 (Concrete) of these Technical Specifications.

D. Placement of backfill material shall be in conformance with Section 66-1 of the Standard Specifications and Section 02225 (Trenching and Backfilling) of these Technical Specifications.

3.06 EARTHEN SWALES

A. Earthen swales shall be excavated to the lines and grades as shown on the Plans and in accordance with Section 02222 (Excavation) of these Technical Specifications.

3.07 EROSION MAT LINED SWALES

A. The TRM shall be installed as shown on the Plans and per manufacturer's recommendations.

B. Trenches for terminal and check slots (anchorage) shall be excavated into the erosion-resistant layer as shown on the Plans. Backfill of trenches shall be compacted to 90 percent of maximum dry density as determined by ASTM D 1557.

C. TRM placed at the top of swale (finish surface) shall be at or below the final grade so surface drainage can flow freely into the swale.

D. TRM shall first be installed in the upstream terminal end slow and rolled downstream with care taken to assure that the TRM conforms to the flow surface of the channel and is not in tension.

E. All splices shall be shingled downstream.

F. Anchorage stakes shall be installed as shown on the Plans and per manufacturer's recommendations.

3.08 LOOSE ROCK RIPRAP LINED SWALES

A. The earthen portion of the swale shall be excavated to the lines and grades as shown on the Plans and in accordance with Section 02222 (Excavation) of these Technical Specifications.

B. Filter geotextile shall be installed to the dimensions as shown on the Plans and in accordance with Section 02771 (Geotextile) of these Technical Specifications.

C. Rock riprap shall be placed on the earthen and ClosureTurf™ swales (where applicable) to the dimensions as shown on the Plans. Rock riprap shall be placed to the average thickness shown on the Plans with a maximum thickness deviation of 4 inches at any location.

D. Rock riprap shall not be placed by dumping.

E. The Contractor shall move and place individual riprap stones as necessary to obtain a stable three-point bearing for each stone and a well-graded distribution along the entire length of the swale. The placed rock riprap shall be free of pockets of small stones or clusters of larger stones.

3.09 GROUTED ROCK RIPRAP OUTFALLS

A. The footprint of the outfall shall be excavated to the dimensions as shown on the Plans and in accordance with Section 02222 (Excavation) of these Technical Specifications.

B. Rock riprap shall be placed within the excavated footprint to the average thickness shown on the Plans with a maximum thickness deviation of 4 inches at any location.

C. Rock riprap shall not be placed by dumping.

D. The Contractor shall move and place individual riprap stones as necessary to obtain a stable three-point bearing for each stone and a well-graded distribution over the entire footprint of the outfall. The placed rock riprap shall be free of pockets of small stones or clusters of larger stones.

E. Placement of concrete for the grouted rock riprap shall be in conformance with Section 03300 (Concrete) of these Technical Specifications.

3.10 LOOSE ROCK RIPRAP INLETS AND OUTLETS

A. The earthen portion of the inlets and outlets shall be excavated to the lines and grades as shown on the Plans and in accordance with Section 02222 (Excavation) of these Technical Specifications.

B. Filter geotextile shall be installed to the dimensions as shown on the Plans and in accordance with Section 02771 (Geotextile) of these Technical Specifications.

C. Rock riprap shall be placed on the installed filter geotextile to the dimensions as shown on the Plans. Rock riprap shall be placed to the average thickness shown on the Plans with a maximum thickness deviation of 4 inches at any location.

D. Rock riprap shall not be placed by dumping.

E. The Contractor shall move and place individual riprap stones as necessary to obtain a stable three-point bearing for each stone and a well-graded distribution along the entire

area of protection. The placed rock riprap shall be free of pockets of small stones or clusters of larger stones.

3.11 EROSION CONTROL

A. Following the application of seed and fertilizer, straw shall be blown onto landfill and borrow area surface slopes that are steeper than 10 percent. Blown straw shall be applied to achieve a minimum thickness of 1.5 inches in place.

B. Following application of the straw, cover the straw with erosion control netting. Space netting anchors at a frequency of 1 foot on center along the edges, and one (1) every 35 square feet for interior areas. Space the butt joints 1 foot apart.

PART 4 MEASUREMENT AND PAYMENT

4.01 DRAIN INLETS AND DRAIN PIPE

A. Drain inlets shall be measured by each drain inlet installed and include all trenching, CMP, backfill, concrete, metal cover, and bars at the opening. Payment shall be included in the Contract Unit Price per each unit installed for "Concrete Drain Inlets (4'x4')" and "30" CMP Drain Inlets" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the respective drain inlets as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

B. Above ground drain pipe shall be measured by the linear foot in place and include all pipe, couplings, and anchor assemblies. Payment shall be included in the Contract Unit Price per linear foot installed for the various sizes and types of "CMP Drain Pipe (Above Ground)" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the above ground drain pipe as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

C. Buried drain pipe shall be measured by the linear foot in place and include all trenching, pipe bedding, pipe and couplings, backfill, and compaction. Payment shall be included in the Contract Unit Price per linear foot installed for the various sizes and types of "CMP Drain Pipe (Buried)" and "HDPE Drain Pipe (Buried)" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the respective buried drain pipe as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.02 SEDIMENTATION BASIN OUTLET STRUCTURES

A. Sedimentation basin outlet structures shall be measured on each outlet structure at each sedimentation basin for the complete installation of the outlet structure including all trenching, excavation, backfill, CMP, HDPE pipe, HDPE riser, pipe bedding, concrete, concrete riprap outfall, and other incidentals shown on the Plans. Payment shall be included in the Contract Unit Price for "Sedimentation Basin Outlet Structures" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the sedimentation basin outlet

labor, equipment, tools, and incidentals required to install the sedimentation basin outlet structures as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore. All payment items under this section shall be excluded from other payment in other sections.

4.03 SIDE SLOPE DRAINAGE CHANNEL GRADING

A. Side slope drainage channel grading shall be measured by the linear foot in place and include all excavation and grading. Installation of the ClosureTurf™ portion is covered separately under payment for the geomembrane and engineered turf pay items. Payment shall be included in the Contract Unit Price per linear foot constructed for "Side Slope Drainage Channel Grading" addressed in this Section and shall include full compensation for providing all labor, equipment, tools, and incidentals required to construct the side slope drainage channels as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.04 SWALES

A. Earthen swales (Type I) shall be measured by the linear foot in place and include all excavation and grading. Payment shall be included in the Contract Unit Price per linear foot installed for "Type I Swales" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the Type I swales as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

B. Earthen swales with TRM (Types II and IV) shall be measured by the linear foot in place and include all excavation, grading and TRM materials. Payment shall be included in the Contract Unit Prices per linear foot installed for "Type II Swales" and "Type IV Swales" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the Type II and Type IV swales as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

C. Earthen swales with loose rock riprap (Type III) shall be measured by the linear foot in place and include all excavation, grading, filter geotextile and riprap. Payment shall be included in the Contract Unit Price per linear foot installed for "Type III Swales" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the Type III swales as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

D. Loose rock riprap swales over ClosureTurf™ (Type V) shall be measured by the linear foot in place and include all excavation, grading and riprap. Installation of the ClosureTurf™ portion is covered separately under payment for the geomembrane and engineered turf pay items. Payment shall be included in the Contract Unit Price per linear foot installed for "Type V Swales" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the Type V swales as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.05 GROUTED ROCK RIPRAP OUTFALLS

A. Grouted rock riprap outfalls shall be measured by each grouted rock riprap outfall installed and include all excavation, rock riprap and concrete. Payment shall be included in the Contract Unit Price per each unit installed for "Grouted Rock Riprap Outfalls" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the grouted rock riprap outfalls as shown on the Plans, as specified herein, and as directed by the Design Engineer. The Contractor shall make provisions for additional material needed to account for excessive voids between rocks, as no additional compensation will be allowed therefore.

4.06 LOOSE ROCK RIPRAP INLETS AND OUTLETS

A. Rock riprap inlets and outlets shall be measured by each rock riprap inlet and outlet installed and include all excavation, filter geotextile and rock riprap. Payment shall be included in the Contract Unit Price per each unit installed for "Loose Rock Riprap Inlets and Outlets" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the rock riprap protection as shown on the Plans, as specified herein, and as directed by the Design Engineer. The Contractor shall make provisions for additional material needed to account for excessive voids between rocks, as no additional compensation will be allowed therefore.

4.07 EROSION CONTROL

A. Erosion control straw/netting shall be measured by the square foot in place and includes all straw, netting and anchorage. Payment shall be included in the Contract Unit Price per square foot installed for "Erosion Control" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the erosion control materials as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

END OF SECTION

SECTION 02771
GEOTEXTILE

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall furnish, transport to the Work site, and install all filter and reinforcement geotextiles in accordance with this Section and at the locations and to the dimensions shown on the Plans. The Contractor shall furnish all labor, supervision, tools, materials (including sewing thread), equipment, transportation, and incidentals as necessary to install the filter and reinforcement geotextiles, including that needed for testing and joining materials in field (sewing, heat bonding, etc.).

1.02 REFERENCES

A. *Caltrans Standard Specifications.* California Department of Transportation, 2010.

B. *Caltrans Standard Plans*. California Department of Transportation, 2010.

C. *American Society for Testing and Materials.* Current Edition.

1.03 APPLICABLE STANDARDS AND SPECIFICATIONS

A.	ASTM D 4355	Standard Test Method for Deterioration of Geotextiles by Exposure to Light, Moisture and Heat in a Xenon Arc Type Apparatus.
B.	ASTM D 4491	Standard Test Methods for Water Permeability of Geotextiles by Permittivity.
C.	ASTM D 4533	Standard Test Method for Trapezoid Tearing Strength of Geotextiles.
D.	ASTM D 4632	Standard Test Method for Breaking Load and Elongation of Geotextiles (Grab Method).
E.	ASTM D 4751	Standard Test Method for Determining the Apparent Opening Size of a Geotextile.
F.	ASTM D 5261	Standard Test Method for Measuring Mass per Unit Area of Geotextiles.
G.	ASTM D 6241	Standard Test Method for Static Puncture Strength Resistance of Geotextiles and Geotextile-Related Products Using a 50-mm Probe.

1.04 SUBMITTALS

A. At least 14 calendar days prior to delivery of filter and reinforcement geotextile rolls to the Work site, the Contractor shall submit three (3) copies of the following to the Design Engineer for approval:

1. Samples, product data sheets, and complete description of filter and reinforcement geotextiles that meet or exceed the product requirements of this Section.
2. Manufacturer's Quality Control (MQC) testing reports for filter and reinforcement geotextiles to be delivered to the Work site. At a minimum, results of those tests specified in Part 2 of this Section must be included in the MQC testing reports.
3. Manufacturer's recommended procedures for transporting, unloading, storage, handling, installation, repair, and seaming (sewing, heat bonding, and lapping) of filter and reinforcement geotextiles.
4. Samples, product data sheets, and complete description of sewing thread recommended by the Manufacturer to sew the filter and reinforcement geotextile.

1.05 TRANSPORT AND STORAGE

A. The filter and reinforcement geotextile rolls shall be transported to the Work site by the Contractor with opaque protective coverings in a closed trailer.

B. At least seven (7) calendar days prior to any Work site delivery, the Contractor shall notify the Design Engineer of the date, time, material type, material quantity, and number of trucks for delivery. A copy of the packing list showing lot and roll numbers for each shipment shall also be provided to the Design Engineer prior to site delivery.

C. Unloading and storage (stacking) of the filter and reinforcement geotextile rolls at the Work site shall be the responsibility of the Contractor; who shall observe and certify, in writing, that the unloading and storage of filter and reinforcement geotextile rolls was performed in accordance with the submitted Manufacturer's recommended procedures.

D. The Contractor shall transport filter and reinforcement geotextile rolls from the storage area in a manner that does not damage the reinforcement geotextiles, and in accordance with the Manufacturer's recommended procedures.

1.06 QUALITY ASSURANCE

A. Testing and Observation
1. Testing and observation of the filter and reinforcement geotextile shall be conducted in accordance with the CQA Plan.
2. The Contractor shall cooperate with the CQA Monitor during observation, testing, and collection of samples.
3. If any portion(s) of the filter and reinforcement geotextile installation is determined by the Design Engineer to not meet the requirements of this Section, based on either testing or observations, the Contractor, at his expense, shall remove and replace that portion(s) to meet the requirements of this Section as directed by the Design Engineer.

PART 2 PRODUCTS

2.01 FILTER GEOTEXTILE

A. The geotextile filter shall be manufactured of non-woven, continuous or staple filament, needle-punched, polypropylene or polyester, ultra-violet (UV)-stabilized yarn orientated into a stable network that maintains its structure during handling, placement, and long-term service.

B. The geotextile filter shall be chemical resistant and cannot be heat burnished or contain recycled materials.

C. The geotextile filter shall have the following minimum average roll values:

1.	Mass per Unit Weight (ASTM D 5261)	3.8 oz./square yard
2.	Grab Tensile Strength (ASTM D 4632)	110 lbs.
3.	Trapezoidal Tear Strength (ASTM D 4533)	50 lbs.
4.	Puncture (ASTM D 6241)	310 lbs.
5.	Permittivity (ASTM D 4491)	1.7 sec^{-1}
6.	Apparent Opening Size (ASTM D 4751)	<No. 70 U.S. Std. Sieve
7.	UV Resistance (ASTM D 4355)	Retain 70% strength @ 500 hrs.

D. A geotextile product which can be used and meets these specifications is TenCate Mirifi 140N.

2.02 REINFORCEMENT GEOTEXTILE

A. Reinforcement geotextile shall be constructed of polypropylene materials and shall be resistant to damage under normal construction activities, and to biological and chemical degradation.

B. Reinforcement geotextile shall be a woven geotextile manufactured for the purposes of separation, confinement, and roadway subgrade reinforcement.

C. Physical properties of the reinforcement geotextile shall be tested at a minimum testing frequency of once per every 100,000 square feet of reinforcement geotextile manufactured and the physical properties shall be as follows:

Test Method	Property	Required Value/MARV
ASTM D 4632	Grab Tensile	
	-Machine Direction	315 lb.
	-Cross Direction	315 lb.
ASTM D 4632	Grab Elongation	
	-Machine Direction	12%
	-Cross Direction	12%
ASTM D 4833	Puncture	120 lb.
ASTM D 4533	Trapezoid Tear Strength	
	-Machine Direction	113 lb.
	-Cross Direction	113 lb.

D. Geotextile products which can be used and meet these specifications are TC Mirafi 600X, Synthetic Industries Geotex 315ST, or equivalent.

2.02 SEWING THREAD

A. The thread used for sewing of filter and reinforcement geotextiles shall be polymeric and have strength properties equal to or greater than the filter and reinforcement geotextiles.

B. The thread used for sewing of filter and reinforcement geotextiles shall be chemical resistant.

C. The thread used for sewing the filter and reinforcement geotextiles shall be equivalent to that recommended by the filter and reinforcement geotextile Manufacturer(s) submitted in accordance with Part 1.04A of this Section.

PART 3 EXECUTION

3.01 PREPARATION AND EXAMINATION

A. The Contractor shall verify that the material and surface upon which the filter and reinforcement geotextiles are to be placed are complete and in accordance with the Technical Specifications for that material or surface prior to filter and reinforcement geotextile installation.

3.02 INSTALLATION

A. Filter and reinforcement geotextiles shall be installed in accordance with Manufacturer's instructions.

B. Filter and reinforcement geotextiles shall be installed with sufficient tension to prevent excessive overlapping, insufficient overlapping, wrinkles, and folds.

C. Filter and reinforcement geotextile panels shall be overlapped with sufficient material to create a prayer fold for sewing operations.

D. Filter and reinforcement geotextiles shall be ballasted during installation and until they are covered with the overlying material.

E. Temporary anchorage for the filter and reinforcement geotextiles during placement shall be the responsibility of the Contractor.

F. Terminal ends of reinforcement geotextile, where the type and purpose of the reinforcement geotextile changes as shown on the Plans, shall be overlapped a minimum of 4 feet.

G. Portions of the filter and reinforcement geotextiles wasted by the Installer, and rendered unusable, as determined by the CQA Monitor, shall be transported by the Contractor off-site to a permitted transfer station or solid waste disposal facility for disposal at the Contractor's expense.

3.03 SEAMING

A. All seams for filter and reinforcement geotextiles shall be made by sewing; alternate seaming methods may be allowed if it is demonstrated by the Contractor that the method will create a seam that is acceptable for the intended purpose and will not reduce the properties of the filter and reinforcement geotextiles below those specified in Part 2 of this Section or cause damage to any underlying geosynthetic materials.

B. Soil materials which could adversely affect sewing operations shall be cleaned from the filter and reinforcement geotextiles prior to sewing.

C. A prayer fold shall be created within the overlap prior to sewing.

D. The prayer fold shall be sewn with a 401 two-thread chain stitch.

PART 4 MEASUREMENT AND PAYMENT

4.01 FILTER GEOTEXTILE

A. Measurement and payment for filter geotextile shall be included in the Contract Unit Prices for "Type III Swales", "Type V Swales" and "Rock Riprap Inlet Protection" addressed in Section 02722 (Drainage and Erosion Controls) of these Technical Specifications.

4.02 REINFORCEMENT GEOTEXTILE

A. Measurement and payment for reinforcement geotextile shall be included in the Contract Unit Price for "Access Roads" addressed in Section 02310 (Access Roads) of these Technical Specifications.

END OF SECTION

SECTION 02772
GEOMEMBRANE

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall furnish and transport to the site all geomembrane as shown on the Plans and a sufficient amount of extrudate rod to complete the extrusion welding necessary for testing and repairing the geomembrane.

B. The Contractor shall furnish all labor, tools, supervision, transportation, and equipment necessary for the installation of the geomembrane, including that needed for testing and welding materials in the field.

1.02 REFERENCES

A. ASTM D 638 Standard Test Method for Tensile Properties of Plastics.

B. ASTM D 746 Standard Test Method for Brittleness Temperature of Plastics and Elastomers by Impact.

Q. FTMS 101C Puncture Resistance.

1.03 QUALIFICATIONS (Not Used - See Section 01010-1.03B)

1.04 SUBMITTALS

A. At least 14 days prior to delivery of geomembrane rolls to the site, the Contractor shall submit the following, in triplicate, to the Engineer for approval:
1. A Certificate of Compliance stating that all resin used for the product to be supplied is from a single source in the United States or Canada, of the same general type, and meets the requirements of Part 2.01 of this Section.
2. Manufacturer's Quality Control (MQC) test results for the geomembrane base resin.
3. Samples, product data sheets, and a complete description of the geomembrane to be supplied that meets or exceeds the product requirements of Part 2.02 of this Section.
4. A 2-foot by 2-foot (minimum size) sample from the same geomembrane specimen tested in accordance with Part 2.02G of this Section and possessing a degree of texturization representative of the material that will be shipped to the site.
5. MQC test results for the geomembrane rolls to be delivered to the site. At a minimum, the results of the tests specified in Part 2.02 of this Section must be included in the MQC testing reports.
6. Manufacturer's recommended procedures for transporting, unloading, storage, handling, installation, repair, seaming (extrusion and fusion welding), and seam testing of geomembrane.
7. A Certificate of Compliance stating that the extrudate rod material meets the product requirements of Part 2.03 of this Section.

B. At least 14 days prior to beginning installation of geomembrane, the Contractor shall submit the following, in triplicate, to the Engineer for approval:
1. Installer's Geomembrane Installation Quality Control Plan, which includes testing procedures and frequencies.
2. Shop Drawings showing the proposed geomembrane panel layout and details of field fabrications including skirt and sleeve pipe boots.
3. Installer's Qualifications including the following:
   a. Resume of Installer's foreman.
   b. Resume of Installer's master welder.
   c. Resumes of Installer's welding and quality control personnel.

C. Upon completion of the geomembrane installation, the Contractor shall submit the following, in triplicate, to the Engineer.
1. Installer's warranty in compliance with Part 1.07B of this Section.

2. As-built geomembrane panel layout drawings showing all panels, testing, sampling, and repair locations.

1.05 TRANSPORT AND STORAGE

A. At least seven days prior to any site delivery, the Contractor shall notify the Engineer of the date, time, material type, material quantity, and number of trucks for delivery. A copy of the packing list showing lot and roll numbers for each shipment shall also be provided to the Engineer prior to site delivery.

B. Unloading and storage (stacking) of the geomembrane rolls at the site is the responsibility of the Contractor; however, unloading and storage of geomembrane rolls shall be performed in accordance with the submitted Manufacturer's recommended procedures.

C. The Contractor shall transport geomembrane rolls from the storage area in a manner that does not damage the geomembrane, and in accordance with the Manufacturer's recommended procedures.

D. The storage area for the geomembrane rolls will be located by the Contractor and must be approved by the Engineer.

1.06 QUALITY ASSURANCE TESTING

A. The CQA Monitor will take at least one sample for every 100,000 square feet of geomembrane delivered to the site and perform the following quality CQA conformance testing to verify that the product meets the requirements of Part 2.02 of this Section.
1. Tensile Properties (ASTM D 6693 / ASTM D 638).
2. Density (ASTM D 1505).
3. Carbon Black Content (ASTM D 4218).
4. Carbon Black Dispersion (ASTM D 5596).
5. Sheet Thickness (ASTM D 5994)

B. The CQA Monitor will take at least one sample per lot of geomembrane delivered to the site for CQA conformance testing to verify compliance with the interface shear strength requirements of Part 2.02F of this Section.

C. Geomembrane shipped to the site that does not contain a degree of texturization comparable to the approved texture sample submitted in accordance with Part 1.04A of this Section will be rejected by the Engineer.

D. Sampling for CQA conformance testing may be performed by the CQA Monitor at the manufacturing plant prior to shipping.

E. The CQA Monitor will collect samples and send them to the Geosynthetics Testing Laboratory for seam testing in accordance with Part 3.05E of this Section. Within 48 hours of sampling, the Engineer will accept or reject the seams based on the results of laboratory testing.

F. The Contractor shall assist with seam sampling by cutting samples and repairing sample locations at the direction of the CQA Monitor.

1.07 WARRANTIES

A. The Contractor shall provide a five-year prorata warranty for the geomembrane against deterioration due to exposure to the elements, either exposed or buried.

B. The Contractor shall provide a two-year non-prorata warranty for the geomembrane against installation defects.

PART 2 PRODUCTS

2.01 RESIN

A. The resin used for manufacturing the geomembrane shall be new virgin material, first quality, compounded Linear Low-density Polyethylene (LLDPE), and manufactured specifically for producing geomembrane.

B. Preferred, but not required to have a 4- to 6-inch wide smooth edge to promote welding.

C. No mixing of different resin types shall occur during geomembrane manufacturing.

D. No second run or recycled materials shall be used during geomembrane manufacturing.

E. The resin used for manufacturing the geomembrane shall have a Specific Gravity (ASTM D 792) of minimum 0.940 g/cm^3 after addition of carbon black and other additives.

F. The resin used for manufacturing the geomembrane shall not contain more than 1 percent (by weight) additives other than carbon black.

G. The resin used for manufacturing the geomembrane shall not contain more than 3.5 percent (by weight) total additives.

2.02 GEOMEMBRANE

A. All geomembrane shall be manufactured by the same Manufacturer in the United States or Canada.

B. Geomembrane shall have a structured studded drainage surface on the top side and a spiked friction surface on the bottom side using a method which fully integrates the texture asperities with the sheet, such as Super Gripnet®, or equivalent; no spray-on texturing shall be allowed.

C. Additives for UV protection, thermal stability, or processing agents must not “bloom” to the surface of the geomembrane over time or inhibit welding.

D. Finished geomembrane rolls shall be free from blemishes, holes, pin holes, bubbles, blisters, excessive gels, undispersed resins, undispersed carbon black, contamination by foreign materials, nicks, and cuts.

E. Geomembrane shall meet the following minimum average roll values for the following properties.

TEST	MINIMUM AVERAGE ROLL VALUE[1]	MQC[3] TEST FREQUENCY
Sheet Thickness (ASTM D 5994)	50-mil ±10 % [2]	10 per roll
Density (ASTM D 792, Method B)	0.993 g/cm^3	1 per rail car
Tensile Strength @ Break (ASTM D 6693)	105 ppi	1 per 100,000 ft^2
Elongation @ Break (ASTM D 638)	300 %	1 per 100,000 ft^2
Tear Resistance (ASTM D 1004)	30 lb	1 per 100,000 ft^2
Puncture Resistance (ASTM D 4833)	55 lb	1 per 100,000 ft^2
Carbon Black Content (ASTM D 4218)	2.0 to 3.0 %	1 per 100,000 ft^2
Carbon Black Dispersion (ASTM D 5596)	All Category 1 or 2	1 per 100,000 ft^2
Oxidation Induction Time (ASTM D 3895)	140 minutes minimum @ 200°C	1 per 100,000 ft^2
Low Temperature Brittleness (ASTM D 746)	< -40°F	Certification
Dimensional Stability (ASTM D 1204)	2 % maximum change	Certification
Drainage Stud Height (ASTM D 7466)	130-mil	1 per 100,000 ft2
Friction Spike Height (ASTM D 7466)	175-mil	1 per 100,000 ft2

[1] The average of all measurements on any roll shall not be less than the MARV value.
[2] The minimum allowable thickness for any measurement shall not be less than 10% of the nominal specified thickness. The average of all measurements on any roll shall not be less than 48 mils.
[3] Manufacturing Quality Control.

F. The geomembrane shall have the following minimum seam strength and test failure criteria when welded in accordance with the submitted Manufacturer's recommended procedures:
   1. For peel test specimens:
      a. The failure mode shall be a film tear bond (FTB).
      b. There shall be no more than 10 percent peel penetration into the weld.
      c. The quantitative value for the peel strength shall be a minimum of 75 ppi.
   2. For shear test specimens:
      a. The failure mode shall be film tear bond (FTB).
      b. The specimen shall achieve a 2-inch elongation with the grips initially set one inch back from the edge of the weld.
      c. The quantitative value for bonded seam strength shall be a minimum of 120 ppi.

2.03 EXTRUDATE ROD

A. All extrudate rod shall be made from same resin as the geomembrane.

B. All additives shall be thoroughly dispersed throughout the rod.

C. Extrudate rod shall be free of contamination by moisture or foreign materials.

2.04 FIELD FABRICATIONS

A. All geomembrane used for field fabrications shall be obtained from the approved geomembrane rolls to be used for the panel installation which meet the material property requirements of Part 2.02 of this Section.

B. The Installer shall fabricate and weld all skirt and sleeve pipe boots in the locations shown on the Plans, and as shown on the approved Shop Drawings.

2.05 GEOMEMBRANE SURFICIAL STRIPS

A. Geomembrane surficial strip material shall be Super Gripnet or single-sided geocomposite (200 mil).

2.06 CLOSURE TURF™ COLLECTION FOOT ASSEMBLIES

A. The ClosureTurf™ LFG collection foot is a component of the ClosureTurf™ to provide the interface between the surficial collection strips, the geomembrane, and the LFG collection well head. The collection foot components are to be provided by the manufacturer of the ClosureTurf™ product.

B. PVC assembly components (i.e., pipe, fittings, valves, sample test port, etc.) shall conform to the requirements of Section 15200 (LFG Collection System Components) of these Technical Specifications.

C. Wellhead adapter shall be 2-inch by 1.5-inch flexible coupling with stainless steel band clamps as manufactured by Fernco, or approved equivalent.

2.07 CLOSURE TURF™ PRESSURE RELIEF VALVES

A. The ClosureTurf™ pressure relief valves are a component of the ClosureTurf™ to provide necessary release of pressure in the event the LFG collection system malfunctions. These pressure relief valves are to be provided by the manufacturer of the ClosureTurf™ product.

2.08 FIELD TESTING EQUIPMENT

A. A field tensiometer shall be used by the Installer for seam strength testing and be calibrated and accurate to within 2 pounds.

B. A one-inch (width) by six-inch (length) cutting die shall be used for cutting seam strength test specimens from bulk seam samples.

PART 3 EXECUTION

3.01 PREPARATION AND EXAMINATION

A. The Installer shall verify that the subgrade surface upon which the geomembrane is to be placed is smooth, uniform, firm and unyielding, and free from rocks or other debris. No protrusions, ruts, or ridges greater in depth or height than 1.0 inch shall be allowed prior to geomembrane installation.

B. The Contractor and Installer shall complete and sign the Subgrade Acceptance Form provided by the CQA Monitor, verifying that the surface which the GCL will be installed upon is acceptable. The CQA Monitor and the Design Engineer will also verify that the surface which the GCL will be installed upon is acceptable. Once the Contractor has signed the Subgrade Acceptance Form, it is the Contractor's responsibility to maintain the surface in the condition required by Part 3.01A of this Section.

C. The Contractor is responsible for temporary anchorage during installation and until permanent ballast is fully installed.

D. Prior to and at the middle of each geomembrane welding work shift and whenever adjustments are made to the welding machines, the Installer shall prepare and test trial welds for each welding machine that are being used or will be used during that work shift. Trial welds shall be prepared for both fusion and extrusion welding machines. Trial weld samples for fusion welding machines shall be a minimum of 6-feet in length; trial weld samples for extrusion welding machines will be a minimum of 3-feet in length with the trial weld centered on and running the length of the sample. Trial welds shall be tested as follows.

1. Trial welds shall be allowed to cool to ambient conditions, prior to testing. After cooling, excessive material shall be cut from the beginning and the end of the trial weld sample (approximately 4-inches from each end). Using the cutting die, four 1-inch specimens shall be cut at an even spacing along the length of the trial weld.
2. Using the field tenisometer, two non-adjacent specimens shall be tested for peel adhesion (peel) and two for bonded seam strength (shear). Both sides of fusion welds shall be tested for peel. The rate of separation for both the peel and the shear tests shall be 2 inches per minute. The CQA Monitor will be present for, and observe, all trial weld tests.
3. All peel test specimens shall meet all of the following criteria:
    a. The failure mode shall be a film tear bond (FTB).
    b. There shall be no more than 10 percent peel penetration into the weld.
    c. The quantitative value for the peel strength shall be a minimum of 75 ppi.
4. All shear test specimens shall meet all of the following criteria:
    a. The failure mode shall be film tear bond (FTB).
    b. The specimen shall achieve a 2-inch elongation with the grips initially set one inch back from the edge of the weld.
    c. The quantitative value for bonded seam strength shall be a minimum of 120 ppi.
5. If any of the four test specimens do not meet the peel or shear criteria, the entire trial weld will be rejected and that machine shall not be used for installation of the geomembrane until passing a retest. Retesting shall consist of repeating the entire trial weld sampling and testing procedure on a new weld performed with the failing machine. If the retested trial weld fails, that welding machine shall not be used for installation of the geomembrane until proper adjustments or repairs and a passing trial weld test results. If the welding machine continually fails field testing, the machine shall be tagged and completely removed from work area.

3.02 INSTALLATION

A. Geomembrane panels shall be deployed parallel to the slope by unrolling down the entire length of the slope. Corrections or adjustments shall be made to panels which become askew to the parallel line of the slope. End-to-end panel butt seams shall occur on benches.

B. The textured geomembrane shall be placed in direct and uniform contact with underlying protective cover subgrade soil, with the spikes down and the stud side up. The geomembrane surface shall not be dragged over the underlying subgrade; a plastic slip sheet or other means shall be used to position the geomembrane without dragging it over the subgrade.

C. Adjacent geomembrane panel edges shall be overlapped a minimum of 4-inches for fusion welding. The alignment of the overlap shall be kept consistent by marking overlap indicator points.

D. Geomembrane damaged during handling, transport, or deployment shall be removed or repaired as directed by the Engineer.

E. Geomembrane installation and seaming methods shall not damage underlying subgrade or soil materials; any damage to underlying soil materials shall be repaired at the expense of the Contractor.

F. The Installer shall only deploy the quantity of geomembrane which can be completely welded and anchored by the end of the work shift or day.

G. The Contractor shall prepare an adequate number of sandbags to ballast the geomembrane during deployment. Geomembrane rolls may also be used for ballast provided that no damage to the deployed geomembrane occurs. Only plastic ties shall be used to close sandbags; no metal or wire ties shall be used. Sandbags shall be removed prior to deploying overlying materials and after completion of permanent closure turf ballast installation. Sandbags shall be disposed of as directed by the Engineer. Sandbag fill shall not be disposed of within the limits of work unless the fill consists of material which meets the Specification for the material it is disposed upon. Adequate sandbags and timely covering are required to prevent wind shifting of geomembrane. If shifting of geomembrane occurs, inspection of underlying subgrade will be required to ensure the subgrade has not been compromised. Repairs or replacement will be required if displacement or damage has occurred .

H. The Installer shall deploy and seam the geomembrane in a manner which minimizes wrinkles; however, the Installer shall be responsible for, and coordinate with the Manufacturer in, providing the proper amount of slack in the installed geomembrane to compensate for contraction due to local temperature extremes prior to covering. Stress-bridging and "fishmouths" shall not be allowed.

I. Immediately after geomembrane panels running through ditch flow lines or at toes of slopes are welded, sandbags shall be placed end-to-end along the entire length of the flow or toe line to prevent geomembrane stress-bridging at those locations.

J. The geomembrane surficial strips, ClosureTurf™ collection foot assemblies, and ClosureTurf™ pressure relief valves shall be installed per the Plans and in accordance with manufacturer's recommendations.

K. Portions of the geomembrane wasted by the Installer, and rendered unusable, as determined by the CQA Monitor, shall be transported and disposed of by the Contractor.

L. No equipment will be allowed on slopes exceeding 15% on the partially constructed turf cap system until after the completed installation of the sand infill ballast. On slopes less than

15%, ATV type vehicles will be allowed prior to infill placement if the tire /track pressure is less than 5 psi.

M. Following full specified sand infill ballast thickness installation, shall be limited to light duty vehicles with drivability tire/track pressures of less than 35 psi.

3.03 FUSION WELDING

A. Fusion welding shall only take place when the ambient temperature is between 40°F and 110°F. The Installer shall measure ambient temperature 6-inches above the deployed geomembrane. Special weather seaming plans shall be submitted by the Installer and approved by Engineer to perform fusion welds outside this ambient temperature range.

B. All geomembrane seams shall be fusion welded by the double-track method leaving an air gap for leak testing. Extrusion welding shall only be used for repairs, patches, and fabrications.

C. Fusion welding machines shall complete trial weld procedures and pass field testing as specified in Part 3.01 of this Section prior to welding the geomembrane seams.

D. A power source capable of producing sufficient and constant voltage under the combined line load of other welders and equipment shall be used.

E. The surface of the geomembrane to be welded shall be thoroughly cleaned.

F. Geomembrane panels shall be welded at the same speed, temperature, roller pressure, and gauge settings used to prepare the trial weld; the Installer shall adjust the above settings as temperature conditions indicate and record welding machine number, operator, machine settings, time, and date for each seam welded.

3.04 EXTRUSION WELDING

A. Extrusion welding guns shall complete trial weld procedures and pass field testing as specified in Part 3.01 of this Section prior to welding patches or fabrications.

B. Geomembrane patches to be extrusion welded shall overlap the underlying geomembrane panel a minimum of 4 inches.

C. The Installer shall cut square repair patches with rounded corners large enough to extend a minimum of 4 inches beyond the repair area in all directions.

D. The geomembrane patch shall be tack-welded to the underlying geomembrane panel to prevent movement during grinding and extrusion welding operations.

E. A disc grinder shall be used to remove surface debris and oxidation from the outer edge of overlapped geomembrane patches and the underlying geomembrane. Grinding parallel to seam shall not be allowed.

F. The nozzle of the extrusion gun shall be purged to remove solidified extrudate before each use.

G. The extrusion weld shall completely cover the entire width of the grind area and extend 4 inches up any intersecting fusion weld.

H. A cap strip patch shall be extrusion welded at all fusion welded seam intersections of three or more geomembrane panels.

3.05 QUALITY CONTROL

A. General
1. The Installer shall perform all quality control procedures and testing in accordance with the approved Geomembrane Installation Quality Control Plan.
2. The Installer shall maintain an accurate geomembrane panel layout drawing during installation. The drawing shall include: 1) roll and panel numbers; 2) seam numbers; 3) geomembrane limits; 4) anchor trench locations; and 5) seam test sample dates and locations.

B. Deployment
1. The Installer shall coordinate with the CQA Monitor in assigning geomembrane panel and corresponding seam numbers.
2. The Installer shall maintain, and submit to the CQA Monitor, daily deployment logs and panel layout drawings as the deployment progresses and record panel and seam numbers, panel dimensions, and deployment quantities.

C. Fusion Welding
1. The Installer shall maintain, and submit to the CQA Monitor, daily welding logs on which are recorded welding machine number, operator, machine settings, time, and date for each seam welded.
2. The entire length of each fusion welded seam shall be air-pressure tested by the Installer. The Installer shall provide an air pump capable of generating and maintaining 40 psi of pressure and equipped with a regulator and pressure gauge. The Installer shall provide pressure feed needles with pressure gauges accurate to 1 psi and perform the following air pressure test procedure:
   a. Seal both ends of the fusion welded seam with vise-grip plate clamps or an extrusion weld. Heat may be applied to the seam ends to aid in sealing the seam in conjunction with the clamps. Due to the potential hazard of igniting landfill gas, propane torches or any other flame producing device shall not be used.
   b. At one end of the seam, insert air pressure needle into the fusion weld channel.
   c. Pressurize the channel to 40 psi and maintain pressure for 5 minutes.
   d. Release air from the opposite end of the seam to verify that the entire length of the fusion weld channel was pressurized. If channel pressure is not maintained with a maximum allowable pressure loss of 2 psi over the 5-minute test period or does not stabilize at all; the Installer shall locate the defective area, isolate it, and repeat air pressure test procedures in each direction from the defective area.
   e. The Installer shall maintain air pressure test logs on which are recorded seam numbers, beginning and ending air pressures, beginning and ending test times, lengths of tested seam, defective areas found, and confirmation of repair.

D. Extrusion Welding

1. The Installer shall maintain, and submit to the CQA Monitor, daily welding logs on which are recorded welding machine number, operator, machine settings, time, and date.
2. The Installer shall vacuum test each extrusion welded along its entire length. The Installer shall provide a vacuum pump capable of generating and maintaining a pressure of 30 inches of mercury, and equipped with a regulator and vacuum gauge. The Installer shall also provide a vacuum box with a gasket-type seal and a clean view window, and vacuum gauge accurate to 1 psi and perform the following vacuum test procedure:
    a. Saturate the extrusion weld with a soap and water solution.
    b. Place view box over the saturated weld, create an air tight seal, and apply vacuum in the box.
    c. Maintain the vacuum for 10 seconds and examine weld for forming bubbles which indicate leaks. Mark detected leaks for follow up extrusion weld repair. Retest detected leaks after repair to verify that the leaks were successfully repaired.
    d. The Installer shall maintain vacuum test logs on which are recorded repair numbers, vacuum test dates, and vacuum test results.

E. Seam Test Sampling Procedures

1. The CQA Monitor will determine seam test sample locations at minimum intervals of 500 lineal feet of welded seam. The CQA Monitor may decrease or increase this frequency based on previous seam test results. The Installer shall cut the seam test sample where indicated by the CQA Monitor.
2. The Installer shall repair sample holes with an extrusion welded patch in accordance with Part 3.04 of this Section and perform a vacuum test in accordance with Part 3.05D of this Section.
3. Seam test samples shall be 12-inches wide by 36-inches long with the weld centered along the length of the sample. Sample sizes may be modified at the request of the CQA Monitor. The Installer shall cut one 1-inch specimen from each end of the sample and field test the specimens for peel adhesion in accordance with Part 3.01 of this Section. If these specimens pass the field peel test, the CQA Monitor will divide the remaining sample and submit one specimen to the Geosynthetics Testing Laboratory for further testing and retain one for archive. If either of the specimens fail the field peel test, the Installer shall perform Failed Seam Analysis Procedures in accordance with Part 3.07 of this Section.
4. The Installer may take and test any sample at its option; however, all sampling and testing shall be done under the observation of the CQA Monitor and all tests and repairs shall be in accordance with the procedural requirements of this Part.

3.06 LABORATORY TESTING

A. The Geosynthetics Testing Laboratory will perform the following test procedure at the direction of the Engineer:

1. Test five specimens from each sample submitted for peel adhesion and five specimens from each sample for bonded seam strength (ASTM D 6392).
2. All specimens must meet the criteria specified in Part 3.01C of this Section for each type of test.
3. Both sides of fusion welded seams shall be tested for peel adhesion.

B. The Engineer's acceptance of the welded geomembrane seams will be based on the results of laboratory seam analysis.

C. The Engineer will notify the Installer of acceptance or rejection of the seam within 24 hours of submission of the samples to the Geosynthetics Testing Laboratory.

3.07 FAILED SEAM ANALYSIS PROCEDURES

A. The Installer shall perform the following procedures in the event of a seam failure determined by field or laboratory testing:

1. The Installer shall mark the failed seam at a distance of 10 feet in each direction from the failed test sample location. The Installer shall cut a 12-inch by 12-inch sample from each location, then cut one 1-inch wide specimen from each end of the sample, and field test the specimens for peel adhesion in accordance with Part 3.01 of this Section. If all specimens pass the field peel test, the Installer shall cut, and submit to the CQA Monitor, a 12-inch wide by 18-inch long sample from each location for laboratory seam testing. If any of the specimens fail the field peel test at either location, the Installer shall continue sampling the failed seam at 10-foot intervals until specimens successfully pass the field peel tests and a sample can be submitted for laboratory testing. If specimens continually fail field peel tests at the 10-foot intervals, the entire seam or portion of the welded seam shall be repaired by the Installer as directed by the Engineer.
2. The Installer shall repair the failed length of seam determined by field peel testing with an 18-inch wide extrusion welded cap strip in accordance with Part 3.04 of this Section. The installer shall vacuum test the cap strip in accordance with Part 3.05D of this Section.
3. If the retest sample fails laboratory testing in accordance with Part 3.06 of this Section, the Installer shall repeat the interval sampling and testing procedure.

B. At the discretion of the CQA Monitor, seam test samples will be taken from extrusion welded cap strips exceeding 100 feet in length.

PART 4 MEASUREMENT AND PAYMENT

4.01 GEOMEMBRANE

A. Geomembrane material shall be measured on a horizontal plane in plan view by the square foot of the in-place material installed. The quantity for "Geomembrane" shall be a final pay quantity as described in Section 9-1.02C, "Final Pay Quantities," of the Standard Specifications and as shown on the Plans. The price paid per square foot for geomembrane shall include full compensation for providing all labor, equipment, tools, and incidentals (including ClosureTurf™ pressure relief valves) required for installation of the geomembrane as shown on the Plans, as specified herein, and as directed by the Engineer and no additional compensation will be allowed therefor. The Contractor shall make provisions for additional material needed to account for overlaps, anchorage, and waste, as no additional compensation will be allowed therefor.

4.02 GEOMEMBRANE SURFICIAL STRIPS

A. Geomobrane material for the surficial strips shall be measured by the lineal foot for the 3.5 foot wide strips. The price per lineal foot for geomembrane surficial strips shall be included in the Contract Unit Price per lineal foot installed for "Geomembrane Surficial Strips" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the geomembrane surficial strips as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefor.

4.03 CLOSURE TURF™ COLLECTION FOOT ASSEMBLIES

A. ClosureTurf™ collection foot assemblies, including connection to the LFG collection system piping, shall be measured by each collection foot assembly installed. Payment shall be included in the Contract Unit Price per each unit installed for "ClosureTurf™ Collection Foot Assembly" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install and connect the collection foot assemblies to the LFG collection system piping as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefor.

END OF SECTION

SECTION 02773
ENGINEERED TURF

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall furnish, transport to the Work site, and install all engineered turf in accordance with this Section and at the locations and to the dimensions shown on the Plans. The Contractor shall furnish all labor, supervision, tools, materials, equipment, transportation, and incidentals necessary to install the engineered turf, sand ballast infill, HydroBinder® Infill, and water release vents, including that needed for testing and connecting materials in field.

1.02 REFERENCES

ASTM D 2256	Standard Test Method for Tensile Properties of Yarns by the Single-Strand Method.
ASTM D 4595	Test Method for Tensile Product (MD/XD).
ASTM D 4632	Test Method for Breaking Load and Elongation of Geotextiles (Grab Method).
ASTM D 4716	Standard Test Method for Constant Head Hydraulic Transmissivity (In-Plane Flow) of Geotextiles and Geotextile Related Products.
ASTM D 4751	Standard Test Method for Determining Apparent Opening Size of a Geotextile.
ASTM D 5035	Standard Test Method for Breaking Force and Elongation of Textile Fabrics (Strip Method).
ASTM D 5261	Test Methods for Mass Per Unit Area (weight) of Woven Fabrics.
ASTM D 5321	Standard Test Method for Determining the Coefficient of Soil and Geosynthetic or Geosynthetic Friction by the Direct Shear Method.
ASTM D 6241	Standard Test Method for Static Puncture Strength Resistance of Geotextiles and Geotextile-Related Products Using a 50-mm Probe.
ASTM D 6913	Standard Test Methods for Particle-Size Distribution.

ASTM D 7277	Standard Test Method for Performance Testing of Articulating Concrete Block Systems in Open Channel Flow
ASTM D 96459	Standard Test Method for Determining Rainfall Induced Erosion
ASTM G 147	Standard Test Method for Determining the UV Stability of Engineered Fiber, Natural and Artificial Weathering Tests.
ASTM G 1545(M)	Standard Test Method for Determining UV Stability (exposed), Modified Cycle, UVA340.

1.04 SUBMITTALS

A. At least 14 calendar days prior to delivery of engineered turf rolls to the Work site, the Contractor shall submit three (3) copies of the following to the Design Engineer for approval:
   1. Samples, product data sheets, and complete description of engineered turf that meets or exceed the product requirements of this Section.
   2. MQC testing reports for engineered turf to be delivered to the Work site. At a minimum, results of those tests specified in Part 2 of this Section must be included in the MQC testing reports.
   3. For the geonet base resin:
      a. A Certificate of Compliance stating that all resin used for the product to be supplied is from a single source in the United States or Canada, of the same general type, and meets the requirements of Part 2 of this Section.
      b. MQC test results.
   4. Manufacturer's recommended procedures for transporting, unloading, storage, handling, installation, repair, and seaming (sewing, heat bonding, lapping, and plastic ties) of the geonet composite.
   5. Samples, product data sheets, and complete description of plastic fasteners (ties) recommended by the Manufacturer to join the geonet and sewing thread recommended by the Manufacturer to sew the geotextile.
   6. Panel layout showing machine direction of rolls.

1.05 TRANSPORT AND STORAGE

A. The engineered turf rolls shall be shipped by the Supplier with protective coverings in a closed trailer or a covered open trailer.

B. At least seven (7) calendar days prior to any Work site delivery, the Contractor shall notify the Design Engineer of the date, time, material type, material quantity, and number of trucks for delivery. A copy of the packing list showing lot and roll numbers for each shipment shall also be provided to the Design Engineer prior to Work site delivery.

C. Unloading and storage (stacking) of the engineered turf rolls at the Work site shall be the responsibility of the Contractor; however, unloading and storage of engineered turf rolls shall be performed in accordance with the submitted Manufacturer's recommended procedures. engineered turf rolls shall be stacked no more than three (3) high.

D. The Contractor shall transport engineered turf rolls from the storage area in a manner that does not damage the geonet composite, and in accordance with the Manufacturer's recommended procedures.

1.06 QUALITY ASSURANCE

A. Testing and Observation
1. Testing and observation of the engineered turf shall be conducted in accordance with the CQA Plan.
2. The Contractor shall cooperate with the CQA Monitor during observation, testing, and collection of samples.
3. If any portion(s) of the engineered turf installation is determined by the Design Engineer to not meet the requirements of this Section, based on either testing or observations, the Contractor, at his expense, shall remove and replace that portion(s) to meet the requirements of this Section as directed by the Design Engineer.

PART 2 PRODUCTS

2.01 ENGINEERED TURF

A. The engineered turf is a synthetic structured material consisting of one or more geotextiles tufted with polyethylene yarns that resemble grass blades such as DuraTurf manufactured by Shaw, or equivalent. Engineered turf shall be manufactured of UV-stabilized yarn oriented into a stable network that maintains its structure during handling, placement and long-term service.

B. The engineered turf shall be chemical resistant and cannot be heat burnished or contain recycled materials.

C. The engineered turf shall have the following minimum average roll values:

ENGINEERED TURF COMPONENT

Product Data	Test Method	Values
CBR Puncture	ASTM D6241	800 lb, (MARV)
Tensile Product (MD/XD)	ASTM D4595	1,000 lb/ft min (MARV)
Rainfall Induced Erosion	ASTM D96459	< 0.45% Infill Loss 6 in/hr
Aerodynamic Evaluation	GTRI Wind Tunnel	120 mph with maximum uplift of 0.12 lb/sf
Engineered Turf Fiber UV Stability	ASTM G147	> 60% retained tensile strength at 100 years (projected)
Backing System UV Stability (Exposed)	ASTM G1545 Modified Cycle 1.UVA340	110 lbs/ft retained tensile strength at 6500 hours (projected)
Steady State Hydraulic Overtopping (ClosureTurf® with HydroBinder™)	ASTM D7277/D7276	5 ft overtopping resulting in 29 ft/s velocity and 8.8 psf shear stress for Manning N Value of 0.02
Full Scale Wave Overtopping Test Cumulative Volume (ClosureTurf® with HydroBinder™)	Colorado State University Wave Simulator	165,000 ft^3/ft
Full Scale Wave Overtopping Test Wave Overtopping Discharge(ClosureTurf® with HydroBinder™)	Colorado State University Wave Simulator	4.0 ft^3/s/ft
Transmissivity w/ underlying structured geomembrane Normal stress 50 psf and 0.33 gradient (m2/sec)	ASTM D4716	2.5E -03m^2/sec., min.
Internal Friction of combined components	ASTM D5321	35°, min.
Sand Infill Gradation and Ballast	ASTM D6913	ASTM C-33 Fine Aggregates
Yarn Weight (Total Product Weight)	ASTM D5261	19 oz. / sq. yd. (25 oz. / sq. yd. +-1 oz.)
Tensile Strength of Yarn	ASTM D2256	15 lbs. min.

2.02 SEWING THREAD

A. The thread used for sewing of engineered turf shall be polymeric and have strength properties equal to or greater than the engineered turf.

B. The thread used for sewing of engineered turf shall be chemical resistant.

C. The thread used for sewing the engineered turf shall be equivalent to that recommended by the engineered turf Manufacturer submitted in accordance with Part 1.04A of this Section.

2.03 SAND BALLAST INFILL

A. Sand Ballast Infill will meet Particle Size Parameters of ASTM C 33-03 for fine aggregates as shown in the following Table 1:

Table 1: Sand Ballast Infill

Sieve	Percent Passing
9.5 mm (3/8")	100
4.75 mm (No. 4)	95 to 100
2.36 mm (No. 8)	80 to 100
1.18 mm (No. 16)	50 to 85
600 µm (No. 30)	25 to 60
300 µm (No. 50)	5 to 30
150 µm (No. 100)	0 to 10

2.04 HYDROBINDER™ INFILL

A. HydroBinder™ is a cementious product used as the infill component for surface drainage conveyance areas.

B. HydroBinder™ infill Shall be HydroBinder™ Cementitious Infill. The HydroBinder™ infill material may be delivered in either pallet form of 80 lb. bags or 3000 lb. bulk super sacks.

C. Cement, except as otherwise specified herein, will be a brand of Portland Cement, meeting ASTM C 150 and will be Type I or Type II. Only one brand of cement will be used throughout the duration of this Contract.

D. The cementitious infill mix design will conform to the requirements of ASTM C 387 for high strength mortars.

E. The cementious infill will have a minimum 28 day compressive strength of 5000 psi.

2.05 WATER RELEASE VENTS

A. Water release vent material shall be double-sided geocomposite (200 mil).

PART 3 EXECUTION

3.01 PREPARATION AND EXAMINATION

A. The Installer shall verify that the material and surface upon which the engineered turf is to be placed is complete and in accordance with these Technical Specifications for that material prior to beginning geonet installation.

B. The Contractor is responsible for temporary anchorage during installation and until permanent anchorage is constructed and completed.

3.02 INSTALLATION

A. Engineered turf shall be installed in accordance with the Manufacturer's instructions.

B. Engineered turf shall be installed with the machine (lengthwise) direction of the roll oriented down the slope in accordance with the Panel Layout.

C. Engineered turf panels shall be deployed from the top of the slope in a way that the engineered turf is laid substantially smooth and filaments are pointing upslope after deployment is complete.

D. The first engineered turf panel deployed shall have the turf filaments facing upward. Subsequent panels shall be deployed turf side down, and on top of the previously installed panel. After seaming each panel, the panel shall be flipped onto the geomembrane component with care to avoid pulling of tufts in the drainage studs.

E. End-to-end panel overlaps shall only occur on benches, unless the length of a slope between benches exceeds the total length of a full engineered turf roll.

F. Engineered turf shall be installed with sufficient tension to prevent excessive overlapping, insufficient overlapping, wrinkles, and folds.

G. A single stitch prayer type seam shall be constructed using a Nulong sewing machine or equivalent. Sewing thread shall be 207 Polyester or equivalent. Sewing will occur between the 1st and 2nd row of Engineered Turf stitches.

H. Engineered turf shall be ballasted during installation and until the engineered turf is covered with the sand ballast infill material.

I. The water release vents shall be installed per the Plans and in accordance with manufacturer's recommendations.

J. On slopes exceeding 15%, no equipment will be allowed on the partially constructed turf cap system until after the completed installation of the sand ballast infill. On slopes less than 15%, ATV type vehicles will be allowed prior to infill placement if the tire /track pressure is less than 5 psi.

K. Following full specified sand ballast infill thickness installation, shall be limited to light duty vehicles with drivability tire/track pressures of less than 35 psi.

L. Engineered turf damaged during installation shall be removed and/or repaired with a sewn or fastened patch at the direction of the Design Engineer.

M. Portions of the engineered turf wasted by the Installer, and rendered unusable, as determined by the Design Engineer, shall be transported by the Contractor and disposed of off-site at a permitted transfer station or solid waste disposal facility.

3.03 SAND BALLAST INFILL PLACEMENT

A. Sand ballast infill shall be placed between the tufts of the engineered turf and:
   1. Shall be per plan either 5/8-inch thick or 2-1/8-inch thick, with a thickness tolerance of ±1/8 inch. Measuring the sand ballast infill thickness will be performed utilizing a digital caliper, or approved alternate measuring device approved by the CQA Officer.
   2. Shall consist wholly of sand meeting ASTM C-33-03 for fine aggregates. See Section 2.03 - SAND BALLAST INFILL - Table 1 for sand infill ballast grain size parameters.
   3. Engineered turf areas that are to receive sand ballast infill must be accepted by the CQA Officer before placement of sand ballast infill takes place.

B. Sand ballast infill shall be worked into the Engineered Turf between the synthetic yarn blades.

C. Conveyor systems and/or Express Blowers shall be used to spread and place the sand ballast infill.

D. The Contractor shall explain with detail in the Preparatory Meeting the method of sand infill deployment to be used.

E. Previously installed components shall not be displaced or damaged as a result of the sand ballast infill component installation.

F. A standard washer will be utilized as a plate for the point of entry into the sand ballast infill for consistent depth control.

3.04 INFILL – HYDROBINDER® PLACEMENT

A. See also Section 2.04 - HydroBinder® INFILL.

B. The HydroBinder® infill layer may be placed using any appropriate equipment capable of completing the work. Manual hand spreading is acceptable when equipment isn't practical.

C. The Contractor shall explain in detail during the Preparatory Meeting the method of HydroBinder® infill deployment.

D. Installation of HydroBinder® infill will only be performed by a Manufacture's approved installer using techniques and equipment approved by the Manufacture.

E. The HydroBinder® shall be installed into the turf while it is in a dry state. The HydroBinder® will be worked into the tufts so the tufts are in an upright position.

F. The HydroBinder® infill shall be placed dry to a thickness of 7/8 inch with a tolerance of +/- 1/8 inch.

G. The hydration process must occur on the same day as the HydroBinder® infill placement. The required HydroBinder® infill thickness will be achieved prior to the hydration process.

H. The cemented infill shall be hydrated thoroughly, however care must be taken to avoid displacement of the non-hydrated infill. The objective is to soak the area to start the hydration process but not to inundate with water beyond saturation.

I. Once hydration is completed as described, backfill and compaction of the vertical anchor trenches (if applicable) shall take place.

K. The HydroBinder® shall be at minimum performance levels within 24 hours. HydroBinder® that does not meet minimum performance levels within 24 hours will be removed and replaced.

3.05 REPAIR

A. All damaged areas or holes shall be repaired with a patch by the Installer as directed by the Design Engineer.

B. Repairs to engineered turf are completed by using a heat-bonded seam. All tie-in seams along flatter slopes less than 15% with length greater than 25 feet will use an approved leistering machine so consistent pressure is achieved throughout the seam. A hand held heat gun with a pressure wheel shall be used for repair of smaller areas. The patch shall extend 2 feet beyond the edge of the damaged area or hole.

C. Contractor may also demonstrate techniques and practices for approval. Field demonstration and approval by the CQA Officer and the Manufacturer is required before incorporating any alternative repair technique.

PART 4 MEASUREMENT AND PAYMENT

4.01 ENGINEERED TURF WITH 5/8" SAND BALLAST INFILL

A. Engineered Turf with 5/8" Sand Ballast Infill shall be measured by the square foot of engineered turf in place covering the entire limits of waste, installed to the toes of all slopes on the landfill or five feet beyond the limits of waste, whichever is greater, as shown on the Plans. The quantity measured for engineered turf shall be as measured on a horizontal plane in plan view and shall include an allowance for overlaps, anchorage and waste. Payment shall be included in the Contract Unit Price per square foot installed for "Engineered Turf with 5/8" Sand Ballast Infill" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the engineered turf and sand ballast infill, including that needed for testing and connecting materials in field as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.02 ENGINEERED TURF WITH 2" SAND BALLAST INFILL

A. Engineered Turf with 2" Sand Ballast Infill shall be measured by the square foot of engineered turf in place covering the entire limits of waste, installed to the toes of all slopes on the landfill or five feet beyond the limits of waste, whichever is greater, as shown on the Plans. The quantity measured for engineered turf shall be as measured on a horizontal plane in plan view and shall include an allowance for overlaps, anchorage and waste. Payment shall be included in the Contract Unit Price per square foot installed for "Engineered Turf with 2" Sand Ballast Infill" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the engineered turf and sand ballast infill, including that needed for testing and connecting materials in field as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.03 ENGINEERED TURF WITH HYDROBINDER INFILL

B. Engineered Turf with HydroBinder® Infill shall be measured by the square foot of engineered turf in place covering the entire limits of waste, installed to the toes of all slopes on the landfill or five feet beyond the limits of waste, whichever is greater, as shown on the Plans. The quantity measured for engineered turf shall be as measured on a horizontal plane in plan view and shall include an allowance for overlaps, anchorage and waste. Payment shall be included in the Contract Unit Price per square foot installed for "Engineered Turf with HydroBinder® Infill" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the engineered turf and HydroBinder® infill, including that needed for testing and connecting materials in field as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.04 ENGINEERED TURF/GEOMEMBRANE ANCHOR TRENCH

A. Engineered turf/geomembrane anchor trench shall be measured by the lineal foot of anchor trench installed, as shown on the Plans. The quantity measured for the anchor trench shall be measured on the horizontal plan and shall include trenching, placement of material in trench, and backfilling. Payment shall be included in the Contract Unit Price per lineal foot installed for "Engineered Turf/Geomembrane Anchor Trench" and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the engineered tur/geomembrane anchor trench, as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.05 WATER RELEASE VENTS

A. Water release vents shall be measured by each water release vent installed. Payment shall be included in the Contract Unit Price per each unit installed for "Water Release Vent" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the isolation valves as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefor.

END OF SECTION

SECTION 02900
SEEDING AND FERTILIZING

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall seed and fertilize the on-site borrow area surfaces, earthen drainage swales, and all construction-related disturbed surfaces in accordance with this Section and at the locations and to the dimensions shown on the Plans. The Contractor shall furnish all labor, supervision, tools, materials, equipment, transportation, and incidentals as necessary to seed and fertilize the various areas identified herein.

1.02 REFERENCES

A. *Caltrans Standard Specifications.* California Department of Transportation, 2010.

B. *Caltrans Standard Plans*. California Department of Transportation, 2010.

1.03 SUBMITTALS

A. Prior to seeding, the Contractor shall submit to the CQA Monitor, in triplicate, the name and location of material sources, laboratory test results, and/or material data sheets conforming to the relevant details shown on the Plans as outlined herein.

B. After seeding, the Contractor shall submit to the CQA Monitor the certified tags from the seed bags.

1.04 QUALITY ASSURANCE

A. Testing and Observation
   1. Testing and observation of the seeding, fertilizing and mulching shall be conducted in accordance with the CQA Plan.
   2. If any portion(s) of the seeding and fertilizing is determined by the CQA Monitor to not meet the requirements of this Section, the Contractor, at his expense, shall rework that portion(s) to meet the requirements of this Section as directed by the Design Engineer.

PART 2 PRODUCTS

2.01 SEED

A. Seeding shall conform to the provisions of Section 20-2.10 (Seed) and Section 20-3.04 (Seeding and Fertilizing) of the Standard Specifications.

B. The seed shall consist of the following mix of species and corresponding application rates:
   1. Trilfolium Incarnaium (Crimson Clover): 25 lbs/AC
   2. Hordeum Vulgare (Common Barley): 50 lbs/AC

3. Festuca Rubra (Creeping Red Fescue): 50 lbs/AC
4. Lolium Perenne (Perennial Ryegrass): 25 lbs/AC

2.02 FERTILIZER

A. Fertilizer shall consist of the following components and percentages:

Ammonia Phosphate Sulfate	16 percent
Phosphoric Acid	20 percent
Water Soluble Potash	0 percent

PART 3 EXECUTION

3.01 GENERAL

A. The method and equipment used to spread the seed and fertilizer shall be subject to the approval of the Design Engineer.

B. Seed and fertilizer shall be applied after the after the access roads and drainage structures have been placed to grade.

C. Seed and fertilizer shall not be applied to the access roads, rock riprap swales, and sedimentation basins.

3.02 APPLICATION

A. The application of seed and fertilizer shall be performed by hydroseeding methods using the following steps:
1. *Step 1:* Seed and fiber shall be hydroseeded onto the designated surfaces at a rate of 150 lbs/AC and 500 lbs/AC, respectively.
2. *Step 2:* Hydromulch with tackifier and fertilizer shall then be applied at rates of 500 lbs/AC (fiber), 150 lbs/AC (tackifier [M-binder, organic bean base glue]), and 200 lbs/AC (fertilizer).

B. All products shall be spread uniformly over all areas subject to revegetation.

PART 4 MEASUREMENT AND PAYMENT

4.01 SEEDING AND FERTILIZING

A. Seeding and fertilizing shall be measured by the acre installed and includes all seed, fertilizer, tackifier and fiber. No adjustments in compensation will be made in the Contract Unit Price paid for "Seeding and Fertilizing" as a result of an increase or decrease in the quantity of revegetation products used, regardless of the reason for the increase or decrease, even if the increase or decrease exceeds 25 percent of the Design Engineer's Estimate. The provisions in Section 4-1.03B (Increased or Decreased Quantities) of the Standard Specifications shall not apply.

B. Payment shall be included in the Contract Unit Price per acre installed for "Seeding and Fertilizing" addressed in this Section and shall include full compensation for providing all

materials, labor, equipment, tools, and incidentals required for seeding and fertilizing as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

END OF SECTION

SECTION 02960
TEMPORARY EROSION AND SEDIMENT CONTROLS

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall implement all erosion control provisions consisting of, but not limited to, the construction of permanent and temporary facilities and taking measures as are necessary to prevent, control and abate water, mud, and erosion damage to public and private property as a result of the construction of this Project. Erosion control shall apply year round to all areas where earthen material is exposed on the Work site and shall not be limited to those areas outlined in these Technical Specifications or as shown on the Plans. The Contractor shall furnish all labor, supervision, tools, materials, equipment, transportation, and incidentals as necessary to implement the erosion control provisions.

1.02 REFERENCES

A. *Caltrans Standard Specifications (Section 20).* California Department of Transportation, May 2006.

B. *California's General Permit for Storm Water Discharges Associated with Construction and Land Disturbance Activities (General Permit) Order No. 2009-0009-DWQ as amended by Order No. 2010-0014-DWQ (NPDES No. CAS000002)*. State Water Resources Control Board, 2010.

1.03 SUBMITTALS

A. The Contractor shall prepare and implement a SWPPP for construction activities in accordance with Section 01550 (Storm Water Pollution Prevention) of these Technical Specifications.

PART 2 PRODUCTS

2.01 STRAW BALES

A. Straw for bales shall be noxious weed free and shall be derived from wheat, rice or barley.

2.02 STRAW WATTLES

A. Straw wattles shall be fiber rolls composed of bio-degradable fibers stuffed in a photo-degradable open weave netting.

2.03 ROCK FOR CONSTRUCTION ENTRANCE

A. Rock for the construction entrance shall conform to the requirements of Section 02207 (Aggregate Materials) of these Technical Specifications.

2.04 SILT FENCING

A. Silt Fencing: Filter fabric shall be a pervious sheet of synthetic polymer composed of at least 85% by weight ethylene, propylene, amide, ester, or vinylidene yarn, woven or non-woven. It shall contain stabilizers and/or inhibitors to resist deterioration by heat, water, and ultra-violet light. The fabric shall conform to the following:
   1. The Equivalent Opening Size (U.S. Standard Sieve) shall be within the range 70-100.
   2. The tensile strength (per ASTM D4632) shall be at least 120 pounds.

B. Silt Fencing Posts: Posts for silt fences shall be either 4-inch diameter wood or 1.33 pounds per linear foot steel with a minimum length of 3 feet. Steel posts shall have projections for fastening wire to them.

PART 3 EXECUTION

3.01 SCHEDULE

A. Construction or implementation of erosion control measures shall be performed year round. Between October 15 and May 15 of each year, such temporary erosion control features as are necessary to prevent damage during the forthcoming winter season shall be constructed and remain functional.

B. The Contractor shall comply with the pollution control measures referenced in these Technical Specifications as part of the overall program to control erosion and de-silt runoff.

C. All temporary erosion control facilities shall be maintained during temporary suspension of Work periods.

3.02 PROTECTION

A. All areas of exposed earth created by the Contractor beyond what is shown on the Plans and referred to in these Technical Specifications and areas cleared and grubbed prior to excavation or embankment operations which are subject to wind erosion and runoff shall also be subject to these Technical Specifications, except that the Contractor shall be fully responsible for all costs and liabilities associated with water pollution and temporary erosion control work in these areas.

3.03 TEMPORARY EROSION CONTROL FACILITIES

A. The Contractor shall conduct his operations in such a manner that storm water runoff will be contained within the Work site or channeled into the storm drain system which serves the runoff area. Storm water runoff from one area shall not be allowed to divert to another runoff area.

B. Temporary down drains, drainage structures, and other devices shall be provided to channel storm water runoff water into the respective permanent storm drain systems during construction. Permanent drainage structures, not fully completed, shall be modified as required to accept de-silted runoff.

C. Fill areas, while being brought to grade, and during periods of completion prior to final construction, shall be protected by various measures to eliminate erosion and the siltation of downstream facilities and adjacent areas. These measures may include, but shall not be limited to:

1. Temporary down drains, either in the form of pipes or paved ditches with protected outfall areas;
2. Graded berms around areas to eliminate erosion of embankment slopes by surface runoff;
3. Embankment slopes, not included as part of the construction contract and constructed by the Contractor for temporary access roads, shall be compacted by track walking the face of the slope in a direction perpendicular to the slope contours. Several passes may be required to adequately compact the slope face.

D. Contour graded areas shall be protected against erosion and the resulting siltation of downstream facilities and adjacent areas during grading operations. Various measures may include, but shall not be limited to:

1. Use of graded contour berms to control sheet flow.
2. Supplemental grading of large areas around temporary or unfinished inlet structures, such as inside ramp loops.

E. Culvert pipe used in conjunction with temporary erosion control measures which was new when delivered to the Work site and, in the opinion of the Design Engineer, is not damaged and whose dimensions and other properties conform to the requirements for new material may be used in the new Work.

PART 4 MEASUREMENT AND PAYMENT

4.01 TEMPORARY EROSION AND SEDIMENT CONTROL

A. Measurement and payment for temporary erosion and sediment control provisions including preparation and implementation of a SWPPP shall be considered as included in the Contract Lump Sum Price paid for "Temporary Erosion and Sediment Controls" as addressed in this Section and Section 01550 (Storm Water Pollution Prevention) of these Technical Specifications and includes all compensation for providing all materials, labor, equipment, tools, and incidentals required to complete the Work specified herein and as directed by the Design Engineer. No additional compensation will be allowed therefore.

END OF SECTION

SECTION 03300
CONCRETE

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall supply, transport to the Work site, and install all concrete for construction of drain inlets and the pads at the flare station, post footings for the metal frame pipe supports and security fencing, foundation for the sedimentation basin outlet structures, and grouted rock riprap outfalls in accordance with this Section and at the locations and to the dimensions shown on the Plans. The Contractor shall furnish all labor, supervision, tools, materials, equipment, transportation, and incidentals as necessary to prepare and construct the various concrete structures.

1.02 REFERENCES

A. *Caltrans Standard Specifications.* California Department of Transportation, 2010.

B. *Caltrans Standard Plans*. California Department of Transportation, 2010.

C. *American Society for Testing and Materials.* Current Edition.

D. *Manual of Standard Practice*, Concrete Reinforcing Steel Institute (CRSI), 2009.

1.03 APPLICABLE STANDARDS AND SPECIFICATIONS

A.	ASTM A 615	Standard Specification for Deformed and Plain Billet-Steel Bars for Concrete Reinforcement.
B.	ASTM C 31	Standard Specification for Making and Curing Concrete Test Specimens in the Field.
C.	ASTM C 39	Standard Test Method for Compressive Strength of Cylindrical Concrete Specimens.
D.	ASTM C 143	Standard Test Method for Slump of Portland Cement Concrete.
E.	ASTM D 1557	Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Modified Effort (56,000 ft-lbf/ft^3 [2,700 kN-m/m^3]).

1.04 SUBMITTALS

A. At least 14 calendar days prior to delivery of materials to the Work site, the Contractor shall provide three (3) copies of the following information to the Design Engineer for approval:
   1. Name and location of the source for the concrete and reinforcing bars.
   2. Laboratory test results for the concrete and reinforcing bars.

3. Manufacturer's product data sheets for the concrete and reinforcing bars to verify that the materials meet or exceed the corresponding product requirements.

1.05 QUALITY ASSURANCE

A. Testing and Observation
1. Testing and observation of the concrete components shall be conducted in accordance with the CQA Plan.
2. The Contractor shall cooperate with the CQA Monitor during observation and testing.
3. If any portion(s) of the concrete is determined by the Design Engineer to not meet the requirements of this Section, based on either testing or observations, the Contractor, at his expense, shall remove and replace that portion(s) to meet the requirements of this Section as directed by the Design Engineer.

PART 2 PRODUCTS

2.01 CONCRETE

A. Concrete shall be supplied from the same approved source during construction of each structure.

B. Concrete for the drain inlets and flare station concrete pads shall be Type II Portland cement concrete meeting all material requirements of Sections 90-1 and 90-2 of the Standard Specifications and shall exhibit a maximum 4-inch slump when tested in accordance with ASTM C 143 and have a designated 28-day compressive strength of 2,500 psi (drain inlets) and 3,000 psi (flare station concrete pads) when tested in accordance with ASTM C 31 and ASTM C 39.

C. Concrete for post footings and sedimentation basin outlet structure foundations shall be minor concrete conforming to the requirements of Section 90-10 of the Standard Specifications.

D. Concrete for the grouted rock riprap outfalls shall be minor concrete conforming to the requirements of Sections 72-5.02 and 90-10 of the Standard Specifications.

2.02 REINFORCEMENT

A. Reinforcing bars shall be billet-steel bars for concrete reinforcement conforming to ASTM A 615, Grade 40, #4 bars.

2.03 FORMS

A. Forms used in concrete installations shall be APA “Plyform” or equivalent as designed by then Contractor and exhibiting sufficient strength to hold the concrete.

2.04 EPOXY

A. Epoxy used for securing dowels or anchors in concrete shall be Simpson "SET – Epoxy" or Covert "CIA-Gel 7000 Epoxy".

2.05 AGGREGATE BASE

A. Aggregate base for the flare station concrete pads shall conform to the requirements of Section 02207 (Aggregate Base) of these Technical Specifications.

2.06 ENGINEERED FILL

A. Engineered fill for the flare station concrete pads shall conform to the requirements of Section 02224 (Engineered Fill) of these Technical Specifications.

PART 3 EXECUTION

3.01 GENERAL

A. The locations, dimensions, and final elevations of the concrete slabs shall be as shown on the Plans or as staked by the Design Engineer.

B. The footprint areas for the flare station concrete pads as shown on the Plans shall be cleared and grubbed in accordance with the requirements of Section 02222 (Excavation) of these Technical Specifications.

C. Following clearing and grubbing, the flare station concrete pad areas shall be overexcavated to a depth of 18 inches and recompacted as engineered fill in accordance with the requirements of Section 02224 (Engineered Fill) of these Technical Specifications. Overexcavation is not required if compaction data beneath the concrete slab footprints are available from the former leachate pond backfilling operations that demonstrate that the upper 18 inches meet the engineered fill compaction requirements.

D. Aggregate base for the flare station concrete pads shall be spread in a uniform loose lift not exceeding 8 inches in thickness, moisture conditioned to within 1 to 3 percentage points of the optimum moisture content, and compacted to a minimum of 95 percent of maximum dry density per ASTM D 1557.

3.02 REINFORCEMENT

A. All reinforcement shall be installed in conformance with CRSI's "Manual of Standard Practice".

B. All reinforcement shall be free from rust, oil, dirt, or any other coating.

C. Continuous reinforcing bars shall be lapped at splices at a minimum of 32 diameters.

D. Unless otherwise noted, reinforcement shall have a minimum concrete cover of 3 inches.

E. Reinforcement shall not be damaged and shall be securely supported and anchored to avoid movement during placement of concrete.

3.03 FORMWORK

A. Design and erection of concrete formwork shall be the responsibility of the Contractor. Strength of concrete formwork shall be sufficient to hold the concrete with minimal or no leakage. Shoring and bracing shall be provided to ensure stability of formwork. Three-quarter-inch chamfer strips shall be used at exposed corners.

3.04 CONCRETE SLAB PLACEMENT

A. Subgrade and forms shall be moistened prior to placing concrete.

B. Care shall be taken to not damage or displace the reinforcing steel components.

C. Concrete shall be placed in a continuous operation and thoroughly vibrated to ensure consolidation around reinforcement.

D. The final surface of the concrete slabs shall have a non-slip broom finish.

E. The Contractor shall repair or patch all significant cracks, spalls and irregularities in formed or finished surfaces or other defects, as required to attain the workmanship standards herein.

3.05 MINOR CONCRETE PLACEMENT

A. Minor concrete for post footings and sedimentation basin outlet structure foundations shall be installed as shown on the Plans and in conformance with Sections 51 and 90-10 of the Standard Specifications, as applicable.

B. Minor concrete for the grouted rock riprap shall be placed in conformance with Section 72-5.04 of the Standard Specifications.

3.06 EPOXY SECURED DOWELS OR ANCHORS

A. The diameter and depth of the drill hole shall be as indicated. If not included, the hole shall be drilled 1/8-inch larger and ten (10) times deeper than the diameter of the dowel or anchor.

B. The hole shall be thoroughly cleaned by blowing it out with compressed air and by using a wire brush.

C. Placement of epoxy in the hole shall be performed using a dispensing tool provided by, or recommended by the manufacturer. The hole shall be completely filled with epoxy.

D. The dowel or anchor shall be placed in the hole and the epoxy allowed sufficient time to completely cure before disturbing the dowel or anchor.

PART 4 MEASUREMENT AND PAYMENT

4.01 CONCRETE SLABS

A. The concrete slabs for the flare station shall be measured by the cubic yard of concrete installed and includes all subgrade and pad preparation work, aggregate base, reinforcement steel, formwork, and epoxy secured dowels and anchors. Payment shall be included in the Contract Unit Price per cubic foot installed for "Flare Station Concrete Slabs" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the flare station concrete slabs as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.02 DRAIN INLETS

A. Measurement and payment for concrete associated with the drain inlets shall be included in the Contract Unit Price for "Drain Inlets" addressed in Section 02722 (Drainage and Erosion Controls) of these Technical Specifications.

4.03 CONCRETE POST FOOTINGS

A. Measurement and payment for concrete post footings associated with the metal frame pipe supports and security fencing for the flare station shall be included in the Contract Unit Prices for "Metal Frame Pipe Supports" addressed in Section 15200 (LFG Collection System Components) and "Security Fencing" addressed in Section 15300 (Flare Station), respectively, of these Technical Specifications.

4.04 SEDIMENTATION BASIN OUTLET STRUCTURES

A. Measurement and payment for concrete associated with the sedimentation basin outlet structure foundations shall be included in the Contract Unit Price for "Sedimentation Basin Outlet Structures" addressed in Section 02722 (Drainage and Erosion Controls) of these Technical Specifications.

4.05 GROUTED ROCK RIPRAP OUTFALLS

A. Measurement and payment for concrete associated with the grouted rock riprap outfalls shall be included in the Contract Unit Price for "Grouted Rock Riprap Outfalls" addressed in Section 02722 (Drainage and Erosion Controls) of these Technical Specifications.

END OF SECTION

SECTION 15100
LANDFILL GAS (LFG) EXTRACTION WELLS

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall install all LFG extraction wells as shown on the Plans and in accordance with these Technical Specifications. The Contractor shall furnish all labor, supervision, tools, materials, equipment, transportation, and incidentals as necessary to install the LFG extraction wells.

1.02 REFERENCES

A. *Caltrans Standard Specifications*. California Department of Transportation, 2010.

1.03 SUBMITTALS

A. At least 14 calendar days prior to commencement of drilling operations, the Contractor shall submit the following to the Design Engineer for approval:
   1. Drilling subcontractor information, including name of subcontractor, proof of State of California drilling contractor license (Class C-57), type and make of drill rig, names and experience of drill rig operator and helpers, and proposed operating procedures.
   2. The name and location of source, laboratory test results, and/or product data sheets for the following materials to verify that the materials meet or exceed the requirements in Section 7-1.2:
      a. PVC well casing and fittings.
      b. Gravel pack material.
      c. Bentonite.
      d. PVC well bore seal.
      e. Prefabricated Well Head Assemblies.
   3. Manufacturer's recommended installation procedures and operation instructions for prefabricated well head assemblies.
   4. Copies of approved drilling permits (if required) issued by the local governing agency.

B. At the completion of each working day, the Contractor shall prepare a work order summarizing the total footage drilled and amount of materials used for well construction, and submit it to the Design Engineer for approval.

C. The Contractor shall submit to the Design Engineer performance test results for the prefabricated well head assemblies within 14 calendar days of completion of the testing.

1.04 QUALITY ASSURANCE

A. Testing and Observation

1. Testing and/or observation of the casing, annular materials, PVC well bore seal and prefabricated well head assembly installations shall be conducted in accordance with the CQA Plan.
2. The Contractor shall cooperate with the CQA Monitor during observation and testing.
3. If any portion(s) of the LFG extraction well installations is determined by the Design Engineer to not meet the requirements of this Section based on observations, the Contractor, at his expense, shall mitigate that portion(s) to meet the requirements of this Section as directed by the Design Engineer.

PART 2 PRODUCTS

2.01 LFG EXTRACTION WELLS

A. PVC WELL CASING AND FITTINGS: PVC well casing and fittings for the LFG extraction wells shall conform to the requirements of Section 15200 (LFG Collection System Components) of these Technical Specifications.

B. GRAVEL PACK: Gravel pack material shall conform to the requirements of Section 02207 (Aggregate Materials) of these Technical Specifications.

C. BENTONITE SEAL: Bentonite seal material shall be 100 percent premium grade bentonite clay.

D. PVC WELL BORE SEAL: PVC well bore seals shall consist of a prefabricated pipe boot and a 10-foot by 10-foot skirt manufactured from 30 mil PVC and designed specifically for the intended purpose. The boot portion shall have a minimum length of 4 feet and shall be sized to accommodate a 4-inch diameter well casing.

E. SOIL BACKFILL: Soil backfill material shall be engineered fill material in accordance with Section 02224 (Engineering Fill) of these Technical Specifications.

2.02 PREFABRICATED WELL HEAD ASSEMBLIES

A. Prefabricated well head assemblies for LFG extraction wells shall be Series 3100 PVC well heads manufactured by Real Environmental Products [(209) 296-7900], or approved equivalent. The overall assembly shall include: Series 3100 PVC well head equipped with a 1.5-inch diameter PVC gate valve and dedicated thermometer; orifice assembly with four (4) interchangeable orifice plates with bore diameters of ½ inch, ¾inch, 1 inch and 1-1/2 inch; elastomeric adaptor for connection between the well casing and well head; and a 2-inch diameter PVC flexible hose for connection between the well head and the LFG collection system piping.

PART 3 EXECUTION

3.01 GENERAL

A. The Contractor's attention is directed to the details contained in the Plans for information regarding individual well construction characteristics.

B. The locations of LFG extraction wells will be staked by the Design Engineer prior to the commencement of drilling operations.

C. All required drilling permit(s), fees, and inspections shall be arranged, and paid for, by the Contractor.

3.02 DRILLING

A. Drilling and installation of LFG extraction wells shall be by a drilling contractor licensed (Class C-57) in the State of California.

B. Individual LFG extraction wells shall be drilled and installed in a single day so as to minimize the potential for LFG emissions from the borehole. Installation shall include placement of casing, gravel pack, and surface seal (including lower and upper hydrated bentonite seals). The top of the casing shall be capped until installation of the prefabricated well head assembly. In the event of equipment breakdown or other unforeseen circumstance prohibits complete installation of the LFG extraction well within the same working day, provisions shall be made to cover and seal the exposed borehole at the surface to prevent LFG emissions.

C. The boreholes for the LFG extraction wells shall be drilled using a bucket auger drill rig capable of drilling 24-inch diameter boreholes. The Design Engineer will prepare boring logs and associated records.

D. The borehole depths listed in the Plans are estimated and may be adjusted in the field by the Design Engineer.

E. Spoils generated as part of drilling operations may be temporarily stockpiled in proximity of the borehole, or discharged directly into a roll-off bin or dump truck. If temporarily stockpiled, the spoils must be removed by the end of each working day and transferred into a roll-off bin or dump truck for subsequent transport and disposal by the Contractor in accordance with Section 02222 (Excavation) of these Technical Specifications. Spoils remaining on-site overnight in a roll-off bin or dump truck shall be covered at the end of each working day. Spoils shall not remain on-site for more than a 48-hour period.

F. As soon as drilling is completed, a safety screen shall be placed over the top of the borehole. This screen shall stay in place until backfilling is within 4 feet of the surface. The safety screen size should be large enough to accommodate all backfill materials and activities yet not large enough for any human to accidentally fall through.

G. The borehole shall be straight and the well casing shall be installed in the center of the borehole. The Contractor shall take all tension off of the pipe by mechanical means and center the well casing in the middle of the borehole before starting to backfill.

H. PVC well casing joints shall be solvent cemented and secured with 3/8-inch long Type 316 stainless steel lag screws.

I. The completion height of the well casing above ground surface shall be such that the final height of the installed prefabricated well head assembly is 5 feet above final grade.

J. Obstructions and saturated conditions may be encountered during drilling; the Contractor is expected to make reasonable effort to drill through obstructions and saturated conditions and may only abandon the borehole if written approval is obtained from the Design Engineer.

3.03 BACKFILLING

A. Backfilling operations shall commence immediately after well drilling is completed and the well casing has been installed in the borehole. Backfill materials shall be installed as shown on the Plans and as directed by the Design Engineer.
   1. If water is encountered during drilling, the Design Engineer may elect to have the borehole remain open overnight to allow the water level to stabilize. Under this scenario, the Contractor shall make provisions to cover and secure the borehole as a safety precaution and to prevent LFG emissions.

B. The gravel pack shall be poured or scooped through the safety screen at a rate that will not endanger the integrity of the well casing.

C. The upper and lower bentonite seals shall be formed by evenly distributing the bentonite material around the annulus of the well casing and then adding fresh water in a manner that will allow for a thorough saturation of the bentonite. The proportion of water added versus bentonite material shall be in accordance with the bentonite manufacturer's recommendations. This process shall be continued until the minimum bentonite seal thickness as specified on the Plans has been achieved.

D. Soil backfill shall be placed from the top of the lower bentonite seal to the bottom of the upper bentonite seal in a manner that will promote self compaction and avoid bridging of the soil backfill material.

E. The PVC well bore seal shall be installed in accordance with the manufacturer's recommendations around the well casing and placed at the location shown on the Plans. At a minimum, the following provisions shall be implemented during PVC well bore seal installation:
   1. The boot portion of the well bore seal shall be secured around the well casing with stainless steel straps to provide an air-tight connection. Following placement of erosion-resistant layer material, the boot shall be installed in a collapsed position above the final grade to accommodate potential settlement.
   2. Following installation, the PVC well bore seal shall be covered with the overlying GCL material or soil (temporary) if the PVC well bore seal is going to be exposed for more than three (3) working days.

F. For each completed LFG extraction well, the Design Engineer will make a record of borehole and well completion details to include the following information:
   1. Boring log summarizing materials and conditions encountered.

2. Well construction log outlining completion depths and intervals for well casing and construction materials.
3. Map showing the well location by grid coordinates and ground surface elevation.
4. Numbering system to correlate each well with its corresponding well log.

3.04 INSTALLATION OF PREFABRICATED WELL HEAD ASSEMBLIES

A. The prefabricated well head assemblies shall be handled and installed in accordance with the manufacturer's recommendations and as shown on the Plans.

B. Provisions shall be made to ensure that the well head is installed such that the interior extension tube assembly is concentric within the well casing.

C. The completion height of the well head assembly shall be 5 feet above final grade as shown on the Plans.

D. The PVC flexible hose connection between the well head and LFG collection system piping shall be installed with sufficient slack (6 to 8 inches) to accommodate expansion and contraction. "IPS Weld-On 795" plastic pipe cement, or approved equivalent, shall be used for flexible hose connections to the well head and LFG collection system piping.

3.05 ABANDONMENT OF LFG EXTRACTION WELL BOREHOLE (IF REQUIRED)

A. Boreholes approved by the Design Engineer for abandonment shall be backfilled with refuse and/or soil to the final grade and compacted. If refuse is used, the refuse should be mechanically compacted within the borehole using the bucket auger to eliminate potential voids.

B. Upon completion of borehole abandonment activities, the area around the borehole shall be restored to meet the surrounding grades as shown on the Plans.

3.06 PERFORMANCE TESTING

A. During testing of the entire LFG collection system as described in Section 15300 (Flare Station) of these Technical Specifications, the Contractor shall test the prefabricated well head assemblies to verify proper operation. The scope of testing shall include the following:
1. Testing of static and differential pressure ports with valve completely open and completely closed.
2. Operation of temperature gauge.
3. Operation of gas sample port.
4. General inspection of well head assembly, PVC flexible hose, and fittings for leaks.

B. Testing of the static and differential pressure ports and gas sample port shall be conducted using a LANDTEC GEM-2000 Analyzer or equivalent. The Contractor shall measure and record the following information for subsequent submittal to the Design Engineer:
1. Static and differential pressure (valve open and closed).
2. Temperature (valve open and closed).

3. Gas composition: methane, carbon dioxide, oxygen and balance (valve open and closed).

PART 4 MEASUREMENT AND PAYMENT

4.01 LFG EXTRACTION WELLS

A. LFG extraction wells shall be measured by the vertical linear foot installed and includes all drilling, backfilling, and materials. Payment shall be included in the Contract Unit Price per vertical linear foot installed for "LFG Extraction Wells" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the LFG extraction wells as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.02 PREFABRICATED WELL HEAD ASSEMBLIES

A. Prefabricated well head assemblies shall be measured by each assembly installed and include supply of four (4) interchangeable orifice plates for each assembly. Payment shall be included in the Contract Unit Price per each unit installed for "Prefabricated Well Head Assemblies" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the prefabricated well head assemblies as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.03 ADDITIONAL BOREHOLE SET-UP

A. Additional borehole set-up (resetting on boreholes allowed to sit overnight for water level stabilization) shall be measured by each set-up required. Payment shall be included in the Contract Unit Price per each occurrence for "Additional Borehole Set-up" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to implement an additional borehole set-up as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.04 BOREHOLE ABANDONMENT

A. Borehole abandonment shall be measured by the vertical liner foot of borehole abandoned and includes all drilling, backfilling, and materials. Payment shall be included in the Contract Unit Price per vertical linear foot of borehole drilled/backfilled for "Borehole Abandonment" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to implement each borehole abandonment as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.05 REFUSE DISPOSAL

A. Measurement and payment for disposal of refuse generated by the LFG extraction well drilling operation shall be included in the Contract Unit Price for "Refuse Disposal" addressed in Section 02222 (Excavation) of these Technical Specifications.

4.06 PERFORMANCE TESTING

A. Measurement and payment for performance testing of the prefabricated well head assemblies described in this Section shall be included in the Contract Unit Price paid for "Prefabricated Well Head Assemblies". No additional compensation will be allowed therefore.

END OF SECTION

SECTION 15200
LFG COLLECTION SYSTEM COMPONENTS

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall furnish, transport to the Work site, and install all required LFG collection system components, including PVC and HDPE pipe, fittings, and valves, flexible couplings, pipe supports and anchors, condensate drop-outs, and condensate discharge points, as shown on the Plans and in accordance with these Technical Specifications. The Contractor shall furnish all labor, supervision, tools, materials, equipment, transportation, and incidentals, including excavation and backfilling services, necessary to install the respective LFC collection system components outlined above.

M. ASTM D 3350 Standard Specification for Polyethylene Plastic Pipe and Fittings Materials.

1.04 SUBMITTALS

A. At least 14 calendar days prior to delivery of materials to the Work site, the Contractor shall provide three (3) copies of the following to the Design Engineer for approval:
   1. Manufacturer's product data sheets for the following materials to verify that the materials meet or exceed the corresponding product requirements:
      a. PVC pipe, fittings, and valves (including gasket, seal, bearing and gear materials).
      b. HDPE pipe and fittings.
      c. Vacuum test port fittings.
      d. PVC-HPDE transition coupling.
      e. Flexible couplings and band clamps.
      f. Block type pipe supports and anchors (including concrete masonry blocks, pipe clamps and miscellaneous fittings).
      g. Metal frame pipe supports (including metal frames, pipe clamps and miscellaneous fittings).
      h. Primer and paint.
   2. Manufacturer's recommended procedures for handling (transporting, unloading, storage, etc.), installation, and welding of PVC and HDPE pipe, fittings, and valves, as applicable.

B. At least 14 calendar days prior to conducting performance testing, the Contractor shall submit proposed procedures for the following to the Design Engineer for approval:
   1. Vacuum pressure test of HDPE condensate drain pipe.
   2. Gravity flow discharge test of condensate discharge points.

C. Within 14 calendar days of completion of performance testing for the respective components, the Contractor shall submit to the Design Engineer test results for the following system components:
   1. PVC LFG collection system pipe.
   2. HDPE condensate drain pipe.
   3. Condensate discharge points.

1.05 QUALITY ASSURANCE

A. Testing and Observation
   1. Testing and observation of the LFG collection system component installations shall be conducted in accordance with the CQA Plan.
   2. The Contractor shall cooperate with the CQA Monitor during observation and testing.
   3. If any portion(s) of the LFG collection system component installations is determined by the Design Engineer to not meet the requirements of this Section, based on either testing or observations, the Contractor, at his expense, shall remove and replace that portion(s) to meet the requirements of this Section as directed by the Design Engineer.

PART 2 PRODUCTS

2.01 PVC PIPE AND FITTINGS

A. PVC pipe shall meet the requirements of ASTM D 1784 and ASTM D 1785 for Schedule 40 and Schedule 80 PVC pipe. The pipe shall be manufactured from a PVC compound which meets the requirements of Cell Classification 12454-B PVC as outlined in ASTM D 1784.

B. PVC fittings shall meet the requirements of ASTM D 2464, ASTM D 2466, and ASTM D 2467 for Schedule 40 and Schedule 80 PVC pipe fittings. Fittings unavailable in Schedule 40 may be replaced with Schedule 80. The fittings shall be manufactured from a PVC compound which meets the requirements of Cell Classification 12454-B PVC as outlined in ASTM D 1784.
   1. Fittings shall be industrial, heavy duty, hub style.
   2. Socket fittings shall be pressure rated as for the corresponding pipe size prescribed by ASTM D 1785. Threaded fittings shall be pressure rated at 50 percent of the rating for socket fittings.
   3. *Flanges:* Flanges shall meet the following specifications:
      a. Flanges shall be one-piece solid design or two-part van stone type which use the tapered, serrated face and full-face gasket technique for joining and are comparable with ANSI B16.5 Class 150 metal flanges.
      b. Flanges shall be non-shock and pressure rated at 150 psi for water service at 73ºF, and have a minimum burst requirement of 3.3 times the rate pressure.
      c. Bolts shall be Type 316 stainless steel ASTM A 193, Grade B8M hex head and nuts shall be ASTM A 194, Grade 8m hex head.
      d. Gaskets shall be full-face neoprene.

4. *Branch Saddles:* Branch saddles shall either be socket style affixed using PVC cement or clamp-on style secured using stainless steel screws.

2.02 PVC BUTTERFLY VALVES (ISOLATION VALVES)

A. Butterfly valves used for isolating LFG collection system piping segments shall be wafer-type design with a body and disc manufactured from a PVC compound which meets the requirements of Cell Class 12454-B PVC as outlined in ASTM D 1784 and shall be compatible with associated PVC pipe fittings. The PVC butterfly valves shall also meet the following material and performance specifications:

1. Shaft shall be cadmium-plated steel alloy or 300 series stainless steel, positively attached to the disc, and totally sealed from exposure to the process gas or environment. The shaft shall also have a directional indicator on top to indicate disc position with handle removed.
2. Valve body shall be of the wafer design for ease of installation and maintenance and shall be compatible with ANSI B16.5 Class 150 metal flanges.
3. Seat material shall be Viton.
4. Bearings shall be corrosion resistant TFE or polypropylene 20 percent glass filled.
5. Secondary seal material shall be Viton and correspond to the seat material for maximum chemical resistance.
6. Handles and worm gear operators shall be corrosion resistant.
7. Valves shall be non-shock, rated at 150 psi for water service at 73°F, and have a minimum burst requirement of 3.3 times the rate pressure.

2.03 PVC BALL VALVES

A. PVC ball-type valves shall be designed with the major components manufactured from a PVC compound which meets the requirements of Cell Class 12454-B PVC as outlined in ASTM D 1784 and shall be compatible with associated PVC pipe fittings. The PVC ball valves shall also meet the following material and performance specifications:

1. Ball seats shall be virgin TFE and the stem/body seals and seat energizers shall be Viton.
2. PVC socket type connectors shall conform to the requirements of ASTM D 2466 and ASTM D 2467.
3. Threaded type connectors shall conform to the requirements of ASTM D 2466 and ASTM D 2464 and ANSI B1.20.1 for tapered pipe threads.
4. The valve assembly shall be of construction such that a two-piece body is screwed together to contain seats which are maintained under compressive load against the ball.
5. Valves shall be non-shock, rated at 150 psi for water service at 73ºF, and have a minimum burst requirement of 3.3 times the rated working pressure.

2.04 PVC GATE VALVES

A. PVC gate-type valves shall be designed with the major components manufactured from a PVC compound which meets the requirements of Cell Class 12454-B PVC as outlined in ASTM D 1784 and shall be compatible with associated PVC pipe

fittings. The PVC gate valves shall also meet the following material and performance specifications:

1. Seals shall be Viton.
2. PVC socket type connectors shall conform to the requirements of ASTM D 2466 and ASTM D 2467.
3. Threaded type connectors shall conform to the requirements of ASTM D 2466 and ASTM D 2464 and ANSI B1.20.1 for tapered pipe threads.
4. Valve wedge shall be constructed of polypropylene and have strain-equalizing threads.
5. Valves shall be non-shock, rated at 150 psi for water service at 73ºF, and have a minimum burst requirement of 3.3 times the rated working pressure.

2.05 PVC CEMENT

A. PVC cements shall meet the requirements of ASTM D 2564 for solvent cemented PVC joints.

2.06 VACUUM/SAMPLE TEST PORTS

A. Vacuum/sample test ports for the LFG collection system piping and ClosureTurf™ collection foot assemblies shall be 1/8-inch flow, ¼-inch threaded polypropylene quick disconnect couplings.

2.07 HDPE PIPE AND FITTINGS

A. HDPE pipe and fittings for the condensate drain piping shall be SDR 9 and rated PE 3408 by the Plastics Pipe Institute. The HDPE pipe shall have a cell classification per ASTM D 3350 of 345444C

B. HDPE pipe and fittings shall meet the following criteria:
   1. The nominal inside diameter of the HDPE pipe shall be true to the pipe size shown on the Plans in accordance with ASTM D 2513.
   2. HDPE fittings for use in laying pipe shall have standard dimensions that conform to ASTM D 3261.
   3. Where possible, HDPE pipe and fittings should be produced by the same manufacturer from identical materials meeting the requirements of this specification. Special or custom fittings may be exempted from this requirement.

2.08 PVC-HDPE TRANSITION COUPLING

A. The PVC-HDPE transition coupling used in the condensate discharge point assemblies to the existing leachate drain shall be Series 735 transition couplings manufactured by Poly-Cam, Inc. [(763) 786-6682], or approved equivalent.

2.09 FLEXIBLE COUPLINGS

A. Flexible couplings shall be 4, 6, or 8 inches in diameter by 18 inches long (Model # LFG44) as manufactured by Snook, Inc. [(2310 799-3333], or approved equivalent.

B. Band clamps used to secure the flexible couplings shall be stainless steel.

2.10 BLOCK TYPE PIPE SUPPORTS AND ANCHORS

A. Blocks for pipe supports and anchors shall be 8” x 8” x 16” masonry blocks.

B. The masonry blocks for the pipe supports shall be equipped with a 2” x 8” redwood cap and #4 rebar stakes covered with rubber hose.

C. Metal frames for the pipe anchors shall be 1-5/8-inch hot-dipped galvanized carbon steel as manufactured by UNISTRUT® (Part No. P1000HS[HG]), or approved equivalent.

D. Pipe clamps shall be galvanized carbon steel and as shown on the Plans.

E. Miscellaneous fittings (i.e., angle braces, bolts, nuts and washers) shall be zinc-coated carbon steel and conform to ASTM A 325.

2.11 METAL FRAME PIPE SUPPORTS

A. Metal frames for pipe supports shall be 1-5/8-inch hot-dipped galvanized carbon steel as manufactured by UNISTRUT® (Part No. P1000HS[HG]), or approved equivalent.

B. Pipe clamps shall be galvanized carbon steel and as shown on the Plans.

C. Miscellaneous fittings (i.e., angle braces, bolts, nuts and washers) shall be zinc-coated carbon steel and conform to ASTM A 325.

2.12 CORRUGATED METAL PIPE (CMP)

A. CMP for pipe supports/drainage for the Type 1 and 3 roadcrossings shall be of 16 gauge CMP continuous helical lock steel conforming to the requirements of Section 66-3 of the Standard Specifications. All CMP shall be galvanization compatible and conform to the requirements of Section 66-3.02 of the Standard Specifications for zinc coated steel.

2.13 STEEL PIPE PROTECTIVE SLEEVES

A. Steel pipe protective sleeves used for the Type 1 and 3 road crossings shall conform to ASTM A53.

2.14 REINFORCED CONCRETE PIPE (RCP) PROTECTIVE SLEEVE

A. The RCP protective sleeve used for the Type 2 road crossing shall conform to ASTM C76, Class III with mesh reinforcement; minimum wall thickness not less than 1.75 inches; steel areas not less than 0.06 square inches per linear foot of pipe barrel; bell and spigot end joints.

2.15 CONCRETE

A. Concrete for block type pipe supports/anchors and metal frame pipe supports shall conform to the requirements of Section 03300 (Concrete) of these Technical Specifications.

2.16 PIPE BEDDING

A. Pipe bedding for buried header crossings shall conform to the requirements of Section 02207 (Aggregate Materials) of these Technical Specifications.

2.17 ENGINEERED FILL

A. Engineered fill for buried header crossings and road crossings shall conform to the requirements of Section 02224 (Engineered Fill) of these Technical Specifications.

PART 3 EXECUTION

3.01 GENERAL

A. The alignment and locations of the LFG collection system components will be staked by the Design Engineer prior to installation.

B. PVC and HDPE pipe, fittings, and valves shall be installed by skilled laborers experienced in installation of such materials.

C. All exposed PVC pipe and fittings shall be painted.

3.02 LFG COLLECTION SYSTEM PIPING

A. LFG collection system piping, including flexible couplings, isolation valves and condensate drop-out points, shall be installed as shown on the Plans.

B. All PVC pipe, fittings and valves shall be handled carefully in loading and unloading, and in such a manner as to avoid shock during placement. PVC pipe, fittings and valves shall not be dropped or dumped.

C. Prior to painting and installation, all PVC pipe, fittings and valves shall be inspected for cuts, scratches, or other damages. Pipe, fittings and valves with imperfections shall not be used.

D. Prior to installation, all PVC pipe and fittings to be left exposed shall be steam cleaned and allowed to dry, then painted with an undercoat coat of high-quality, water-based exterior latex primer, followed by a topcoat of high-quality, ultra-violet resistant, water-based exterior latex paint. The pipe shall be painted to within 6 inches of each end of the pipe section length. Light sanding may be necessary to achieve an acceptable bond. The paint shall be medium gray or white in color, or as specified by the City. Within 24 hours of cleaning, the first coat shall be applied followed by the second coat no more than 48 hours after the first coat has dried. The pipe joints shall be painted in this manner after installation.

E. PVC pipe, fittings and valves shall be joined with socket and solvent cement welding in accordance with ASTM D 2855. Joining of PVC pipe, fittings and valves shall be in accordance with these specifications and the pipe manufacturer's recommendations.

F. All PVC pipe cuts shall be square and perpendicular to the centerline of the pipe. In addition, PVC pipe ends shall be beveled prior to applying primer and solvent cement so that the primer or cement are not wiped off during insertion into the fitting socket.

G. All burrs, chips, etc. generated as a result of cutting operations shall be removed from the pipe interior and exterior. In addition, the inside of the piping shall be kept clean of dirt and debris. Piping left overnight shall be capped.

H. A coating of CPS primer as recommended by the PVC pipe supplier shall be applied to the entire interior surface of the fitting socket, and to an equivalent area on the exterior of the pipe prior to applying solvent cement.

I. The solvent cement shall comply with the requirements of ASTM D 2564 and shall be applied in strict accordance with manufacturer's specifications.

J. PVC pipe, fittings and valves shall not be primed or solvent welded when it is raining or when ambient temperature is below 40°F or above 100°F.

K. After solvent welding, the PVC pipe, fittings and valves shall remain undisturbed until cement has thoroughly set. As a guideline for joint setting time, use 1 hour for ambient temperatures 60°F to 100°F, or 2 hours when ambient temperature is 40°F to 60°F.

L. Flexible couplings shall be installed at the locations shown on the Plans. The flexible couplings shall be installed per the pipe separation criteria specified in the Plans based on the ambient temperature at the time of installation. The stainless steel band clamps shall be secured around the ends of the flexible coupling in such a manner as to provide an air-tight joint.

M. Vacuum/sample test ports shall be installed at the locations and orientations shown on the Plans. The ports shall be installed by drilling and tapping an appropriate sized hole in the LFG collection pipe to allow insertion of the threaded quick disconnect coupling. The ports shall be installed currently with the LFG collection pipe installation and near the end of pipe sections (but not within coupled joints) to facilitate the removal of PVC shavings introduced into the pipe by the drilling/tapping process.

N. Block type pipe supports shall be installed under all pipe segments located on benches. The block type pipe supports shall be spaced at 6 feet on-center (maximum) along the full length of the pipe segments.

O. Block type pipe anchors shall be installed every 50 linear feet (minimum) of LFG collection system piping, as well as at the locations of all tee, elbow and wye fittings (both ends, but not on the fittings themselves). Pipe clamps shall be secured around the LFG header system pipe to ensure that the pipe does not move. Securing of the pipe clamps shall be done in such a manner as to not damage the pipe. No portion of the fittings and flexible couplings shall rest on the block type pipe anchors.

P. Strap type pipe anchors shall be installed at various locations as shown on the Plans to prevent movement associated with thermal expansion. Strap type pipe anchors shall be installed per the Plans and in accordance with the manfucturer’s recommendations.

Q. Metal frame pipe supports shall be installed at channel crossings and near the flare station at the locations shown on the Plans. The pipe supports shall be spaced at 6 feet on-center (maximum) along the full length of the designated spans. Concrete for the pipe supports shall be batched and placed in accordance with the requirements of Section 03300 (Concrete) of these Technical Specifications. The height of cross-bar pipe supports shall be adjusted as appropriate to ensure positive slope of LFG collection system piping.

3.03 BURIED HEADER CROSSINGS

A. Trenching across bench sections shall be to the depth and dimensions shown on the Plans. *Do not excavate deeper than necessary to avoid or minimize the volume of refuse that may be encountered*.

B. Pipe bedding material and LFG collection system piping shall be placed to the dimensions shown on the Plans. LFG collection system piping shall be sloped as shown on the Plans to maintain proper condensate drainage capabilities. The pipe bedding shall be placed in accordance with the requirements of Section 02225 (Trenching and Backfilling) of these Technical Specifications

C. The remainder of trench shall be backfilled with engineered fill in accordance with the requirements of Section 02225 (Trenching and Backfilling) of these Technical Specifications and as shown on the Plans.

3.04 ROAD CROSSINGS

A. CMP used for pipe support/drainage and the steel pipe/RCP protective sleeves shall be installed in the orientations shown on the Plans. The CMP shall be aligned with the center line of the drainage swale.

B. A small section of reinforcement geotextile used in the access road construction shall be wrapped around the steel pipe protective sleeve where it will be in direct contact with the underlying pipe support/drainage CMP in order to provide a cushion between the two pipes.

C. LFG collection system piping shall be inserted through the steel pipe/RCP protective sleeves in a manner that will not damage or compromise the LFG collection system piping.

D. Engineered fill shall be placed around and over the CMPs and protective sleeves as shown on the Plans and in accordance with the requirements of Section 02224 (Engineered Fill) of these Technical Specifications.

E. The final surface of the road crossing shall be completed in accordance with the requirements of Section 02310 (Access Roads) of these Technical Specifications and as shown on the Plans.

3.05 CONDENSATE DRAIN PIPE AND FITTINGS

A. The HDPE pipe and fitting manufacturer shall package products for shipment in a manner suitable for safe transport and shall be subsequently handled in accordance with the manufacturer's recommendations.

B. Prior to installation, all HDPE pipe and fittings shall be inspected for cuts, scratches, or other damages. Pipe and fittings with imperfections shall not be used.

C. Trench excavation and backfill for buried HDPE pipe and fittings shall be as shown on the Plans.

D. HDPE pipe connection ends and fittings shall be joined by butt fusion procedures in accordance with the HDPE pipe and fitting manufacturer's recommended procedures.

E. The Contractor shall not bend the HDPE pipe to a degree greater than the minimum radius recommended by the manufacturer.

F. The HDPE pipe shall not be subjected to strains that will overstress or buckle piping or impose excessive stress on joints.

G. Open ends of fused HDPE pipe shall be covered or capped at the end of each working day to prevent entry by animals or debris.

H. For segments completed above ground, provide sufficient slack to allow for thermal expansion and contraction so as to not promote excessive stress on the piping following installation.

I. For segments completed below ground, the Contractor shall allow for thermal expansion or contraction of the HDPE pipe within the trench and coordinate pipe backfill operations to avoid buildup of thermal stresses. Whenever possible, segment tie-ins shall be completed within the trench to prevent overstressed conditions.

J. Following placement of HDPE pipe, sufficient time shall be allowed (per manufacturer's recommendations) for the pipe to adjust to trench temperature prior to testing, segment tie-ins, or backfilling activities.

3.06 CONDENSATE DROP-OUTS

A. Condensate drop-outs, including u-trap assemblies, shall be installed at the locations and to the dimensions shown on the Plans. *Do not excavate deeper than necessary to avoid or minimize the volume of refuse that may be encountered.*

B. The transition from PVC to HDPE shall be at the flange connection as shown on the Plans.

C. PVC and HDPE pipe, fittings and valves shall be installed in accordance with Part 3.02 (LFG Collection System Piping) and Part 3.05 (Condensate Drain Pipe and Fittings) of this Section.

D. Strap type pipe anchors shall be installed at various points on the u-trap piping as shown on the Plans to prevent movement associated with thermal expansion. Strap type pipe anchors shall be installed per the Plans and in accordance with the manfucturer's recommendations.

E. Following construction of u-trap assemblies and prior to start of LFG collection system operations, the u-trap assemblies shall be filled with clean water.

3.07 CONDENSATE DISCHARGE POINTS

A. Condensate discharge points shall be installed at the locations and to the dimensions shown on the Plans.

B. Soil and/or refuse shall be excavated to expose the existing condensate drain. If refuse is encountered, the refuse shall be removed and disposed of in accordance with Section 02222 (Excavation) of these Technical Specifications.

C. When entering excavations to install branch saddles, miscellaneous piping and/or backfill materials, the Contractor's Health and Safety Plan shall be followed accordingly, including trench safety, LFG hazards and possible confined space entry (i.e., oxygen-deficient atmosphere).

D. PVC and HDPE pipe and fittings shall be installed in accordance with Part 3.02 (LFG Collection System Piping) and Part 3.05 (Condensate Drain Pipe and Fittings) of this Section.

E. For condensate discharge points located within the limits of the final cover system, the respective final cover system components shall be placed and installed in accordance with Sections 02240 (Foundation Layer), 02772 (Geomembrane), and 02773 (Engineered Turf) of these Technical Specifications. Portions below the final cover system shall be backfilled in accordance with Section 02225 (Trenching and Backfilling) of these Technical Specifications.

F. For condensate discharge points located outside the limits of the final cover system, the excavation shall be backfilled in accordance with Section 02225 (Trenching and Backfilling) of these Technical Specifications.

3.08 PERFORMANCE TESTING

A. *PVC LFG Collection System Pipe:* After all PVC pipe and fittings have been joined, including flexible couplings, all connections shall be visually inspected to verify that the connections are securely intact. Tension on the stainless steel straps for the flexible couplings shall also be checked to ensure that the ends of the flexible couplings are adequately secured to the LFG collection system piping and that the tension within the flexible couplings is appropriate based on the given ambient temperature.

B. *HDPE Condensate Drain Pipe:* Before the HDPE condensate drain pipe is connected to the PVC piping system and existing leachate drain, each HDPE condensate drain pipe segment shall be tested and withstand a minimum of 5 psig vacuum for a period of not less than 10 minutes without any drop in pressure. Vacuum shall be measured by a

mercury manometer, slope gauge, or an equivalent device calibrated to read increments of not greater than 0.1 psi. The source of the vacuum shall be isolated before the test is made. Testing shall be performed prior to backfilling segments of the HDPE condensate drain pipe that are to be buried. It shall be the Contractor's responsibility to ensure that proper safety precautions are observed during the testing.

C. *Condensate Discharge Points:* After the HDPE condensate drain pipe is connected to the leachate drain but prior to connecting it to PVC piping system, the functionality of each HDPE condensate drain pipe segment shall be tested to verify each segment's ability to transmit water to the existing leachate drain. Testing shall include introducing water at the uppermost point (i.e., highest elevation) of each segment and verifying the influx of water into the existing leachate drain utilizing the closest downgradient manhole as the point of observation.

PART 4 MEASUREMENT AND PAYMENT

4.01 LFG COLLECTION SYSTEM PIPING

A. PVC pipe and fittings for the LFG collection system piping shall be measured by the linear foot of each for each size of pipe installed and includes all fittings. Payment shall be included in the Contract Unit Price per linear foot installed for "PVC Pipe and Fittings" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the PVC pipe and fittings as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

B. Isolation valves shall be measured by each isolation valve installed. Payment shall be included in the Contract Unit Price per each unit installed for "Isolation Valves" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the isolation valves as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

C. Flexible couplings shall be measured by each flexible coupling installed. Payment shall be included in the Contract Unit Price per each unit installed for "Flexible Couplings" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the flexible couplings as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

D. Vacuum test ports shall be measured by each vacuum test port installed. Payment shall be included in the Contract Unit Price per each unit installed for "Vacuum Test Ports" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the vacuum test ports as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore

E. Block type pipe supports shall be measured by each block type pipe support installed. Payment shall be included in the Contract Unit Price per each unit installed for "Block Type Pipe Supports" addressed in this Section and shall include full compensation for

providing all materials, labor, equipment, tools, and incidentals required to install the block type pipe supports as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

F. Block type pipe anchors shall be measured by each block type pipe anchor installed. Payment shall be included in the Contract Unit Price per each unit installed for "Block Type Pipe Anchors" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the block type pipe anchors as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

G. Strap type pipe anchors shall be measured by each strap type pipe anchor installed. Payment shall be included in the Contract Unit Price per each unit installed for "Strap Type Pipe Anchors" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the strap type pipe anchors as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

H. Metal frame pipe supports installed within the waste boundary shall be measured by each metal frame pipe support installed and includes all fittings and concrete post footings. Payment shall be included in the Contract Unit Price per each unit installed for "Metal Frame Pipe Supports – Within Waste Boundary" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the metal frame pipe supports within the waste boundary as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

I. Metal frame pipe supports installed outside the waste boundary shall be measured by each metal frame pipe support installed and includes all fittings and concrete post footings. Payment shall be included in the Contract Unit Price per each unit installed for "Metal Frame Pipe Supports – Outside Waste Boundary" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the metal frame pipe supports outside the waste boundary as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

J. The buried header crossing shall be measured by each buried header crossing installed and includes all trenching and backfill materials. *PVC pipe and fittings for the LFG collection system piping are not included in this payment as they are addressed separately.* Payment shall be included in the Contract Unit Price per each unit installed for "Buried Header Crossing" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the buried header crossing as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

K. Road crossings shall be measured by each road crossing (Type 1, 2, or 3) installed and includes all trenching, steel pipe/RCP protection sleeves, pipe support/drainage CMPs, and backfill materials. *PVC pipe and fittings for the LFG collection system piping and reinforcement geotextile/aggregate base associated with the access road construction are*

not included in this payment as they are addressed separately. Payment shall be included in the Contract Unit Prices per each unit installed for "Type 1 Road Crossings", "Type 2 Road Crossing" and "Type 3 Road Crossing" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the road crossings as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.02 CONDENSATE DRAIN PIPING

A. HDPE pipe and fittings for the condensate drain piping shall be measured by the linear foot installed and includes all fittings. *HDPE pipe and fittings for the condensate drop-outs and condensate discharge points are not included in this payment as they are addressed separately* Payment shall be included in the Contract Unit Price per linear foot installed for "Condensate Drain Piping" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the condensate drain piping as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.03 CONDENSATE DROP-OUTS

A. Condensate drop-outs, including u-trap assemblies, shall be measured by each condensate drop-out installed. Payment shall be included in the Contract Unit Price per each unit installed for "Condensate Drop-outs" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the condensate drop-outs as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.04 CONDENSATE DISCHARAGE POINTS

A. Condensate discharge points shall be measured by each condensate discharge point installed. Payment shall be included in the Contract Unit Price per each unit installed for "Condensate Discharge Points" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the condensate discharge points as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.05 PERFORMANCE TESTING

A. Measurement and payment for performance testing of the various LFG collection system components described in this Section shall be included in the Contract Unit Price paid for the various items of Work for which they are required. No additional compensation will be allowed therefore.

END OF SECTION

SECTION 15300
FLARE STATION

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall assemble all required flare station components and associated appurtenances and implement improvements as shown on the Plans and in accordance with these Technical Specifications, including: installation of a skid-mounted packaged combustion system; installation of condensate drainage line between the skid-mounted packaged combustion system and leachate wet well; completion of all electrical, telephone, and mechanical connections; installation of security fencing; and placement of aggregate base within and around the flare station area as shown on the Plans.

B. The Contractor shall furnish all labor, supervision, tools, materials, equipment, and incidentals necessary to assemble all required flare station components and associated appurtenances, including all required piping, fittings, and connections.

C. The Contractor shall not begin flare station assembly activities requiring hookup to the LFG collection system until performance testing of that system is completed in accordance with Section 15100 (Landfill Gas [LFG] Extraction Wells) and Section 15200 (LFG Collection System Components) of these Technical Specifications.

D. The Owner will be responsible for purchasing and arranging delivery of the skid-mounted packaged combustion system. The actual plans and specifications for these units are not currently available. Based on this circumstance, the design plans, specifications, and installation instructions for the aforementioned system will be supplied to the Contractor a minimum of six (6) weeks prior to commencement of the scheduled LFG collection system installation activities. The Contractor shall be responsible for reviewing the design plans, specifications, and installation instructions in a timely manner and furnishing all necessary materials required to complete the Work in accordance with the approved Construction Schedule.

E. The Contractor shall be responsible for mechanical and electrical assembly and connections of the skid-mounted packaged combustion system. As noted above, actual plans and specifications for these units are not currently available. Based on these circumstances, an assumed scope of work has been developed based on the Design Engineer's experience on similar projects. Whereas the assumed scope of work presented herein is considered representative of what the assembly will entail, the actual work scope is subject to minor revisions based on requirements specified by the selected flare manufacturer.

F. Assembly of the skid-mounted packaged combustion system will require use of a 5 ton crane. The crane will also be required for unloading the skid-mounted packaged combustion system upon its delivery to the Work site. The Contractor shall be responsible for furnishing and operating the crane to implement these tasks. The Design

Engineer or Owner will coordinate the delivery schedule of the skid-mounted packaged combustion system with the Contractor.

G. A representative of the manufacturer of the skid-mounted packaged combustion system will be present during start-up and troubleshooting of the system. Written approval of the system installation and operation by the manufacturer will be required prior to Owner's acceptance of the flare station components. The Owner will pay for the manufacturer's inspection services under the provisions and requirements of this Section.

1.03 APPLICABLE STANDARDS AND SPECIFICATIONS

A. ASTM D 1557 Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Modified Effort (56,000 ft-lbf/ft^3 [2,700 kN-m/m^3]).

1.04 SUBMITTALS

A. At least 14 calendar days prior to commencement of flare station assembly, the Contractor shall submit to the Design Engineer copies of any building permits (if required) issued by the local governing agency.

B. Within 14 calendar days of completion of flare station assembly, the Contractor shall submit to the Design Engineer copies of any building inspection reports (if required) issued by the local governing agency.

C. At least 14 calendar days prior to conducting performance testing, the Contractor shall submit proposed procedures for the following to the Design Engineer for approval:
   1. Skid-mounted packaged combustion system operation.
   2. Hydrostatic pressure test of PVC condensate discharge pipe.

D. Within 14 calendar days of completion of performance testing for the respective components, the Contractor shall submit to the Design Engineer test results for the following system components:
   1. Skid-mounted packaged combustion system.
   2. PVC condensate discharge pipe.

1.05 QUALITY ASSURANCE

A. Testing and Observation
   1. Testing and observation of the flare station components shall be conducted in accordance with the CQA Plan.
   2. The Contractor shall cooperate with the CQA Monitor during observation and testing.
   3. If any portion(s) of the flare station components is determined by the Design Engineer to not meet the requirements of this Section, based on either testing or observations, the Contractor, at his expense, shall fix that portion(s) to meet the requirements of this Section as directed by the Design Engineer.
   4. Abraded and otherwise damaged portions of shop-applied paint shall be cleaned and repainted per the flare manufacturer's recommendations. Welded seams and other un-coated surfaces, heads and nuts of field-installed bolts, and surface where paint was damaged during installation shall be given a coat of specified primer, followed by top coat paint once the primer has completely dried.

PART 2 PRODUCTS

2.01 SKID-MOUNTED PACKAGED COMBUSTION SYSTEM

A. The skid-mounted packaged combustion system will be furnished by the Owner. In general, the system will be comprised of the following primary equipment components:
   1. *Primary Skid Assembly* (AISC designed) housed on a galvanized structural steel skid. This skid will be installed on the eastern flare station concrete pad as shown on the Plans. Primary equipment components mounted to the skid include:
      a. Gas-liquid separator.
      b. Two (2) centrifugal blowers equipped with TEFC electric motors and variable frequency drive.
      c. 4-inch to 8-inch diameter LFG process piping (stainless steel or HDPE) equipped within an automatic block valve.
      d. Control station assembly that includes a self-supporting steel rack with a weather-proof control panel, main power supply disconnect, power transformer, and pilot gas control system.
   2. *Totally-Enclosed Vertical Ground Flare* constructed of A-36 carbon steel. The flare will be installed on the western flare station concrete pad as shown on the Plans. The flare stack diameter will be 4 feet (estimated) with an overall height of approximately 30 feet (estimated). Primary equipment components mounted to the skid include:
      a. One (1) or two (2) combustion air dampers.
      b. Self-checking ultra-violet flame scanner.
      c. Purge air blower.
      d. Thermocouples.
   3. *Miscellaneous Appurtenances* including a flow meter, inlet flame arrestor, continuous chart recorder, and an automatic telephone dialer system.
   4. All piping, conduit and manual valves are pre-piped/pre-wired to the greatest extent possible and are mounted within the skid boundaries.

2.02 ELECTRICAL CONDUIT, WIRE AND FITTINGS

A. Electrical conduit, wire, and fittings for the flare station shall conform to the requirements of Section 15400 (Flare Station Electrical and Telephone Feed) of these Technical Specifications.

2.03 PVC PIPE, FITTINGS AND BALL VALVE

A. PVC pipe, fittings and ball valve for the condensate drainage line between the skid-mounted packaged combustion system and leachate wet well shall conform to the requirements of Section 15200 (LFG Collection System Components) of these Technical Specifications.

2.04 PIPE BEDDING

A. Pipe bedding for the buried portion of the condensate drainage line shall conform to the requirements of Section 02207 (Aggregate Materials) of these Technical Specifications.

2.05 TRENCH BACKFILL

A. Backfill for the buried portion of the condensate drainage line shall conform to the requirements of Section 02225 (Trenching and Backfilling) of these Technical Specifications.

2.06 CHAIN LINK FENCE

A. Chain link fence materials for the security fence shall conform to the requirements of Section 80-4.01 of the Standard Specifications and as shown on the Plans.

2.07 CONCRETE

A. Concrete for the security fence post footings shall conform to the requirements of Section 03300 (Concrete) of these Technical Specifications.

2.08 AGGREGATE BASE

A. Aggregate base placed on the completed ground surface within and around the flare station shall conform to the requirements of Section 02207 (Aggregate Materials) of these Technical Specifications.

PART 3 EXECUTION

3.01 FLARE STATION ASSEMBLY

A. All required building permits, fees, and inspections shall be arranged and paid for by the Contractor.

B. Assembly of the flare components shall be performed by skilled laborers experienced in installation of similar equipment.

C. The skid-mounted packaged combustion system shall be installed in strict accordance with the manufacturer's specifications. Design drawings and installation instructions will be provided to the Contractor upon selection of the flare manufacturer. In general, installation of the skid-mounted packaged combustion system will include the following tasks:

1. *Mechanical Assembly*
   a. Mount/anchor the primary skid assembly and totally-enclosed vertical ground flare to the concrete slabs.
   b. Connect inlet flame arrestor to the totally-enclosed vertical ground flare.
   c. Connect LFG process piping from the primary skid assembly to the flame arrestor.
   d. Mount thermocouples (three or four) onto the totally-enclosed vertical ground flare (elevated).
   e. Connect the LFG collection system header pipe from the wellfield to the primary skid assembly.
2. *Electrical Assembly*
   a. Connect main power supply, telephone line, and conduit to the control station assembly.
   b. Connect thermocouple wire and conduit between the thermocouples (elevated) and the control station assembly.

D. Abraded and otherwise damaged

3.02 CONDENSATE DRAINAGE LINE

A. Trenching and pipe bedding placement shall conform to the requirements of Section 02225 (Trenching and Backfilling) of these Technical Specifications.

B. Handling and installation of the PVC pipe, fittings and ball valve shall conform to the requirements of Section 15300 (LFG Collection System Components) of these Technical Specifications.

C. The condensate drainage line shall be installed at a minimum slope of 1 percent in the direction of the leachate wet well.

D. The wall of the leachate wet well shall be penetrated at the appropriate depth by coring or other means to allow for insertion of the condensate drainage line. The annular space between the condensate drainage line and the wall of the leachate wet well shall be sealed using non-shrink grout.

E. Following placement of pipe bedding material, the remainder of the trench shall be backfilled in accordance with the requirements of Section 02225 (Trenching and Backfilling) of these Technical Specifications.

3.03 SECURITY FENCE

A. The chain link fence and gates shall be installed as shown on the Plans and in accordance with the requirements of Section 80-4.02 of the Standard Specifications.

B. All line, corner, and gate post assemblies shall be constructed with concrete post footings in accordance with the requirements of Section 03300 (Concrete) of these Technical Specifications.

C. Soil between fence posts shall be leveled to create a 2-inch clearance under the fence fabric.

3.04 FLARE STATION AGGREGATE BASE

A. Aggregate base within and around the flare station shall be placed to the dimensions shown on the Plans.

B. The aggregate base shall be spread in uniform loose lifts not exceeding 8 inches in thickness.

C. The aggregate base shall be moisture conditioned to within 1 to 3 percentage points of optimum moisture content, and compacted to a minimum of 95 percent of maximum dry density per ASTM D 1557. The final compacted thickness shall be a minimum of 6 inches.

3.05 PERFORMANCE TESTING

A. *Skid-Mounted Packaged Combustion System:* The skid-mounted packaged combustion system shall be tested to verify proper operation in accordance with the manufacturer's recommendations. Performance testing shall be supervised by the flare manufacturer's on-site inspector and shall encompass all aspects of system operations, including but not limited to the verification of proper operation of the following components:

1. Gas-liquid separator.
2. Blowers.
3. Automatic ignition and pilot gas control system.
4. Automatic temperature controls, including thermocouples and actuated louver assembly.
5. Automatic block valve operation.
6. Flow meter and continuous chart recorder.
7. Control panel gauges and indicator lighter.
8. Safety shut-down and alarm systems, including automatic telephone dialer system.

Written approval from the flare manufacturer's representative for the system installation and operation will be required prior to the Owner's acceptance of the flare station components. The written approval shall certify that the equipment was properly installed and connected, is in accurate alignment, and is free of undue stress imposed by piping or mounting bolts. The performance testing and acquisition of the manufacturer's approval shall be done within a 3-day work period.

During performance testing of the flare station, the entire LFG collection system well field shall be visually inspected to identify any problems or breaks in the system that may have resulted from system operations.

B. *Condensate Drainage Line:* The PVC condensate drainage line between the flare station and existing leachate wet well shall be hydrostatically pressure tested in accordance with the pipe manufacturer's recommended procedures. It shall be the Contractor's responsibility to ensure that proper safety precautions are observed during the testing.

PART 4 MEASUREMENT AND PAYMENT

4.01 FLARE STATION ASSEMBLY

A. Measurement and payment for flare station assembly shall be included in the Contract Lump Sum Price for "Flare Station Assembly" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, general electrical work, and incidentals required to assemble the flare station as shown on the Plans, as specified herein and within the flare manufacturer's specifications, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.02 CONDENSATE DRAINAGE LINE

A. Measurement and payment for the condensate drain line shall be included in the Contract Lump Sum Price above for "Flare Station Assembly" of this Section. No additional compensation will be allowed therefore.

4.03 SECURITY FENCE

A. Security fencing for the flare station shall be measured by the linear foot installed and includes all posts, chain link fence fabric, gates, slats and fittings. Payment shall be included in the Contract Unit Price per linear foot installed for "Security Fencing" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the security fence as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.04 FLARE STATION AGGREGATE BASE

A. Aggregate base placed within and around the flare station shall be measured by the square foot installed. Payment shall be included in the Contract Unit Price per square foot installed for "Flare Station Aggregate Base" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the aggregate base as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.05 PERFORMANCE TESTING

A. Measurement and payment for performance testing of the skid-mounted packaged combustion system and condensate discharge pipe described in this Section shall be

included in the Contract Lump Sum Price paid for "Flare Station Assembly". No additional compensation will be allowed therefore.

END OF SECTION

SECTION 15400
FLARE STATION ELECTRICAL AND TELEPHONE FEED

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall furnish and install the electrical and telephone feed for the flare station as shown on the Plans and in accordance with these Technical Specifications, which includes extending electrical and telephone services from the existing service point locations to the flare station control panel. The Contractor shall furnish all labor, tools, supervision, equipment, and materials necessary to provide the flare station electrical and telephone feed.

B. The Owner will be responsible for upgrading the power supply at the existing electrical service point shown on the Plans to accommodate the following power requirements for the flare station: 480 volts, 3 phase, 60 hertz, 100 amps, and 35 HP. In addition, the Owner will be responsible for extending telephone service to the service point shown on the Plans.

1.02 APPLICABLE STANDARDS AND SPECIFICATIONS

A. California Administrative Code (CAC) - Title 24.

B. County Ordinances.

C. National Electrical Code (NEC).

D. National Electrical Manufacturer's Association (NEMA).

E. National Fire Protection Association (NFPA).

F. Underwriters Laboratory Inc. (UL).

1.03 SUBMITTALS

A. At least 14 calendar days prior to delivery of materials to the Work site, the Contractor shall submit the following to the Design Engineer for approval:

1. Name and location of source, product data sheets, and manufacturer's installation instructions for the following materials to verify that the materials meet or exceed the product requirements specified herein:
    a. Wire.
    b. Conduit and fittings.
    c. Meter socket.
    d. Pull boxes.
    e. Panel.
    f. Junction and outlet boxes.

B. At least 14 calendar days prior to commencement of a specific task, the Contractor shall submit to the Design Engineer copies of electrical permits (if required) issued by the local governing agency.

C. Within 14 calendar days of completion of all electrical work, the Contractor shall submit to the Design Engineer copies of electrical inspection reports (if required) issued by the local governing agency.

1.04 QUALITY ASSURANCE

A. Testing and Observation
1. The Contractor shall notify the Design Engineer of progress of all Work in order that the Design Engineer may make the appropriate site inspections.
2. The Contractor shall cooperate with the Design Engineer during testing and observation.
3. If any portion(s) of the electrical components is determined by the Design Engineer to not meet the requirements of this Section, based on either testing or observations, the Contractor, at his expense, shall repair or replace that portion(s) to meet the requirements of this Section as directed by the Design Engineer.

1.05 HAZARDOUS CLASSIFICATION

A. All underground electrical installed shall be classified as Class 1, Division 2. Above ground electrical work from the ground surface to within 18 inches above the ground surface shall be classified as Class 1, Division 2.

PART 2 PRODUCTS

2.01 GENEAL

A. All electrical materials shall be new, meet UL requirements, and bear appropriate UL labels.

2.02 WIRE

A. Wire shall be NEC standard copper wire and shall bear UL and manufacturer's labels. Wire shall provide proper connection and operation of all equipment. Requirements for connection of the respective electrical components are as follows:
1. *Main Power Supply:* Copper AWG No. 2, THW (four [4] wires total).
2. *Automatic Telephone Dialer System:* Standard telephone line (one [1] wire total).

2.03 CONDUIT AND FITTINGS

A. All exposed conduit and fittings shall be rigid PVC type, Schedule 80. All buried conduit and fittings shall be rigid PVC type, Schedule 40. Conduit size requirements for the respective electrical components are as follows:
1. *Main Power Supply:* 1-1/4 inch conduit.
2. *Automatic Telephone Dialer System:* ½ inch conduit.

2.04 METER SOCKET

A. Meter socket for main power supply shall be NEMA 3R, raintight-outdoor, UL listed, with drip shield top that requires no gasketing. Size of meter socket shall accommodate power service requirements.

2.05 JUNCTION AND OUTLET BOXES

A. Junction and outlet boxes shall be NEMA 4 galvanized metal type, cast iron, or malleable iron with proper cover and/or mounting lugs as required.

2.06 WARNING TAPE

A. Direct burial warning tape reading "CAUTION, ELECTRICAL LINE BURIED BELOW", 4 mil polyethylene with foil laminate shall be installed in all underground electrical installations. Panduit, Motivator 3M, or approved equivalent.

2.07 PIPE BEDDING

A. Pipe bedding for conduit shall conform to the requirements of Section 02207 (Aggregate Materials) of these Technical Specifications.

2.08 ENGINEERED FILL

A. Engineered fill for backfill above the pipe bedding shall conform to the requirements of Section 02224 (Engineered Fill) of these Technical Specifications.

PART 3 EXECUTION

3.01 GENERAL

A. All required electrical permits, fees, and inspections shall be arranged and paid for by the Contractor.

B. The Contractor shall furnish, install, and maintain all temporary power and lighting systems needed for construction. After construction is completed, the Contractor shall remove all temporary power equipment and devices.

C. All electrical work shall be conducted by skilled electricians and laborers experienced in this type of work. All equipment, materials, installation, and workmanship shall be in accordance with the mandatory and advisory provisions of NFPA 70 and the NEC.

D. The Contractor shall verify that the wire and conduit sizes specified herein for the main power supply and automatic telephone dialer system are appropriate for the intended use.

E. The Contractor shall install all electrical components in accordance with the NEC, NFPA and local codes and regulations for installation in a Class 1, Division 1 or Class 1, Division 2 classified locations as defined in Part 1.05 of this Section and shown on the Plans. Nothing on the Plans or in these Technical Specifications is to be construed to permit work not conforming to these governing codes and standards.

F. Installation of electrical and telephone feed shall be performed in accordance with the local electrical and telephone company rules and regulations.

G. The electrical and telephone feed from the existing service points to the flare station control panel shall be completed below grade as shown on the Plans.

H. The Contractor shall verify service and panel locations and all other service requirements prior to starting Work. Except for Work specifically excluded from the Contract, the Contractor shall provide all Work required by the serving utility companies to render utility services to the Project.

3.02 PREPARATION

A. The Contractor shall handle electrical materials carefully during loading and unloading. All means necessary shall be used to protect electrical materials before, during and after installation and to protect the installed work of other trades. In the event of damage, provisions shall be made to immediately make repairs and replacement necessary to the approval of the Design Engineer.

B. The Contractor shall inspect materials for damage and imperfections prior to installation. Damaged materials or materials with imperfections shall not be used.

3.03 TRENCHING AND BACKFILLING

A. Trenching and placement of pipe bedding and backfill material shall conform to the requirements of Section 02225 (Trenching and Backfilling) of these Technical Specifications.

3.04 INSTALLATION

A. All equipment, motors, conduit and outlets, as applicable, shall be permanently and effectively grounded in accordance with NEC, CAC - Title 24 and local codes.

B. Conduits shall be sloped towards pull boxes. Conduits shall run in straight lines except where a change in direction is necessary. Couplings shall be staggered for maximum duct line strength.

C. Buried conduit and fittings shall not be dropped or dumped into trenches and the ends of conduit shall be kept closed with approved conduit seals during construction. Immediately prior to pulling wire or cable, a swab shall be drawn through all conduits to force out water and foreign materials.

D. Junction boxes shall be installed in an accessible location as required for splicing, connections and pulling of wire.

E. All above ground conduit shall be properly secured on pipe supports or concrete slabs.

F. The meter socket installed at the existing service pole shall comply with the height and fastening specifications outlined in the local electric company rules and regulations.

3.05 CLEAN-UP

A. All exposed portions of electrical installation shall be thoroughly cleaned, including the removal of all traces of soil, labels, grease, oil, and other foreign matter. Only cleaners recommended by the manufacturer shall be used.

PART 4 MEASUREMENT AND PAYMENT

4.01 ELECTRICAL AND TELEPHONE FEED

A. The electrical and telephone feed shall be measured by the linear foot installed, including trench excavation and backfill. Payment shall be included in the Contract Unit Price per linear foot installed for "Electrical and Telephone Feed" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the electrical and telephone feed as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.02 GENERAL ELECTRICAL WORK

A. Measurement and payment for general electrical work associated with assembly of the flare station shall be included in the Contract Lump Sum Price for "Flare Station Assembly" addressed in Section 15300 (Flare Station) of these Technical Specifications. No additional compensation will be allowed therefore.

END OF SECTION

SECTION 15500
LEACHATE OVERFLOW COLLECTION AND STORAGE SYSTEM

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall furnish, transport to the Work site, and install all leachate overflow collection and storage system components, including a 10,000 gallon double wall fiberglass reinforced leachate UST, tank accessories, field testing, collection system piping and accessories, and lining of the existing sediment chamber and leachate wet well in accordance with this Section and at the locations and to the dimensions shown on the Plans. The Contractor shall furnish all labor, supervision, tools, materials, equipment, transportation, and incidentals as necessary to install the leachate overflow collection and storage system.

B. The existing sediment chamber is a concrete manhole structure, approximately nine feet deep (base to top of manhole); four feet in diameter with a 30" high riser cone (48" to 24" in diameter). The existing wet well is approximately 18 feet deep and five feet in diameter and contains two submersible pumps.

C. The Contractor accepts full responsibility for proper handling and installation of the leachate UST and shall insure that good workmanship, practices, and construction procedures are followed during the handling and installation of the leachate UST, regardless of the inclusion or omission of any applicable suggestion in this Section.

F. UL Standard for Safety 1316.

1.04 SUBMITTALS

A. At least 14 calendar days prior to delivery of materials to the Work site, the Contractor shall provide three (3) copies of the following information to the Design Engineer for approval:
   1. Manufacturer's product data sheets for the following materials to verify that the materials meet or exceed the corresponding product requirements:
      a. Leachate UST, fittings, and accessories.
      b. Collection piping and fittings.
      c. Concrete junction boxes and accessories.
   2. Manufacturer's recommended procedures for handling (transporting, unloading, storage, etc.) and installation of each of the products identified in Subsection 1.04(A)(1) of this Part.

B. Field Test Reports: Tank tightness test at delivery and after installation.

C. At least 14 calendar days prior to commencement of lining the leachate sediment chamber and wet well, the Contractor shall submit the following to the Design Engineer for approval:
   1. Procedures for removal and re-installation of the existing pumps within the leachate wet well.
   2. Name, location and experience of Subcontractor responsible for installation of lining product. Subcontractor shall have sufficient prior experience in the installation of the lining product.
   3. Manufacturer's recommended application procedures for lining product.
   4. Product data and chemical resistance data.

1.05 TRANSPORT AND STORAGE

A. Unloading and storage of the leachate UST and collection piping at the Work site shall be the responsibility of the Contractor and shall be performed in accordance with the manufacturer's recommended procedures.

1.06 QUALITY ASSURANCE

A. Governing Standards, as applicable:
   1. Manufacturer of the leachate overflow storage tank shall be in the business of manufacturing tanks with materials conforming to the requirements of ANSI/AWWA D120-02 Thermosetting Fiberglass-Reinforced Plastic Tanks.

2. Tank manufacturer shall be in the business of manufacturing tanks to UL 1316 standards.

PART 2 PRODUCTS

2.01 PIPE MATERIALS

A. Pipe for gravity drain lines shall be PVC per AWWA C-900, with integral wall, bell and spigot joints. Pipe and fitting shall meet wall and strength minimum of SDR 26, and the requirements of ASTM D 3034. Joints shall be equipped with rubber rings. The bell shall consist of an integral wall section with a solid cross section rubber ring factory assembled, securely locked in place to prevent displacement. Rubber rings shall meet the requirements of ASTM F 477. All fittings and accessories shall be manufactured and furnished by the pipe supplier and have bell and/or space configurations identical to that of the pipe.

2.02 PIPE ACCESSORIES

A. All fittings and accessories shall be manufactured and furnished by pipe supplier of same material as pipe molded or formed to suit pipe size and end design, in required tee, bends, elbows, cleanouts, reducers, traps and other configurations required.

2.03 PIPE BEDDING

A. Pipe bedding shall conform to the requirements of Section 02207 (Aggregate Materials) of these Technical Specifications.

2.04 CONCRETE JUNCTION BOXES

A. Concrete junction boxes for the leachate collection piping shall be as shown on the Plans. Concrete boxes shall be manufactured of cast in place concrete or prefabricated reinforced concrete or approved steel equivalent to the dimensions set forth in the Plans.

B. Concrete for the junction boxes shall be a 6 sack Portland cement Type II mix and must meet the requirements of a maximum slump of 4 inches and a minimum 28-day compressive strength of 2,500 psi when tested in accordance with ASTM C 143 and ASTM C 39, respectively.

2.05 LEACHATE SEDIMENT CHAMBER/WET WELL LINING

A. Lining material for the existing sediment chamber and wet well shall be a solids epoxy resin-based coating formulated for use in chemically aggressive sewer systems. It is the intent that this material shall provide waterproofing, sealing, structural reinforcement, and corrosion protection of the existing sediment chamber and wet well.

B. The coating material shall be resistant to attack from the following: volatile organic compounds; bleaches; sulfuric, acetic, hydrochloric, phosphoric, nitric, chromic, oleic, and stearic acids; sodium and calcium hydroxides; ammonium, sodium, calcium, magnesium, and ferric chlorides; ferric sulfate, hydrogen sulfides, petroleum oil and greases, vegetable and

animal oils, fats, greases, soaps and detergents. The coating shall be impermeable to sewage gases and liquid and shall be non-conducive to bacterial or fungus growth.

2.06 LEACHATE UST

A. Design Criteria
   1. *Internal Load:* Tank shall withstand a 5 psig air pressure test with 5:1 safety factor. Contractor shall individually test tank for leakage prior to installation. Maximum test pressure is 5-psi.
   2. *Vacuum Test:* To verify structural integrity, tank shall be vacuum tested by the manufacturer at the factory to 11.5 inches of mercury.
   3. *Surface Load:* Tank shall withstand surface H-20 axle loads when properly installed according to current manufacturer's installation instructions.
   4. *External Hydrostatic Pressure:* Tank shall be capable of being buried in ground with 7 feet of overburden over the top of the tank, the hole fully flooded, and a safety factor of 5:1 against general buckling.
   5. Tank shall support accessory equipment such as drop tubes when installed according to tank manufacturer's recommendations and limitations.

B. Tank shall be double wall, horizontal glass fiber reinforced tank manufactured with 100 percent resin and glass-fiber reinforcement. No sand fibers. Capacity shall be as indicated on Plans.

C. Product Storage:
   1. Tank shall be capable of storing chemicals or leachate with specific gravity up to 1.1.
   2. Tank shall be vented to atmospheric pressure.
   3. Tanks shall be capable of storing products identified in the manufacturer's current standard limited warranty.

D. Interstitial Space: Double wall tank shall have a space between the walls to allow for the free flow and containment of leaked material from the primary tank. The space also allows the insertion of a monitoring device through a monitoring fitting.

2.07 TANK ACCESSORIES

A. Manway: Flanged 22-inch (minimum) inside diameter manway with UL listed gasket, bolt and cover.

B. NPT Fittings: NPT fittings shall be sized and located as indicated on Plans. Fittings shall be UL listed. All fittings are to be 4 inches in diameter and supplied with plugs. NPT fittings shall withstand a minimum of 150 foot-pounds of torque and 1,000 foot-pounds of bending, both with a 2:1 safety factor. The monitor fitting shall consist of a 4-inch NPT fitting on the tank.

C. Striker plates shall be installed under each service fitting and manway opening.

D. Float Switch and Alarm Panel: One (1) mechanical float switch shall be provided and set at bottom of tank to detect presence of any liquid. The float switch shall be approved for use with intrinsically safe, Class I, Division 1 applications and shall be connected to an alarm

panel located at pump station structure, warning lights only. The alarm shall also be connected to an existing auto-dialer.

E. A 2-inch diameter PVC vent pipe shall be installed from tank to the surface with a goose-neck and screen.

F. Anchor Straps: Anchor straps shall be of glass fiber reinforced type and located per manufacturer's recommendations. Each strap shall be capable of withstanding the maximum buoyance force of the tank assuming the tank empty and submerged in groundwater. Number and location of straps shall be per manufacturer's recommendations.

G. Concrete Deadman: Two concrete deadman, 12" x 12" x the tank length, shall be installed at the bottom of the tank excavation as shown on the Plans.

2.08 TANK BEDDING

A. Tank bedding shall conform to the requirements of Section 02207 (Aggregate Materials) of these Technical Specifications.

2.09 BACKFILL MATERIAL

A. Backfill material above the pipe bedding and tank bedding shall conform to the requirements of Section 02225 (Trenching and Backfilling) of these Technical Specifications.

PART 3 EXECUTION

3.01 BRACING AND SHORING

A. As required by the Trench Construction Safety Orders of the California Construction Safety Orders of the Division of Occupational Safety and Health, bracing and shoring shall be installed in trenches or excavations of 5 feet or greater depth to insure the safety of workers and to protect and facilitate the Work.

B. Bracing and shoring shall comply with Section 5-1.02A and 7-1.01E of the Standard Specifications.

3.02 GENERAL PIPE INSTALLATION

A. Contractor shall verify location of point of connection (POC) at the existing leachate collection piping as shown the Plans by potholing to determine the location and depth (elevation).

B. For the gravity drain pipe, the trench subgrade shall provide uniform support at a uniform slope along full length of pipe.

C. Contractor shall furnish all necessary fittings, fixtures, hardware, plates, fasteners, etc. to provide complete installation.

D. Location of pipes, fixtures, fittings, and drains that are shown on the Plans are approximate. The Contractor shall locate fittings and drains to best serve the intended use and to avoid mechanical and structural interferences. Location of valves, drains, and fittings must be approved by the Design Engineer prior to installation.

E. All installations shall be secure and watertight.

3.03 PIPE INSTALLATION

A. Excavation of pipe trenches shall be in accordance with Section 02225 (Trenching and Backfilling) of these Technical Specifications and as shown on the Plans.

B. The bottom of the trench shall be graded and prepared to provide a firm and uniform bearing throughout the entire length of the pipe barrel.

C. Pipe, fittings, and accessories shall be installed in accordance with manufacturer's instructions. Sealed joints shall be watertight.

D. Pipe shall be placed to the lines and grades as shown on the Plans.

E. The pipe shall be laid without break upgrade from structure to structure, with bell end upgrade for bell and spigot pipe.

F. The horizontal alignment of the pipe shall be laid such that any point shall not vary more than 0.10 feet from the design alignment established and shown on the Plans.

G. Pipe bedding material shall be placed at sides and over top of pipe in accordance with Section 02225 (Trenching and Backfilling) of these Technical Specifications and as shown on the Plans.

H. Trench backfill above the pipe bedding shall be in accordance with Section 02225 (Trenching and Backfilling) of these Technical Specifications and as shown on the Plans. Pipe shall not be displaced or damaged when compacting.

3.04 CONCRETE JUNCTION BOXES

A. Excavation for concrete junction boxes shall be in accordance with Section 02222 (Excavation) of these Technical Specifications and as shown on the Plans.

B. Concrete junction boxes shall be installed in accordance with manufacturer's instructions. Placement of the concrete junction boxes into the excavation shall be performed in a manner that will not induce damage or compromise future stability.

C. Backfill for concrete structures shall conform to the provisions in Section 19-3 of the Standard Specifications.

3.05 LEACHATE SEDIMENT CHAMBER/WET WELL LINING

A. Sequencing of this task shall be after installation of the condensate discharge line from the flare station to the leachate wet well in order to ensure that the new penetration is properly sealed by the lining application.

B. The Contractor's Health and Safety Plan shall be followed accordingly, including LFG hazards and possible confined space entry (i.e., oxygen-deficient atmosphere), for all phases of Work.

C. Prior to start of Work, provisions shall be made to divert leachate from the existing leachate drain from discharging into the leachate sediment chamber. The leachate may be diverted to the new leachate UST (if already installed) or collected in a temporary holding tank of sufficient size.

D. Once discharge into the leachate sediment chamber has been diverted, all leachate shall be pumped from the leachate sediment chamber and wet well. The pumped leachate may be discharged to the existing leachate AST, new leachate UST (if already installed), or temporary holding tank.

E. If sediment is present at the base of the leachate sediment chamber and/or wet well, provisions shall be made to remove all sediment. Removed sediment may be disposed of with refuse excavated from other site activities, or transported separately and disposed of at a permitted transfer station or solid waste disposal facility.

F. Existing pumps and any other equipment/features that may inhibit application product shall be removed and stored in a dry and secure location.

G. The interior walls and base shall be cleaned to remove all dirt, dust, corrosion products, loose concrete, debris, grease, oils, growths, and foreign matter and residues. Residual generated by the cleaning operations shall be removed and managed in the same manner as described previously for leachate and sediment.

H. Sufficient time shall be provided to allow the surfaces of the interior walls and base to dry. Drying time may be expedited by mechanical means. Coatings shall be applied only to a sound clean surface profile consistent with the manufacturer's published recommendation.

I. Cracks, joints, eroded and damaged areas shall be sealed with a compatible grout/mortar as recommended by the coating manufacturer prior to application of the coating material.

J. Coating material shall be applied in a manner and thickness consistent with the manufacturer's published recommendation. Coatings shall be applied in a manner consistent with all applicable environmental and health and safety regulations. At a minimum, during application, the applicators shall use protective clothing, eye protection, chemical resistant gloves, and air respirators. Coating shall be applied to provide full and sufficient coverage of all interior walls and base and shall be free of blisters, pinholes, holidays, or discontinuities. Application shall be performed in strict accordance with recommended manufacturer's procedures.

K. Pumps and any other equipment/features that were removed shall be re-installed and normal operation of the leachate sediment chamber/wet well restored per pre-existing conditions.

3.06 TANK HANDLING

A. Contractor Acceptance Inspection: The Contractor is responsible for damage in shipment according to the checklist included in the tank shipment. Any discrepancies should be reported to the Design Engineer.

B. The tank shall not be dropped, rolled or impacted. The tank shall be set on smooth ground, free of rocks and foreign objects, and chock tanks to prevent movement.

3.07 TANK INSTALLATION

A. The tank excavation shall be large enough to provide:
   1. 2 feet of clearance between the tank sides and ends and the excavation walls in stable soil.
   2. 12 inches of bedding under the tank.

B. Excavation for the tank shall be in accordance with Section 02222 (Excavation) of these Technical Specifications and as shown on the Plans. Contractor shall slope or shore sides of tank hole excavation as required to comply with the requirements of "OSHA Construction Standards".

C. The tank and all related piping and accessories shall be installed as per manufacturer's printed instructions.

D. Tank backfill shall be as follows:
   1. Tank bedding material shall be evenly placed over bottom of the excavation to attain a minimum thickness of 12 inches.
   2. A 12-inch lift of tank backfill shall initially be placed evenly around the tank. Care shall be taken to push backfill material completely beneath tank bottom and under end caps to provide necessary tank support, without voids.
   3. A second 12-inch lift of tank backfill shall be placed evenly around the tank using the same procedures described above.
   4. After completion of the second lift, tank backfill can be brought to the top of the tank without additional handwork.
   5. The tank shall never be left on the bed without tank backfill to the top of tank if there is any chance of more than 12 inches of water in the hole.
   6. Once tank backfill material has been placed completely over the tank to the depth shown on the Plans, backfill the remainder of the tank excavation in accordance with Section 02225 (Trenching and Backfilling) of these Technical Specifications.

3.08 PERFORMANCE TESTING

A. UST Air Test:
   1. Prior to setting the tank, the Contractor shall perform an aerostatic leakage test in the presence of the Design Engineer.

2. Pressurizing the relatively small annular space between two (2) tank shells can occur very quickly. A pressure of over 5 psi may cause damage to the tank structure which may not be immediately apparent. For all such tests, an air gauge with maximum ½ psi increments shall be used.
3. The Contractor shall provide a valve and manifold arrangement with two (2) air gauges to perform tests.
4. Testing shall be in accordance with the tank manufacturer's instructions.
5. While tank is under pressure, the entire tank, including fittings, should be wetted with a soapy solution to inspect for minor leaks which otherwise might not be evident.

B. Leachate Sediment Chamber/Wet Well:
1. Visual inspection to verify a leak-free, uniform appearance.
2. The applied wet film thickness shall be verified per ASTM D 4414, Standard Practice for Measurement of Wet Film Thickness of Organic Coatings by Notched Gages.
3. The leachate sediment chamber and wet well shall be operated after the lining application and re-assembly of the pumps and other equipment/features to verify that the system is operating in accordance with pre-existing conditions.

C. If tests indicate Work does not meet specified requirements, all Work shall be removed, replaced and retested at no cost to the City.

PART 4 MEASUREMENT AND PAYMENT

4.01 LEACHATE COLLECTION PIPING

A. Leachate collection system piping shall be measured by the linear foot of collection piping installed and includes all piping, fittings, trenching, and backfilling. Payment shall be included in the Contract Unit Price per linear foot installed for the various sizes and types of "Leachate Collection Piping" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the leachate collection piping as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.02 CONCRETE JUNCTION BOXES

A. Concrete junction boxes for the leachate collection piping shall be measured by each box installed and include all trenching, backfill, concrete, and cover. Payment shall be included in the Contract Unit Price per each unit installed for "Concrete Junction Boxes" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the concrete junction boxes as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.03 LEACHATE SEDIMENT CHAMBER/WET WELL LINING

A. Measurement and payment for lining of the leachate sediment chamber/wet well shall be included in the Contract Lump Sum Price for "Leachate Sediment Chamber/Wet Well Lining" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to line the leachate sediment chamber/wet well as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.04 LEACHATE UST

A. Measurement and payment for the leachate UST shall be included in the Contract Lump Sum Price for "Leachate UST" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, general electrical work, and incidentals required to install the leachate UST and accessories as shown on the Plans, as specified herein and within the tank manufacturer's specifications, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

GENERAL INFORMATION

CQA SECTION 01000
INTRODUCTION

PART 1 GENERAL

1.01 PROJECT DESCRIPTION

A. The City of Ukiah Landfill is located in Mendocino County, California approximately two miles east of the City of Ukiah. The Work site address is 3100 Vichy Springs Road, Ukiah, California 95482 (Sheet 1). The City of Ukiah Landfill was operated as a Class III solid waste disposal facility and is comprised of a single waste management unit that is approximately 40 acres in size.

B. This Construction Quality Assurance (CQA) Plan applies to the final closure of the City of Ukiah Landfill. The final closure project encompasses approximately 65 acres in area and consists of the following construction features:

Site Preparation:
- Refuse excavation and relocation.
- Interim cover preparation.

Final Cover System (in ascending order):
- 2-foot thick foundation layer.
- Gas relief/venting system.
- LLDPE geomembrane.
- Engineered synthetic turf with specific grade sand infill ballast.

Miscellaneous items:
- Drainage and erosion control measures.
- Access roads.
- General earthwork, including various excavations and fills.
- Leachate overflow collection and storage system, including installation of a leachate underground storage tanks (UST).
- Landfill gas (LFG) collection system, including condensate drainage components.
- Installation of skid-mounted packaged combustion system provided by others.
- Borrow area reclamation.
- Seeding and fertilizing.
- Security fencing.

C. A detailed scope of construction for each unit of construction is presented in Section 01010 of this CQA Plan.

1.02 PURPOSE

A. The purpose of this CQA Plan is to provide a detailed guidance document for correct and thorough CQA verification procedures implemented during construction. This CQA Plan is also intended to identify, prevent, and correct problems and deficiencies that may occur during construction. This CQA Plan details general and specific requirements of the CQA program that will be implemented during construction to verify and document that

construction is in compliance with the contract documents and the design intent. Requirements of the CQA program include the following:

1. Product quality assurance verification testing to verify that all materials are in compliance with the Technical Specifications.
2. Construction monitoring and documentation to verify that each unit of construction is in compliance with the Technical Specifications and that construction was executed correctly using industry-standard construction methods and the proper materials.
3. Review and approval of product submittals to verify that construction materials are in compliance with the Technical Specifications.
4. Testing to verify that installed or constructed components are in compliance with the Technical Specifications.
5. CQA documentation consisting of Daily Summary Reports, CQA field logs, testing forms, installation logs, document control binders, material control logs, testing reports, photographic documentation, technical revisions, design modifications, record as-built drawings, and corrective action determination and verification reports.
6. Preparation of the CQA Certification Report that documents the CQA program implemented during construction and that construction was completed in compliance with the contract documents and the design intent. The CQA Certification Report will be submitted to the California Regional Water Quality Control Board, North Coast Region (RWQCB).

B. Although the CQA Plan provides a foundation for the CQA program, this plan may be modified and revised as appropriate prior to and during construction. All modifications and revisions to the CQA program will be documented in the CQA Certification Report.

1.03 PROJECT ORGANIZATION

A. The City of Ukiah, Department of Public Works (City) is the owner and operator of the City of Ukiah Landfill and has ultimate responsibility for the Project, including overall project management and project funding. For purposes of this CQA Plan, the City will be referred to as "Owner". The Owner has contracted with the following organizations to complete construction in accordance with the project documents listed in Part 1.02 of Section 01090 (References) of this CQA Plan.

1. EBA Engineering (EBA) - Design Engineer and CQA Certifying Engineer.
2. To Be Determined – Construction Contractor and Subcontractors.

B. EBA is the Design and CQA Certifying Engineer for the Project. As the Design Engineer, EBA is responsible for the design and site engineering related to the design. Site engineering includes: 1) review and approval of product and construction submittals required by the contract documents; 2) technical issues related to construction; 3) interpretation of the Technical Specifications and the Construction Drawings (herein after referred to as "Plans"); and 4) design modifications and technical revisions. For purposes of this CQA Plan, EBA will be referred to as "Design Engineer" when functioning as the Design Engineer.

As the CQA Certifying Engineer, EBA is responsible for certifying to the Owner and RWQCB that construction is in compliance with the contract documents and the design intent. Specific responsibilities of the CQA Certifying Engineer include: 1) providing a professional engineer or certified engineering geologist registered in the state of California; 2) implementing and managing the CQA program outlined in Part 1.02 of this Section; 3) review of all CQA documentation; and 4) preparation of the CQA Certification Report. EBA will provide an on-site CQA Team to implement and manage the CQA program consisting of a CQA Officer, CQA Monitors, a CQA Surveyor, and Geosynthetics and Soils CQA Testing

Laboratories. For purposes of this CQA Plan, EBA will be referred to as "CQA Officer" when functioning as the CQA Certifying Engineer.

C. The Construction Contractor is responsible for overall performance of the earthwork, including construction of drainage and erosion control measures, in accordance with the contract documents and as shown on the construction drawings. For purposes of this CQA Plan, the Construction Contractor will be referred to as "Contractor".

D. The Project Organization for CQA is shown on Table 01000-1, CQA Organization Chart

1.04 CQA PLAN FORMAT

A. This CQA Plan closely parallels the format of the Technical Specifications in the contract documents. The intent of this parallel format is to avoid discrepancies between the two documents, therefore preventing misinterpretations and misunderstandings between the Owner, Contractor, Design Engineer and CQA Certifying Engineer. This format also organizes all necessary quality assurance verification procedures for each unit of construction into a single section.

B. Division 1 of this plan presents general information about the construction project and the CQA program.

C. Division 2 of this plan provides detailed and specific CQA procedures to be implemented by the CQA Officer for each unit of construction. Division 2 is written instruction and direction for members of the CQA Team.

CQA SECTION 01010
SCOPE OF CONSTRUCTION

PART 1 GENERAL

1.01 SECTION SUMMARY

A. Work to be performed by the Design Engineer

B. Work to be performed by the Owner.

C. Contractor's scope of work.

1.02 WORK TO BE PERFORMED BY THE DESIGN ENGINEER

A. The Design Engineer will provide three (3) reference control points with benchmark elevations in the vicinity of the Work site. All other necessary control or reference points needed to perform construction will be established by the Contractor.

1.03 WORK TO BE PERFORMED BY THE OWNER

A. The Owner will provide the following construction materials and services:
   1. Material for engineered fill.
   2. Material for the foundation layer.
   3. Skid-mounted packaged combustion system, including totally-enclosed vertical ground flare.
   4. Extension of adequate power and telephone service to the location of the skid-mounted packaged combustion system.

1.04 CONTRACTOR'S SCOPE OF WORK

A. The Contractor's scope of work includes the following.
   1. Mobilization of construction equipment and personnel.
   2. Excavation of on-site borrow material for construction of final cover system soil components, as well as sedimentation basin improvements.
   3. Construction of final cover system, including interim cover preparation and placement/installation of foundation layer, geomembrane, engineered turf, hydrobinder, and sand ballast.
   4. Seeding and fertilizing of disturbed areas and on-site borrow area.
   5. Excavation and construction of, and supply of materials for, drainage and erosion control measures.
   6. Construction of, and supply of materials for, access roads.
   7. Construction of, and supply of materials for, leachate overflow collection and storage system, including installation of new leachate UST and lining of existing leachate sediment chamber and wet well.
   8. Construction of, and supply materials for, LFG collection and control system, including installation of LFG extraction wells, LFG collection system piping and condensate drainage components.

9. Installation of Owner-supplied skid-mounted packaged combustion system, including totally-enclosed vertical ground flare.
10. Construction of, and supply of materials for, security fencing.

END OF CQA SECTION 01010
SCOPE OF CONSTRUCTION

CQA SECTION 01039
PROJECT MEETINGS

PART 1 GENERAL

1.01 SECTION SUMMARY

A. Communication and coordination between the Design Engineer, Contractor, and CQA Team are most important to achieve the common goals of quality construction and successful completion of the project.

B. A series of project meetings will be held for the purpose of establishing a successful environment of communications, coordination, and overall teamwork; the meetings will be administered by the CQA Officer to: 1) clearly define responsibility and authority of each organization involved in the project; 2) resolve communication problems, misunderstandings, and misinterpretations; 3) find solutions to unanticipated developments; and 4) identify, prevent, and correct problems and deficiencies that may occur during the construction process.

C. Project meetings include the following.
1. Preconstruction meeting.
2. Progress meetings.
3. Preparatory meetings.

1.02 PRECONSTRUCTION MEETING

A. A preconstruction meeting will be held to discuss topics relating to the commencement of the project.

B. The objectives of this meeting are to: 1) clearly define the roles, responsibility, and authority of each organization and individual involved in the project; 2) review specific requirements of the CQA program; and 3) establish a foundation of cooperation to achieve quality construction. The following agenda, as related to CQA, will be addressed by the Design Engineer:
1. Introduce and discuss roles, authority, and responsibilities of each organization and individual involved in the project.
2. Establish lines of communication.
3. Review Technical Specifications and Plans.
4. Distribution of the CQA Plan.
5. Review of CQA activities to be performed.
6. Discuss Contractor's construction schedule and workplan.
7. Discuss Contractor's Construction Quality Control (CQC) procedures and responsibilities.
8. Discuss submittal review and approval procedures.
9. Discuss non-conformance and corrective action procedures.
10. Discuss construction restrictions due to weather conditions.
11. Discuss and schedule weekly progress meetings.
12. Discuss health and safety issues.
13. Discuss preparatory meetings.

C. A Meeting/Discussion Summary Report (see Part 1.08 of Section 01400 of this CQA Plan) will be completed by the CQA Officer and distributed to all parties in attendance.

D. The following representatives from each organization are required to attend the preconstruction meeting:
   1. City's Project Manager or representative.
   2. Contractor's Project Manager and on-site Superintendent.
   3. Installer's Project Manager and on-site Superintendent.
   4. Design Engineer's Project Manager and CQA Officer.

1.03 PROGRESS MEETINGS

A. The CQA Officer will schedule and administer weekly progress meetings. The objectives of these meetings are to: 1) maintain lines of communication; 2) review work progress and CQA activities performed previously; 3) discuss upcoming construction and related CQA activities; and 4) maintain and improve the established foundation of cooperation to achieve quality construction. The following agenda will be addressed by the CQA Officer.
   1. Review minutes of previous progress meeting.
   2. Review work progress.
   3. Review and update construction schedule and obtain a 2-week look-ahead schedule from the Contractor.
   4. Discuss CQA and CQC related field observations, testing results, problems, decisions, and conflicts.
   5. Review and update Submittal Log.

B. A Meeting/Discussion Summary Report (see Section 01400 of this CQA Plan) will be completed by the CQA Officer and distributed to all parties in attendance.

C. The following representatives from each organization are required to attend the weekly progress meetings.
   1. City's Project Manager or representative.
   2. Contractor's on-site Superintendent.
   3. Installers on-site Superintendent (during geosynthetics installation).
   4. Design Engineer's Project Manager and CQA Officer.

1.04 PREPARATORY MEETINGS

A. The CQA Officer will schedule and administer informal preparatory meetings prior to beginning construction/implementation of the following items.
   1. Refuse excavation and interim cover preparation.
   2. Foundation layer placement.
   3. Geomembrane placement.
   4. Engineered turf installation.
   5. Sand ballast placement.
   6. General earthwork, drainage and erosion control, and access road construction, as needed.
   7. Sedimentation basin improvements.
   8. Leachate overflow collection and storage system installation.
   9. LFG collection system installation.
   10. Borrow area reclamation.
   11. Seeding and fertilizing.

B. The objective of these preparatory meetings is to establish a complete understanding of the upcoming unit of construction and CQA activities that will be implemented during construction. To achieve this objective, the following agenda will be addressed by the CQA Officer.

1. Review "Products" part of the applicable section of the Technical Specifications.
2. Review "Execution" part of the applicable section of the Technical Specifications.
3. Discuss any construction and grade control staking needed to perform and complete the Work.
4. Discuss CQA testing, observation, and surveying to be performed.
5. Verify that all submittals have been, or will be, received by the CQA Officer and approved by the Design Engineer in accordance with the schedule.
6. Discuss Contractor's CQC responsibilities.
7. Discuss Contractor's coordination, scheduling, and sequencing of the work.
8. Discuss Contractor's proposed equipment and manpower.

C. A Meeting/Discussion Summary Report (see Section 01400 of this CQA Plan) will be completed by the CQA Officer and distributed to all parties in attendance.

D. The following representatives from each organization are required to attend the preparatory meetings.

1. Design Engineer's Project Manager or representative.
2. Contractor's on-site Superintendent.
3. On-site Superintendent of any Subcontractor, as applicable to the unit of construction.
4. CQA Officer.
5. CQA Monitor(s), as applicable to the unit of construction.

END OF CQA SECTION 01039
PROJECT MEETINGS

CQA SECTION 01050
GENERAL REQUIREMENTS

PART 1 GENERAL

1.01 SECTION SUMMARY

A. Conformance testing.

B. Construction monitoring.

C. Construction testing.

D. Project meetings.

E. Submittal review and approval.

F. Documentation.

1.02 CONFORMANCE TESTING

A. Prior to using a product or material in construction, sampling and testing will be performed to verify that construction products and materials to be used are in conformance with the Technical Specifications.

B. Conformance testing requirements, methods, and sampling frequencies are given for each unit of construction in Division 2 of this CQA Plan.

C. All product and material conformance test samples will be recorded on the appropriate Master Testing Control Log, assigned a sample number, and processed by the CQA Officer for either on-site or off-site testing. The Master Testing Control Logs document: 1) sample numbers; 2) product or material types; 3) required testing; 4) sampling locations and dates; 5) testing personnel or organization; 6) testing completion dates; and 7) a brief summary of the testing results. The Master Testing Control Log for soils are presented in Appendix C.

D. At the request of the Design Engineer, conformance test samples will be archived at the Work site or an alternate location determined by the Owner for a period of one year. Archived samples will be stored in sealed plastic containers tagged with: 1) the sample number; 2) product or material type; 3) the project name and number; 4) sample date and location; and 5) the date for discarding the sample.

E. The following products or materials require conformance testing.
1. Miscellaneous aggregate materials.
2. Engineered fill.
3. Foundation soil layer.
4. Geomembrane.
5. Engineered turf.
6. Concrete.

1.03 CONSTRUCTION MONITORING

A. Each unit of construction will be monitored to verify compliance with the Technical Specifications and that construction was executed correctly using industry-standard construction methods and the proper materials.

B. Monitoring guidelines and procedures are specified for each construction unit in Division 2 of this CQA Plan and include the following:
   1. Field tests.
   2. Observations.
   3. Field surveys.
   4. Physical measurements.

1.04 CONSTRUCTION TESTING

A. Construction testing will be performed during installation and construction to verify compliance with the Technical Specifications.

B. Construction testing may be performed by the Contractor, Design Engineer, or CQA personnel as required for each construction unit in Division 2 of this CQA Plan and includes the following:
   1. Engineered fill.
   2. Foundation layer.
   3. Aggregate base for access roads.
   4. Geomembrane.
   5. Engineered turf.
   6. Sand ballast.

1.05 PROJECT MEETINGS

A. In accordance with Section 01039 of this CQA Plan.

1.06 SUBMITTAL REVIEW AND APPROVAL

A. In accordance with Section 01300 of this CQA Plan.

1.07 DOCUMENTATION

A. In accordance with Section 01400 of this CQA Plan.

END OF CQA SECTION 01050

1.02 PROJECT REFERENCE DOCUMENTS

A. The following project reference documents provide support and background information for use in conjunction with this CQA Plan.

1. *Joint Technical Document for City of Ukiah Landfill, Mendocino County, California;* EBA Engineering, January 2008.
2. *Response to RWQCB Comments Dated February 21, 2008, Joint Technical Document, City of Ukiah Landfill, Mendocino County, California;* EBA Engineering, April 21, 2008.
3. *January 2008 Joint Technical Document Addendum, Response to Regulatory Comments, Final Closure and Postclosure Maintenance Plans, City of Ukiah Landfill, Mendocino County, California;* EBA Engineering, June 20, 2013.
4. *Design Plan for Landfill Gas Collection and Control System, City of Ukiah Landfill, Mendocino County, California;* EBA Engineering, October 2013.

1.03 INDUSTRY STANDARDS AND TECHNICAL REFERENCE DOCUMENTS

A. The following industry standards and technical reference documents were used in the preparation of this CQA Plan.

1. *ASTM Standards and Other Specifications and Test Methods on the Quality Assurance of Landfill Liner Systems.* American Society for Testing and Materials, Current Edition.
2. *Technical Guidance Document, Quality Assurance and Quality Control for Waste Containment Facilities [EPA/600/R-93/182].* United States Environmental Protection Agency, September 1993.
3. *Federal Register (Vol. 56, No. 196, pp. 50978 - 51119). Part II, Environmental Protection Agency, 40 CFR Parts 257 and 258 - Solid Waste Disposal Facility*

Criteria; Final Rule [EPA/OSW-FR-91-004 FRL-4011-9]. United States Environmental Protection Agency, October 9, 1991.

4. *California Code of Regulations, Title 27 - Combined SWRCB/CIWMB Regulations, Division 2, Subdivision 1, Chapter 3, Subchapter 2, Article 4, Section 20324.* Effective July 18, 1997.
5. *Caltrans Standard Specifications.* California Department of Transportation, 2010.
6. *Caltrans Standard Plans.* California Department of Transportation, 2010.
7. *California Test Methods. California Department of Transportation, Current Edition.*
8. *California Building Code. Current Edition.*

1.04 SOILS TESTING STANDARDS AND METHODS

A. The following standard soils testing methods and procedures apply as referenced in the Technical Specifications and/or this CQA Plan.

1.	ASTM C 33	Standard Specification for Concrete Aggregates.
2.	ASTM C 136	Sieve Analysis of Fine and Coarse Aggregates.
3.	ASTM D 422	Standard Test Method for Particle-Size Analysis of Soils.
4.	ASTM D 1557	Test Method for Laboratory Compaction Characteristics of Soil Using Modified Effort (56,000 ft-lbf/ft^3 [2,700 kN-m/m^3]).
5.	ASTM D 2434	Standard Test Method for Permeability of Granular Soils (Constant Head).
6.	ASTM D 2487	Standard Classification of Soils for Engineering Purposes (Unified Soil Classification System).
7.	ASTM D 2488	Standard Practice for Description and Identification of Soils (Visual-Manual Procedure).
8.	ASTM D 2922	Standard Test Methods for Density of Soil and Soil-Aggregate in Place by Nuclear Methods (Shallow Depth).
9.	ASTM D 3017	Standard Test Method for Water Content of Soil and Rock in Place by Nuclear Methods (Shallow Depth).
10.	ASTM D 4959	Standard Test Method for Determination of Water (Moisture) Content of Soil by Direct Heating.
11.	CTM 229	Method of Test for Durability Index.
12.	CTM 301	Method for Determining the Resistance "R" Value of Treated and Untreated Bases, Subbases, and Basement Soils by the Stabilometer.

1.05 GEOSNYTHETICS TESTING STANDARDS AND METHODS

A. The following standard geosynthetics testing methods and procedures apply as referenced in the Technical Specifications and/or this CQA Plan.

1.	ASTM D 638	Standard Test Method for Tensile Properties of Plastics.
2.	ASTM D 746	Standard Test Method for Brittleness Temperature of Plastics and Elastomers by Impact.
3.	ASTM D 792	Standard Test Method for Specific Gravity and Density of Plastics by Displacement.
4.	ASTM D 1004	Test Method for Initial Tear Resistance of Plastic Film and Sheeting.
5.	ASTM D 1204	Standard Test Method for Linear Dimensional Changes to Nonrigid Thermoplastic Sheeting or Film at Elevated Temperatures.

6.	ASTM D 1505	Test Method for Density of Plastics by the Density-Gradient Technique.
7.	ASTM D 2256	Standard Test Method for Tensile Properties of Yarns by the Single-Strand Method.
8.	ASTM D 3895	Standard Test Method for Copper Induced Oxidative Induction Time of Polyolefins by Thermal Analysis.
9.	ASTM D 4218	Test Method for Carbon Black Content.
10.	ASTM D 4355	Standard Test Method for Deterioration of Geotextiles by Exposure to Light, Moisture and Heat in a Xenon Arc Type Apparatus.
11.	ASTM D 4491	Standard Test Methods for Water Permeability of Geotextiles by Permittivity.
12.	ASTM D 4533	Standard Test Method for Trapezoid Tearing Strength of Geotextiles.
13.	ASTM D 4595	Test Method for Tensile Product (MD/XD).
14.	ASTM D 4632	Standard Test Method for Breaking Load and Elongation of Geotextiles (Grab Method).
15.	ASTM D 4716	Standard Test Method for Constant Head Hydraulic Transmissivity (In-Plane Flow) of Geotextiles and Geotextile Related Products.
16.	ASTM D 4751	Standard Test Method for Determining the Apparent Opening Size of a Geotextile.
17.	ASTM D 4833	Test Method for Index Puncture Resistance of Geotextiles, Geomembranes, and Related Products.
18.	ASTM D 5035	Standard Test Method for Breaking Force and Elongation of Textile Fabrics (Strip Method).
19.	ASTM D 5261	Standard Test Method for Measuring Mass per Unit Area of Geotextiles.
20.	ASTM D 5321	Standard Test Method for Determining the Coefficient of Soil and Geosynthetic or Geosynthetic Friction by the Direct Shear Method.
21.	ASTM D 5397	Standard Test Method for Notched Constant Tensile Load Test of Geomembrane.
22.	ASTM D 5596	Standard Test Method for Microscopic Evaluation of the Dispersion of Carbon Black in Polyolefin Geosynthetics.
23.	ASTM D 5617	Standard Test Method for Multi-Axial Tension Test for Geosynthetics.
24.	ASTM D 5994	Sheet Thickness for Textured Geomembrane.
25.	ASTM D 6241	Standard Test Method for Static Puncture Strength Resistance of Geotextiles and Geotextile-Related Products Using a 50-mm Probe.
26.	ASTM D 6392	Standard Practice for Determining the Integrity of Field Seams Used in Joining Flexible Polymeric Sheet Geomembranes.
27.	ASTM D 6693	Standard Test Method for Determining of Tensile Properties of Nonreinforced Polyethylene and Nonreinforced Flexible Polypropylene Geomembranes.
28.	ASTM D 6913	Standard Test Methods for Particle-Size Distribution.
29.	ASTM D 7277	Standard Test Method for Performance Testing of Articulating Concrete Block Systems in Open Channel Flow.

30.	ASTM D 7466	Standard Test Method for Measuring Asperity Height of Textured Geomembranes.
31.	ASTM D 96459	Standard Test Method for Determining Rainfall Induced Erosion.
32.	ASTM G 147	Standard Test Method for Determining the UV Stability of Engineered Fiber, Natural and Artificial Weathering Tests.
33.	ASTM G 1545(M)	Standard Test Method for Determining UV Stability (exposed), Modified Cycle, UVA340.
34.	FTMS 101C	Puncture Resistance.

1.06 LANDFILL GAS EXTRACTION SYSTEM TESTING STANDARDS AND METHODS

A. The following standard geosynthetics testing methods and procedures apply as referenced in the Technical Specifications and/or this CQA Plan.

1.	ASTM A 193	Standard Specification for Alloy Steel and Stainless Steel Bolting Materials for High Temperature Service.
2.	ASTM A 325	Standard Specification for Structural Bolts, Steel, Heat Treated, 120/105 KSI Minimum Tensile Strength.
3.	ASTM D 1784	Standard Specification for Rigid PVC Compounds and Chlorinated PVC Compounds.
4.	ASTM D 1785	Standard Specification for PVC Plastic Pipe, Schedules 40, 80, and 120.
5.	ASTM D 2464	Standard Specification for Threaded PVC Plastic Pipe Fittings, Schedule 80.
6.	ASTM D 2466	Standard Specification for Threaded PVC Plastic Pipe Fittings, Schedule 40.
7.	ASTM D 2467	Standard Specification for Socket-Type PVC Plastic Pipe Fittings, Schedule 80.
8.	ASTM D 2513	Standard Specification for Thermoplastic Gas Pressure Pipe, Tubing, and Fittings.
9.	ASTM D 2564	Standard Specification for Solvent Cements for PVC Plastic Piping Systems.
10.	ASTM D 2855	Standard Specification for Making Solvent-Cemented Joints with PVC Pipe and Fittings.
11.	ASTM D 3034	Standard Specification for Type PSM Poly (Vinyl Chloride) (PVC) Sewer Pipe and Fittings.
12.	ASTM D 3212	Standard Specification for Joints for Drain and Sewer Plastic Pipes Using Flexible Elastomeric Seals.
13.	ASTM D 3261	Standard Specification for Butt Heat Fusion Polyethylene (PE) Plastic Fittings for Polyethylene (PE) Plastic Pipe and Tubing.
14.	ASTM D 3350	Standard Specification for Polyethylene Plastic Pipe and Fittings Materials.
15.	ASTM D 3786	Standard Test Method for Methoxyl and Hydroxypropyl Substitution in Cellulose Ether Products by Gas Chromatography.
16.	ASTM D 7001	Standard Specification for Geocomposites for Pavement Edge Drains and Other High-Flow Applications.
17.	ASTM F 477	Standard Specification for Elastomeric Seals (Gaskets) for Joining Plastic Pipe.

18.	ASTM F 2648	Standard Specification for 2 to 60 inch [50 to 1500 mm] Annular Corrugated Pipe Wall Polyethylene (PE) Pipe and Fittings for Land Drainage Applications.

1.07 CONCRETE TESTING STANDARDS AND METHODS

A. The following standard concrete testing methods and procedures apply as referenced in the Technical Specifications and/or this CQA Plan.

1.	ASTM C 39	Standard Test Method for Compressive Strength of Cylindrical Concrete Specimens.
2.	ASTM C 42	Standard Test Method for Obtaining and Testing Drilled Cores and Sawed Beams of Concrete.
3.	ASTM C 143	Standard Test Method for Slump of Portland Cement Concrete.
4.	ASTM C 150	Standard Specification for Portland Cement.
5.	ASTM C 260	Standard Specification for Air-Entraining Admixtures for Concrete.
6.	CBC Section 1701	Structural Tests and Special Inspections.
7.	CBC Section 1905	Concrete Quality, Mixing and Placing.

1.08 STEEL TESTING STANDARDS AND METHODS

A. The following standard steel testing methods and procedures apply as referenced in these Technical Specifications and/or the CQA Plan.

1.	ASTM A 36	Standard Specification for Carbon Structural Steel.
2.	ASTM A 90	Test Method for Weight (Mass) of Coating on Iron and Steel Articles with Zinc or Zinc-Alloy Coating.
3.	ASTM A 185	Standard Specifications for Steel Welded Wire Reinforcement, Plain, for Concrete.
4.	ASTM A 313	Specification for Chromium-Nickel Stainless and Heat-Resisting Steel Spring Wire.
5.	ASTM A 370-97a	Test Methods and Definitions for Mechanical Testing of Steel Products.
6.	ASTM A 615	Standard Specification for Deformed and Plain Carbon-Steel Bars for Concrete Reinforcement.
7.	ASTM A 641	Specification for Zinc Coated (Galvanized) Carbon Steel Wire.
8.	ASTM A 764	Specification for Steel Wire, Carbon, Drawn Galvanized and Galvanized at Size for Mechanical Springs.
9.	ASTM A 975-97	Standard Specification for Double-Twisted Hexagonal Mesh Gabions and Revet Mattresses (Metallic-Coated Steel Wire or Metallic-Coated Steel Wire with Polyvinyl Chloride (PVC) Coating).

1.09 ACRONYMS

A. Whenever the following acronyms for standards, institutes and societies are referenced in the Technical Specifications or this CQA Plan, the following meanings apply:

1.	AASHTO	American Association of State Highway and Transportation Officials
2.	AISC	American Institute of Steel Construction
3.	ANSI	American National Standards Institute

4.	ASTM	American Society for Testing and Materials
5.	AWWA	American Water Works Association
6.	CAC	California Administrative Code
7.	CFR	Code of Federal Regulations
8.	CRSI	Concrete Reinforcing Steel Institute
9.	CTM	California Test Methods
10.	NEMA	National Electrical Manufacturer's Association
11.	NEC	National Electric Code
12.	NFPA	National Fire Protection Association
13.	OSHA	Occupational Health and Safety Administration
14.	RWQCB	Regional Water Quality Control Board
15.	SWANA	Solid Waste Association of North America
16.	SWRCB	State Water Resources Control Board
17.	UL	Underwriters Laboratories Inc.
18.	US	United States

B. Whenever the following acronyms for materials and units are referenced in the Technical Specifications or this CQA Plan, the following meanings apply:

1.	AC	acre
2.	AWG	American Wire Gauge
3.	cm	centimeter
4.	ClosureTurf™	Three (3) component final cover system composed of structured LLDPE geomembrane liner drainage studs and spike, engineered synthetic turf, and a specific grade of sand infill ballast.
5.	CMP	corrugated metal pipe
6.	Enginneer Turf	Synthetic turf component of ClosureTurf™
7.	EPDM	ethylene propylene diene monomer
8.	°F	degree Fahrenheit
9.	ft	foot
10.	g	gram
11.	LLDPE	Linear Low-Density Polyethylene
12.	HDPE	High Density Polyethylene
13.	HP	horse power
14.	HydroBinder	Cementious infill used for surface drainage conveyance areas of engineered turf.
15.	in	inch
16.	”	inch
17.	kN	kilonewtons
18.	lb	pound
19.	MARV	minimum average roll value
20.	m	meter
21.	mm	millimeter
22.	mil	1/1000 of 1 inch
23.	ml	milliliters
24.	min	minute
25.	No.	number
26.	oz	ounce
27.	%	percent
28.	psf	pounds per square foot
29.	psi	pounds per square inch
30.	psig	pounds per square inch gauge
31.	PVC	Polyvinyl Chloride

32.	SDR	Standard Dimension Ratio
33.	sec	second
34.	TFE	tetrafluoroethylene
35.	TRM	turf reinforcement mat
36.	yd	yard

C. Whenever the following miscellaneous acronyms are referenced in the Technical Specifications or this CQA Plan, the following meanings apply:

1.	AST	Above Ground Storage Tank
2.	@	at
3.	BMP	Best Management Practice
4.	CQA	Construction Quality Assurance
5.	CQC	Construction Quality Control
6.	CSMP	Construction Storm Water Management Plan
7.	EBA	EBA Engineering
8.	=	equals
9.	LFG	Landfill Gas
10.	max.	maximum
11.	min.	minimum
12.	MQC	Manufacturer's Quality Control
13.	MSDS	Material Data Safety Sheet
14.	NOI	Notice of Intent
15.	NPDES	National Pollutant Discharge Elimination System
16.	PDF	Portable Document Format
17.	POC	Point of Connection
18.	QSD	Qualified SWPPP Developer
19.	QSP	Qualified SWPPP Practitioner
20.	REAP	Rain Event Action Plan
21.	SAP	Storm Water Action Plan
22.	SMARTS	Storm Water Multiple Application and Report Tracking System
23.	SPC	Storm Water Pollution Control
24.	Std.	Standard
25.	SWPPP	Storm Water Pollution Prevention Plan
26.	TEFC	Totally Enclosed Fan Cooled
27.	UST	Underground Storage Tank
28.	UV	Ultra-violet
29.	WDID	Waste Discharge Identification
30.	WPC	Water Pollution Control

1.10 CONTACT ADDRESSES AND TELEPHONE NUMBERS

A. The following are addresses, telephone numbers, and fax numbers for individual contacts at each organization involved in the project.

City of Ukiah
Department of Public Works
300 Seminary Avenue
Ukiah, CA 95482
Telephone: (707) 463-6282
Fax: (707) 463-6204

EBA Engineering
825 Sonoma Avenue
Santa Rosa, CA 95404
Contact Name: Damon F. Brown, P.G., C.E.G., C.Hg.
Telephone: (707) 544-0784
Fax: (707) 544-0866

END OF CQA SECTION 01090
REFERENCES

CQA SECTION 01300
SUBMITTALS

PART 1 GENERAL

1.01 SECTION SUMMARY

A. Submittal Control Log.

B. Submittal review and approval procedures.

1.02 SUBMITTAL CONTROL LOG

A. The Submittal Control Log lists all submittals required by the Technical Specifications. The Submittal Control Log will be maintained by the CQA Officer in coordination with the Contractor during construction. The Submittal Control Log documents: 1) submittal number; 2) referenced specification section; 3) submittal description; 4) submitter; 5) date received; 6) reviewer; 7) action taken determination; and 8) return date.

1.03 SUBMITTAL REVIEW AND APPROVAL PROCEDURES

A. Three (3) copies of each submittal listed in the Submittal Control Log will be submitted to the CQA Officer by the Contractor in accordance with the Technical Specifications. The submittals will be forwarded by the CQA Officer to the Design Engineer for review and approval. The Design Engineer may perform a preliminary review of submittals for compliance with the Technical Specifications and issue a verbal *Approval for Use* to the CQA Officer who, in turn, will notify the Contractor that no corrective action determinations were required prior to issuing a verbal *Approval for Use*. All submittals which are not in compliance with the Technical Specifications must be immediately forwarded to the Design Engineer for review and corrective action determinations.

B. At the completion of the review process, the Design Engineer will return two (2) copies of each submittal to the CQA Officer with *Action Taken* determinations stamped on both copies of the submittal. The *Action Taken* determinations and the return dates will be recorded on the Submittal Control Log. One copy of the reviewed submittal will be returned to the Contractor and the other copy will be archived by the CQA Officer in the submittal documentation control binder.

C. The Submittal Control Log will be reviewed and updated in coordination with the Contractor at the weekly progress meetings.

CQA SECTION 01400
DOCUMENTATION

PART 1 GENERAL

1.01 SECTION SUMMARY

A. Daily Summary Report.

B. Daily Field Log (Inspection Data Sheet).

C. Construction monitoring forms.

D. Laboratory testing reports.

E. Non-conformance/Corrective Action Form.

F. Acceptance Report.

G. Meeting/Discussion Summary Report.

H. Photograph Log.

I. Document Control.

J. As-built Record Documents.

K. CQA Certification Report.

L. Documentation archive storage.

1.02 DAILY SUMMARY REPORT

A. A summary report will be prepared daily by the CQA Officer. This report will organize and summarize all construction and CQA activities (monitoring and testing) completed during each day. The Daily Summary Report will contain or reference the following information:

1. Title block containing: 1) project name; 2) project number; 3) project location; 4) name of Owner; 5) name of Contractor; 6) date and day; 7) Document Control Number (see Part 1.10 of this Section); and 8) weather conditions.
2. Summary of construction activities for each unit of construction including equipment, personnel, and subcontractors utilized for each unit of construction and identification of the general area(s) where construction took place.
3. General summary of CQA activities (monitoring and testing) completed for each unit of construction with reference to attached Daily Field Logs (see Part 1.03 of this Section) which describe construction monitoring, construction testing results, and quality control procedures and test results.
4. General description of any non-conformance with the Plans or Technical Specifications and the corrective action measures taken with reference to attached Non-conformance/Corrective Action Forms (see Part 1.06 of this Section) which

contain a more detailed description of the non-conformance issue and its corrective action.

5. List of any materials received and status of submittal(s).
6. List of project meetings or pertinent discussions with reference to attached Meeting/Discussion Summary Report (see Part 1.08 of this Section).
7. Other miscellaneous information.
8. Signature of CQA Officer.

B. A sample Daily Summary Report is included in Appendix A, Project Documentation Forms.

1.03 DAILY FIELD LOG (INSPECTION DATA SHEET)

A. Each CQA Monitor will maintain an individual Daily Field Log (or Inspection Data Sheet) which will be assigned a cross-referencing Document Control Number (see Part 1.10 of this Section) and contain daily entries of the CQA Monitor.

B. On the Daily Field Log, the CQA Monitors will provide a written account of construction activities, construction monitoring, construction testing, and quality control procedures performed during the day for the monitored construction unit(s), as well as any observations (i.e., notes, charts, sketches, or photograph reference).

C. Construction monitoring forms (see Part 1.04 of this Section) and laboratory testing forms (see Part 1.05 of this Section) will be attached to, or referenced in, the Daily Field Log.

1.04 CONSTRUCTION MONITORING FORMS

A. Construction activities, construction monitoring, and construction testing will be recorded on appropriate construction monitoring forms. The following construction monitoring forms, or similar forms, will be issued by the CQA Officer for this project and are presented in the following appendices:

1. Soils Monitoring Forms (Appendix B)
   a. Soils Test Request - Sample Custody Log
   b. Nuclear Density/Moisture Test Data
2. Geosynthetics Monitoring Forms (Appendix C)
   a. Geomembrane Delivery and Control Log
   b. Engineered Turf Delivery and Control Log
   c. Geomembrane Test Request – Sample Custody Log
   d. Engineered Turf Test Request – Sample Custody Log
   e. Geomembrane Deployment/Seaming Log
   f. Geomembrane Repair Log
   g. Engineered Turf Deployment/Seaming Lot
   h. Engineered Turf Repair Log

B. Completed construction monitoring forms will be submitted by the CQA Monitor to the CQA Officer for review with Daily Field Logs, or at the completion of testing, and will be addressed by the CQA Officer in the Daily Summary Reports.

1.05 LABORATORY TESTING REPORTS

A. Laboratory testing reports will be issued by the Soils and Geosynthetics CQA Testing Laboratories for conformance and construction testing. Laboratory testing reports will be issued for the following testing during the project.

1. Moisture content, particle size analysis, Atterberg limits, Unified Soil Classification, and/or moisture-density relationship testing for miscellaneous aggregate materials, engineered fill, foundation layer, and erosion-resistant layer materials.
2. Particle size analysis for sand ballast.
3. Conformance testing for geomembrane.
4. Conformance testing for engineered turf.
5. Conformance testing for concrete.

B. Laboratory testing reports will be addressed by the CQA Officer in the Daily Summary Report on the date of receipt.

1.06 NON-CONFORMANCE/CORRECTIVE ACTION FORM

A. A Non-conformance/Corrective Action Form will be issued by the Owner to the CQA Officer who will notify the Contractor or Installer of construction or materials not in compliance with the Plans or Technical Specifications, or for defective workmanship or materials even if in compliance with the Plans and Technical Specifications. The Non-conformance/Corrective Action Form will contain or reference the following information:
1. Title block containing: 1) project name; 2) project number; 3) project location; 4) name of Owner; 5) name of Contractor; 6) date and day; and 7) Document Control Number (see Part 1.10 of this Section).
2. Description of the non-conformance issue, construction unit, and location.
3. Reference to the technical specification(s) and/or plan(s) for which materials or construction are not in compliance.
4. Description of corrective action measures necessary to fully correct the area of non-conformance with the Plans and/or Technical Specifications as determined by the Owner.
5. Specification variance or revisions to the As-built Record Drawings (see Part 1.11 of this Section) required.
6. If necessary, any Daily Field Log, construction monitoring forms, laboratory testing report(s), Meeting/Discussion Summary Report, or Photograph Log pertaining to the non-conformance issue will be referenced by Document Control or Photograph Number to fully substantiate the non-conformance issue and corrective action determination.
7. Signature of the CQA Officer verifying that corrective measures determined by the Owner have been taken by the Contractor or Installer.

B. A sample Non-conformance/Corrective Action Form is included in Appendix A, Project Documentation Forms.

1.07 ACCEPTANCE REPORT

A. An Acceptance Report will be prepared for each Construction Unit to verify that all materials and construction are in compliance with the Plans and Technical Specifications. The Acceptance Report will reference all relevant Daily Summary Reports, Daily Field Logs (Inspection Data Sheets), and Non-conformance/Corrective Action Forms by the Document Control Number.

B. A sample Acceptance Report is included in Appendix A, Project Documentation Forms.

1.08 MEETING/DISCUSSION SUMMARY REPORT

A. A Meeting/Discussion Summary Report will be prepared for each scheduled Project Meeting (see Section 01039 of this CQA Plan) and any pertinent discussion between the Contractor and CQA personnel. The Meeting/Discussion Summary Report will contain the following information:

1. Title block containing: 1) project name; 2) project number; 3) project location; 4) name of Owner; 5) name of Contractor; 6) date and time; 7) meeting location; and 8) Document Control Number (see Part 1.10 of this Section).
2. Meeting name or general discussion subject matter.
3. List of meeting attendees or discussion participants.
4. Minutes of scheduled Project Meetings or synopsis of discussion.
5. List of any items needing resolution resulting from the meeting or discussion.
6. Signature of CQA Officer.

B. A sample Meeting/Discussion Summary Report is included in Appendix A, Project Documentation Forms.

1.09 PHOTOGRAPH LOG

A. All construction activities will be continually photographed to clearly show and define construction methods and as-built conditions of completed units of construction. Photographs will include: 1) product or material sources; 2) construction methods in progress for each unit of construction; 3) completed units of construction; 4) damaged, rejected, or substandard materials and construction; 5) corrective action measures to rectify damaged, rejected, or substandard construction; 6) completed units of construction after completion of corrective action measures; and 7) design modifications. Photographs will be identified by number, date, and time of the photograph. The CQA Officer will maintain a cross-referencing photography log documenting the subject matter of each photograph.

B. A sample Photograph Log is included in Appendix A, Project Documentation Forms.

1.10 DOCUMENT CONTROL

A. A unique Document Control Number will be assigned to all CQA documents generated during construction and implementation of this CQA Plan.

B. The Document Control Number will organize and index all CQA documentation for cross-referencing, to allow easy access to all documents, and to enable a reviewer to identify and retrieve original CQA documentation for any completed unit of construction.

C. Complete documentation of all CQA activities will be controlled and secured in a series of 3-ring binders maintained by the CQA Officer with a duplicate copy maintained at the offices of the Owner, at the option of the Owner. This documentation control structure organizes and indexes all CQA documents and is intended to allow easy access to all documents for review and audit by the Owner, Design Engineer, or regulatory agencies. The following is a preliminary list and contents of the *CQA Documentation Binders* to be established and maintained by the CQA Officer.

1. Title: *Daily Summary Reports and Field Logs.*
   Color code (optional): Blue.
   Contents: Daily Summary Reports prepared by the CQA Officer and Daily Field Logs completed by the CQA Monitors.
2. Title: *Project Administration Documentation.*
   Color code (optional): Red.
   Contents: Non-conformance/Corrective Action Forms, Acceptance Reports, Meeting/Discussion Summary Reports, Owner correspondence, Design Engineer correspondence, Contractor correspondence, and miscellaneous correspondence.
3. Title: *Contractor Daily Field Reports.*
   Color code (optional): Green.
   Contents: Any Daily Field Reports prepared by the Contractor (or Installer).
4. Title: *Submittals.*
   Color code (optional): Purple.
   Contents: Updated Submittal Control Log, submittal transmittal cover sheets, and all reviewed and approved (or other status) submittals.
5. Title: *Soils CQA.*
   Color code (optional): White.
   Contents: Construction monitoring forms and laboratory testing reports for soils.
6. Title: *Geosynthetics CQA.*
   Color code (optional): Orange.
   Contents: Construction monitoring forms and laboratory testing reports for geosynthetics.
7. Title: *CQA Plan.*
   Color code (optional): Teal.
   Contents: CQA Plan.
8. Title: *Photography Log.*
   Color code (optional): Yellow.
   Contents: Construction and CQA photographs and cross-referencing Photograph Logs.

1.11 AS-BUILT RECORD DOCUMENTS

A. As-built Record Documents will be maintained by the CQA Officer and will be reviewed and verified by the Design Engineer.

B. The As-built Record Documents will show actual as-built conditions of construction, including an aerial topographic survey illustrating the final construction grades and configuration, and will adequately reflect that construction is in substantial compliance with the design intent of the Plans and Technical Specifications; irrelevant deviations in actual construction that do not substantially affect the design intent will not be incorporated into the As-built Record Documents, but will be addressed in the CQA Certification Report (see Part 1.12 of this Section).

C. As-built Record Documents will be prepared during the construction process by making modifications as they occur to a single set of construction drawings designated as the *Site As-built Record Documents*; at the completion of construction the CQA Officer will incorporate all as-built conditions into the *Final As-built Record Documents.*

D. The final As-built Record Documents will contain revision numbers, dates, and reviewer initials; and will be signed and stamped by the CQA Certifying Engineer.

1.12 CQA CERTIFICATION REPORT

A. At the completion of the project, the CQA Certifying Engineer will prepare a CQA Certification Report and submit it to the Owner. The CQA Certification Report will consist of information and data generated by the CQA program and will document that the final closure construction is in compliance with the design intent of the Plans and Technical Specifications. At a minimum, the CQA Certification Report will contain the following information.

1. Summary of construction methods for each unit of construction completed.
2. Summary of the CQA program implemented during construction and specific CQA activities (monitoring and testing) performed for each unit of construction completed.
3. Results of conformance testing and construction testing.
4. Revisions made to Plans and variances from Technical Specifications allowed.
5. Final As-built Record Documents.
6. Statement of compliance with the design intent of the Plans and Technical Specifications, signed and stamped by the CQA Certifying Engineer, a professional engineer or certified engineering geologist registered in the State of California.

1.13 DOCUMENTATION ARCHIVE STORAGE

A. At the completion of the project and after submittal of the CQA Certification Report and As-built Record Documents to the Owner, all original documentation generated by construction and the CQA program will be archived at the Owner's administrative office with duplicate copies stored at the offices of the Design Engineer and CQA Certifying Engineer.

END OF CQA SECTION 01400
DOCUMENTATION

DIVISION 2

CONSTRUCTION QUALITY ASSURANCE PROCEDURES

CQA SECTION 02207
AGGREGATE MATERIALS

PART 1 GENERAL

1.01 SUMMARY

A. The CQA Officer shall perform CQA procedures as outlined in this Section and follow guidelines for monitoring and testing to verify and document that the aggregate materials are in compliance with the Plans and Technical Specifications.

1.02 SUBMITTALS

A. Collect three (3) copies of each submittal required in the Technical Specifications.

B. Verify compliance with the submittal schedule and update Submittal Log.

C. Perform submittal review and approval procedures in Part 1.03 of Section 01300 (Submittals) of this CQA Plan.

PART 2 PRODUCTS

2.01 AGGREGATE MATERIALS

A. Verify that the following aggregate materials meet the applicable product requirements of Section 02207 (Aggregate Materials) of the Technical Specifications:
1. Aggregate base.
2. Pipe bedding.
3. Sand ballast.
4. Loose rock riprap.
5. Grouted rock riprap.
6. Gravel pack.
7. Concrete aggregate.
8. Coarse rock for construction entrance.
9. Concrete sand.
10. Tank bedding and backfill.

2.02 CONFORMANCE TESTING

A. Prior to aggregate base, pipe bedding, tank bedding and tank backfill placement operations, sample these respective materials to be used at the Work site and send the samples to the Soils Testing Laboratory to perform following test as specified:
1. Moisture-Density Relationship (ASTM D 1557); one (1) per source.

B. Prior to sand ballast placement operations, sample the actual sand material to be used at the Work site and send the samples to the Soils Testing Laboratory to perform at least one (1) of each of the following tests as specified:
1. Sieve Analysis (ASTM C 136) per every 10,000 cubic yards.
2. Permeability (ASTM D 2434 [modified]) per every 10,000 cubic yards.

C. Verify that the respective aggregate materials are derived from the approved sources throughout the Work.

PART 3 EXECUTION

3.01 STOCKPILING

A. Verify that the Contractor places all aggregate materials in the appropriate stockpile areas designated in the Plans and in accordance with all requirements in the Technical Specifications.

B. Verify that provisions are made to direct surface water away from stockpile site(s) so as to prevent erosion or deterioration of materials.

END OF CQA SECTION 02207
AGGREGATE MATERIALS

CQA SECTION 02222
EXCAVATION

PART 1 GENERAL

1.01 SUMMARY

A. The CQA Officer shall perform CQA procedures as outlined in this Section and follow guidelines for monitoring and testing to verify and document that all excavation work associated with the various construction tasks are in compliance with the Plans and Technical Specifications.

1.02 SUBMITTALS

A. Collect three (3) copies of the Contractor's Storm Water Pollution Prevention Plan (SWPPP) as required in the Technical Specifications.

B. Collect certified weight tags issued by the permitted transfer station or solid waste disposal facility for all loads of refuse transported off-site for disposal.

C. Verify compliance with the submittal schedule and update Submittal Log.

D. Perform submittal review and approval procedures in Part 1.03 of Section 01300 (Submittals) of this CQA Plan.

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION

3.01 PREPARATION

A. Prior to beginning of any portion of general earthwork, hold a preparatory meeting in accordance with Part 1.04 of Section 01039 (Project Meetings) of this CQA Plan.

B. Verify that the Contractor has located all underground utilities prior to performing any excavation for drainage and/or erosion control structures outside the limits of Work shown on the Plans.

3.02 CLEARING AND GRUBBING

A. Verify that all areas delineated for construction as shown on the Plans, including interim cover soil on the landfill surface and natural ground surface within the limits of the on-site borrow area, are cleared of all vegetative growth, such as brush, grass, weeds, or other deleterious material.

B. Verify that clearing and grubbing is performed prior to beginning excavation of any area.

C. Verify that cleared and grubbed debris are stockpiled separately from excavated material in accordance with the requirements set forth in Part 3.05 of this Section.

3.03 REFUSE EXCAVATION AND RELOCATION

A. After clearing and grubbing, verify that residual existing interim cover soil overlying the designated refuse excavation areas is segregated and subsequently reused as foundation layer material.

B. Verify that refuse beneath the existing power lines is excavated to the lines, grades and dimensions shown on the Plans.

C. Verify that the excavated refuse is relocated to the designated refuse relocation area shown on the Plans.

D. Verify that the relocated refuse placed within the designated refuse relocation area is spread in uniform lifts not exceeding 2 feet in thickness and the each lift is compacted with a minimum of four (4) passes using a dozer.

E. Verify that the relocated refuse lifts is covered with a minimum of 6 inches of soil at the end of each working day to minimize vector hazards and odor nuisance.

F. Verify that within five (5) working days of completing the refuse excavation work beneath the existing power lines, the refuse relocation area is completely covered with a minimum of 12 inches of prepared and compacted foundation layer material in accordance with Section 02240 (Foundation Layer) of these Technical Specifications.

3.04 INCIDENTAL REFUSE EXCAVATION AND DISPOSAL

A. Verify that refuse is excavated at the locations and to the details shown on the Plans to accommodate the installation of drainage, LFG collection system, and condensate drain/discharge components.

B. Verify that excavated refuse is handled and managed in accordance with the procedures outlined in Section 02222 (Excavation) of the Technical Specifications, including placement of refuse in roll-off bins or dump trucks, covering of roll-off bins or dump trucks containing refuse at the end of each working day, and the removal of refuse from the site within 48 hours of being excavated.

C. Verify that the Contractor does not mix excess, surplus, or waste materials from other general construction activities with the refuse derived from the excavation work described in this Section.

3.05 SOIL EXCAVATION

A. Verify that excavation of swales for drainage and erosion control structures conforms to Section 19-4.01 of the Standard Specifications.

3.06 GRADING

A. Verify that the excavations for the on-site borrow area, drainage swales, and leachate UST are constructed in conformance with the lines, grades, and dimensions shown on the Plans.

B. Verify that unsuitable materials, as determined by the Design Engineer, encountered at the subgrade elevation are removed and stockpiled separately from excavated material or disposed of in accordance with Section 02222 (Excavation) of the Technical Specifications.

C. Verify that where excavation is inadvertently carried below subgrade elevations, suitable provision is made by the Contractor for adjustment of same as determined by the Design Engineer to meet requirements incurred by the deeper excavation; also, verify that inadvertent over-excavation in such locations is rectified by backfilling with engineered fill and compacting to provide a firm and unyielding subgrade in accordance with the requirements of the Technical Specifications.

3.07 HAUL ROAD CONSTRUCTION

A. Verify that haul road locations have been approved by the Design Engineer.

3.08 DUST CONTROL

A. Verify that dust control measures are implemented by the Contractor in accordance with the approved Dust Control Plan and are effective in preventing and controlling the generation of dust in construction zones, along haul roads, in equipment parking areas, and in other locations as may be required due to operations related to performing the Work, and as required by the Design Engineer.

3.09 EROSION CONTROL

A. Verify that erosion and sediment control measures are implemented by the Contractor in accordance with the approved SWPPP, and as directed by the Design Engineer for all excavation work areas including on-site borrow area, sedimentation basins, leachate UST, stockpile areas, adjacent areas which have been disturbed, or any other affected areas.

3.10 DRAINAGE CONTROL

A. Verify that the Contractor provides ample means and devices with which to promptly remove and dispose of all water from any source entering the stockpile area(s) and any other active Work areas, and maintains these at all times until authorization for their removal is issued by the Design Engineer.

3.11 CORRECTIVE ACTIONS

A. If any portion(s) of the excavation work does not meet the requirements of the Plans and Technical Specifications, based on either field test results, observations, field survey, and/or physical measurement, verify that that portion(s) is reworked or removed and replaced to meet the requirements of the Plans and Technical Specifications and that the corrective actions implemented by the Contractor are in conformance with methods approved by the Design Engineer and the applicable Standard Specifications.

END OF CQA SECTION 02222
EXCAVATION

CQA SECTION 02224
ENGINEERED FILL

PART 1 GENERAL

1.01 SUMMARY

A. The CQA Officer shall perform CQA procedures as outlined in this Section and follow guidelines for monitoring and testing to verify and document that engineered fill materials and construction methods are in compliance with the Plans and Technical Specifications.

1.02 SUBMITTALS (Not Used)

PART 2 PRODUCTS

2.01 ENGINEERED FILL

A. Verify that the engineered fill materials meets the applicable product requirements of Section 02224 (Engineered Fill) of the Technical Specifications.

2.02 CONFORMANCE TESTING

A. Verify that engineered fill is obtained from one of the approved on-site borrow sources.

B. If engineered fill placement operations are being performed concurrently and from the same borrow source area as the foundation layer or erosion-resistant layer construction, use results from the foundation/erosion-resistant layer conformance testing to determine moisture-density relationship for compaction. If not, sample the actual engineered fill material to be used and send the samples to the Soils Testing Laboratory to perform the following test per the stated frequency of material to be placed or a minimum of two (2) tests, whichever results in the greater number of tests:
   1. Moisture-Density Relationship Curve (ASTM D 1557) per every 5,000 cubic yards.

C. If engineered fill material appearance or properties are different from those identified from borrow source characterization or change within the same location at the on-site borrow source, based on visual observation, perform additional borrow source characterization tests in accordance with the aforementioned conformance testing program.

D. Notify the Design Engineer of a change in materials and receive approval from the Design Engineer for use of the material as engineered fill prior to excavating additional material from that location within the on-site borrow source.

PART 3 EXECUTION

3.01 PREPARATION

A. Prior to engineered fill placement operations, hold a preparatory meeting in accordance with Part 1.04 of Section 01039 (Project Meetings) of this CQA Plan.

B. Convey to the Contractor that the nuclear testing gauge shall be calibrated on a daily basis using the methods and materials recommended by the gauge manufacturer. The nuclear gauge serial number and the name of the soil technician performing the soil density testing shall be noted to demonstrate that both the technician and the nuclear gauge are certified.

3.02 PLACEMENT

A. Verify that prior to placement of engineered fill on native ground, the subgrade is scarified to a depth of approximately 6 inches, moisture conditioned to within 1 to 3 percentage points of optimum moisture content, and compacted to at least 90 percent of the maximum dry density as determined by ASTM D1557.

B. Verify that engineered fill material is spread in uniform loose lifts not exceeding 8 inches in thickness.

C. Verify that each loose lift is moisture conditioned and thoroughly mixed to ensure a uniformly distributed moisture content.

3.03 COMPACTION

A. Verify that the final thickness of compacted lifts does not exceed 6 inches.

B. Perform the following field tests at the frequency shown to verify that the compacted engineered fill has a minimum dry density of 90 percent of the maximum dry density and is at a moisture content within 1 to 3 percentage points of the optimum moisture content as determined from ASTM D 1557:

1. *Dry Density and Moisture Content - Nuclear (ASTM D 2922 and D 3017)*; at least four samples (4) per 1,000 cubic yards of material placed or four samples per day.
   a. For sedimentation basin improvements and former leachate pond backfill, perform at least one (1) test per every 5,000 cubic yards
2. *Moisture Content (ASTM D 4959)*; at least one (1) test per every ten (10) nuclear gauge tests.

C. Record corresponding dry density and moisture content results on the Nuclear Density/Moisture Test Data form.

3.04 CORRECTIVE ACTIONS

A. If any portion(s) of the engineered fill does not meet the requirements of the Plans and Technical Specifications, based on either field test results, observations, field survey, and/or physical measurement, verify that that portion(s) is reworked or removed and replaced to meet the requirements of the Plans and Technical Specifications and that the corrective actions implemented by the Contractor are in conformance with methods approved by the Design Engineer and the applicable Standard Specifications.

END OF CQA SECTION 02224
ENGINEERED FILL

CQA SECTION 02225
TRENCHING AND BACKFILLING

PART 1 GENERAL

1.01 SUMMARY

A. The CQA Officer shall perform CQA procedures as outlined in this Section and follow guidelines for monitoring and testing to verify and document that all trenching and backfilling work associated with the various construction tasks are in compliance with the Plans and Technical Specifications.

1.02 SUBMITTALS (Not Used)

PART 2 PRODUCTS

2.01 PIPE BEDDING

A. Verify pipe bedding conformance under CQA Section 02207 (Aggregate Materials) of this CQA Plan.

2.02 ENGINEERED FILL

A. Verify engineered fill conformance under CQA Section 02224 (Engineered Fill) of this CQA Plan.

2.03 CONFORMANCE TESTING

A. Review moisture-density relationship conformance test results for the pipe bedding and engineered fill as determined under CQA Section 02207 (Aggregate Materials) and CQA Section 02224 (Engineered Fill), respectively, of this CQA Plan.

PART 3 EXECUTION

3.01 TRENCH PREPARATION

A. Verify that the required points of connection, lines, levels, contours, and datum locations have been identified by the Contractor.

B. Verify that the Contractor has located all utilities to avoid mechanical and structural interference.

3.02 TRENCH EXCAVATION

A. Verify that trenches are excavated to the lines and grades as shown on the Plans.

B. Verify that any water or materials that interfere with the work is removed.

C. Verify that soft areas of trench subgrades not capable of compaction in place are cut out.

D. Verify that trench bottoms are firm, continuous, relatively smooth and free of rocks and/or unsuitable material prior to the installation of pipe bedding or trench backfill material.

3.03 SHORING, SHEETING, AND BRACING OF TRENCH

A. Verify that the Contractor has secured a trench permit from the California Division of Industrial Safety prior to excavating any trench over 5 feet in depth.

B. Verify that shoring and sheeting is removed as the backfill is completed in a manner that will not damage the pipe or permit voids in the backfill.

3.04 PIPE/CONDUIT TRENCH BACKFILLING

A. Verify that trenches are backfilled to the lines and grades as shown on the Plans.

B. Verify that the placement methods employed do not disturb or damage buried drainage pipes and conduits in the trench.

C. Verify that pipe bedding material is placed at trench bottom in one continuous level layer not exceeding 6 inches in compacted depth.

D. Verify that pipe bedding is placed around the sides and to the top of the pipe/conduit, tamped in place, and compacted.

E. Verify that optimum moisture content of pipe bedding material is maintained to attain required compaction density.

F. Perform the following field tests at the frequency shown to verify that the compacted pipe bedding and engineered fill have a minimum dry density of 90 percent of the maximum dry density and is at a moisture content within 1 to 3 percentage points of the optimum moisture content as determined from ASTM D 1557:
   1. *Dry Density and Moisture Content - Nuclear (ASTM D 2922 and D 3017)*; at least one (1) test per 100 linear feet per lift or at a change in material.
   2. *Moisture Content (ASTM D 4959)*; at least one (1) test per every ten (10) nuclear gauge tests.

G. Record corresponding dry density and moisture content results on the Nuclear Density/Moisture Test Data form.

H. Verify that trenches are not jetted, unless allowed by the Design Engineer.

I. For buried pipe that does not require pipe bedding or engineered fill (condensate drain pipe), verify that the trench backfill is placed in a manner that will not damage the pipe and that the backfill is compacted to a firm consistency consistent with surrounding erosion-resistant layer material.

3.05 ANCHOR TRENCH BACKFILLING

A. Verify that the placement method employed does not damage the ClosureTurf™ in the trench.

B. Verify that the portion of the trench above the ClosureTurf™ is backfilled with engineered fill and field tested consistent with the procedures described in Part 3.04 of this Section.

C. Verify that trenches are not jetted, unless allowed by the Design Engineer.

D. Verify that the trenches are backfilled to the lines and grades as shown on the Plans.

3.06 CORRECTIVE ACTIONS

A. If any portion(s) of the trenching and/or backfilling does not meet the requirements of the Plans and Technical Specifications, based on either field test results, observations, field survey, and/or physical measurement, verify that that portion(s) is reworked or removed and replaced to meet the requirements of the Plans and Technical Specifications and that the corrective actions implemented by the Contractor are in conformance with methods approved by the Design Engineer and the applicable Standard Specifications.

END OF CQA SECTION 02225
TRENCHING AND BACKFILLING

CQA SECTION 02240
FOUNDATION LAYER

PART 1 GENERAL

1.01 SUMMARY

A. The CQA Officer shall perform CQA procedures as outlined in this Section and follow guidelines for monitoring and testing to verify and document that the foundation layer materials and construction methods are in compliance with the Plans and Technical Specifications.

1.02 SUBMITTALS (Not Used)

PART 2 PRODUCTS

2.01 FOUNDATION LAYER MATERIAL

A. Verify that the foundation layer materials meet the applicable product requirements of Section 02240 (Foundation Layer) of the Technical Specifications.

B. Verify that residual interim cover soil derived from designated refuse excavation areas is free of refuse and suitable for reuse as new foundation layer material.

2.02 CONFORMANCE TESTING

A. Following clearing and grubbing of landfill surface but prior to fine grading and scarification operations, sample existing interim cover material to be incorporated into the foundation layer and send the samples to the Soils Testing Laboratory to perform at least one (1) of each of the following tests as specified:
   1. Particle Size Analysis (ASTM D 422) per every 5,000 cubic yards.
   2. Unified Soil Classification (ASTM D 2487) per every 5,000 cubic yards.
   3. Moisture-Density Relationship Curve (ASTM D 1557) per every 5,000 cubic yards.

B. Prior to new foundation layer placement operations, sample the actual foundation layer material to be used at the Work site and send the samples to the Soils Testing Laboratory to perform at least one (1) of each of the following tests as specified:
   1. Particle Size Analysis (ASTM D 422) per every 5,000 cubic yards.
   2. Unified Soil Classification (ASTM D 2487) per every 5,000 cubic yards.
   3. Moisture-Density Relationship Curve (ASTM D 1557) per every 5,000 cubic yards.

C. Verify that foundation layer material is obtained from the approved on-site borrow source as determined from the aforementioned conformance testing.

D. If foundation layer material appearance or properties are different from those identified from borrow source characterization or change within the same location at the on-site borrow source, based on visual observation, perform additional borrow source characterization tests in accordance with the aforementioned conformance testing program.

E. Notify the Design Engineer of a change in materials and receive approval from the Design Engineer for use of the material for foundation layer construction prior to excavating additional material from that location within the on-site borrow source.

PART 3 EXECUTION

3.01 PREPARATION

A. Prior to foundation layer placement operations, hold a preparatory meeting in accordance with Part 1.04 of Section 01039 (Project Meetings) of this CQA Plan.

B. Convey to the Contractor that the nuclear testing gauge shall be calibrated on a daily basis using the methods and materials recommended by the gauge manufacturer. The nuclear gauge serial number and the name of the soil technician performing the soil density testing shall be noted to demonstrate that both the technician and the nuclear gauge are certified.

3.02 PREPARATION OF EXISTING INTERIM COVER SOIL TO BE INCORPORATED INTO THE FOUNDATION LAYER

A. Perform visual soil classification of the interim cover soils per the following test method and frequency:
   1. *Visual Soil Classification (ASTM D 2488)*; at least one (1) test per every acre.

B. Verify that existing interim cover soils are scarified to a minimum depth of 12 inches.

C. Following scarification, verify that existing interim cover soils are moisture conditioned and thoroughly mixed to ensure a uniformly distributed moisture content to within 1 to 3 percentage points of the optimum moisture content.

D. Perform the following field tests at the frequency shown to verify that the compacted interim cover soils have a minimum dry density of 90 percent of the maximum dry density and within 1 to 3 percentage points of the optimum moisture content as determined from ASTM D 1557:
   1. *Dry Density and Moisture Content - Nuclear (ASTM D 2922 and D 3017)*. Soil shall be sampled and tested at a frequency of four samples per 1,000 cubic yards (3/AC/lift) of material placed or four samples per day, whichever frequency results in the greatest number of tests.
   2. *Moisture Content (ASTM D 4959)*; at least one (1) test per every ten (10) nuclear gauge tests.

3.03 PLACEMENT AND COMPACTION OF NEW FOUNDATION LAYER MATERIAL

A. Verify that foundation layer material is moisture conditioned and thoroughly mixed in the on-site borrow area to ensure a uniformly distributed moisture content. At time of placement, perform the following field test at the frequency shown to verify that the foundation layer material meets the soil classification requirements:
   1. *Soil Classification (ASTM D 2488)*; one (1) sample per three (3) acres per lift (2,400 cubic yards) of material placed or change in material, whichever results in the greater number of tests.

B. Record corresponding soil classification results on the Test Data form.

C. Continuously observe all placement operations to verify that the foundation layer material is consistent and has no oversized particles, overly wet or dry areas, or organic, deleterious, or other unsuitable matter.

D. Verify that foundation layer material is spread in uniform loose lifts not exceeding 8 or 12 inches in thickness.

E. Verify that each loose lift is moisture conditioned and thoroughly mixed to ensure a uniformly distributed moisture content.

F. Verify that the final thickness of compacted lifts for new foundation layer material does not exceed 6 inches.

G. Perform the following field tests on each 6-inch lift at the frequency shown to verify that the foundation layer has been compacted to 90 percent of the maximum dry density and is within 1 to 3 percentage points of the optimum moisture content as determined from ASTM D 1557:

1. *Dry Density and Moisture Content - Nuclear (ASTM D 2922 and D 3017)*. Soil shall be sampled and tested at a frequency of four samples per 1,000 cubic yards (3/AC/lift) of material placed or four samples per day, whichever frequency results in the greatest number of tests.
2. *Moisture Content (ASTM D 4959)*; at least one (1) test per every ten (10) nuclear gauge tests.

H. Record corresponding dry density and moisture content results on the Nuclear Density/Moisture Test Data form.

3.04 FINAL SURFACE PREPARATION

A. Verify that the completed foundation layer surface is free of individual particles or protrusions greater than 0.50 inches in diameter.

B. Verify that ruts and ridges on the completed foundation layer surface are limited to a maximum depth or height of 1.0 inch.

3.05 CONFORMANCE VERIFICATION

A. Verify by auger or survey that the completed foundation layer has a minimum thickness of 12 inches. Measurements by either method shall be conducted using a grid pattern with 100-foot centers.

3.06 CORRECTIVE ACTIONS

A. If any portion(s) of the foundation layer does not meet the requirements of the Plans and Technical Specifications, based on either field test results, observations, field survey, and/or physical measurement, verify that that portion(s) is reworked or removed and replaced to meet the requirements of the Plans and Technical Specifications and that the corrective actions implemented by the Contractor are in conformance with methods approved by the Design Engineer and the applicable Standard Specifications.

END OF CQA SECTION 02240
FOUNDATION LAYER

CQA SECTION 02310
ACCESS ROADS

PART 1 GENERAL

1.01 SUMMARY

A. The CQA Officer shall perform CQA procedures as outlined in this Section and follow guidelines for monitoring and testing to verify and document that the access road materials and construction methods are in compliance with the Plans and Technical Specifications.

1.02 SUBMITTALS (Not Used)

PART 2 PRODUCTS

2.01 REINFORCEMENT GEOTEXTILE

A. Verify reinforcement geotextile conformance under CQA Section 02771 (Reinforcement Geotextile) of this CQA Plan.

2.02 AGGREGATE BASE

A. Verify aggregate base conformance under CQA Section 02207 (Aggregate Materials) of this CQA Plan.

2.03 CONFORMANCE TESTING

A. Review moisture-density relationship conformance test results for the aggregate base as determined under CQA Section 02207 (Aggregate Materials) of this CQA Plan.

PART 3 EXECUTION

3.01 SUBGRADE

A. Where access roads are not constructed on engineered fill, verify that subgrade is scarified a minimum of 6 inches, uniformly moisture conditioned to within 1 to 3 percentages points of optimum moisture content, and compacted to at least 90 percent of the maximum dry density as determined by ASTM D 1557.

B. Where access roads are constructed on engineered fill, verify that the engineered fill has been placed and compacted in accordance with the requirements of Section 02224 (Engineered Fill) of this CQA Plan.

C. Where access roads are constructed on installed engineered turf, verify that the following precautions and requirement are implemented:

1. Vehicle and equipment access on the installed engineered turf conform with applicable provisions outlined in Section 02772 (Geomembrane) of the Technical Specifications.

2. Verify that the initial lift of engineering filled placed atop the installed engineered turf is well graded and does not contain rocks or clods over 1 inch in greatest dimension.

3.02 REINFORCEMENT GEOTEXTILE

A. Verify that reinforcement geotextile is installed, including examination of subgrade surface, in accordance with the requirements for geotextile as set forth in Section 02771 (Geotextile) of this CQA Plan.

3.03 AGGREGATE BASE

A. Verify the stability of the subgrade by proof rolling with a roller or loaded water truck. Verify that any areas determined not to be suitable are allowed to air dry until stable or over-excavated and backfilled with aggregate base.

B. Verify that trucks do not back-dump aggregate base onto the reinforcement geotextile and that they only drive on previously dumped aggregate base to progress.

C. Verify that aggregate base material is spread in uniform loose lifts not exceeding 8 inches in thickness.

D. Perform the following field tests at the frequency shown to verify that the compacted aggregate base material has a minimum dry density of 95 percent of the maximum dry density and is within 1 to 3 percentage points of the optimum moisture content as determined from ASTM D 1557:
   1. *Dry Density and Moisture Content - Nuclear (ASTM D 2922 and D 3017)*; at least one (1) test per 100 linear feet per lift.
   2. *Moisture Content (ASTM D 4959);* at least one (1) test per every ten (10) nuclear gauge tests.

E. Record corresponding dry density and moisture content results on the Nuclear Density/Moisture Test Data form.

F. Verify that access roads are "proof rolled" with a heavy wheel-load vehicle, such as a loaded water truck, to identify weak areas, and verify that any weak areas are reworked to the Design Engineer's satisfaction.

3.04 CORRECTIVE ACTIONS

A. If any portion(s) of the access roads does not meet the requirements of the Plans and Technical Specifications, based on either field test results, observations, field survey, and/or physical measurement, verify that that portion(s) is reworked or removed and replaced to meet the requirements of the Plans and Technical Specifications and that the corrective actions implemented by the Contractor are in conformance with methods approved by the Design Engineer and the applicable Standard Specifications.

B. If any portion(s) of the underlying installed engineered turf is damaged during the access road construction as determined by visual observations, verify that that portion(s) is repaired or removed and replaced to meet the requirements of the Technical Specifications and that the

corrective actions implemented by the Contractor are in conformance with methods approved by the Design Engineer and the applicable Standard Specifications.

END OF CQA SECTION 02310
ACCESS ROADS

CQA SECTION 02722
DRAINAGE AND EROSION CONTROLS

PART 1 GENERAL

1.01 SUMMARY

A. The CQA Officer shall perform CQA procedures as outlined in this Section and follow guidelines for monitoring and testing to verify and document that the drainage and erosion control materials and construction methods are in compliance with the Plans and Technical Specifications.

1.02 SUBMITTALS

A. Collect three (3) copies of each submittal required in the Technical Specifications.

B. Verify compliance with the submittal schedule and update Submittal Log.

C. Perform submittal review and approval procedures in Part 1.03 of Section 01300 (Submittals) of this CQA Plan.

PART 2 PRODUCTS

2.01 DRAINAGE AND EROSION CONTROL COMPONENTS

A. Verify that the following drainage and erosion control components meet the applicable product requirements of Section 02722 (Drainage and Erosion Controls) of the Technical Specifications:
1. Corrugated metal pipe (CMP), couplings and fabricated fittings.
2. High density polyethylene (HDPE) pipe, couplings and fabricated fittings.
3. CMP anchor assembly stakes and hardware.
4. Wood posts and railings.
5. Steel grates for drainage inlets.
6. Turf reinforcement mat (TRM).
7. TRM anchorage stakes.
8. Erosion control netting.
9. Erosion control netting anchors.

2.02 PIPE BEDDING

A. Verify pipe bedding conformance under CQA Section 02207 (Aggregate Materials) of this CQA Plan.

2.03 BACKFILL

A. Verify that backfill placed above pipe bedding consists of material excavated from the trench/excavation unless specified otherwise by the Design Engineer.

B. Review moisture-density relationship conformance test results for the erosion-resistant layer as determined under CQA Section 02250 (Erosion-Resistant Layer) of this CQA Plan.

2.04 ROCK RIPRAP

A. Verify rock riprap conformance under CQA Section 02207 (Aggregate Materials) of this CQA Plan.

2.05 CONCRETE

A. Verify concrete conformance under CQA Section 03300 (Concrete) of this CQA Plan.

PART 3 EXECUTION

3.01 PREPARATION

A. Prior to beginning construction of any drainage and erosion control structure, hold a preparatory meeting in accordance with Part 1.04 of Section 01039 (Project Meetings) of this CQA Plan.

3.02 STOCKPILING

A. Verify that the Contractor places all drainage and erosion control materials in an area(s) approved by the Design Engineer.

3.03 EXCAVATION

A. Verify excavation conformance under CQA Section 02222 (Excavation) of this CQA Plan.

3.04 DRAIN INLETS AND DRAIN PIPE

A. Verify trenching conformance under CQA Section 02225 (Trenching and Backfilling) of this CQA Plan.

B. Verify that drain inlets/buried drain pipe and associated bedding and backfill material are placed in conformance with Section 66-1 of the Standard Specifications and the Technical Specifications.

C. Verify that above ground drain pipes are placed and anchored in conformance with Section 66 of the Standard Specifications and as shown on the Plans.

3.05 SEDIMENTATION BASIN OUTLET STRUCTURES

A. Verify that vertical slots are cut in the sedimentation basin drainage risers to the dimensions, orientation and frequency as shown on the Plans.

B. Verify trenching conformance under CQA Section 02225 (Trenching and Backfilling) of this CQA Plan.

C. Verify that minor concrete installed for the drainage riser foundations is as shown on the Plans.

D. Verify concrete placement conformance under CQA Section 03300 (Concrete) of this CQA Plan.

E. Verify that bedding and backfill material are placed in conformance with Section 66-1 of the Standard Specifications and the Technical Specifications.

3.06 EARTHEN SWALES

A. Verify excavation conformance under CQA Section 02222 (Excavation) of this CQA Plan.

3.07 EROSION MAT LINED SWALES

A. Verify that the TRM is installed as shown on the Plans and per manufacturer's recommendations.

B. Verify that trenches for terminal and check slots (anchorage) are excavated into the erosion-resistant layer as shown on the Plans.

C. Verify trench backfill conformance under CQA Section 02225 (Trenching and Backfilling) and perform the following field tests at the frequency shown to verify that the trench backfill has a minimum dry density of 90 percent of the maximum dry density and is within 1 to 3 percentage points of the optimum moisture content as determined from ASTM D 1557:

1. *Dry Density and Moisture Content - Nuclear (ASTM D 2922 and D 3017)*; at least one (1) test per 100 linear feet per lift.
2. *Moisture Content (ASTM D 4959);* at least one (1) test per every ten (10) nuclear gauge tests.

D. Record corresponding dry density and moisture content results on the Nuclear Density/Moisture Test Data form.

E. Verify that TRM placed at the top of swale (finish surface) is at or below the final grade so surface drainage can flow freely into the swale.

F. Verify that all splices are shingled downstream.

G. Verify that anchorage stakes are installed as shown on the Plans and per manufacturer's recommendations.

3.08 LOOSE ROCK RIPRAP LINED SWALES

A. Verify filter geotextile installation conformance under CQA Section 02771 (Geotextile) of this CQA Plan.

B. Verify that rock riprap is placed to the average thickness shown on the Plans with a maximum thickness deviation of 4 inches at any location.

C. Verify that rock riprap is not be placed by dumping.

D. Verify that individual riprap stones are moved and placed as necessary to obtain a stable three-point bearing for each stone and a well-graded distribution along the entire length of the swale.

E. Verify that the placed rock riprap is free of pockets of small stones or clusters of larger stones.

3.09 GROUTED ROCK RIPRAP OUTFALLS

A. Verify that the footprint of the outfall is excavated to the dimensions as shown on the Plans.

B. Verify that rock riprap is placed within the excavated footprint to the average thickness shown on the Plans with a maximum thickness deviation of 4 inches at any location.

C. Verify that rock riprap is not be placed by dumping.

D. Verify that individual riprap stones are moved and placed as necessary to obtain a stable three-point bearing for each stone and a well-graded distribution over the entire footprint of the outfall.

F. Verify that the placed rock riprap is free of pockets of small stones or clusters of larger stones.

G. Verify concrete placement conformance under CQA Section 03300 (Concrete) of this CQA Plan.

3.10 LOOSE ROCK RIPRAP INLETS AND OUTLETS

A. Verify that the footprint of the inlet or outfall is excavated to the dimensions as shown on the Plans.

B. Verify filter geotextile installation conformance under CQA Section 02771 (Geotextile) of this CQA Plan.

C. Verify that rock riprap is placed on the installed filter geotextile to the average thickness shown on the Plans with a maximum thickness deviation of 4 inches at any location.

D. Verify that rock riprap is not be placed by dumping.

E. Verify that individual riprap stones are moved and placed as necessary to obtain a stable three-point bearing for each stone and a well-graded distribution over the entire footprint of the inlet or outfall.

F. Verify that the placed rock riprap is free of pockets of small stones or clusters of larger stones.

3.11 EROSION CONTROL

A. Verify that the finish surface has been track walked prior to placement of seeding, fertilizer and straw.

B. Verify that the straw is placed onto landfill surface slopes that are steeper than 10 percent.

C. Verify that the blown straw applied to the landfill surface slopes has a minimum thickness of 1.5 inches in place.

D. Verify that erosion control netting is placed over the applied straw and that the netting is secured with anchors at a frequency of 1 foot on center along the edges, and one (1) every 35 square feet for interior areas. Verify that butt joints are spaced 1 foot apart.

3.12 CONFORMANCE VERIFICATION

A. After construction of any portion of drainage and erosion control measures, verify all grades and dimensions of completed work by either field survey or physical measurement.

3.13 CORRECTIVE ACTIONS

A. If any portion(s) of the drainage and erosion control provisions do not meet the requirements of the Plans and Technical Specifications, based on either field test results, observations, field survey, and/or physical measurement, verify that that portion(s) is reworked or removed and replaced to meet the requirements of the Technical Specifications and that the corrective actions implemented by the Contractor are in conformance with methods approved by the Design Engineer and the applicable Standard Specifications.

END OF CQA SECTION 02722
DRAINAGE AND EROSION CONTROL

CQA SECTION 02771
GEOTEXTILE

PART 1 GENERAL

1.01 SUMMARY

A. The CQA Officer shall perform CQA procedures as outlined in this Section and follow guidelines for monitoring and testing to verify and document that reinforcement geotextile materials and installation are in compliance with the Plans and Technical Specifications.

1.02 SUBMITTALS

A. Collect three (3) copies of each submittal listed in the Technical Specifications.

B. Verify compliance with the submittal schedule and update Submittal Log.

C. Perform submittal review and approval procedures in Part 1.03 of Section 01300 (Submittals) of this CQA Plan.

1.03 TRANSPORT AND STORAGE

A. Upon delivery of the filter and reinforcement geotextile rolls to the Work site, verify that the rolls have been transported with opaque protective coverings and within a closed trailer.

B. During unloading of the filter and reinforcement geotextile rolls at the Work site, perform the following procedure:
   1. Obtain a copy of the packing list.
   2. Complete the Geotextile Delivery and Control Log for each shipment and attach a copy of the packing list. The Geotextile Delivery and Control Log documents the following:
      a. Delivery date.
      b. Roll numbers.
      c. Batch/lot numbers or production dates.
      d. Roll dimensions.
      e. Receipt of MQC test reports.
      f. CQA conformance test sampling.
      g. Receipt of CQA conformance test results.
      h. Manufacturer and Product Name or Designation.
      i. Name of CQA monitor observing delivery and storage.
      j. Total quantity delivered with each shipment and the cumulative total quantity delivered to date.
      k. Additional notes including rejection of materials, condition of delivered materials, and other materials included with the shipments.
   3. Obtain written certification from the Supplier that unloading and storage of the filter and reinforcement geotextile rolls has been done in accordance with the Manufacturer's recommended procedures.
   4. Verify that filter and reinforcement geotextile rolls are transported, unloaded, handled, and stored in a manner that does not damage the filter and reinforcement

geotextile rolls or their protective coverings in accordance with the Manufacturer's recommended procedures and the following requirements:

a. Nylon or other cloth straps were used to unload and handle the filter and reinforcement geotextile rolls to protect the rolls and their protective coverings from damage.

b. The filter and reinforcement geotextile rolls were stacked no more than five rolls high and with a 3-foot wide access path between the stacked rows.

5. Verify that damaged protective coverings are repaired or replaced.

6. Identify and separate damaged or rejected filter and reinforcement geotextile rolls.

PART 2 PRODUCTS

2.01 GEOTEXTILE COMPONENTS

A. Verify that the following filter and reinforcement geotextile components meet the applicable product requirements of Section 02771 (Geotextile) of the Technical Specifications:

1. Filter geotextile.
2. Reinforcement geotextile.
3. Sewing thread.

PART 3 EXECUTION

3.01 PREPARATION AND EXAMINATION

A. Prior to filter and reinforcement geotextile installation, hold a preparatory meeting in accordance with Part 1.04 of Section 01039 (Project Meetings) of this CQA Plan.

B. Prior to filter and reinforcement geotextile installation, verify that all underlying material installation and construction has been completed in accordance with the Technical Specifications.

3.02 INSTALLATION

A. Verify that the filter and reinforcement geotextile is installed in accordance with Manufacturer's instructions for deployment, seaming, and exposure.

B. Verify that the filter and reinforcement geotextile is installed with sufficient tension to prevent excessive overlapping, insufficient overlapping, wrinkles, and folds.

C. Verify that the filter and reinforcement geotextile panels are overlapped with sufficient material to create a prayer fold for sewing operations.

D. Verify that the filter and reinforcement geotextile is adequately ballasted during installation and until geotextile is covered with the overlying material.

E. Verify that the reinforcement geotextile are permanently anchored as shown on the Plans when installation is complete.

F. Verify that filter and reinforcement geotextile damaged during installation is removed and/or repaired with a sewn patch.

G. Verify that terminal ends of reinforcement geotextile, where the type and purpose of the geotextile changes as shown on the Plans, are overlapped a minimum of 4 feet.

H. Verify that when cutting any filter and reinforcement geotextile above other geosynthetics, the Installer uses a knife with a hooked blade.

I. Verify that the underlying soil subgrade or installed geosynthetics are not damaged by filter and reinforcement geotextile installation equipment or methods and that any damaged soil subgrade or installed geosynthetics are completely repaired in accordance with the requirements of the applicable parts of Section 02771 (Geotextile) of the Technical Specifications.

J. Verify that rocks, excessive dust, excessive moisture or other matter that could cause damage, hamper sewing operations, or clog the filter and reinforcement geotextile are not trapped under the filter and reinforcement geotextile or within the overlap.

3.03 SEAMING AND REPAIR

A. Verify that all seams are sewn unless an alternate seaming method is allowed by the Design Engineer based on the Installer's demonstration of the alternative acceptability.

B. Verify that overlaps are clean and free of soil materials which could adversely affect sewing operations.

C. Verify that a prayer fold is made within the overlap prior to sewing.

D. Verify that a continuous 401 two-thread chain stitch is used to sew the prayer fold.

E. Verify that damaged filter and reinforcement geotextile is removed entirely and replaced or repaired in accordance with the following guidelines:
   1. Repair (patching) material shall be of the same type as the damaged filter and reinforcement geotextile.
   2. Patches shall extend a minimum of 12 inches in all directions beyond the damaged area with the machine direction of the patch aligned with the machine direction of the damaged filter and reinforcement geotextile.
   3. Patches shall be seamed using the same method used for seaming the damaged filter and reinforcement geotextile.

3.04 CORRECTIVE ACTIONS

A. If any portion(s) of the filter and reinforcement geotextile provisions do not meet the requirements of the Plans and Technical Specifications, based on either observations and/or physical measurement, verify that that portion(s) is repaired or removed and replaced to meet the requirements of the Technical Specifications and that the corrective actions implemented by the Contractor are in conformance with methods approved by the Design Engineer and the applicable Standard Specifications.

END OF CQA SECTION 02771
REINFORCEMENT GEOTEXTILE

CQA SECTION 02772
GEOMEMBRANE

PART 1 GENERAL

1.01 SUMMARY

A. The CQA Officer shall perform CQA procedures as outlined in this Section and follow guidelines for monitoring and testing to verify and document that geomembrane liner materials and installation are in compliance with the Plans and Technical Specifications.

1.02 SUBMITTALS

A. Collect three copies of each submittal listed in the Specifications.

B. Verify compliance with the submittal schedule and update Submittal Log.

C. Perform submittal review and approval procedures in Part 1.03 of Section 01300 (Submittals) of this CQA Plan.

1.03 TRANSPORT AND STORAGE

A. During unloading of the geomembrane rolls at the site, perform the following procedure:
   1. Obtain a copy of the packing list.
   2. Complete the Geomembrane Delivery and Control Log for each shipment and attach a copy of the packing list. The Geomembrane Delivery and Control Log documents the following:
      a. Delivery date;
      b. Roll numbers;
      c. Batch/lot numbers or production dates;
      d. Roll dimensions;
      e. Receipt of MQC test reports;
      f. Manufacturer and Product Name or Designation;
      g. Name of CQA monitor observing delivery and storage;
      h. Total quantity delivered with each shipment and the a cumulative total quantity delivered to date; and
      i. Additional notes including rejection of materials, condition of delivered materials, and other materials included with the shipments.
   3. Obtain written certification from the Supplier that unloading and storage of the geomembrane rolls has been done in accordance with the Manufacturer's recommended procedures.
   4. Verify that geomembrane rolls are transported, unloaded, handled, and stored in a manner that does not damage the geomembrane rolls in accordance with the Manufacturer's recommended procedures and the following requirements:
      a. Stinger or straps (nylon or other cloth) shall be used to unload and handle the geomembrane rolls to protect the rolls from damage.
      b. The geomembrane rolls shall be stacked no more than three rolls high and with a 3-foot wide access path between the stacked rows.
   5. Identify and separate damaged or rejected geomembrane rolls.

PART 2 PRODUCTS

2.01 GEOMEMBRANE

A. Verify that geomembrane material consists of a compounded Linear Low-density polyethylene (LLDPE) meeting the product requirements of the Technical Specifications.

2.02 EXTRUDATE ROD

A. Verify that extrudate rod is made from the same resin as the geomembrane.

2.03 GEOMEMBRANE SURFICIAL STRIPS

A. Verify that geomembrane surficial strip material consists of Super Gripnet or single-sided geocomposite (200 mil).

2.04 CLOSURE TURF™ COLLECTION FOOT ASSEMBLIES

A. Verify that ClosureTurf™ collection foot components are provided by the manufacturer of the ClosureTurf™ product.

B. Verify PVC assembly components conformance under CQA Section 15200 (LFG Collection System Components) of this CQA Plan.

C. Verify that wellhead adapter consists of 2-inch by 1.5-inch flexible coupling with stainless steel band clamps as manufactured by Fernco, or approved equivalent.

2.05 CLOSURE TURF™ PRESSURE RELIEF VALVES

A. Verify that ClosureTurf™ pressure relief valves are provided by the manufacturer of the ClosureTurf™ product.

2.06 FIELD TESTING EQUIPMENT

A. Verify that the Installer provides and uses a field tensiometer for seam testing that has been calibrated within the last year and is accurate to within 2 pounds.

B. Verify that the Installer provides and uses a 1-inch (width) by 6-inch (length) cutting die for cutting seam test specimens.

2.07 CONFORMANCE TESTING

A. Conduct sampling for CQA conformance testing at the site upon delivery or at the manufacturing plant prior to shipment and delivery to the site.

B. For every 100,000 square feet of material delivered to the site, select at least one geomembrane roll to sample for CQA conformance testing.

C. Sample the selected geomembrane rolls for CQA conformance testing using the following procedure:

1. Cut and discard the first three feet of geomembrane material from across the entire width of the roll.
2. Cut the next 12 inches of material from across the entire width of the roll; this section of material is the CQA conformance testing sample.
3. Assign a CQA test number to the sample and mark the following information directly on the sample with a paint marker:
   a. Machine direction of the sample.
   b. Manufacturer's roll number.
   c. CQA test number.
4. Complete the geomembrane Test Request and Sample Custody Log and ship samples to the Geosynthetics Testing Laboratory via overnight delivery.

D. The following CQA conformance tests will be performed by the Geosynthetics Testing Laboratory to verify compliance with the product requirements of the Specifications:
1. Tensile Properties (ASTM D 6693 / ASTM D 638).
2. Density (ASTM D 1505).
3. Carbon Black Content (ASTM D 4218).
4. Carbon Black Dispersion (ASTM D 5596).
5. Sheet Thickness (ASTM D 5994).

E. Upon completion of CQA conformance testing and receipt of the results, review all results for compliance with the Specifications and report any test results which are not in compliance with the Specifications to the Engineer.

F. Additional CQA conformance testing or corrective action to be performed in the event of test results which are not in compliance with the Specifications will be determined by the Engineer.

PART 3 EXECUTION

3.01 PREPARATION AND EXAMINATION

A. Prior to geomembrane installation, hold a preparatory meeting in accordance with Section 01039 (Progress Meetings) of this CQA Plan.

B. Prior to geomembrane installation, verify that all underlying material installation and construction has been completed in accordance with the Technical Specifications.

C. Verify that prior to and at the middle of each geomembrane welding work shift and whenever adjustments are made to the welding machines, the Installer prepares and tests trial welds for each welding machine that is being used or will be used during that work shift.

D. Verify that trial welds are prepared for both fusion and extrusion welding machines and sampled using the following guidelines:
1. Trial weld samples for fusion welding machines should be a minimum of 6 feet in length.
2. Trial weld samples for extrusion welding machines should be a minimum of 3 feet in length.
3. The trial weld should be centered along and run the entire length of the sample.

E. Verify that trial welds are tested as follows:
   1. Trial welds should be allowed to cool to ambient conditions prior to testing.
   2. After cooling, excessive material should be cut from the beginning and the end of the trial weld sample (approximately 4-inches from each end).
   3. Using the cutting die, four 1-inch specimens should be cut at an even spacing along the length of the trial weld.
   4. Using the field tensiometer with a rate of separation of 2 inches per minute, two non-adjacent specimens shall be tested for peel adhesion (peel) and two for bonded seam strength (shear); both sides of fusion welds shall be tested for peel.

F. Record peel and shear test results for trial welds on the Geomembrane Deployment/Welding Log using the following criteria:
   1. Peel test specimens:
      a. The break is either a film tear bond (FTB-passing) or a non-film tear bond (NFTB-failing).
      b. Percent of peel penetration into the weld (maximum of 10%).
      c. Quantitative value for peel strength (minimum of 75 ppi).
   2. Shear test specimens:
      a. The break is either a film tear bond (FTB-passing) or a non-film tear bond (NFTB-failing).
      b. Elongation of shear specimen (minimum of 2 inches).
      c. Quantitative value for bonded seam strength (minimum of 120 ppi).

G. If any of the four test specimens do not meet the peel or shear criteria, reject the entire trial weld and verify that the welding machine is not used for installation of the geomembrane until passing a retest consisting of repeating the entire trial weld sampling and testing procedure on a new weld performed with the failing machine.

H. If the retested trial weld fails, verify that the welding machine is not used for installation of the geomembrane until proper adjustments or repairs are made and passing a retest; if the welding machine continually fails field trial weld testing, verify that the welding machine is tagged and completely removed from work area.

3.02 INSTALLATION

A. Verify that geomembrane panels are deployed parallel to the slope by unrolling down the entire length of the slope and that corrections or adjustments are made to panels which become askew to the parallel line of the slope.

B. Verify that adjacent geomembrane panel edges are overlapped a minimum of 4-inches for fusion welding and alignment of the overlap is kept consistent by marking overlap indicator points.

C. Verify that geomembrane damaged during handling, transport, or deployment is removed or repaired.

D. Verify that the underlying the soil subgrade or installed geosynthetics are not damaged by geomembrane installation equipment or methods and that any damaged soil subgrade or installed geosynthetics are completely repaired in accordance with the requirements of the applicable section of the Specifications.

E. Verify that the Installer only deploys the quantity of geomembrane which can be completely welded and anchored by the end of the work shift or day.

F. Verify that the Installer prepares an adequate number of sandbags to ballast the geomembrane during deployment in accordance with the following guidelines:
   1. Only plastic ties should be used to close sandbags; no metal or wire ties are allowed.
   2. Sandbags should be removed prior to deploying overlying materials and after completion of permanent geomembrane anchorage.
   3. Sandbag fill should not be disposed of within the limits of work unless the fill consists of material which meets the Specification for the material it is disposed upon.
   4. Geomembrane rolls may also be used for ballast provided that no damage to the deployed geomembrane occurs.

G. Verify that the Installer deploys and seams the geomembrane in a manner which minimizes wrinkles and provides the proper amount of slack in the installed geomembrane to compensate for contraction due to local temperature extremes prior to covering; no stress-bridging or "fishmouths" are allowed.

H. Verify that immediately after geomembrane panels running through ditch flow lines or at toes of slopes are welded, sandbags are placed end-to-end along the entire length of the flow or toe line to prevent stress-bridging at those locations; alternatively, to reduce the number of sandbags required and to further prevent stress-bridging, the Installer may anchor the geomembrane near the toes of slopes within a backfilled anchor trench constructed in accordance with the Specifications.

I. Verify that the geomembrane surficial strips, ClosureTurf™ collection foot assemblies, and ClosureTurf™ pressure relief valves are installed per the Plans and in accordance with manufacturer's recommendations.

J. Verify that geomembrane panels are not overlapped or seamed perpendicular to the slope on slopes with a gradient of more than 10 percent, within 20 feet of the top of any slope, and unless the geomembrane is anchored within a backfilled anchor trench constructed in accordance with the Specifications.

K. Verify that when cutting any geomembrane above another geomembrane, the Installer uses a knife with a hooked blade.

L. Record the following information on the Geomembrane Deployment/Welding Log:
   Note: The abbreviations in parenthesis following each verification procedure are used on the Geomembrane Deployment/Welding Log.
   1. Temperature (T). Ambient and geomembrane surface temperatures with a description of the current weather conditions. Record every two hours and document dramatic changes in temperature and weather conditions.
   2. Trial Welds (TW). Time of trial weld, type of welding equipment, welding equipment number, welding operator, and results of field peel and shear testing of trial welds.
   3. Panel (P). Assigned panel number, geomembrane roll number, panel dimensions, and area of panel.

M. Using a graph computation sheet, field sketch a panel layout drawing of the geomembrane panels deployed during the day and attach this field sketch to the completed Geomembrane Deployment/Welding Log; the daily field sketches will be transposed to the master panel layout drawing.

3.03 FUSION WELDING

A. Verify that fusion welding operations only take place when the ambient temperature is between 40°F and 110°F unless the special weather welding plans have been submitted by the Installer and approved by Engineer to weld outside this range; measure ambient temperature 6-inches above the in-place geomembrane and record readings every two hours on the Geomembrane Deployment/Welding Log.

B. Verify that all geomembrane seams are fusion welded by the double-track method leaving an air gap for leak testing; extrusion welding can only be used for repairs, patches, fabrications, and inaccessible areas.

C. Prior to welding, verify that all fusion welding machines have performed trial welds and passed field trial weld testing.

D. Verify that the Installer's power source is capable of producing sufficient and constant voltage under the combined line load of multiple welders and other equipment.

E. Verify that surfaces to be welded are thoroughly cleaned.

F. Verify that seams are welded at the same speed, temperature, roller pressure, and gauge settings used to prepare the trial weld and that the welding operators record welding machine numbers, operators, machine settings, times, and dates on each seam welded.

G. Closely observe each fusion welding machine to verify that the machine is not adversely affecting or damaging the parent geomembrane material outside the welding area.

H. Record the following information on the Geomembrane Deployment/Welding Log:
Note: The abbreviations in parenthesis following each verification procedure are used on the Geomembrane Deployment/Welding Log.

1. Seam (S). Assigned seam number, welding equipment number that welded the seam, welding operator, and length of the welded seam.
2. End of Seam Test. (EST). If the Installer's quality control program requires that specimens be taken from the end of each welded seam and tested for peel adhesion, record these results using the same criteria as for trial welds. If the Installer records these results, request a copy of the results and this information can be omitted from the Geomembrane Deployment/Welding Log.
3. Seam Test Sample (STS). Assigned sample number, seam number sample is located on, location of sample within the seam, welding machine number, welding operator, and results of field seam testing.

3.04 EXTRUSION WELDING

A. Verify that extrusion welding is used only for repairs, patches, fabrications, and inaccessible areas.

B. Prior to welding, verify that all extrusion welding machines have performed trial welds and passed field trial weld testing.

C. Verify that geomembrane patches overlap the underlying geomembrane panel a minimum of 4 inches.

D. Verify that geomembrane patches are cut square with rounded corners and are large enough to extend a minimum of 4 inches in all directions over the repair area.

E. Verify that geomembrane patches are tack-welded to the underlying geomembrane panel to prevent movement during grinding and extrusion welding operations.

F. Verify that the outer edge of repair patches and the adjacent underlying geomembrane are disc-ground to remove surface debris and oxidation and that grinding is not parallel to seam.

G. Verify that the nozzles of extrusion guns are purged before each use to remove solidified extrudate.

H. Verify that the extrusion weld completely covers the entire width of the grind area and that extrusion safety welds extend 4 inches up any intersecting fusion weld.

I. Verify that a cap strip patch is extrusion welded at all fusion welded seam intersections of three or more geomembrane panels.

3.05 QUALITY CONTROL

A. Verify that quality control procedures are performed by the Installer in accordance with the Installer's Geomembrane Installation Quality Control Manual except where amended or modified by the Engineer or the Specifications.

B. Verify that the Installer maintains the following quality control documentation during the geomembrane installation in accordance with the Specifications:
   1. An accurate geomembrane panel layout drawing which includes; 1) roll and panel numbers; 2) seam numbers; 3) geomembrane limits; 4) anchor trench locations; and 5) seam test sample locations.
   2. Daily deployment logs and panel layout drawings to be submitted to the CQA Officer daily which include; 1) panel and seam numbers; 2) panel dimensions; and 3) deployment quantities.
   3. Daily welding logs to be submitted to the CQA Officer daily which include; 1) welding machine numbers; 2) operators; 3) machine settings; and 4) times and dates for each seam welded.

C. Verify that the entire length of each fusion welded seam is air-pressure tested by the Installer, with an air pump capable of generating and maintaining 40 psi of pressure and equipped with a regulator and pressure gauge and pressure feed needles having pressure gauges accurate to 1 psi, in accordance with the following procedure:
   1. Seal both ends of the fusion welded seam with vise-grip plate clamps or an extrusion weld; heat may be applied to the seam ends to aid in sealing the seam in conjunction with the clamps but due to the potential hazard of igniting landfill gas, propane torches or any other flame producing device are not allowed.
   2. At one end of the seam, insert air pressure needle into the fusion weld channel.

3. Pressurize the channel to 30-35 psi and maintain pressure for 5 minutes.
4. Release air from the opposite end of the seam to verify that the entire length of the fusion weld channel was pressurized.
5. If channel pressure is not maintained with a maximum allowable pressure loss of 2 psi over the 5-minute test period or does not stabilize at all, locate the defective area, isolate it, and repeat air pressure test procedures in each direction from the defective area.

D. Verify that the Installer maintains air-pressure test logs on which are recorded seam numbers, beginning and ending air pressures, beginning and ending test times, lengths of tested seam, defective areas found, and confirmation of repair.

E. Record the following air-pressure testing information on the Geomembrane Deployment/Welding Log:
Note: The abbreviations in parenthesis following each verification procedure are used on the Geomembrane Deployment/Welding Log.
1. Air-Pressure Test (AP). Seam number tested, start time of the air pressure test and initial air pressure (psi), termination time of the air pressure test and ending air pressure (psi), and length of seam or portion of seam successfully tested.

F. Verify that the entire length of each extrusion welded seam and repair is vacuum tested by the Installer in accordance with the following procedures, with a vacuum pump capable of generating and maintaining 30 inches of mercury and equipped with a clean view window, regulator, and vacuum gauge accurate to 1 psi:
1. Saturate the extrusion weld with a soap and water solution.
2. Place view box over the saturated weld, create an air tight seal, and apply vacuum in the box.
3. Maintain the vacuum for 10 seconds and examine weld for forming bubbles which indicate leaks; mark detected leaks for follow-up extrusion weld repair and retest detected leaks after repair to verify that the leaks were successfully repaired.

G. Verify that the Installer maintains vacuum test logs on which are recorded repair numbers, vacuum test dates, and vacuum test results.

H. Record the following vacuum testing information on the Geomembrane Repair Log.
1. Assigned repair number, location and description of repair, vacuum test dates, and vacuum test results.

3.06 SEAM TEST SAMPLING

A. Determine seam analysis sample locations by the *stratified random sampling method*. The stratified random sampling method allows random selection of a single sewn analysis sample location anywhere within the required 500-lineal feet sampling interval required in the technical specifications. Have the Installer perform the following seam analysis sampling procedures.
1. Seam analysis samples will be 12-inches wide by 36-inches long with the weld centered down the length of the sample. Samples sizes may be modified at the request of the Installer or CQA Officer. Cut one 1-inch specimen from each end of the sample, and field test specimens for peel adhesion in accordance with the Technical specifications. If these specimens pass the field peel test, submit sample for

laboratory seam analysis. If either of the specimens fail the field peel test, perform Faded Seam Analysis Procedures in accordance with Section 3.08 of this Section.

2. Divide the sample into equal two sections, submit one Section for seam analysis and archive storage the second section.
3. Installer may obtain and test any seam analysis sample at its option.
4. Repair sample holes and vacuum test repair in accordance with Section 3.04 of this Section.

B. Based on the seam analysis *sampling method of attributes,* the CQA Officer may decrease or increase the 500-foot sampling interval based on the following control chart of passing percentages of seam analysis results.

Percent Of Passing Seam Analysis	Sampling Modifications
100	Decrease sampling interval to 1000 lf.
90 – 100	Decrease sampling interval to 750 lf.
60 – 90	Maintain sampling interval at 500 lf.
30 - 60	Increase sampling interval to 250 lf.

Note: Sampling modifications will be considered only after 20 percent of seam analysis is completed.

3.07 LABORATORY TESTING

A. Laboratory seam analysis will be performed at the Geosynthetics Testing Laboratory, which is independent of the geomembrane Manufacturer and Installer, and will be performed in accordance with the following procedures.

1. Seam analysis will include peel adhesion and bonded seam strength (ASTM D 6392). Five specimens will be tested for each method.
2. Both sides of fusion welded seams will be tested for peel adhesion.
3. All five of the specimens must meet the Fail Criteria specified in the technical specifications.

B. Acceptance of the welded geomembrane seams will be based on the results of laboratory seam analysis.

3.08 FAILED SEAM ANALYSIS PROCEDURES

A. In coordination with the Installer, perform the following quality assurance verification procedures in the event of a seam analysis sample failure determined by either field testing or laboratory seam analysis.

1. Track the welded seam 10 feet in both directions away from the failed seam analysis sample location. Cut a small 12-inch wide by 12-inch long sample from each location. Cut one 1-inch specimen from each end of the sample, and field test specimens for peel adhesion in accordance with Part 3.01 of this Section. If these specimens pass the field peel test, submit a 12-inch wide by 18-inch long re-test sample from both locations for laboratory seam analysis. If either of the specimens fail the field peel test at either location, continue tracking the welded seam at 10-foot intervals until specimens successfully pass the field peel tests and a sample can be

submitted for laboratory seam analysis. If specimens continually fail field peel tests at 10-foot intervals, the entire seam or portion of the welded seam will be repaired at the discretion of the CQA Officer.

2. Verify that the failed length of seam is repaired with an 18-inch wide extrusion welded cap strip. Tack and extrusion welding the leading flap of the fusion welded seam is not permitted. Verify that the extrusion welded cap strip is vacuum tested in accordance with the technical specifications.
3. If the re-test sample fails laboratory seam analysis, repeat the above procedures.

B. Sample extrusion welded cap strips exceeding 100 feet in length for seam analysis.

END OF CQA SECTION 02772
GEOMEMBRANE

CQA SECTION 02773
ENGINEERED TURF

PART 1 GENERAL

1.01 SUMMARY

A. The CQA Officer shall perform CQA procedures as outlined in this Section and follow guidelines for monitoring and testing to verify and document that geonet composite material and installation are in compliance with the Plans and Technical Specifications.

1.02 SUBMITTALS

A. Collect three (3) copies of each submittal listed in the Technical Specifications.

B. Verify compliance with the submittal schedule and update Submittal Log.

C. Perform submittal review and approval procedures in Part 1.03 of Section 01300 of this CQA Plan.

1.03 TRANSPORT AND STORAGE

A. Upon delivery of the engineered turf rolls to the Work site, verify that the rolls have been transported with opaque protective coverings and within a closed trailer or covered open trailer.

B. During unloading of the geonet composite rolls at the Work site, perform the following procedure:
   1. Obtain a copy of the packing list.
   2. Complete the Engineered Turf Delivery and Control Log for each shipment and attach a copy of the packing list. The Engineered Turf Delivery and Control Log documents the following:
      a. Delivery date.
      b. Roll numbers.
      c. Batch/lot numbers or production dates.
      d. Roll dimensions.
      e. Manufacturer and Product Name or Designation.
      f. Name of CQA monitor observing delivery and storage.
      g. Total quantity delivered with each shipment.
      h. Additional notes including rejection of materials, condition of delivered materials, and other materials included with the shipments.
   3. Verify unloading and storage of the engineered turf rolls has been done in accordance with the Manufacturer's recommended procedures.
   4. Verify that engineered turf rolls are transported, unloaded, handled, and stored in a manner that does not damage the engineered turf rolls or their protective coverings in accordance with the Manufacturer's recommended procedures and the following requirements:

a. Nylon or other cloth straps are used to unload and handle the geonet composite rolls to protect the rolls and their protective coverings from damage.
b. The engineered turf rolls are stacked no more than five (5) rolls high and with a 3-foot wide access path between the stacked rows.

5. Identify and separate damaged or rejected engineered turf rolls.
6. Verify that damaged protective coverings are repaired or replaced.
7. If CQA conformance test sampling, in accordance with Part 2.03C of this Section, is to be performed during delivery to the Work site, determine which geonet composite rolls will be sampled by either individual roll numbers, batch/lot numbers, or production dates, and position the rolls for convenient sampling.

PART 2 PRODUCTS

2.01 ENGINEERED TURF COMPONENTS

A. Verify that the following engineered turf components meet the applicable product requirements of Section 02773 (Engineered Turf) of the Technical Specifications:
1. Engineered turf geotextiles.
2. Engineered turf polyethylene yarns (grass blades).
3. Sewing thread.
4. Sand ballast infill.
5. HydroBinder®.
6. Water release vents.

2.02 CONFORMANCE TESTING

A. Conduct sampling for CQA conformance testing at the Work site upon delivery or at the manufacturing plant prior to shipment and delivery to the Work site.

B. For every 100,000 square feet of material delivered to the Work site, select at least one (1) engineered turf roll to sample for CQA conformance testing.

C. Sample the selected engineered turf rolls for CQA conformance testing using the following procedure:
1. Cut and discard the first 3 feet of engineered turf material from across the entire width of the roll.
2. Cut the next 18 inches of material from across the entire width of the roll; this section of material is the CQA conformance testing sample.
3. Mark the sample with the following information directly on the sample with a paint marker:
a. Machine direction of the sample.
b. Manufacturer's roll number.
c. CQA test number.
4. Immediately re-wrap the sampled engineered turf roll with its protective covering; use additional opaque plastic sheeting, if needed, to completely cover the roll.
5. Complete the Engineered Turf Test Request and Sample Custody Log and ship samples to the Geosynthetics Testing Laboratory.

D. The following CQA conformance tests will be performed by the Geosynthetics Testing Laboratory to verify compliance with the product requirements of the Technical Specifications at the following frequencies:

One (1) per every 100,000 square feet of Engineered Turf material components to be installed:

1. CBR Puncture (ASTM D 6241).
2. Tensile Properties (ASTM D 4595).
3. Rainfall Induced Erosion (ASTM D 96459).
4. Fiber UV Stability (ASTM G 147).
5. Backing System UV Stability, Exposed (ASTM G 1545 Modified Cycle 1.UVA340).
6. Steady State Hydraulic Overtopping, Turf with HydroBinder® (ASTM D 7277 / ASTM D 7276).
7. Transmissivity with underlying structure geomembrane (ASTM D 4716).
8. Internal Friction of combined components (ASTM D 5321).
9. Sand Infill Gradation and Ballast (ASTM D 6913).
10. Yarn Weight (ASTM D 5261).
11. Tensile Strength of Yarn (ASTM D 2256).

E. Upon completion of CQA conformance testing and receipt of the results, review all results for compliance with the Technical Specifications and report any test results which are not in compliance with the Technical Specifications to the Design Engineer.

F. Additional CQA conformance testing or corrective action to be performed in the event of test results which are not in compliance with the Technical Specifications will be determined by the Design Engineer.

PART 3 EXECUTION

3.01 PREPARATION AND EXAMINATION

A. Prior to engineered turf installation, hold a preparatory meeting in accordance with Part 1.04 of Section 01039 of this CQA Plan.

B. Prior to engineered turf installation, verify that all underlying material installation and construction has been completed in accordance with the Technical Specifications.

3.02 INSTALLATION

A. Verify that engineered turf is installed in accordance with the Manufacturer's instructions.

B. Verify that engineered turf is installed with the machine (lengthwise) direction of the roll oriented down the slope.

C. Verify that the engineered turf panels are deployed from the top of the slope in a way that the engineered turf is laid substantially smooth and filaments are pointing upslope after deployment is complete.

D. Verify that the first engineered turf panel deployed has the turf filaments facing upward. Verify that subsequent panels are deployed turf side down, and on top of the previously installed panel. Verify that after seaming each panel, the panel is flipped onto the geomembrane component with care to avoid pulling of tufts in the drainage studs.

E. Verify that end-to-end panel overlaps only occur on benches, unless the length of a slope between benches exceeds the total length of a full engineered turf roll.

F. Verify that the engineered turf is installed with sufficient tension to prevent excessive overlapping, insufficient overlapping, wrinkles, and folds.

G. Verify that a single stitch prayer type seam is constructed using a Nulong sewing machine or equivalent. Verify that sewing thread is 207 Polyester or equivalent and that sewing occurs between the 1st and 2nd row of engineered turf stitches.

H. Verify that the engineered turf is ballasted during installation and until the engineered turf is covered with the sand ballast infill material.

I. Verify that water release vents are installed per the Plans and in accordance with manufacturer's recommendations.

J. Verify that on slopes exceeding 15%, no equipment is allowed on the partially constructed turf cap system until after the completed installation of the sand ballast infill. Verify that on slopes less than 15%, ATV type vehicles are allowed prior to infill placement if the tire /track pressure is less than 5 psi.

K. Verify that following full specified sand ballast infill thickness installation, traffic be limited to light duty vehicles with drivability tire/track pressures of less than 35 psi.

L. Verify that engineered turf damaged during installation is removed and/or repaired with a sewn or fastened patch at the direction of the Design Engineer.

M. Verify that portions of the engineered turf wasted by the Installer, and rendered unusable, as determined by the Design Engineer, are transported by the Contractor and disposed of off-site at a permitted transfer station or solid waste disposal facility.

3.03 SAND BALLAST INFILL PLACEMENT

A. Verify that sand ballast infill is placed between the tufts of the engineered turf and:
   1. Is per plan either 5/8 inch thick or 2 1/8 inch thick, with a thickness tolerance of +/- 1/8 inch.
   2. Consists wholly of sand meeting ASTM C-33-03 for fine aggregates.
   3. Turf areas that are to receive sand ballast infill are accepted by the CQA Officer before placement of sand ballast infill takes place

B. Verify that sand ballast infill is worked into the engineered turf between the synthetic yarn blades.

C. Verify that conveyor systems and/or Express Blowers are used to spread and place the sand ballast infill.

D. Verify that the Contractor has explained with detail in the Preparatory Meeting the method of sand infill deployment to be used.

E. Verify that previously installed components are not displaced or damaged as a result of the sand ballast infill component installation.

F. Verify that a standard washer is utilized as a plate for the point of entry into the sand ballast infill for consistent depth control.

3.04 INFILL – HYDROBINDER® PLACEMENT

A. Verify that the HydroBinder® infill layer is placed using appropriate equipment capable of completing the work.

B. Verify that the Contractor has explained in detail during the Preparatory Meeting the method of HydroBinder® infill deployment.

C. Verify that installation of HydroBinder® infill is only be performed by a Manufacture's approved installer using techniques and equipment approved by the Manufacture.

D. Verify that the HydroBinder® is installed into the turf while it is in a dry state and that the HydroBinder® is worked into the tufts so the tufts are in an upright position.

E. Verify that the HydroBinder® infill is placed dry to a thickness of 7/8 inch with a tolerance of +/- 1/8 inch.

F. Verify that the hydration process occurs on the same day as the HydroBinder® infill placement and that the required HydroBinder® infill thickness is achieved prior to the hydration process.

G. Verify that the cemented infill is hydrated thoroughly and that care is taken to avoid displacement of the non-hydrated infill.

H. Verify that once hydration is completed as described, backfill and compaction of the vertical anchor trenches (if applicable) take place.

I. Verify that the HydroBinder® is at minimum performance levels within 24 hours.

3.05 DOCUMENTATION

A. Document daily observations of the deployment and seaming operations.

3.06 REPAIRS

A. Verify that all damaged areas or holes are repaired with a patch that extends 2 feet beyond the edge of the damaged area or hole.

3.07 CORRECTIVE ACTIONS

A. If any portion(s) of the engineered turf components do not meet the requirements of the Plans and Technical Specifications, based on either observations and/or physical measurement,

verify that that portion(s) is repaired or removed and replaced to meet the requirements of the Technical Specifications and that the corrective actions implemented by the Contractor are in conformance with methods approved by the Design Engineer and the applicable Standard Specifications.

END OF CQA SECTION 02773
ENGINEERED TURF

CQA SECTION 02900
SEEDING AND FERTILIZING

PART 1 GENERAL

1.01 SUMMARY

A. The CQA Officer shall perform CQA procedures as outlined in this Section and follow guidelines for monitoring and testing to verify and document that revegetation materials and placement methods are in compliance with the Plans and Technical Specifications.

1.02 SUBMITTALS

A. Collect three (3) copies of each submittal required in the Technical Specifications.

B. Verify compliance with the submittal schedule and update Submittal Log.

C. Perform submittal review and approval procedures in Part 1.03 of Section 01300 (Submittals) of this CQA Plan.

PART 2 PRODUCTS

2.01 REVEGETATION MATERIALS

A. Verify that the following revegetation materials meet the applicable product requirements of Section 02900 (Seeding and Fertilizing) of the Technical Specifications:
1. Seed.
2. Fertilizer.
3. Tackifier.
4. Fiber.

B. Verify that fertilizer conforms to Section 20-2.02 of the Standard Specifications.

C. Verify that seed conforms to Section 20-2.10 of the Standard Specifications.

D. Verify that fiber and/or stabilizing emulsion, if used, conforms to Sections 20-2.07 and 20-2.11, respectively, of the Standard Specifications.

PART 3 EXECUTION

3.01 PREPARATION

A. Prior to beginning of revegetation activities, hold a preparatory meeting in accordance with Part 1.04 of Section 01039 (Project Meetings) of this CQA Plan.

B. Verify that the method and equipment to be used to spread the seed, fertilizer and mulch has been approved by the Design Engineer.

C. Verify that the access roads, drainage structures, and erosion-resistant layer have been placed to grade before seed, fertilizer and mulch is applied and verify with the Contractor that revegetation shall not occur on the access roads, lined drainage swales, and sedimentation basins.

3.02 APPLICATION

A. Verify that seed and fertilizer (including fiber and/or stabilizing emulsion, if applicable) are applied to the areas designated on the Plans.

B. Verify that all products are spread uniformly over all areas subject to revegetation.

3.03 CONFORMANCE VERIFICATION

A. Verify application rates on a daily basis for the respective materials by comparing the amount used (as determined from weight tags) to the total acreage covered.

3.04 CORRECTIVE ACTIONS

A. If any portion(s) of the seeding and fertilizing provisions do not meet the requirements of the Plans and Technical Specifications, based on either observations and/or physical measurement, verify that that portion(s) is reworked or removed and replaced to meet the requirements of the Technical Specifications and that the corrective actions implemented by the Contractor are in conformance with methods approved by the Design Engineer and the applicable Standard Specifications.

END OF CQA SECTION 02900
SEEDING AND FERTILIZING

CQA SECTION 02960
TEMPORARY EROSION AND SEDIMENT CONTROLS

PART 1 GENERAL

1.01 SUMMARY

A. The CQA Officer shall perform CQA procedures as outlined in this Section and follow guidelines for monitoring and testing to verify and document that the temporary erosion and sediment control materials and installation methods are in compliance with the Plans and Technical Specifications.

1.02 SUBMITTALS (NOT USED)

PART 2 PRODUCTS

2.01 EROSION AND SEDIMENT CONTROL COMPONENTS

A. Verify that the following erosion and sediment control components meet the applicable product requirements of Section 02960 (Temporary Erosion and Sediment Controls) of the Technical Specifications:
1. Straw bales.
2. Straw wattles.
3. Silt fencing.

2.02 ROCK FOR CONSTRUCTION ENTRANCE

A. Verify rock conformance under CQA Section 02207 (Aggregate Materials) of this CQA Plan.

PART 3 EXECUTION

3.01 PREPARATION AND SCHEDULE

A. Prior to beginning installation of any temporary erosion and sediment control components, hold a preparatory meeting in accordance with Part 1.04 of Section 01039 (Project Meetings) of this CQA Plan.

B. Verify that the Storm Water Pollution Prevention Plan (SWPPP) has been prepared by a Qualified SWPPP Developer (QSD), been submitted to the State Water Resources Control Board, and that a WDID number has been received for the project.

C. Verify that temporary erosion and sediment control measures are implemented year round during the course of the Project, and that temporary erosion control features are installed and maintained between October 15 and May 15 of each year.

3.02 PROTECTION

A. Verify that temporary erosion and sediment control measures are implemented in all areas of exposed earth created by the Contractor beyond what is shown on the Plans and referred to in

the Technical Specifications and areas cleared and grubbed prior to excavation or embankment operations which are subject to wind erosion and runoff.

3.03 TEMPORARY EROSION CONTROL FACILITIES

A. Verify that the Contractor conducts his operations in such a manner that storm water runoff is contained within the Work site or channeled into the storm drain system which serves the runoff area.

B. Verify that storm water runoff from one area is not diverted to another runoff area.

C. Verify that temporary down drains, drainage structures, and other devices are provided to channel storm water runoff water into the respective permanent storm drain systems during construction. Also verify that permanent drainage structures, not fully completed, are modified as required to accept de-silted runoff.

D. Verify that fill areas, while being brought to grade and during periods of completion prior to final construction, are protected by various measures to eliminate erosion and the siltation of downstream facilities and adjacent areas.

E. Verify that contour graded areas are protected against erosion and the resulting siltation of downstream facilities and adjacent areas during grading operations.

F. Verify that incorporation of culvert pipe used in conjunction with temporary erosion control measures for final construction improvements has been approved by the Design Engineer.

3.04 CORRECTIVE ACTIONS

A. If any portion(s) of the temporary erosion and sediment controls does not meet the requirements of the Plans and Technical Specifications, based on either field test results, observations, field survey, and/or physical measurement, verify that that portion(s) is reworked or removed and replaced to meet the requirements of the Plans and Technical Specifications and that the corrective actions implemented by the Contractor are in conformance with methods approved by the Design Engineer and the applicable Standard Specifications.

END OF CQA SECTION 02960
TEMPORARY EROSION AND SEDIMENT CONTROLS

CQA SECTION 03300
CONCRETE

PART 1 GENERAL

1.01 SUMMARY

A. The CQA Officer shall perform CQA procedures as outlined in this Section and follow guidelines for monitoring and testing to verify and document that the concrete materials and construction methods are in compliance with the Plans and Technical Specifications.

1.02 SUBMITTALS

A. Collect three (3) copies of each submittal required in the Technical Specifications.

B. Verify compliance with the submittal schedule and update Submittal Log.

C. Perform submittal review and approval procedures in Part 1.03 of Section 01300 (Submittals) of this CQA Plan.

PART 2 PRODUCTS

2.01 CONCRETE COMPONENTS

A. Verify that the following concrete components meet the applicable product requirements of Section 03300 (Concrete) of the Technical Specifications:
1. Concrete.
2. Reinforcement.
3. Forms.
4. Epoxy.

2.02 AGGREGATE BASE

A. Verify aggregate base conformance under CQA Section 02207 (Aggregate Materials) of this CQA Plan.

2.03 ENGINEERED FILL

A. Verify engineered fill conformance under CQA Section 02224 (Engineered Fill) of this CQA Plan.

2.04 CONFORMANCE TESTING

A. Review moisture-density relationship conformance test results for the aggregate base as determined under CQA Section 02207 (Aggregate Materials) of this CQA Plan.

B. Verify that concrete and aggregate base materials are obtained from the approved sources throughout the Work.

PART 3 EXECUTION

3.01 PREPARATION

A. Prior to beginning construction of any drainage and erosion control structure, hold a preparatory meeting in accordance with Part 1.04 of Section 01039 (Project Meetings) of this CQA Plan.

B. Verify that the locations and dimensions of the concrete pads are as shown on the Plans or as staked by the Design Engineer.

C. Verify that the footprint areas for the flare station concrete pads as shown on the Plans are properly cleared and grubbed and that the underlying subgrade conforms to the engineered fill requirements per CQA Section 02224 (Engineered Fill) of this CQA Plan.

D. Verify that aggregate base for the flare station concrete pad is spread in a uniform loose lift not exceeding 8 inches in thickness.

E. Perform the following field tests at the frequency shown to verify that the compacted aggregate base material has a minimum dry density of 95 percent of the maximum dry density and is within 1 to 3 percentage points of the optimum moisture content as determined from ASTM D 1557:
   1. *Dry Density and Moisture Content - Nuclear (ASTM D 2922 and D 3017)*; at least one test beneath each concrete pad.
   2. *Moisture Content (ASTM D 4959);* at least one (1) test per every ten (10) nuclear gauge tests.

F. Record corresponding dry density and moisture content results on the Nuclear Density/Moisture Test Data form.

3.02 REINFORCEMENT

A. Verify that all reinforcement is installed in conformance with Concrete Reinforcing Steel Institute's (CRSI's) "Manual of Standard Practice".

B. Verify that all reinforcement is free from rust, oil, dirt, or any other coating.

C. Verify that continuous reinforcing bars are lapped at splices at a minimum of 32 diameters.

D. Verify that reinforcement has a minimum concrete cover of 3 inches (unless otherwise noted).

E. Verify that reinforcement is not damaged and is securely supported and anchored to avoid movement during placement of concrete.

3.03 FORMWORK

A. Verify that the strength of concrete formwork is sufficient to hold the concrete with minimal or no leakage and that shoring and bracing is provided to ensure stability of formwork.

B. Verify that 3/4-inch chamfer strips are used at exposed corners.

3.04 CONCRETE SLAB AND DRAIN INLET PLACEMENT

A. Verify that the subgrade and forms are moistened prior to placing concrete.

B. Verify that care is taken to not damage or displace the reinforcing steel components.

C. Verify that concrete is placed in a continuous operation and thoroughly vibrated to ensure consolidation around reinforcement.

D. Collect samples of the concrete to be used at the Work site and perform the following tests to verify that the concrete has the slump and compressive strength characteristics specified in the Technical Specifications:
   1. *Slump (ASTM C 143)*; one test per each concrete pour.
   2. *Compressive Strength (ASTM C 31 and ASTM C 39)*; one test per each concrete pour.

E. Verify that the final surfaces of the concrete slabs have a non-slip broom finish.

F. Verify that all significant cracks, spalls and irregularities in formed or finished surfaces or other defects are properly repaired or patched.

3.05 MINOR CONCRETE PLACEMENT

A. Verify that minor concrete for post footings and the sedimentation basin outlet structure foundations are installed as shown on the Plans and in conformance with Sections 51 and 90-10 of the Standard Specifications, as applicable.

B. Verify that minor concrete for the grouted rock riprap is placed in conformance with Section 72-5.04 of the Standard Specifications.

3.06 EPOXY SECURED DOWELS OR ANCHORS

A. Verify that the diameter and depth of the drill hole is as indicated. If not included, verify that the hole is drilled 1/8-inch larger and ten (10) times deeper than the diameter of the dowel or anchor.

B. Verify that the hole is thoroughly cleaned by blowing it out with compressed air and by using a wire brush.

C. Verify that placement of epoxy in the hole is performed using a dispensing tool provided by, or recommended by the manufacturer and that the hole shall is completely filled with epoxy.

D. Verify that the dowel or anchor is placed in the hole and the epoxy allowed sufficient time to completely cure before disturbing the dowel or anchor.

3.07 CONFORMANCE VERIFICATION

A. After construction, verify by survey that the flare station concrete pads are completed at the elevations shown on the plans.

3.08 CORRECTIVE ACTIONS

A. If any portion(s) of the concrete provisions do not meet the requirements of the Plans and Technical Specifications, based on either field test results, observations, field survey, and/or physical measurement, verify that that portion(s) is reworked or removed and replaced to meet the requirements of the Technical Specifications and that the corrective actions implemented by the Contractor are in conformance with methods approved by the Design Engineer and the applicable Standard Specifications.

END OF CQA SECTION 03300
CONCRETE

CQA SECTION 15100
LANDFILL GAS (LFG) EXTRACTION WELLS

PART 1 GENERAL

1.01 SUMMARY

A. The CQA Officer shall perform CQA procedures as outlined in this Section and follow guidelines for monitoring and testing to verify and document that the LFG extraction well materials and construction methods are in compliance with the Plans and Technical Specifications.

1.02 SUBMITTALS

A. Collect three (3) copies of each submittal required in the Technical Specifications.

B. Verify compliance with the submittal schedule and update Submittal Log.

C. Perform submittal review and approval procedures in Part 1.03 of Section 01300 (Submittals) of this CQA Plan.

PART 2 PRODUCTS

2.01 LFG EXTRACTION WELL COMPONENTS

A. Verify that the following LFG extraction well components meet the applicable product requirements of Section 15100 (Landfill Gas [LFG] Extraction Wells) of the Technical Specifications:
1. PVC well casing and fittings.
2. Bentonite Seal.
3. PVC well bore seal.
4. Prefabricated well head assemblies.

2.02 GRAVEL PACK

A. Verify gravel pack conformance under CQA Section 02207 (Aggregate Materials) of this CQA Plan.

2.03 SOIL BACKFILL

A. Verify soil backfill conformance under CQA Section 02250 (Erosion-Resistant Layer) of this CQA Plan.

PART 3 EXECUTION

3.01 PREPARATION

A. Prior to LFG extraction well drilling and installation, hold a preparatory meeting in accordance with Part 1.04 of Section 01039 (Project Meetings) of this CQA Plan.

B. Verify that the LFG extraction well locations conform to the locations staked by the Design Engineer.

C. Verify that a drilling permit(s), if required, has been obtained by the Contractor.

D. Verify that drilling contractor is licensed (Class C-57) in the State of California.

E. Verify that the Contractor understands that individual LFG extraction wells must be drilled and installed in a single day so as to minimize the potential for LFG emissions from the borehole. In the event of equipment breakdown or other unforeseen circumstance that prohibits complete installation of the LFG extraction well within the same working day, verify that provisions are made to cover and seal the exposed borehole at the surface to prevent LFG emissions.

3.02 DRILLING

A. Verify that the boreholes for the LFG extraction wells are drilled using a bucket auger drill rig capable of drilling 24-inch diameter boreholes.

B. Verify that a safety screen is placed over the top of the borehole as soon as drilling is completed and that the screen is kept in place until backfilling is within 4 feet of the surface. Verify that the safety screen size is large enough to accommodate all backfill materials and activities yet not large enough for any human to accidentally fall through.

C. Verify that the borehole is straight and the well casing is installed in the center of the borehole. Verify that the Contractor takes all tension off of the pipe by mechanical means and centers the well casing in the middle of the borehole before starting to backfill.

D. Verify that PVC well casing joints are solvent cemented and secured with 3/8-inch long Type 316 stainless steel lag screws.

E. Verify that the completion height of the well casing above ground surface is such that the final height of the installed prefabricated well head assembly is 5 feet above final grade.

F. Verify that the top of the casing is capped until installation of the prefabricated well head assembly.

G. Verify that spoils generated as part of the drilling process are handle and managed in conformance with CQA Section 02222 (Excavation) of this CQA Plan.

H. In the event obstructions and/or saturated conditions are encountered during drilling, verify that the Contractor makes a reasonable effort to drill through obstructions and saturated conditions and that abandonment of the borehole is not performed without written approval obtained from the Design Engineer.

3.03 BACKFILLING

A. Verify that backfilling operations commence immediately after well drilling is completed and the well casing has been installed in the borehole. Verify that backfill materials are installed as shown on the Plans and as directed by the Design Engineer.

B. Verify that the gravel pack is poured or scooped through the safety screen at a rate that will not endanger the integrity of the well casing.

C. Verify that the upper and lower bentonite seals are formed by evenly distributing the bentonite material around the annulus of the well casing and that fresh water is added in a manner that will allow for a thorough saturation of the bentonite. Verify that the proportion of water added versus bentonite material is in accordance with the bentonite manufacturer's recommendations.

D. Verify that soil backfill is placed from the top of the lower bentonite seal to the bottom of the upper bentonite seal in a manner that will promote self compaction and avoid bridging of the soil backfill material.

E. Verify that the PVC well bore seal is installed in accordance with the manufacturer's recommendations around the well casing and placed at the location shown on the Plans.

F. Verify that the boot portion of the well bore seal is secured around the well casing with stainless steel straps to provide an air-tight connection. Following placement of erosion-resistant layer material, verify that the boot is installed in a collapsed position above the final grade to accommodate potential settlement.

G. Verify that the PVC well bore seal is covered with the overlying GCL material or soil (temporary) if the PVC well bore seal is going to be exposed for more than three (3) working days.

3.04 INSTALLATION OF PREFABRICATED WELL HEAD ASSEMBLY

A. Verify that the prefabricated well head assemblies are handled and installed in accordance with the manufacturer's recommendations and as shown on the Plans.

B. Verify that the well head is installed such that the interior extension tube assembly is concentric within the well casing.

C. Verify that the final completion height of the well head assembly is 5 feet above final grade as shown on the Plans.

D. Verify that the PVC flexible hose connection between the well head and LFG collection system piping is installed with sufficient slack (6 to 8 inches) to accommodate expansion and contraction. Verify that "IPS Weld-On 795" plastic pipe cement, or approved equivalent, is used for flexible hose connections to the well head and LFG collection system piping.

3.05 ABANDONMENT OF LFG EXTRACTION WELL BOREHOLE (IF REQUIRED)

A. Verify that boreholes approved by the Design Engineer for abandonment are backfilled with refuse and/or soil to the final grade and compacted. If refuse is used, verify that the refuse is mechanically compacted within the borehole using the bucket auger to eliminate potential voids.

B. Upon completion of borehole abandonment activities, verify that the area around the borehole is restored to meet the surrounding grades as shown on the Plans.

3.06 PERFORMANCE TESTING

A. Verify that performance testing of the prefabricated well head assemblies is performed in conformance with Section 15100 (Landfill Gas [LFG] Extraction Wells) of the Technical Specifications.

3.07 CORRECTIVE ACTIONS

A. If any portion(s) of the LFG extraction well provisions do not meet the requirements of the Plans and Technical Specifications, based on either field test results, observations, field survey, and/or physical measurement, verify that that portion(s) is reworked or removed and replaced to meet the requirements of the Technical Specifications and that the corrective actions implemented by the Contractor are in conformance with methods approved by the Design Engineer and the applicable Standard Specifications.

END OF CQA SECTION 15100
LANDFILL GAS (LFG) EXTRACTION WELLS

CQA SECTION 15200
LFG COLLECTION SYSTEM COMPONENTS

PART 1 GENERAL

1.01 SUMMARY

A. The CQA Officer shall perform CQA procedures as outlined in this Section and follow guidelines for monitoring and testing to verify and document that the LFG collection system component materials and construction methods are in compliance with the Plans and Technical Specifications.

1.02 SUBMITTALS

A. Collect three (3) copies of each submittal required in the Technical Specifications.

B. Verify compliance with the submittal schedule and update Submittal Log.

C. Perform submittal review and approval procedures in Part 1.03 of Section 01300 (Submittals) of this CQA Plan.

PART 2 PRODUCTS

2.01 LFG COLLECTION SYSTEM COMPONENTS

A. Verify that the following LFG collection system components meet the applicable product requirements of Section 15200 (LFG Collection System Components) of the Technical Specifications:

1. PVC pipe and fittings.
2. PVC butterfly valves (isolation valves).
3. PVC ball valves.
4. PVC cement.
5. Vacuum/sample test ports.
6. HDPE pipe and fittings.
7. PVC-HDPE transition coupling.
8. Flexible couplings.
9. Block type pipe supports and anchors (including concrete masonry blocks, pipe clamps and miscellaneous fittings).
10. Metal frame pipe supports (including metal frames, pipe clamps and miscellaneous fittings).
11. CMP.
12. Steel pipe protective sleeves.
13. Reinforced concrete pipe (RCP) protective sleeve.

2.02 CONCRETE

A. Verify concrete conformance under CQA Section 03300 (Concrete) of this CQA Plan.

2.03 PIPE BEDDING

A. Verify pipe bedding conformance under CQA Section 02207 (Aggregate Materials) of this CQA Plan.

2.04 ENGINEERED FILL

A. Verify engineered fill conformance under CQA Section 02224 (Engineered Fill) of this CQA Plan.

2.05 CONFORMANCE TESTING

A. Review moisture-density relationship conformance test results for the pipe bedding and engineered fill as determined under CQA Section 02207 (Aggregate Materials) and CQA Section 02224 (Engineered Fill), respectively, of this CQA Plan.

PART 3 EXECUTION

3.01 PREPARATION

A. Prior to LFG collection system construction, hold a preparatory meeting in accordance with Part 1.04 of Section 01039 (Project Meetings) of this CQA Plan.

3.02 LFG COLLECTION SYSTEM PIPING

A. Verify that the LFG collection system piping, including flexible couplings, isolation valves and condensate drop-out points are installed as shown on the Plans.

B. Verify that all PVC pipe, fittings and valves are inspected for cuts, scratches, or other damages prior to painting and installation.

C. Verify that prior to installation, all PVC pipe and fittings to be left exposed are steam cleaned and allowed to dry, then painted in conformance with Section 15200 (LFG Collection System Components) of the Technical Specifications.

D. Verify that PVC pipe, fittings and valves are joined with socket and solvent cement welding in accordance with ASTM D 2855 and that the joining of PVC pipe, fittings and valves are in accordance with the pipe manufacturer's recommendations and the Technical Specifications.

E. Verify that PVC pipe cuts are square and perpendicular to the centerline of the pipe and that PVC pipe ends are beveled prior to applying primer and solvent cement so that the primer or cement are not wiped off during insertion into the fitting socket.

F. Verify that all burrs, chips, etc. generated as a result of cutting operations are removed from the pipe interior and exterior and that the inside of the piping is kept clean of dirt and debris. Also verify that any piping left overnight is capped.

G. Verify that a coating of CPS primer as recommended by the PVC pipe supplier is applied to the entire interior surface of the fitting socket, and to an equivalent area on the exterior of the pipe prior to applying solvent cement.

H. Verify that the solvent cement used complies with the requirements of ASTM D 2564 and is applied in strict accordance with manufacturer's specifications.

I. Verify that PVC pipe, fittings and valves are not primed or solvent welded when it is raining or when ambient temperature is below 40°F or above 100°F.

J. Verify that after solvent welding, the PVC pipe, fittings and valves are allowed to remain undisturbed until cement has thoroughly set.

K. Verify that flexible couplings are installed at the locations shown on the Plans and that the flexible couplings are installed per the pipe separation criteria specified in the Plans based on the ambient temperature at the time of installation. Also verify that stainless steel band clamps are secured around the ends of the flexible coupling in such a manner as to provide an air-tight joint.

L. Verify that vacuum/sample test ports are installed at the locations and orientations shown on the Plans and in accordance with the procedures described in Section 15200 (LFG Collection System Components) of the Technical Specifications.

M. Verify that block type pipe supports are installed under the selected pipe segments as specified on the Plans and that they are spaced at 6 feet on-center along the full length of the pipe segments.

N. Verify that block type pipe anchors are installed every 50 linear feet (minimum) of LFG collection system piping, as well as at the locations of all tee, elbow and wye fittings (both ends, but not on the fittings themselves) and that the pipe clamps are secured around the LFG header system pipe to ensure that the pipe does not move.

O. Verify that strap type pipe anchors are installed at the various locations shown on the Plans and in accordance with manufacturer's recommendations.

P. Verify that metal frame pipe supports are installed at the locations shown on the Plans and that they are spaced at 6 feet on-center. Verify that the height of cross-bar pipe supports are adjusted as appropriate to ensure positive slope of LFG collection system piping. Verify concrete placement conformance under CQA Section 03300 (Concrete) of this CQA Plan.

3.03 BURIED HEADER CROSSINGS

A. Verify that trenching across bench sections are to the depth and dimensions shown on the Plans.

B. Verify that LFG collection system piping is sloped at a minimum of 3 percent to maintain proper condensate drainage capabilities.

C. Verify backfill conformance under CQA Section 02225 (Trenching and Backfilling) and perform the following field tests at the frequency shown to verify that the compacted pipe bedding and engineered fill have a minimum dry density of 90 percent of the maximum dry density and is within 1 to 3 percentage points of the optimum moisture content as determined from ASTM D 1557:

1. *Dry Density and Moisture Content - Nuclear (ASTM D 2922 and D 3017)*; at least one (1) test per 100 linear feet per lift.

2. *Moisture Content (ASTM D 4959);* at least one (1) test per every ten (10) nuclear gauge tests.

D. Record corresponding dry density and moisture content results on the Nuclear Density/Moisture Test Data form.

3.04 ROAD CROSSINGS

A. Verify that pipe support/drainage CMPs and steel pipe/RCP protective sleeves are installed in the orientations shown on the Plans and that the pipe support/drainage CMPs are aligned with the center line of the drainage swale.

B. Verify that reinforcement geotextile is wrapped around the steel pipe protective sleeve where it will be in direct contact with the underlying pipe support/drainage CMP.

C. Verify that LFG collection system piping is inserted through the steel pipe/RCP protective sleeves in a manner that does not damage or compromise the LFG collection system piping.

D. Verify engineered fill placement conformance under CQA Section 02224 (Engineered Fill) and perform the following field tests at the frequency shown to verify that the compacted engineered fill has a minimum dry density of 90 percent of the maximum dry density and is within 1 to 3 percentage points of the optimum moisture content as determined from ASTM D 1557:

1. *Dry Density and Moisture Content - Nuclear (ASTM D 2922 and D 3017)*; at least one (1) test per 100 linear feet per lift.
2. *Moisture Content (ASTM D 4959);* at least one (1) test per every ten (10) nuclear gauge tests.

E. Record corresponding dry density and moisture content results on the Nuclear Density/Moisture Test Data form.

3.05 CONDENSATE DRAIN PIPE AND FITTINGS

A. Prior to installation, verify that all HDPE pipe and fittings are inspected for cuts, scratches, or other damages and that pipe and/or fittings with imperfections are not used.

B. Verify that trench excavation and backfill for buried HDPE pipe and fittings are as shown on the Plans.

C. Verify that HDPE pipe connection ends and fittings are joined by butt fusion procedures in accordance with the HDPE pipe and fitting manufacturer's recommended procedures.

D. Verify during construction that the HDPE pipe is not bent to a degree greater than the minimum radius recommended by the manufacturer and that the HDPE pipe is not subjected to strains that will overstress or buckle piping or impose excessive stress on joints.

E. Verify that open ends of fused HDPE pipe are covered or capped at the end of each working day to prevent entry by animals or debris.

F. Verify that sufficient slack is provided for segments completed above ground to allow for thermal expansion and contraction so as to not promote excessive stress on the piping following installation.

G. Verify that allowance is provided for thermal expansion or contraction of buried HDPE pipe within trenches and is coordinated with the pipe backfill operations to avoid buildup of thermal stresses.

H. Verify that sufficient time (per manufacturer's recommendations) is provided following placement of HDPE pipe to allow the pipe to adjust to trench temperature prior to testing, segment tie-ins, or backfilling activities.

3.06 CONDENSATE DROP-OUTS

A. Verify that the condensate drop-outs, including u-trap assemblies, are installed at the locations and to the dimensions shown on the Plans.

B. Verify that excavations are not deeper than necessary to maintain adequate buffer above the underlying GCL.

C. Verify that the transition from PVC to HDPE is conducted at the flange connection as shown on the Plans.

D. Verify PVC and HDPE pipe, fittings and valves installation conformance under Parts 3.01 and 3.05 of this Section.

E. Verify installation of strap type pipe anchors at various points on the u-trap piping as shown on the Plans.

F. Verify that the u-trap assemblies are filled with clean water following construction and prior to start of LFG collection system operations.

3.07 CONDENSATE DISCHARGE POINTS

A. Verify that the Condensate discharge points are installed at the locations and to the dimensions shown on the Plans.

B. Verify soil and/or refuse excavation and handling conformance under CQA Section 02222 (Excavation) of this CQA Plan.

C. Verify PVC and HDPE pipe and fittings installation conformance under Parts 3.01 and 3.05 of this Section.

D. For condensate discharge points located within the limits of the final cover system, verify placement conformance of the engineered fill and respective final cover system components above the condensate discharge points per the applicable sections of this CQA Plan.

E. For condensate discharge points located outside the limits of the final cover system, verify engineered fill placement conformance under CQA Section 02224 (Engineered Fill) and perform the following field tests at the frequency shown to verify that the compacted engineered fill has a minimum dry density of 90 percent of the maximum dry density and is within 1 to 3 percentage points of the optimum moisture content as determined from ASTM D 1557:

1. *Dry Density and Moisture Content - Nuclear (ASTM D 2922 and D 3017)*; at least one (1) test per 100 linear feet per lift.

2. *Moisture Content (ASTM D 4959);* at least one (1) test per every ten (10) nuclear gauge tests.

F. Record corresponding dry density and moisture content results on the Nuclear Density/Moisture Test Data form.

3.08 PERFORMANCE TESTING

A. Verify that performance testing of the PVC LFG collection system pipe, HDPE condensate drain pipe, and condensate discharge points is performed in conformance with Section 15200 (LFG Collection System Components) of the Technical Specifications.

3.09 CORRECTIVE ACTIONS

A. If any portion(s) of the LFG collection system components provisions do not meet the requirements of the Plans and Technical Specifications, based on either field test results, observations, field survey, and/or physical measurement, verify that that portion(s) is reworked or removed and replaced to meet the requirements of the Technical Specifications and that the corrective actions implemented by the Contractor are in conformance with methods approved by the Design Engineer and the applicable Standard Specifications.

END OF CQA SECTION 15200
LFG COLLECTION SYSTEM COMPONENTS

CQA SECTION 15300
FLARE STATION

PART 1 GENERAL

1.01 SUMMARY

A. The CQA Officer shall perform CQA procedures as outlined in this Section and follow guidelines for monitoring and testing to verify and document that the flare station materials and construction methods are in compliance with the Plans and Technical Specifications.

1.02 SUBMITTALS

A. Collect three (3) copies of each submittal required in the Technical Specifications.

B. Verify compliance with the submittal schedule and update Submittal Log.

C. Perform submittal review and approval procedures in Part 1.03 of Section 01300 (Submittals) of this CQA Plan.

PART 2 PRODUCTS

2.01 FLARE STATION COMPONENTS

A. Verify that the following flare station components meet the applicable product requirements of Section 15300 (Flare Station) of the Technical Specifications:
1. Skid-mounted packaged combustion system.
2. Electrical conduit, wire and fittings.
3. Chain link fence.

2.02 PVC PIPE, FITTINGS AND BALL VALVE

A. Verify PVC pipe, fittings and ball valve conformance under CQA Section 15200 (LFG Collection System Components) of this CQA Plan.

2.03 PIPE BEDDING

A. Verify pipe bedding conformance under CQA Section 02207 (Aggregate Materials) of this CQA Plan.

2.04 ENGINEERED FILL

A. Verify engineered fill conformance under CQA Section 02224 (Engineered Fill) of this CQA Plan.

2.05 CONCRETE

A. Verify concrete conformance under CQA Section 03300 (Concrete) of this CQA Plan.

2.06 AGGREGATE BASE

A. Verify aggregate base conformance under CQA Section 02207 (Aggregate Materials) of this CQA Plan.

2.07 CONFORMANCE TESTING

A. Review moisture-density relationship conformance test results for the aggregate base as determined under CQA Section 02207 (Aggregate Materials) of this CQA Plan.

PART 3 EXECUTION

3.01 FLARE STATION ASSEMBLY

A. Prior to flare station assembly activities, hold a preparatory meeting in accordance with Part 1.04 of Section 01039 (Project Meetings) of this CQA Plan.

B. Verify that Contractor has obtained all required building permits.

C. Verify that Contractor's laborers are skilled and experienced in the installation of similar equipment.

D. Verify that the skid-mounted packaged combustion system is installed in strict accordance with the manufacturer's specifications.

3.02 CONDENSATE DRAINAGE LINE

A. Verify that the condensate drain line between the flare station and leachate wet well is installed as shown on the Plans.

B. Verify trenching and pipe bedding conformance under CQA Section 02225 (Trenching and Backfilling) of this CQA Plan.

C. Verify PVC pipe, fittings and ball valve installation conformance under CQA Section 15200 (LFG Collection System Components) of this CQA Plan.

D. Verify that the condensate drainage line is installed at a minimum slope of 1 percent in the direction of the leachate wet well.

E. Verify that the condensate drainage line penetrates the wall of the leachate wet well at the appropriate depth and that the annular space between the condensate drainage line and the wall of the leachate wet well is sealed using non-shrink grout.

F. Verify engineered fill placement conformance under CQA Section 02224 (Engineered Fill) of this CQA Plan.

3.03 SECURITY FENCE

A. Verify that the chain link fence and gates are installed as shown on the Plans and in accordance with the requirements of Section 80-4.02 of the Standard Specifications.

B. Verify that all line, corner, and gate post assemblies are constructed with concrete post footings.

C. Verify that soil between fence posts is leveled to create a 2-inch clearance under the fence fabric.

3.04 FLARE STATION AGGREGATE BASE

A. Verify that the aggregate base within and around the flare station is placed to the dimensions shown on the Plans.

B. Verify that the aggregate base is spread in uniform loose lifts not exceeding 8 inches in thickness.

C. Perform the following field tests at the frequency shown to verify that the compacted aggregate base material has a minimum dry density of 95 percent of the maximum dry density and is within 1 to 3 percentage points of the optimum moisture content as determined from ASTM D 1557:

1. *Dry Density and Moisture Content – Nuclear (ASTM D 2922 and D 3017);* at one test per every 1,200 square feet.
2. *Moisture Content (ASTM D 4959);* at least one (1) test per every ten (10) nuclear gauge tests.

D. Record corresponding dry density and moisture content results on the Nuclear Density/Moisture Test Data form.

E. Verify that the final compacted thickness is a minimum of 6 inches.

3.05 PERFORMANCE TESTING

A. Verify that performance testing of the skid-mounted packaged combustion system and condensate drainage line is performed in conformance with Section 15300 (Flare Station) of the Technical Specifications.

3.06 CORRECTIVE ACTIONS

A. If any portion(s) of the flare station provisions do not meet the requirements of the Plans and Technical Specifications, based on either field test results, observations, field survey, and/or physical measurement, verify that that portion(s) is reworked or removed and replaced to meet the requirements of the Technical Specifications and that the corrective actions implemented by the Contractor are in conformance with methods approved by the Design Engineer and the applicable Standard Specifications.

END OF CQA SECTION 15300
FLARE STATION

CQA SECTION 15400
FLARE STATION ELECTRICAL AND TELEPHONE FEED

PART 1 GENERAL

1.01 SUMMARY

A. The CQA Officer shall perform CQA procedures as outlined in this Section and follow guidelines for monitoring and testing to verify and document that the flare station electrical and telephone feed materials and installation methods are in compliance with the Plans and Technical Specifications.

1.02 SUBMITTALS

A. Collect three (3) copies of each submittal required in the Technical Specifications.

B. Verify compliance with the submittal schedule and update Submittal Log.

C. Perform submittal review and approval procedures in Part 1.03 of Section 01300 (Submittals) of this CQA Plan.

PART 2 PRODUCTS

2.01 ELECTRICAL AND TELEPHONE FEED COMPONENTS

A. Verify that the following electrical and telephone feed components meet the applicable product requirements of Section 15400 (Flare Station Electrical and Telephone Feed) of the Technical Specifications:
1. Wire.
2. Conduit and fittings.
3. Meter socket.
4. Junction and outlet boxes.
5. Warning tape.

2.02 PIPE BEDDING

A. Verify pipe bedding conformance under CQA Section 02207 (Aggregate Materials) of this CQA Plan.

2.03 ENGINEERED FILL

A. Verify engineered fill conformance under CQA Section 02224 (Engineered Fill) of this CQA Plan.

2.04 CONCRETE

A. Verify concrete conformance under CQA Section 03300 (Concrete) of this CQA Plan.

2.05 CONFORMANCE TESTING

A. Review moisture-density relationship conformance test results for pipe bedding and the engineered fill used for backfilling the former leachate pond as determined under CQA Section 02207 (Aggregate Base) and CQA Section 02224 (Engineered Fill), respectively, of this CQA Plan.

PART 3 EXECUTION

3.01 GENERAL

A. Prior to electrical and telephone feed installation, hold a preparatory meeting in accordance with Part 1.04 of Section 01039 (Project Meetings) of this CQA Plan.

B. Verify that Contractor has obtained all required electrical permits.

C. Verify that Contractor has furnished and installed all temporary power and lighting systems needed for construction and their subsequent removal after construction is completed.

D. Verify that Contractor has verified that the wire and conduit sizes for the main power supply and automatic telephone dialer system are appropriate for the intended use.

E. Verify that all electrical components are in accordance with the National Electric Code (NEC), National Fire Protection Association (NFPA) and local codes and regulations for installation in a Class 1, Division 1 or Class 1, Division 2 classified locations.

F. Verify that electrical and telephone feed installations are performed in accordance with the local electrical and telephone company rules and regulations.

G. Verify that the electrical and telephone feed from the existing service points to the flare station control panel is completed below grade as shown on the Plans.

H. Verify that Contractor has confirmed service and panel locations and all other service requirements prior to starting Work.

3.02 PREPARATION

A. Verify that all materials are inspected for damage and imperfections prior to installation and that damaged materials or materials with imperfections are not used.

3.03 TRENCHING AND BACKFILLING

A. Verify trenching and pipe bedding placement conformance under CQA Section 02225 (Trenching and Backfilling) of this CQA Plan.

B. Perform the following field tests at the frequency shown to verify that the compacted pipe bedding and engineered fill have a minimum dry density of 90 percent of the maximum dry density and is at a moisture content within 1 to 3 percentage points of the optimum moisture content as determined from ASTM D 1557:

1. *Dry Density and Moisture Content – Nuclear (ASTM D 2922 and D 3017);* at least one (1) test per 100 linear feet per lift or at a change in material.
2. *Moisture Content (ASTM D 4959);* at least one (1) test per every ten (10) nuclear gauge tests.

C. Record corresponding dry density and moisture content results on the Nuclear Density/Moisture Test Data form.

3.04 INSTALLATION

A. Verify that all equipment, motors, conduit and outlets, as applicable, are permanently and effectively grounded in accordance with NEC, California Administrative Code (CAC) - Title 24 and local codes.

B. Verify that all conduits are sloped towards pull boxes and run in straight lines except where a change in direction is necessary. Also verify that couplings are staggered for maximum duct line strength.

C. Verify that the ends of buried conduit are kept closed with approved conduit seals during construction and that immediately prior to pulling wire or cable, a swab is drawn through all conduits to force out water and foreign materials.

D. Verify that junction boxes are installed in an accessible location as required for splicing, connections and pulling of wire.

E. Verify that all above ground conduit is properly secured on pipe supports or concrete slabs.

F. Verify that the meter socket installed at the existing service pole complies with the height and fastening specifications outlined in the local electric company rules and regulations.

3.05 CLEAN-UP

A. Verify that all exposed portions of electrical installation are thoroughly cleaned, including the removal of all traces of soil, labels, grease, oil, and other foreign matter.

3.06 CORRECTIVE ACTIONS

A. If any portion(s) of the flare station electrical and telephone feed provisions do not meet the requirements of the Plans and Technical Specifications, based on either field test results, observations, field survey, and/or physical measurement, verify that that portion(s) is reworked or removed and replaced to meet the requirements of the Technical Specifications and that the corrective actions implemented by the Contractor are in conformance with methods approved by the Design Engineer and the applicable Standard Specifications.

END OF CQA SECTION 15400
FLARE STATION ELECTRICAL AND TELEPHONE FEED

CQA SECTION 15500
LEACHATE OVERFLOW COLLECTION AND STORAGE SYSTEM

PART 1 GENERAL

1.01 SUMMARY

A. The CQA Officer shall perform CQA procedures as outlined in this Section and follow guidelines for monitoring and testing to verify and document that the leachate overflow collection and storage system materials and construction methods are in compliance with the Plans and Technical Specifications.

1.02 SUBMITTALS

A. Collect three (3) copies of each submittal required in the Technical Specifications.

B. Verify compliance with the submittal schedule and update Submittal Log.

C. Perform submittal review and approval procedures in Part 1.03 of Section 01300 (Submittals) of this CQA Plan.

PART 2 PRODUCTS

2.01 COLLECTION AND STORAGE SYSTEM COMPONENTS

A. Verify that the following leachate overflow collection and storage system components meet the applicable product requirements of Section 15500 (Leachate Overflow Collection and Storage System) of the Technical Specifications:
1. Pipe materials.
2. Pipe accessories.
3. Concrete junction boxes.
4. Lining material for leachate sediment chamber/wet well.
5. Leachate UST and accessories.

2.02 PIPE BEDDING

A. Verify pipe bedding conformance under CQA Section 02207 (Aggregate Materials) of this CQA Plan.

2.03 TANK BEDDING AND BACKFILL

A. Verify tank bedding and backfill conformance under CQA Section 02207 (Aggregate Materials) of this CQA Plan.

2.04 ENGINEERED FILL

A. Verify engineered fill conformance under CQA Section 02224 (Engineered Fill) of this CQA Plan.

2.05 CONFORMANCE TESTING

A. Review moisture-density relationship conformance test results for the pipe bedding and tank bedding and backfill as determined under CQA Section 02207 (Aggregate Materials) of this CQA Plan.

B. Review moisture-density relationship conformance test results for the engineered fill as determined under CQA Section 02224 (Engineered Fill) of this CQA Plan.

PART 3 EXECUTION

3.01 BRACING AND SHORING

A. Verify that Bracing and shoring complies with Section 5-1.02A and 7-1.01E of the Standard Specifications.

3.02 GENERAL PIPE INSTALLATION

A. Verify that Contractor confirms the location of point of connection (POC) at the existing leachate collection piping as shown the Plans by potholing to determine the location and depth (elevation).

B. Verify that the trench subgrade for the gravity drain pipe provides uniform support at a uniform slope along full length of pipe.

3.03 PIPE INSTALLATION

A. Verify trench conformance under CQA Section 02225 (Trenching and Backfilling) of this CQA Plan.

B. Verify that the bottom of the trench is graded and prepared to provide a firm and uniform bearing throughout the entire length of the pipe barrel.

C. Verify that pipe, fittings, and accessories are installed in accordance with manufacturer's instructions and that the sealed joints are watertight.

D. Verify that pipe is placed to the lines and grades as shown on the Plans.

E. Verify that the pipe is laid without break upgrade from structure to structure, with bell end upgrade for bell and spigot pipe.

F. Verify that the horizontal alignment of the pipe is laid such that no points vary more than 0.10 feet from the design alignment established and shown on the Plans.

G. Verify backfill conformance under CQA Section 02225 (Trenching and Backfilling) and perform the following field tests at the frequency shown to verify that the compacted pipe bedding and engineered fill have a minimum dry density of 90 percent of the maximum dry density and is at a moisture content within 1 to 3 percentage points of the optimum moisture content as determined from ASTM D 1557:

1. *Dry Density and Moisture Content – Nuclear (ASTM D 2922 and D 3017);* at least one (1) test per 100 linear feet per lift or at a change in material.
2. *Moisture Content (ASTM D 4959);* at least one (1) test per every ten (10) nuclear gauge tests.

H. Record corresponding dry density and moisture content results on the Nuclear Density/Moisture Test Data form.

3.04 CONCRETE JUNCTION BOXES

A. Verify excavation conformance under CQA Section 02222 (Excavation) of this CQA Plan.

B. Verify that concrete junction boxes are installed in accordance with manufacturer's instructions and that their placement into the excavation is performed in a manner that will not induce damage or compromise future stability.

C. Verify that backfilling operations conform to the provisions in Section 19-3 of the Standard Specifications.

3.05 LEACHATE SEDIMENT CHAMBER/WET WELL LINING

A. Prior to start of Work, verify that provisions have been made to divert leachate from the existing leachate drain from discharging into the leachate sediment chamber and document how the leachate is being diverted and managed.

B. Verify that all leachate is pumped from the leachate sediment chamber and wet well and document where the leachate is pumped and managed.

C. Verify that any sediment present at the base of the leachate sediment chamber and/or wet well is removed and document how the sediment is removed and managed.

D. Verify that existing pumps and any other equipment/features that may inhibit application product are removed and stored in a dry and secure location

E. Verify that the interior walls and base of the sediment chamber and wet well are steam cleaned to remove residual grime and residues. Also verify that residual rinseate generated by the steam cleaning operations is removed and document how the removed rinseate is managed.

F. Verify that sufficient time is provided to allow the surfaces of the interior walls and base to dry and document the nature of any mechanical means employed to expedite the drying time, as applicable.

G. Verify that the lining product is applied to provide full and sufficient coverage of all interior walls and base and that the application is performed in strict accordance with recommended manufacturer’s procedures.

H. Verify that pumps and any other equipment/features that were removed are re-installed and verify that normal operation of the leachate sediment chamber/wet well is restored per pre-existing conditions.

3.06 TANK HOLDING

A. Verify that the tank is not dropped, rolled or impacted during unloaded and that the tank is set on smooth ground, free of rocks and foreign objects, and chock tanks to prevent movement.

3.07 TANK INSTALLATION

A. Verify excavation conformance under CQA Section 02222 (Excavation) of this CQA Plan.

B. Verify that the tank excavation is large enough to provide 2 feet of clearance between the tank sides and ends and the excavation walls in stable soil and 12 inches of bedding under the tank.

C. Verify that the tank and all related piping and accessories are installed as per manufacturer's printed instructions.

D. Verify that the tank bedding and backfill is placed in accordance with the sequence and procedures outlined in Section 15500 (Leachate Overflow Collection and Storage System) of the Technical Specifications.

E. Following placement of the tank bedding and backfill, verify backfill conformance for the remainder of the excavation under CQA Section 02225 (Trenching and Backfilling) and perform the following field tests at the frequency shown to verify that the compacted engineered fill has a minimum dry density of 90 percent of the maximum dry density and is within 1 to 3 percentage points of the optimum moisture content as determined from ASTM D 1557:
   a. *Dry Density and Moisture Content – Nuclear (ASTM D 2922 and D 3017);* at one test per every 1,200 square feet.
   b. *Moisture Content (ASTM D 4959);* at least one (1) test per every ten (10) nuclear gauge tests.

F. Record corresponding dry density and moisture content results on the Nuclear Density/Moisture Test Data form.

3.08 PERFORMANCE TESTING

A. Verify that performance testing of the leachate sediment chamber/wet well and leachate UST is performed in conformance with Section 15500 (Leachate Overflow Collection and Storage System) of the Technical Specifications.

3.09 CORRECTIVE ACTIONS

A. If any portion(s) of the leachate overflow connection and storage system provisions do not meet the requirements of the Plans and Technical Specifications, based on either field test results, observations, field survey, and/or physical measurement, verify that that portion(s) is reworked or removed and replaced to meet the requirements of the Technical Specifications and that the corrective actions implemented by the Contractor are in conformance with methods approved by the Design Engineer and the applicable Standard Specifications.

GENERAL NOTES

1. ALL CONSTRUCTION MATERIALS AND METHODS SHALL CONFORM TO THE REQUIREMENTS OF THE COUNTY OF MENDOCINO. ALL REFERENCES TO STATE OF CALIFORNIA, DEPARTMENT OF TRANSPORTATION STANDARD SPECIFICATIONS SHALL REFER TO THE MAY, 2006 EDITION OF THE STANDARD SPECIFICATIONS. ATTENTION IS ALSO DIRECTED TO THE STATE OF CALIFORNIA, DEPARTMENT OF TRANSPORTATION STANDARD PLANS (MAY 6, 2006) WHICH, WHEN APPLICABLE, ARE INCLUDED IN THESE DRAWINGS AND REFERENCED BY STANDARD PLAN NUMBER.
2. PUBLIC SAFETY AND TRAFFIC CONTROL SHALL BE PROVIDED IN ACCORDANCE WITH COUNTY REQUIREMENTS AND AS DIRECTED BY THE ENGINEER. SAFE VEHICULAR AND PEDESTRIAN ACCESS SHALL BE PROVIDED AT ALL TIMES DURING CONSTRUCTION.
3. A REGISTERED CIVIL ENGINEER OR LICENSED LAND SURVEYOR SHALL DO ALL FIELD STAKING AT THE EXPENSE OF THE CONTRACTOR.
4. ANY DISCREPANCY DISCOVERED BY THE CONTRACTOR IN THESE PLANS OR ANY FIELD CONDITIONS DISCOVERED BY THE CONTRACTOR THAT MAY DELAY OR OBSTRUCT THE PROPER COMPLETION OF THE WORK PER THESE PLANS SHALL BE BROUGHT TO THE ATTENTION OF THE ENGINEER IMMEDIATELY UPON DISCOVERY. SAID NOTIFICATION SHALL BE IN WRITING.
5. CONSTRUCTION CONTRACTOR AGREES THAT IN ACCORDANCE WITH GENERALLY ACCEPTED CONSTRUCTION PRACTICES, GENERAL CONTRACTOR WILL BE REQUIRED TO ASSUME SOLE AND COMPLETE RESPONSIBILITY FOR JOB SITE CONDITIONS DURING THE COURSE OF CONSTRUCTION OF THE PROJECT INCLUDING SAFETY OF ALL PERSONS AND PROPERTY; THAT THIS REQUIREMENT SHALL BE MADE TO APPLY CONTINUOUSLY AND NOT BE LIMITED TO NORMAL WORKING HOURS.
6. CONTRACTOR IS RESPONSIBLE FOR THE PROTECTION OF ALL EXISTING MONUMENTS AND OTHER SURVEY MARKERS. MONUMENTS, SURVEY MARKERS, GAS, WATER AND MONITORING DEVICES DESTROYED DURING CONSTRUCTION SHALL BE REPLACED AT THE CONTRACTOR'S EXPENSE.
7. CONTRACTOR SHALL MAINTAIN ADEQUATE DUST CONTROL PER SECTION 10, CALTRANS STANDARD SPECIFICATIONS.
8. DURING CONSTRUCTION , THE CONTRACTOR SHALL BE RESPONSIBLE FOR CONTROLLING NOISE, ODORS, DUST, AND DEBRIS TO MINIMIZE IMPACTS ON SURROUNDING PROPERTIES AND ROADWAYS. CONTRACTOR SHALL BE RESPONSIBLE THAT ALL CONSTRUCTION EQUIPMENT IS EQUIPPED WITH MANUFACTURER'S APPROVED MUFFLER BAFFLES. FAILURE TO DO SO MAY RESULT IN THE ISSUANCE OF AN ORDER TO STOP WORK.
9. CONTRACTOR SHALL INDEPENDENTLY REVIEW GROUND, TOPOGRAPHY, AND EXISTING CONDITIONS THROUGHOUT THE LIMITS OF WORK, AND ASSUME WHOLLY AND UNCONDITIONALLY THE RISK OF COMPLETING THE WORK SET OUT ON THESE PLANS, REGARDLESS OF ROCK, WATER TABLE, OR OTHER CONDITIONS WHICH THE CONTRACTOR MAY ENCOUNTER IN THE COURSE OF THE WORK.
10. THE CONTRACTOR SHALL CHECK AND VERIFY ALL DIMENSIONS AND EXISTING CONDITIONS BEFORE LAYING OUT THE WORK AND NOTIFY THE ENGINEER OF ANY DISCREPANCIES BEFORE STARTING WORK. HE SHALL BE RESPONSIBLE FOR ANY ERRORS RESULTING FROM HIS FAILURE TO DO SO.
11. DIMENSION TAKE PRECEDENCE OVER SCALE.
12. ALL WORK TO BE COMPLETED IS ACCORDANCE WITH THE PROJECT SPECIFICATIONS.
13. CONTRACTOR IS RESPONSIBLE FOR CONTACTING PG&E WITH REGARD TO OVERHEAD POWER LINES AND ASSOCIATED HEALTH AND SAFETY PROVISIONS PRIOR TO THE COMMENCEMENT OF WORK.

EROSION CONTROL NOTES

GENERAL

1. PERFORM EROSION PREVENTION AND SEDIMENT CONTROL IN ACCORDANCE WITH THE COUNTY OF MENDOCINO STANDARDS, CALIFORNIA DEPARTMENT OF TRANSPORTATION STANDARD SPECIFICATIONS, AND THE PROJECT CONSTRUCTION DOCUMENTS.
2. THE CONTRACTOR IS RESPONSIBLE FOR PREVENTING STORM WATER POLLUTION GENERATED FROM THE CONSTRUCTION SITE YEAR ROUND. WORK SITES WITH INADEQUATE EROSION AND SEDIMENT CONTROL MAY BE SUBJECT TO A STOP WORK ORDER.
3. IF DISCREPANCIES OCCUR BETWEEN THESE NOTES, MATERIAL REFERENCED HEREIN OR MANUFACTURER'S RECOMMENDATIONS, THEN THE MOST PROTECTIVE SHALL APPLY.
4. AT ALL TIMES THE CONTRACTOR IS RESPONSIBLE FOR OBTAINING AND COMPLYING WITH THE STATE OF CALIFORNIA NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM (NPDES) GENERAL PERMIT WASTE DISCHARGE REQUIREMENTS FOR DISCHARGES OF STORM WATER RUNOFF ASSOCIATED WITH CONSTRUCTION ACTIVITY. CONSTRUCTION ACTIVITIES INCLUDE BUT ARE NOT LIMITED TO CLEARING, GRADING, EXCAVATION, STOCKPILING, AND RECONSTRUCTION OF EXISTING FACILITIES INVOLVING REMOVAL AND REPLACEMENT.

RAINY SEASON OPERATIONS

1. THE CONTRACTOR MUST IMPLEMENT AN EFFECTIVE COMBINATION OF EROSION PREVENTION AND SEDIMENT CONTROL ON ALL DISTURBED AREAS DURING THE RAINY SEASON (OCTOBER 15 - APRIL 15). CONSTRUCTION GRADING AND DRAINAGE IMPROVEMENT SHALL BE PERMITTED DURING THE RAINY SEASON ONLY WHEN ON-SITE SOIL CONDITIONS PERMIT THE WORK TO BE PERFORMED. STORM WATER BMPS REFERENCED OR DETAILED IN THE PERMIT AUTHORITY'S BEST MANAGEMENT PRACTICES GUIDE SHALL BE IMPLEMENTED AND FUNCTIONAL ON THE SITE AT ALL TIMES.

YEAR ROUND REQUIREMENTS

1. DURING THE NON-RAINY SEASON, ON ANY DAY WHEN THE NATIONAL WEATHER SERVICE FORECAST IS A CHANCE OF RAIN OF 30% OR GREATER WITHIN THE NEXT 24 HOURS, STORM WATER BMPS REFERENCED OR DETAILED IN PRMD'S BEST MANAGEMENT PRACTICES GUIDE SHALL BE IMPLEMENTED, INSTALLED, AND FUNCTIONAL ON THE SITE TO PREVENT SOIL AND OTHER POLLUTANT DISCHARGES. AT ALL OTHER TIMES, BMPS SHOULD BE STORED ON SITE IN PREPARATION FOR INSTALLATION PRIOR TO RAIN EVENTS.
2. EROSION PREVENTION AND SEDIMENT CONTROL MEASURES SHALL BE INSPECTED BY THE CONTRACTOR BEFORE FORECASTED STORM EVENTS AND AFTER STORM EVENTS TO ENSURE MEASURES ARE FUNCTIONING PROPERLY. EROSION PREVENTION AND SEDIMENT CONTROL MEASURES THAT HAVE FAILED OR ARE NO LONGER EFFECTIVE SHALL BE PROMPTLY REPLACED. EROSION PREVENTION AND SEDIMENT CONTROL MEASURES SHALL BE MAINTAINED UNTIL DISTURBED AREAS ARE STABILIZED.
3. THE LIMITS OF GRADING SHALL BE DEFINED AND MARKED ON SITE TO PREVENT DAMAGE TO SURROUNDING VEGETATION. PRESERVATION OF EXISTING VEGETATION SHALL OCCUR TO THE MAXIMUM EXTENT PRACTICABLE. ANY EXISTING VEGETATION WITHIN THE LIMITS OF GRADING THAT IS TO REMAIN UNDISTURBED BY THE WORK SHALL BE IDENTIFIED AND PROTECTED FROM DAMAGE BY MARKING, FENCING, OR OTHER MEASURES.
4. CHANGES TO THE EROSION PREVENTION AND SEDIMENT CONTROL PLAN MAY BE MADE TO RESPOND TO FIELD CONDITIONS AND SHALL BE NOTED ON THE PLAN.
5. DISCHARGES OF POTENTIAL POLLUTANTS FROM CONSTRUCTION SITES SHALL BE PREVENTED USING SOURCE CONTROLS TO THE MAXIMUM EXTENT PRACTICABLE. POTENTIAL POLLUTANTS INCLUDE BUT ARE NOT LIMITED TO: SEDIMENT, TRASH, NUTRIENTS, PATHOGENS, PETROLEUM HYDROCARBONS, METALS, CONCRETE, CEMENT, ASPHALT, LIME, PAINT, STAINS, GLUES, WOOD PRODUCTS, PESTICIDES, HERBICIDES, CHEMICALS, HAZARDOUS WASTE, SANITARY WASTE, VEHICLE OR EQUIPMENT WASH WATER, AND CHLORINATED WATER.
6. ENTRANCE(S) TO THE CONSTRUCTION SITE SHALL BE MAINTAINED IN A CONDITION THAT WILL PREVENT TRACKING OR FLOWING OF POTENTIAL POLLUTANTS OFFSITE. POTENTIAL POLLUTANTS DEPOSITED ON PAVED AREAS WITHIN THE COUNTY RIGHT-OF-WAY, SUCH AS ROADWAYS AND SIDEWALKS, SHALL BE PROPERLY DISPOSED OF AT THE END OF EACH WORKING DAY OR MORE FREQUENTLY AS NECESSARY. THE CONTRACTOR SHALL BE RESPONSIBLE FOR CLEANING CONSTRUCTION VEHICLES LEAVING THE SITE ON A DAILY BASIS TO PREVENT DUST, SILT, AND DIRT FROM BEING RELEASED OR TRACKED OFFSITE. ALL SEDIMENT DEPOSITED ON PAVED ROADWAYS SHALL BE REMOVED AT THE END OF EACH WORKING DAY OR MORE OFTEN AS NECESSARY.
7. ALL DISTURBED AREAS SHALL BE PROTECTED BY USING EROSION PREVENTION MEASURES TO THE MAXIMUM EXTENT PRACTICABLE, SUCH AS ESTABLISHING VEGETATION COVERAGE, HYDROSEEDING, STRAW MULCH, BLANKETS OR MATS. TEMPORARY OR PERMANENT REVEGETATION SHALL BE INSTALLED AS SOON AS PRACTICAL AFTER VEGETATION REMOVAL BUT IN ALL CASES PRIOR TO OCTOBER 15. PRIOR TO FINAL INSPECTION, ALL DISTURBED AREAS SHALL BE REVEGETATED OR LANDSCAPING SHALL BE INSTALLED.
8. WHENEVER IT IS NOT POSSIBLE TO USE EROSION PREVENTION MEASURES ON EXPOSED SLOPES, SEDIMENT CONTROL DEVICES SUCH AS FIBER ROLLS AND SILT FENCES SHALL BE INSTALLED TO PREVENT SEDIMENT MIGRATION. FIBER ROLLS AND SILT FENCES SHALL BE TRENCHED AND KEYED INTO THE SOIL AND INSTALLED ON CONTOUR. SILT FENCES SHALL BE INSTALLED APPROXIMATELY 2 TO 5 FEET FROM TOE OF SLOPE.
9. HYDROSEEDING SHALL BE CONDUCTED IN A THREE STEP PROCESS. FIRST, EVENLY APPLY SEED MIX AND FERTILIZER TO THE EXPOSED SLOPE. SECOND, EVENLY APPLY MULCH OVER THE SEED AND FERTILIZER. THIRD, STABILIZE THE MULCH IN PLACE. AN EQUIVALENT SINGLE STEP PROCESS, WITH SEED, FERTILIZER, WATER, AND BONDED FIBERS IS ACCEPTABLE. APPLICATIONS SHALL BE BROADCASTED MECHANICALLY OR MANUALLY AT THE RATES SPECIFIED IN THE PROJECT CONSTRUCTION DOCUMENTS.
10. DUST CONTROL SHALL BE PROVIDED BY CONTRACTOR DURING ALL PHASES OF CONSTRUCTION.
11. STORM DRAIN INLETS SHALL BE PROTECTED FROM POTENTIAL POLLUTANTS UNTIL DRAINAGE CONVEYANCE SYSTEMS ARE FUNCTIONAL AND CONSTRUCTION HAS BEEN COMPLETED.
12. ENERGY DISSIPATERS SHALL BE INSTALLED AT STORM DRAIN OUTLETS WHICH MAY CONVEY EROSIVE STORM WATER FLOW.
13. SOIL AND MATERIAL STOCKPILES SHALL BE PROPERLY PROTECTED TO MINIMIZE SEDIMENT AND POLLUTANT TRANSPORT FROM THE CONSTRUCTION SITE.
14. SOLID WASTE, SUCH AS TRASH, DISCARDED BUILDING MATERIALS AND DEBRIS, SHALL BE PLACED IN DESIGNATED COLLECTION AREAS OR CONTAINERS. THE CONSTRUCTION SITE SHALL BE CLEARED OF SOLID WASTE DAILY OR AS NECESSARY. REGULAR REMOVAL AND PROPER DISPOSAL SHALL BE COORDINATED BY THE CONTRACTOR.
15. A CONCRETE WASHOUT AREA, SUCH AS A TEMPORARY PIT, SHALL BE DESIGNATED TO CLEAN CONCRETE TRUCKS AND TOOLS. AT NO TIME SHALL CONCRETE PRODUCTS AND WASTE BE ALLOWED TO ENTER COUNTY WATERWAYS SUCH AS CREEKS OR STORM DRAINS. NO WASHOUT OF CONCRETE, MORTAR MIXERS, OR TRUCKS SHALL BE ALLOWED ON SOIL.
16. PROPER APPLICATION, CLEANING, AND STORAGE OF POTENTIALLY HAZARDOUS MATERIALS, SUCH AS PAINTS AND CHEMICALS, SHALL BE CONDUCTED TO PREVENT THE DISCHARGE OF POLLUTANTS.
17. TEMPORARY RESTROOMS AND SANITARY FACILITIES SHALL BE LOCATED AND MAINTAINED DURING CONSTRUCTION ACTIVITIES TO PREVENT THE DISCHARGE OF POLLUTANTS.
18. APPROPRIATE VEHICLE STORAGE, FUELING, MAINTENANCE, AND CLEANING AREAS SHALL BE DESIGNATED AND MAINTAINED TO PREVENT DISCHARGE OF POLLUTANTS.

APPENDIX K

EMERGENCY RESPONSE PLAN

Emergency Response Plan

City of Ukiah Landfill

Mendocino County, California

April 2019

Prepared For:

City of Ukiah
Public Works Department
Ukiah, California

Prepared By:

EBA ENGINEERING
825 Sonoma Avenue
Santa Rosa, California
EBA Job No. 02-907

1.0 INTRODUCTION

Division 2, Title 27, Article 2, Section 21130 of the California Code of Regulations (effective date: 7/18/98) requires the development of an Emergency Response Plan at landfill closure to address potential events that could impact the integrity of the landfill cover and related appurtenances resulting in the release of waste products. These regulations are included here for review.

27CCR, §21130

(a) the operator shall maintain a written postclosure Emergency Response Plan at the facility or at an alternate location as approved by the EA. The Emergency Response Plan must identify occurrences that may exceed the design of the site and endanger public health or the environment. The plan shall describe specific procedures that minimize these hazards to protect public health and safety. The events that the plan shall address include, but are not limited to: vandalism, fires, explosions, earthquakes, floods, the collapse or failure of artificial or natural dikes, levees or dams; surface drainage problems; and other waste releases.

(b) The Emergency Response Plan shall contain the following:

(1) identification of events which could require the implementation of emergency response actions: This section shall not apply to the gas monitoring provisions;

(2) a description of the actions to be taken, and the sequence and implementation timetable needed to mitigate the conditions;

(3) a statement regarding the general availability of equipment required to mitigate each type of emergency.

(c) The operator shall amend the Emergency Response Plan under the following conditions:

(1) whenever a failure or release occurs for which the plan did not provide an adequate response;

(2) when the postclosure land use and/or structures on the site change and these changes are not addressed in the existing plan; or

(3) if the EA notifies the operator in writing that the current Emergency Response Plan is inadequate under the provision of this section. The notifying agency shall include within the written notice the items that plan needs to consider for it to comply with this section. The operator shall submit an amended Emergency Response Plan to the EA within thirty (30) days of notification of an inadequacy.

(d) Whenever the operator amends the Emergency Response Plan pursuant to (c) (1 or 2), the operator shall submit a written copy of the amended plan to the EA.

2.0 SPECIFIC EVENTS AND RESPONSES

The following presents a summary of specific events requiring correction action at the City of Ukiah Landfill (Landfill) and actions to be taken to minimize the release of waste products.

Earthquake

Given the final closure configuration of the Landfill, a seismic event within the area should not result in slope failure or a release of waste products; however, such an event could impact the integrity of the final cover, drainage conveyance systems, or monitoring systems. The following is the sequence and schedule of actions to be taken in the event of an earthquake to minimize potential hazards.

- In event of an earthquake, the site will be inspected by a qualified engineer within 24-hours to evaluate the integrity of the landfill cover, ancillary facilities and the potential for hazardous conditions.
- Within 5 days, notify the Local Enforcement Agency (LEA), the Sheriff's Department, California Regional Water Quality Control Board – North Coast Region (RWQCB), and the California Department of Resources Recycling and Recovery (CalRecycle) of any failure.
- Contact with areas of damaged landfill cover or potentially hazardous areas/conditions will be limited.
- Areas of concern will be stabilized pending reconstruction activities.
- Reconstruction requirements and construction scheduling will be evaluated and prepared for submittal to the LEA, RWQCB, and CalRecycle within 7 days.
- Areas requiring repair will be reconstructed in accordance with the Construction Quality Assurance Plan to original design specifications and contours, or the Final Closure Plan will be amended/revised and approved by the LEA, CalRecycle, and RWQCB.
- The LEA, RWQCB, and CalRecycle will be notified as to completion of construction activities.

Fires, Subsurface Fire, or Explosion

The potential for fire, subsurface fire, and/or explosion exists due to the presence of landfill gas. In the event of a fire or explosion, mitigative actions, sequence of actions, and timetable to minimize potential hazards will include the following:

- Immediately make a determination of the severity of the fire or explosion.

- If the fire or explosion is deemed severe, the Sheriff's Department and the Fire Department will be immediately notified. Also notify CalRecycle, RWQCB, LEA, and Mendocino County Air Quality Management District, and other authorities necessary to evaluate extent of damage.

- In the case of a surface fire or explosion, an area will be cordoned off from the incident and personnel will be retained on-site until the area has been declared safe.

- In the case of a subsurface fire that is not deemed severe, within 24 hours, turn off extraction wells in the adjoining area, then proceed with locating the source of the oxygen infiltration and repair the breach accordingly. If repair of breach will take longer than 48 hours, temporarily cover area of breach with soil to minimize further oxygen intrusion.

- If a subsurface fire is deemed severe:

    A. Secure the services of a consultant experienced in subsurface fires.

    B. Identify surface fractures, geologic features, or other cover features which may act as a conduit for oxygen infiltration.

    C. Determine the extent of subsurface fire through subsurface vapor and temperature monitoring.

    D. Cordon off area affected by fire.

    E. Evaluate the feasibility of extinguishing the fire by 1) remediation of conduits of air infiltration, 2) excavation of affected areas and extinguishing the fire using conventional means (water or foam vapor suppressant), 3) extinguishing the fire through CO2 injection, or 4) other methods identified by the consultant.

    F. Implement procedures to extinguish the fire.

- Repairs shall be made in accordance with the Construction Quality Assurance Plan.

- The LEA, RWQCB, and CalRecycle will be notified as to completion of construction activities.

Wild fires also represent a potential hazard. Whereas the ClosureTurf material should provide greater protection against flame propagation than a vegetative cover, the potential remains for damage to occur. Thus, a post-fire inspection will

be performed following such an incident to evaluate the integrity and potential damage to pertinent site components, including the ClosureTurf final cover system, landfill gas collection system (including the totally-enclosed vertical ground flare), leachate management system, monitoring system components, and perimeter security fencing and signage. Any damaged components identified by the inspection will be recorded and provisions made to implement the repairs accordingly.

Surface Drainage Failures and Floods

In the event of a wash out due to a surface drainage failure or flood, mitigative actions, sequence of actions, and timetable to minimize potential hazards will include the following:

- Inspection and evaluation of any damage incurred to the landfill cover and determination of the potential for hazardous conditions.
- Areas identified as potentially hazardous will be cordoned off.
- The LEA, RWQCB, and CalRecycle will be notified of the failure.
- Reconstruction requirements and construction scheduling will be evaluated and prepared for submittal to the LEA, RWQCB, and CalRecycle within 7 days.
- Repairs will be made in accordance with the Construction Quality Assurance Plan.
- The LEA, RWQCB, and CalRecycle will be notified as to completion of construction activities.

Vandalism

In the event that vandalism occurs that impacts the integrity of landfill closure facilities, mitigative actions, sequence of actions, and timetable to minimize potential hazards include the following:

- Inspection and evaluation of any damage incurred to the landfill cover and determination of the potential for hazardous conditions.
- Areas identified as potentially hazardous will be cordoned off.
- The LEA, RWQCB, and CalRecycle will be notified of the vandalism.
- Reconstruction requirements and construction scheduling will be evaluated and prepared for submittal to the LEA, RWQCB, and CalRecycle within 7 days.

- Repairs will be made in accordance with the Construction Quality Assurance Plan.
- The LEA, RWQCB, and CalRecycle will be notified as to completion of construction activities.

3.0 AVAILABLE EQUIPMENT

Standby equipment is available from the City of Ukiah Public Works Department on a priority basis.

4.0 EMERGENCY CONTACTS AND TELEPHONE NUMBERS

City of Ukiah Public Works Department:	(707) 463-6280

CalRecycle:	(916) 341-6360
LEA:	(707) 234-6625
Mendocino County Air Quality Management District:	(707) 463-4354

APPENDIX L

CLOSURE AND POSTCLOSURE MAINTENANCE COST ESTIMATES

CLOSURE

UKIAH LANDFILL FINAL CLOSURE CONSTRUCTION COST ESTIMATE

The objective is to determine the estimated total cost of closure activities at the Ukiah Landfill. Costs are based on the plans prepared by EBA Engineering titled: Construction Drawings for City of Ukiah Landfill Final Closure Construction. Individual cost items were determined as bid items for the construction contract and include:

- Miscellaneous items for mobilization, removal, adjustments, and demolition;
- Final cover items;
- Drainage system items;
- Access road items;
- Landfill gas extraction system items;
- Landfill leachate collection system items; and
- Revegetation.

In addition, costs are provided for design support engineering services during construction and construction quality assurance during construction that includes inspections, testing, and reporting.

References used to estimate construction costs included the following:

- Contractor bids and contracts for previous landfill closure projects that have recently been completed, adjusted for inflation. These previously completed landfill closure projects were all subject to the prevailing wage requirements.

- Manufacturers and suppliers/installers information for specialized items such as the Engineered Turf product for material and installation costs.

- General Prevailing Wage Determination Made by the Director of Industrial Relations Pursuant to California Labor Code Part 7, Chapter 1, Article 2, Section 1770, 1773, and 1773.1, current edition.

- Labor Surcharge and Equipment Rental Rates, State of California Business, Transportation, and Housing Agency, Department of Transportation Division of Construction, Effective April 1, 2019 through March 31, 2020.

- Discussions with local contractors and suppliers for actual material and installation costs.

The following tables present a summary of the final closure costs, a breakdown of individual cost items (bid items) including reference footnotes for each cost item, a breakdown of the inspection, testing, reporting, and design support engineering costs during construction (CQA), and the applicable Prevailing Wage and Labor Surcharge and Equipment Rental Rate tables. For those cost items where previous contractor costs were not available or not applicable, unit costs were determined by estimating the production rate, labor, and equipment that would be needed and applying the prevailing wage rates and the labor surcharge and equipment rental rates referenced above. The worksheets for these items are included.

FINAL CLOSURE COST ESTIMATE WORKSHEET
CITY OF UKIAH LANDFILL

PROJECT DESCRIPTION

The information presented herein provides an itemized breakdown of costs to implement the final closure construction activities summarized in the Construction Drawings for the Final Closure of the City of Ukiah Landfill

PREPARED BY:	EBA ENGINEERING		
GENERAL SITE INFORMATION			
Name of Solid Waste Landfill:	City of Ukiah Landfill		
Solid Waste Facilities Permit No.:	23-AA-0019		
Facility Operator:	City of Ukiah, Department of Public Works		
Site Owner:	City of Ukiah, Department of Public Works		
Site Location (CA coordinates, township & range or longitude/latitude, preferred)	SE 1/4, Section 10 Township 15 North, Range 12 West		
Assessors Parcel Number:	178-130-010		
Site Address :	3100 Vichy Springs Road Ukiah, CA		

FINAL CLOSURE COSTS

1. Final Closure Costs			
a. Miscellaneous - Mobilization, Removal, Adjustment, Demolition	$	137,676	See Cost Estimate Worksheet - Item 1-13
b. Final Cover	$	6,871,169	See Cost Estimate Worksheet - Items 14-20, 37-44, 46 and 52
c. Drainage Facilities	$	656,766	See Cost Estimate Worksheet - Items 23-36
d. Access Roads	$	233,360	See Cost Estimate Worksheet - Items 21 and 22
e. Landfill Gas Extraction System	$	620,168	See Cost Estimate Worksheet - Items 47-51 and 53-77
f. Landfill Leachate Collection System Modifications	$	55,954	See Cost Estimate Worksheet - Items 78-82
g. Revegetation	$	26,435	See Cost Estimate Worksheet - Item 45
h. Signage	$	1,680	See Cost Estimate Worksheet -Item 83
Contractor Bid Subtotal	$	8,603,207	
2. Design Support Engineering	$	18,600	
3. Construction Quality Assurance for Closure Construction	$	534,740	
4. Landfill Structure Removal	$	-	Included in Above
5. Groundwater Monitoring Installations	$	-	None
6. Security	$	-	Included in Above
Final Closure Subtotal	$	9,156,547	
Final Closure Subtotal 20% Contingency	$	1,831,309	
TOTAL FINAL CLOSURE	$	10,987,856

ITEM #4 - REMOVE EXISTING CMP AND HDPE DOWNDRAINS AND DRAIN OUTLETS

ESTIMATED DURATION					
Item	Quantity	Units	Production Rate		Days
Removal of downdrains and inlets	LS	days			1
Item Duration:					1

NOTES:
1. Production rate based on an estimate of 1 day for removal of existing downdrains and drain inlets

LABOR COSTS					
Personnel	Number	Wage Rate	Units	Quantity	Subtotal
Laborer	2	$ 77.03	/hr.	10	$ 1,541
Backhoe operator	1	$ 107.70	/hr.	10	$ 1,077
Dump truck operator	1	$ 77.03	/hr.	10	$ 770
Labor Total:					$ 3,388

EQUIPMENT COSTS					
Item	Number	Rate per Unit	Units	Quantity	Subtotal
Backhoe	1	$ 45.85	/hr.	10	$ 459
Pickup truck	1	$ 30.07	/hr.	10	$ 301
Dump truck	1	$ 100.38	/hr.	10	$ 1,004
Equipment Total:					$ 1,763

MATERIALS					
Item	Number	Rate per Unit	Units	Quantity	Subtotal
					$ -
					$ -
Materials Total:					$ -

Total Lump Sum Cost for Labor, Equipment, and Materials: $ 5,151

ITEM #5 - REMOVE EXISTING LEACHATE PIPING

ESTIMATED DURATION					
Item	Quantity	Units	Production Rate		Days
Removal of existing leachate piping	LS	days			0.5
Item Duration:					0.5

NOTES:
1. Production rate based on an estimate of 0.5 day for removal of existing downdrains and drain inlets

LABOR COSTS					
Personnel	Number	Wage Rate	Units	Quantity	Subtotal
Laborer	2	$ 77.03	/hr.	5	$ 770
Backhoe operator	1	$ 107.70	/hr.	5	$ 539
Dump truck operator	1	$ 77.03	/hr.	5	$ 385
Labor Total:					$ 1,694

EQUIPMENT COSTS					
Item	Number	Rate per Unit	Units	Quantity	Subtotal
Backhoe	1	$ 45.85	/hr.	5	$ 229
Pickup truck	1	$ 30.07	/hr.	5	$ 150
Dump truck	1	$ 100.38	/hr.	5	$ 502
Equipment Total:					$ 882

MATERIALS					
Item	Number	Rate per Unit	Units	Quantity	Subtotal
					$ -
					$ -
Materials Total:					$ -

Total Lump Sum Cost for Labor, Equipment, and Materials: $ 2,575

ITEM #6 - ADJUST EXISTING LEACHATE MANHOLES TO GRADE

ESTIMATED DURATION					
Item	Quantity	Units	Production Rate		Days
Adjust existing leachate manholes	5	ea	3	/day	1.7
Item Duration:					1.7

NOTES:
1. Production rate based on an estimate of 3 manhole adjustments per day

LABOR COSTS					
Personnel	Number	Wage Rate	Units	Quantity	Subtotal
Laborer	2	$ 77.03	/hr.	17	$ 2,568
Backhoe operator	1	$ 107.70	/hr.	17	$ 1,795
Labor Total:					$ 4,363

EQUIPMENT COSTS					
Item	Number	Rate per Unit	Units	Quantity	Subtotal
Backhoe	1	$ 45.85	/hr.	17	$ 764
Pickup truck	1	$ 30.07	/hr.	17	$ 501
			/hr.	17	$ -
Equipment Total:					$ 1,265

MATERIALS					
Item	Number	Rate per Unit	Units	Quantity	Subtotal
					$ -
					$ -
Materials Total:					$ -

Total for Labor, Equipment, and Materials:	$	5,628
Quantity of Unit Item		5
Unit Cost:	$	1,130

ITEM #13 - STRUCTURE DEMOLITION

ESTIMATED DURATION					
Item	Quantity	Units	Production Rate		Days
Removal of structures	LS	days			1
Item Duration:					1

NOTES:
1. Production rate based on an estimate of 1 day for removal of existing structure.

LABOR COSTS					
Personnel	Number	Wage Rate	Units	Quantity	Subtotal
Laborer	2	$ 77.03	/hr.	10	$ 1,541
Backhoe operator	1	$ 107.70	/hr.	10	$ 1,077
Dump truck operator	1	$ 77.03	/hr.	10	$ 770
Labor Total:					$ 3,388

EQUIPMENT COSTS					
Item	Number	Rate per Unit	Units	Quantity	Subtotal
Backhoe	1	$ 45.85	/hr.	10	$ 459
Pickup truck	1	$ 30.07	/hr.	10	$ 301
Dump truck	1	$ 100.38	/hr.	10	$ 1,004
Equipment Total:					$ 1,763

MATERIALS					
Item	Number	Rate per Unit	Units	Quantity	Subtotal
					$ -
					$ -
Materials Total:					$ -

Total Lump Sum Cost for Labor, Equipment, and Materials: $ 5,151

ITEM #67 - BURIED HEADER CROSSING

ESTIMATED DURATION					
Item	Quantity	Units	Production Rate		Days
Construction of buried header crossings	2	ea	2	/day	1
Item Duration:					1

NOTES:
1. Production rate based on an estimate of 2 buried header crossing constructions per day

LABOR COSTS					
Personnel	Number	Wage Rate	Units	Quantity	Subtotal
Laborer	2	$ 77.03	/hr.	8	$ 1,232
Backhoe operator	1	$ 107.70	/hr.	8	$ 862
Labor Total:					$ 2,094

EQUIPMENT COSTS					
Item	Number	Rate per Unit	Units	Quantity	Subtotal
Backhoe	1	$ 45.85	/hr.	8	$ 367
Equipment Total:					$ 367

MATERIALS					
Item	Number	Rate per Unit	Units	Quantity	Subtotal
Pipe Bedding	2	$ 17.25	/ton	1	$ 34.50
Materials Total:					$ 34.50

Total for Labor, Equipment, and Materials:	$ 2,495
Quantity of Unit Item	2
Unit Cost:	$ 1,250

ITEM #68 - ROAD CROSSING - TYPE 1

ESTIMATED DURATION					
Item	Quantity	Units	Production Rate		Days
Construction of Type 1 road crossings	10	ea	1	/day	10
Item Duration:					10

NOTES:

1. Production rate based on an estimate of 1 Type 1 road crossing constructions per day

LABOR COSTS					
Personnel	Number	Wage Rate	Units	Quantity	Subtotal
Laborer	2	$ 77.03	/hr.	80	$ 12,325
Backhoe operator	1	$ 107.70	/hr.	80	$ 8,616
Labor Total:					$ 20,941

EQUIPMENT COSTS					
Item	Number	Rate per Unit	Units	Quantity	Subtotal
Backhoe	1	$ 45.85	/hr.	80	$ 3,668
Hand Guided Compactor	1	$ 10.84	/hr.	80	$ 867
Equipment Total:					$ 4,535

MATERIALS					
Item	Number	Rate per Unit	Units	Quantity	Subtotal
10" Steel Pipe Protective Sleeve	10	$ 85.10	/LF	20	$ 17,020.00
12 HDPE Corrugated Pipe	10	$ 26.45	/LF	40	$ 10,580.00
Aggregate Base	10	$ 1.37	/SF	540	$ 7,398.00
Materials Total:					$ 34,998.00

Total for Labor, Equipment, and Materials:	$ 60,474
Quantity of Unit Item	10
Unit Cost:	$ 6,050

ITEM #69 - ROAD CROSSING - TYPE 2

ESTIMATED DURATION					
Item	Quantity	Units	Production Rate		Days
Construction of Type 2 road crossing	1	ea	1	/day	1
Item Duration:					1

NOTES:

1. Production rate based on an estimate of 1 Type 2 road crossing construction per day

LABOR COSTS					
Personnel	Number	Wage Rate	Units	Quantity	Subtotal
Laborer	2	$ 77.03	/hr.	8	$ 1,232
Backhoe operator	1	$ 107.70	/hr.	8	$ 862
Labor Total:					$ 2,094

EQUIPMENT COSTS					
Item	Number	Rate per Unit	Units	Quantity	Subtotal
Backhoe	1	$ 45.85	/hr.	8	$ 367
Hand Guided Compactor	1	$ 10.84	/hr.	8	$ 87
Equipment Total:					$ 454

MATERIALS					
Item	Number	Rate per Unit	Units	Quantity	Subtotal
12" RCP Protective Sleeve	1	$ 20.70	/LF	50	$ 1,035.00
Aggregate Base	1	$ 1.37	/SF	600	$ 822.00
Materials Total:					$ 1,857.00

Total for Labor, Equipment, and Materials:	$ 4,405
Quantity of Unit Item	1
Unit Cost:	$ 4,405

ITEM #70 - ROAD CROSSING - TYPE 3

ESTIMATED DURATION					
Item	Quantity	Units	Production Rate		Days
Construction of Type 3 road crossing	1	ea	0.67	/day	1.5
Item Duration:					1

NOTES:

1. Production rate based on an estimate of 0.67 Type 3 road crossing construction per day

LABOR COSTS					
Personnel	Number	Wage Rate	Units	Quantity	Subtotal
Laborer	2	$ 77.03	/hr.	12	$ 1,840
Backhoe operator	1	$ 107.70	/hr.	12	$ 1,286
Labor Total:					$ 3,125

EQUIPMENT COSTS					
Item	Number	Rate per Unit	Units	Quantity	Subtotal
Backhoe	1	$ 45.85	/hr.	12	$ 547
Hand Guided Compactor	1	$ 10.84	/hr.	8	$ 87
Equipment Total:					$ 634

MATERIALS					
Item	Number	Rate per Unit	Units	Quantity	Subtotal
10" Steel Pipe Protective Sleeve	1	$ 85.10	/LF	20	$ 1,702.00
12 HDPE Corrugated Pipe	1	$ 26.45	/LF	40	$ 1,058.00
Aggregate Base	1	$ 1.37	/SF	540	$ 739.80
Materials Total:					$ 3,499.80

Total for Labor, Equipment, and Materials:	$	7,260
Quantity of Unit Item		1
Unit Cost:	$	7,260

ITEM #74 - FLARE STATION ASSEMBLY

ESTIMATED DURATION					
Item	Quantity	Units	Production Rate		Days
Flare station assembly	LS	days			5
Item Duration:					5

NOTES:
1. Production rate based on an estimate of 5 days to assembly flare station

LABOR COSTS					
Personnel	Number	Wage Rate	Units	Quantity	Subtotal
Laborer	2	$ 77.03	/hr.	50	$ 7,703
Crain Operator	1	$ 107.70	/hr.	8	$ 862
Foreman	1	$ 100.80	/hr.	8	$ 806
Labor Total:					$ 9,371

EQUIPMENT COSTS					
Item	Number	Rate per Unit	Units	Quantity	Subtotal
Crain	1	$ 116.35	/hr.	8	$ 931
Pickup truck	1	$ 30.07	/hr.	50	$ 1,504
			/hr.	50	$ -
Equipment Total:					$ 2,434

MATERIALS					
Item	Number	Rate per Unit	Units	Quantity	Subtotal
					$ -
					$ -
Materials Total:					$ -

Total Lump Sum Cost for Labor, Equipment, and Materials: $ 11,805

POSTCLOSURE MAINTENANCE

FINAL POSTCLOSURE MAINTENANCE COST ESTIMATE WORKSHEET
CITY OF UKIAH LANDFILL

PROJECT DESCRIPTION

The information presented herein provides an itemized breakdown of costs to implement postclosure maintenance activities for the City of Ukiah Landfill during the 30-year postclosure maintenance period.

PREPAREAD BY: EBA ENGINEERING

GENERAL SITE INFORMATION

Name of Solid Waste Landfill: City of Ukiah Landfill

Solid Waste Facilities Permit Number: 23-AA-0019

Facility Operator: City of Ukiah, Department of Public Works

Site Owner: City of Ukiah, Department of Public Works

Site Location (CA coordinates, township & range or longitude/latitude, preferred): SE 1/4, Section 10 Township 15 North, Range 12 West

Assessors Parcel Number: 178-130-010

Site Address: 3100 Vichy Springs Road
Ukiah, CA

FINAL POSTCLOSURE MAINTENANCE COSTS

1. Revegetation		
a. Regrading / Erosion Control / Reseeding	$	2,795
2. Leachate Management		
a. Leachate System Maintenance	$	2,750
b. Leachate/Condensate Disposal	$	822
c. Leachate Monitoring and Reporting	$	2,596
d. Leachate 5-year Constituents of Concern Testing (normalized to cost per year)	$	435
3. Environmental Monitoring		
a. LFG Collection System Operation, Monitoring and Maintenance	$	39,033
b. Annual Source Testing of Flare	$	4,459
c. AB32 Surface Emissions Monitoring and Reporting	$	13,657
d. Perimeter LFG Monitoring and Reporting	$	5,932
e. Perimeter Monitoring Probe Replacement (normalized to cost per year)	$	4,163
f. Perimeter Monitoring Probe Maintenance	$	465
g. Groundwater Monitoring and Reporting	$	47,306
h. Groundwater 5-year Constituents of Concern Testing (normalized to cost per year)	$	4,081

3. Environmental Monitoring *(continued)*		
i. Monitoring Well Replacement (normalized to cost per year)	$	6,744
j. Monitoring Well Maintenance	$	570
k. Surface Water Monitoring and Reporting	$	1,803
l. Surface Water 5-year Constituents of Concern Testing (normalized to cost per year)	$	484
4. Drainage Maintenance	$	3,034
5. Security	$	1,462
6. Inspection	$	3,884
7. Other		
a. ClosureTurf - Sand Ballast Infill Maintenance	$	2,393
b. 5-year Iso-Settlement Analysis (normalized to cost per year)	$	4,151
c. Geomembrane Replacement (normalized to cost per year)	$	86,715
Final Postclosure Maintenance Subtotal	$	239,731
Subtotal x 30 years Postclosure Care	**$**	**7,191,931**

LEACHATE MONITORING & MAINTENANCE
CITY OF UKIAH LANDFILL
UKIAH, CALIFORNIA

LEACHATE MAINTENANCE AND MONITORING

LEACHATE SYSTEM MAINTENANCE

Description	Unit Rate		Quantity	Extended Cost	Source / Assumptions
Annual Maintenance	$ 2,750.00	LS	1.00	$ 2,750.00	Assumed.
			Extended Total:	*$ 2,750.00*	

LEACHATE DISPOSAL

Description	Unit Rate		Quantity	Extended Cost	Source / Assumptions
Leachate Disposal (per day)	$ 0.0044	/gal.	300	$ 1.32	
			Subtotal (per day):	$ 1.32	
			Extended Subtotal (per year):	$ 481.80	
Sr. Hydrogeologist - Mgmt	$ 170.00	/hr.	2.00	$ 340.00	Engineering consultant wage rate.
			Extended Total:	*$ 821.80*	

SEMI-ANNUAL LEACHATE LEVEL MONITORING

Description	Unit Rate		Quantity	Extended Cost	Source / Assumptions
Field Technician - Sampling	$ 105.00	/hr.	0.50	$ 52.50	Engineering consultant wage rate.
Mileage (1 Round Trip)	$ 0.58	/mi.	0.00	$ -	Included under GW monitoring.
Water Level Meter	$ 33.00	/day	0.00	$ -	Included under GW monitoring.
			Subtotal:	$ 52.50	
			Extended Total (2 Events):	*$ 105.00*	

QUARTERLY LEACHATE MONITORING

Description	Unit Rate		Quantity	Extended Cost	Source / Assumptions
Field Technician - Sampling	$ 105.00	/hr.	0.50	$ 52.50	Engineering consultant wage rate.
Mileage (1 Round Trip)	$ 0.58	/mi.	0.00	$ -	Included under GW monitoring.
Parameter Meter	$ 33.00	/day	0.00	$ -	Included under GW monitoring.
Materials - Disposable Bailer	$ 12.00	ea.	1.00	$ 12.00	Engineering consultant equipment/material rate.
Total Dissolved Solids	$ 15.00	ea.	1.00	$ 15.00	Lab Quote
Chloride	$ 18.00	ea.	1.00	$ 18.00	Lab Quote

QUARTERLY LEACHATE MONITORING *(Continued)*

Description	Unit Rate		Quantity	Extended Cost	Source / Assumptions
Sulfate	$ 18.00	ea.	1.00	$ 18.00	Lab Quote
Nitrate as N	$ 18.00	ea.	1.00	$ 18.00	Lab Quote
COD	$ 30.00	ea.	1.00	$ 30.00	Lab Quote
BOD	$ 33.00	ea.	1.00	$ 33.00	Lab Quote
Total Ammonia	$ 25.00	ea.	1.00	$ 25.00	Lab Quote
Total Alkalinity	$ 15.00	ea.	1.00	$ 15.00	Lab Quote
VOCs (8260)	$ 140.00	ea.	1.00	$ 140.00	Lab Quote
Total Purgeable/Extractable Petroleum Hydrocarbons	$ 100.00	ea.	1.00	$ 100.00	Lab Quote
QA/QC - Trip Blank for VOCs (8260)	$ 140.00	ea.	0.00	$ -	Included under GW monitoring.
Geotracker EDD File	10 Percent of Total Lab Cost			$ 41.20	
Project Manager - Mgmt	$ 105.00	/hr.	0.00	$ -	Included under GW monitoring.
			Subtotal:	$ 517.70	
			Extended Total (4 Events):	*$ 2,070.80*	

ANNUAL LEACHATE TESTING

Description	Unit Rate		Quantity	Extended Cost	Source / Assumptions
Inorganics	$ 370.00	ea.	1.00	$ 370.00	Lab Quote
Extractable Oil and Grease	$ 50.00	ea.	1.00	$ 50.00	Lab Quote
			Extended Total:	*$ 420.00*	

LEACHATE REPORTING

Description	Unit Rate		Quantity	Extended Cost	Source / Assumptions
Staff Geologist - Reporting	$ 105.00	/hr.	0.00	$ -	Included under GW monitoring.
Drafting	$ 100.00	/hr.	0.00	$ -	Included under GW monitoring.
Sr. Hydrogeologist (MD) - Mgmt & Review	$ 170.00	/hr.	0.00	$ -	Included under GW monitoring.
Clerical	$ 65.00	/hr.	0.00	$ -	Included under GW monitoring.
			Extended Total:	***$ -***	

5-YEAR CONSTITUENTS OF CONCERN TESTING

Description	Unit Rate		Quantity	Extended Cost	Source / Assumptions
SVOCs (8270)	$ 295.00	ea.	1.00	$ 295.00	Lab Quote
Organochlorine Pesticides + PCBs	$ 130.00	ea.	1.00	$ 130.00	Lab Quote
Organophosphorus Compounds	$ 190.00	ea.	1.00	$ 190.00	Lab Quote
Chlorophenoxy Herbicides	$ 175.00	ea.	1.00	$ 175.00	Lab Quote
			Testing Subtotal:	$ 790.00	

5-YEAR CONSTITUENTS OF CONCERN TESTING *(Continued)*

Description	Unit Rate		Quantity	Extended Cost	Source / Assumptions
Staff Geologist - Additional Report Prep / Mgmt	$ 105.00	/hr.	8.00	$ 840.00	Engineering consultant wage rate.
Sr. Hydrogeologist - Additional Report Review	$ 170.00	/hr.	3.00	$ 510.00	Engineering consultant wage rate.
Clerical - Additional Clerical	$ 65.00	/hr.	0.50	$ 32.50	Engineering consultant wage rate.
			Reporting Subtotal:	$ 1,382.50	
			Extended Subtotal:	$ 2,172.50	
Total 5-year COC Testing Costs:	$ 2,172.50	/ea.	6.00	$ 13,035.00	6 events during 30-year PM period.
			Normalized 5-year COC Testing Costs per Year:	*$ 434.50*	
TOTAL ANNUAL COST				***$ 6,602.10***	

LANDFILL GAS MONITORING
CITY OF UKIAH LANDFILL
UKIAH, CALIFORNIA

LFG COLLECTION SYSTEM

WELLHEAD MONITORING & SYSTEM MAINTENANCE

Description	Unit Rate		Quantity	Extended Cost	Source / Assumptions
Field Technician - Well Field Tuning	$ 105.00	/hr.	8.00	$ 840.00	Engineering consultant wage rate. Assumes once per month.
Mileage (1 Round Trip)	$ 0.58	/mi.	130.00	$ 75.40	Engineering consultant equipment/material rate.
Meter	$ 100.00	/day	1.00	$ 100.00	Engineering consultant equipment/material rate.
Field Technician - Data Entry/Management	$ 105.00	/hr.	1.00	$ 105.00	Engineering consultant wage rate.
Sr. Hydrogeologist - Mgmt	$ 170.00	/hr.	2.00	$ 340.00	Engineering consultant wage rate.
			Subtotal:	$ 1,460.40	
Annual Maintenance	$ 3,200.00	LS	1.00	$ 3,200.00	Assumed.
			Extended Total (12 Events):	*$ 20,724.80*	

UTILITIES

Description	Unit Rate		Hours	Extended Cost	Source / Assumptions
Electricity (assume 10 HP)	$ 0.22	/kw-hr.	8760.00	$ 18,308.40	Assumes unit power use of 9.5 kw
			Extended Total:	*$ 18,308.40*	

ANNUAL SOURCE TEST

Description	Unit Rate		Quantity	Extended Cost	Source / Assumptions
Source Testing - Contractor	$ 3,000.00	LS	1.00	$ 3,000.00	Contactor Quote
Hydraulic Personnel Lift (Boom Type - Code 50-74)	$ 413.76	LS	1.00	$ 413.76	Equipment Rental Rates - California Department of Transportation.
Field Technician - Well Field Support	$ 105.00	/hr.	6.00	$ 630.00	Engineering consultant wage rate.
Mileage (1 Round Trip)	$ 0.58	/mi.	130.00	$ 75.40	Engineering consultant equipment/material rate.
Sr. Hydrogeologist - Mgmt	$ 170.00	/hr.	2.00	$ 340.00	Engineering consultant wage rate.
			Extended Total:	*$ 4,459.16*	

AB32 SURFACE EMISSIONS MONITORING & REPORTING

FIELD MONITORING

Description	Unit Rate		Quantity	Extended Cost	Source / Assumptions
Staff Geologist - Field (Travel)	$ 105.00	/hr.	2.00	$ 210.00	Engineering consultant wage rate.
Staff Geologist - Field (Set-up Windlog)	$ 105.00	/hr.	1.00	$ 105.00	Engineering consultant wage rate.
Staff Geologist - Field (Emissions Monitoring)	$ 105.00	/hr.	8.00	$ 840.00	Engineering consultant wage rate.
Mileage (1 Round Trip)	$ 0.58	/mi.	130.00	$ 75.40	Engineering consultant equipment/material rate.
FID Rental + Shipping	$ 575.00	LS	1.00	$ 575.00	Contactor Quote

FIELD MONITORING *(Continued)*

Description	Unit Rate	Quantity	Extended Cost	Source / Assumptions
Windlog Rental	$ 100.00 /ev.	1.00	$ 100.00	Engineering consultant equipment/material rate.
Staff Geologist - Data Reduction	$ 105.00 /hr.	1.00	$ 105.00	Engineering consultant wage rate.
Staff Geologist - Mgmt	$ 105.00 /hr.	3.00	$ 315.00	Engineering consultant wage rate.
Sr. Hydrogeologist - Mgmt	$ 170.00 /hr.	3.00	$ 510.00	Engineering consultant wage rate.
Clerical	$ 65.00 /hr.	1.00	$ 65.00	Engineering consultant wage rate.
		Subtotal:	$ 2,900.40	
		Extended Total (4 Events):	*$ 11,601.60*	

ANNUAL REPORTING

Description	Unit Rate	Quantity	Extended Cost	Source / Assumptions
Staff Geologist - Reporting	$ 105.00 /hr.	12.00	$ 1,260.00	Engineering consultant wage rate.
Drafting	$ 100.00 /hr.	0.50	$ 50.00	Engineering consultant wage rate.
Sr. Hydrogeologist - Mgmt & Review	$ 170.00 /hr.	4.00	$ 680.00	Engineering consultant wage rate.
Clerical	$ 65.00 /hr.	1.00	$ 65.00	Engineering consultant wage rate.
		Extended Total:	*$ 2,055.00*	

QUARTERLY PERIMETER MONITORING & REPORTING

Description	Unit Rate	Quantity	Extended Cost	Source / Assumptions
Staff Geologist - Field Monitoring	$ 105.00 /hr.	6.00	$ 630.00	Engineering consultant wage rate.
RKI Eagle Meter	$ 100.00 /day	1.00	$ 100.00	Engineering consultant equipment/material rate.

CHAPTER 1.0 – INTRODUCTION AND PURPOSE

1.0 INTRODUCTION

1.1 CEQA Compliance

The City of Ukiah Department of Public Works Solid Waste Division is the lead agency under the California Environmental Quality Act (CEQA) for the proposed Ukiah Landfill Final Closure Plan (Project) located at 3100 Vichy Springs Road in Ukiah, California. The property is further identified by Mendocino County Assessor's Parcel Number 178-130-01. In accordance with Section 15070 through Section 15075, Negative Declaration Process, of the CEQA Guidelines, this Initial Study/Proposed Mitigated Negative Declaration (IS/PMND) has been prepared by the City of Ukiah. Section 15070 of the CEQA Guidelines states the following with respect to the preparation of a Mitigated Negative Declaration:

"A public agency shall prepare or have prepared a proposed negative declaration or mitigated negative declaration for a project subject to CEQA when:

(a) The initial study shows that there is no substantial evidence, in light of the whole record before the agency, that the project may have a significant effect on the environment, or

(b) The initial study identifies potentially significant effects, but:

(1) Revisions in the project plans or proposals made by, or agreed to by the applicant before a proposed mitigated negative declaration and initial study are released for public review would avoid the effects or mitigate the effects to a point where clearly no significant effect would occur, and

(2) There is no substantial evidence, in light of the whole record before the agency that the project as revised may have a significant effect on the environment.

As prescribed in Section 15070, an Initial Study has been prepared that analyzes the potential project-related impacts anticipated to occur as a result of implementing the Final Closure and Post Closure Maintenance Plan for the Ukiah Landfill as proposed by the City of Ukiah. Pursuant to Section 15071 of the CEQA Guidelines, the Initial Study/Proposed Mitigated Negative Declaration includes:

- A description of the proposed project (refer to Section 2.0);
- The location of the project (refer to Section 2.1);
- A list of the environmental factors potentially affected by project implementation (Refer to Section 3.0);
- A comprehensive analysis of each environmental topic included in the County's environmental checklist (refer to Chapter 4.0);
- A proposed finding that the project will not have a significant effect on the environment (refer to Section 5.1); and
- Mitigation measures (refer to Section 5.2).

1.2 Incorporation by Reference

As allowed under by Section 15150 of the State CEQA Guidelines, this initial study incorporates the Final Closure Plan for the Ukiah Landfill by reference. The closure plan and technical appendices were utilized during the preparation of the Initial Study. The relevant information and/or analysis that has been incorporated by reference into this initial study has been summarized. The Final Closure Plan is available for review at the City of Ukiah Department of Public Works located at 300 Seminary Avenue in Ukiah, California 95482.

1.3 Purpose

The Final Closure and Post Closure Maintenance Plan (Closure Plan) for the Ukiah Landfill was prepared for the City of Ukiah by EBA Engineering (EBA) for submittal to the California Department of Resources Recycling and Recovery (CalRecycle), the Mendocino County Department of Public Health Environmental Health Division acting as the Local Enforcement Agency (LEA), and the North Coast Regional Water Quality Control Board (NCRWQCB) for the final closure of the Ukiah Landfill. The City of Ukiah is the owner of the Ukiah Landfill.

The environmental document that follows is an Initial Study and Mitigated Negative Declaration (IS/MND) for the Ukiah Landfill Closure Plan project as proposed by the City of Ukiah. An initial study is a preliminary analysis that is completed as part of the project design and assessment to determine whether an environmental impact report or negative declaration must be prepared to assess potential environmental impacts in accordance with the California Environmental Quality Act (CEQA) and State CEQA Guidelines (Section 15000 *et seq*.). The initial study is intended to determine if the project may have a significant effect on the environment. A negative declaration is a written statement that briefly describes the reasons why a proposed project will not have a significant effect on the environment and, therefore, does not require the preparation of an EIR.

As indicated above, the City of Ukiah is proposing to implement the final closure of the Ukiah Landfill, which will be implemented upon the adoption of this document by the City of Ukiah City Council. This study has been prepared in accordance with the CEQA, Public Resources Code 21000 *et seq*., and the State CEQA Guidelines, California Code of Regulations, Section 15000 *et seq*. This document provides a description of the project setting and characteristics and includes an environmental evaluation and checklist that identifies the potential environmental impacts associated with implementation of the Closure Plan and includes a discussion of the checklist responses and findings.

1.4 Determination of No Significant Impacts

This Initial Study/Mitigated Negative Declaration has been prepared pursuant to Section 15070 through Section 15075 of the CEQA Guidelines as prescribed in Section 1.1, above. As indicated in Chapter 5.0 of the document, no significant impacts will occur as a result of project implementation with the incorporation of appropriate mitigation measures and conditions of approval that will be incorporated into the project design. The City of Ukiah City Council and, if necessary, other responsible agencies identified in the Initial Study will consider the information contained in this document prior to making a final decision on the proposed Final Closure Plan.

CHAPTER 2.0 – PROJECT DESCRIPTION

2.0 PROJECT DESCRIPTION

2.1 Project Location

The Ukiah Landfill is located approximately three miles east of the City of Ukiah within the unincorporated area of Mendocino County. The landfill is part of a 283.5 acre parcel of land and has a physical address of 3100 Vichy Springs Road, Ukiah, California in the southeast ¼ of Section 10, Township 15 north, Range 12 west, Mount Diablo Base and Meridian. The property is further identified by Mendocino County Assessor's Parcel Number 178-130-01.

2.2 Environmental Setting

The Ukiah Landfill is located at 3100 Vichy Springs Road, approximately three miles east of Ukiah in Mendocino County, California. The property is identified as Mendocino County Assessor's Parcel number 178-130-01. The landfill occupies approximately 40 acres of permitted landfill area on a 283.5-acre parcel having a maximum width of approximately 1,000 feet in the north-south direction and a maximum length of about 3,500 feet in the east-west direction. Existing ground surface elevations at the landfill range from approximately 710 feet above mean sea level (MSL) near the western footprint, to about 970 feet MSL along the southeast footprint. The landfill has been graded to form a series of flat terraces stepping down from south to north. The landfill surface is covered with seasonal grasses. A City-owned shooting range is situated on the Landfill property approximately 2,000 feet northeast of the waste management unit footprint. Zoning for the project site is designated as Public Facilities by the Mendocino County General Plan.

Land adjacent to the landfill property is zoned primarily as rangeland and is used for grazing. Dwellings within 1,000 feet of the landfill property include a group of structures owned by the Vichy Springs Investment Group that are located within 500 feet of the landfill's south property line and a single-family residence located approximately 900 feet west of the landfill's western property boundary. A rural residential development is located approximately one-quarter mile west of the landfill property boundary. A housing development is also located along the south side of Vichy Springs Road and westward of the Vichy Springs Resort. The entire development is approximately 1,000 feet southward of the landfill property boundary and is separated from the Landfill by an intervening ridge.

It should be noted that the City owns an approximate 97-acre parcel (Assessor's Parcel No. 178-210-01) that adjoins a portion of the landfill's southern property boundary. This property, which has been previously identified as the "Gun Club Parcel", was purchased as a buffer zone to limit future development adjacent to the Landfill. The Gun Club Parcel is a separate parcel and is not considered part of the landfill property.

The Ukiah Landfill is located in the foothills along the eastern margin of Ukiah Valley, which is a fault-bound, structural basin in the Northern Coast Range Geologic province. Virtually the entire northern portion of the Coast Range Geologic province east of the San Andreas Fault is underlain by Franciscan assemblage bedrock. The landfill site is located near the boundary of the Coastal and Central belts of the Franciscan assemblage. The Central belt is largely composed of a tectonic melange composed of numerous large, discontinuous bodies of graywacke sandstone, metagraywacke, greenstone, chert, and serpentinite in a highly sheared and deformed shale matrix.

During Miocene time (approximately 23 million years before present; m.y.b.p) a relatively large elongate basin began subsiding in the vicinity of Ukiah, in response to extensional stresses associated with translational displacement along the north-northwest trending Maacama Fault, and less obvious sub-parallel strike-slip faults to the west. Erosion of the surrounding Franciscan basement, and continued basin subsidence throughout Pliocene-Pleistocene time (from ~5 m.y.b.p. to 10,000 years ago), has resulted in the accumulation

of a thick section of alluvial, fluvial and lacustrine deposits. The alluvial and fluvial deposits are represented by lenticular bodies of orange-brown to brown clayey and silty sands and gravels. Alternatively, the lucustrine deposits are represented by thick blue-gray claystone and siltstone units with occasional sand and gravel lenses. The maximum thickness of the continental basin deposits is estimated to be in excess of 2,000 feet (Cardwell, 1965).

Other geologic units in the Ukiah area include older Pleistocene continental terrace deposits, younger Pleistocene continental terrace deposits, and Holocene alluvium. The older Pleistocene continental terrace deposits consist of heavily dissected, partially consolidated or cemented, lenticular beds of gravel, sand, silt, and clay. These deposits are lithologically similar to the underlying continental basin deposits; however, the terrace deposits generally contain less silt and clay-sized material. The older continental terraces are typically found at higher elevations along the margins of the Ukiah basin. The younger terrace deposits consist of similar materials. However, they are typically present at lower elevations, and are less consolidated, less cemented, and less dissected than the older terrace deposits. The Holocene alluvial deposits consist of unconsolidated sand, gravel, silt, and clay units that were deposited along active stream channels and flood plains during the last 10,000 years. The alluvial deposits are present in all major valleys and many of the minor stream courses.

A regional seismicity and faulting study was conducted to develop estimates of Holocene fault potential at the site and maximum probable earthquakes which could affect the project site. The nearest known Holocene faults are those associated with the Maacama fault zone, located approximately 1 kilometer west of the project site. There are no known Holocene faults within the site boundaries.

Groundwater conditions at the project site is well defined and has been monitored for many years pursuant to regulatory requirements in accordance with Monitoring and Reporting Order No. R1-2002-0061. Currently there are 18 groundwater monitoring wells that are used to perform compliance monitoring in both the alluvial deposits and the continental basin deposits.

Groundwater elevation data was used to evaluate groundwater flow direction and gradient conditions within the respective water-bearing zones. Since the Quaternary alluvial deposits are confined to the unnamed ephemeral creek's depositional channel, the direction of groundwater flow within these deposits generally coincides with the axis of the creek. This translates to an overall westerly groundwater flow component with a hydraulic gradient of approximately 0.03 feet/foot.

Groundwater flow conditions within the Plio-Pleistocene continental basin deposits exhibit converging groundwater flow components on either side of the unnamed ephemeral creek. In general, a northwesterly groundwater flow component predominates on the south side of the creek (i.e., beneath the landfill), whereas a south-southwesterly groundwater flow component is present north of the creek. These flow components appear to converge in proximity of the creek, whereupon groundwater flows westerly down the axis of the canyon. These potentiometric surface conditions generally mimic the topography, which is fairly typical in mountainous terrain. The hydraulic gradient along the flanks of the creek ranges from approximately 0.1 feet/foot on the north flank to approximately 0.04 to 0.06 feet/foot on the south flank, whereas the gradient along the axis of the creek is approximately 0.02 feet/foot.

2.3 Background and History

Waste disposal operations at the Landfill began in 1955 at the eastern end of the landfill footprint and progressed upslope and westward. During the 1970's, the unnamed ephemeral creek was realigned northward to maximize the available fill area, and a soil berm was constructed along the toe of the landfill to separate the waste from the realigned creek channel. The method of operation during the Landfill's development was a fill and cover approach in a canyon/gully terrain. The Landfill operated as a nonhazardous Class III solid waste disposal site servicing the City of Ukiah and the surrounding area. The types of waste

received included garbage, rubbish, demolition and construction waste, brush, stumps, large appliances diverted as scrap metal and street refuse. The Landfill ceased operations in September 2001.

Environmental monitoring at the Landfill was originally regulated under Order 75-43 in conformance with Title 23 of the California Code of Regulations (23 CCR). In September 1993, Order 75-43 was amended by Order 93-83 as a mechanism to implement State Water Resources Control Board Resolution No. 93-62 and federal municipal solid waste regulations (i.e., "Subtitle D") per Title 40 of the Code of Federal Regulations (40 CFR), Parts 257 and 258. Concurrent with this amendment was the preparation of a Report of Waste Discharge for the purpose of formally updating the Landfill's WDRs and to address groundwater impacts previously identified at the site. The combination of these two documents was subsequently used by the NCRWQCB to issue new WDRs (Order 94-123) for the site in October 1994.

In the Fall of 1995, an Engineering Feasibility Study (EFS) was conducted by Dames & Moore to evaluate corrective action alternatives for the mitigation of groundwater impacts and to assess potential leachate management options. Findings from the EFS included recommendations to upgrade the groundwater monitoring network, performance of a health-based risk assessment, and modification of the leachate collection/management facilities. The monitoring system upgrades and health-based risk assessment were subsequently completed in the Fall of 1996. Modifications to the leachate collection/management facilities, which included the diversion of collected leachate to an aboveground storage tank and pumping to the City's sewer piping system via a combination force main/gravity drain, were also completed in the Fall of 1996.

Following completion of the respective corrective action measures, the site was monitored on a quarterly basis in accordance with Order 94-123. On June 27, 2002, the NCRWQCB adopted the current WDRs (Order R1-2002-0061) for the site to address interim closure, corrective action needs, and submittal of plans to complete cap construction in accordance with 27 CCR. Order R1-2002-0061 is the currently monitoring document for the project site.

2.4 Existing Environmental Control Systems

Landfill Gas Collection and Monitoring

Landfill Gas Control

The Landfill currently includes a partial perimeter LFG collection system that was installed between the southwestern edge of the Landfill and the property line. In general, the system consists of 17 vertical extraction points installed in native geologic materials and completed at depths ranging from 35 to 133 feet below ground surface. The extraction points are connected to a buried 6-inch diameter, high-density polyethylene (HDPE) header pipe that leads to a vacuum blower located at the western end of the Landfill. The vacuum blower creates a vacuum in the header pipe that draws the LFG from the soil through the extraction points and header pipe, whereupon the collected LFG (diluted) is vented to the atmosphere via a 4-foot tall, 4-inch diameter stack. The system works on the premise that the extraction well field creates a barrier against migration while simultaneously mixing the collected LFG with "clean" soil pore gas that dilutes the LFG to concentrations that can be discharged directly to the atmosphere.

As part of final closure, a LFG extraction, collection, and control system will be installed that will replace the partial perimeter collection system. The design for the system has been developed to meet the requirements of 17 CCR, §95464(b). The design flow rate for the system has been established at 35 to 210 SCFM (at 50 percent methane). This range covers the highest anticipated LFG recovery rate based on the most conservative generation model (180 SCFM), as well as some excess to allow for extraction from the final cover system's gas relief layer. In addition, the design range can accommodate lower flows to account for future operations as the generation rate continues to decreases over time. Overall, the LFG extraction, collection, and control system will consist of a series of perimeter and interior LFG extraction wells, associated above ground collection system piping, condensate collection provisions, and a flare station for destruction of the LFG.

LFG Monitoring

There is currently ten (10) LFG monitoring points (GAS-1 through GAS-10) located at various locations along the landfill property boundary. These points are used to monitor methane concentrations at the property boundary as required by 27CCR, §20921. The regulatory compliance level for methane along the landfill property boundary is 5 percent by volume.

Each of the LFG monitoring points are equipped with one to four individual monitoring probes constructed of ¾-inch diameter polyvinyl chloride (PVC) casing and capped with labcock valves. The monitoring probes range in depth from approximately 9 to 250 feet BGS. The number and depth of monitoring probes at each location are based on site lithology (i.e., permeable zones) and the maximum depth of refuse as measured within 1,000 feet of the monitoring point in question. The scope of monitoring at each probe included measuring static pressure and methane concentration

Landfill Leachate Control

The Landfill is unlined and is not equipped with an engineered or traditional blanket leachate collection and removal system (LCRS). Instead, leachate collection at the Landfill consists of a series of polyvinyl chloride (PVC) piping and French drain systems installed to collect leachate from seeps occurring along the completed slope faces. Leachate collected by these components is then conveyed by gravity flow to a primary buried pipeline located along the northern toe of the Landfill. The buried pipeline, in turn, drains the leachate westward and ultimately discharges to the leachate management facilities located at the western toe of the Landfill. A description of the leachate management facilities is as follows:

- Discharge from the primary buried pipeline is diverted to a subsurface concrete sedimentation chamber equipped with a valved sediment drain at its base. The clarified leachate within the chamber is then discharged (by gravity flow) to an adjacent pump station wet well (identified herein as the "leachate wet well") via a 10-inch diameter overflow line.

- Clarified leachate discharged to the leachate wet well is then pumped to a leachate storage tank for temporary storage. The leachate wet well is equipped with two (2) 25-gallon per minute (gpm), low-head, submersible pumps that are actuated by high/low water level controls. If the clarified leachate discharge rate exceeds the leachate wet well's pumping capacity (50 gpm), the excess leachate will be diverted to an underground storage tank to be installed as part of final closure.

- As noted above, leachate from the leachate wet well is diverted to the leachate storage tank for temporary storage. The leachate storage tank has a 63,500-gallon volumetric capacity and is constructed of AWWA factory epoxy lined and coated bolted steel. As was the case for the leachate wet well, the leachate storage tank is also equipped with a 10-inch diameter overflow line that will divert leachate to the underground storage in the case of an emergency.

- Leachate stored in the leachate storage tank is subsequently pumped to a sewer line connection located on Vichy Springs Road via a force main/gravity drain. The force main/gravity drain is constructed of 4-inch diameter PVC and is approximately 5,200 feet in length. The pump lift station for the leachate storage tank is equipped with two (2) 45-gpm pumps (one duty, one standby), thereby giving the system a total pumping capacity of 90 gpm.

Groundwater Monitoring Network

The existing groundwater monitoring network consists of 18 groundwater monitoring wells primarily concentrated along the northern and western margins of the Landfill. Groundwater monitoring well 87-1 was installed in 1987 and was subsequently used as part of the Water Quality Solid Waste Assessment Test (SWAT) conducted at the Landfill during the late 1980's. The remaining groundwater monitoring wells were installed over the period of 1990 through 1996 as a mechanism to characterize groundwater impacts at the site and to upgrade the Landfill's detection monitoring network. In accordance with the criteria specified in

Section D(3)(b) of M&RP R1-2002-0061, the respective groundwater monitoring wells have the following use designation:

- *Detection Monitoring Wells*:

  87-1, 90-1, 90-2, 90-5, 90-6, 90-7, 90-8, 92-2, 92-3, 94-1, 94-2, 96-1, 96-2 and 96-3

- *Corrective Action Monitoring Wells*:

  90-3, 90-4, 92-1 and 92-4

- *Points of Compliance Wells*:

  87-1, 90-2, 90-3, 90-4, 90-5, 90-7 and 90-8

The two (2) primary water-bearing formation deposits underlying the site correspond to Quaternary alluvial deposits and Plio-Pleistocene upper/lower continental basin deposits. Groundwater monitoring wells completed within the Quaternary alluvial deposits include 87-1, 90-1, 90-3, 90-4, 92-1 and 94-1. These groundwater monitoring wells range in depth from approximately 12 to 35 feet BGS. The remaining groundwater monitoring wells are completed in the Plio-Pleistocene upper or lower continental basin deposits and range in depth from approximately 23 to 160 feet BGS.

Stormwater Monitoring and Reporting

The City of Ukiah conducts monitoring and reporting for storm water discharges in accordance with the General Industrial Permit that is administered by the State Water Resources Control Board. Stormwater sampling is performed at the two surface water discharge locations as noted above during the first significant storm and at the end of the rainy season in accordance with the permit requirements.

2.5 Project Characteristics/Description

Closure of the Ukiah Landfill will be performed in accordance with the applicable regulatory standards. The components and systems required for closure of the landfill include the final cover and grading design to control stormwater, potential infiltration and accommodate future settlement, landfill slope stability, construction quality assurance, drainage and erosion control systems, LFG control and monitoring systems, groundwater/surface water monitoring systems, and site security. A description of each of these closure components proposed is presented below.

Final Cover Design

As outlined in 27 CCR, §20950, the primary performance goal for final closure is to minimize the infiltration of water into the waste, thereby minimizing the production of leachate and LFG. The proposed final cover design for the Landfill areas will consist of the following layers, from top to bottom:

- Synthetic erosion-resistant layer;
- A structured geomembrane low hydraulic-conductivity layer that includes a drainage layer; and
- A minimum one foot thick foundation layer.

This final cover design for the Landfill areas is an engineered alternative final cover consistent with 27 CCR, §20080. A copy of the Final Grade Construction Plans are included in Appendix B.

Several factors were taken into consideration is establishing the proposed final cover design for the Landfill, including the geometry of the existing landfill, local climatic conditions, final cover material availability, slope stability, erosion protection, and construction cost.

Final Grading, Drainage, and Erosion Control

The limits of refuse were established from record information and by a field investigation. The proposed final cover system will cover all areas within the limits of refuse. Due to clearance requirements under existing power lines that run through the Landfill area, excavation and relocation of refuse will be required to maintain clearance between the finish surface and the power lines. The excavated refuse will be placed on other (flatter) sections of the Landfill.

The Final Grading Plan as shown on Figure 3 (Appendix A) illustrates the final landfill footprint and shows the Landfill configuration following foundation layer grading. Final refuse slopes will have a maximum gradient no steeper than 2:1 (horizontal to vertical). The synthetic erosion-resistant layer will essentially eliminate the discharge of sediment from the Landfill surface as no soil component will be utilized in the final cover design.

Proposed drainage facilities consist of a network of benches, ditches and storm drain that drain to 18- and 24-inch diameter corrugated metal pipe (CMP) discharge culverts. These CMP culverts discharge to the unnamed ephemeral creek channel at various locations along the length of the Landfill's northern boundary. In general, the drainage system is designed to intercept run-off at intervals along the inside edge of berms, benches or access roads. A sedimentation pond is located at the western end of the Landfill to control sediment run-off from slope areas along the western and southern fill boundaries. Three (3) additional sedimentation ponds are also located at the northeastern end of the Landfill to contain sediment run-off from soil borrow areas. Please refer to Figure 2 (Appendix A) for the locations of the respective sedimentation ponds.

Access improvements will include placing aggregate base over portion of the existing perimeter road and along benches to provide all-weather access.

The soil borrow area will be reclaimed by re-grading and re-vegetating (hydroseeding) with native grasses.

Landfill Gas Control

The Landfill currently includes a partial perimeter LFG collection system that was installed between the southwestern edge of the Landfill and the property line. In general, the system consists of 17 vertical extraction points installed in native geologic materials and completed at depths ranging from 35 to 133 feet below ground surface. The extraction points are connected to a buried 6-inch diameter, high-density polyethylene (HDPE) header pipe that leads to a vacuum blower located at the western end of the Landfill. The vacuum blower creates a vacuum in the header pipe that draws the LFG from the soil through the extraction points and header pipe, whereupon the collected LFG (diluted) is vented to the atmosphere via a 4-foot tall, 4-inch diameter stack. The system works on the premise that the extraction well field creates a barrier against migration while simultaneously mixing the collected LFG with "clean" soil pore gas that dilutes the LFG to concentrations that can be discharged directly to the atmosphere.

As part of final closure, a LFG extraction, collection, and control system will be installed that will replace the partial perimeter collection system. The design for the system has been developed to meet the requirements of 17 CCR, §95464(b). The design flow rate for the system has been established at 35 to 210 SCFM (at 50 percent methane). This range covers the highest anticipated LFG recovery rate based on the most conservative generation model (180 SCFM), as well as some excess to allow for extraction from the final cover system's gas relief layer. In addition, the design range can accommodate lower flows to account for future operations as the generation rate continues to decreases over time. Overall, the LFG extraction, collection, and control system will consist of a series of perimeter and interior LFG extraction wells, associated above ground collection system piping, condensate collection provisions, and a flare station for destruction of the LFG, see Figure 4 (Appendix A).

Landfill Leachate Control

The Landfill is unlined and is not equipped with an engineered or traditional blanket leachate collection and removal system (LCRS). Instead, leachate collection at the Landfill consists of a series of polyvinyl chloride (PVC) piping and French drain systems installed to collect leachate from seeps occurring along the completed

slope faces. Leachate collected by these components is then conveyed by gravity flow to a primary buried pipeline located along the northern toe of the Landfill. The buried pipeline, in turn, drains the leachate westward and ultimately discharges to the leachate management facilities located at the western toe of the Landfill. A description of the leachate management facilities is as follows:

- Discharge from the primary buried pipeline is diverted to a subsurface concrete sedimentation chamber equipped with a valved sediment drain at its base. The clarified leachate within the chamber is then discharged (by gravity flow) to an adjacent pump station wet well (identified herein as the "leachate wet well") via a 10-inch diameter overflow line.

- Clarified leachate discharged to the leachate wet well is then pumped to a leachate storage tank for temporary storage. The leachate wet well is equipped with two (2) 25-gallon per minute (gpm), low-head, submersible pumps that are actuated by high/low water level controls. If the clarified leachate discharge rate exceeds the leachate wet well's pumping capacity (50 gpm), the excess leachate will be diverted to an underground storage tank to be installed as part of final closure.

- As noted above, leachate from the leachate wet well is diverted to the leachate storage tank for temporary storage. The leachate storage tank has a 63,500-gallon volumetric capacity and is constructed of AWWA factory epoxy lined and coated bolted steel. As was the case for the leachate wet well, the leachate storage tank is also equipped with a 10-inch diameter overflow line that will divert leachate to the underground storage in the case of an emergency.

- Leachate stored in the leachate storage tank is subsequently pumped to a sewer line connection located on Vichy Springs Road via a force main/gravity drain. The force main/gravity drain is constructed of 4-inch diameter PVC and is approximately 5,200 feet in length. The pump lift station for the leachate storage tank is equipped with two (2) 45-gpm pumps (one duty, one standby), thereby giving the system a total pumping capacity of 90 gpm.

Construction Quality Assurance

The implementation of the Construction Quality Assurance (CQA) Plan will provide documentation that suitable materials and standard construction practices are used to place the final cover and to document that placement is consistent with the closure plan design specifications in 27 CCR, §20323 and §20324. Elements of the CQA Plan include a project description and definitions, qualifications and responsibilities, requirements for the final cover evaluation, inspection standards, testing frequencies, meetings, and documentation. This information will be collected during construction of the final closure and incorporated into the project's final closure construction CQA Certification Report, which will be submitted to the appropriate agencies for recording and reporting purposes.

Post Closure Maintenance Plan

After closure activities are completed, the Final Post Closure Maintenance Plan (FPCMP) for the Landfill will be implemented by the City of Ukiah in accordance with 27 CCR, Chapters 3 and 4, and 40 CFR, §258.61. Post closure maintenance activities for the Landfill will consist of the following:

- Final cover inspection and maintenance;
- Landfill settlement monitoring and maintenance;
- LFG monitoring and maintenance;
- Groundwater systems monitoring and maintenance;
- Storm water monitoring;
- Access road/bench maintenance;
- Drainage systems inspection and maintenance; and
- Site security inspection and maintenance.

Detection Monitoring Program

A Detection Monitoring Program (DMP) is currently implemented at the Landfill in accordance with 27 CCR, §20420 and Waste Discharge Requirements Order No. R1-2002-0061 issued by the North Coast Regional Water Quality Control Board and is anticipated to continue through the post closure maintenance period. The scope of the DMP includes the following monitoring and sampling activities:

- Monthly monitoring and recording of leachate discharge volumes.
- Quarterly sampling and analysis of leachate samples from the leachate wet well. The scope of analytical testing is in accordance with Table I of Monitoring and Reporting Program No. R1-2002-0061 (M&RP).
- Quarterly monitoring and recording groundwater elevations and groundwater flow directions.
- Quarterly sampling and analysis of groundwater samples from detection monitoring wells and points of compliance monitoring wells. The scope of analytical testing is in accordance with Table II of the M&RP.
- Performance of quarterly statistical analyses of groundwater chemistry data to identify exceedances of applicable concentration limits.
- Quarterly sampling and analysis of surface water samples, including semi-quantitative comparisons between upstream and downstream water chemistry data to identify potential landfill-related surface water quality impacts. The scope of analytical testing is in accordance with Table III of the M&RP.
- Performance of monthly standard observations to monitor the conditions of the WMU, the landfill perimeter, and receiving waters.

Results and findings from the aforementioned activities are summarized in a Detection Monitoring Report and submitted to the North Coast Regional Water Quality Control Board on a quarterly basis. Standard quarterly report submittals include a presentation of the sampling and monitoring procedures (including Standard Operating Procedures), tabulated summaries of leachate, groundwater, and surface water field and laboratory data, statistical analysis results and supporting calculations, groundwater potentiometric surface map, results of standard observations, and copies of Certified Analytical Reports (CARs) and associated chain-of-custody documentation. Annual reports are also prepared that include (in addition to the above information) graphical summaries of monitoring data, an evaluation of the findings.

Landfill Gas Monitoring Program

A perimeter LFG monitoring program is currently implemented at the Landfill to fulfill monitoring requirements set forth in 27 CCR, §20921. This perimeter monitoring program will continue through the post closure maintenance period in accordance with the FPCMP. The system consists of ten LFG monitoring points (GAS-1 through GAS-10). The locations of the LFG monitoring points are shown on Figure 4 (Appendix A). Each of the LFG monitoring points are equipped with one to four individual monitoring probes constructed of ¾-inch diameter polyvinyl chloride (PVC) casing and capped with labcock valves. The monitoring probes range in depth from approximately 9 to 250 feet below ground surface BGS.

In addition to fulfilling the aforementioned regulatory requirements, the monitoring of perimeter probes will provide pertinent information regarding the overall performance of the LFG collection and control system. As the installation of the final cover system could increase lateral and vertical pressures within the Landfill, thereby potentially inducing subsurface migration of LFG, the perimeter monitoring will assist in determining whether the LFG collection and control system is providing adequate subsurface migration control, including whether ongoing operation of the existing partial perimeter LFG collection system is necessary if the historical LFG migration in that area can be abated by the new system. In accordance with 27 CCR, §20934, the results of the monitoring will be reported within 90 days from when the monitoring is performed and submitted to the

Local Enforcement Agency (LEA), Mendocino County Air Quality Management District (MCAQMD) and the NCRWQCB.

The LFG collection and control system and landfill surface will also be monitored to comply with AB32 requirements in accordance with 17 CCR, §95469. The scope of monitoring will include the following:

- Instantaneous surface monitoring will be conducted on a quarterly basis to determine if surface emissions of 500 ppmv or greater, other than non-repeatable, momentary readings, are present at any location on the WMU surface. The monitoring will be accomplished using a portable gas detector while walking in a designated 25-foot spacing interval pattern where practical.

- Integrated surface monitoring will be conducted on a quarterly basis to determine if the average methane concentration within the individual grids exceeds 25 ppmv.

- Any components of the LFG control and collection system that are under positive pressure will be monitored on a quarterly basis to determine if any leaks are present at methane concentrations exceeding 500 ppmv.

- The wellhead for each extraction well will be monitored on a monthly basis to determine whether the extraction well is being operated under vacuum conditions (i.e., negative pressure).

- The flare will be monitored for temperature and flow rate using dedicated instrumentation and the corresponding data documented using a continuous recorder. In addition, the flare will be source tested on an annual basis to verify compliance with emissions and destruction efficiency criteria.

The test methods and procedures employed to perform the respective monitoring provisions outlined above will be in accordance with the applicable subsections of 17 CCR, §95471. This includes portable gas meter instrumentation and calibration, emissions monitoring procedures, wind speed data collection, and precipitation documentation (i.e., no measurable precipitation 72 hours prior to emissions monitoring).

2.6 Project Timing

As indicated above, landfill operations at the Ukiah Landfill ceased in 2001. The City of Ukiah has commenced the final closure process with preparation of submittal of the Final Closure Post Closure Maintenance Plan. The final closure date is contingent upon approval of the Final Closure Plan by applicable agencies. Each of the phases of the work is identified and described below.

Final Closure Schedule

The closure implementation schedule for the Ukiah landfill includes the estimated time frame to complete the closure tasks associated with each component of closure. The closure construction process will begin upon completion of final closure design and preparation and approval of the plan, selection of a qualified contractor and the subsequent issuance of a Notice to Proceed. This construction schedule may differ from the selected Contractor's schedule based on the Contractor's equipment and personnel resources. For purposes of evaluating different components of the project, the following estimate of equipment type and hours have been generated. These estimates of manpower and equipment needs have been used for purposes of evaluating several components of this study including greenhouse gas generation estimates, impacts from noise, traffic and other components. Please note that this information is used for estimating project requirements only and actual project needs will be based on contractor bid estimates. Using the following information it is projected that the project duration will be approximately six months. Please also note that several of the project components will be conducted in parallel and coordinated with the overall project efforts.

Final Closure Schedule Ukiah Landfill

Estimate of Landfill Project Manpower and Equipment

Qty	**Demolition**	**Total days:**	5			Demolition includes removal of above ground piping
						and drain inlets
					0	
1	Tractors/Loaders/Backhoes	4	5	4	20	
1	Rubber-Tired Dozers	4	5	4	20	
	Site Preparation	**Total days:**	10			Site preparation includes clearing, stripping, scarifying approx.
						50 acres of landfill and borrow area surfaces
1	Rubber Tired Dozers	8	10	8	80	
1	Tractors/Loaders/Backhoes	8	10	8	80	
	Grading / Excavation	**Total days:**	20			Grading/Excavation includes excavating and relocation of refuse,
						grading and placement of foundation layer material from
1	Excavators	8	2	0.8	16	onsite borrow area, placement miscellaneous engineered fill
1	Graders	8	10	4	80	Excavation quantity = 13,500 CY
1	Rubber Tired Dozers	8	20	8	160	Foundation layer quantity = 61,500 CY
2	Tractors/Loaders/Backhoes	8	20	8	320	Engineered fill quantity = 8,850 CY
2	Scrapers	8	10	4	160	
	Well Drilling	**Total days:**	10			Well drilling includes drilling for the LFG extraction wells
						Vertical lineal feet = 940
1	Tractor/Loader/Backhoe	4	10	4	40	
1	Bore/Drill Rigs	8	10	8	80	
	Final Cover	**Total days:**	40			Final cover includes placement of the synthetic turf material
						that includes a geomenbrane, drainage layer, turf, and sand
2	Tractor/Loader/Backhoe	4	40	4	320	ballast
2	Welders	6	40	6	480	
2	Generator Sets	6	40	6	480	
	Utilities (Storm Drain, LFG Pipe)	**Total days:**	20			Utilities includes storm drain culverts and inlets, and installation
						of above ground LFG piping that is butt welded
1	Tractor/Loader/Backhoe	4	20	4	80	
1	Excavators	6	10	3	60	
1	Welder	4	15	3	60	
1	Generator Sets	4	15	3	60	
	LFG Flare Station	**Total days:**	15			LFG flare station includes setting flare and blower skids,
						preparation of foundation and placement of concrete (8 CY),
1	Cranes	4	3	0.8	12	installation of underground storage tank, and
2	Tractors/Loaders/Backhoes	4	8	2.1	64	placement of aggregate base
1	Excavator	8	2	1.1	16	Electric available
	Roads	**Total days:**	15			Roads include placement of aggregate base on perimeter
						access road and benches
1	Rollers	8	15	8	120	
2	Tractors/Loaders/Backhoes	8	15	8	240	

The type of equipment and required personnel expected to be utilized during closure construction includes, but is not limited to, the following:

Types of Equipment

- Scrapers
- Dozers
- Loaders
- Compactors
- Dump Trucks (or End Dump Trailers)
- Water Pulls
- Soil Conditioning and Screening Equipment (Grizzlies)
- Forklift
- Weeding Machine
- Pickup Trucks

Personnel

- Construction Manager
- Field Inspector(s)
- Field Engineer(s)
- Geotechnical Technician(s)
- Labor Crews (including qualified geosynthetics welders)
- Equipment Operators
- Surveyors
- Fabricators
- Mechanics

Once enough equipment is on-site, clearing and grubbing of the landfill surface can begin, as mobilization continues. Rough grading can then begin in those areas that have been cleared and grubbed. During preparation of the site for final cover placement, foundation layers for the final cover materials will be placed. In addition there are several areas within the landfill that will require the grading, removal and final placement of refuse to provide clearance of electrical transmission lines that traverse over the landfill. The waste removal and reconsolidation activities will be conducted concurrent with clearing and grubbing and preliminary grading.

Placement of the final cover materials will begin after grading of the site. As placement of the final cover progresses, the LFG wells and collection system and drainage system required for closure can be integrated and constructed. The drainage facilities to be constructed during final cover placement will include the perimeter access road drainage systems, removal and relocation of the existing drainage components and outfalls and any ancillary drainage facilities including the desilting basin structures. The drainage facilities and the LFG collection system components will be completed in conjunction with the final cover construction. Placement of erosion control best management practices can begin upon completion of the final cover installation.

The estimated time frame for completion of all closure construction activities for the site is estimated to be 6 months which complies with the 180 day standard time frame required by 27 CCR, Section 21110 (e).

2.7 Project Objectives

The Final Closure and Post-Closure Maintenance Plan for the Ukiah Landfill has been prepared for submittal to the following agencies:

- California Department of Resources Recycling and Recovery (CalRecycle)

- Mendocino County Department of Public Health
- North Coast Regional Water Quality Control Board
- Mendocino County Air Quality Management District

The plan has been prepared in accordance with Title 27 of the California Code of Regulations (27 CCR), Chapters 3 and 4 and the Code of Federal Regulations (CFR) 40, Subpart F. The objectives of the plan are identified below.

Project Objectives

- To provide a basis for the establishment of an accurate detailed cost estimate for closure and post-closure maintenance.

- To provide a detailed plan and schedule for closure implementation.

- To provide a plan and schedule for the inspection, maintenance and monitoring procedures to be implemented during the post-closure maintenance period.

- To allow the applicable agencies to monitor closure and post-closure activities to determine that all landfill closure and post-closure maintenance and monitoring requirements are being followed in accordance with the approved plan.

2.8 Regulatory Permits/Approvals

The following permits are required for the closure activities at the Ukiah Landfill:

- North Coast Regional Water Quality Control Board: Approval of the Final Construction Plans, Technical Specifications, and CQA Plan.

- California Department of Resources Recycling and Recovery (CalRecycle): Approval of the Final Construction Plans, Technical Specifications, and CQA Plan.

- Mendocino County Health & Human Services Agency (LEA): Approval of the Final Construction Plans, Technical Specifications, and CQA Plan.

- Mendocino County Air Quality Management District: Approval of the Authority to Construct and Permit to Operation for the LFG extraction and control system.

- North Coast Regional Water Quality Control Board: Approval of an updated Storm Water Pollution Prevention Plan (SWPPP) for Industrial Activities.

- California Department of Fish and Game: Approval of a 1602 Streambed Alteration Agreement for construction of storm drain outfalls in the adjacent stream.

- North Coast Regional Water Quality Control Board: Approval of a 401 permit for construction of storm drain outfalls in the adjacent stream.

- U.S. Army Corps of Engineers: Approval of a 404 permit for construction of storm drain outfalls in the adjacent stream.

CHAPTER 3.0 – ENVIRONMENTAL FACTORS POTENTIALLY AFFECTED AND DETERMINATION

3.0 ENVIRONMENTAL FACTORS POTENTIALLY AFFECTED AND DETERMINATION

3.1 Environmental Factors Potentially Affected

The environmental factors checked below would be potentially affected by this project, involving at least one impact that is a "Potentially Significant Impact," as indicated by the checklist on the following pages.

	Aesthetics		Land Use and Planning
	Agriculture and Forest Resources		Mineral Resources
	Air Quality		Noise
	Biological Resources		Population and Housing
	Cultural Resources		Public Services
	Geology and Soils		Recreation
	Greenhouse Gas Emissions		Transportation/Traffic
	Hazards and Hazardous Materials		Utilities and Service Systems
	Hydrology and Water Quality		Mandatory Findings of Significance

Chapter 4.0 (Environmental Analysis) analyzes the potential environmental impacts associated with the proposed Final Closure/Post-Closure Maintenance Plan project. The issue areas evaluated in this Initial Study include:

- Aesthetics
- Agriculture and Forest Resources
- Air Quality
- Biological Resources
- Cultural Resources
- Geology and Soils
- Greenhouse Gas Emissions
- Hazards and Hazardous Materials
- Hydrology and Water Quality
- Land Use and Planning
- Mineral Resources
- Noise
- Population and Housing
- Public Services
- Recreation
- Transportation/Traffic
- Utilities and Service Systems
- Mandatory Findings of Significance

The environmental analysis in Section 4.0 is patterned after the Initial Study Checklist recommended by the *CEQA Guidelines*, as amended, and used by the City of Ukiah in its environmental review process. For the preliminary environmental assessment undertaken as part of this Initial Study's preparation, a determination that there is a potential for significant effects indicates the need to more fully analyze the development's impacts and to identify mitigation.

For the evaluation of potential impacts, the questions in the Initial Study Checklist are stated and an answer is provided according to the analysis undertaken as part of the Initial Study. The analysis considers the long-term, direct, indirect, and cumulative impacts of the development. To each question, there are four possible responses:

▪ **No Impact.** The development will not have any measurable environmental impact on the environment.

▪ **Less Than Significant Impact.** The development will have the potential for impacting the environment, although this impact will be below established thresholds that are considered to be significant.

▪ **Less Than Significant Impact With Mitigation Incorporated.** The development will have the potential to generate impacts, which may be considered as a significant effect on the environment, although mitigation measures or changes to the development's physical or operational characteristics can reduce these impacts to levels that are less than significant.

▪ **Potentially Significant Impact.** The development could have impacts, which may be considered significant, and therefore additional analysis is required to identify mitigation measures that could reduce potentially significant impacts to less than significant levels.

Where potential impacts are anticipated to be significant, mitigation measures will be required, such that impacts may be avoided or reduced to insignificant levels.

3.2 Environmental Determination

On the basis of this initial evaluation:

_____ I find that the proposed use **COULD NOT** have a significant effect on the environment, and a **NEGATIVE DECLARATION** will be prepared.

__**X**__ I find that although the proposal could have a significant effect on the environment, there will not be a significant effect in this case because revisions in the project have been made by or agreed to by the project proponent. A **MITIGATED NEGATIVE DECLARATION** will be prepared.

_____ I find that the proposal **MAY** have a significant effect on the environment, and an **ENVIRONMENTAL IMPACT REPORT** is required.

_____ I find that the proposal **MAY** have a significant effect(s) on the environment, but at least one effect 1) has been adequately analyzed in an earlier document pursuant to applicable legal standards, and 2) has been addressed by mitigation measures based on the earlier analysis as described on attached sheets, if the effect is a "potentially significant impact" or "potentially significant unless mitigated." An **ENVIRONMENTAL IMPACT REPORT** is required, but it must analyze only the effects that remain to be addressed.

_____ I find that although the proposed project could have a significant effect on the environment, because all potentially significant effect (a) have been analyzed adequately in an earlier EIR or NEGATIVE DECLARATION, pursuant to all applicable standards, and (b) have been avoided or mitigated pursuant to that earlier EIR or NEGATIVE DECLARATION, including revisions or mitigation measures are imposed upon the proposed project, nothing further is required.

Printed Name/Title	Date

CHAPTER 4.0 – ENVIRONMENTAL ANALYSIS

4.0 ENVIRONMENTAL ANALYSIS

The purpose of this Initial Study/Proposed Mitigated Negative Declaration for the proposed Ukiah Landfill Final Closure Plan to provide an analysis of the potential environmental consequences that are anticipated to occur as a result of implementation of the project in accordance with the environmental review process as implemented by the City of Ukiah. The analysis contained in this chapter includes a discussion of the anticipated impacts associated with the implementation of the Ukiah Landfill Final Closure Plan and any impacts that result from that development, as described in Chapter 2.0 (Project Description).

4.1 Aesthetics

Would the project:	**Potentially Significant Impact**	**Less Than Significant With Mitigation Incorporated**	**Less Than Significant Impact**	**No Impact**
a. Have a substantial adverse effect on a scenic vista?			X	
b. Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?			X	
c. Substantially degrade the existing visual character or quality of the site and its surroundings?			X	
d. Create a new source of substantial light or glare, which would adversely affect day or nighttime views in the area?				X

Significance Criteria:

A project may be deemed to have a significance adverse aesthetic impact if it results in any of the following:

- Changes at the site substantially degrade the character of the site, degrade an existing public view shed, or alter the character of a public view shed by the introduction of anomalous structures or elements.

- Changes at the site would result in changes in the expectations of viewers (measured against the relative importance of those views) and would result in a negative impression of the view shed. (The emphasis of this criterion is on views from public areas, not views from individual lots unless view easements are involved.)

- Changes at the site substantially conflict with and/or do not uphold the scenic and visual quality objectives for development, as articulated in the County's General Plan goals, objectives and policies.

Analysis:

a. Have a substantial adverse effect on a scenic vista?

Less Than Significant Impact. As indicated in the Mendocino County Resources Management Element,

Mendocino County is a predominantly rural county. Most of the land in the county is in forest or in agricultural production. Both forest and agricultural lands are considered open spaces that add to the quality of life of county residents and attract tourists. The various state and county parks protect areas with scenic value, particularly redwood groves. The coast is considered a scenic resource, and policies in the County's Coastal Element are designed to protect its scenic value. Areas such as the forest lands and other open space areas have been identified as scenic resources in the County's Resource Management Element.

The project site property consists of a 283.5 acre rural parcel of land of which approximately 40 acres of the property is occupied by the landfill unit. The Ukiah Landfill began refuse disposal operations in 1955 and ceased operations in 2001. As discussed herein the landfill property is surrounded by rural agricultural and undeveloped lands that are typically large in size with very limited to no public access. The project site property has been significantly altered by past landfilling activities and is not considered to be a scenic or aesthetic resource in its altered condition. The proposed project includes the closure of the landfill that consists of the placement of a final cover material with the sequential installation of grading and drainage improvements and landfill gas collection and control equipment. The final cover element of the proposed project includes no structures on the surface of the final closure project, with the exception of the landfill gas flare station located on the northwest portion of the site, which would create a visual element that would adversely affect the visual/aesthetic character of the project area, including the adjacent forestland.

Other features of the landfill include a landfill gas monitoring and control system, surface water control system, a groundwater and stormwater monitoring and reporting system/program, and a leachate collection and removal system. These environmental control systems are composed of minor surface and subsurface features, including monitoring wells, pipes, a landfill gas flare and related features. As indicated above, no significant vertical elements that would be visually obtrusive are proposed on the site, with the exception of the landfill gas flare, as part of the final closure process. Therefore, no significant visual impacts will occur as a result of project implementation and no associated mitigation measures are required.

The project site is located at the end of Vichy Springs Road which is not identified in the Mendocino County General Plan as a Scenic Resource.

As a result, project implementation will not affect existing views from scenic corridors/roads.

b. Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Less than Significant Impact. The project site property is located in an area of Mendocino County that is removed from any scenic highways and is not identified as a scenic amenity or resources. The site has been substantially altered by past landfilling activities and is not characterized by any important or significant aesthetic resources. Furthermore, the project site is not located adjacent to or within the view shed of any designated highways/roadways as designated by the Mendocino County General Plan.

Current closure and post-closure requirements significantly limit future land uses over the refuse footprint in order to maintain the integrity of the final cover surface. The proposed post-closure end use for the Ukiah Landfill refuse footprint will be non-irrigated vegetated open space. The landfill surface will consist of a geosynthetic final cover layer. In addition, implementation of the proposed final closure plan and subsequent post-closure maintenance activities includes environmental control systems and related features that are intended to meet current closure requirements so that the project site does not pose a health hazard or other adverse effects to the environment. No significant above-ground structures or other features are proposed, other than the landfill gas flare station, are proposed that would either affect the existing site characteristics or the visual/aesthetic character of the site and/or area. As a result, no significant impacts are anticipated and no mitigation measures are required.

c. Substantially degrade the existing visual character or quality of the site and its surroundings?

Less than Significant Impact. As indicated above, no development (i.e., structures or vertical features) are proposed for the project, other than the landfill gas flare station, that would affect the aesthetic character either of the project site or the surrounding area. Furthermore, the proposed project is consistent with Policy RM-128 of the Resources Management Element (i.e., protect the scenic values of the county's natural and rural landscapes, scenic resources, and areas of significant natural beauty). Therefore, no significant impacts will occur either to the aesthetic character of the site or to that of the surrounding area and no mitigation measures are required.

d. Create a new source of substantial light or glare, which would adversely affect day or nighttime views in the area?

No Impact. The subject property is located in a remote area of Mendocino County and is removed from urban areas. Project implementation does not include any new lighting sources and/or features that would result in the creation of new lighting either on the site or in the project area. All construction activities will occur during the daylight hours, which would not require lighting. Upon completion of the final closure construction activities, site activities would then be limited to routine maintenance, monitoring, and repair of site features/facilities; however, no new lighting would be required and, therefore, is not incorporated into the project. As a result, no lighting impacts will occur and no mitigation measures are required.

Cumulative Impacts

As indicated in Chapter 2.0 (Project Description), no development is proposed that would result in either short- or long-term visual impacts. Closure of the Ukiah Landfill encompasses excavation and earthwork that is short term in nature and the relocation of refuse from a portion of the landfill to provide vertical clearance for electrical power lines that traverse the project site property. No structures, other than the landfill gas flare, are proposed over the limits of the refuse footprint or in close proximity to the refuse limits that would contribute to the degradation of the aesthetic character of the area. Once completed, the project site would be characterized by native grasses and shrubs as well as the environmental control system features that are intended to address groundwater/leachate and air emissions. These systems and features would not contribute to the cumulative degradation of the visual/aesthetic character of the area; no significant cumulative impacts will occur as a result of project implementation.

Mitigation Measures

Project implementation will not result in any potentially significant visual impacts. Therefore, no mitigation measures are required.

4.2 Agriculture and Forest Resources

In determining whether impacts to agricultural resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and Site Assessment Model (1997) prepared by the California Department of Conservation as an optional model to use in assessing impacts on agriculture and farmland. In determining whether impacts to forest resources, including timberland, are significant environmental effects, lead agencies may refer to information compiled by the California Department of Forestry and Fire Protection regarding the state's inventory of forest land, including the Forest and Range Assessment Project and the Forest Legacy Assessment project; and forest carbon measurement methodology provided in Forest Protocols adopted by the California Air Resources Board. Would the project:	**Potentially Significant Impact**	**Less Than Significant With Mitigation Incorporated**	**Less Than Significant Impact**	**No Impact**
a. Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?				X
b. Conflict with existing zoning for agricultural use, or a Williamson Act contract?				X
c. Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?				X
d. Result in the loss of forest land or conversion of forest land to non-forest use?				X
e. Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?				X

Significance Criteria:

A project may be deemed to have a significance adverse impact on agricultural soils if it results in any of the following:

- Loss or elimination of "prime" agricultural lands as designated by the State of California and/or County of Mendocino and such designated soils are capable of sustained, viable agricultural production.

- Loss or elimination of forest land or conversion of forest land and/or timberland to non-forest uses.

Analysis:

a. Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?

No Impact. The project site has designated zoning by the Mendocino County General Plan as Public Facilities. The California Department of Conservation Division of Land Resource Protection Farmland Mapping and Monitoring Program identifies the project site as Urban and Built-Up Land which includes properties Land that is occupied by structures with a building density of at least one unit to 1.5 acres, or approximately 6 structures to a 10 acre parcel. Common examples include residential, industrial, commercial, institutional facilities, cemeteries, airports, golf courses, sanitary landfills, sewage treatment plants and water control structures. The project site is not identified as Prime Farmland, Unique Farmland or Farmland of Statewide Importance. The proposed project is the final closure of the Ukiah Landfill and will not result in a conversion of any prime farmland or farmland of State-wide importance. Therefore, no significant impacts to existing farmland resources will occur; no mitigation measures are required.

b. Conflict with existing zoning for agricultural use, or a Williamson Act contract?

No Impact. The subject property is not zoned for agricultural uses and, furthermore, is not bound by a Williamson Act contract. The site encompasses a closed Class III landfill and does not support any existing agricultural uses. Implementation of the proposed Final Closure Post-Closure Maintenance Plan will not result in any conflicts with either the zoning or long-range land use plans adopted by the County of Mendocino for the site. No significant impacts to agricultural soils will occur as a result of the proposed project and no mitigation measures are required.

c. Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?

No Impact. The project site is zoned by the County of Mendocino General Plan as Public Facilities and therefore is not zoned or designated as forest land. The area surrounding the project site are zoned as rangeland with limited residential zoning to the south and no direct or indirect impacts would occur as a result of the proposed landfill closure. Formal closure of the landfill will not result in any infrastructure extensions and/or future urban development that would encroach into the neighboring lands adjacent to the subject property. Therefore, project implementation would not result in the conversion of any forest land subject to the Public Resources Code. No impacts are anticipated and no mitigation measures are required.

d. Result in the loss of forest land or conversion of forest land to non-forest use?

No Impact. The proposed project includes the final closure of the Ukiah Landfill. As discussed above, the project site is zoned as Public Facilities by the Mendocino General Plan. The project site is a 283.5 acre property that is characterized by oak woodlands and chaparral vegetation. The proposed project implementation will not result in a loss of forest land to non-forest uses or convert forest lands to non-forest use. No impacts are anticipated and no mitigation measures are required.

e. Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?

No Impact. Implementation of the project will result in the closure of the Ukiah Landfill. Because the site does not contain Prime Farmland, Unique Farmland or Farmland of Statewide Importance or support any agricultural resources, project implementation will not result in the conversion of existing important, designated agricultural resources for non-agricultural purposes or the conversion of forest land to non-forest land. The surrounding properties located in the vicinity of the project site are zoned as Rangeland by the Mendocino County General Plan. The proposed project is completely confined within the boundaries of the 283.5 acre property parcel and is not expected to affect the surrounding properties other than short term disturbances during construction.

Cumulative Impacts

Because the project site and surrounding area is not designated as Prime Farmland, Unique Farmland or Farmland of Statewide Importance or forest resources, no conversion or loss of such resources will occur as a result of the project. Therefore, implementation of the proposed project will not contribute to the cumulative loss of either important agricultural soils or forest resources. No significant cumulative impacts will occur.

Mitigation Measures

Project implementation will not result in any potentially significant impacts to either agricultural source or forestry resources. Therefore, no mitigation measures are required.

4.3 Air Quality

Where available, the significance criteria established by the applicable air quality management or air pollution control district may be relied upon to make the following determinations. Would the project:	**Potentially Significant Impact**	**Less Than Significant Impact With Mitigation Incorporated**	**Less Than Significant Impact**	**No Impact**
a. Conflict with or obstruct implementation of the applicable air quality plan?			X	
b. Violate any air quality standard or contribute substantially to an existing or projected air quality violation?			X	
c. Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?			X	
d. Expose sensitive receptors to substantial pollutant concentrations?			X	
e. Create objectionable odors affecting a substantial number of people?			X	

Significance Criteria:

The proposed project would result in significant adverse environmental impacts if any of the following occur:

- The project could interfere with the attainment of the federal or state ambient air quality standards by either violating or contributing to an existing or projected air quality violation.
- The project could result in population increases within the regional statistical area that would be in excess of that projected in the Air Quality Management Plan (AQMP).
- The project could generate vehicle trips that cause a localized violation of carbon monoxide (CO) standards.
- The project might have the potential to create or be subjected to objectionable odors.
- The project could have hazardous materials on-site and could result in an accidental release of air toxic emissions.

- The project could be occupied by sensitive receptors near a facility that emits air toxics or near CO "hot spots."

- The project could emit carcinogenic air contaminants that could pose a cancer risk.

Analysis:

Illingworth and Rodkin prepared an air quality assessment that evaluated the potential air quality impacts of the proposed project based on the anticipated final closure construction activities. The findings and recommendations of the Gas Emissions Assessment are summarized in this section of the initial study and are contained in Appendix C.

In addition, permitting is in process for the installation of the landfill gas collection and control system. This system includes LFG extraction wells that will be placed in and around the landfill footprint and the installation of a flare compound on the northwest side of the landfill that will include a LFDG flare and blower system for the collection destruction of LFG. The Mendocino County Air Quality Management District (MCAQMD) is the permitting and oversight agency for the installation and operation of the flare system. Design and permitting documentation has been submitted to the Mendocino County Air Quality Management District which is in process.

a. Conflict with or obstruct implementation of the applicable air quality plan?

Less than Significant Impact. The project area is located on the southeastern portion of Mendocino County and designated Inland South. The Inland South area includes the City of Ukiah and Willits and much of the surrounding areas. The MCAQMD maintains a network of five air quality monitoring stations within its jurisdiction, several of which are located in the Inland South area. The Inland South area includes the cities of Ukiah and Willits which are both major population centers in the county. These cities both also have the Highway 101 corridor that runs south to north through Mendocino County and through both Ukiah and Willits.

The air quality within Mendocino County is generally good and generally complies with established air quality standards. The Inland South area, like the rest of Mendocino County, is non-attainment for the state particulate matter 10 microns (PM-10) standard. The primary sources of PM-10 have been identified as wood combustion emissions, fugitive dust from construction projects, automobile emissions and industry. Some of the automobile emissions are the result of pass-through traffic on 101 because of its nature as a major transportation corridor in the state. The MCAQMD has full monitoring stations (NOx, Ozone, CO and PM-10) in both Ukiah and Willits. A PM-2.5 monitor has been established in Ukiah. Both Ukiah and Willits have had PM-10 exceedances in the past. Winter cold-air inversions are common in the valleys from November to February.

The MCAQMD is currently identified as "non-attainment" for the PM_{10} standard. The primary sources of particulate matter are identified as wood smoke, fugitive dust and automotive emissions. Although project implementation will result in short-term impacts, once the final cover and related closure plan features are completed, no additional air pollutant emissions will occur. An exception is the operation of the LFG flare which is permitted for operation by the MCAQMD. The short-term construction related emissions required to implement the proposed project would not exceed thresholds established by the Mendocino County Air Quality Management District (refer to Table 4.3-1) below. The proposed project is consistent with Policy RM-37 of the Mendocino County General Plan Resource Management Element (i.e., public and private development shall not exceed MCAQMD emissions standards) and Policy RM-41 (i.e., reduce dust generation from unpaved roads). The proposed project will be required to implement dust control management practices to comply with all regulatory requirements to reduce and control particulate emissions and therefore project implementation would not conflict with adopted plans and programs; no significant impacts would occur.

b. Violate any air quality standard or contribute substantially to an existing or projected air quality violation?

Less than Significant Impact With Mitigation. The proposed project will result in the emission of exhaust gases and has the potential to generate dust emissions if unmitigated. Exhaust emissions during construction will result from the operation of heavy equipment. It should be noted that the emissions estimates have been calculated using standard assumptions of equipment type and project duration. The threshold for pollutant generation is Table 4.3.1 summarizes the project related construction impacts for the proposed project.

Table 4.3.1

Emissions Summary - Construction
Ukiah Landfill Closure

	ROG	NOx	CO	SO2	Fugitive PM10	Exhaust PM10	PM10 Total	Fugitive PM2.5	Exhaust PM2.5	PM2.5 Total	Bio- CO2	NBio- CO2	Total CO2	CH4	N2O	CO2e
Year	tons/yr										MT/yr					
Total	0.339	2.9636	3.1892	5.0300e-003	80.0951	0.0968	80.192	8.0441	0.0905	8.1346	0	459.9091	459.9091	0.0261	0	460.4567

Source: Illingsworth & Rodkin - Ukiah Landfill Closure May 2015

MCAQMD CEQA significance thresholds for construction activities were adopted in June 2010. There are no construction related thresholds established for greenhouse gas emissions. Thresholds are established for criteria pollutants including apply only to particulate exhaust. The project-related construction particulate emissions would be substantially below the emissions thresholds established by the MCAQMD. Emission levels of criteria pollutants will also be below MCAQMD significance thresholds. Thresholds for fugitive dust are set at 54 and 82 pounds per day for indirect emissions. No emission thresholds are established for construction related fugitive dust emissions which are set at levels that are controllable with the implementation of best management practices. It is noted that surface disturbances from the proposed project may create dust that would require mitigation and control. It should further be noted that PM10 total is estimated to be 80.1 tons per year from the project if unmitigated while PM 2.5 total is estimated to be 8.0 tons per year if unmitigated. Mitigation for exhaust emissions will include using modern equipment that is compliant with current regulatory emission standards. Mitigation for dust will include using and maintaining dust control measures during all phases of the project.

c. Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Less than Significant Impact. Criteria pollutants include Reactive Organic Gases, Oxides of Nitrogen and particulate matter that is defined as PM2.5 and PM10. Emission levels of these criteria pollutants will be below the MCAQMD significance thresholds. In addition only PM10 is in non-attainment for the MCAQMD and the estimated emissions of PM10 for the proposed project are well below the established threshold values. Therefore the impact is less than significant.

d. Expose sensitive receptors to substantial pollutant concentrations?

Less than Significant Impact. The proposed project has the potential to generate pollutant sources from several sources including fugitive dust and exhaust emissions. Diesel exhaust is a concern and has been identified as a toxic air contaminant. The exhaust from diesel engines includes hundreds of different gaseous and particulate components, many of which are toxic. Many of these toxic compounds adhere to the diesel particles, which are very small and can penetrate deeply into the lungs. Diesel engine particulate matter has been identified as a human carcinogen. Mobile sources such as trucks, heavy equipment and automobiles are some of the primary sources of diesel emissions. Diesel exhaust contains both pulmonary irritants and hazardous compounds that can affect sensitive receptors such as young children, senior citizens, or those susceptible to chronic respiratory disease such as asthma, bronchitis, and emphysema.
In 2005, the California Air Resources Board (CARB) approved a regulatory measure to reduce emissions of

toxic and criteria pollutants by limiting the idling of new heavy-duty diesel vehicles, which altered five sections of Title 13 of the California Code of Regulations. The changes relevant to the proposed project are in Section 2485, Airborne Toxic Control Measure to Limit Diesel-Fueled Commercial Motor Vehicle Idling, which limit idling of a vehicle's primary diesel engine for greater than five minutes in any location (with some exceptions) or operation of a diesel-fueled auxiliary power system within 100 feet of residential areas.

Implementation of the proposed project would result in the use of diesel trucks to transport equipment and construction materials as well as diesel-powered construction equipment would be operated on site. Combustion emissions include suspended fine particulates ($PM_{2.5}$). When these emissions are generated by diesel-powered equipment, they are referred to as diesel particulate matter (DPM), which contain substances that are known carcinogens. DPM is classified by the Bay Area Air Quality Management District (BAAQMD) as a toxic air contaminant (TAC) and the BAAQMD CEQA Guidelines include quantitative thresholds to determine the significance of the project's construction-related emissions, both on a project-specific and cumulative basis. In 2010, the BAAQMD adopted updated CEQA significance thresholds, including health risk exposure guidelines. The MCAQMD has elected to adopt these guidelines.

It is anticipated that implementation of the proposed project will require the importation of up to 3,500 cubic yards of sand as part of the final cover which could generate approximately 200 truck trips. The remaining soil will be used from an onsite source within the project site boundaries. The public exposure risk from this truck traffic is seen as minimal and the pass-by exposure health risk during soil hauling would be negligible at the edge of the selected haul route. Therefore, no significant impacts are anticipated to occur as a result of the proposed project and no mitigation measures are required.

e. Create objectionable odors affecting a substantial number of people?

Less than Significant Impact. The proposed project is designed to minimize local odor risk by insuring long-term landfill cover integrity. No substantial quantities of buried refuse will be disturbed by the proposed project. Furthermore, sensitive receptors such as residential development are located greater than 500 feet from the property boundary. Therefore, no significant odor impacts would occur.

Cumulative Impacts

As indicated in the preceding analysis, project implementation will not result in an exceedance of the construction emissions threshold adopted by the MCAQMD; no long-term (i.e., operational) impacts will occur and, therefore, implementation of the proposed project would not result in potentially significant cumulative impacts. Compliance with the applicable MCAQMD and policies and programs of the County as articulated in the General Plan will ensure that dust emissions are minimized during construction to further reduce short-term cumulative impacts. Furthermore, the project is consistent with the County's long-range plans for the subject property. Therefore, potential cumulative air quality impacts are less than significant.

Mitigation Measures

As indicated in the preceding discussion the proposed project implementation has the potential to generate fugitive dust which is predicted as a contributor to particulate matter impacts from the construction activities if unmitigated. Control of fugitive dust is mandated by MCAQMD rules and shall be implemented during all phases of the project. The required dust control mitigation measures include:

MM 4.3-1 Water shall be applied by means of truck(s), hoses, and/or sprinklers as needed prior to any land clearing or earth movement to minimize dust emissions.

MM 4.3-2 All material excavated, stockpiled, or graded shall be sufficiently watered to prevent fugitive dust from leaving the property boundaries or causing a public nuisance. Watering should occur at least twice daily, however frequency of watering shall be based on the type of operation, soil, and wind exposure

MM 4.3-3 All on-site vehicles traffic shall be limited to 15 miles per hour (mph) on unpaved roads.

MM 4.3-4 All trucks hauling soil, sand, or other loose material on public roads will be covered or required to maintain at least two feet of freeboard.

MM 4.3-5 All land clearing, grading, or earth moving activities shall be suspended as necessary, based on site conditions, to prevent excessive windblown dust when winds are expected to exceed 20 mph.

MM 4.3-6 All inactive portions of the construction site shall be covered, seeded, or watered until a suitable cover is established. Alternatively nontoxic soil stabilizers can be applied to all inactive construction areas.

MM 4.3-7 Paved areas adjacent to construction sites shall be swept or washed as required to remove excess accumulations of silt and/or mud, which may have results from grading and construction activities.

MM 4.3-8 A publically visible sign shall be posted with the telephone number and person to contact regarding dust complaints.

4.4 Biological Resources

Would the project:	**Potentially Significant Impact**	**Less Than Significant With Mitigation Incorporated**	**Less Than Significant Impact**	**No Impact**
a. Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?		X		
b. Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?		X		
c. Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?		X		
d. Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?			X	
e. Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?			X	
f. Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?			X	

Significance Criteria:

The proposed project would result in significant adverse environmental impacts if one or more of the following conditions occur as a result of implementation of the proposed project:

- Direct or indirect loss of individuals of a state- or federal-listed threatened or endangered species.
- Substantial adverse effect on a rare plant or animal species.
- Substantial adverse effect on a species or native plant or animal community.
- Substantial adverse effect on a habitat of concern.
- Substantial adverse effect on a critical, yet limited, resource utilized by state or federal listed threatened or endangered species.
- Substantial adverse effect on the movement of any resident or migratory fish or wildlife species.

Analysis:

a. Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Less than Significant with Mitigation Incorporated. A Biological Resource Assessment was prepared for the project site by Wildlife Research Associates. In addition a Special Status Plant Survey Report was prepared by Jane Valerius Environmental Consulting and Geri Hulse-Stephens Botanical Consulting for the project site. And finally a Delineation of Waters of the United States, Including Wetlands was prepared by Jane Valerius Environmental Consulting. These studies were performed to attain a baseline assessment of the project site property to identify flora and fauna species that are or reasonably could be expected to be present at the project site and to evaluate the potential impacts associated with the implementation of the project. It should be noted that the project includes the landfill closure process which will include the removal and replacement of drainage structures within an unnamed tributary of Sulfur Creek which is tributary to the Russian River which will require permitting and mitigation measures by applicable regulatory agencies.

The following provides a summary of the findings and recommendations of these studies.

Wildlife
Wildlife Research Associates and Jane Valerius Environmental Consulting were contracted by the City of Ukiah to perform this Biological Resources Assessment for the federally listed Threatened California red-legged frog (*Rana draytonii*) and the federal and State listed threatened Central Coast steelhead (*Oncorhynchus mykiss irideus*).

The project site is dominated by non-native grassland on the landfill with blue oak woodland and mixed chaparral along the edges. The creeks support a riparian tree and shrub cover dominated by willows. Ponds on the site support cattail marsh or spikerush marsh vegetation and there are several small seasonal wetlands within the grassland at the borrow area on the east side. Potential jurisdiction wetlands and waters was delineated for the site.

The Biological Resource Assessment evaluated the potential for occurrence of 35 special-status plant species, and 19 special-status wildlife species, as well as the potential for California red-legged frog to occur on the

site.
There is potential habitat on site for several special status plants to occur. Focused, seasonal special status plant surveys were conducted in April and May with a third and final survey completed in July. No special status plants have been observed within the project study area.

Steelhead are known to occur within Sulphur Creek and the Russian River. The ephemeral tributary on-site does not support suitable habitat in terms of pool depth and the tributary dries by the end of the summer. In addition, a barrier to fish passage occurs in the ephemeral creek crossing at Redeemer Road (CNDDB 2015). As a result, no steelhead occur within the ephemeral tributary on site.

No California red-legged frog adults or larvae were detected during the field surveys, although suitable potential habitat for California red-legged frogs occurs on the site. The project site is located outside the range of California red-legged frogs in Mendocino County (USFWS 2009).

Foothill yellow legged frog (*Rana boylii*), a California Species of Special Concern, was observed within the ephemeral tributary within the proposed project area during the survey.

Several nesting passerines (perching birds), such as grasshopper sparrow (*Ammodramus savannarum*) were observed nesting within the project area.

For a complete discussion of the biological survey please refer to the Biological Resource Assessment that is included in Appendix E.

Plants
As required by the California Department of Fish and Wildlife (CDFW), plant surveys were conducted during the time of year when special status plants are most identifiable, which is typically when they are in flower. Prior to the site visit a search of the U. S. Fish & Wildlife Service (USFWS) quadrangle species lists (USFWS 2015), California Natural Diversity Data Base (CNDDB) (CNDDB 2015) and the California Native Plant Society (CNPS) (CNPS 2015) on-line electronic inventory was conducted for the 9-quadrangle search around the Ukiah 7.5-minute USGS quadrangle.

Surveys were conducted throughout the 2015 blooming window, capturing an entire blooming season. Site visits were conducted from spring to early summer, a period broad enough to include know blooming and fruiting times of potentially occurring special status plant species and also encompassing the blooming period of early annuals, wetland plants and late blooming herbaceous perennial species. These surveys took place on April 15, 21 and 29, May 19 and 22 and June 30, 2015. The survey was floristic in nature and took into account all vascular plant species, lichens and mosses encountered. The entire project area was covered on foot as thoroughly as possible so that all representative habitat types, topographic features and aspects were investigated. Material that could not be identified in the field was collected so that a determination could be made at a later time using a dissecting scope and reference materials. Mosses were collected and sent to a moss expert for identification. Sensitive plant communities were identified mapped and described. A complete list of vascular plant species, mosses and lichens were recorded along with habitat and plant community characteristics.

Plant Communities
Nomenclature for vegetation types follows *The Manual of California Vegetation* Second Edition (Sawyer, et. al. 2009) where applicable. Nine vegetation communities occur within the project study area. These are: 1) *Avena (barbata, fatua)* semi-natural herbaceous stands or wild oats grasslands; 2) ruderal forbs; 3) *Nasella pulchra* herbaceous alliance or purple needle grass grassland; 4) *Quercus douglasii* woodland alliance or blue oak woodland; 5) *Arctostaphylos manzanita* provisional shrubland alliance or manzanita chaparral; 6) *Salix exigua* shrubland alliance or sandbar willow thickets; 7) *Eleocharis macrostachya* herbaceous alliance or pale spike rush marshes; 8) *Typha angustifolia* herbaceous alliance or cattail marshes; and 9) seasonal wetlands.

1) Wild oats grasslands is the dominant vegetation type within the project study area as this type covers most of the landfill area, borrow area and roadsides. The wild oats grassland is mixed in with the ruderal forbs type. The revegetated portions of the landfill have a mixture of non-native grasses and in some areas non-native forbs (ruderal forbs) are dominant.

2) Ruderal forbs dominate the area on northeastern portion of the project study area in the flat area of the former borrow pit. This area is dominated primarily by non-native forb species.

3) Purple needle grass grassland was mapped in several locations in the borrow pit area. Small areas of purple needlegrass occur in other locations on the site but are not large enough to map separately as a stand along grassland community. The areas on the borrow site were large enough to map and identify as a separate plant community.

4) Blue oak woodland occurs along the southern portion of the project study area and also occurs along the northern bank of the unnamed creek that forms the northern boundary of the study area.

5) Manzanita chaparral occurs primarily on the northern portion of the study area along the north bank of the unnamed creek.

6) Sandbar willow thickets occur along unnamed creek that forms the northern boundary of the study area.

7) Pale spike rush marshes occur along the pond margins along with the cattail marsh types and also within vegetated sections of the unnamed creek channel in the eastern portion of the study area.

8) Cattail marshes occur in conjunction with the pale spike rush vegetation type and include the same species.

9) Seasonal wetlands were mapped in four areas in the eastern portion of the study area. Three seasonal wetlands were mapped in the borrow area and one occurs along the entrance road on the southeastern side of the project study area. Seasonal wetlands occur as relatively small depressions in the flatter areas of the borrow area. The one along the road appears to have developed as a result of water flowing along the inside portion of the roadway.

Special Status Plants

Review of the USFWS, the CDFW, and the CNDDB revealed that nine (9) federally listed plant species, one (1) federal candidate, three (3) state-listed species and twenty-two (22) CNPS ranked species have potential to occur in the area. There are no coastal dunes, coastal prairie, coastal scrub, coastal bluff scrub, volcanic ash flow vernal pools, lower montane coniferous forest, upper montane coniferous forest, North Coast coniferous forest, or closed-cone coniferous forest and no serpentinite within the project area that would provide habitat for many of these species. Although potential habitat occurs in the project area for many of the special status plant species known to occur in the area none were found during the protocol level seasonal plant surveys.

A total of 255 vascular plants and 41 mosses and lichens were observed during the April, May and June 2015 plant surveys. These 296 species represent 73 plant families. There was a high diversity of species even within the grassland areas of the landfill. The pond wetland areas actually have a low diversity of species, most of which are native species, but the ponds provide aquatic habitat which has high wildlife value. The creeks on the site have a diversity of both wetland and non-wetland species, most of which are native species, and also provide valuable wildlife habitat including habitat for the state listed foothill yellow-legged frog.

Findings

No special status plant species were found during the seasonal and protocol level plant surveys conducted for the project study area. In spite of the drought occurring in the region plants were in flower and 255 vascular plants were recorded along with 41 mosses and lichens. The surveys were conducted during the time of year

when special status plants would have been identifiable. Based on the surveys the site does not support any special status plants are none are expected to occur on the site.

The purple needle grass grassland is a special status vegetation community. This type occurs on the slopes of the existing former borrow area in the northeast portion of the study area. The sandbar willow thickets, cattail marsh, pale spike rush marshes and seasonal wetland areas are wetland vegetation types and even though they do not have a special status designation they are regulated by the US Army Corps of Engineers, North Coast Regional Water Quality Control Board and CDFW and therefore are considered to be sensitive natural communities and any impacts to these communities type will require mitigation if any impacts occur to these vegetation types.

For a complete discussion of the survey please refer to the Special Status Plant Survey Report that is included in Appendix F.

The project includes grading and drainage improvements as shown on the Construction Drawings in Appendix B. The construction activities have the potential to generate excessive turbidity by generation of sediment from ground disturbances. The actions of grading, capping and restoration activities as proposed for the project which includes erosion control measures being implemented during and following the project, will minimize the introduction of fine sediments to the stream channel. Several mitigation measures have been prescribed so that impacts to the stream channel and aquatic life are reduced to a less than significant level.

It should also be mentioned that during the construction phases of the landfill closure, the potential introduction of pollutants to the stream channel (e.g., gasoline, oil, lubricants of the heavy machinery to be used for grading, compaction, transportation of materials, etc.) may also occur, which could result in potential impacts to the aquatic life. Although the potential for such an impact is low, several mitigation measures have been identified for implementation during construction to ensure that the introduction of such pollutants does not occur.

b. Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Less Than Significant With Mitigation Incorporated. As discussed, the project includes the removal and replacement of five storm drain outlets, installation of five new outlets and abandonment of six outfalls that discharge to the unnamed tributary to Sulfur Creek located directly adjacent to the landfill footprint. The work associated with these structures is subject to permitting by the California Department of Fish & Wildlife, the North Coast Regional Water Quality Control Board and the US Army Corps of Engineers. Due to the fact that no federally listed species present at the project site it is not expected that a Section 7 consultation will be required with the US Fish & Wildlife Service.

The work related to the storm drain outfalls is to occur within the bed and bank of the unnamed tributary of Sulfur Creek. While this work is relatively minor with a total of approximately 30 cubic yards of fill materials within the bed of the waterway, there will be disturbance to the bed and bank of the waterway during the construction activities.
Mitigation measures for the protection of the riparian corridor including plants and animals will be implemented as part of the work. In addition erosion control measures and restoration of the disturbed areas will be conducted as part of the work.

c. Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Less Than Significant With Mitigation Incorporated. A wetlands delineation was completed for the project site by Jane Valerius. There are two unnamed creek drainages within the project study. The eastern tributary

drainage is an ephemeral drainage and is mapped as vegetated other waters. The upper portion of the main drainage that forms the northern boundary of the study area is dry with no wetland vegetation in the creek channel. The lower portion of the northern creek channel from the bridge to the western end of the study area has wetland vegetation within the creek bed and within the ordinary high water mark. The northern creek channel varies in width but has an average width of between 15 to 20 feet within the ordinary high water mark. The eastern tributary channel is more narrow and incised and varies from 8 to 10 feet in width. Areas mapped as potential jurisdictional wetlands also include the three former sediment ponds that occur within the study area. A fourth pond, identified as the leachate pond, has not been identified as jurisdictional because this pond is part of the treatment system for the landfill, even though it supports wetland vegetation. Seven small seasonal wetland were also mapped.

A total of 32,623 square feet (sf) or 0.75 acres of non-vegetated other waters were mapped for the two unnamed tributary creek drainages, along with 44,383 sf (1.02 acres) of vegetated other waters, 119,010 sf (2.73 acres) of vegetated ponds and 6,130 sf (0.14 acres). The total potential jurisdictional area is 202,146 sf or 4.64 acres. The three sedimentation ponds at the project site are identified as jurisdictional wetlands. The creek is identified as vegetated other waters and other waters which lack wetland vegetation. Isolated seasonal wetlands are also present in several areas located off the landfill footprint. The work related to the replacement of old storm drains and installation of new drains will work within limited areas of the bed and bank of the channel of the seasonal creek. This work will require permitting and mitigation from applicable agencies. Avoidance and mitigation measures will be implemented to protect jurisdictional waters and sensitive habitat areas.

d. Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Less than Significant Impact. The project site footprint for the landfill is approximately 40 acres. With the exception of temporary, construction-related activities that would occur during the closure construction activities, the project implementation would not result in any significant changes to the landfill or physical environment beyond the limits of the landfill footprint. The area surrounding the project site encompasses open space and rangelands on all sides with some residential development to the south. The project as proposed would not result in any direct long-term impacts to wildlife movement in the area. With the final cover of the landfill surface being a geosynthetic material that is ballasted with sand is not expected to produce sediment that would impact the creek and associated aquatic processes. In addition, the proposed drainage system would be expected to reduce the amount of sedimentation that may enter the creek. No significant impacts are anticipated either to wildlife movement and project implementation would not adversely affect any native wildlife nursery sites. No mitigation measures are required.

e. Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Less than Significant Impact. The proposed project is located in an area that is comprised generally of grasslands and oak woodlands with some chaparral. There are no trees that exist within the refuse footprint of the landfill. The proposed project will include earthwork and grading that will occur almost exclusively within the limits of the existing landfill footprint. Project implementation will include the replacement and abandonment of several storm drain outlets located on the bed of the unnamed tributary stream that does include limited riparian vegetation. The wetland delineation and biological survey indicated no presence of listed and protected plant and animal species within the area of the proposed project. Potential impacts to trees located along the periphery of the landfill footprint that may be affected by the project activities within the landfill or any of the environmental control systems such as the landfill gas flare compound would not be significant because they do not support sensitive species and are not otherwise protected. Therefore, potential impacts are less than significant; no mitigation measures are required.

f. Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Less than Significant Impact. There are no known Habitat Conservation Plans in effect for the project site property or surrounding area As a result, potential impacts will be less than significant.

Cumulative Impacts

Project implementation will result in some temporary impacts during the final closure activities, including potential erosion and sedimentation. In addition, noise and dust generated during the construction of the final cover and related environmental control systems could also affect some avian and small animal species in the project area. In order to ensure that such impacts are avoided or reduced, several mitigation measures must be implemented, which will also minimize the potential for significant cumulative effect to occur as well. Once final closure of the Ukiah Landfill has been completed, no significant long-term (i.e., operational) impacts will occur. With the exception of regular maintenance that will take place on the site, no activities will occur that would affect either sensitive habitat or species in the project area. Therefore, potentially significant project-related cumulative impacts would be less than significant.

Mitigation Measures

Potential project-related impacts to terrestrial and aquatic biological resources will be reduced to a less than significant level through the implementation of the measures prescribed below.

<u>Construction Related Mitigation Measures</u>

MM 4.4-1 Work is proposed to be conducted outside the rainy season (defined as October 15-April 15), primarily between June 15 and October 15, after the summer season when the creek flows are low, therefore no erosion or sediment control is expected to be necessary. To avoid debris contamination in the creek, a silt fence will be placed parallel to the project area in the creek to contain spoils from drilling and any concrete that may inadvertently drop into the creek during construction. All debris will be cleared out of the creek before the silt fence is removed.

MM 4.4-2 Prior to the start of construction, a Service-approved biologist will train all construction personnel regarding habitat sensitivity, identification of special status species, and required practices before the start of construction. The training will include the general measures that are being implemented to conserve the species as they relate to the project, the penalties for non-compliance, and the boundaries of the project area. If new construction personnel are added to the project, the contractor will ensure that the personnel receive the mandatory training before starting work. A fact sheet or other supporting materials containing this information will be prepared and distributed to all construction personnel. Upon completion of training, construction personnel will sign a form stating that they attended the training and understand all the conservation and protection measures.

MM 4.4-3 No project related activities will occur outside the exclusion fence.

MM 4.4-3 Appropriate dust abatement measures (e.g., spraying exposed areas) shall be implemented during construction if airborne dust appears to be significant.

MM 4.4-4 During grading, avoid side-casting excess material downslope towards the stream channel.

MM 4.4-5 All on-site storage of fuels, oils, and lubricants shall be located in an area where an accidental spill prevents this material from flowing downslope towards the stream.

MM 4.4-6 All equipment that uses fuels, oils, and/or lubricants, when not in use, shall be stored in areas where leakage and spills do not flow downslope toward the creek.

MM 4.4-7 Regular inspections of all equipment fuel lines, connections, filters, etc., shall be performed to ensure that leaks are detected and treated in a timely fashion.

MM 4.4-8 All refueling of machinery shall occur in an area where accidental spills will not flow toward the stream channel. Fuel absorbent matting and other spill containment materials shall be stored on-site and all operators shall be familiar with their proper use.

MM 4.4-9 The project site shall be restored to pre-construction condition or better. Streambank, ground and/or soil exposed as a result of construction, and soil within and above toe-rock shall be revegetated by live planting, seed casting, or hydroseeding prior to November 30 of the project year. All debris, sediment, rubbish, vegetation or other material removed from waterway shall be removed to a location where it will not re-enter the waters of the state.

Wildlife Related Mitigation Measures

MM 4.4-10 Roosting and Nesting surveys for special-status species (i.e., bats and birds) by a qualified biologist shall be conducted at the appropriate times before construction starts to determine occupancy at the site. If no special-status species are found, no further action other than the Best Management Practices identified above are required. If individuals are found, including nesting birds, a buffer zone around the species or nest will be required at a sufficient distance to prevent take of individual plants, or until after the nesting season.

MM 4.4-11 Due to the potential for special-status species to occur, move through, or into the ephemeral tributary portion of the project area, an on-site monitor, shall at a minimum, check the ground beneath all equipment and stored materials each morning before construction starts to prevent take of individuals. All pipes or tubing 4 inches or greater shall be sealed by the relevant contractor with tape at both ends to prevent animals from entering the pipes at night. All trenches and other excavations shall be backfilled the same day they are opened, or shall have an exit ramp built into the excavation to allow animals to escape.

MM 4.4-12 For all areas where rock is to be placed and pools are present, the applicant will capture and relocate any native amphibians found at pools nearest to the rock base placement (within 35 feet or based on a biologist recommendation). Captured native animals will be relocated to the closest pool.

MM 4.4-13 The proposed project could result in “take” of individual foothill yellow-legged frog known to occur within this portion of the ephemeral tributary. There is potential for both adults and tadpoles to be affected by the proposed project. Construction will occur above any existing water. If this is not possible, measures will be taken to isolate the workspace from flowing water to prevent stream sedimentation and turbidity. To prevent take of individuals a pre-construction survey of the ephemeral tributary shall be conducted 3 months in advance of work proposed for the ephemeral tributary. The surveys will determine if individuals are present. If no individuals (e.g., adults, juveniles or tadpoles) are present, no further action is required. If adults are present work in the creek shall occur after the metamorph stage of development, typically after August. This timing will ensure that individuals can leave an area of the own volition.

MM 4.4-14 The proposed project could result in “take” of individual western pond turtle that may move along this portion of the ephemeral tributary and may use the ponds on the site. To prevent take of individuals a pre-construction survey of the ephemeral tributary and the ponds shall be conducted 3 months in advance of work proposed for either water body. The surveys will determine if individuals are present. If no individuals (e.g., adults, or juveniles) are present, no further action is required. If individuals are present measures to prevent take of individual foothill yellow-legged frog will address concerns for western pond turtle.

MM 4.4-15 The proposed project could result in the removal of occupied passerine nests in the trees and

shrubs on the project site. Disturbance during the nesting season may result in nest abandonment and mortality of young. Bird species not protected under CESA or FESA, such as some passerines (including mourning dove and scrub jays) are protected under the Fish and Game Code 3503 and the MBTA, and some raptors (including American kestrel) are protected under Fish and Game Code 3503.5 and the MBTA. These aforementioned species may potentially be impacted by the removal of potential nesting habitat in the trees within the project area. Disturbance during the nesting season (February 15- August 15) may result in the potential nest abandonment and mortality of young, which is considered a "take" of an individual. This is a potentially significant impact. To avoid "take" and/or further evaluate presence or absence of passerines, the following measures are recommended:

1. Grading or removal of nesting trees should be conducted outside the nesting season, which occurs between approximately March 1 and August 15.
2. If grading between August 15 and March 1 is infeasible and groundbreaking must occur within the breeding season, a pre-construction nesting bird (both passerine and raptor) survey of the grasslands and adjacent trees shall be performed by a qualified biologist within 7 days of ground breaking. If no nesting birds are observed no further action is required and grading shall occur within one week of the survey to prevent "take" of individual birds that could begin nesting after the survey.
3. If bird nests (either passerine and/or raptor) are observed during the pre-construction survey, a disturbance-free buffer zone shall be established around the nest tree(s) until the young have fledged, as determined by a qualified biologist.
4. The radius of the required buffer zone can vary depending on the species, (i.e., 75-100 feet for passerines and 200-300 feet for raptors), with the dimensions of any required buffer zones to be determined by a qualified biologist in consultation with CDFG.
5. To delineate the buffer zone around a nesting tree, orange construction fencing shall be placed at the specified radius from the base of the tree within which no machinery or workers shall intrude.
6. After the fencing is in place there will be no restrictions on grading or construction activities outside the prescribed buffer zones.

Plant Related Mitigation Measures

MM 4.4-16 The project shall either avoid take or obtain formal incidental take coverage with the required compensatory measures where avoidance cannot be achieved for the affected categories: state and federally listed or proposed species, state candidates for listing, and California Native Plant Society (CNPS) Rank 1B species.

MM 4.4-17 For species that do not have formal take protection (e.g., CNPS Rank 1B plants and federally-listed plants where there is no federal nexus), the City shall avoid, minimize, and/or compensate (in that order of preference) at the same level of mitigation as those species that are afforded formal take protection.

MM 4.4-18 If listed plant species are found on the project site, then the project applicant shall prepare a mitigation plan that describes the avoidance or compensatory mitigation measures that would be implemented for these populations. As a performance standard, the plan shall provide for no net loss in the quantity or quality of plant populations. The mitigation plan shall be submitted to the USFWS and/or CDFW for approval for federal and state-listed plants, respectively. The mitigation plan shall include the mitigation measures, which are adopted from the CNPS Policy on *Mitigation Guidelines Regarding Impacts to Rare, Threatened and Endangered Plants* (CNPS 1998), described below, or equally effective alternative measures:

1. Mitigation for impacts to listed plants would include avoidance measures, when feasible, and compensatory mitigation when avoidance is not possible. Avoidance measures shall include buffer zones to avoid impacting listed plants; installing exclusion fencing around the existing plant populations prior to and during construction. Compensatory mitigation shall include replanting on site or propagation of plants at a nearby conservation site through seeding or translocation. Mitigation

ratios shall be sufficient to achieve performance criteria of no net loss of plants. Post-project monitoring shall verify that avoidance and mitigation measures are successful.

2. If mitigation for impacts to listed or List 1B plants occurs at a non-bank site, preference would be given to locating the mitigation site in an area as close to the project site as possible. If mitigation sites are not available in the vicinity of the project site, mitigation for listed plants may be accomplished at any site in Mendocino County that is suitable and supports the impacted plant population.

3. A long-term mitigation, monitoring, and management plan shall be developed for plant mitigation and submitted to the USFWS and/or CDFW for approval prior to initiation of construction activities. Mitigation sites shall be monitored for five years after installation. Depending on the actual case-by-case circumstances listed plants within the Project footprint may be salvaged and/or transplanted to a mitigation site approved by the CDFG and/or USFWS. When feasible, seed from plants unavoidably impacted shall be collected and preserved for planting on an approved mitigation site.

4. Impacted plants shall be mitigated at the ratio of 2:1, or as required by resources agencies, for both individuals and area.

5. All storage and staging areas shall be located outside of stands of listed plants.

MM 4.4-19 The project shall avoid significant loss of individuals of a CNPS Rank 2, 3, or 4 (sensitive) plant species, to the extent feasible. Avoidance measures shall include, but not be limited to, buffer zones, to avoid impacting special status plants and installation of exclusion fencing around the existing plant populations prior to and during construction. If the impacts from the project exceed 15% of the known occurrences or populations in Mendocino County, then plants shall be relocated or compensatory mitigation shall occur. The project applicant shall prepare a mitigation plan that describes the avoidance or compensatory mitigation measures that would be implemented for these populations. The mitigation plan would be submitted to the CDFW for approval and include the following, or equally effective alternative measures:

1. Prior to the initiation of construction, Rank 2, 3 or 4 plants that would be unavoidably impacted during construction shall be salvaged and transplanted or their seeds shall be collected and preserved for subsequent re-planting. The transplanted plants or seeds shall be reestablished on site if possible; otherwise, they shall be established on a mitigation parcel. Mitigation sites shall be monitored for five years after installation.

2. Impacted Rank 2, 3 or 4 plants shall be mitigated at a ratio of 1:1, or as required by resources agencies, for both individuals and area.

MM 4.4-20 Removal of trees containing suitable bat roosting habitat comprised of cavities, crevices, and/or exfoliating bark, may cause direct mortality of roosting bats if removed during maternity season prior to self-sufficient volancy of pups, or in winter during torpor or hibernation. Removal of larger mature trees has the potential of causing direct mortality of solitary tree-roosting species such as western red bat or hoary bat. Presence/absence surveys for bats in trees are extremely problematic for several reasons. First, only a small percentage of trees can be effectively surveyed by inspecting crevices or cavities due to limited physical access to the roost features, or complete visual access of the feature. As a result, in most cases, trees must be surveyed at night using night vision and bioacoustic equipment to observe any bats emerging from roost features. Typically, only one, or two adjacent trees can be surveyed by each observer each night. In addition, bats are less site-faithful to trees than other roost types like caves, mines, bridges or buildings, and switch tree roosts frequently when active. Therefore, trees must be removed no more than 24-48 hours after each night emergence survey, to ensure the tree is removed prior to bats moving in subsequent to surveys. Because of these logistical limitations, it is rarely safe to rely on emergence surveys of trees if more than a few are present on a project site. Instead, it is generally more cost-effective to presume presence of roosting bats, then conduct two-step tree removal during seasonal periods of bat activity, so that bats can safely abandon

the tree prior to removal. These dates are:

A) Between March 1 (or after evening temperatures rise above 45F and 72 hours after rains fall to less than 0.5" in 24 hours) and April 15 (maternity season), after which time non-volant pups are present in maternity roosts, and;

B) Between September 1, after young are self-sufficiently volant, and October 15, or before evening temperatures fall below 45F, and 72 hours prior to onset of rains greater than 0.5" in 24 hours.

4.5 Cultural Resources

Would the project:	**Potentially Significant Impact**	**Less than Significant With Mitigation Incorporated**	**Less Than Significant Impact**	**No Impact**
a. Cause a substantial adverse change in the significance of a historical resource as defined in CEQA Guidelines §15064.5?				X
b. Cause a substantial adverse change in the significance of an archaeological resource pursuant to CEQA Guidelines §15064.5?				X
c. Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?				X
d. Disturb any human remains, including those interred outside of formal cemeteries?				X

Significance Criteria:

As part of the determination made pursuant to the Public Resources Code (PRC) Section 21080.1, the lead agency must also determine whether a project may have a significant effect on "unique" archaeological resources. As defined in PRC Section 21083.2(g), an archaeological resource will be "unique" if it:

- Is associated with an event or person of recognized significance in California or American history or recognized scientific importance in prehistory

- Can provide information that is of demonstrable public interest and is useful in addressing scientifically consequential and reasonable research questions.

- Has a special or particular quality such as oldest, best example, largest, or last surviving example of its kind.

- Is at least 100 years old and possesses substantial stratigraphic integrity.

- Involves important research questions that historical research has shown can be answered only with archaeological methods.

- Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature; and/or

- Directly or indirectly destroy fossils that have potential to increase scientific knowledge, including all identifiable vertebrate remains, corals, and plants

Analysis:

a. Cause a substantial adverse change in the significance of a historical resource as defined in CEQA Guidelines §15064.5?

No Impact. The site is a closed landfill that has been significantly altered as a result of grading and excavation and the deposition of refuse into the Class III landfill. There are no identified historical structures and/or other historical resources currently known to exist either on the site or within the project area, which is characterized by grassland and devoid of any development. Project implementation will include grading and site alteration in order to implement the proposed final closure plan, including environmental control systems. However, it is not anticipated that any historic resources will be affected, either directly or indirectly as a result of the construction activities, which would not affect any area within the project site property that has not already been altered or areas off-site that have not been altered. Therefore, no impacts to historical resources will occur as a result of project implementation and no mitigation measures are required.

b. Cause a substantial adverse change in the significance of an archaeological resource pursuant to CEQA Guidelines §15064.5?

No Impact. The subject property was utilized as a Class III municipal landfill between 1955 and 2001. Approximately 40 acres of the 283.5 acre property encompass the project area. The landfill activities that occurred at the property extensively altered the property as a result of the landfilling and related activities necessary to maintain the project site property. The proposed project includes the construction of the final cover for the landfill as well as associated activities such as groundwater quality monitoring and site maintenance. Cover materials for the final cover will consist of a geosynthetic membrane that is ballasted with sand. Some excavation of the existing borrow site located within the limits of the site will occur as necessary which would result in additional site disturbance; however, it is important to note that these areas have been previously altered by past grading activities conducting at the project site. As a result, it is not likely that significant archaeological resources would be encountered during the proposed final closure and post closure activities. Therefore, potential impacts are anticipated to be less than significant. Nonetheless, because surface disturbance is proposed, a measure has been proposed that includes on-site monitoring during grading to ensure that if any artifacts are uncovered, they can be properly evaluated and appropriate mitigation action(s) implemented, if necessary, prior to proceeding with grading.

c. Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

No Impact. As previously indicated, the subject property has been significantly altered as a result of prior grading and landfill activities that have occurred on the site between 1955 and 2001. Implementation of the final closure plan, which includes some additional excavation within the project site property and placement of final cover over the landfill as well as installation/modification of the environmental control systems will not result in any potentially significant impacts to paleontological resources because the areas that will be altered by the proposed project have already been altered; no paleontological resources are known to existing within the affected areas and, therefore, no impacts to such resources would occur. Therefore, no significant impacts are anticipated and no mitigation measures are required.

d. Disturb any human remains, including those interred outside of formal cemeteries?

No Impact. The project will not encompass any sites or properties that possess known cultural values. Specifically, no formal cemeteries are located either on the project site in the vicinity of the project area, and no human remains are known to exist within the project site area. Although project implementation will require grading and limited excavation to implement the proposed project, the discovery of human remains is not anticipated. As a result, no significant impacts are anticipated. However, in the unlikely event that human remains would be encountered, compliance with the State Health and Safety Code and Public Resources Code (refer to SC 4.5-2) will ensure that they are properly treated, if found on the site. Therefore, no impacts are anticipated.

Cumulative Impacts
As indicated above, the subject property has been extensively altered as a result of prior excavation associated with the operation of the landfill. As a result, no cultural and/or paleontological resources are expected to occur that would result in significant cumulative impacts.

Mitigation Measures
No significant impacts are anticipated to occur to cultural/archaeological, paleontological and/or historic resources; no mitigation measures are required.

MM 4.5-1 Prior to the approval of the project Plans and Specifications, the City of Ukiah Public Works Department shall confirm that the plans and specifications stipulate that if evidence of subsurface archaeological resources are found during construction, excavation and other construction activity in that area shall cease and the contractor shall contact the Construction Engineer, who will then contact a county certified archaeologist to determine the extent of the find and take proper actions.

MM 4.5-2 If human remains are encountered, State Health and Safety Code Section 7050.5 states that no further disturbance shall occur until the County Coroner has made a determination of origin and disposition pursuant to Public Resources Code Section 5097.98. The County Coroner must be notified of the find immediately. If the remains are determined to be prehistoric, the Coroner will notify the Native American Heritage Commission (NAHC), which will determine and notify a Most Likely Descendant (MLD). With the permission of the landowner or his/her authorized representative, the MLD may inspect the site of the discovery. The MLD shall complete the inspection within 48 hours of notification by the NAHC. The City of Ukiah Public Works shall consult with the MLD regarding treatment and disposition of the human remains and items associated with Native American burials.

4.6 Geology and Soils

Would the project:	**Potentially Significant Impact**	**Less than Significant With Mitigation Incorporated**	**Less Than Significant Impact**	**No Impact**
a. Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:				
1. Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.			X	
2) Strong seismic ground shaking?			X	

3) Seismic-related ground failure, including liquefaction?			X	
4) Landslides?			X	
b. Result in substantial soil erosion or the loss of topsoil?			X	
c. Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-site or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?			X	
d. Be located on expansive soil, as defined in Table 18-1-B of the California Building Code (2001), creating substantial risks to life or property?			X	
e. Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?				X

Significance Criteria:

The proposed project would result in significant adverse environmental impacts if one or more of the following conditions occur as a result of implementation of the proposed project:

• Ground shaking and/or secondary seismic effects (i.e., liquefaction, slope failure, etc.) could cause substantial structural damage and/or an unmitigated risk to human safety, even after implementation of the recommended geotechnical measures, required local and State seismic design parameters, and common engineering practices for seismic hazard abatement.

• Adverse soil conditions such as compressible, expansive, or corrosive soils are not mitigated and present a damage hazard to occupied structures or infrastructure facilities.

Analysis:

a.1. **Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving r*upture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.***

Less than Significant Impact. The project site is located approximately one mile east of the Maacama Fault Zone as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map. There are no mapped faults located on the project site property. As previously indicated, the proposed project is to construct the final cover and environmental control systems for the Ukiah Landfill and no structures are proposed with the exception of landfill gas flare. Scheduled maintenance of the flare and compliance monitoring of groundwater and landfill gas will occur following final closure; however there would be no occupants on the project site that would be exposed to the effects of fault rupture.

The final closure design includes an analysis of stability that includes earthquakes and ground shaking. Since the landfill is positioned near the Maacama Fault Zone, in the event of a large earthquake whose focal mechanism is close to the project site, ground rupture could occur. The probability of such an occurrence is regarded as considerably smaller than the possibility of a maximum probably earthquake (MPE) event, and would be largely mitigated by the elastic properties of the refuse and cover materials. While such an event could still result in distress to the final cover, inspection of the project site and repair of the geosynthetic cover could be employed to mitigate this condition. The site has been designed in accordance with the applicable design standards and the potential adverse effects associated with fault rupture as well as other secondary

seismic effects would be reduced to a less than significant level as a result of the design and no additional mitigation is required.

a.2. Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving strong seismic ground shaking?

Less than Significant Impact. The project site is located in the northern portion of the Coast Ranges geomorphic province, which is characterized by a series of northwest-southeast trending ridges and valleys that are associated with faults and folds that follow the same trend. The project site is located approximately one mile east of the Maacama Fault Zone which is identified as a Holocene Fault and mapped as a Special Studies Zone by the State of California.

The proposed project is to include the final closure of the landfill and there will be no occupants at the property. A seismic hazard review was completed to evaluate the earthquake parameters that could affect slope stability conditions at the project site in the event of an earthquake event. The final closure design of the landfill was engineered to accommodate the design parameters of a Maximum Probable Event in order to minimize potential damage pursuant to all applicable regulatory requirements. While the project site is seen as being minimally susceptible to potentially strong seismic shaking, no structures are proposed on the landfill and, with the exception of regular monitoring and maintenance of the environmental control systems that would be periodically conducted no workers or occupants would occupy the project site. Based on these factors no significant impacts are anticipated and no additional mitigation measures are required.

a.3. ***Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving seismic-related ground failure, including liquefaction?***

Less than Significant Impact. Although the project site is located approximately one mile from the Maacama Fault Zone and would be subject to potentially strong seismic ground shaking and related secondary effects, the proposed project does not include the construction of any buildings and/or structures and, furthermore, would not be occupied by workers that would be subjected to the effects of seismic-related ground failure. As previously indicated, the landfill closure has been designed in accordance with all applicable regulatory requirement prescribed in Title 27, which are intended to reduce the potential for losses of both property and life. As a result, potential impacts will be less than significant; no mitigation measures are required.

a.4. Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving landslides?

Less than Significant Impact. As indicated the proposed project does not include the construction of any buildings or related structures that would be occupied with workers. As a result, project implementation would not subject either people or structures to the potential adverse effects of landsliding. The closure plan has been designed to ensure that the potential for slope failure is minimized. The stability of the proposed final cover system addressed both the steepest and highest slopes that will exist on the landfill. The construction specifications for final closure construction will specify the minimum material strength and other performance criteria required to meet the design standards

b. Result in substantial soil erosion or the loss of topsoil?

Less than Significant Impact. Grading and excavation of the landfill during the closure construction phase will expose soils temporarily and result in potential erosion from the action of both water and wind. In order to ensure that potential erosion is minimized, the landfill closure design incorporates erosion control measures that will reduce the potential for soil erosion. These features include landfill grading, vegetation, and a slope bench system. The decks will be graded in such a way as to allow for sheet flow run-off over a minimum slope of approximately three percent. In addition, any large erosion gullies formed during storm events on the deck

and slopes will be filled and the area track walked by a crawler tractor to replace and recompact the soil as part of post-closure maintenance activities. The erosion control plan is incorporated into the final design plans and specifications that is included in Appendix B. In addition a Construction Stormwater Permit will be obtained and implemented to control erosion during the construction phase of the project. Therefore, project design with the erosion control measures identified above will avoid potentially significant erosion impacts. No additional mitigation measures are required.

c. Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on-site or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Less than Significant Impact. As discussed previously the closure design of the landfill has been designed to provide and maintain slope stability to minimize the potential for slope failure. As a result, potential impacts associated with landsliding and/or slope failure is reduced to a less than significant level. Furthermore, the landfill appears to be founded on stable geologic formation with no indication of active or recent landsliding activity. As expected, the greatest settlement of the landfill is expected to occur in areas where refuse thicknesses are greatest; however, no significant settlement of the foundation subgrade underlying the landfill anticipated.

d. Be located on expansive soil, as defined in Table 18-1-B of the California Building Code (2001), creating substantial risks to life or property?

Less than Significant Impact. The project encompasses an approximate 40 acre landfill footprint that is underlain by native soil consisting of alluvium and continental terrace deposits. As previously indicated, no structures are proposed that would be exposed to potential expansive soils. Therefore, project implementation would not result in substantial risks to either life or property. No mitigation measures are required.

e. Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?

No Impact. The proposed project does not include any development that would require sewage disposal. Final closure of the SCL includes the construction of a top deck and related environmental control systems that neither generate raw sewage nor create a need for sewage disposal, including the use of septic tanks or alternative waste water disposal system. No significant impacts will occur and no mitigation measures are required.

Cumulative Impacts

Project implementation will not result in any significant cumulative impacts associated with site soils or geology because the final cover and environmental control systems proposed for the SCL have been designed to meet all applicable regulatory requirements prescribed in Title 27 of the California Code of Regulations (27 CCR), Chapters 3 and 4 and the Code of Federal Regulations (CFR) 40, Subpart F to ensure that loss of property and life is minimized on the subject property. Therefore, cumulative soils and geologic impacts are anticipated to be less than significant.

Mitigation Measures

As indicated in the analysis presented in this section, the site has been designed based on the results of the detailed soils and geologic testing and investigation conducted for the proposed project. The project as designed complies with all applicable regulatory requirements, including Title 27. As a result, potential soils and geologic impacts have been avoided or reduced to a less than significant level through project design. Therefore, no mitigation measures are required.

4.7 Greenhouse Gas Emissions

Would the project:	Potentially Significant Impact	Less than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
a. Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?			X	
b. Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?			X	

Significance Criteria:

The proposed project would result in significant adverse environmental impacts if one or more of the following conditions occur as a result of implementation:

- The project generates GHG emissions, directly or indirectly that may have a significant impact on the environment, or,

- The project conflicts with an applicable plan, policy or regulation adopted to reduce GHG emissions.

Analysis:

Illingworth and Rodkin prepared a Construction Greenhouse Gas Emissions Assessment for the proposed project (Appendix C). The assessment analyzed potential climate change/greenhouse gas impacts. The analysis presented below summarizes the findings and recommendations of that analysis and addresses the initial study checklist issues noted above.

a. Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Less than Significant Impact. Global temperatures are affected by naturally occurring and anthropogenic-generated atmospheric gases, such as water vapor, carbon dioxide, methane, and nitrous oxide. Gases that trap heat in the atmosphere are called greenhouse gases. Solar radiation enters the earth's atmosphere from space, and a portion of the radiation is absorbed at the surface. The earth emits this radiation back toward space as infrared radiation. Greenhouse gases, which are mostly transparent to incoming solar radiation, are effective in absorbing infrared radiation and redirecting some of this back to the earth's surface. As a result, this radiation that otherwise would have escaped back into space is now retained, resulting in a warming of the atmosphere. This is known as the greenhouse effect. The greenhouse effect helps maintain a habitable climate. Emissions of GHGs from human activities, such as electricity production, motor vehicle use and agriculture, are elevating the concentration of GHGs in the atmosphere, and are reported to have led to a trend of unnatural warming of the earth's natural climate, known as global warming or global climate change. The term "global climate change" is often used interchangeably with the term "global warming," but "global climate change" is preferred because it implies that there are other consequences to the global climate in addition to rising temperatures. Other than water vapor, the primary GHGs contributing to global climate change include the following gases:

- Carbon dioxide (CO2), primarily a byproduct of fuel combustion;

- Nitrous oxide (N2O), a byproduct of fuel combustion; also associated with agricultural operations such as the fertilization of crops;

- Methane (CH4), commonly created by off-gassing from agricultural practices (e.g. livestock), wastewater treatment and landfill operations;

- Chlorofluorocarbons (CFCs) were used as refrigerants, propellants and cleaning solvents, but their production has been mostly prohibited by international treaty;

- Hydrofluorocarbons (HFCs) are now widely used as a substitute for chlorofluorocarbons in refrigeration and cooling; and

- Perfluorocarbons (PFCs) and sulfur hexafluoride (SF6) emissions are commonly created by industries such as aluminum production and semiconductor manufacturing.

These gases vary considerably in terms of Global Warming Potential (GWP), a term developed to compare the propensity of each GHG to trap heat in the atmosphere relative to another GHG. GWP is based on several factors, including the relative effectiveness of a gas to absorb infrared radiation and the length of time of gas remains in the atmosphere. The GWP of each GHG is measured relative to CO2. Accordingly, GHG emissions are typically measured and reported in terms of equivalent CO2 (CO2e). For instance, SF6 is 22,800 times more intense in terms of global climate change contribution than CO2. The State of California is addressing the issue of GHG through legislation, policy guidance, and outreach programs. CO2 is the primary GHG emitted from land use and industrial projects. In 2006 California enacted AB 32 – the Global Warming Solutions Act, which requires that statewide GHG emissions be reduced to 1990 levels by 2020. In 2008, the California Air Resources Board (CARB) adopted the Climate Change Scoping Plan in response to AB 32. This plan describes the strategies that the State will implement to reduce future emissions by 28% to meet the 1990 target goal in 2020.

Per Appendix G of the CEQA Guidelines, greenhouse gas emissions are considered significant if implementation of the proposed projects would:

- Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment.

- Conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases.

Mendocino County Air Quality Management District has published CEQA thresholds of significance. However, there are no established thresholds of significance for GHG emissions during temporary construction.

Construction Emissions
CalEEMod was used to predict construction emissions in the form of CO2e. CalEEMod is a computer model developed by the South Coast Air Quality Management District (SCAQMD) with cooperation of other California Air Districts to estimate air pollutant and GHG emissions. The model is recommended by MCAQMD for use in quantifying construction and development project GHG emissions. The project applicant provided the anticipated construction schedule and proposed construction equipment, which were input to the model. An approximate 6-month construction schedule was entered in the model based on project-specific information. See *Attachment 1* for the project construction schedule. Construction phases included the following:

- Demolition and removal of piping and drain inlets;

- Site preparation;

- Grading/excavation;

- Well drilling;

- Final cover;
- Utilities (storm drain, LFG pipe);
- Construction of the LFG flare station; and
- Paving of roads.

In addition, the project size (50 acres including borrow area surfaces) was input to the model. The anticipated soil hauling volumes (114,500 cubic yards (cy) foundation layer, 3,500 cy of sand and site excavation excavation) were also input. Preparation of the LFG flare station foundation would require approximately 8 cy of concrete.

Results of modeling indicate that construction of the project would emit 460 metric tons of CO2e. As mentioned above, neither Mendocino County nor the MCAQMD have quantified thresholds for construction activities. For comparison, the emissions would be below the lowest threshold (1,100 metric tons of C02e per year for land use development projects) adopted by MCQMD and would be considered less-than significant.

It should be noted that the project applicant is encouraged to incorporate best management practices to reduce GHG emissions during construction, where feasible and applicable. Best management practices may include, but are not limited to, using alternative-fueled (e.g., biodiesel, electric) construction vehicles/equipment for at least 15 percent of the fleet, using at least 10 percent local building materials, and recycling or reusing at least 50 percent of construction waste or demolition materials.

b. Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Less than Significant Impact. While explicit thresholds and requirements for greenhouse gas emissions have yet to be developed by Mendocino County, various state agencies have begun to examine proposed land use plans and specific projects for their potential GHG impacts. Because Mendocino County is primarily rural, the amount of greenhouse gases generated by human activities (primarily the burning of fossil fuels for vehicles, heating, and other uses) is small in total compared to other, more urban counties (although higher per capita due to the distances involved in traveling around the County) and miniscule in statewide or global terms. However, like all other areas worldwide that contribute to global warming, Mendocino County will be affected by climate change and shares a responsibility to address this issue. Long-term efforts will focus on reductions in the sources of greenhouse gases in the county through a comprehensive greenhouse reduction plan for both County operations and the broader area governed by Mendocino County. In the near term, this Mendocino County General Plan identifies energy-reducing policies that will also lower overall CO_2 emissions.

The County's Resource Management Element has identified several policies that address GHG, including Policy RM 50 to implement existing strategies to reduce GHG emissions and incorporate future measures adopted by the State in the future. The Policy identifies several action items, including;

- RM 50.1 to inventory existing and historical sources of GHG in the County and coordinate with other jurisdictions to ensure completeness,
- RM 50.2 To create a GHG reduction plan for the unincorporated areas of the County that sets specific reduction strategies and targets, and
- RM 50.3 To reduce the County's GHG emissions by adopting measures that reduce the consumption

of fossil fuel.

As indicated above, the proposed project encompasses only short-term, construction impacts required to implement the final closure plan. Because the MCAQMD has not adopted a significance threshold, the significance of the project-related CO2(e) emissions, which was based on the Bay Area Air Quality Management District threshold of 1,100 MT/year for operational CO2(e) emissions, was determined to be less than significant. Furthermore, no operational GHG emissions would occur and, therefore, none of the policies adopted by the County would apply to the proposed project. Thus, the proposed project would not conflict with any long-range policy and/or program of the County.

Cumulative Impacts
Project-related cumulative impacts will not be significant because the MCAQMD does not have a threshold for construction emissions. Nonetheless, the short-term (i.e., construction) emissions of GHG will not exceed the 1,100 MT/Year threshold for operational emissions adopted by the Bay Area Air Quality Management District.

Mitigation Measures:
No significant GHG impacts will occur as a result of project implementation and no mitigation measures are required.

4.8 Hazards and Hazardous Materials

Would the project:	**Potentially Significant Impact**	**Less than Significant With Mitigation Incorporated**	**Less Than Significant Impact**	**No Impact**
a. Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?			X	
b. Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?			X	
c. Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?				X
d. Be located on a site, which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5, and, as a result, would it create a significant hazard to the public or the environment?			X	

e. For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?			X	
f. For a project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?				X
g. Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?				X
h. Expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?				X

Significance Criteria:

The proposed project would result in significant adverse environmental impacts if one or more of the following conditions occur as a result of implementation of the proposed project:

- Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials.
- Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment.
- Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school.
- Be located on a site that is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would create a significant hazard to the public or the environment.
- Result in a safety hazard for people residing or working in the project area if located within two miles of a public airport or public use airport.

Analysis:

a. Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Less than Significant Impact. The proposed project does not include any operations that would result in the transport of hazardous materials, either to or from the project site property. Final closure of the landfill includes grading and excavation associated with relocating some refuse that is located under existing power transmission lines to other locations of the landfill; however, no refuse would be transported off the site. No significant impacts are anticipated and no mitigation measures will be required.

b. Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Less than Significant Impact. Toxic air contaminants could have a substantial exposure risk if they were generated by site activities, and if there was a sensitive population in the project vicinity. Any temporary

surface disturbance of the landfill could create dust that contains naturally occurring asbestos and crystalline silica. The possible presence of these materials depends upon the geomorphology of the underlying rock of a given site. Asbestos containing minerals are typically associated with mafic and ultamafic rocks such as serpentine. A review of the geologic map for the project site does not map serpentine soils as being present.

Crystal silicon dust is mainly associated with igneous and metamorphic rock formation. The project site is underlain by alluvial deposits and continental terrace deposits. This lithology contains could contain silicon dust. Dust generation from excavation and placement of final cover will have negligible potential for generation of any hazardous materials. Any public impact potential is further mitigated by the limited duration of the activity, and by the large distance buffer between on-site emissions and the nearest off-site receptors. With the control of fugitive dust the impacts from dust will be insignificant.

c. Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

No Impact. The subject property is located in an area that is rural in nature. No schools exist within one-quarter mile of the project site. As a result, air emissions and other landfill-related emissions would not affect a school within the one-quarter mile radius criterion. No significant impact will occur and no mitigation measures are required.

d. Be located on a site, which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5, and, as a result, would it create a significant hazard to the public or the environment?

Less than Significant Impact. The Ukiah Landfill is a Class III landfill that was closed in 2001. The proposed project will result in the construction of the final cover for the landfill as well as related environmental control systems that are intended to minimize the potential for creating a hazard to the public or environment. The environmental control systems include both a landfill gas control system and a landfill gas monitoring system. The landfill gas control system includes a flare that is designed and permitted for maximum destruction of methane and non-methane organic compounds. The gas collection system and flare is designed to prevent potential landfill gas accumulation under the liner system.

In addition, landfill gas monitoring wells have been installed around the perimeter of the landfill within the property limits but outside the limits of refuse at a maximum spacing of 1,000 feet as required by Title 27. Testing of these wells is performed quarterly and the results have continually indicated no presence of landfill gas at concentrations greater than regulatory thresholds at the property boundary.

In addition, a leachate collection and removal system (LCRS) is currently operational on the landfill. The LCRS is designed to collect leachate from the landfill which is then pumped via dedicated pipeline to dispose of the leachate at the Ukiah Wastewater Treatment Facility. This system will continue to operate on the closed landfill to collect and store leachate prior to disposal.

With the incorporation of the proposed environmental control systems and continued operation of the LCRS, no potential significant risk to public health and/or the environment is anticipated. No additional mitigation measures are required.

e. For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

No Impact. There is a municipal airport located within the Ukiah Valley that is located approximately five miles west of the project site. The proposed project is limited in scope and duration and will have impact on

the use of the Ukiah Airport or present a safety hazard to the use of the airport. As a result, no hazards to or from aviation will occur; no mitigation measures are required.

f. For a project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

No Impact. No private airfields are known to exist in the vicinity of the Ukiah Landfill property. Therefore, no significant impacts will occur and no mitigation measures are required.

g. Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

No Impact. The County of Mendocino adopted an Emergency Action Plan (EAP) in May 2015 to address emergency response procedures for a wide variety of emergency situations, including hazardous materials emergencies and related events requiring response by emergency personnel and/or emergency evacuation of the population. The EAP is intended to ensure that each County facility has procedures in place to enable effective and efficient response to an emergency. As previously indicated, the proposed project would result only in the construction of the final cover and related environmental control systems at the project site to ensure that the landfill is closed in accordance with all applicable requirements prescribed in Title 27 and that no potential public health hazard remains. Although the proposed project includes the excavation of some solid waste and redisposal at another location within the landfill, potential for public health risk and/or environmental degradation is not anticipated. However, Title 27 requires an operator to prepare an Emergency Response Plan (ERP) as part of a final closure plan. An ERP is included in the Joint Technical Document for the Ukiah Landfill which includes procedures related to catastrophic events.

The ERP identifies occurrences that may exceed the design of the site and endanger public health or the environment. The ERP also sets forth actions which will minimize the effects of these catastrophic events. The provisions of this ERP will be carried out immediately whenever an event occurs such as a fire, explosion, flood, earthquake, vandalism, surface drainage problems or release of any waste product which may threaten public health and/or the environment. The ERP will be kept in the operating record at the City of Ukiah. The ERP includes specific procedures for reporting and responding to emergency situations at the project site. Implementation of the ERP will ensure that appropriate actions will be taken in accordance with the ERP to respond to any emergency situation that may occur at the project site. Therefore, no significant impacts are anticipated and no mitigation measures are required.

h. Expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Potentially Significant with Mitigation Incorporated. The proposed project is located within a moderate to high fire hazard area as designated by the California Department of Forestry and Fire Protection, the project implementation does not propose any development that would subject either structures or occupants of the site to the potential for loss, injury or death resulting from the potential for wildland fires. Final closure of the landfill will include the construction of the final cover and associated environmental control systems; however, no long-term occupancy of the site by workers or others will occur that would contribute to the potential for wildland fires. It is possible, however, that some risk of fire would exist during the construction phase of the proposed project, when heavy trucks and construction equipment necessary to implement the proposed project are being used. Such potential fire hazard may occur as a result of heavy trucks hauling materials and equipment to the site, which could start a fire. In addition, it is also possible that construction worker vehicles or other heavy equipment parked in grassy areas on the site could also cause a fire. As a result, it will be necessary to incorporate measures to reduce the potential for fires on the site and adjacent roadways. Mitigation measures that include restricting construction vehicles and heavy equipment to designated areas that are free of grass and vegetation, having a water truck present for on-site fire control, and smoking in

designated areas only will mitigate the potential for fire sources from the proposed project to a less than significant level.

Cumulative Impacts
As indicated above, final closure of the landfill will comply with all regulatory requirements in order to eliminate and/or minimize potential hazards associated with the landfill (e.g., air emissions, water quality, etc.). In addition, potential health and safety impacts would also be avoided through the implementation of the environmental control systems proposed to close the landfill. Finally, potential short- term cumulative impacts associated with fire protection would be minimized through the implementation of the mitigation prescribed for the project. No significant long-term cumulative impacts are anticipated upon completion of the final cover and associated environmental control systems because exposure to potentially hazardous conditions will be reduced to a less than significant level.

Mitigation Measures
No significant impacts are anticipated as a result of the proposed project. Potential impacts from a wildland fire should be controlled with the following mitigation measures:

MM 4.8-1 Maintain a water truck on site to control a wild land fie if it were to occur.

MM 4.8-2 Smoking shall be restricted to the controlled areas of the project site working area.

MM 4.8.3 Maintain a designated area for fuel and liquid storage that include fire extinguishers and spill control materials that are suitable for the materials used and stored at the project site.

4.9 Hydrology and Water Quality

Would the project:	**Potentially Significant Impact**	**Less than Significant With Mitigation Incorporated**	**Less Than Significant Impact**	**No Impact**
a. Violate any water quality standards or waste discharge requirements?			X	
b. Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?			X	
c. Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of stream or river, in a manner, which would result in substantial erosion or siltation on- or off-site?		X		

d. Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner, which would result in flooding on- or off-site?			X	
e. Create or contribute runoff which would exceed the capacity of existing or planned storm water drainage systems or provide substantial additional sources of polluted runoff?			X	
f. Otherwise substantially degrade water quality?			X	
g. Place housing within a 100-year flood hazard as mapped on a Federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation				X
h. Place within a 100-year flood hazard area structures, which would impede or redirect flood flows?				X
i. Expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?				X
j. Inundation by seiche, tsunami, or mudflow?				X
k. Potentially impact stormwater runoff from construction activities?			X	
l. Potentially impact stormwater runoff from post construction activities?			X	
m. Result in a potential for discharge of stormwater pollutants from areas of material storage, vehicle or equipment fueling, vehicle or equipment maintenance (including washing), waste handling, hazardous materials handling or storage, delivery areas, loading docks or other outdoor work areas?			X	
n. Result in the potential for discharge or stormwater to affect the beneficial uses of the receiving waters?			X	
o. Create the potential for significant change in the flow velocity or volume of stormwater runoff to cause environmental harm?			X	
p. Creates insignificant increases in erosion of the project site or surrounding areas?			X	

Significance Criteria:

The proposed project would result in significant adverse environmental impacts if one or more of the following conditions occur as a result of implementation of the proposed project:

- Substantial and adverse increased inundation, sedimentation and/or damage from water forces to the

subject project and/or other properties are caused by improvements such as grading, construction of barriers or structures.

- Development within the 100-year flood plain as delineated by FEMA that would expose people and/or property to potential serious injury and/or damage.

- Impervious surfaces increase and/or divert storm water runoff that results in the inability of the existing collection and conveyance facilities to accommodate the increased flows.

- Project implementation will cause a violation of water quality objectives for surface and groundwater as established by the Water Quality Control Plan and impede the existing beneficial uses of on-site surface waters or off-site coastal waters as defined in the Water Quality Control Plan.

- A usable groundwater aquifer for municipal, private, or agricultural purposes is substantially and adversely affected by depletion or recharge.

- Storm water and/or induced runoff mixes with a tidal habitat or pond causing instability to the existing water quality (e.g., reduction of salinity below 16 ppm) which, in turn, substantially and adversely affects the sensitive brackish/saltwater marsh habitat by allowing for the introduction and establishment of invasive fresh water species.

- Sediments are increased and/or diverted by proposed improvements and cause sediment deposition in defined sensitive habitat areas (e.g., wetlands, jurisdictional waters) that adversely affect or significantly affect significant habitat and/or sensitive species as recognized by the applicable resource agencies.

Analysis:

a. Violate any water quality standards or waste discharge requirements?

Less than Significant Impact with Mitigation. The project site is located adjacent to an unnamed tributary of Sulfur Creek, a tributary to the Russian River. The Russian River and its tributaries are identified as an impaired waterbody as defined by Section 303(d) of the federal Clean Water Act and 40 CFR §130.7 that identifies waterbodies that do not meet water quality standards and are not supporting their beneficial uses. The entire Russian River watershed is impaired for excessive sediment and temperature and more recently pathogen indicator bacterial impairment. A Total Maximum Daily Load (TMDL) study for sediment and temperature have not been prepared by applicable regulatory agencies. The Russian River and its tributaries support populations of coho salmon, chinook salmon and steelhead trout.

The proposed project will include large scale disturbance of the 39 acre site from activities such as grading and landform alteration necessary to construct the final cover and environmental control systems for the Ukiah Landfill. If not properly addressed, erosion may occur, which may impact water quality in the unnamed tributary. The proposed project design has erosion control features that will control and reduce the potential for soil erosion during and after the completion of the project. Erosion control measures will be implemented at the beginning of the project and maintained throughout the project cycle to maintain control of sediment from the project site area. Post project sedimentation controls are also designed into the project to include slope stabilization and placement of final erosion control features.

A Detection Monitoring Program (DMP) is currently implemented at the Landfill in accordance with 27 CCR, §20420 and Waste Discharge Requirements Order No. R1-2002-0061 issued by the North Coast Regional Water Quality Control Board and is anticipated to continue through the post closure maintenance period. The scope of the DMP includes the following monitoring and sampling activities:

- Monthly monitoring and recording of leachate discharge volumes.

- Quarterly sampling and analysis of leachate samples from the leachate wet well. The scope of analytical testing is in accordance with Table I of Monitoring and Reporting Program No. R1-2002-0061 (M&RP).

- Quarterly monitoring and recording groundwater elevations and groundwater flow directions.

- Quarterly sampling and analysis of groundwater samples from detection monitoring wells and points of compliance monitoring wells. The scope of analytical testing is in accordance with Table II of the M&RP.
- Performance of quarterly statistical analyses of groundwater chemistry data to identify exceedances of applicable concentration limits.

- Quarterly sampling and analysis of surface water samples, including semi-quantitative comparisons between upstream and downstream water chemistry data to identify potential landfill-related surface water quality impacts. The scope of analytical testing is in accordance with Table III of the M&RP.

- Performance of monthly standard observations to monitor the conditions of the WMU, the landfill perimeter, and receiving waters.

Results and findings from the aforementioned activities are summarized in a Detection Monitoring Report and submitted to the North Coast Regional Water Quality Control Board on a quarterly basis. Standard quarterly report submittals include a presentation of the sampling and monitoring procedures (including Standard Operating Procedures), tabulated summaries of leachate, groundwater, and surface water field and laboratory data, statistical analysis results and supporting calculations, groundwater potentiometric surface map, results of standard observations, and copies of Certified Analytical Reports (CARs) and associated chain-of-custody documentation. Annual reports are also prepared that include (in addition to the above information) graphical summaries of monitoring data, an evaluation of the findings.

Landfill Gas Monitoring Program

A perimeter LFG monitoring program is currently implemented at the Landfill to fulfill monitoring requirements set forth in 27 CCR, §20921. This perimeter monitoring program will continue through the post closure maintenance period in accordance with the FPCMP. The system consists of ten LFG monitoring points (GAS-1 through GAS-10). The locations of the LFG monitoring points are shown on Figure 4 (Appendix A). Each of the LFG monitoring points are equipped with one to four individual monitoring probes constructed of ¾-inch diameter polyvinyl chloride (PVC) casing and capped with labcock valves. The monitoring probes range in depth from approximately 9 to 250 feet below ground surface BGS.

In addition to fulfilling the aforementioned regulatory requirements, the monitoring of perimeter probes will provide pertinent information regarding the overall performance of the LFG collection and control system. As the installation of the final cover system could increase lateral and vertical pressures within the Landfill, thereby potentially inducing subsurface migration of LFG, the perimeter monitoring will assist in determining whether the LFG collection and control system is providing adequate subsurface migration control, including whether ongoing operation of the existing partial perimeter LFG collection system is necessary if the historical LFG migration in that area can be abated by the new system. In accordance with 27 CCR, §20934, the results of the monitoring will be reported within 90 days from when the monitoring is performed and submitted to the Local Enforcement Agency (LEA), Mendocino County Air Quality Management District (MCAQMD) and RWQCB.

The LFG collection and control system and landfill surface will also be monitored to comply with AB32 requirements in accordance with 17 CCR, §95469. The scope of monitoring will include the following:

- Instantaneous surface monitoring will be conducted on a quarterly basis to determine if surface

emissions of 500 ppmv or greater, other than non-repeatable, momentary readings, are present at any location on the WMU surface. The monitoring will be accomplished using a portable gas detector while walking in a designated 25-foot spacing interval pattern where practical.

- Integrated surface monitoring will be conducted on a quarterly basis to determine if the average methane concentration within the individual grids exceeds 25 ppmv.

- Any components of the LFG control and collection system that are under positive pressure will be monitored on a quarterly basis to determine if any leaks are present at methane concentrations exceeding 500 ppmv.

- The wellhead for each extraction well will be monitored on a monthly basis to determine whether the extraction well is being operated under vacuum conditions (i.e., negative pressure).

- The flare will be monitored for temperature and flow rate using dedicated instrumentation and the corresponding data documented using a continuous recorder. In addition, the flare will be source tested on an annual basis to verify compliance with emissions and destruction efficiency criteria.

The proposed project should not result in a violation of water quality standards or waste discharge requirements. In fact long term protection to surface and groundwater resources are expected from the final closure of the landfill from the increased stability and exposure of the site as well as the collection and control of landfill gas. No significant impacts are anticipated and no mitigation measures are required.

b. Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Less than Significant Impact. Final closure and post closure activities will not result in any potential impacts to existing groundwater supplies or groundwater recharge. The construction of a final cover cap is intended to ensure that surface water does not penetrate the final cover and enter the refuse below the cover. Surface water will be directed away from the landfill into designed collection and conveyance systems and will not, adversely affect either groundwater supplies or recharge. With the exception of short term and minor demands for water supplies during the construction phase, project implementation will not result in any long-term, unanticipated demands for potable water that would impacts the County's public water supply. Once construction of the final cover is completed, the post closure maintenance activities will not require any significant amount of water. No significant impacts are anticipated and no mitigation measures are required.

c. Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of stream or river, in a manner, which would result in substantial erosion or siltation on- or off-site?

Less than Significant with Mitigation Incorporated. Implementation of the proposed project will include mass grading and landform changes that will disturb the 39 acre project site area. The existing grade of the project site has been established through the final operations of the landfill and includes a number of slopes and benches that will be altered to final grade specifications as established in the approved engineering design standards. The proposed project implementation could lead to potential erosion and sediment discharge during the construction phase if not properly addressed in the design of the project and implemented. Design and permitting components are built into the proposed project to control and minimize the impacts to surface water and groundwater during the construction phase of the project. In addition, erosion and sediment discharge is will be minimized through the implementation of best management practices in accordance with

the Stormwater Pollution Prevention Plan.

The proposed project also includes the removal and replacement of a number of stormwater outfalls to the unnamed tributary located directly adjacent to the project area. The changes to these outfalls are very limited in extent of area disturbed as well as the fill quantities that will be required for the structures. The changes to the drainage outfalls are seen as net improvements to the existing drainage system components that were construction during the active landfill operations. The improved drainage outfalls will include minor rock outfalls located within the flow line of the tributary stream and direct stormwater to the existing channel. Engineered drawings and details of the drainage improvements are included in Appendix B.

The proposed project also includes enlarging an existing sedimentation basin located on the eastern side of the project area. The sedimentation basin is an existing structure that has been present for many years and was reportedly constructed as a means to control erosion from the barrow pit area located to the east of the landfill. The maintenance of the structure is being performed to increase the capacity of the structure as part of the proposed project and ensure the long term effectiveness and continued use of the structure. The basin was delineated as part of the wetland delineation and determined to be subject to jurisdiction by applicable agencies. Permitting is being conducted with applicable agencies for the proposed work on the structure.

In addition hydrology calculations have been completed for the proposed drainage improvements that calculate and predict runoff generation and intensity during design storm events. The results of this analysis indicates very minor changed to stream velocity and flow intensity. A copy of the hydrology calculations are included in Appendix H.

Together with the erosion control features identified above, potential erosion and siltation impacts will be reduced to a less than significant level with mitigation.

d. Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner, which would result in flooding on- or off-site?

Less than Significant Impact. Existing drainage ditches have been in place for many years and have been constructed as the landfill filling operation proceeded. The proposed project includes drainage improvements that will be installed in the same landfill footprint but as discussed several of the storm drain outfalls will be replaced or upgraded as part of the project. A perimeter ditch exists along the head of the landfill to divert water from running onto the site that is then directed around the existing landfill unit. Benches and culvert drains direct storm water runoff to interior drains and then finally to outfalls located at the toe of the landfill that drain to the unnamed tributary. Hydrology calculations have been prepared to identify runoff intensity and effects of the drainage to the unnamed tributary which are included in Appendix H.

Implementation of the proposed project will not significantly alter the existing drainage pattern of the site and would also not result in significant changes to the hydrology of the unnamed tributary. A hydrology study was prepared for the proposed project that analyzed the potential post-construction runoff that would occur following implementation of the proposed project. The proposed project has been designed to accommodate surface runoff associated with a 100-year storm event. The proposed final drainage system is shown on the Final Grading Plan enclosed in Appendix B. As a result, no significant impacts are anticipated and no mitigation measures are required.

e. Create or contribute runoff which would exceed the capacity of existing or planned storm water drainage systems or provide substantial additional sources of polluted runoff?

Less than Significant Impact. The proposed project includes the placement of final cover material to close the landfill. The cover materials are essential impermeable and have the potential of increasing peak runoff and intensity. One of the main purposes of the improvement associated with the Final Closure Improvements

is to provide a cover for the waste management unit. When constructed, the cover will provide an impermeable surface protecting the waste management unit from storm water infiltration. As a result, the cover will also increase the amount of storm water leaving the project site. Although there will be an increase in the amount of storm water leaving the project site, when analyzing the watershed upstream of and including the project site, the hydromodification impacts are minimal.

Hydrographs were developed for the pre and post closure construction and when compared, the two showed that there would be an increase in approximately 182,577 cubic feet of storm water in the watershed for a 2 year-24 hour storm event. This is a 5.3% increase. To see how the 5.3% increase would affect the hydrology of the watershed upstream of and including the project site, further calculations were performed. The calculations show that time of concentrations changed from 38.8 minutes to 38.7 minutes or 0.3% increase and for a 2 year storm event, the flows intensities increase from 369.68 cfs to 388.08 cfs or an increase of 5.0%. Further hydraulic calculations were performed to determine the hydraulic capacity of the existing channel. These calculations found that for a 2 year storm event, the flow depth increase from 3.52 feet to 3.60 feet or a 2.2 % increase and the velocity increased from 8.90 feet per second to 8.98 feet per second or a 0.9% increase. All of these increases are considered to have an impact on the overall hydrology/hydraulics of the existing unnamed drainage course.

To help alleviate some of the minor hydromodification impacts of the Final Closure Improvements, the improvements will include post construction best management practices through the use of a synthetic turf liner, routing portions of the surface drainage into an existing retention basin, and improvements to the existing drainage structures out letting into the unnamed drainage course.

The synthetic turf liner will reduce sediment loads by providing an impermeable liner on relatively steep 2:1 slopes (horizontal to vertical). Although the existing slopes are vegetated, the steep slopes provide a mechanism for sediments to enter the unnamed drainage course. This liner will protect the slopes from erosion and reduce the sediments that would come from them.

Since the project site is very congested, the design maximizes the use of storm water detention/retention through the use of an existing storm water retention basin. A portion of the site will be routed to this existing retention basin to provide storm water storage.

The Final Closure Improvements will also improve existing storm drain outlets into the unnamed drainage course. The existing outlets currently “shotgun” into the drainage course at five to six feet above the flow line, providing the potential for significant erosion. These outlets will be replaced with new ones that allow for the storm drain to outlet near the toe of the bank at an elevation of one foot above the flow line and with rock rip rap energy dissipaters at the end. This will reduce the potential for significant erosion at the storm drain outfalls. No additional mitigation measures are required.

f. Otherwise substantially degrade water quality?

Less than Significant Impact. As previously discussed, the proposed project has been designed with protection for water quality features that will effectively minimize potential siltation, the primary pollutant anticipated to occur as a result of the proposed project. Potentially significant impacts would be reduced to a less than significant level with the implementation of the water quality features and erosion control plan.

g. Place housing within a 100-year flood hazard as mapped on a Federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map?

No Impact. The proposed project is not located within the limits of a FEMA-designated 100-year floodplain. Furthermore, no residential development is proposed that would be subjected to inundation resulting from flooding. No impacts will occur.

h. Place within a 100-year flood hazard area structures, which would impede or redirect flood flows?

No Impact. As previously indicated, the subject property is not located within the limits of a 100-year floodplain and is not subject to inundation resulting from flooding. Furthermore, no structures are proposed on the project site or in a 100-year flood hazard area that would impede or redirect flood flows. No impacts will occur as a result of project implementation.

i. Expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

No Impact. The proposed project includes the construction of the final cover for the landfill and associated environmental control systems; neither structures nor people will be exposed to loss, injury or death resulting from flooding, including that caused by the failure of either a dam or levee. No impacts will occur as a result of project implementation.

j. Inundation by seiche, tsunami, or mudflow?

No Impact. A seiche involves the oscillation of a body of water in an enclosed basin, such as a reservoir, storage tank, or lake. No enclosed bodies of water are located in the immediate vicinity of the project site; therefore, no impacts from seiches are anticipated as a result of project implementation. A tsunami, commonly referred to as a tidal wave, is a sea wave generated by submarine earthquakes, major landslides, or volcanic action. The project site is located well inland, away from the Mendocino County coastline. Due to the elevation and the distance from the coastline, tsunami hazards do not exist for the project site and vicinity. Furthermore, all slopes have been designed to eliminate or minimize the potential of seismic effects that could be undermined by seismic activity or other instability. Implementation of the proposed project will not expose either people or structures to seiches, tsunamis or mudflows. Therefore, no impacts will occur as a result of project implementation.

k. Potentially impact stormwater runoff from construction activities?

Less than Significant Impact. Site preparation activities will result in some grading, including excavation associated with site preparation that would expose native soils to the effects of wind and water; however, the Stormwater Pollution Prevention Plan (SWPPP) and erosion control measures incorporated into the project design will ensure that measures are integrated into the construction activities to minimize the erosion potential and the effect on groundwater and surface water quality. With the implementation of the BMPs prescribed through the SWPPP prepared for the proposed project, potentially significant impacts will be avoided and; no mitigation measures are required.

l. Potentially impact stormwater runoff from post construction activities?

Less than Significant Impact. Post construction activities include only monitoring and maintenance of the project site to ensure that the environmental control systems are properly operating. Although some increase in surface runoff would occur as a result of the final closure plan (e.g., environmental control systems, drainage plan modification, etc.), impervious surfaces would not be increased. No activities are proposed for the project site that would result in stormwater runoff impacts associated with post-closure activities. No mitigation measures are required.

m. Result in a potential for discharge of stormwater pollutants from areas of material storage, vehicle or equipment fueling, vehicle or equipment maintenance (including washing), waste handling, hazardous materials handling or storage, delivery areas, loading docks or other outdoor work areas?

Less than Significant Impact. As previously discussed, a SWPPP will be prepared that will include appropriate BMPs to ensure that surface water discharges have been adequately controlled to minimize the discharge of sediment and other pollutants. Specifically, the BMPs will include treatment requirements

intended to reduce potential pollutants resulting from vehicle and equipment storage, equipment fueling and/or equipment maintenance and related activities that could affect surface water quality during the construction phase of the proposed project. Implementation of the BMPs will minimize potential impacts to downstream water quality resulting from project-related stormwater discharges. No additional mitigation are required.

n. Result in the potential for discharge or stormwater to affect the beneficial uses of the receiving waters?

Less than Significant Impact. As previously indicated the Russian River and its tributaries support populations of chinook and coho salmon and steelhead trout. The Russian River is listed by applicable regulatory agencies for a variety of water quality impairments. The main water quality impairment in the Russian River is sediment. Sediment sources typically are generated from a variety of natural and anthropogenic sources including road mass wasting, bank erosion, natural mass wasting, surficial road erosion, road gullies and land disturbance activities. Although project implementation could result in potential erosion, the proposed project has been designed to address the potential for the generation of sediment. Sediment control measures have been incorporated into the design of the project to minimize erosion. In addition, preparation of the mandatory SWPPP will require that construction BMPs also be implemented to ensure that potential pollutant loads are eliminated or reduced to an acceptable level. Therefore, potential impacts will be less than significant; no mitigation measures are required.

o. Create the potential for significant change in the flow velocity or volume of stormwater runoff to cause environmental harm?

Less than Significant Impact. Refer to Section 4.9e. The proposed project has been designed to accommodate post- construction surface flows generated by a 100-year storm. The runoff will be directed to drainage and conveyance facilities that have adequate capacity prior to their discharge. No significant impacts are anticipated and no mitigation measures are required.

p. Creates insignificant increases in erosion of the project site or surrounding areas?

Less than Significant Impact. Refer to Section 4.9c. As indicated in that section, project implementation could result in potential on-site erosion if not property addressed. However, the project design includes several measures to minimize both on- and off-site erosion. With the implementation of the erosion control features and erosion control plan, potential erosion impacts will be reduced to a less than significant level.

Cumulative Impacts

As indicated in the preceding analysis, the project has been designed to comply with Title 27 for landfill closures and includes an array of drainage, erosion, and water quality features to ensure that the project will not result in significant impacts within the watershed. These features will avoid or minimize not only project-related impacts but also would avoid contributing to the cumulative degradation of the drainage and water quality regime in the region. Implementation of the proposed project will not, therefore, result in potentially significant cumulative impacts.

Mitigation Measures

MM4.9-1 An erosion control plan shall be included with the project planning and design documentation that sets forth management and project site requirements for the control and minimization of sediment and erosion.

MM 4.9-2 Grading shall be prohibited after October 15 of any year without regulatory agency approval.

MM 4.9.3 Erosion control structures such as sedimentation ponds, energy dissipaters, and silt fences shall be installed prior to the start of the proposed project and maintained until project completion.

MM 4.9-4 A General Construction Storm Water Pollution Prevention Plan shall be prepared and implemented

as part of the project permitting and documentation. The SWPPP will be fully implemented and remain in effect until the completion of the project.

MM 4.9-5 Post closure monitoring and inspection will be implemented to ensure the project site remains stable and free of slope failures or sediment sources.

4.10 Land Use and Planning

Would the project:	Potentially Significant Impact	Less than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
a. Physically divide an established community?				X
b. Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?				X
c. Conflict with any applicable habitat conservation plan or natural community conservation plan?				X

Significance Criteria:

The proposed project would result in significant adverse environmental impacts if any of the following occur:

- Physically divide an established community.
- Conflict with the County of Mendocino County General Plan or zoning ordinance.
- Conflict with the Habitat Conservation Plan for Mendocino County.
- Be incompatible with adjacent land uses.

Analysis:

a. Physically divide an established community? No Impact.
The proposed project includes the implementation of the final closure plan for the project site which has been closed since 2001. The project site is located in a rural portion of Mendocino County that is surrounded entirely by open space, including forest areas with little residential development or other urban uses are located in the vicinity of the project site that would be affected by the closure or post closure activities. Furthermore, the proposed project does not include any elements or features (e.g., roadways, pipelines, etc.) that would physically divide an existing community. The end use of the landfill is open space, which is consistent and compatible with the open space and forestry uses in the project environs. Therefore, no significant conflicts with existing land uses will occur; no mitigation measures are required.

b. Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?
No Impact. Project implementation is consistent with relevant development goals and policies as specified in the County of Mendocino General Plan. Implementation of the proposed project does not include any features

that extend beyond the limits of the landfill property. No structures are proposed that would either affect the rural character of the area or directly affect existing resources following the construction of the final cover and environmental control systems. Where potential short-term adverse effects are identified, adequate mitigation measures have been prescribed and will be implemented to ensure that the adverse effects are minimized and reduced to an acceptable level.

The proposed project is also consistent with State and federal requirements for closure of landfills and includes the final cover and grading design to control stormwater, potential infiltration and accommodate future settlement, landfill slope stability, construction quality assurance, drainage and erosion control systems, LFG control and monitoring systems, groundwater/surface water monitoring systems, and site security. Each of these environmental control systems are intended to comply with all applicable regulatory requirements for closure, including public health and safety. In addition, the proposed project will also allow the CalRecycle, the NCRWQCB, and the LEA to monitor closure and post-closure activities to determine that all landfill closure and post-closure maintenance and monitoring requirements are being followed in accordance with the approved plan.

The proposed project is consistent with the applicable policies and programs adopted by the County of Mendocino. No significant land use will occur and no mitigation measures are required.

c. Conflict with any applicable habitat conservation plan or natural community conservation plan?
No Impact. There are no habitat Conservation Plan or Community Conservation Plan in place at the project site. No impacts are anticipated and no mitigation measures are required.

Cumulative Impacts

As indicated in the preceding analysis, the proposed project will not conflict with any adopted policies and/or programs of the County. No development is proposed that would divide an established community and the project does not conflict with an adopted Habitat Conservation Plan or Community Conservation Plan. As a result project implementation would not contribute to potentially significant cumulative land use impacts.

Mitigation Measures
No significant land use impacts are anticipated and no mitigation measures are required.

4.11 Mineral Resources

Would the project:	Potentially Significant Impact	Less than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
a. Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?				X
b. Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?				X

Significance Criteria:

The proposed project would result in significant adverse environmental impacts if any of the following occur:

• Project implementation will result in the loss of availability of a mineral resource identified on the County's General Plan and/or State of California documents that has economic values both locally and

regionally.

Analysis:

a. Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?

No Impact. A variety of minerals resources are known to exist in Mendocino County. The most predominant minerals found in Mendocino County are aggregate resources, primarily sand and gravel. Three sources of aggregate materials are present in Mendocino County: quarries, in-stream gravel, and terrace gravel deposits. The project site does not contain any important deposits of aggregate/sand and gravel. Furthermore, neither the Mendocino County General Plan nor the State of California has identified the project area as a potential mineral resource of State-wide or regional significance. No mineral resources are known to exist and, therefore, project implementation will not result in the loss of availability of a known mineral resource that would be important to the state, region or local area. As a result, no significant impacts will occur as a result of project implementation and no mitigation measures are required.

b. Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?

No Impact. As indicated above, the Mendocino County General Plan does not identify the project site as having potential value as a locally important mineral resource site. The proposed project will not result in the loss of any locally important mineral resource site and, therefore, no impacts will occur.

Cumulative Impacts

The proposed project would not result in the loss of any known important mineral resources. Therefore, project implementation will not result in or contribute to potentially significant cumulative impacts.

Mitigation Measures

No impacts to mineral resources will occur as a result of project implementation and no mitigation measures are required.

4.12 Noise

Would the project:	Potentially Significant Impact	Less than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
a. Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?			X	
b. Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?			X	
c. A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?			X	
d. A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?			X	

e. For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?				X
f. For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?				X

Significance Criteria:

The proposed project would result in significant adverse environmental impacts if any of the following occur:

• An increase of three dB which creates an area of noise/land use incompatibility; and/or

• The proposed project generates noise that would contribute to noise levels that exceed the State noise/land use compatibility guidelines which allow for exterior noise levels up to 70 dB CNEL; and/or

• The proposed development is exposed to noise levels that exceed the State noise/land use compatibility guidelines, which allow for exterior levels up to 70 dB CNEL; and/or

▪ The proposed development generates noise that exceeds the thresholds prescribed in the Appendix C of the Mendocino County Municipal Code (Title 20); and/or

▪ Exposure of persons to or generation of excessive groundborne vibrations or groundborne noise levels.

Analysis:

a. Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Less than Significant Impact. The Noise Element of the Mendocino County General Plan has identified noise levels for various land uses that are considered compatible with planned uses. These levels are designed to achieve acceptable interior noise levels with standard building practice while maintaining an outdoor environment that can be considered reasonably pleasant. General Plan Table 3-K (August, 2009) establishes the following exterior noise standards:

Residential	60 dB
Commercial	75 dB
Industrial	80 dB

These standards apply to land use exposure from noise sources outside of local control from sources such as transportation from road ways and airports. Noise sources that are controlled by local regulation are generally considered stationary sources. These sources include noise from a variety of sources such as mechanical equipment, amplified music, public events, barking dogs, etc. are most typically regulated by ordinance. In Mendocino County, these standards are found in Appendix C of Title 20 of the County Code Zoning Ordinance. Based on the County's noise regulations, the stationary noise standards for light and heavy industrial uses are established at 70 and 75 dBA. These levels are not to be exceeded for more than 30 minutes in any hour throughout an entire day.

Noise generation from the proposed project would result from construction activities including on-road trucking and from temporary heavy equipment operations such as grading and excavation and work related to placement and construction of the final cover. The on-road noise generation is pre-empted from local control

except for enforcement of the vehicle code for equipment. Noise from the operation of off-road equipment is controllable by ordinance. However, most jurisdictions in California exempt temporary construction equipment operations noise from numerical standards compliance as long as a number of specified conditions are met.

b. Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Less than Significant Impact. Construction activities that would be expected from the proposed project generate groundborne vibration from the operation of heavy equipment. The effects of groundborne vibration include discernible movement of building floors, rattling of windows, shaking of items on shelves or hanging on walls, and rumbling sounds. Construction activity impacts are typically highly confined to within a few feet of the noise generating activity. An exception to this may include projects that have very large equipment such as pile drivers. Such equipment will not be used for the proposed equipment. Because vibration is typically not an issue, very few jurisdictions have adopted vibration significance thresholds. Vibration thresholds have been adopted for major public works construction projects, but these relate mostly to structural protection (cracking foundations or stucco) rather than to human annoyance.

The proposed project is located in an area characterized by open space and rangeland with no sensitive land uses within 1,000 feet of the project area. There are several residential properties located to the south and southwest of the project site that include the Vichy Springs property which is greater than 500 feet from the property as well as a residential dwelling that is approximately 900 feet west of the project site area. The remainder of residential dwellings are located greater than one-quarter mile from the project site. The aspect and location of the project site area is such that it is separated by rolling topography with no line of site access to the project site area. The potential vibration levels caused by the equipment utilized for the proposed project would be less than the threshold of perceptibility. As a result, potential vibration effects associated with the use of construction equipment on the site would not result in any potentially significant groundborne vibration impacts either to structures or people. Therefore, no significant impacts will occur and no mitigation measures are required.

c. A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?

Less than Significant Impact. The proposed project is expected to be approximately six months in duration. The noise generated by the proposed project would result during the construction period required to construct the final cover and related environmental control systems for the project. With the exception of periodic on-going environmental monitoring and maintenance of the closed landfill and environmental control systems, no other long-term noise would be generated by the landfill closure. Any future noise levels associated with maintenance that may be required in the future would be neither excessive nor long-term. Therefore, no significant impacts would occur and no mitigation measures are required.

d. A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Less than Significant Impact. The proposed project will include the use of various types and sizes of construction equipment that will be utilized during construction of the proposed improvements. Stationary equipment consists of equipment that generates noise from one general area and includes items such as pumps, generators, compressors, etc. These types of equipment operate at a constant noise level under normal operation and are classified as non-impact equipment. Other types of stationary equipment such as pile drivers, jackhammers, pavement breakers, blasting operations, etc., produce variable and sporadic noise levels and often produce impact-type noises. Impact equipment is equipment that generates impulsive noise, where impulsive noise is defined as noise of short duration that is generally less than one second, high intensity, abrupt onset, rapid decay, and often rapidly changing spectral composition. For impact equipment, the noise is produced by the impact of a mass on a surface, typically repeating over time.

Mobile equipment such as bulldozers, excavators, scrapers, graders, etc., may operate in a cyclic fashion in which a period of full power is followed by a period of reduced power. Other equipment such as compressors, although generally considered to be stationary when operating, can be readily relocated to another location for the next operation.

The Federal Highway Administration Construction Noise Handbook identifies equipment and operation noise levels for various types of construction equipment that are expressed in terms of maximum noise levels at a measured distance of 50 feet from the noise source. The noise levels for the types of equipment expected to be used for the proposed project ranges from 60 to 90 decibels. These noise levels exceed the levels as set forth in the Mendocino General Plan; however due to the proximity of the project site in a rural area with greater than 500 feet of separation to residential properties, construction noise levels that exceed 70dB could result in potentially impacts to residences and wildlife. However, maintaining separation from residences and noise-sensitive biotic habitat, plus implementation of the standard measures identified at the end of this section, will maintain construction equipment noise impacts at less than significance levels.

e. For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

No Impact. The proposed project is located approximately three miles northeast of the Ukiah Municipal Airport. The project site is not located within an airport plan and the noise generated by the airport operations does not extend into the area in which the landfill is located.

f. For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

No Impact. There are no private airstrips located within the area of the project site that would either affect or be affected by the proposed project. As a result, no workers or others would be exposed to excessive noise levels associated with a private aviation facility.

Cumulative Impacts

As discussed above, all of the potential noise generated by the proposed project will be short-term in nature, lasting approximately six months during the construction phase of the proposed project. Upon completion of the project and related environmental control systems for the landfill, no long-term noise will be generated on-site. Furthermore, the proposed project is located in an area that is characterized by open space and forestlands. The short-term increase in noise generated on-site during construction as well as that resulting from the heavy truck traffic required for soil import that could adversely affect residential properties and potentially sensitive species in the project area will cease upon completion of the hauling operations. Mitigation measures are prescribed below to address the potential short-term noise impacts that will be adequate to maintain noise levels below significant levels. As a result, cumulative noise impacts caused by the proposed project will be less than significant.

Mitigation Measures

As indicated in the preceding analysis, no significant project-related noise impacts would occur as a result of project implementation. Nonetheless, project activity noise impacts can be maintained at less-than-significant levels with implementation of the following measures:

MM 4.12-1 Construction activities shall comply with standard Mendocino County conditions with respect to hours of lesser noise sensitivity, use of proper mufflers and selection of quieter equipment.

MM 4.12-2 Noise generating activities at the construction site or in areas adjacent to the construction site associated with the project in any way should be restricted to the hours of 7:00 a.m. to 6:00 p.m., Monday through Friday. No construction activities should occur on weekends or holidays.

MM 4.12-3 All internal combustion engine drive equipment should have intake and exhaust mufflers that are in good condition and appropriate for the equipment.

MM 4.12-4 Unnecessary idling of internal combustion engines should be strictly prohibited.

MM 4.12-5 Low noise air compressors and other stationary noise sources should be utilized where technology exists.

4.13 Population and Housing

Would the project:	Potentially Significant Impact	Less than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
a. Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?				X
b. Displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?				X
c. Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?				X

Significance Criteria:

The proposed project would result in significant adverse environmental impacts if any of the following occur:

- Induce substantial growth or concentration of population.
- Displace a large number of people.
- Disrupt or divide the physical arrangement of an established community.
- Be substantially inconsistent with long-range, adopted County goals and/or policies.

Analysis:

a. Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?

No Impact. Project implementation includes the final closure of the Ukiah landfill in accordance with local, regional, state and federal requirements. No residential or other development is proposed that would result in additional population growth. No infrastructure is required to be extended to the site that would induce population growth in the area. Therefore, no significant growth-inducing impacts are anticipated and no mitigation measures are required.

b. Displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?

No Impact. The proposed project includes the closure of the Ukiah Landfill and does not support any

residential dwelling units. The proposed project would not result in the displacement of any existing housing or other residential development. Therefore no loss of housing stock currently existing in Mendocino County would occur and no impacts are anticipated.

c. Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?

No Impact. As indicated above, the proposed project will not result in the elimination of any existing housing and would not displace or otherwise adversely affect residents living within the unincorporated areas of Mendocino County or other nearby communities. Therefore no impacts are anticipated and no mitigation measures are required.

Cumulative Impacts
Because the proposed project would not result in the loss of any existing housing and/or the displacement of residents, implementation of the proposed project will not contribute to the cumulative impacts to population and housing. Therefore, no significant cumulative impacts to population and housing will occur as a result of project implementation.

Mitigation Measures
Project implementation will not result in any potentially significant impacts to population and housing. No mitigation measures are required.

4.14 Public Services

Would the project:	Potentially Significant Impact	Less than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
a. Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:				
1. Fire protection?		X		
2. Police protection?			X	
3. Schools?				X
4. Parks?				X
5. Other public facilities?			X	

Significance Criteria:

The proposed project would result in significant adverse environmental impacts if any of the following occur:

- An increase in the demand for fire protection services to such a degree that accepted service standards

(e.g., manpower, equipment, response times, etc.) are not maintained.

• The interference with emergency response or evacuation plan(s) in the community or not provide internally consistent analysis or policies to guide future development.

• Expose people or structures to significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands.

• Result in response times that exceed the County's adopted maximum emergency response criteria.

• An increase in the demand for law enforcement services to such a degree that accepted service standards are not maintained without an increase in manpower and/or equipment.

• Create student enrollments that exceed available capacities of school facilities or educational services and would require the construction of new school facilities.

Analysis:

a.1. Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for fire protection?

Less than Significant with Mitigation Incorporated. The project site is located in an unincorporated area of Mendocino County that is designated as having a "high fire hazard" potential. Fire protection and emergency services are provided by the Mendocino County Fire Department in cooperation with the California Division of Forestry (CDF) through contract services. Due to the existing rangelands surrounding the project site, the project site is located in an area that has the potential for wildland fires, particularly during the summer months and dry season when grasses and other vegetation have become overgrown and dry. The proposed project would not affect the existing level of public services provided in the area. No permanent structures and/or occupants will occupy the project site following completion of the final closure components and no increase in the potential for fire would exist. The proposed project will utilize heavy equipment during the final closure activities and a fire potential does exist as a result of sparks that may be created from heavy equipment and/or vehicles that may ignite dry grass or other vegetation. Specifically, heavy trucks hauling materials and equipment to the site could start a fire along the sides of the roadways if hot mufflers and undercarriage components come in contact with dry grass and other overgrown vegetation along the side of the roadways. In addition, it is also possible that construction worker vehicles or other heavy equipment parked in grassy areas on the site could also cause a fire. As a result, it will be necessary to incorporate measures to reduce the potential for fires on the site and adjacent roadways. With the implementation of the mitigation measures prescribed below, potential impacts will be less than significant.

a.2. Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for police protection?

Less than Significant Impact. Police protection and law enforcement services in the unincorporated portions of the County are provided by the Mendocino County Sheriff Department. The project site has been inactive for several years and does not pose an existing law enforcement problem for the Sheriff Department. No significant crime or other illegal activities occur on or in the vicinity of the site that adversely affect the ability of the Sheriff Department to provide an adequate level of service. Implementation of the proposed

project will result in some short-term construction activities lasting approximately six months. During that period, increased truck and vehicular activity will occur along the roadways and highways patrolled by the Sheriff Department; however, no significant safety or other law enforcement problems that could adversely impact the existing law enforcement service are anticipated as a result of the increased truck traffic. Upon completion of the final cover construction, all of the heavy truck traffic will cease; only a small number of intermittent project- related traffic will be generated as a result of post-closure maintenance (e.g., site monitoring, etc.). The number of trips is extremely small and will not affect the current level of police protection in the area. In order to facilitate site security, the landfill disposal area has a locking gate at the entrance road.

Access to the project site is restricted with fencing and locked gates that restrict access. Security fencing, access gates and signs will be inspected quarterly to ensure that the integrity of site security has been maintained. All groundwater monitoring wells will have locking well covers. The gates will be inspected to ensure that the locks are intact. Any necessary repairs or replacements will be made during the quarterly inspection. Therefore, no significant impacts will occur as a result of project implementation and no mitigation measures are required.

a.3. Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for schools?

No Impact. The proposed project includes the final closure of the Ukiah landfill as well as the post closure maintenance activities that will be conducted at the site. No development (i.e., residential) is proposed that would result in the generation of school-age children that would affect the existing school facilities and services. As a result, no impacts to schools will occur and no mitigation measures are required.

a.4. Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for parks?

No Impact. The proposed project includes no new structures or new residential development and implementation of the proposed project will not create any demands for parks and/or recreational facilities and amenities, which are typically associated with increases in population. As a result no impacts are anticipated to parks and/or recreational facilities and no mitigation measures are required.

a.5. Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for other public facilities?

Less than Significant Impact. No governmental services would be affected as a result of project implementation. The City of Ukiah is responsible for maintaining and monitoring the project site, which will not adversely impact existing governmental services. The City of Ukiah will be responsible for ensuring that post closure maintenance activities occur pursuant to the final plan requirements. These responsibilities include ensuring that the drainage, groundwater and other environmental control systems are properly operating. These activities are anticipated and will not adversely affect the ability of municipalities to provide adequate post closure maintenance of the project site. As a result, no significant impacts are anticipated and no mitigation measures are required.

Cumulative Impacts

Project implementation would result in the final closure of the Ukiah Landfill. Because the proposed project

does not include a change in land use such as residential development that has a need for and would generate a demand for most public services (e.g., police, parks and recreation, schools, etc.), potential demands on those services are not expected to occur. However, several measures have been prescribed to ensure that any potential impacts to fire protection service and facilities are adequately addressed and would not, therefore, result in potentially significant cumulative impacts. Furthermore, without residential development, no impacts would occur either to public schools or library facilities. Therefore, no significant cumulative impacts will occur.

Mitigation Measures
Project implementation will not result in any significant impacts to police protection, schools, parks and recreational facilities and other government services and/or facilities; however, some potential for wildland fires does exist, which must be addressed. The following mitigation measures shall be incorporated into the project to address the potential wildland fire impacts.

MM 4.14-1 No vehicles, including construction worker vehicles, heavy trucks and/or equipment, shall be parked in areas covered with grass. Parking areas shall be established for all vehicles in an area that is cleared of all grass.

MM 4.14-2 A water truck shall be present on-site for fire control should flammable material ignite during the final closure construction.

4.15 Recreation

Would the project:	Potentially Significant Impact	Less than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
a. Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?				X
b. Does the project include recreational facilities or require the construction or expansion of recreational facilities, which might have an adverse physical effect on the environment?				X

Significance Criteria:

The proposed project would result in significant adverse environmental impacts if any of the following occur:

- Create a demand for recreation services that exceeds the design or use standards of existing and/or planned facilities on the adopted Recreation Element of the Mendocino County General Plan for the area.

Analysis:

a. Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

No Impact. The project proposes only the final closure of the Ukiah Landfill. No residential development is proposed that would create a demand for neighborhood and/or regional parks or other recreational facilities. Therefore, project implementation would not result in any impacts to parks and/or recreation facilities in the Mendocino County; no mitigation measures are required.

b. Does the project include recreational facilities or require the construction or expansion of recreational facilities, which might have an adverse physical effect on the environment?

No Impact. As indicated above, the proposed project does not include the residential development that could have a direct impact on the County's inventory of parks and recreational facilities. Because no residential development is proposed, no significant recreation impacts will occur. As a result, no mitigation measures are required.

Cumulative Impacts
Because no residential development that would create a demand for parks and recreational facilities in the County is proposed, the proposed project would not result in any incremental, cumulative impacts to those facilities.

Mitigation Measures
No project-related impacts to recreational facilities in the County of Mendocino are anticipated to occur; therefore, no mitigation measures are required.

4.16 Transportation/Circulation

Would the project:	Potentially Significant Impact	Less than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
a. Conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?			X	
b. Conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion			X	
c. Result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?				X
d. Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?			X	
e. Result in inadequate emergency access?			X	

f. Conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities?				X

Significance Criteria:

A project will normally have a significant adverse impact on traffic and circulation if it results in any of the following:

- An increase in traffic that is substantial in relation to the existing traffic load and capacity of the street system (i.e., result in a substantial increase in either the number of vehicle trips, the volume-to-capacity ratio on roads, or congestion at intersections).

- An increase in the level of service standard established by the County Congestion Management agency for designated roads or highways.

- An increase in hazards due to design features (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)

- Inadequate emergency access.

- Inadequate parking capacity.

- A conflict with adopted policies, plans, or programs supporting alternative transportation (e.g., bus turnouts, bicycle racks, etc.).

- Hazards or barriers to pedestrians or bicyclists.

Analysis:

a. Conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Less than Significant Impact. The proposed project is located at the eastern end of Vichy Springs Road. The greatest number of vehicular trips resulting from project implementation will occur during the construction phase. The proposed project will require site workers to travel to the site daily during the duration of the project. The number of workers will be minimal nominal and new traffic trips on Vichy Springs Road will be short-term in duration lasting a maximum of six months during the construction period. In addition to the site worker traffic trips there will be the delivery of equipment and materials to the site. For the purpose of this study we assume that a maximum of 20 workers will be at the project site on a daily basis resulting in 20 traffic trips. It is also anticipated that up to 10 traffic trips a day will occur for delivery of materials and equipment. As a result, it is anticipated that no more than 30 two-way trips per day would be generated by these activities, all of which would be added to the circulation network in the area. The addition of the 30 two-way worker and materials delivery trips would utilize Vichy Springs Road to access the project site.

In addition to worker- and materials delivery-related trips, it will also be necessary to import soils from the an off-site location to construct portions of the final cover. It is anticipated that a maximum of 3,500 cubic yards of material will be imported to the site, resulting in truck traffic during the importation process. The number

and frequency of trips depends on the source and location of the import materials. The remaining materials will be used from onsite sources.

The affected roadways have adequate capacity to accommodate the vehicular trips generated by the proposed project, which will be significantly fewer on a daily basis than the number of trips that occurred when the landfill was an operational landfill prior to 2001. It is important to note that the heavy truck trips will be short in duration depending on the source and location of the import material, which could increase the daily trip rate and reduce the duration. After that, the only project-related trips will be associated with the movement of workers to and from the site and movement of equipment and materials. In addition, these vehicular trips will be temporary in nature and will cease upon completion of the construction of the final cover. The number of vehicular trips associated with the post closure maintenance activities will be significantly less than during construction of the final cover. As a result, no significant impacts are anticipated. The addition of the project-related trips will not significantly affect the operations on existing roadways. As a result, no significant impacts are anticipated and no mitigation measures are required.

Implementation of the proposed project will not result in the generation of a significant number of vehicle trips that would cause traffic congestion beyond adopted policies and/or forecasts. The only project-related vehicular traffic generated by the proposed closure and post-closure maintenance operations would be associated with worker trips and the transport of materials and equipment to the site. The number of trips is related to the number of workers that would be employed to work on the site during closure and post-closure maintenance. It is anticipated that the onsite workers would generate a very small number of vehicular trips (approximately 20 two-way trips per day) as a result of their daily commutes. In addition, approximately ten two-way trips/day would be added to the existing traffic volumes as a result of trucks hauling materials and equipment to the site. Any contribution of trips caused by the few additional workers would be extremely modest and will not adversely affect the level of operations of any of the intersections in the vicinity of project site. Potential project-related impacts will be less than significant.

b. Conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Less than Significant Impact. Vichy Springs Road provides the only vehicular access to the project site. Due to the limited traffic along Vichy Springs Road, the addition of the haul trucks and construction vehicles would not significantly impact travel on that roadway. As a result, potential impacts will be less than significant.

c. Result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

No Impact. The Ukiah Municipal Airport is located approximately three miles southwest of the project site. Due to the distance of the proposed project to the Ukiah Municipal Airport, final closure activities, including long-term maintenance of the closed facility, will not affect aviation activities at the airport or expose workers at the site to potential hazards associated with the airport operations. The project site is not located within the area of influence of the Ukiah Municipal Airport and is neither affected by nor affects operations occurring at that aviation facility. Therefore, no significant impacts will occur and no mitigation measures are required.

d. Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?

Less than Significant Impact. The proposed project is located in an area of Mendocino County that open space and rural residential properties. Access to the project site is from Vichy Springs Road. Project implementation will necessitate the importation of approximately 3,500 cubic yards of earth material in order to construct the final cover, resulting in the generation of about 200 two-way truck trips at the site. Vichy Springs Road is a rural roadway that dead ends at the entrance to the project site. As a result little traffic

circulation is present. The posted speed limit is 35 miles per hour on Vichy Springs Road and all traffic requirements will be implemented for site worker transportation and delivery vehicles. The proposed project does not modify the design if public roadways and all of the proposed work is confined within the boundaries of the project site and increase in hazards or incompatible uses are anticipated to occur during the implementation of the project. Therefore a less than significant impact is seen from the implementation of the project.

e. Result in inadequate emergency access?

Less than Significant Impact. Vehicular and emergency access to the project site is from Vichy Springs Road. Construction workers, haul trucks, and maintenance personnel entering the site will utilize Vichy Springs Road during the implementation phase of the project. Although the number and type of vehicles will vary on a daily basis, depending on the activities undertaken, project implementation would not adversely affect access to the project site from Vichy Springs Road. No significant impacts to emergency access will occur as a result of project implementation.

f. Conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities?

No Impact. The project site is a remote site which is located beyond the urban limits of Ukiah. As such, the area of the project site is not served by public transportation and is not in an area where bicycle or pedestrian trails exist. The proposed project does not include any uses that would necessitate the transport of people using public transit and/or by other means of transportation, including bicycle trails, pedestrian trails, etc. Therefore, project implementation will not conflict with or adversely affect any existing alternative modes of transportation. No significant impacts will occur and no mitigation measures are required.

Cumulative Impacts
As indicated in the preceding analysis, potential traffic impacts associated with the project would be short-term in nature, lasting only during the construction phase. Long-term traffic generated by the proposed project would be similar to existing traffic and would be associated with monitoring and maintenance of the environmental control systems construction at the project site. The additional traffic generated by the proposed project would cease following completion of the construction activities. Therefore, no significant cumulative traffic impacts would occur.

4.17 Utilities and Service Systems

Would the project:	Potentially Significant Impact	Less than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
a. Exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?			X	
b. Require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?			X	
c. Require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant			X	
d. Have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?			X	

e. Result in a determination by the wastewater treatment provider, which serves or may serve the project that it has adequate capacity to serve the project's projected demand				X
f. Be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?				X
g. Comply with federal, state, and local statutes and regulations related to solid waste?				X

Significance Criteria:

The proposed project would result in significant adverse environmental impacts if any of the following occur:

- The project-related demand caused an increase in wastewater treatment that reached or exceeded the current capacity of existing or planned treatment facilities or caused a reduction in the level of service, thereby requiring substantial expansion of existing facilities or the construction of new facilities.
- The proposed project's use of water resources will substantially and adversely deplete existing sources of domestic water.
- The proposed project will require the construction of new water facilities beyond those already planned and the cost of which would not be borne by the applicant.
- The project will generate solid waste that exceeds the capacity of the landfill to accept and disposal of the waste.

Analysis:

a. Exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Less than Significant Impact. The Ukiah Landfill does not have a formal leachate collection and recovery system but collects landfill leachate and stormwater from a system of collection drains that is conveyed to a holding tank located on the western side of the landfill. The leachate is pumped via buried pipeline to an existing sewer trunk of the community service district operated by the City of Ukiah. Available information indicates that 519,230 gallons of leachate was collected and disposed of to the sanitary sewer in 2014. A review of this information indicates that the volume of leachate greatly increases during the winter months and in fact the leachate that is collected appears to be composed primarily of stormwater. There are no structures at the project site and no bathrooms or other facilities that generate wastewater. It is expected that the proposed project will greatly reduce the generation of leachate by stopping infiltration of stormwater into the cover of the landfill as well as improving drainage and stormwater conveyance system components. Project implementation will not require new sewer collection and/or treatment facilities and would not exceed any wastewater treatment requirements of the Regional Water Quality Control Board. Therefore, no significant impacts are anticipated and no mitigation measures are required.

b. Require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Less than Significant Impact. The proposed project will maintain the existing sewer connection for the disposal of leachate. The project will also include the removal of one existing leachate holding pond. No water mains exist in the project area. With the exception of some temporary demands for water, which would be trucked onto the site and utilized on the site during construction to suppress dust and particulate emissions

as a result of grading, implementation of the proposed project will not create a demand for potable water. Furthermore, project implementation would not require the construction of any water treatment, storage and/or distribution facilities in order to implement the proposed project. Therefore, no significant impacts are anticipated and no mitigation measures are required.

c. Require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Less than Significant Impact with Mitigation Incorporated. Project implementation includes the construction of and modification to the on-site storm drainage facilities. The existing landfill has several benches and drains that direct stormwater to an unnamed tributary located adjacent to the site. Several of the existing drains are substandard and need to be replaced. Several others will be removed and upgraded. Several additional outfalls will be abandoned. Work associated with the drainage outfalls includes work in the bed and bank of the unnamed tributary. Fill calculations and design specifications indicates that approximately three cubic yards of materials net fill will be placed at each drain that is replaced or improved. It is anticipated that fill quantities will total approximately 30 cubic yards in the bed and bank of the unnamed tributary from the storm drain improvements.

The proposed work in the bed and bank of the unnamed tributary will require permitting from applicable agencies. Permits will include a 401 Water Quality Certification from the North Coast Regional Water Quality Control Board, a 404 Clean Water Act Permit from the US Army Corps of Engineers and a 1602 Streambed Alteration Agreement from the California Department of Fish and Wildlife. The suite of permits will be supported by engineering plan and specifications for the proposed work as well as several components of mitigation and avoidance measures for the protection of fish and wildlife. As discussed herein there were no listed Federal species of plants or animals present within the project area. The Wetland Delineation did identify the presence of Waters of the US and Other Waters being present in the unnamed tributary.

While there is not an expansion of the storm water conveyance system components it is clear that work in the bed and bank of the creek will require mitigation and avoidance measures. These measures will be implemented as part of the project to minimize and mitigate conditions related to this activity. As a result, no significant impacts to storm drain facilities are anticipated and no mitigation measures are required.

d. Have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Less than Significant Impact. As indicated above, project implementation would require only temporary use of water for dust suppression during construction of the final cover and related activities that would occur. The use of water would cease upon completion of the construction activities. Once the proposed project is completed no water supplies would be necessary in the long-term to support the end use. Therefore, project implementation would not result in impacts to the existing and future water supply available to the County of Mendocino.

e. Result in a determination by the wastewater treatment provider, which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?

No Impact. As indicated above, the existing landfill discharges leachate and stormwater from the collection system to the sanitary sewer system operated by the City of Ukiah. The completion of the proposed project will reduce leachate and stormwater volumes captured and disposed of from the site. In addition no structures such as bathrooms or dwellings that generate human waste will be present at the project site that would adversely affect the existing treatment capacity of the regional wastewater treatment plan. No impacts will occur as a result of project implementation.

f. Be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

No Impact. The proposed project includes the closure of the Ukiah and the related environmental control systems. No development is proposed that would generate solid waste. Therefore, no impacts to landfill capacity will occur.

g. Comply with federal, state, and local statutes and regulations related to solid waste?

No Impact. As discussed closure of the Ukiah Landfill will be performed in accordance with the applicable regulatory standards prescribed in the California Code of Regulations Title 27, Chapters 3 and 4 and 40 Code of Federal Regulation, Subpart F. The components and systems required for closure of the landfill include the final cover and grading design to control stormwater, potential infiltration and accommodate future settlement, landfill slope stability, construction quality assurance, drainage and erosion control systems, landfill gas collection, control and monitoring systems, groundwater and surface water monitoring systems, and site security. No significant impacts will occur because the proposed project will comply with all applicable regulatory requirements.

Cumulative Impacts

Project implementation will include work in the bed and bank of the unnamed tributary that could impact water quality. It should be recognized however that the new and replaced storm drain system components will improve water quality by providing bank stability, dissipation of energy from discharge of storm water and a reduction in sediment that is currently generated by substandard storm drain system components. Mitigation and avoidance measures will be employed for this work that will mitigate the potential impacts to less than significant levels. These measures will be required by applicable regulatory agencies that will permit and oversee the work related to the storm water conveyance system improvements.

The proposed project creates only a short-term demand for water that will be used during the construction process to control fugitive dust and moisture condition materials for compaction; however, the demand for water would cease upon completion of the final closure plan and no long-term demands would occur.

The proposed project will reduce the amount of leachate and stormwater is captured and disposed of to the Ukiah wastewater treatment plant by reducing infiltration of stormwater and improving site stability.

The proposed project would also not result in the generation of any solid waste and would not, therefore, contribute to cumulative solid waste generation in Mendocino County. Because the project is consistent with the long-range plans and policies adopted for the subject site and would not create demands for water or generation sewage and/or refuse that exceed those anticipated by the County's General Plan, the potential cumulative impacts would be less than significant.

CHAPTER 5.0 – CONCLUSIONS

5.0 CONCLUSIONS

5.1 Mandatory Findings of Significance

Would the project:	Potentially Significant Impact	Less than Significant With Mitigation Incorporated	Less Than Significant Impact	No Impact
a. Does the project have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?		X		
b. Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?			X	
c. Does the project have environmental effects, which will cause substantial adverse effects on human beings, either directly or indirectly?			X	

Impact Analysis

a. Does the project have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?

Less Than Significant with Mitigation Incorporated. The project site has been highly disturbed by past landfill operations and activities that have modified the existing site features. The project site was closed in 2001 and does not accept refuse for disposal. Implementation of the proposed project will result in the construction of the final landfill cover and related environmental control systems necessary to achieve final closure. Implementation of the proposed project would not significantly degrade the quality of the environment because the subject site has been extensively altered by prior development associated with the historic use of the site as a landfill. Although some short-term potential indirect impacts may occur in the project area resulting from construction noise, generation of dust, and erosion/siltation, project implementation will not result in the loss of any sensitive habitat or species, including both terrestrial and aquatic species or to other sensitive receptors in the area surrounding the project site. The project has been designed to avoid the creation of such impacts. In addition, where potential impacts have been identified, appropriate mitigation measures have been incorporated to ensure that potential impacts to biological resources are reduced to a less than significant level. Although no cultural or scientific resources are known to be located on the site and important historic resources would not be adversely affected

by the project, monitoring during the grading phase will ensure that any potential artifacts that may be encountered can be evaluated and appropriate measures implemented. Project implementation will not substantially reduce the habitat of fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal, or eliminate important examples of major periods of California history or prehistory. As previously indicated, potentially significant impacts to biological resources are anticipated as a result of project implementation will be mitigated, resulting in less than significant impacts to those resources.

b. Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?

Less than Significant Impact. As indicated in the analysis presented in the initial study, implementation of the proposed project will not result in significant cumulative impacts. In particular, project-related impacts are short-term in nature and occurring only during the construction phase (e.g., traffic, noise, air quality, etc.). Furthermore, the project site is located in a rural area of Mendocino County with significant distance between the project site and residential or commercial development. The closest developed properties to the project site include the Vichy Springs Resort and a developed residential subdivision located to the southwest of the project site. Neither of these sites have a direct line of site to the project site and both are located a significant distance from the project. Thus, with the mitigation measures that are described herein, the short-term impacts resulting from project implementation would not contribute to cumulative long-term operational impacts such as traffic, noise, air quality, etc. Further, the proposed project does not have the potential to generate other project-related impacts that may be cumulatively considerable. Lastly, the proposed project will not have a foreseen effects of known or prospective current or future projects Therefore, no significant impacts are anticipated as a result of the implementation of the proposed project.

c. Does the project have environmental effects, which will cause substantial adverse effects on human beings, either directly or indirectly?

Less than Significant Impact. This study reviewed the proposed project's potential impacts involving each of the issues included in the environmental checklist. As concluded in these assessments, the proposed project would not result in any significant impacts related to these issues. Although project implementation will result in physical changes to the project site, the alterations are not anticipated to result in significant changes or impacts to the environment. Implementation of the proposed project does not include development that would result in any direct or indirect impacts on humans. The project proposes only to place a final cover and related environmental control systems on the existing closed landfill in compliance with Title 27 of the California Code of Regulations. The proposed project is consistent with the Mendocino County General Plan and Title 27 of the California Code of Regulations which regulates landfill closures. Potential impacts of the proposed project have been evaluated in the preceding analysis. Where potentially significant impacts have been identified, adequate mitigation measures have been proposed that would reduce such impacts to a less than significant level. Therefore, potential significant impacts are anticipated to be less than significant after the incorporation and implementation of mitigation measures prescribed in this document.

5.2 Mitigation Monitoring and Reporting Program

In accordance with the California Environmental Quality Act (CEQA), the City of Ukiah Department of Public Works prepared a Mitigated Negative Declaration (MND) and Initial Study for the proposed project located at 3100 Vichy Springs Road in Ukiah, California. The MND indicated that the potential adverse environmental impacts of the project, in terms of Biological Resources, Hydrology and Water Quality, Noise, and Transportation/Traffic could be reduced to below levels of significance or minimized with the implementation of mitigation measures. The mitigation measures have been incorporated into the project and the MND is scheduled for adoption by the City of Ukiah, in conjunction with the approval of the project.

Section 21081.6 of the Public Resources Code (PRC) and CEQA Guidelines section 15097 require the Lead Agency for each project which is subject to CEQA to monitor performance of the mitigation measures included in any environmental document to ensure that implementation does, in fact, take place. The PRC requires the Lead Agency to adopt a monitoring and reporting program that is designed to ensure compliance during project implementation. In accordance with PRC Section 21081.6 and CEQA Guidelines section 15097, the following Mitigation Monitoring Reporting Program has been prepared and will be implemented for the Ukiah Landfill Final Closure Plan. Table 5-1 lists the mitigation measures or standard conditions, responsible parties, time frame for implementation, and monitoring parties.

Table 5.1

Summary of Mitigation Measures & Implementation

Ukiah Landfill Final Closure

3100 Vichy Springs Road, Ukiah, California

Mitigation Reference	Mitigation Measure	Method of Verification	Timing of Implementation	Responsible Party
MM 4.3-1	Water shall be applied by means of truck(s), hoses, and/or sprinklers as needed prior to any land clearing or earth movement to minimize dust emissions.	Monitoring During Construction Activities	During all phases of project	Contractors & Subcontractors
MM 4.3-2	All material excavated, stockpiled, or graded shall be sufficiently watered to prevent fugitive dust from leaving the property boundaries or causing a public nuisance. Watering should occur at least twice daily, however frequency of watering shall be based on the type of operation, soil, and wind exposure	Monitoring During Construction Activities	During all phases of project	Contractors & Subcontractors
MM 4.3-3	All on-site vehicles traffic shall be limited to 15 miles per hour (mph) on unpaved roads.	Monitoring During Construction Activities	During all phases of project	Contractors & Subcontractors
MM 4.3-4	All trucks hauling soil, sand, or other loose material on public roads will be covered or required to maintain at least two feet of freeboard.	Monitoring During Construction Activities	During all phases of project	Contractors & Subcontractors
MM 4.3-5	All land clearing, grading, or earth moving activities shall be suspended as necessary, based on site conditions, to prevent excessive windblown dust when winds are expected to exceed 20 mph.	Monitoring During Construction Activities	During all phases of project	Contractors & Subcontractors
MM 4.3-6	All inactive portions of the construction site shall be covered, seeded, or watered until a suitable cover is established. Alternatively nontoxic soil stabilizers can be applied to all inactive construction areas.	Monitoring During Construction Activities	During all phases of project	Contractors & Subcontractors
MM 4.3-7	Paved areas adjacent to construction sites shall be swept or washed as required to remove excess accumulations of silt and/or mud, which may have results from grading and construction activities.	Monitoring During Construction Activities	During all phases of project	Contractors & Subcontractors
MM 4.3-8	A publically visible sign shall be posted with the telephone number and person to contact regarding dust complaints.	Monitoring During Construction Activities	During all phases of project	Contractors & Subcontractors
MM 4.4-1	Work is proposed to be conducted outside the rainy season (defined as October 15-April 15), primarily between June 15 and October 15, after the summer season when the creek flows are low, therefore no erosion or sediment control is expected to be necessary. To avoid debris contamination in the creek, a silt fence will be placed parallel to the project area in the creek to contain spoils from drilling and any concrete that may inadvertently drop into the creek during construction. All debris will be cleared out of the creek before the silt fence is removed.	Monitoring During Construction Activities	During all phases of project	Contractors & Subcontractors
MM 4.4-2	Prior to the start of construction, a US Fish and Wildlife Service-approved biologist will train all construction personnel regarding habitat sensitivity, identification of special status species, and required practices before the start of construction. The training will include the general measures that are being implemented to conserve the species as they relate to the project, the penalties for non-compliance, and the boundaries of the project area. If new construction personnel are added to the project, the contractor will ensure that the personnel receive the mandatory training before starting work. A fact sheet or other supporting materials containing this information will be prepared and distributed to all construction personnel. Upon completion of training, construction personnel will sign a form stating that they attended the training and understand all the conservation and protection measures.	Biological training will be performed initially with all contractors and subcontractors as appropriate. Biological monitoring will be conducted as necessary throughout the project implementation by qualified and trained personnel.	Initial training will be conducted at the start of the project. Additional training will be conducted as necessary throughout project as new phases of work start	Qualified biologist and trainined personnel.
MM 4.4-3	No project related activities will occur outside the exclusion fence.	Monitoring During Construction Activities	During all phases of project	Contractors & Subcontractors
MM 4.4-3	Appropriate dust abatement measures (e.g., spraying exposed areas) shall be implemented during construction if airborne dust appears to be significant.	Monitoring During Construction Activities	During all phases of project	Contractors & Subcontractors

Table 5.1

Summary of Mitigation Measures & Implementation

Ukiah Landfill Final Closure

3100 Vichy Springs Road, Ukiah, California

Mitigation Reference	Mitigation Measure	Method of Verification	Timing of Implementation	Responsible Party
MM 4.4-4	During grading, avoid side-casting excess material downslope towards the stream channel.	Monitoring During Construction Activities	During all phases of project	Contractors & Subcontractors
MM 4.4-5	All on-site storage of fuels, oils, and lubricants shall be located in an area where an accidental spill prevents this material from flowing downslope towards the stream.	Monitoring During Construction Activities	During all phases of project	Contractors & Subcontractors
MM 4.4-6	All equipment that uses fuels, oils, and/or lubricants, when not in use, shall be stored in areas where leakage and spills do not flow downslope toward the creek.	Monitoring During Construction Activities	During all phases of project	Contractors & Subcontractors
MM 4.4-7	Regular inspections of all equipment fuel lines, connections, filters, etc., shall be performed to ensure that leaks are detected and treated in a timely fashion.	Monitoring During Construction Activities	During all phases of project	Contractors & Subcontractors
MM 4.4-8	All refueling of machinery shall occur in an area where accidental spills will not flow toward the stream channel. Fuel absorbent matting and other spill containment materials shall be stored on-site and all operators shall be familiar with their proper use.	Monitoring During Construction Activities	During all phases of project	Contractors & Subcontractors
MM 4.4-9	The project site shall be restored to pre-construction condition or better. Streambank, ground and/or soil exposed as a result of construction, and soil within and above toe-rock shall be revegetated by live planting, seed casting, or hydroseeding prior to November 30 of the project year. All debris, sediment, rubbish, vegetation or other material removed from waterway shall be removed to a location where it will not re-enter the waters of the state.	Monitoring During Construction Activities	During all phases of project	Contractors & Subcontractors
MM 4.4-10	Roosting and Nesting surveys for special-status species (i.e., bats and birds) by a qualified biologist shall be conducted at the appropriate times before construction starts to determine occupancy at the site. If no special-status species are found, no further action other than the Best Management Practices identified in the Biological Assessment are required. If individuals are found, including nesting birds, a buffer zone around the species or nest will be required at a sufficient distance to prevent take of individual plants, or until after the nesting season.	Monitoring During Construction Activities	During all phases of project	Qualified biologist and trainined personnel. Contractors & Subcontractors
MM 4.4-11	Due to the potential for special-status species to occur, move through, or into the ephemeral tributary portion of the project area, an on-site monitor, shall at a minimum, check the ground beneath all equipment and stored materials each morning before construction starts to prevent take of individuals. All pipes or tubing 4 inches or greater shall be sealed by the relevant contractor with tape at both ends to prevent animals from entering the pipes at night. All trenches and other excavations shall be backfilled the same day they are opened, or shall have an exit ramp built into the excavation to allow animals to escape.	Monitoring During Construction Activities	During all phases of project	Qualified biologist and trainined personnel. Contractors & Subcontractors
MM 4.4-12	For all areas where rock is to be placed and pools are present, the applicant will capture and relocate any native amphibians found at pools nearest to the rock base placement (within 35 feet or based on a biologist recommendation). Captured native animals will be relocated to the closest pool.	Monitoring During Construction Activities	During all phases of project	Contractors & Subcontractors

Table 5.1

Summary of Mitigation Measures & Implementation

Ukiah Landfill Final Closure

3100 Vichy Springs Road, Ukiah, California

Mitigation Reference	Mitigation Measure	Method of Verification	Timing of Implementation	Responsible Party
MM 4.4-13	The proposed project could result in “take” of individual foothill yellow-legged frog known to occur within this portion of the ephemeral tributary. There is potential for both adults and tadpoles to be affected by the proposed project. Construction will occur above any existing water. If this is not possible, measures will be taken to isolate the workspace from flowing water to prevent stream sedimentation and turbidity. To prevent take of individuals a pre-construction survey of the ephemeral tributary shall be conducted 3 months in advance of work proposed for the ephemeral tributary. The surveys will determine if individuals are present. If no individuals (e.g., adults, juveniles or tadpoles) are present, no further action is required. If adults are present work in the creek shall occur after the metamorph stage of development, typically after August. This timing will ensure that individuals can leave an area of the own volition.	Monitoring During Construction Activities	During all phases of project	Qualified biologist and trainined personnel. Contractors & Subcontractors
MM 4.4-14	The proposed project could result in “take” of individual western pond turtle that may move along this portion of the ephemeral tributary and may use the ponds on the site. To prevent take of individuals a pre-construction survey of the ephemeral tributary and the ponds shall be conducted 3 months in advance of work proposed for either water body. The surveys will determine if individuals are present. If no individuals (e.g., adults, or juveniles) are present, no further action is required. If individuals are present measures to prevent take of individual foothill yellow-legged frog will address concerns for western pond turtle.	Monitoring During Construction Activities	During all phases of project	Qualified biologist and trainined personnel. Contractors & Subcontractors
MM 4.4-15	The proposed project could result in the removal of occupied passerine nests in the trees and shrubs on the project site. Disturbance during the nesting season may result in nest abandonment and mortality of young. Bird species not protected under CESA or FESA, such as some passerines (including mourning dove and scrub jays) are protected under the Fish and Game Code 3503 and the MBTA, and some raptors (including American kestrel) are protected under Fish and Game Code 3503.5 and the MBTA. These aforementioned species may potentially be impacted by the removal of potential nesting habitat in the trees within the project area. Disturbance during the nesting season (February 15- August 15) may result in the potential nest abandonment and mortality of young, which is considered a “take” of an individual. This is a potentially significant impact. To avoid “take” and/or further evaluate presence or absence of passerines, the following measures are recommended:	Monitoring During Construction Activities	During all phases of project	Qualified biologist and trainined personnel. Contractors & Subcontractors
	1. Grading or removal of nesting trees should be conducted outside the nesting season, which occurs between approximately March 1 and August 15.	Monitoring During Construction Activities	During all phases of project	Qualified biologist and trainined personnel. Contractors & Subcontractors

Table 5.1

Summary of Mitigation Measures & Implementation

Ukiah Landfill Final Closure

3100 Vichy Springs Road, Ukiah, California

Mitigation Reference	Mitigation Measure	Method of Verification	Timing of Implementation	Responsible Party
	2. If grading between August 15 and March 1 is infeasible and groundbreaking must occur within the breeding season, a pre-construction nesting bird (both passerine and raptor) survey of the grasslands and adjacent trees shall be performed by a qualified biologist within 7 days of ground breaking. If no nesting birds are observed no further action is required and grading shall occur within one week of the survey to prevent "take" of individual birds that could begin nesting after the survey.	Monitoring During Construction Activities	During all phases of project	Qualified biologist and trainined personnel. Contractors & Subcontractors
	3. If bird nests (either passerine and/or raptor) are observed during the pre-construction survey, a disturbance-free buffer zone shall be established around the nest tree(s) until the young have fledged, as determined by a qualified biologist.	Monitoring During Construction Activities	During all phases of project	Qualified biologist and trainined personnel. Contractors & Subcontractors
	4. The radius of the required buffer zone can vary depending on the species, (i.e., 75-100 feet for passerines and 200-300 feet for raptors), with the dimensions of any required buffer zones to be determined by a qualified biologist in consultation with CDFG.	Monitoring During Construction Activities	During all phases of project	Qualified biologist and trainined personnel. Contractors & Subcontractors
	5. To delineate the buffer zone around a nesting tree, orange construction fencing shall be placed at the specified radius from the base of the tree within which no machinery or workers shall intrude.	Monitoring During Construction Activities	During all phases of project	Qualified biologist and trainined personnel. Contractors & Subcontractors
	6. After the fencing is in place there will be no restrictions on grading or construction activities outside the prescribed buffer zones.	Monitoring During Construction Activities	During all phases of project	Qualified biologist and trainined personnel. Contractors & Subcontractors
MM 4.4-16	The project shall either avoid take or obtain formal incidental take coverage with the required compensatory measures where avoidance cannot be achieved for state and federally listed or proposed species, state candidates for listing, and California Native Plant Society (CNPS) Rank 1B species if they are encountered.	Monitoring During Construction Activities	During all phases of project	Qualified biologist and trainined personnel. Contractors & Subcontractors
MM 4.4-17	For species that do not have formal take protection (e.g., CNPS Rank 1B plants and federally-listed plants where there is no federal nexus), the City shall avoid, minimize, and/or compensate (in that order of preference) at the same level of mitigation as those species that are afforded formal take protection if such plant species are encountered at the project site.	Monitoring During Construction Activities	During all phases of project	Qualified biologist and trainined personnel. Contractors & Subcontractors
MM 4.4-18	If listed plant species are found on the project site, then the project applicant shall prepare a mitigation plan that describes the avoidance or compensatory mitigation measures that would be implemented for these populations. As a performance standard, the plan shall provide for no net loss in the quantity or quality of plant populations. The mitigation plan shall be submitted to the USFWS and/or CDFW for approval for federal and state-listed plants, respectively, if encountered at the project site. The mitigation plan would include the mitigation measures, which are adopted from the CNPS Policy on Mitigation Guidelines Regarding Impacts to Rare, Threatened and Endangered Plants (CNPS 1998), described below, or equally effective alternative measures:	Monitoring During Construction Activities	During all phases of project	Qualified biologist and trainined personnel. Contractors & Subcontractors
	1. Mitigation for impacts to listed plants would include avoidance measures, when feasible, and compensatory mitigation when avoidance is not possible. Avoidance measures shall include buffer zones to avoid impacting listed plants; installing exclusion fencing around the existing plant populations prior to and during construction. Compensatory mitigation shall include replanting on site or propagation of plants at a nearby conservation site through seeding or translocation. Mitigation ratios shall be sufficient to achieve performance criteria of no net loss of plants. Post-project monitoring shall verify that avoidance and mitigation measures are successful.	Monitoring During Construction Activities	During all phases of project	Qualified biologist and trainined personnel. Contractors & Subcontractors
	2. If mitigation for impacts to listed or List 1B plants occurs at a non-bank site, preference would be given to locating the mitigation site in an area as close to the project site as possible. If mitigation sites are not available in the vicinity of the project site, mitigation for listed plants may be accomplished at any site in Mendocino County that is suitable and supports the impacted plant population.	Monitoring During Construction Activities	During all phases of project	Qualified biologist and trainined personnel. Contractors & Subcontractors

Table 5.1

Summary of Mitigation Measures & Implementation

Ukiah Landfill Final Closure

3100 Vichy Springs Road, Ukiah, California

Mitigation Reference	Mitigation Measure	Method of Verification	Timing of Implementation	Responsible Party
	3. A long-term mitigation, monitoring, and management plan shall be developed for plant mitigation and submitted to the USFWS and/or CDFW for approval prior to initiation of construction activities. Mitigation sites shall be monitored for five years after installation. Depending on the actual case-by-case circumstances listed plants within the Project footprint may be salvaged and/or transplanted to a mitigation site approved by the CDFG and/or USFWS. When feasible, seed from plants unavoidably impacted shall be collected and preserved for planting on an approved mitigation site.	Monitoring During Construction Activities	During all phases of project	Qualified biologist and trainined personnel. Contractors & Subcontractors
	4. Impacted plants shall be mitigated at the ratio of 2:1, or as required by resources agencies, for both individuals and area.	Monitoring During Construction Activities	During all phases of project	Qualified biologist and trainined personnel. Contractors & Subcontractors
	5. All storage and staging areas shall be located outside of stands of listed plants.	Monitoring During Construction Activities	During all phases of project	Qualified biologist and trainined personnel. Contractors & Subcontractors
MM 4.4-19	The project shall avoid significant loss of individuals of a CNPS Rank 2, 3, or 4 (sensitive) plant species, to the extent feasible if encounted atthe project site. Avoidance measures shall include, but not be limited to, buffer zones, to avoid impacting special status plants and installation of exclusion fencing around the existing plant populations prior to and during construction. If the impacts from the project exceed 15% of the known occurrences or populations in Mendocino County, then plants shall be relocated or compensatory mitigation shall occur. The project applicant shall prepare a mitigation plan that describes the avoidance or compensatory mitigation measures that would be implemented for these populations. The mitigation plan would be submitted to the CDFW for approval and include the following, or equally effective alternative measures:	Monitoring During Construction Activities	During all phases of project	Qualified biologist and trainined personnel. Contractors & Subcontractors
	1. Prior to the initiation of construction, Rank 2, 3 or 4 plants that would be unavoidably impacted during construction shall be salvaged and transplanted or their seeds shall be collected and preserved for subsequent re-planting. The transplanted plants or seeds shall be reestablished on site if possible; otherwise, they shall be established on a mitigation parcel. Mitigation sites shall be monitored for five years after installation.	Monitoring During Construction Activities	During all phases of project	Qualified biologist and trainined personnel. Contractors & Subcontractors
	2. Impacted Rank 2, 3 or 4 plants shall be mitigated at a ratio of 1:1, or as required by resources agencies, for both individuals and area.	Monitoring During Construction Activities	During all phases of project	Qualified biologist and trainined personnel. Contractors & Subcontractors
MM 4.4-20	Removal of trees containing suitable bat roosting habitat comprised of cavities, crevices, and/or exfoliating bark, may cause direct mortality of roosting bats if removed during maternity season prior to self-sufficient volancy of pups, or in winter during torpor or hibernation. Removal of larger mature trees has the potential of causing direct mortality of solitary tree-roosting species such as western red bat or hoary bat. Presence/absence surveys for bats in trees are extremely problematic for several reasons. First, only a small percentage of trees can be effectively surveyed by inspecting crevices or cavities due to limited physical access to the roost features, or complete visual access of the feature. As a result, in most cases, trees must be surveyed at night using night vision and bioacoustic equipment to observe any bats emerging from roost features. Typically, only one, or two adjacent trees can be surveyed by each observer each night. In addition, bats are less site-faithful to trees than other roost types like caves, mines, bridges or buildings, and switch tree roosts frequently when active. Therefore, trees must be removed no more than 24-48 hours after each night emergence survey, to ensure the tree is removed prior to bats moving in subsequent to surveys. Because of these logistical limitations, it is rarely safe to rely on emergence surveys of trees if more than a few are present on a project site. Instead, it is generally more cost-effective to presume presence of roosting bats, then conduct two-step tree removal during seasonal periods of bat activity, so that bats can safely abandon the tree prior to removal. These dates are:	Monitoring During Construction Activities	During all phases of project	Qualified biologist and trainined personnel. Contractors & Subcontractors

Table 5.1

Summary of Mitigation Measures & Implementation

Ukiah Landfill Final Closure

3100 Vichy Springs Road, Ukiah, California

Mitigation Reference	Mitigation Measure	Method of Verification	Timing of Implementation	Responsible Party
	A) Between March 1 (or after evening temperatures rise above 45F and 72 hours after rains fall to less than 0.5" in 24 hours) and April 15 (maternity season), after which time non-volant pups are present in maternity roosts, and;	Monitoring During Construction Activities	During all phases of project	Qualified biologist and trainined personnel. Contractors & Subcontractors
	B) Between September 1, after young are self-sufficiently volant, and October 15, or before evening temperatures fall below 45F, and 72 hours prior to onset of rains greater than 0.5" in 24 hours.	Monitoring During Construction Activities	During all phases of project	Qualified biologist and trainined personnel. Contractors & Subcontractors
MM 4.5-1	Prior to the approval of the project Plans and Specifications, the plans and specifications stipulate that if evidence of subsurface archaeological resources are found during construction, excavation and other construction activity in that area shall cease and the contractor shall contact the Construction Engineer, who will then contact a county certified archaeologist to determine the extent of the find and take proper actions.	Monitoring During Construction Activities	During all phases of project	Contractors & Subcontractors
MM 4.5-2	If human remains are encountered, State Health and Safety Code Section 7050.5 states that no further disturbance shall occur until the County Coroner has made a determination of origin and disposition pursuant to Public Resources Code Section 5097.98. The County Coroner must be notified of the find immediately. If the remains are determined to be prehistoric, the Coroner will notify the Native American Heritage Commission (NAHC), which will determine and notify a Most Likely Descendant (MLD). With the permission of the landowner or his/her authorized representative, the MLD may inspect the site of the discovery. The MLD shall complete the inspection within 48 hours of notification by the NAHC. The City of Ukiah Public Works Department shall consult with the MLD regarding treatment and disposition of the human remains and items associated with Native American burials.	Monitoring During Construction Activities	During all phases of project	Contractors & Subcontractors
MM 4.8-1	Maintain a water truck on site to control a wild land fire if it were to occur.	Monitoring During Construction Activities	During all phases of project	Contractors & Subcontractors
MM 4.8-2	Smoking shall be restricted to the controlled areas of the project site working area.	Monitoring During Construction Activities	During all phases of project	Contractors & Subcontractors
MM 4.8.3	Maintain a designated area for fuel and liquid storage that include fire extinguishers and spill control materials that are suitable for the materials used and stored at the project site.	Monitoring During Construction Activities	During all phases of project	Contractors & Subcontractors
MM4.9-1	An erosion control plan shall be included with the project planning and design documentation that sets forth management and project site requirements for the control and minimization of sediment and erosion.	Monitoring During Construction Activities	During all phases of project	Contractors & Subcontractors
MM 4.9-2	Grading shall be prohibited after October 15 of any year without regulatory agency approval.	Monitoring During Construction Activities	During all phases of project	Contractors & Subcontractors
MM 4.9.3	Erosion control structures such as sedimentation ponds, energy dissipaters, and silt fences shall be installed prior to the start of the proposed project and maintained until project completion.	Monitoring During Construction Activities	During all phases of project	Contractors & Subcontractors
MM 4.9-4	A General Construction Storm Water Pollution Prevention Plan shall be prepared and implemented as part of the project permitting and documentation. The SWPPP will be fully implemented and remain in effect until the completion of the project.	Monitoring During Construction Activities by Qualified Stormwater Practitioner	During all phases of project	Legally Responsible Party
MM 4.9-5	Post closure monitoring and inspection will be implemented to ensure the project site remains stable and free of slope failures or sediment sources.	Monitoring After Activities	Monitoring will be conducted after compoletion of project to verify site conditions.	City of Ukiah and it's Contractors & Subcontractors
MM 4.12-1	Construction activities shall comply with standard Mendocino County conditions with respect to hours of lesser noise sensitivity, use of proper mufflers and selection of quieter equipment.	Monitoring During Construction Activities	During all phases of project	Contractors & Subcontractors
MM 4.12-2	Noise generating activities at the construction site or in areas adjacent to the construction site associated with the project in any way should be restricted to the hours of 7:00 a.m. to 6:00 p.m., Monday through Friday. No construction activities should occur on weekends or holidays.	Monitoring During Construction Activities	During all phases of project	Contractors & Subcontractors
MM 4.12-3	All internal combustion engine drive equipment should have intake and exhaust mufflers that are in good condition and appropriate for the equipment.	Monitoring During Construction Activities	During all phases of project	Contractors & Subcontractors
MM 4.12-4	Unnecessary idling of internal combustion engines should be strictly prohibited.	Monitoring During Construction Activities	During all phases of project	Contractors & Subcontractors
MM 4.12-5	Low noise air compressors and other stationary noise sources should be utilized where technology exists.	Monitoring During Construction Activities	During all phases of project	Contractors & Subcontractors
MM 4.14-1	No vehicles, including construction worker vehicles, heavy trucks and/or equipment, shall be parked in areas covered with grass. Parking areas shall be established for all vehicles in an area that is cleared of all grass.	Monitoring During Construction Activities	During all phases of project	Contractors & Subcontractors
MM 4.14-2	A water truck shall be present on-site for fire control should flammable material ignite during the final closure construction.	Monitoring During Construction Activities	During all phases of project	Contractors & Subcontractors

GENERAL NOTES

1. ALL CONSTRUCTION MATERIALS AND METHODS SHALL CONFORM TO THE REQUIREMENTS OF THE COUNTY OF MENDOCINO. ALL REFERENCES TO STATE OF CALIFORNIA, DEPARTMENT OF TRANSPORTATION STANDARD SPECIFICATIONS SHALL REFER TO THE MAY, 2006 EDITION OF THE STANDARD SPECIFICATIONS. ATTENTION IS ALSO DIRECTED TO THE STATE OF CALIFORNIA, DEPARTMENT OF TRANSPORTATION STANDARD PLANS (MAY 6, 2006) WHICH, WHEN APPLICABLE, ARE INCLUDED IN THESE DRAWINGS AND REFERENCED BY STANDARD PLAN NUMBER.
2. PUBLIC SAFETY AND TRAFFIC CONTROL SHALL BE PROVIDED IN ACCORDANCE WITH COUNTY REQUIREMENTS AND AS DIRECTED BY THE ENGINEER. SAFE VEHICULAR AND PEDESTRIAN ACCESS SHALL BE PROVIDED AT ALL TIMES DURING CONSTRUCTION.
3. A REGISTERED CIVIL ENGINEER OR LICENSED LAND SURVEYOR SHALL DO ALL FIELD STAKING AT THE EXPENSE OF THE CONTRACTOR.
4. ANY DISCREPANCY DISCOVERED BY THE CONTRACTOR IN THESE PLANS OR ANY FIELD CONDITIONS DISCOVERED BY THE CONTRACTOR THAT MAY DELAY OR OBSTRUCT THE PROPER COMPLETION OF THE WORK PER THESE PLANS SHALL BE BROUGHT TO THE ATTENTION OF THE ENGINEER IMMEDIATELY UPON DISCOVERY. SAID NOTIFICATION SHALL BE IN WRITING.
5. CONSTRUCTION CONTRACTOR AGREES THAT IN ACCORDANCE WITH GENERALLY ACCEPTED CONSTRUCTION PRACTICES, GENERAL CONTRACTOR WILL BE REQUIRED TO ASSUME SOLE AND COMPLETE RESPONSIBILITY FOR JOB SITE CONDITIONS DURING THE COURSE OF CONSTRUCTION OF THE PROJECT INCLUDING SAFETY OF ALL PERSONS AND PROPERTY; THAT THIS REQUIREMENT SHALL BE MADE TO APPLY CONTINUOUSLY AND NOT BE LIMITED TO NORMAL WORKING HOURS.
6. CONTRACTOR IS RESPONSIBLE FOR THE PROTECTION OF ALL EXISTING MONUMENTS AND OTHER SURVEY MARKERS. MONUMENTS, SURVEY MARKERS, GAS, WATER AND MONITORING DEVICES DESTROYED DURING CONSTRUCTION SHALL BE REPLACED AT THE CONTRACTOR'S EXPENSE.
7. CONTRACTOR SHALL MAINTAIN ADEQUATE DUST CONTROL PER SECTION 10, CALTRANS STANDARD SPECIFICATIONS.
8. DURING CONSTRUCTION , THE CONTRACTOR SHALL BE RESPONSIBLE FOR CONTROLLING NOISE, ODORS, DUST, AND DEBRIS TO MINIMIZE IMPACTS ON SURROUNDING PROPERTIES AND ROADWAYS. CONTRACTOR SHALL BE RESPONSIBLE THAT ALL CONSTRUCTION EQUIPMENT IS EQUIPPED WITH MANUFACTURER'S APPROVED MUFFLER BAFFLES. FAILURE TO DO SO MAY RESULT IN THE ISSUANCE OF AN ORDER TO STOP WORK.
9. CONTRACTOR SHALL INDEPENDENTLY REVIEW GROUND, TOPOGRAPHY, AND EXISTING CONDITIONS THROUGHOUT THE LIMITS OF WORK, AND ASSUME WHOLLY AND UNCONDITIONALLY THE RISK OF COMPLETING THE WORK SET OUT ON THESE PLANS, REGARDLESS OF ROCK, WATER TABLE, OR OTHER CONDITIONS WHICH THE CONTRACTOR MAY ENCOUNTER IN THE COURSE OF THE WORK.
10. THE CONTRACTOR SHALL CHECK AND VERIFY ALL DIMENSIONS AND EXISTING CONDITIONS BEFORE LAYING OUT THE WORK AND NOTIFY THE ENGINEER OF ANY DISCREPANCIES BEFORE STARTING WORK. HE SHALL BE RESPONSIBLE FOR ANY ERRORS RESULTING FROM HIS FAILURE TO DO SO.
11. DIMENSION TAKE PRECEDENCE OVER SCALE.
12. ALL WORK TO BE COMPLETED IS ACCORDANCE WITH THE PROJECT SPECIFICATIONS.

EROSION CONTROL NOTES

GENERAL

1. PERFORM EROSION PREVENTION AND SEDIMENT CONTROL IN ACCORDANCE WITH THE COUNTY OF MENDOCINO STANDARDS, CALIFORNIA DEPARTMENT OF TRANSPORTATION STANDARD SPECIFICATIONS, AND THE PROJECT CONSTRUCTION DOCUMENTS.
2. THE CONTRACTOR IS RESPONSIBLE FOR PREVENTING STORM WATER POLLUTION GENERATED FROM THE CONSTRUCTION SITE YEAR ROUND. WORK SITES WITH INADEQUATE EROSION AND SEDIMENT CONTROL MAY BE SUBJECT TO A STOP WORK ORDER.
3. IF DISCREPANCIES OCCUR BETWEEN THESE NOTES, MATERIAL REFERENCED HEREIN OR MANUFACTURER'S RECOMMENDATIONS, THEN THE MOST PROTECTIVE SHALL APPLY.
4. AT ALL TIMES THE CONTRACTOR IS RESPONSIBLE FOR OBTAINING AND COMPLYING WITH THE STATE OF CALIFORNIA NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM (NPDES) GENERAL PERMIT WASTE DISCHARGE REQUIREMENTS FOR DISCHARGES OF STORM WATER RUNOFF ASSOCIATED WITH CONSTRUCTION ACTIVITY. CONSTRUCTION ACTIVITIES INCLUDE BUT ARE NOT LIMITED TO CLEARING, GRADING, EXCAVATION, STOCKPILING, AND RECONSTRUCTION OF EXISTING FACILITIES INVOLVING REMOVAL AND REPLACEMENT.

RAINY SEASON OPERATIONS

1. THE CONTRACTOR MUST IMPLEMENT AN EFFECTIVE COMBINATION OF EROSION PREVENTION AND SEDIMENT CONTROL ON ALL DISTURBED AREAS DURING THE RAINY SEASON (OCTOBER 15 - APRIL 15). CONSTRUCTION GRADING AND DRAINAGE IMPROVEMENT SHALL BE PERMITTED DURING THE RAINY SEASON ONLY WHEN ON-SITE SOIL CONDITIONS PERMIT THE WORK TO BE PERFORMED. STORM WATER BMP'S REFERENCED OR DETAILED IN THE PERMIT AUTHORITY'S BEST MANAGEMENT PRACTICES GUIDE SHALL BE IMPLEMENTED AND FUNCTIONAL ON THE SITE AT ALL TIMES.

YEAR ROUND REQUIREMENTS

1. DURING THE NON-RAINY SEASON, ON ANY DAY WHEN THE NATIONAL WEATHER SERVICE FORECAST IS A CHANCE OF RAIN OF 30% OR GREATER WITHIN THE NEXT 24 HOURS, STORM WATER BMPS REFERENCED OR DETAILED IN PRMD'S BEST MANAGEMENT PRACTICES GUIDE SHALL BE IMPLEMENTED, INSTALLED, AND FUNCTIONAL ON THE SITE TO PREVENT SOIL AND OTHER POLLUTANT DISCHARGES. AT ALL OTHER TIMES, BMPS SHOULD BE STORED ON SITE IN PREPARATION FOR INSTALLATION PRIOR TO RAIN EVENTS.
2. EROSION PREVENTION AND SEDIMENT CONTROL MEASURES SHALL BE INSPECTED BY THE CONTRACTOR BEFORE FORECASTED STORM EVENTS AND AFTER STORM EVENTS TO ENSURE MEASURES ARE FUNCTIONING PROPERLY. EROSION PREVENTION AND SEDIMENT CONTROL MEASURES THAT HAVE FAILED OR ARE NO LONGER EFFECTIVE SHALL BE PROMPTLY REPLACED. EROSION PREVENTION AND SEDIMENT CONTROL MEASURES SHALL BE MAINTAINED UNTIL DISTURBED AREAS ARE STABILIZED.
3. THE LIMITS OF GRADING SHALL BE DEFINED AND MARKED ON SITE TO PREVENT DAMAGE TO SURROUNDING VEGETATION. PRESERVATION OF EXISTING VEGETATION SHALL OCCUR TO THE MAXIMUM EXTENT PRACTICABLE. ANY EXISTING VEGETATION WITHIN THE LIMITS OF GRADING THAT IS TO REMAIN UNDISTURBED BY THE WORK SHALL BE IDENTIFIED AND PROTECTED FROM DAMAGE BY MARKING, FENCING, OR OTHER MEASURES.
4. CHANGES TO THE EROSION PREVENTION AND SEDIMENT CONTROL PLAN MAY BE MADE TO RESPOND TO FIELD CONDITIONS AND SHALL BE NOTED ON THE PLAN.
5. DISCHARGES OF POTENTIAL POLLUTANTS FROM CONSTRUCTION SITES SHALL BE PREVENTED USING SOURCE CONTROLS TO THE MAXIMUM EXTENT PRACTICABLE. POTENTIAL POLLUTANTS INCLUDE BUT ARE NOT LIMITED TO: SEDIMENT, TRASH, NUTRIENTS, PATHOGENS, PETROLEUM HYDROCARBONS, METALS, CONCRETE, CEMENT, ASPHALT, LIME, PAINT, STAINS, GLUES, WOOD PRODUCTS, PESTICIDES, HERBICIDES, CHEMICALS, HAZARDOUS WASTE, SANITARY WASTE, VEHICLE OR EQUIPMENT WASH WATER, AND CHLORINATED WATER.
6. ENTRANCE(S) TO THE CONSTRUCTION SITE SHALL BE MAINTAINED IN A CONDITION THAT WILL PREVENT TRACKING OR FLOWING OF POTENTIAL POLLUTANTS OFFSITE. POTENTIAL POLLUTANTS DEPOSITED ON PAVED AREAS WITHIN THE COUNTY RIGHT-OF-WAY, SUCH AS ROADWAYS AND SIDEWALKS, SHALL BE PROPERLY DISPOSED OF AT THE END OF EACH WORKING DAY OR MORE FREQUENTLY AS NECESSARY. THE CONTRACTOR SHALL BE RESPONSIBLE FOR CLEANING CONSTRUCTION VEHICLES LEAVING THE SITE ON A DAILY BASIS TO PREVENT DUST, SILT, AND DIRT FROM BEING RELEASED OR TRACKED OFFSITE. ALL SEDIMENT DEPOSITED ON PAVED ROADWAYS SHALL BE REMOVED AT THE END OF EACH WORKING DAY OR MORE OFTEN AS NECESSARY.
7. ALL DISTURBED AREAS SHALL BE PROTECTED BY USING EROSION PREVENTION MEASURES TO THE MAXIMUM EXTENT PRACTICABLE, SUCH AS ESTABLISHING VEGETATION COVERAGE, HYDROSEEDING, STRAW MULCH, BLANKETS OR MATS. TEMPORARY OR PERMANENT REVEGETATION SHALL BE INSTALLED AS SOON AS PRACTICAL AFTER VEGETATION REMOVAL BUT IN ALL CASES PRIOR TO OCTOBER 15. PRIOR TO FINAL INSPECTION, ALL DISTURBED AREAS SHALL BE REVEGETATED OR LANDSCAPING SHALL BE INSTALLED.
8. WHENEVER IT IS NOT POSSIBLE TO USE EROSION PREVENTION MEASURES ON EXPOSED SLOPES, SEDIMENT CONTROL DEVICES SUCH AS FIBER ROLLS AND SILT FENCES SHALL BE INSTALLED TO PREVENT SEDIMENT MIGRATION. FIBER ROLLS AND SILT FENCES SHALL BE TRENCHED AND KEYED INTO THE SOIL AND INSTALLED ON CONTOUR. SILT FENCES SHALL BE INSTALLED APPROXIMATELY 2 TO 5 FEET FROM TOE OF SLOPE.
9. HYDROSEEDING SHALL BE CONDUCTED IN A THREE STEP PROCESS. FIRST, EVENLY APPLY SEED MIX AND FERTILIZER TO THE EXPOSED SLOPE. SECOND, EVENLY APPLY MULCH OVER THE SEED AND FERTILIZER. THIRD, STABILIZE THE MULCH IN PLACE. AN EQUIVALENT SINGLE STEP PROCESS, WITH SEED, FERTILIZER, WATER, AND BONDED FIBERS IS ACCEPTABLE.

   APPLICATIONS SHALL BE BROADCASTED MECHANICALLY OR MANUALLY AT THE RATES SPECIFIED IN THE PROJECT CONSTRUCTION DOCUMENTS.
10. DUST CONTROL SHALL BE PROVIDED BY CONTRACTOR DURING ALL PHASES OF CONSTRUCTION.
11. STORM DRAIN INLETS SHALL BE PROTECTED FROM POTENTIAL POLLUTANTS UNTIL DRAINAGE CONVEYANCE SYSTEMS ARE FUNCTIONAL AND CONSTRUCTION HAS BEEN COMPLETED.
12. ENERGY DISSIPATERS SHALL BE INSTALLED AT STORM DRAIN OUTLETS WHICH MAY CONVEY EROSIVE STORM WATER FLOW.
13. SOIL AND MATERIAL STOCKPILES SHALL BE PROPERLY PROTECTED TO MINIMIZE SEDIMENT AND POLLUTANT TRANSPORT FROM THE CONSTRUCTION SITE.
14. SOLID WASTE, SUCH AS TRASH, DISCARDED BUILDING MATERIALS AND DEBRIS, SHALL BE PLACED IN DESIGNATED COLLECTION AREAS OR CONTAINERS. THE CONSTRUCTION SITE SHALL BE CLEARED OF SOLID WASTE DAILY OR AS NECESSARY. REGULAR REMOVAL AND PROPER DISPOSAL SHALL BE COORDINATED BY THE CONTRACTOR.
15. A CONCRETE WASHOUT AREA, SUCH AS A TEMPORARY PIT, SHALL BE DESIGNATED TO CLEAN CONCRETE TRUCKS AND TOOLS. AT NO TIME SHALL CONCRETE PRODUCTS AND WASTE BE ALLOWED TO ENTER COUNTY WATERWAYS SUCH AS CREEKS OR STORM DRAINS. NO WASHOUT OF CONCRETE, MORTAR MIXERS, OR TRUCKS SHALL BE ALLOWED ON SOIL.
16. PROPER APPLICATION, CLEANING, AND STORAGE OF POTENTIALLY HAZARDOUS MATERIALS, SUCH AS PAINTS AND CHEMICALS, SHALL BE CONDUCTED TO PREVENT THE DISCHARGE OF POLLUTANTS.
17. TEMPORARY RESTROOMS AND SANITARY FACILITIES SHALL BE LOCATED AND MAINTAINED DURING CONSTRUCTION ACTIVITIES TO PREVENT THE DISCHARGE OF POLLUTANTS.
18. APPROPRIATE VEHICLE STORAGE, FUELING, MAINTENANCE, AND CLEANING AREAS SHALL BE DESIGNATED AND MAINTAINED TO PREVENT DISCHARGE OF POLLUTANTS.

SUBJECT: **Ukiah Landfill Closure, Ukiah, CA –**
Construction Greenhouse Gas Emissions Assessment

Dear David:

This letter presents the evaluation of construction greenhouse gas (GHG) emissions associated with the proposed closure of the Ukiah Landfill located in Ukiah. The proposed project will involve closure of the existing landfill, including demolition of piping and drain inlets, site preparation, grading and excavation, well drilling, final cover, utilities, construction of the landfill gas (LFG) flare station, and paving of roads.

The primary sources of GHG emissions associated with the project would be from off-road construction equipment on-site and mobile emissions from worker and hauling truck traffic. The California Emissions Estimator Model (CalEEMod) Version 2013.2.2 was used to predict emissions from construction of the project. CalEEMod is recommended by the Mendocino County Air Quality Management District (MCAQMD) for quantification of construction and development project GHG emissions.

Setting and Regulatory Background

Global temperatures are affected by naturally occurring and anthropogenic-generated (generated by humankind) atmospheric gases, such as water vapor, carbon dioxide, methane, and nitrous oxide. Gases that trap heat in the atmosphere are called greenhouse gases. Solar radiation enters the earth's atmosphere from space, and a portion of the radiation is absorbed at the surface. The earth emits this radiation back toward space as infrared radiation. Greenhouse gases, which are mostly transparent to incoming solar radiation, are effective in absorbing infrared radiation and redirecting some of this back to the earth's surface. As a result, this radiation that otherwise would have escaped back into space is now retained, resulting in a warming of the atmosphere. This is known as the greenhouse effect. The greenhouse effect helps maintain a habitable climate. Emissions of GHGs from human activities, such as electricity production, motor vehicle use and agriculture, are elevating the concentration of GHGs in the atmosphere, and are reported to have led to a trend of unnatural warming of the earth's natural climate, known as global warming or global climate change. The term "global climate change" is often used interchangeably with the term "global warming," but "global climate change" is preferred because it

implies that there are other consequences to the global climate in addition to rising temperatures. Other than water vapor, the primary GHGs contributing to global climate change include the following gases:

- Carbon dioxide (CO_2), primarily a byproduct of fuel combustion;
- Nitrous oxide (N_2O), a byproduct of fuel combustion; also associated with agricultural operations such as the fertilization of crops;
- Methane (CH_4), commonly created by off-gassing from agricultural practices (e.g. livestock), wastewater treatment and landfill operations;
- Chlorofluorocarbons (CFCs) were used as refrigerants, propellants and cleaning solvents, but their production has been mostly prohibited by international treaty;
- Hydrofluorocarbons (HFCs) are now widely used as a substitute for chlorofluorocarbons in refrigeration and cooling; and
- Perfluorocarbons (PFCs) and sulfur hexafluoride (SF_6) emissions are commonly created by industries such as aluminum production and semiconductor manufacturing.

These gases vary considerably in terms of Global Warming Potential (GWP), a term developed to compare the propensity of each GHG to trap heat in the atmosphere relative to another GHG. GWP is based on several factors, including the relative effectiveness of a gas to absorb infrared radiation and the length of time of gas remains in the atmosphere. The GWP of each GHG is measured relative to CO_2. Accordingly, GHG emissions are typically measured and reported in terms of equivalent CO_2 (CO_2e). For instance, SF_6 is 22,800 times more intense in terms of global climate change contribution than CO_2.

The State of California is addressing the issue of GHG through legislation, policy guidance, and outreach programs. CO_2 is the primary GHG emitted from land use and industrial projects. In 2006 California enacted AB 32 – the Global Warming Solutions Act, which requires that statewide GHG emissions be reduced to 1990 levels by 2020. In 2008, the California Air Resources Board (CARB) adopted the Climate Change Scoping Plan in response to AB 32. This plan describes the strategies that the State will implement to reduce future emissions by 28% to meet the 1990 target goal in 2020.

Per Appendix G of the CEQA Guidelines, greenhouse gas emissions are considered significant if implementation of the proposed projects would:

1. Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment.
2. Conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases.

MCAQMD has published CEQA thresholds of significance.[1] However, there are no established thresholds of significance for GHG emissions during temporary construction.

Construction Emissions

CalEEMod was used to predict construction emissions in the form of CO_2e. CalEEMod is a computer model developed by the South Coast Air Quality Management District (SCAQMD) with cooperation of other California Air Districts to estimate air pollutant and GHG emissions. The model is recommended by MCAQMD for use in quantifying construction and development project GHG emissions. The project

[1] MCAQMD, 2010. *Adopted Air Quality CEQA Thresholds of Significance*. June.

applicant provided the anticipated construction schedule and proposed construction equipment, which were input to the model. An approximate 5-month construction schedule was entered in the model based on project-specific information. See *Attachment 1* for the project construction schedule. Construction phases included the following:

- Demolition and removal of piping and drain inlets;
- Site preparation;
- Grading/excavation;
- Well drilling;
- Final cover;
- Utilities (storm drain, LFG pipe);
- Construction of the LFG flare station; and
- Paving of roads.

In addition, the project size (50 acres including borrow area surfaces) was input to the model. The anticipated soil hauling volumes (61,500 cubic yards (cy) foundation layer, 8,850 cy engineered fill, and 13,500 cy excavation) were also input. Preparation of the LFG flare station foundation would require approximately 8 cy of concrete.

Results of modeling indicate that construction of the project would emit 460 metric tons of CO_2e. As mentioned above, neither the County nor the MCAQMD have quantified thresholds for construction activities. For comparison, the emissions would be below the lowest threshold (1,100 metric tons of $C0_2e$ per year for land use development projects) adopted by MCAQMD and would be considered *less-than-significant*. It should be noted that the project applicant is encouraged to incorporate best management practices to reduce GHG emissions during construction, where feasible and applicable. Best management practices may include, but are not limited to, using alternative-fueled (e.g., biodiesel, electric) construction vehicles/equipment for at least 15 percent of the fleet, using at least 10 percent local building materials, and recycling or reusing at least 50 percent of construction waste or demolition materials.

* * *

This concludes our assessment of the construction GHG impacts from this project. If you have any questions or comments, please feel free to contact me at (707) 794-0400, x.35. We appreciate the opportunity to assist you.

Sincerely,

Joshua D. Carman
Illingworth & Rodkin

APPENDIX D

LFG FLARE DOCUMENTATION

AIR QUALITY MANAGEMENT DISTRICT

306 EAST GOBBI STREET
UKIAH, CA 95482
(707) 463-4354

AIR QUALITY APPLICATION FORM # 207.48

Section I — TYPE OF APPLICATION

- [x] Authority to Construct
- [ ] Permit for Existing Equipment
- [ ] Permit Update
- [ ] Transfer of Location
- [ ] Transfer of Ownership
- [ ] Registration of Equipment
- [ ] Modification of Permit- Previous Application #

Section II — APPLICATION INSTRUCTIONS (Also review List & Criteria)

A. This application must be filled out completely with all statements answered. Please type or print in black or blue ink. For permitting assistance please call the District office at 707-463-4354.
B. Applications must be accompanied by one copy of each plan, specification, and drawing required. The District may request additional information.
C. This application must be signed by the owner/operator or a responsible member of the organization that is to operate the equipment for which the application is made.
D. Incomplete applications will delay the review process. Faxed applications or copies will not be accepted.
E. Mail original signed application to: **Mendocino County AQMD, 306 E Gobbi Street Ukiah, CA, 95482**
F. Construction and/or operation prior to obtaining a permit from the District is a violation of District Regulations and subject to penalties as specified in Regulation 1, Rule 1-300(i).

Section III — APPLICANT INFORMATION

Name of Business or Organization (DBA) Permit Will be Issued to: City of Ukiah

Legal Owner (if different from DBA)

Type of Ownership: [ ] Corporation [ ] Partnership [ ] Sole Proprietor [x] Government Agency [ ] Other

Nature of Business: City/Municipality

Mailing Address, City, State, Zip: 300 Seminary Avenue, Ukiah CA 95482

Address Where Equipment is Located: 3100 Vichy Springs Road, Ukiah CA 95482

Equipment or Process Name: **Landfill Gas Control Systems**

Section IV — PROCESS DESCRIPTION

Process - Landfill Gas Control System (List equipment on Page 2)

Estimated Volume of Landfilled Waste: 1,732,000 CY (1,039,116 tons @ ~~(Cu.Yds.)~~ density of 1,200 PCY) — Estimate

Describe Type of Waste (municipal, nonbiodegradable, hazardous, etc.): Municipal

Type of Cover (i.e., clay, membrane, etc.): Membrane (upon closure) — Closure Turf™

Cover Depths: N/A Max. N/A Ft., N/A Min. N/A Ft., Average N/A Ft.

Operating Status: [ ] Accepting Waste [ ] Inactive [x] Closed

Date Waste First Accepted: 1955 Date Waste Last Accepted: 2001 Closure Date: 2016

Section V — AUTHORIZED FACILITY REPRESENTATIVE INFORMATION

Signature of Owner/Operator — Date

Name (Please Print): Tim Eriksen — Title: Director of Public Works/City Eng.

Telephone Number: (707) 463-6280 — Fax Number: (707) 463-6204

Email: teriksen@cityofukiah.com

(District Use Only) *District Receipt Stamp:*

Application #:

Facility ID #:

AIR QUALITY MANAGEMENT DISTRICT
306 EAST GOBBI STREET
UKIAH, CA 95482
(707) 463-4354

AIR QUALITY APPLICATION FORM # 207.48, Page 2

Duplicate this page as necessary for additional process equipment. List all equipment (saws, sanders, routers, loaders, etc. that produce air emissions.

Section VI LANDFILL GAS COLLECTION SYSTEM INFORMATION

What will be the end use of collected landfill gas? (Enclosed Flare, Boiler, Gas Turbine, etc.)

Enclosed Flare

Number of Gas Collection Wells: 18 (EW-1 through EW-18)

Gas Collection Well Materials of Construction:

4" Schedule 80 PVC Casing (perforated & blank), 1"-2" ϕ non-calcareous washed rock (gravel pack), Bentonite hole plug, Soil Backfill.

Well Depths: Max. 80 Ft., Min. 25 Ft., Average 52 Ft.

Will each well be equipped with a shut-off valve? Pre-fabricated Wellhead Assembly ☒ Yes ☐ No

Describe the materials to be used as packing at the well head/ landfill cover interface:

- Each well will be equipped w/ PVC wellbore seal. Seaming bentonite will be placed at membrane/casing penetration beneath the PVC wellbore seal.

Estimated volume of landfill gas to be collected each day: 302,400 Cu. Ft. (max @ 210 SCFM)

Estimated landfill gas heat content: 269 to 492 BTU/SCF

Describe the method of condensate and leachate collection and disposal: Condensate will be collected at low points within conveyance system (drop-outs) and discharged to existing leachate drain. Leachate drain discharges to vault, where it is pumped to storage tank & eventually pumped to POTW.

Describe any safety or monitoring devices for ensuring the collection system integrity: System is equipped with continuous temperature sensors. Drop in temperature would be indicative of potential leak or integrity issue. Well field & piping also inspected on regular basis to ID potential integrity issues.

Describe the equipment that will condition or process collected landfill gas: (i.e.: Enclosed Flare, Boiler, Gas Turbine, etc.)

Enclosed Flare

Number of Condition / Processing Devices: 1

What is the Methane Destruction Efficiency: >98% %

Does the control equipment have Automatic Dampers?	☒ Yes	☐ No
Does the control equipment have Automatic Shutdown?	☒ Yes	☐ No
Does the control equipment have Flame Arrestors?	☒ Yes	☐ No
Are there Continuous Recording Temperature Sensors?	☒ Yes	☐ No

What fuel will supplement unburned methane during startup and restart? ☐ Natural Gas ☒ Propane ☐ Other

Describe any backup landfill gas processing equipment or other information on Page 3:

AIR QUALITY MANAGEMENT DISTRICT
306 EAST GOBBI STREET
UKIAH, CA 95482
(707) 463-4354

AIR QUALITY APPLICATION FORM # 207.30, Page 3

Duplicate this page as necessary for additional process equipment. List all equipment that produces air emissions.

Section V EQUIPMENT INFORMATION

Equipment Description: Gas Blower (2) – See "Supplemental Information" package.
Make: Continental | Model: 08.07
Serial Number: To be determined | Horsepower: 7.5 | ☐ Portable ☒ Stationary
Power Source: ☒ Electric ☐ Diesel ☐ Natural Gas ☐ Propane ☐ Other

Equipment Description: Purge Air Blower – See "Supplemental Information" package.
Make: American Fan Company | Model: SC-800
Serial Number: To be determined | Horsepower: 3/4 | ☐ Portable ☒ Stationary
Power Source: ☒ Electric ☐ Diesel ☐ Natural Gas ☐ Propane ☐ Other

Equipment Description:
Make: | Model:
Serial Number: | Horsepower: | ☐ Portable ☐ Stationary
Power Source: ☐ Electric ☐ Diesel ☐ Natural Gas ☐ Propane ☐ Other

Equipment Description:
Make: | Model:
Serial Number: | Horsepower: | ☐ Portable ☐ Stationary
Power Source: ☐ Electric ☐ Diesel ☐ Natural Gas ☐ Propane ☐ Other

Section VI AIR POLLUTION CONTROL (ABATEMENT) DEVICE INFORMATION

Type of Afterburner Control Device: ☒ Direct Flame (Enclosed Flare) ☐ Catalyst
Make: John Zink Company LLC | Model: Enclosed ZTOF Flare
Btu/Hr: 6.2 MMBtu/hr (maximum) | Operating Temperature: 1,400 to 1,800°F
Exhaust Velocity (Ft./Min.): 271 ft/min (based on 3,400 SCFM through 4' ϕ flare)
Retention Time (Seconds): 0.7 seconds

Section VII CHEMICAL APPLICATION AND STORAGE INFORMATION

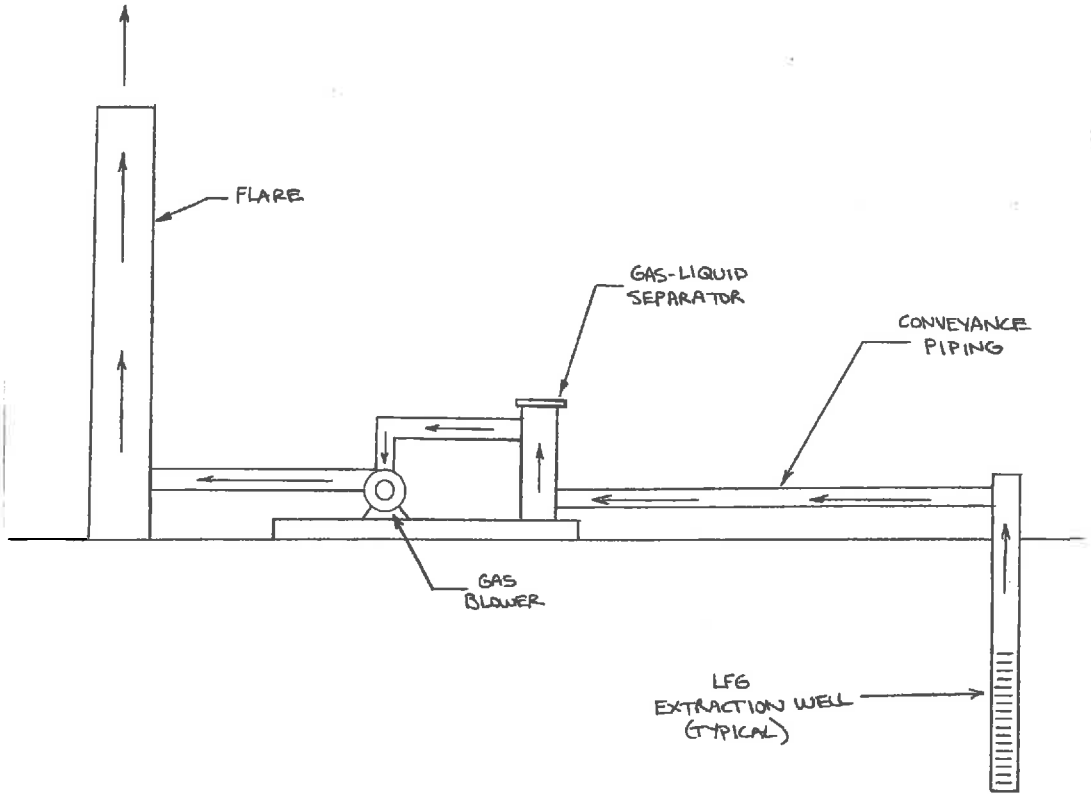
Product Identification: Not Applicable. (Include MSDS)
Method of Application: | Application Rate:
Applicator: Make: | Model:
Serial Number: | Storage Tank Size:
Power Source: ☐ Electric ☐ Diesel ☐ Natural Gas ☐ Propane ☐ Other

Describe periodic maintenance procedures to be used to ensure that emissions will be minimized:
See "Supplemental Information" package.

AIR QUALITY MANAGEMENT DISTRICT
306 EAST GOBBI STREET
UKIAH, CA 95482
(707) 463-4354

AIR QUALITY APPLICATION FORM # 207.48, Page 3

Attach a drawing showing well locations, depths, transfer piping and process equipment. Also provide a schematic of gas collection well construction and completions and a narrative about maintenance of the collection and processing equipment. Duplicate this page as necessary for each diagram.



Section VII FACILITY AND PROCESS FLOW DIAGRAM

Include adjacent buildings and streets on facility drawings.
Indicate all associated processes on process flow diagrams.

N↑

- See Appendix E (Construction Drawings) of Updated Design Plan (EBA, 2015) for various drawings/schematics requested above. Also see "Supplemental Information" package for maintenance narrative

PROCESS FLOW DIAGRAM

AUTHORITY TO CONTRUCT PERMIT APPLICATION
CITY OF UKIAH LANDFILL

SUPPLEMENTAL INFORMATION

The following provides supplemental information in support of the Authority to Construct (ATC) permit application.

SECTION IV – PROCESS DESCRIPTION

Describe Process

The process entails operation of a landfill gas (LFG) collection and control system at the City of Ukiah Landfill (Landfill). The design, which was developed to meet the requirements of Title 17 of the California Code of Regulations (17CCR), §95464(b), was summarized in a report entitled *"Design Plan for LFG Collection and Control System, City of Ukiah Landfill (Design Plan)"* dated October 2013 and submitted to the Mendocino County Air Quality Management District (MCAQMD) for regulatory approval. The MCAQMD subsequently approved the *Design Plan* in a letter dated January 2, 2014. Overall, the LFG collection and control system will consist of a series of perimeter and interior LFG extraction wells (well field), associated above ground collection system piping, condensate collection provisions, and a flare station. Operations will consist of applying a vacuum to the well field for the purpose of extracting LFG from the buried refuse mass associated with the Landfill. The LFG extracted from the well field will be conveyed via piping to a totally-enclosed vertical ground flare (flare) for subsequent combustion and destruction of the methane and non-methane organic compound (NMOC) components associated with the LFG.

SECTION VI – EQUIPMENT INFORMATION

Gas Blowers

Two gas blowers will be mounted on a packaged skid assembly. The design includes two gas blowers for the purpose of redundancy. As such, only one gas blower will be operated at any given time. Please see the shop drawings enclosed herein (Attachment 1) for illustrations of the gas blower configuration on the packaged skid assembly.

Per the ATC permit application requirements, the following additional information is provided for the gas blowers:

2.a *Inlet and Outlet Temperatures:* The inlet and outlet temperatures for the gas blowers will be approximately 100°F and 153°F, respectively.

2.b *Emission Points:* The emission point corresponds to the flare, which is described under Section VII of the ATC permit application.

2.c *Material Entering/Leaving Equipment:* The material entering and leaving the gas blowers will be LFG, which is generally comprised of approximately 30 to 55 percent methane, 30 to 40 percent carbon dioxide, 5 to 10 percent nitrogen, 0 to 5 percent oxygen, and 50 to 1,200 parts per million by volume (ppmv) NMOCs.

2.d *Energy Consumption:* 5.6 KW/hr.

2.e *Operation Frequency:* Continuous

Purge Air Blower

The flare will be equipped with a purge air blower for the purpose of purging the flare cylinder prior to startup. Please see the shop drawings enclosed herein (Attachment 1) for illustrations of the purge air blower for the flare.

Per the ATC permit application requirements, the following additional information is provided for the purge air blower:

2.a *Inlet and Outlet Temperatures:* The inlet and outlet temperatures for the purge air blower will be equal to ambient temperatures at the time the blower is in operation.

2.b *Emission Points:* The emission point corresponds to the top of the flare, which is described under Section VII of the ATC permit application.

2.c *Material Entering/Leaving Equipment:* The material entering and leaving the purge air blower will be ambient air.

2.d *Energy Consumption:* 0.6 KW/hr.

2.e *Operation Frequency:* Intermittent

Remaining Components

The remaining components associated with the LFG collection and control system do not include equipment that qualify under this section. These components include: LFG extraction wells; LFG conveyance piping; gas-liquid separator for removal of moisture from the LFG stream prior to entering the gas blowers (packaged skid assembly); and system control panel (packaged skid assembly).

SECTION VII – AIR POLLUTION CONTROL (ABATEMENT) DEVICE INFORMATION

1.a *Type of Control Device:* Totally enclosed vertical ground flare

1.b *Equipment Make and Model:* Enclosed ZTOF Flare manufactured by John Zink Company LLC

1.c Not Applicable

1.d *Type of Material to be Controlled:* LFG

1.e *Type of Collection Device for Controlled Material:* LFG extraction wells and conveyance piping.

1.f *Calculations / Drawings:* See *Design Plan* (previously submitted) and enclosed shop drawings (Attachment 1) for details of the control device.

2.a *Schematic of Air Pollution Control Equipment:* See enclosed shop drawings (Attachment 1).

2.b *Inlet and Outlet Concentrations:* The inlet concentrations of the LFG are estimated to be as follows (approximate): 30 to 55 percent methane; 30 to 40 percent carbon dioxide; 5 to 10 percent nitrogen; 0 to 5 percent oxygen; and 50 to 1,200 ppmv NMOCs.

The outlet concentrations and/or destruction efficiency of the flare are expected to be as follows:

- Overall Destruction Efficiency: 98 percent by weight
- NOx, lb / MMBTU: 0.05
- CO, lb / MMBTU: 0.20

2.c *Control Efficiency:* Control efficiency will be determined through source testing. Per 17CCR, §95464(b)(4)(A), source testing will be initially performed on an annual basis. However, if the flare remains in compliance after three consecutive source tests, the annual source test frequency will be extended to every three years.

2.d Not Applicable

2.e *Energy Consumption:* The energy consumption for the flare is negligible as compared to the gas blowers. Components requiring energy include pilot ignitor (startup only), purge air blower (startup only), actuated control damper, flame detection system, and thermocouples.

2.f *Height of Outlet Above Ground Level:* 30 feet

2.g *Size and Shape of Outlet:* 4-foot round

2.h *Flow Rate of Exhaust Gases:* 3,400 standard cubic feet per minute (assumes an operating temperature of 1,600°F)

2.i *Outlet Temperature:* 1,400°F to 1,800°F

2.j *Estimated Quantities of Pollutants Emitted:* The following provides a summary of the estimated quantities of pollutants to be emitted by the flare:

- Methane Emissions: 0.81 to 5.9 pounds per hour (lbs/hr)
- NMOCs Emissions: 0.01 to 0.04 lbs/hr
- SO2 Emissions: 0.02 to 0.06 lbs/hr
- NOX Emissions: 0.05 to 0.37 lbs/hr
- CO Emissions: 0.17 to 1.2 lbs/hr

2.k *Copies of Calculations:* See Attachment 2 for emissions calculations.

SECTION IX – PERIODIC MAINTENANCE PROCEDURES

The LFG collection and control system will be monitored and maintained as outlined in the *Design Plan* (previously submitted). Upon initial startup, the system will be monitored on a weekly basis, then transition to at least monthly once the well field concentrations have stabilized. During these weekly/monthly monitoring events, the various system components (i.e., well heads, conveyance piping, packaged skid assembly, and flare) will be inspected to identify any maintenance and repairs that might be necessary to ensure optimal operating conditions. In addition, all equipment associated with the packaged skid assembly and flare (i.e., gas blowers, gas-liquid separator, flame arrestor, etc.) will be maintained and serviced in accordance with the manufacturer's recommendations. Finally, the flare will be source tested in accordance with the frequency stipulated in 17CCR, §95464(b)(4)(A) to verify ongoing compliance with applicable emission standards.

AUTOMATIC TELEPHONE DIALER

MANUFACTURER: PHONETICS
MODEL: SENSAPHONE FGD-1800-CD
QUANTITY: ONE (1) REQUIRED

FEATURES: 8 UNIVERSALLY CONFIGURABLE INPUT CHANNELS, APPROXIMATE 12 HOUR RECHARGABLE BATTERY, STATUS AND CHANNEL INDICATING LIGHTS

CONFIGURATION:
CHANNEL 1: FLAME FAILURE
CHANNEL 2: FLARE HIGH TEMPERATURE
CHANNEL 3: FLARE LOW TEMPERATURE
CHANNEL 4: AUTOMATIC BLOCK VALVE FAILURE
CHANNEL 5: BL-103 GAS BLOWER FAILURE
CHANNEL 6: BL-104 GAS BLOWER FAILURE
CHANNEL 7: SEPARATOR HIGH LEVEL ALARM
CHANNEL 8: GENERAL ALARM

POWER: 120 V, SINGLE PHASE, 60 HZ WITH POWER CORD

CENTRIFUGAL GAS BLOWER

MANUFACTURER:	CONTINENTAL
MODEL:	08.07
QUANTITY:	TWO (2) REQUIRED
FEATURES:	INLET DIRECT DRIVE; CAST ALUMINUM INLET AND OUTLET HEADS; CAST ALUMINUM INTERMEDIATE SECTIONS; CAST ALUMINUM ALLOY IMPELLERS MOUNTED ON CARBON STEEL SHAFT SUPPORTED BY TWO GREASE LUBRICATED BALL BEARINGS; COMMON STEEL BASE PLATE; EXTERNAL DRAIN CONNECTION WITH PLUG; VIBRATION ISOLATION MOUNTING PADS; 4" DIAMETER VERTICAL INLET AND OUTLET CONNECTIONS
OPTIONS:	1/2" DIAMETER NPT CONNECTION IN EACH BEARING HOUSING FOR A SEPARATE THERMOCOUPLE 1/2" DIAMETER NPT CONNECTION IN EACH INBOARD BEARING HOUSING FOR A SEPARATE VIBRATION TRANSMITTER
MOTOR:	7.5 HP, 480 V, THREE PHASE, 60 HZ, TOTALLY ENCLOSED FAN COOLED (TEFC) MOTOR WITH 120 V INTEGRAL HEATER AND SUITABLE FOR VARIABLE FREQUENCY DRIVE OPERATION
DESIGN CONDITIONS:	LANDFILL GAS AT 100 °F, 210 SCFM MAXIMUM, -35" H_2O INLET, 10" H_2O DISCHARGE, 55% METHANE (CH_4) MAXIMUM, 45% CARBON DIOXIDE (CO_2), 705' ELEVATION

NOTES
1. * - SUPPLIED BY JOHN ZINK CO. AND SHIPPED LOOSE FOR FIELD INSTALLATION.
2. ** - SUPPLIED BY OTHERS (NOT BY JOHN ZINK CO.)
3. ELECTRICAL AREA CLASSIFICATION: NON-HAZARDOUS
4. IGNITION TRANSFORMER IS INSIDE PNL-103 AND MOUNTED ON FLARE.
5. TEMPERATURE CONTROL THERMOCOUPLE (TE-202) IS SELECTED DEPENDING ON GAS FLOW RATE TO FLARE. EQUIPMENT DAMAGE MAY OCCUR IF THE IMPROPER ELEVATION IS SELECTED.
6. DAMPER TCV-202A IS AUTOMATIC.
7. LOCATE FLOW ELEMENT WITH 10 DIAMETERS OF STRAIGHT UNDISTURBED FLOW UPSTREAM AND 5 DIAMETERS DOWNSTREAM.
8. LOCATE FLAME ARRESTOR AT FLARE INLET WITH 5 DIAMETERS OF STRAIGHT UNDISTURBED FLOW UPSTREAM.
9. THERMOCOUPLE WIRE AND IGNITION WIRE SUPPLIED BY JOHN ZINK CO. AND SHIPPED LOOSE FOR FIELD INSTALLATION.
10. PNL-101, PNL-102, VFD-103 & VFD-104 ARE TO BE U.L. LISTED AS INDUSTRIAL CONTROL PANELS.

HIGH TEMPERATURE SHUTDOWN THERMOCOUPLE LOCATION

GAS FLOW (SCFM)	TE-201 ELEVATION (FT)
ALL FLOW RATES	17'-0"

TEMPERATURE CONTROL THERMOCOUPLE LOCATION AT MAXIMUM METHANE CONCENTRATION

GAS FLOW (SCFM)	TE-202 ELEVATION (FT)
53 - 105	17'-0"
105 - 158	22'-8"
158 - 210	28'-0"

INTRODUCTION

This report and attachments presents the results of seasonal protocol level surveys conducted for special status plants for the Ukiah Landfill Closure Project located at 3100 Vichy Springs Road, Ukiah, Mendocino County, CA. This work was conducted on behalf of the City of Ukiah, who is the project proponent or applicant. The assessor parcel number (APN) for the project study area is 027-020-069. This report is an addendum to the Biological Resource Assessment report prepared by Wildlife Research Associates and Jane Valerius Environmental Consulting for the City of Ukiah dated May 27, 2015.

The Ukiah Landfill Closure project is located approximately three miles east of Ukiah in Mendocino County, California and is located on the Ukiah USGS 7.5-minute quadrangle. The Landfill occupies approximately 40 acres of permitted landfill area on a 284-acre parcel. The Landfill has been graded to form a series of flat terraces stepping down from south to north. The project study area included a 50-foot buffer around the landfill and included some natural oak woodland communities, constructed ponds and natural creek channels.

The proposed project includes closure of the Landfill which will be performed in accordance with the applicable regulatory standards prescribed in the California Code of Regulations (CCR) [i.e., 27 CCR, Chapters 3 and 4 and CFR, Subpart F]. The components and systems required for closure of the Landfill include the final cover and grading design to control storm water, potential infiltration and accommodate future settlement, drainage and erosion control systems, landfill slope stability, landfill gas (LFG) control systems, leachate control systems, and construction quality assurance (CQA).

METHODS

As required by the California Department of Fish and Wildlife (CDFW), plant surveys were conducted during the time of year when special status plants are most identifiable, which is typically when they are in flower. Prior to the site visit a search of the U. S. Fish & Wildlife Service (USFWS) quadrangle species lists (USFWS 2015), California Natural Diversity Data Base (CNDDB) (CNDDB 2015) and the California Native Plant Society (CNPS) (CNPS 2015) on-line electronic inventory was conducted for the 9-quadrangle search around the Ukiah 7.5-minute USGS quadrangle. A list of special status plant species known to occur in the area based on these data base searches is provided as Appendix A.

Surveys were conducted throughout the 2015 blooming window, capturing an entire blooming season. Site visits were conducted from spring to early summer, a period broad enough to include know blooming and fruiting times of potentially occurring special status plant species and also encompassing the blooming period of early annuals, wetland plants and late blooming herbaceous perennial species. These surveys took place on April 15, 21 and 29, May 19 and 22 and June 30, 2015. The survey was floristic in nature and took into account all vascular plant species, lichens and mosses encountered. The entire project area was covered on foot as thoroughly as possible so that all representative habitat types, topographic features and aspects were investigated. Material that could not be identified in the field was collected so that a determination could be made at a later time using a dissecting scope and reference materials. Mosses were collected and sent to a moss expert for identification. Sensitive plant communities were identified mapped and described. A complete list of vascular plant species, mosses and lichens were recorded (Appendix B) along with habitat and plant community characteristics.

RESULTS

Plant Communities

Nomenclature for vegetation types follows *The Manual of California Vegetation* Second Edition (Sawyer, et. al. 2009) where applicable. Nine vegetation communities occur within the project study area. These are: 1) *Avena (barbata, fatua)* semi-natural herbaceous stands or wild oats grasslands; 2) ruderal forbs; 3) *Nasella pulchra* herbaceous alliance or purple needle grass grassland; 4) *Quercus douglasii* woodland alliance or blue oak woodland; 5) *Arctostaphylos manzanita* provisional shrubland alliance or manzanita chaparral; 6) *Salix exigua* shrubland alliance or sandbar willow thickets; 7) *Eleocharis macrostachya* herbaceous alliance or pale spike rush marshes; 8) *Typha angustifolia* herbaceous alliance or cattail marshes; and 9) seasonal wetlands.

1) Wild oats grasslands is the dominant vegetation type within the project study area as this type covers most of the landfill area, borrow area and roadsides. The wild oats grassland is mixed in with the ruderal forbs type. The revegetated portions of the landfill have a mixture of non-native grasses and in some areas non-native forbs (ruderal forbs) are dominant. Plant species commonly found in the wild oats grasslands include wild oats (*Avena barbata, A. fatua*), rip-gut brome (*Bromus diandrus*), soft chess (*Bromus hordaceus*), hare barley (*Hordeum murinum* ssp. *leporinum*), Harding grass (*Phalaris aquatica*), orchard grass (*Dactylis glomerata*), ryegrass (*Festuca perennis*), tall fescue (*Festuca arundinacea*) and rattail fescue (*Festuca myuros*). A few native grass species were also noted in this type including purple needle grass (*Nasella pulchra*), California oatgass (*Danthonia californica*) and six weeks fescue (*Festuca microstachys*). A variety of non-native forb species also occur in this type including hairy vetch (*Vicia villosa*), cut-leaf plantain (*Plantago coronopus*), yellow star thistle (*Centaurea solsititalis*), European umbrella milkwort (*Tolpis barbata*), yellow glandweed (*Parentucellia viscosa*), Mediterranean linseed (*Bellardia trixago*), rose clover (*Trifolium hirtum),* filarees (*Erodium cicutarium, E. botrys*), and rough cat's-ear (*Hypochaeris radicata*). Native forb species included blow wives (*Achyrachaena mollis*), erect plantain (*Plantago erecta*), suncups (*Taraxia ovata*), blue-eyed grass (*Sisrynchium bellum*), soaproot (*Chloragalum pomeridianum*), Pacific sanicle (*Sanicula crassicaulis*), and California buttercup (*Ranunculus californicus*).

2) Ruderal forbs dominate the area on northeastern portion of the project study area in the flat area of the former borrow pit. This area is dominated primarily by non-native forb species such as European umbrella milkwort, lesser hawbit (*Leontodon taraxacoides* ssp. *taraxacoides*), cut-leaf plantain, hairy vetch, yellow star thistle, and rough cat's-ear.

3) Purple needle grass grassland was mapped in several locations in the borrow pit area. Small areas of purple needlegrass occur in other locations on the site but are not large enough to map separately as a stand along grassland community. The areas on the borrow site were large enough to map and identify as a separate plant community.

4) Blue oak woodland occurs along the southern portion of the project study area and also occurs along the northern bank of the unnamed creek that forms the northern boundary of the study area. Blue oak (*Quercus douglasii*) are the dominant species. Other trees and shrubs noted include interior live oak (*Quercus wislenzi* var. *wislizeni*), coast live oak (*Quercus agrifolia*), black oak (*Quercus kelloggii*), Shreve oak (*Quercus parvula* var. *shrevei*), buckeye (*Aesculus californica*), madrone (*Arbutus menziesii*), coyote brush (*Baccharis pilularis*), manzanita (*Arctostaphylos manzanita* ssp. *glaucescens*), toyon (*Heteromeles arbutifolia*), buckbrush (*Ceanothus cuneatus*), mountain mahogany (*Cercocarpus betuloides)* and poison oak (*Toxicodendron diversilobum*). A diversity of native grasses are found in this type include onion grass (*Melica geyeri, M. torreyana*), blue wildrye (*Elymus glaucus*), Nevada bluegrass (*Poa secunda*) and native fescues (*Festuca rubra and F. idahoensis*). Native forbs include blue dicks (*Dichelostemma capitatum*), for-toothed ookow (*Dicelstemma congestum*), Ithuriels' spear (*Triteleia laxa*), phacelia (*Phacelia* sp.), Pacific sanicle, soaproot, Diogene's lantern (*Calochortus amabilis*), farewell to spring (*Clarkia gracilis*) and fringed checkerbloom (*Sidalcea diploscypha*).

5) Manzanita chaparral occurs primarily on the northern portion of the study area along the north bank of the unnamed creek. Whiteleaf manzanita (*Arctostaphylos manzanita* ssp. *glaucescens*) is dominant and includes other chaparral shrub species such as toyon, buckbrush, coyote brush, mountain mahogany, chamise (*Adenostoma fasciculatum*), sticky monkeyflower (*Mimulus aurantiacus*), and snowberry (*Symphoricarpos albus* var. *laevigatus)*. A variety of native and non-native grasses and forbs occur as understory species including blue-eyed grass, Douglas iris (*Iris douglasiana*), phacelia, hound's tongue (*Cynoglossum grande*), blue dicks, farewell to spring, and Ithuriel's spear.

6) Sandbar willow thickets occur along unnamed creek that forms the northern boundary of the study area. Sandbar willow (*Salix exigua*), arroyo willow (*Salix lasiolepis*) and red willow (*Salix laevigata*) are dominant. Other tree and shrub species include valley oak (*Quercus lobata*), Fremont cottonwood (*Populus fremontii*), madrone, manzanita, coyote brush, Himalayan blackberry (*Rubus armeniacus*) and poison oak. Herbaceous wetland plants noted within the creek bed include scouring rush (*Equisetum hymale*), rushes (*Juncus patens, J mexicanus, J. balticus ssp. ater*), foothill sedge (*Carex tumulicola)*, pale spike rush (*Eleocharis macrostachya*) and cattails (*Typha angustifolia*).

7) Pale spike rush marshes occur along the pond margins along with the cattail marsh types and also within vegetated sections of the unnamed creek channel in the eastern portion of the study area. The dominant species is pale spike rush. Other wetland plants noted include pennyroyal (*Mentha pulegium*), curly dock (*Rumex crispus*), umbrella sedge (*Cyperus eragrostis*), rushes and water plantain (*Alisma sp.*).

8) Cattail marshes occur in conjunction with the pale spike rush vegetation type and include the same species. Narrowleaf cattail (*Typha angustifolia*) is dominant and can be a monotypic community type.

9) Seasonal wetlands were mapped in four areas in the eastern portion of the study area. Three seasonal wetlands were mapped in the borrow area and one occurs along the entrance road on the southeastern side of the project study area. Seasonal wetlands occur as relatively small depressions in the flatter areas of the borrow area. The one along the road appears to have developed as a result of water flowing along the inside portion of the roadway. Plant species noted in these areas include pennyroyal, cocklebur (*Xanthium strumarium*), rabbitsfoot grass (*Polypogon monspeliensis*), small quaking grass (*Briza minor*), Mediterranean barley (*Hordeum marinum* ssp. *gussoneanum*), hyssop loosestrife (*Lythrum hyssopifolium*) and cut-leaf plantain.

Special Status Plants

Review of the USFWS (USFWS 2015), the CDFW, and the CNDDB (CNDDB 2015) revealed that nine (9) federally listed plant species, one (1) federal candidate, three (3) state-listed species and twenty-two (22) CNPS ranked species have potential to occur in the area. There are no coastal dunes, coastal prairie, coastal scrub, coastal bluff scrub, volcanic ash flow vernal pools, lower montane coniferous forest, upper montane coniferous forest, North Coast coniferous forest, or closed-cone coniferous forest and no serpentinite within the project area that would provide habitat for many of these species. Although potential habitat occurs in the project area for many of the special status plant species known to occur in the area none were found during the protocol level seasonal plant surveys.

A total of 255 vascular plants and 41 mosses and lichens were observed during the April, May and June 2015 plant surveys (Appendix B). These 296 species represent 73 plant families. There was a high diversity of species even within the grassland areas of the landfill. The pond wetland areas actually have a low diversity of species, most of which are native species, but the ponds provide aquatic habitat which has high wildlife value. The creeks on the site have a diversity of both wetland and non-wetland species, most of which are native species, and also provide valuable wildlife habitat including habitat for the state listed foothill yellow-legged frog.

No special status plant species were found during the seasonal and protocol level plant surveys conducted for the project study area. In spite of the drought occurring in the region plants were in flower and 255 vascular plants were recorded along with 41 mosses and lichens. The surveys were conducted during the time of year when special status plants would have been identifiable. Based on the surveys the site does not support any special status plants are none are expected to occur on the site.

The purple needle grass grassland is a special status vegetation community. This type occurs on the slopes of the existing former borrow area in the northeast portion of the study area. The sandbar willow thickets, cattail marsh, pale spike rush marshes and seasonal wetland areas are wetland vegetation types and even though they do not have a special status designation they are regulated by the Corps, RWQCB and CDFW and therefore are considered to be sensitive natural communities and any impacts to these communities type will require mitigation if any impacts occur to these vegetation types.

APPENDIX A:

Potentially Occurring Special-Status Plant Species in the Ukiah Sanitary Landfill Closure Study Area.

Scientific Name Common Name	Status USFWS/ CDFG/ CNPS Rank	Habitat Affinities and Blooming Period	Occurrence Potential
Arabis macdonaldiana McDonald's rock-cress	FE/CE/1B	Lower montane coniferous forest, upper montane coniferous forest on serpentinite. Blooms May to July. Elevation: 135-1800m.	None. No habitat on site.
Arctostaphylos stanfordiana ssp. *raichei* Raiche's manzanita	-/-/1B	Chaparral, lower montane coniferous forest (openings)/rocky, often serpentinite. Blooms February to April. Elevation: 450-1000m.	None. Potential chaparral habitat on site but not observed during surveys.
Arctostapylos canescens ssp. *sonomensis* Sonoma canescent manzanita	-/-/1B	Chaparral, lower montane coniferous forest/sometimes serpentinite. Blooms January to June. Elevation: 180-1675m.	None. Potential chaparral habitat on site but not observed during surveys.
Arenaria paludicola Marsh sandwort	FE/CE/1B	Marshes and swamps (freshwater or brackish), sandy, openings. Blooms May to August. Elevation 3-170m.	None. Potential freshwater marsh habitat on site but not known from Mendocino County. Not observed during surveys.
Astragalus breweri Brewer's milk-vetch	-/-/4	Chaparral, cismontane woodland, meadows and seeps, valley and foothill grassland (open, often gravelly)/often serpentinite, volcanic. Blooms April to June. Elevation 90-730m.	None. Potential chaparral, cismontane woodland and grassland habitat on site but not observed during surveys.
Brasenia schreberi Watershield	-/-/2B	Marshes and swamps/freshwater. Blooms June to September. Elevation: 30-2200m.	None. Potential freshwater marsh habitat on site. Not observed during surveys.
Carex comosa Bristly sedge	-/-/2B	Coastal prairie, marshes and swamps (lake margins), valley and foothill grassland. Blooms May to September. Elevation: 0-625m.	None. Potential marsh and grassland habitat on site. Not observed during surveys
Ceanothus confusus Rincon Ridge ceanothus	-/-/1B	Closed-cone coniferous forest, chaparral, cismontane woodland/volcanic or serpentinite. Blooms February to June. Elevation: 75-1065m.	None. Potential chaparral and cismontane habitat on site but not observed during surveys.
Chorizanthe howellii Howell's spineflower	FE/CE/1B	Coastal dunes, coastal prairie, coastal scrub. Blooms May to July. Elevation: 0-35m.	None. No habitat on site.
Cuscuta jepsonii Jepson's dodder	-/-/1B	North Coast coniferous forest/streambanks. Blooms July to September. Elevation: 1200-2300m.	None. No habitat on site.

Scientific Name Common Name	Status USFWS/ CDFG/ CNPS Rank	Habitat Affinities and Blooming Period	Occurrence Potential
Entosthodon kochii Koch's cord moss	-/-/1B	Cismontane woodland (soil). Elevation: 180-1000m.	None. Potential cismontane woodland habitat on site. Not observed during surveys.
Eriogonum kelloggii Red Mountian (Kellogg's) buckwheat	FC/CE/1B	Lower montane coniferous forest (rocky, serpentinite). Blooms May to August.	None. No habitat on site.
*Erysimum menziesii (*includes ssp*. yadonii)* Menzies's wallflower	FE/CE/1B	Coastal dunes. Blooms March to September. Elevation: 0-35m.	None. No habitat on site.
Fissidens pauperculus Minute pocket moss	-/-/1B	North Coast coniferous forest (damp coastal soil). Elevation: 10-1024m.	None. No habitat on site.
Fritillaria roderickii Roderick's fritillary	-/CE/1B	Coastal bluff scrub, coastal prairie, valley and foothill grassland. Blooms March to May. Elevation: 15-400m.	None. Potential grassland habitat present but not observed during surveys.
Grimmia torenii Toren's grimmia	-/-/1B	Chaparral, cismontane woodland, lower montane coniferous forest/openings, rocky, boulder and rock walls, carbonate, volcanic. Elevation: 320-1160m.	None. Potential chaparral and cismontane woodland habitat on site. Not observed during surveys.
Hemizonia congesta ssp. *congesta* Congested-headed hayfield tarplant	-/-/1B	Valley and foothill grassland/sometimes roadsides. Blooms April to November. Elevation: 20-560m.	None. Potential grassland habitat on site but not observed during surveys.
Hesperolinon adenophyllum glandular western flax	-/-/1B	Chaparral, cismontane woodland, valley and foothill grassland/usually serpentinite. Blooms May-Aug. Elevation: 150-1315 m.	None. No serpentinite in project area.
Horkelia bolanderi Bolander's horkelia	-/-/1B	Chaparral, lower montane coniferous forest, meadows and seeps, valley and foothill grassland/edges, vernally mesic areas. Blooms June-Aug. Elevation: 450-1100 m.	None. Potential chaparral and grassland habitat on site. Not observed during surveys.
Howellia aquatilis Water howellia	FT/-/2B	Freshwater marshes and swamps. Blooms June. Elevation: 1085-1290m.	None. Potential freshwater march habitat on site. Not observed during surveys.
Kopsiopsis hookeri Small groundcone	-/-/2B	North Coast coniferous forest. April-Aug. Elevation: 90-885 m.	None. No habitat on site.
Lasthenia burkei Burke's goldfields	FE/CE/1B	Meadows and seeps (mesic), vernal pools. Blooms April to June. Elevation: 15-600m.	None. Typical habitat not present in study area. Not observed during surveys.
Layia septentrionalis Colusa layia	-/-/1B	Chaparral, cismontane woodland, valley and foothill grassland/sandy, serpentinite. Blooms April to May. Elevation: 100-1098m.	None. No habitat on site – no serpentinite.

Scientific Name Common Name	Status USFWS/ CDFG/ CNPS Rank	Habitat Affinities and Blooming Period	Occurrence Potential
Limnanthes bakeri Baker's meadowfoam	-/CR/1B	Meadows and seeps, freshwater marshes and swamps, valley and foothill grassland (vernally mesic), vernal pools. Blooms April to May. Elevation: 175-910m.	None. Typical habitat not on site. Not observed during surveys.
Malacothamnus hallii Halls' bush-mallow	-/-/1B	Chaparral, coastal scrub. Blooms May to September (October). Elevation: 10-650m.	None. Potential chaparral habitat present but not observed on site.
Malacothamnus mendocinensis Mendocino bush-mallow	-/-/1A	Cismontane woodland. Blooms May to June. Elevation: 425-575m.	None. Potential cismontane woodland habitat present but not observed on site.
Navarretia leucocephala ssp. *bakeri* Baker's navarretia	-/-/1B	Cismontane woodland, lower montane coniferous forest, meadows and seeps, valley and foothill grassland, vernal pools/mesic. Blooms April to June. Elevation: 5-1740m.	None. Potential cismontane woodland and grassland habitat on site but not observed during surveys.
Navarretia leucocephala ssp. *pauciflora* Few-flowered navarretia	FE/CT/1B	Volcanic ash flow vernal pools. Blooms May to June. Elevation: 400-855m.	None. No habitat on site.
Navarretia leucocephala ssp. *plieantha* Many-flowered navarretia	FE/CE/1B	Volcanic ash flow vernal pools. Blooms May to June. Elevation: 30-950m.	None. No habitat on site.
Plagiobothrys lithocaryus Mayacamas popcorn-flower	-/-/1A	Chaparral, cismontane woodland, valley and foothill grassland/mesic. Blooms April to May. Elevation: 300-450m.	None. Potential cismontane woodland and grassland habitat on site but not observed during surveys.
Pleuropogon hooverianus North Coast semaphore grass	-/CT/1B	Chaparral, cismontane woodland, valley and foothill grassland/mesic. Blooms April to June. Elevation 10-671m.	None. Potential chaparral, cismontane woodland and grassland habitat on site but not observed during surveys.
Sanguisorba officinalis Great burnet	-/-/2B	Bogs and fens, broadleafed upland forest, meadows and seeps, marshes and swamps, North Coast coniferous forest, riparian forest/often serpentinite. Blooms July-October. Elevation: 60-1400m.	None. Typical habitat not on site. No serpentintie.
Sedum laxum ssp. *eastwoodiae* Red Mountain stonecrop	FC/-/1B	Lower montane coniferous forest (serpentinite). Blooms May to July. Elevation: 600-1200m.	None. No habitat on site.
Traycina rostrata Beaked tracyina	-/-/1B	Cismontane woodland, valley and foothill grassland. Blooms May to June. Elevation: 90-790m.	None. Potential cismontane woodland and grassland habitat present on site but not observed during surveys.

Scientific Name Common Name	Status USFWS/ CDFG/ CNPS Rank	Habitat Affinities and Blooming Period	Occurrence Potential
Viburnum ellipticum Oval-leaved viburnum	-/-/2B	Chaparral, cismontane woodland, lower montane coniferous forest. Blooms May to June. Elevation: 215-1400m.	None. Potential chaparral and cismontane woodland habitat on site but not observed during surveys.

Rank4: Plants that have a limited distribution – a watch list

APPENDIX B

Plant species, including mosses and lichens, observed during April to June 2015 surveys.

Scientific Name	Common Name
VASCULAR PLANTS	
Achillea millefolium	Yarrow
Achyrachaena mollis	Blow wives*
Acmispon americanus	Spanish clover
Acmispon brachycarpus	Deervetch
Acmispon parviflorus	Small-flowered lotus
Adenostoma fasciculatum	Chamise
Adiantum jordanii	Maiden hair fern
Aegilops truncialis	Barbed goatgrass*
Aesculus californica	California buckeye
Agrostis exerata	Spike bentgrass*
Agrostis stolonifera	Red top*
Aira caryophyllea	Silver European hairgrass*
Alisma trivale	Water plantain
Allium bolanderi var. bolanderi	Bolander's onion
Anisocarpus madioides	Woodland tarweed
Anthemis cotula	Mayweed*
Anthriscus caucalis	Bur-chervil*
Aphanes occidentalis	Lady's mantle
Arbutus menziesii	Madrone
Arctostaphylos manzanita ssp. *glaucescens*	White leaf manzanita
Artemisia douglasiana	Mugwort
Ascelpias fascicularis	Narrow-leaf milkweed
Avena barbata	Slender wild oat*
Avena fatua	Wild oat
Baccharis glutinosa	Marsh baccharis
Baccharis pilularis	Coyote brush
Bellardia trixago	Mediterranean linseed*
Brassica nigra	Black mustard*
Briza maxima	Large quaking grass*
Briza minor	Small quaking grass*
Brodiaea elegans ssp. *elegans*	Harvey brodiaea
Bromus carninatus	California brome
Bromus caroli-henrici	Poverty brome*
Bromus diandrus	Rip-gut brome*
Bromus hordeaceus	Soft chess*
Bromus laevipes	Woodland brome
Bromus madritensis ssp. *rubens*	Foxtail chess*
Calochortus amabilis	Diogene's lantern

Scientific Name	Common Name
Calycadenia fremontii	Fremont's western rosinweed
Cardamine oligosperma	Bittercress
Carduus pycnocephalus	Itlaian thistle*
Carex tumulicola	Foothill sedge
Ceanothus cuneatus ssp. *cuneatus*	Buckbrush
Centaurea soltitialis	Yellow star-sthistle*
Ceratium glomeratum	Chickweed*
Cercocarpus betuloides	Birch-leaf mountain mahogany
Chlorogalum pomeridianum	Soaproot
Cirsium vulgare	Bull thistle*
Clarkia purpurea ssp. *quadrivulnera*	Wine cups
Claytonia perfoliata	Miner's lettuce
Clinopodium douglasii	Yerba Buena
Collinsia heterophylla	Chinese houses
Cortaderia jubata	Jubata grass*
Croton setiger	Turkey mullein*
Cynodon dactylon	Bermuda grass*
Cynoglossum grande	Hound's tongue
Cynosurus echinatus	Hedgehog dotail grass*
Cyperus eragrostis	Umbrella sedge
Dactylis glomerata	Orchard grass*
Danthonia californica	California oat-grass
Datisca glomerata	Durango root
Datisca glomerata	Durango root
Daucus carota	Queen Anne's lace*
Daucus pusillus	Rattlesnake weed
Delphinium decorum ssp. *tracyi*	larkspur
Deschampsia elongata	Slender hairgrass
Dichelosemma capitatum ssp. *capitatum*	Blue dicks
Dichelosemma congestum	Ookow
Dipascus fullonum	Wild teasel*
Distichlis spicata	Inland saltgrass
Dodecatheon hendersonii	Shooting star
Draba verna	Whitlow-grass
Eleocharis macrostachya	Pale spike rush
Elymus caput-medusae	Medusa head grass*
Elymus glaucus ssp. *glaucus*	Blue wildrye
Elymus triticoides	Creeping wildrye
Epilobium brachycarpum	Panicled willow herb
Epilobium ciliatum	Fringed willow herb
Epilobium sp.	Willow herb
Epilobium torreyi	Torrey's willow herb
Equisetum hyemale ssp. affine	Tall scouring rush
Equisetum telemateia	Giant horsetail

Scientific Name	Common Name
Erigeron canadensis	Horseweed*
Eriodictyon californicum	Yerba santa
Erodium bothrys	Broadleaf filaree*
Erodium cicutarium	Red-stemmed filaree*
Euphorbia crenulata	Chinese caps
Eurybia radulina	Broad-leafed aster
Festuca arundinacea	Tall fescue*
Festuca bromoides	Brome fescue*
Festuca idahoensis	Idaho fescue
Festuca microstachys	Small fescue
Festuca myuros	Rattail fescue*
Festuca perennis	Ryegrass*
Festuca rubra	Red fescue
Foeniculum vulgare	Fennel*
Galium aparine	Goose-grass*
Galium californicum	California bedstraw
Galium parisiense	Wall bedstraw
Galium porrigens	Climbing bedstraw
Gamochaeta ustulata	Spoon-leaf purple everlasting
Gastridium phleoides	Nit grass*
Genista monspessulana	French broom*
Geranium dissectum	Cut-leaf geranium*
Geranium molle	Dove-foot geranium*
Githopsis specularioides	Bluecup
Helenium puberulum	Sneezeweed
Helminthotheca echioides	Bristly ox-tongue*
Hesperevax sparsiflora var. *sparsiflora*	Erect evax
Heteromeles arbutifolia	Toyon
Hieracium album	Hawkweed
Hoita macrostachya (?)	Large leather root
Holcus lanatus	Velvet grass*
Hordeum marinum ssp. *gussoneanum*	Mediterranean barley*
Hordeum murinum ssp. *leporinum*	Hare barley*
Hypericum perforatum	Klamath weed*
Hypochaeris glabra	Smooth cat's-ear*
Hypochaeris radicata	Rough cat's-ear
Iris macrosyphon	Long-tubed iris
Juncus balticus ssp. ater	Baltic rush
Juncus bufonius var. *bufonius*	Toad rush
Juncus bufonius var. *congestus*	Clustered toad rush
Juncus mexicanus	Mexican rush
Juncus occidentalis	Western rush
Juncus patens	Spreading rush
Juncus xiphioides	Iris-leaved rush

Scientific Name	Common Name
Kickxia elatine	Fluellein*
Lactuca saligna	Willow-leaf lettuce*
Lactuca serriola	Pricklylettuce*
Lagophylla ramosissima	Common hareleaf*
Lathyrus hirsutus	Caley pea*
Lathyrus latifolia	Perennial sweet pea*
Lathyrus vestitus	Hillside pea*
Leontodon taraxacoides	Hawkbit*
Leptosiphon bicolor	Bicolored linanthus
Linum bienne	Flax*
Logfia gallica	Narrowleaf cottonweed*
Lotus corniculatus	Bird's-foot trefoil*
Lupinus bicolor	Miniature lupine
Lupinus microcarpus var. *densiflorus*	Chick lupine
Luzula comosa	Wood rush
Lysimachia arvensis	Scarlet pimpernel*
Lythrum hyssopifolium	Hyssop loosestrife*
Madia exigua	Small tarweed
Madia sp.	Madia
Marah fabaceus	California man-root
Marsilea vestita ssp. *vestita*	Water clover
Medicago polymorpha	Bur clover*
Medicago praecox	Medicago*
Melica geyeri	Geyer's onion grass
Melica torreyana	Torrey's melic
Melilotus albus	White sweet clover*
Melilotus indicus	Sour clover*
Mentha pulegium	Penneyroyal*
Micranthes californica	California saxifrage
Micropus californicus	Slender cottonweed
Microseris douglasii	Douglas microseris
Mimulus aurantiacus	Bush monkeyflower
Mimulus guttatus	Seep monkeyflower
Mondardella villosa	Coyote mint
Navarretia intertexta	Needleleaf navarretia
Navarretia pubescens	Downy pincushion plant, purple navarretia
Navarretia squarrosa	Skunkweed
Navarretia tagetina	Marigold navarretia
Nemophila heterophylla	White nemophila
Nemophila menziesii	Baby blue-eyes
Parentucellia viscosa	Yellow glandweed*
Pectocarya pusilla	Little pectocary
Pedicularis densilfora	Indian warrior
Pentagramma triangularis	Gold-back fern

Scientific Name	Common Name
Perideridia kelloggii	Kellogg's yampa
Petrohagia dubia	Grass pink*
Phacelia imbricata ssp. *imbricata*	Imbricate scorpionweed
Phalaris aquatica	Harding grass*
Phalaris paradoxa	Hood canary grass
Plantago coronopus	Cut-leaf plantain*
Plantago erecta	Erect plantain
Plantago lanceolata	English plantain*
Poa pratensis	Kentucky bluegrass*
Poa secunda	Pacific bluegrass
Polygala californica	California milkwort
Polygonum aviculare	Yard knotweed*
Polypogon monspeliensis	Rabbit's foot grass*
Populus fremontii	Fremont's cottonwood
Potomageton natans	Floating-leafed pondweed
Potomageton nodosus	Long-leaved pondweed
Pseudognaphalium luteoalbum	Cudweed
Psilocarphus tenellus	Woolly-heads
Quercus agrifolia	Coast live oak
Quercus douglasii	Blue oak
Quercus garryana	Oregon oak
Quercus kelloggii	Black oak
Quercus lobata	Valley oak
Quercus parvula var. *shrevei*	Shreve oak
Quercus wislizeni	Interior live oak
Ranunculus muricatus	Spiny-fruited buttercup*
Ranunculus occidentalis	Western buttercup
Rosa californica	California rose
Rosa gymnocarpa	Wood rose
Rubus armeniacus	Himalayan blackberry*
Rubus ursinus	California blackberry
Rumex crispus	Curly dock*
Salix exigua	Sandbar willow
Salix laevigata	Red willow
Salix lasiolepis	Arroyo willow
Sanicula bipinnata	Poison sanicle
Sanicula bipinnatifida	Purple sanicle
Sanicula crassicaulis	Gamble weed
Scandix pectin-veneris	Venus' needle
Scutellaria sp.	skullcap
Sherardia arvensis	Field madder*
Sidalcea diploscypha	Fringed checkerbloom
Silene lacinata ssp. *californica*	Indian pink
Silybum marinum	Milk thistle*

Scientific Name	Common Name
Sisrynchium bellum	Blue-eyed grass
Sonchus asper	Prickly sow-thistle*
Spergularia rubra	Red sand-spurrey*
Stachys ajugoides	Hedge-nettle
Stachys rigida var. quercetorum	Rough hedge-nettle
Stellaria media	Common chickweed*
Stipa lepida	Foothill needlegrass
Stipa pulchra	Purple needlegrass
Stuckenia pectinata	Fennel-leaf pondweed
Symphoricarpos albus var. *laegivatus*	Snowberry
Symphoricarpos mollis	Creeping snowberry
Taraxia ovata	Sun cups
Tolpis barbata	European umbrella milkwort*
Torilis arvensis	Japanese hedge parsley*
Torilis nodosa	Short sock-destroyer*
Toxicodendron diversilobum	Poison oak
Toxicoscordion micrantha	Death camus
Tragopogon porrifolius	Salsify*
Trichostemma lanceolatum	Vinegar weed
Trientalis latifolia	Star flower
Trifolium bifidum var. bifidum	Pinole clover
Trifolium dubium	Little hop clover*
Trifolium hirtum	Rose clover*
Trifolium incarnatum	Crimson clover*
Trifolium oliganthum	Few-flowered clover
Trifolium subterraneum	Subterranean clover*
Trifolium willdenovii	Tomcat clover
Triphyseria eriantha ssp. *eriantha*	Butter n' eggs
Triteleia hyacinthina	White brodiaea
Tritelia laxa	Ithuriel's spear
Typha angustifolia	Narrow-leaved cattail
Umbellularia californica	California bay laurel
Uropappus lindleyi	Silver puffs
Verbena lasiostachys var. *lasiostachys*	Western vervain
Vernonica arvensis	Common speedwell*
Vicia sativa ssp. *sativa*	Spring vetch*
Vicia villosa ssp. *villosa*	Hairy vetch*
Vitis californicus	Wild grape
Xanthium strumarium	Cocklebur*
Yabae microcarpa	Yabea
Zeltnera muehlenbergii	Monterey centaury
MOSSES	
Antitrichia californica	
Atrichum selwynii	

Scientific Name	**Common Name**
Claopodium whippleanum

SUMMARY

The Ukiah Landfill Closure project, located at 3100 Vichy Springs Road, is approximately three miles east of Ukiah in Mendocino County, California. The site is located on a saddle, with Sulphur Creek located off-site to the south, and an unnamed tributary to the Russian River located on-site along the northern boundary. The Landfill occupies approximately 40 acres of permitted landfill area on a 284-acre parcel. The Landfill has been graded to form a series of flat terraces stepping down from south to north. The Landfill surface is covered with a combination of native and non-native grasses and forbs. The proposed project area supports a blue line creek and was flowing at the time of the field work.

The proposed project includes closure of the Landfill which will be performed in accordance with the applicable regulatory standards prescribed in the California Code of Regulations (CCR) [i.e., 27 CCR, Chapters 3 and 4 and CFR, Subpart F]. The components and systems required for closure of the Landfill include the final cover and grading design to control storm water, potential infiltration and accommodate future settlement, drainage and erosion control systems, landfill slope stability, landfill gas (LFG) control systems, leachate control systems, and construction quality assurance (CQA). A description of each of these closure components proposed for construction of the Landfill closure improvements is presented in this document.

Wildlife Research Associates and Jane Valerius Environmental Consulting were contracted by the City of Ukiah to perform this Biological Resources Assessment for the federally listed Threatened California red-legged frog (*Rana draytonii*) and the federal and State listed threatened Central Coast steelhead (*Oncorhynchus mykiss irideus*).

The site is dominated by non-native grassland on the landfill with blue oak woodland and mixed chaparral along the edges. The creeks support a riparian tree and shrub cover dominated by willows. Pponds on the site support cattail marsh or spikerush marsh vegetation and there are several small seasonal wetlands within the grassland at the borrow area on the east side. A total of xx acres of potential jurisdiction wetlands and waters was delineated for the site.

As part of this Biological Resource Assessment, we also evaluated the potential for occurrence of 35 special-status plant species, and 19 special-status wildlife species, as well as the potential for California red-legged frog to occur on the site.

There is potential habitat on site for several special status plants to occur. Focused, seasonal special status plant surveys were conducted in April and May with a third and final survey to be conducted in July. As of the date of this report no special status plants have been observed within the project study area.

At this time no trees will be removed as part of the project. However, if in the future trees are to be removed, replacement rations must be in compliance with the Mendocino County General Plan Conservation Element, which is a 2:1 replacement-to-loss ratio.

Steelhead are known to occur within Sulphur Creek and the Russian River. The ephemeral tributary on-site does not support suitable habitat in terms of pool depth and the tributary dries by the end of the summer. In addition, a barrier to fish passage occurs in the ephemeral creek crossing at Redeemer Road (CNDDB 2015). As a result, no steelhead occur within the ephemeral tributary on site.

No California red-legged frog adults or larvae were detected during the field surveys, although

suitable potential habitat for California red-legged frogs occurs on the site. The project site is located outside the range of California red-legged frogs in Mendocino County (USFWS 2009).

Foothill yellow legged frog (*Rana boylii*), a California Species of Special Concern, was observed within the ephemeral tributary within the proposed project area during the survey.

Several nesting passerines (perching birds), such as grasshopper sparrow (*Ammodramus savannarum*) were observed nesting within the project area.

Best Construction Practices and Avoidance and Minimization Measures to prevent take of individuals discussed above are included in this report.

List of Acronyms and Abbreviations

BRA	Biological Resource Assessment
CDFW	California Department of Fish and Wildlife

WPT	Western pond turtle

1.0 INTRODUCTION

The purpose of this Biological Resource Assessment is to provide technical information and to review the proposed City of Ukiah's Sanitary Landfill Closure project site, located in the City of Ukiah, Mendocino County (Appendix A, Figure 1). Wildlife Research Associates and Jane Valerius Environmental Consulting prepared this Biological Resources Assessment to provide sufficient detail to determine the potential effects of the proposed project on the federally listed Threatened steelhead (*Oncorhynchus mykiss irideus*), the federally-listed Threatened California red-legged frog (*Rana draytonii*) (hereafter CRF) and the California Species of Special Concern foothill yellow frog (*Rana boylii*).

This Biological Resource Assessment was also conducted to determine the potential for special-status vegetation communities, plant and animal species to occur within the proposed linear project, and to identify the limitations to potential development of the project, such as riparian and wetland habitat removal. The biological resource assessment is prepared in accordance with legal requirements found in Section 7 (a)(2) of the Endangered Species Act (16 U.S. C 1536(c)) and also provides information required for an Initial Study/Mitigated Negative Declaration as part of the California Environmental Quality Act (CEQA) review for the project. The document presents technical information upon which later decisions regarding project affects are developed.

1.1 REASON FOR THE PROJECT

Waste disposal operations at the Landfill began in 1955 at the eastern end of the landfill footprint and progressed upslope and westward. During the 1970's, the unnamed ephemeral creek was realigned northward to maximize the available fill area, and a soil berm was constructed along the toe of the landfill to separate the waste from the realigned creek channel. The method of operation during the Landfill's development was a fill and cover approach in a canyon/gully terrain. The Landfill operated as a nonhazardous Class III solid waste disposal site servicing Ukiah and the surrounding area. The Landfill ceased operations in September 2001.

Environmental monitoring at the Landfill was originally regulated under Waste Discharge Requirements (WDR) Order No. 75-43 in conformance with Title 23 of the California Code of Regulations (23CCR). In September 1993, WDR Order No. 75-43 was amended by WDR Order No.93-83 as a mechanism to implement State Water Resources Control Board Resolution No. 93-62 and federal municipal solid waste regulations (i.e., "Subtitle D") per Title 40 of the Code of Federal Regulations (40 CFR), Parts 257 and 258. Concurrent with this amendment was the preparation of a Report of Waste Discharge (RoWD) (EBA, 1993b) for the purpose of formally updating the Landfill's WDRs and to address groundwater impacts previously identified at the site. The combination of these two documents was subsequently used by the RWQCB to issue new interim closure WDRs (WDR Order No.94-123) for the site in October 1994. WDR Order No. 94-123 represents the current WDR regulating environmental monitoring at the Landfill.

1.2 PROJECT SPONSOR

The Ukiah Landfill Closure project is proposed by the City of Ukiah Public Works Department. The contact person is:

Name: Richard J. Seanor, PE, Deputy Director of Public Works
Address: 300 Seminary Ave, Ukiah, CA 95482-5400
Telephone Number: 707-463-6296

1.3 PROJECT DESCRIPTION

1.3.1 Location

The City of Ukiah Sanitary Landfill Closure project, located at 3100 Vichy Springs Road, approximately three miles east of Ukiah, is situated on the east side of the Ukiah Valley, east of the Russian River and HWY 101, south of Lake Mendocino and west of the Mayacamas Mountains in the rural area of eastern Mendocino County, California (Appendix A, Figure 2). The project area is located in an unsectioned portion of the Yokaya Rancheria in the southeastern portion of the Ukiah 7.5-minute topographic quadrangle, within Township 15N and Range 12W. Surrounding land uses consist of mainly open space lands, ranches and vineyards.

The Landfill occupies approximately 40 acres of permitted landfill area on a 284-acre parcel having a maximum width of approximately 1,000 feet in the north-south direction and a maximum length of about 3,500 feet in the east-west direction. Existing ground surface elevations at the Landfill range from approximately 710 feet above mean sea level (MSL) near the western footprint, to about 970 feet MSL along the southeast footprint. The Landfill has been graded to form a series of flat terraces stepping down from south to north. The Landfill surface is covered with seasonal grasses.

Land adjacent to the Landfill property is zoned primarily as rangeland and is used for grazing. Dwellings within 1,000 feet of the landfill property include a group of structures owned by the Vichy Springs Investment Group that are located within 500 feet of the Landfill's south property line and a single-family residence located approximately 900 feet west of the Landfill's western property boundary. A rural residential development is located approximately ¼-mile west of the Landfill property boundary. A housing development is also located along the south side of Vichy Springs Road and westward of the Vichy Springs Resort. The entire development is approximately 1,000 feet southward of the Landfill property boundary and is separated from the Landfill by an intervening ridge.

A City-owned shooting range is situated on the Landfill property approximately 2,000 feet northeast of the waste management unit (WMU) footprint. It should be noted that the City owns an approximate 97-acre parcel (Assessor's Parcel No. 178-210-01) that adjoins a portion of the Landfill's southern property boundary. This property, which has been previously identified as the "Gun Club Parcel", was purchased as a buffer zone to limit future development adjacent to the Landfill. The Gun Club Parcel is a separate parcel and is not considered part of the Landfill property.

A site plan showing the general existing site configuration is presented as Figure 2 (Appendix A).

Landfill Development and History

Waste disposal operations at the Landfill began in 1955 at the eastern end of the landfill footprint and progressed upslope and westward. During the 1970's, the unnamed ephemeral creek was realigned northward to maximize the available fill area, and a soil berm was constructed along the toe of the landfill to separate the waste from the realigned creek channel. The method of operation during the Landfill's development was a fill and cover approach in a canyon/gully terrain. The Landfill operated as a nonhazardous Class III solid waste disposal site servicing Ukiah and the surrounding area. The Landfill ceased operations in September 2001.

Environmental monitoring at the Landfill was originally regulated under Waste Discharge Requirements (WDR) Order No. 75-43 in conformance with Title 23 of the California Code of Regulations (23CCR). In September 1993, WDR Order No. 75-43 was amended by WDR Order No.93-83 as a mechanism to implement State Water Resources Control Board Resolution No. 93-62 and federal municipal solid waste regulations (i.e., "Subtitle D") per Title 40 of the Code of Federal Regulations (40 CFR), Parts 257 and 258. Concurrent with this amendment was the preparation of a Report of Waste Discharge (RoWD) (EBA 1993b) for the purpose of formally updating the Landfill's WDRs and to address groundwater impacts previously identified at the site. The combination of these two documents was subsequently used by the RWQCB to issue new interim closure WDRs (WDR Order No.94-123) for the site in October 1994. WDR Order No. 94-123 represents the current WDR regulating environmental monitoring at the Landfill.

1.3.2 Action Area

The Project Action Area is defined as all areas to be affected directly or indirectly by the Federal action, and not merely in the immediate area involved in the action (50 CFR Sect. 402.02). The action area is analyzed for potential direct and indirect effects to federally-listed species. The action area includes a tributary to the Russian River, which is located approximately 1.43 miles east of the Russian River, and 97 acres of upland habitat. Vichy Springs Road, which runs parallel to Sulphur Creek, is part of the action area that will be used for equipment and machines. Sulphur Creek is a blue line creek. The action area is located outside the City of Ukiah in Mendocino County.

The construction activities include 50 feet beyond the existing perimeter road and are included in the action area. All staging areas will be on existing roadways or compacted shoulders adjacent to the landfill. Please refer to Chapter 5.0 for discussion of these potential effects

1.3.3 Proposed Action – Final Closure Plan

1.3.3.1 Final Cover Design

As outlined in 27 CCR, §20950, the primary performance goal for final closure is to minimize the infiltration of water into the waste, thereby minimizing the production of leachate and LFG. The proposed final cover design for the Landfill areas will consist of the following layers, from top to bottom:

- Synthetic erosion-resistant layer;
- A structured geomembrane low hydraulic-conductivity layer that includes a drainage layer; and
- A minimum one foot thick foundation layer.

This final cover design for the Landfill areas is an engineered alternative final cover consistent with 27 CCR, §20080.

Several factors were taken into consideration is establishing the proposed final cover design for the Landfill, including the geometry of the existing landfill, local climatic conditions, final cover material availability, slope stability, erosion protection, and construction cost.

1.3.3.2 Final Grading, Drainage, and Erosion Control

The limits of refuse were established from record information and by a field investigation. The proposed final cover system will cover all areas within the limits of refuse. Due to clearance requirements under existing power lines that run through the Landfill area, excavation and relocation of refuse will be required to maintain clearance between the finish surface and the power lines. The excavated refuse will be placed on other (flatter) sections of the Landfill.

The Final Grading Plan as shown on Figure 3 (Appendix A) illustrates the final landfill footprint and shows the Landfill configuration following foundation layer grading. Final refuse slopes will have a maximum gradient no steeper than 2:1 (horizontal to vertical). The synthetic erosion-resistant layer will essentially eliminate the discharge of sediment from the Landfill surface as no soil component will be utilized in the final cover design.

Proposed drainage facilities consist of a network of benches, ditches and storm drain that drain to 18- and 24-inch diameter corrugated metal pipe (CMP) discharge culverts. To prevent soil erosion in the ephemeral tributary the culverts will be installed with energy dissipaters that measure XX by XX feet. These CMP culverts discharge to the unnamed ephemeral creek channel at various locations along the length of the Landfill's northern boundary. In general, the drainage system is designed to intercept run-off at intervals along the inside edge of berms, benches or access roads. A sedimentation pond is located at the western end of the Landfill to control sediment run-off from slope areas along the western and southern fill boundaries. Three (3) additional sedimentation ponds are also located at the northeastern end of the Landfill to contain sediment run-off from soil borrow areas. Please refer to Figure 2 (Appendix A) for the locations of the respective sedimentation ponds.

Access improvements will include placing aggregate base over portion of the existing perimeter road and along benches to provide all-weather access.

The soil borrow area will be reclaimed by re-grading and re-vegetating (hydroseeding) with native grasses.

1.3.3.3 Landfill Gas Control

The Landfill currently includes a partial perimeter LFG collection system that was installed between the southwestern edge of the Landfill and the property line. In general, the system consists of 17 vertical extraction points installed in native geologic materials and completed at depths ranging from 35 to 133 feet below ground surface. The extraction points are connected to a buried 6-inch diameter, high-density polyethylene (HDPE) header pipe that leads to a vacuum blower located at the western end of the Landfill. The vacuum blower creates a vacuum in the header pipe that draws the LFG from the soil through the extraction points and header pipe, whereupon the collected LFG (diluted) is vented to the atmosphere via a 4-foot tall, 4-inch diameter stack. The system works on the premise that the extraction well field creates a barrier against migration while simultaneously mixing the collected LFG with "clean" soil pore gas that dilutes the LFG to concentrations that can be discharged directly to the atmosphere.

As part of final closure, a LFG extraction, collection, and control system will be installed that will replace the partial perimeter collection system. The design for the system has been developed to meet the requirements of 17 CCR, §95464(b). The design flow rate for the system has been established at 35 to 210 SCFM (at 50 percent methane). This range covers the highest anticipated LFG recovery rate based on the most conservative generation model (180 SCFM), as well as

some excess to allow for extraction from the final cover system's gas relief layer. In addition, the design range can accommodate lower flows to account for future operations as the generation rate continues to decreases over time. Overall, the LFG extraction, collection, and control system will consist of a series of perimeter and interior LFG extraction wells, associated above ground collection system piping, condensate collection provisions, and a flare station for destruction of the LFG, see Figure 4 (Appendix A).

1.3.3.4 Landfill Leachate Control

The Landfill is unlined and is not equipped with an engineered or traditional blanket leachate collection and removal system (LCRS). Instead, leachate collection at the Landfill consists of a series of polyvinyl chloride (PVC) piping and French drain systems installed to collect leachate from seeps occurring along the completed slope faces. Leachate collected by these components is then conveyed by gravity flow to a primary buried pipeline located along the northern toe of the Landfill. The buried pipeline, in turn, drains the leachate westward and ultimately discharges to the leachate management facilities located at the western toe of the Landfill. A description of the leachate management facilities is as follows:

- Discharge from the primary buried pipeline is diverted to a subsurface concrete sedimentation chamber equipped with a valved sediment drain at its base. The clarified leachate within the chamber is then discharged (by gravity flow) to an adjacent pump station wet well (identified herein as the "leachate wet well") via a 10-inch diameter overflow line.

- Clarified leachate discharged to the leachate wet well is then pumped to a leachate storage tank for temporary storage. The leachate wet well is equipped with two (2) 25-gallon per minute (gpm), low-head, submersible pumps that are actuated by high/low water level controls. If the clarified leachate discharge rate exceeds the leachate wet well's pumping capacity (50 gpm), the excess leachate will be diverted to an underground storage tank to be installed as part of final closure.

- As noted above, leachate from the leachate wet well is diverted to the leachate storage tank for temporary storage. The leachate storage tank has a 63,500-gallon volumetric capacity and is constructed of AWWA factory epoxy lined and coated bolted steel. As was the case for the leachate wet well, the leachate storage tank is also equipped with a 10-inch diameter overflow line that will divert leachate to the underground storage in the case of an emergency.

- Leachate stored in the leachate storage tank is subsequently pumped to a sewer line connection located on Vichy Springs Road via a force main/gravity drain. The force main/gravity drain is constructed of 4-inch diameter PVC and is approximately 5,200 feet in length. The pump lift station for the leachate storage tank is equipped with two (2) 45-gpm pumps (one duty, one standby), thereby giving the system a total pumping capacity of 90 gpm.

1.3.3.5 Construction Quality Assurance

The implementation of the Construction Quality Assurance (CQA) Plan will provide documentation that suitable materials and standard construction practices are used to place the final cover and to document that placement is consistent with the closure plan design

specifications in 27 CCR, §20323 and §20324. Elements of the CQA Plan include: project description and definitions, qualifications and responsibilities, requirements for the final cover evaluation, inspection standards, testing frequencies, meetings, and documentation. This information will be collected during construction of the final closure and incorporated into the project's final closure construction CQA Certification Report, which will be submitted to the appropriate agencies for recording and reporting purposes.

1.3.4 Post Closure Maintenance Plan

After closure activities are completed, the Final Post Closure Maintenance Plan (FPCMP) for the Landfill will be implemented by the City of Ukiah in accordance with 27 CCR, Chapters 3 and 4, and 40 CFR, §258.61. Post closure maintenance activities for the Landfill will consist of the following:

- Final cover inspection and maintenance;
- Landfill settlement monitoring and maintenance;
- LFG monitoring and maintenance;
- Groundwater systems monitoring and maintenance;
- Storm water monitoring;
- Access road/bench maintenance;
- Drainage systems inspection and maintenance; and
- Site security inspection and maintenance.

1.3.4.1 Detection Monitoring Program

A Detection Monitoring Program (DMP) is currently implemented at the Landfill in accordance with 27 CCR, §20420 and Waste Discharge Requirements Order No. R1-2002-0061 and is anticipated to continue through the post closure maintenance period. The scope of the DMP includes the following monitoring and sampling activities:

- Monthly monitoring and recording of leachate discharge volumes.

- Quarterly sampling and analysis of leachate samples from the leachate wet well. The scope of analytical testing is in accordance with Table I of Monitoring and Reporting Program No. R1-2002-0061 (M&RP).

- Quarterly monitoring and recording groundwater elevations and groundwater flow directions.

- Quarterly sampling and analysis of groundwater samples from detection monitoring wells and points of compliance monitoring wells. The scope of analytical testing is in accordance with Table II of the M&RP.

- Performance of quarterly statistical analyses of groundwater chemistry data to identify exceedances of applicable concentration limits.

- Quarterly sampling and analysis of surface water samples, including semi-quantitative comparisons between upstream and downstream water chemistry data to identify potential landfill-related surface water quality impacts. The scope of analytical testing is

in accordance with Table III of the M&RP.

- Performance of monthly standard observations to monitor the conditions of the WMU, the landfill perimeter, and receiving waters.

Results and findings from the aforementioned activities are summarized in a Detection Monitoring Report and submitted to the Regional Water Quality Control Board on a quarterly basis. Standard quarterly report submittals include a presentation of the sampling and monitoring procedures (including Standard Operating Procedures), tabulated summaries of leachate, groundwater, and surface water field and laboratory data, statistical analysis results and supporting calculations, groundwater potentiometric surface map, results of standard observations, and copies of Certified Analytical Reports (CARs) and associated chain-of-custody documentation. Annual reports are also prepared that include (in addition to the above information) graphical summaries of monitoring data, an evaluation of the findings.

1.3.5 Extent of Project Effects

The construction of this project will involve temporary direct effects. Temporary effects include staging areas.

1.3.6 Best Construction Practices

The ephemeral tributary will not likely support water after July of any given year. As a result, placement of rock base below dissipaters will likely not affect stream turbidity. However, small pools may be present and may support special status species. For all areas where rock is to be placed and pools are present, the applicant will capture and relocate any native amphibians found at pools nearest to the rock base placement (within 35 feet or based on a biologist recommendation). Captured native animals will be relocated to the closest pool.

1.3.7 Construction Best Management Practices

Construction BMPs will be incorporated in the construction of the project and include, but are not limited to, the following:

A. Work is proposed to be conducted outside the rainy season (defined as October 15-April 15), primarily between June 15 and October 15, after the summer season when the creek flows are low, therefore no erosion or sediment control is expected to be necessary. To avoid debris contamination in the creek, a silt fence will be placed parallel to the project area in the creek to contain spoils from drilling and any concrete that may inadvertently drop into the creek during construction. All debris will be cleared out of the creek before the silt fence is removed.

B. Roosting and Nesting surveys for special-status species (i.e., bats and birds) by a qualified biologist shall be conducted at the appropriate times before construction starts to determine occupancy at the site. If no special-status species are found, no further action other than the Best Management Practices identified above are required. If individuals are found, including nesting birds, a buffer zone around the species or nest will be required at a sufficient distance to prevent take of individual plants, or until after the nesting season.

C. Due to the potential for special-status species to occur, move through, or into the ephemeral tributary portion of the project area, an on-site monitor, shall at a minimum, check the ground

beneath all equipment and stored materials each morning before construction starts to prevent take of individuals. All pipes or tubing 4 inches or greater shall be sealed by the relevant contractor with tape at both ends to prevent animals from entering the pipes at night. All trenches and other excavations shall be backfilled the same day they are opened, or shall have an exit ramp built into the excavation to allow animals to escape.

1.4 PROJECT ALTERNATIVES

There is no project alternative.

2.0 STUDY METHODOLOGY

This Biological Resource Assessment used the best available scientific and commercial data to evaluate the potential effects to biological resources from the proposed project. Literature review, aerial imagery and field surveys informed the descriptions of the vegetation communities, identification of present and past occurrences of special-status species in the vicinity of the proposed project, the assessment of habitats for special-status animal species.

2.1 LITERATURE SEARCH

Information on special-status plant species was compiled through a review of the literature and database search. Database searches for known occurrences of special-status species focused on the Ukiah, Cow Mountain, Purdy's Garden and Elledge Peak U.S. Geologic Service 7.5-minute topographic quadrangles, which provided a 4.8 km (5 mi) radius around the proposed project area. The following sources were reviewed to determine which special-status plant and wildlife species have been documented in the vicinity of the project site:

- U.S. Fish and Wildlife Service (USFWS) quadrangle species lists (USFWS 2015)
- USFWS list of special-status animals for Sonoma County (USFWS 2015)
- California Natural Diversity Database records (CNDDB) (CNDDB 2015)
- California Department of Fish and Wildlife's (CDFW) Special Animals List (CDFW 2015),
- State and Federally Listed Endangered and Threatened Animals of California (CDFW 2015)
- California Native Plant Society (CNPS) Electronic Inventory records (CNPS 2015)
- City of Ukiah General Plan Update (2009)
- CDFG publication "California's Wildlife, Volumes I-III" (Zeiner et al., 1990)

The U.S. Fish and Wildlife Service (USFWS) electronic list of Endangered and Threatened Species was queried electronically (www.fws.gov/sacramento/es_spp_lists-overview.htm). We also reviewed the CalFish IMAPS Viewer (www.calfish.org/DataandMaps/CalFishGeographicData), developed by CDFW Biogeographic Branch for analysis of steelhead Critical Habitat along tributaries to the Russian River.

Other sources of information regarding reported occurrences include locations previously reported to the U.C Berkeley Museum of Vertebrate Zoology and the California Academy of Sciences.

2.2 PERSONNEL AND SURVEY DATES

Trish Tatarian, wildlife biologist of Wildlife Research Associates, and Jane Valerius, botanist and wetland specialist of Jane Valerius Environmental Consulting, conducted an initial daytime survey of the project site on April 15 and 29, 2015, from 1000 to 1600. Trish surveyed the trees for suitable bird nesting habitat, potential bat roosting habitat, and analyzed the on-site habitats for suitability for Steelhead, California red-legged frog and fisher.

Jane evaluated the on-site vegetation communities for their potential to support special status plants and/or wetland communities. Jane Valerius and Geri Hulse-Stephens conducted surveys for special status plants on April 15, 21 and 29 and May 19 and 22, 2015. A final survey for special status plants will be conducted in June or July 2015. A separate report with the findings of all the special status plant surveys will be prepared once surveys are complete.

A delineation of waters of the U.S. was conducted by Jane Valerius on April 29, 2015, with the preliminary findings presented in the *Delineation of Waters of the U.S. for the Ukiah Sanitary Landfill Closure Project* (Jane Valerius Environmental Consulting 2015). This report will be submitted to the U.S. Army Corps of Engineers (Corps) for their verification as part of the permit application for work to be conducted in wetlands associated with the landfill and in the tributary to the Russian River.

2.3 IMPACT ASSESSMENT METHODOLOGY

We examined the on-site vegetation communities, present and past occurrence locations of federally listed species and federal species of concern within close proximity of the proposed project areas, and habitats for special-status plant and animal species. Based on the current site conditions, we evaluated the potential for occurrence on the site for special-status biological resources and used the project description to determine any potential direct or indirect effects.

The USFWS, CDFW, and CNPS guidelines for conducting special status plant surveys were followed for the April, and May site visits in that the survey was floristic in nature, with every plant observed identified to the extent necessary to determine its rarity and listing status. Surveys were conducted the using systematic field techniques in all habitats of the site to ensure a thorough coverage of potential impact areas was well documented.

We based our determination of whether the proposed project may result in adverse impacts to federally-listed special-status species, based on guidelines established by the USFW under Section 7(a) of the Federal Endangered Species Act (FESA), in which a project that may have an adverse effect impact on listed biological resources must be assessed. FESA states that, "each federal agency shall…insure that any *action authorized, funded, or carried out by such agency (hereinafter in this section referred to as an "agency action") is not likely to jeopardize the continued existence of any endangered or threatened or result in the destruction or adverse modification of habitat of such species." Thus, components of the proposed project were deemed to have an adverse impact on special-status biological resources if they could result in effects as described in the above statement to any listed species or its habitat.

We based our determination of whether the proposed project may result in adverse impacts to State special-status species based on CEQA, the CDFW and the CNPS guidelines for special status plants and animals.

We also evaluated potential impacts from the project to habitats not occupied by species but for which habitats occurred.

2.4 LIMITATIONS THAT MAY INFLUENCE RESULTS

No focused wildlife surveys for this Biological Resource Assessment were conducted; species opportunistically observed during the field survey were noted. As a result, the potential for a special-status animal species to occur in the project area was based on reported occurrences in the vicinity of and habitats within the project area. The limitation of relying on reported occurrences is that not all lands have been surveyed for their occupancy of special status species. As a result, a lack of findings of a species in a particular area may not be result of no occupancy but rather the result of no focused surveys being conducted.

For those wildlife species that were present (i.e., reported in the CNDDB) in the project area at the time of the Biological Resource Assessment, focused surveys were not conducted. For example, the assessment was conducted in April 2015, but construction is proposed for 2016 and

nesting bird species on or adjacent to the site may change their nesting locations between the survey and the start of construction. No focused surveys for special status wildlife species were conducted given the timeline of this Biological Resource Assessment. Plant species identifiable at the time of the survey were recorded.

Focused surveys for special status plant were conducted and will be completed in June or July when the later flowering summer species will be identifiable. Plant species identifiable at the time of the survey were recorded. A list of plant species observed for the April and May 2015 surveys is provided as Appendix X.

3.0 ENVIRONMENTAL BASELINE

The project area is located within the North Coast Bioregion (Welsh 1994). This bioregion is located within northern California and encompasses the area from southwestern Oregon to southern Monterey County (Welsh 1994). Habitats in this bioregion are delineated by the Pacific Ocean on the west and the Klamath Bioregion on the east and is influenced by the transition from Coast Range montane forest to the dry interior of the Sacramento Valley Bioregion. All of Mendocino County is in this bioregion. Habitats within this bioregion include both mesic (moist) habitats, such as freshwater marsh, and xeric (dry) habitats, such as chaparral, and are typical of a Mediterranean type climate. Average rainfall in the area is 75 inches (Welsh 1994).

Located south of Lake Mendocino, the 50-acre project area is located within the headwaters of an ephemeral tributary to the Russian River. It is located north of Sulphur Creek, a perennial creek, which supports steelhead (*Onchorhynchus mykiss*) and foothill yellow legged frog (*Rana boylii*). There is no hydrologic connection between Sulphur Creek and the ephemeral tributary located on the northern boundary of the site. Although hydrologically connected to the Russian River, an 8-foot tall cement fish barrier occurs at the Redeemer Road crossing, located approximately 1.25 miles west of the project area. See below under Special Status Species for more details.

The Landfill occupies approximately 40 acres of permitted landfill area on a 284-acre parcel having a maximum width of approximately 1,000 feet in the north-south direction and a maximum length of about 3,500 feet in the east-west direction. Existing ground surface elevations at the Landfill range from approximately 710 feet above mean sea level (MSL) near the western footprint, to about 970 feet MSL along the southeast footprint.

3.1 WETLAND AND WATERS OF THE U.S. AND STATE

A formal delineation of waters of the U.S. and state, including wetlands, was conducted for the project study area on April 29 and May 22, 2015 by Jane Valerius Environmental Consulting. A separate delineation report will be prepared and submitted to the U.S. Army Corps of Engineers (Corps) for their review and verification.

There are two unnamed creek drainages within the project study. These creek drainages are mapped as blue-line drainages on the Ukiah USGS 7.5-minute quadrangle and eventually flow into the Russian River west of the landfill. The eastern tributary drainage is an ephemeral drainage that has areas of wetland vegetation and areas that are dry with no wetland vegetation. The upper portion of the main drainage that forms the northern boundary of the study area is dry with mostly no wetland vegetation in the creek channel, although this creek has a well-developed riparian canopy cover of mostly willows and does include some valley oak and cottonwood. The eastern tributary lacks any tree or shrub cover with the exception of a few isolated valley oaks. The lower portion of the northern creek channel from the bridge to the western end of the study area has wetland vegetation within the creek bed and within the ordinary high water mark. The northern creek channel varies in width but has an average width of between 15 to 20 feet within the ordinary high water mark. The eastern tributary channel is more narrow and incised and varies from 5 to 10 feet in width, with an average of about 8-feet wide at the ordinary high water mark.

Areas mapped as jurisdictional wetlands include the three former sediment ponds that occur within the study area. A fourth pond, identified as the leachate pond, has not been identified as jurisdictional because this pond is part of the treatment system for the landfill, even though it supports wetland vegetation. Seven small seasonal wetland were also mapped. Six of these are in the borrow pit area in the northeastern portion of the study area and one occurs along the

entrance road at the southeastern portion of the study area.

3.2 VEGETATION COMMUNITIES

Nomenclature for vegetation types follows *The Manual of California Vegetation* Second Edition (Sawyer, et. al. 2009) where applicable. Nine vegetation communities occur within the project study area. These are: 1) *Avena (barbata, fatua)* semi-natural herbaceous stands or wild oats grasslands; 2) ruderal forbs; 3) *Nasella pulchra* herbaceous alliance or purple needle grass grassland; 4) *Quercus douglasii* woodland alliance or blue oak woodland; 5) *Arctostaphylos manzanita* provisional shrubland alliance or manzanita chaparral; 6) *Salix exigua* shrubland alliance or sandbar willow thickets; 7) *Eleocharis macrostachya* herbaceous alliance or pale spike rush marshes; 8) *Typha angustifolia* herbaceous alliance or cattail marshes; and 9) seasonal wetlands.

1) Wild oats grasslands is the dominant vegetation type within the project study area as this type covers most of the landfill area, borrow area and roadsides. The wild oats grassland is mixed in with the ruderal forbs type. The revegetated portions of the landfill have a mixture of non-native grasses and in some areas non-native forbs (ruderal forbs) are dominant. Plant species commonly found in the wild oats grasslands include wild oats (*Avena barbata, A. fatua*), rip-gut brome (*Bromus diandrus*), soft chess (*Bromus hordaceus*), hare barley (*Hordeum murinum* ssp. *leporinum*), Harding grass (*Phalaris aquatica*), orchard grass (*Dactylis glomerata*), ryegrass (*Festuca perennis*), tall fescue (*Festuca arundinacea*) and rattail fescue (*Festuca myuros*). A few native grass species were also noted in this type including purple needle grass (*Nasella pulchra*), California oatgass (*Danthonia californica*) and six weeks fescue (*Festuca microstachys*). A variety of non-native forb species also occur in this type including hairy vetch (*Vicia villosa*), cut-leaf plantain (*Plantago coronopus*), yellow star thistle (*Centaurea solsititalis*), European umbrella milkwort (*Tolpis barbata*), yellow glandweed (*Parentucellia viscosa*), Mediterranean linseed (*Bellardia trixago*), rose clover (*Trifolium hirtum),* filarees (*Erodium cicutarium, E. botrys*), and rough cat's-ear (*Hypochaeris radicata*). Native forb species included blow wives (*Achyrachaena mollis*), erect plantain (*Plantago erecta*), suncups (*Taraxia ovata*), blue-eyed grass (*Sisrynchium bellum*), soaproot (*Chloragalum pomeridianum*), Pacific sanicle (*Sanicula crassicaulis*), and California buttercup (*Ranunculus californicus*).

2) Ruderal forbs dominate the area on northeastern portion of the project study area in the flat area of the former borrow pit. This area is dominated primarily by non-native forb species such as European umbrella milkwort, lesser hawbit (*Leontodon taraxacoides* ssp. *taraxacoides*), cut-leaf plantain, hairy vetch, yellow star thistle, and rough cat's-ear.

3) Purple needle grass grassland was mapped in several locations in the borrow pit area. Small areas of purple needlegrass occur in other locations on the site but are not large enough to map separately as a stand along grassland community. The areas on the borrow site were large enough to map and identify as a separate plant community.

4) Blue oak woodland occurs along the southern portion of the project study area and also occurs along the northern bank of the unnamed creek that forms the northern boundary of the study area. Blue oak (*Quercus douglasii*) are the dominant species. Other trees and shrubs noted include interior live oak (*Quercus wislenzi* var. *wislizeni*), coast live oak (*Quercus agrifolia*), black oak (*Quercus kelloggii*), Shreve oak (*Quercus parvula* var. *shrevei*), buckeye (*Aesculus californica*), madrone (*Arbutus menziesii*), coyote brush (*Baccharis pilularis*), manzanita (*Arctostaphylos manzanita* ssp. *glaucescens*), toyon (*Heteromeles arbutifolia*), buckbrush (*Ceanothus cuneatus*), mountain mahogany (*Cercocarpus betuloides)* and poison oak (*Toxicodendron diversilobum*). A

diversity of native grasses are found in this type include onion grass (*Melica geyeri, M. torreyana*), blue wildrye (*Elymus glaucus*), Nevada bluegrass (*Poa secunda*) and native fescues (*Festuca rubra and F. idahoensis*). Native forbs include blue dicks (*Dichelostemma capitatum*), for-toothed ookow (*Dicelstemma congestum*), Ithuriels' spear (*Triteleia laxa*), phacelia (*Phacelia* sp.), Pacific sanicle, soaproot, Diogene's lantern (*Calochortus amabilis*), farewell to spring (*Clarkia gracilis*) and fringed checkerbloom (*Sidalcea diploscypha*).

5) Manzanita chaparral occurs primarily on the northern portion of the study area along the north bank of the unnamed creek. Whiteleaf manzanita (*Arctostaphylos manzanita* ssp. *glaucescens*) is dominant and includes other chaparral shrub species such as toyon, buckbrush, coyote brush, mountain mahogany, chamise (*Adenostoma fasciculatum*), sticky monkeyflower (*Mimulus aurantiacus*), and snowberry (*Symphoricarpos albus* var. *laevigatus)*. A variety of native and non-native grasses and forbs occur as understory species including blue-eyed grass, Douglas iris (*Iris douglasiana*), phacelia, hound's tongue (*Cynoglossum grande*), blue dicks, farewell to spring, and Ithurie's spear.

6) Sandbar willow thickets occur along unnamed creek that forms the northern boundary of the study area. Sandbar willow (*Salix exigua*), arroyo willow (*Salix lasiolepis*) and red willow (*Salix laevigata*) are dominant. Other tree and shrub species include valley oak (*Quercus lobata*), Fremont cottonwood (*Populus fremontii*), madrone, manzanita, coyote brush, Himalayan blackberry (*Rubus armeniacus*) and poison oak. Herbaceous wetland plants noted within the creek bed include scouring rush (*Equisetum hymale*), rushes (*Juncus patens, J mexicanus, J. balticus ssp. ater*), foothill sedge (*Carex tumulicola*, pale spike ush (*Eleocharis macrostachya*) and cattails (*Typha angustifolia*).

7) Pale spike rush marshes occur along the pond margins along with the cattail marsh types and also within vegetated sections of the unnamed creek channel in the eastern portion of the study area. The dominant species is pale spike rush. Other wetland plants noted include penneyroyal (*Mentha pulegium*), curly dock (*Rumex crispus*), umbrella sedge (*Cyperus eragrostis*), rushes and water plantain (*Alisma sp.*).

8) Cattail marshes occur in conjunction with the pale spike rush vegetation type and include the same species. Narrowleaf cattail (*Typha angustifolia*) is dominant and can be a monotypic community type.

9) Seasonal wetlands were mapped in four areas in the eastern portion of the study area. Three seasonal wetlands were mapped in the borrow area and one occurs along the entrance road on the southeastern side of the project study area. Seasonal wetlands occur as relatively small depressions in the flatter areas of the borrow area. The one along the road appears to have developed as a result of water flowing along the inside portion of the roadway. Plant species noted in these areas include penneyroal, cocklebur (*Xanthium strumarium*), rabbitsfoot grass (*Polypogon monspeliensis*), small quaking grass (*Briza minor*), Mediterranean barley (*Hordeum marinum* ssp. *gussoneanum*), hyssop loosestrife (*Lythrum hyssopifolium*) and cut-leaf plantain.

3.3 WILDLIFE HABITATS

Wildlife habitat classifications for this report is based on the California Department of Fish and Game's Wildlife Habitat Relationships (WHR) System (CDFG 1988) which places an emphasis on dominant vegetation, vegetation diversity and physiographic character of the habitat. The value of a site to wildlife is influenced by a combination of the physical and biological

components of the immediate environment, and includes such features as type, size, and diversity of vegetation communities present and their degree of disturbance. As a plant community is degraded by loss of understory species, creation of openings, and a reduction in canopy area, a loss of structural diversity generally results. Degradation of the structural diversity of a community typically diminishes wildlife habitat quality, often resulting in a reduction of wildlife species diversity.

Vegetation communities are often classified based on the dominant plant species within the community. Wildlife habitats are typically distinguished by vegetation type, with varying combinations of plant species providing different resources for use by wildlife. As a result, wildlife habitats are often classified on a more inclusive manner of the structure of the habitat rather than the specifics of the plant species, resulting in several vegetation communities occurring under one type of wildlife habitat (Table 1).

Table 1: Vegetation Communities and Wildlife Habitat Corollary

Vegetation Community	Wildlife Habitat (WHR)
wild oats grasslands, ruderal forbs	Non-native grasslands
purple needle grass grassland	Native grasslands
sandbar willow thickets	Valley-foothill riparian
manzanita chaparral	Mixed Chaparral
blue oak woodland	Montane Hardwood
pale spike rush marshes, cattail marshes, seasonal wetlands	Freshwater pond

The following is a discussion of existing habitats found on site and the wildlife species they support.

Non-native Grassland. Grassland habitat, including native and non-native grasslands, provides both primary habitat, such as nesting and foraging, and secondary habitat, such as a movement corridor. Small species using this habitat as primary habitat include reptiles and amphibians, such as southern alligator lizard (*Gerrhonotus multicarinatus*), western fence lizard (*Sceloporus occidentalis*), and Pacific slender salamander (*Batrachoseps attenuatus*), which feed on invertebrates found within and beneath vegetation and boulders within the vegetation community. This habitat also attracts seed-eating and insect-eating species of birds and mammals. California quail (*Lophortyx californicus*), mourning dove (*Zenaidura macroura*), and grasshopper sparrow (*Ammodramus savannarum),* are a few seed-eaters that nest and forage in grasslands. Insect-eaters such as scrub jays (*Aphelocoma coerulescens*) use the habitat for foraging only. Grasslands are important foraging grounds for aerial and ground foraging insect-eating bat species such as myotis (*Myotis* spp.) and pallid bat (*Antrozous pallidus*). A large number of other mammal species such as California vole (*Microtus californicus*), deer mouse (*Peromyscus maniculatus*), Botta's pocket gopher (*Thomomys bottae*), and brush rabbit (*Sylvilagus bachmani*) also forage and nest within grasslands. Small rodents attract raptors (birds of prey) such as owls, as well as red-tailed hawks (*Buteo jamaicensis*) and red-shouldered hawks (*Buteo lineatus*), among others. Black-tailed deer (*Odoicoileus hemionus californicus*) use grassland for grazing and, if the grass is tall enough, for nesting at night. Coyotes (*Canis latrans*) and striped skunk (*Mephitis mephitis*)

also inhabit the grassland.

Valley-Foothill Riparian. This habitat occurs along the ephemeral tributary on the northern boundary. The tributary supports insect diversity attractive to a variety of migratory birds and provides nesting habitat. Typically, diverse foraging substrates, such as foliage, bark and ground substrates, increase feeding availability. Birds that forage for insects in the leaves of plants include Bewick's wren (*Thryomanes bewickii*), and bushtit (*Psaltriparus minimus*). Bark-insect foraging species, such as plain titmouse (*Parus inornatus*) and white-breasted nuthatch (*Sitta carolinensis*) forage for insects in the bark. There are a few species that are adapted to foraging for insects in flight, such as black phoebe (*Sayornis nigricans*), and western wood pewee (*Contopus sordidulus*). Generalist omnivores are species such as the scrub jay (*Aphelocoma caerulescens*) that eat a variety of different foods, from insects to seeds to fruits. Although insects are the primary food source for most species in the riparian habitat, ground dwelling species, such as California quail (*Callipepla californica*) and California towhee (*Pipilo fuscus*), are also present in the riparian habitat feeding on seeds. The reduced vegetation along the north bank within the project area reduces the occupancy of the project area by these species but habitat still exists on the south bank to support many of these species.

The aquatic habitat of the tributary to the Russian River is comprised of pools up to 2 feet deep on either end of the proposed project area with varying degrees of canopy cover. Along the project area, the majority of the streambed structure is riffles with shallow flows, between 2-6 inches of water, at the time of the survey.

The ephemeral drainage located on the north side of the project area does no support steelhead habitat. There is no perennial water and the pools are not deep enough for the water to last for the entire summer period. In addition, there is an eight foot high cement fish barrier at the creek crossing of Redeemer Road. This barrier is part of the culvert system that runs under the roadway.

Mixed Chaparral. Chaparral habitat, often interspersed with other habitats, provides foraging and nesting habitat for species that are attracted to edges of communities. These edge community species include California quail, California thrasher (*Toxostoma redivivum*), mourning dove (*Zenaidura macroura*), and spotted towhee (*Pipilo crissalis*), that forage among the leaf litter for invertebrates. Avian species that use the canopy of the chaparral for catching insects include blue-gray gnatcatcher (*Polioptila caerulea*), and wrentit (*Chamaea fasciata*). Besides insects, flowers of the manzanita and ceonothus attract nectar drinkers such as Anna's hummingbird (*Calypte anna*). If nesting cliffs are nearby prairie flacons (*Falco mexicanus*) will use chaparral for foraging grounds, as well as sharp-shinned hawks, if water is nearby. Mammals use this habitat for protection and foraging grounds, feeding off new shoots of plants. Black-tailed deer (*Odoicoileus hemionius*) often feed in chaparral but this habitat supports a lower density than in oak savannah. Other species include brush rabbits (*Sylvilagus audubonii*), gophers, and deer mice (*Peromyscus maniculatus*). Small mammals attract predators such as long-tailed weasel (*Mustela frenata*), gray fox, and bobcat (*Felis rufous*). Western rattlesnakes (*Crotalus viridis*) inhabit the warm, dry chaparral community, as well as western fence lizards (*Sceloporus occidentalis*).

Montane Hardwood. The woodlands provide habitat for a variety of species, including refugia for reptiles, such as ring-necked snake (*Diadophis punctatus*), amphibians, such as the Pacific slender salamander (*Batrachoseps attenuatus*) and arboreal salamander (*Aneides lugubris*), foraging and nesting habitat for passerines, and roosting habitat for bats. Smaller passerines, such as black-capped chickadee (*Poecile atricapillus*), lazuli bunting (*Passerina amoena),* bushtit (*Psaltriparus minimus*), oak titmouse (*Baeolophus inornatus*) and acorn woodpecker (*Melanerpes*

formicivorus) observed on the site may nest and forage in the woodlands, feeding on insects on the bark. No large cavities that may support the larger raptors, such as great horned owl (*Bubo virginianus*), were observed in any of the trees in the mixed oak woodland. Other species observed foraging on the site include red-tailed hawk (*Buteo jamaicensis*), red-shouldered hawk (*Buteo lineatus*), spotted towhee (*Pipilo maculatus*), dark eyed junco (*Junco hyemalis*) and California towhee (*Pipilo crissalis*). Oak trees on the lower west-facing slopes provide potential nesting habitat for tree swallows (*Tachycineta bicolor*) and Coopers hawk (*Accipiter cooperii*). Mammals such as mule deer utilize the understory of this community, i.e. poison oak, and black berry bushes, in the form of shelter and food from the berries. The gray fox also utilizes the poison oak and black berry bushes for food and shelter, foraging on small birds and mammals, insects, fungi and berries. Several of the trees were of a diameter large enough to support roosting bats species, such as long-eared myotis (*Myotis evotis*), long-legged myotis (*Myotis volans*), Yuma myotis (*Myotis yumanensis*), California myotis (*Myotis californicus*), big brown bat (*Eptesicus fuscus*), silver-haired bat (*Lasionycteris noctivagans*) and pallid bat (*Antrozous pallidus*), a California Species of Special Concern (SSC) species.

Lacustrine. Lacustrine habitat (pond or lake habitat) contains standing water, from either a dammed river channel or an inland depression. Sizes may vary from pond size, less than one hectre, to reservoir size, comprising several square miles. Most permanent lacustrine systems support fish, while intermittent forms do not. Lacustrine habitats provide a source of water, and cover within riparian areas. The diversity of habitats typically found around lacustrine habitats provide a higher ratio of edge communities and therefore higher wildlife diversity. Wildlife species typically found in this habitat include amphibians and reptiles, such as Sierran tree frog (*Pseudacris sierra*), aquatic garter snake (*Thamnophis couchii*) and western pond turtle (*Clemmys marmorata*), among others. American bullfrog (*Lithobates catesbeianus*) was observed and heard in the ponds. High diversity of invertebrate species provides foraging opportunities for a variety of avian species, including red-winged blackbird (*Agelaius phoeniceus*) and American coot (*Fulica americana*). Snowy egret (*Leocophoyx thula*), black crowned night heron (*Nycticorax nycticorax*) and mallard (*Anas platyrhynchos*) may also forage and nest in this habitat. Mammals common in this habitat are meadow vole (*Microtus californicus*) along the edges of the pond area, raccoon (*Procyon lotor*) that may forage on eggs and invertebrates, with striped skunk (*Mephitis mephitis*) and gray fox (*Urocyon cinereoargenteus*) using the pond as a source of water. This habitat provides important foraging and drinking areas for aerial and ground feeding insectivorous bats, such as *Myotis* species and pallid bat (*Antrozous pallidus*)

3.4 WILDLIFE MOVEMENT CORRIDORS

The proposed project site is located within the Central Coast Ecoregion which supports a wide range of connectivity areas that include natural landscapes that act as corridors to allow for wildlife movement, as well as interstate connections that act as barriers to movement (Spencer, et al. 2010). Wildlife movement includes migration (i.e., usually one way per season), inter-population movement (i.e., long-term genetic flow) and small travel pathways (i.e., daily movement corridors within an animal's territory). While small travel pathways usually facilitate movement for daily home range activities such as foraging or escape from predators, they also provide connection between outlying populations and the main corridor, permitting an increase in gene flow among populations. Barriers to movement include those structures that impede such movements, such as large scale development or major highways with no undercrossings. Roads cause habitat fragmentation because they break large habitat areas into smaller habitat patches that support fewer individuals, which can increase loss of genetic diversity and risk of local extinction. Additionally, roads may prevent access to essential physical or biological features

necessary for breeding, feeding, or sheltering.

As described in the *California Essential Connectivity Project* (Spencer, et al. 2010), the study area is located in North Coast Ecoregion (Fig. 3.2, Spencer, et al. 2010). The natural drainages in the immediate area (e.g., Sulphur Creek) flow west into the Russian River which then flows south and west into Pacific Ocean. The Study Area is considered to be within the #615 Natural Landscape Block (defined as relatively natural habitat blocks that support native biodiversity) that occurs within the Cache Creek and Russian River watersheds. The study area is located in the #36 Essential Connectivity Area (defined as areas that are essential for ecological connectivity between blocks) (Fig. 3.4, Spencer, et al. 2010).

The ephemeral tributary to the Russian River is not considered a movement corridor for fish, such as steelhead, due to the road barrier at Redeemer Road. See under special status species for a specific description of the barrier. Amphibians, such as foothill yellow-legged frog, and mammals, such as striped skunk may use the creek as a movement corridor. Movements by these wildlife species occur between habitats in the Russian River, located downstream, and the ponds located upstream at the headwaters of the creek. The creek provides cover from predators while these movements are being made.

4.0 SPECIAL-STATUS SPECIES AND THEIR NATURAL COMMUNITIES

4.1 REGULATORY REQUIREMENTS

4.1.1 Federal Endangered Species Act (FESA)

To determine whether the proposed project may result in adverse effects to federally listed species, the criteria used was based on guidelines established by the USFW under Section 7(a) of the FESA, in which a project that may have an adverse effect on listed biological resources must be assessed. FESA (16 U.S. Code [USC 1531–1544) provides for the conservation of species that are Endangered or Threatened throughout all or a significant portion of their range, as well as the protection of habitats on which they depend.

Section 7 requires federal agencies to consult with USFWS or NMFS, or both, before performing any action (including actions such as funding a program or issuing a permit) that may affect listed species or designated Critical Habitat. The section 7 consultations are designed to assist Federal agencies in fulfilling their duty to ensure federal actions "do not jeopardize" the continued existence of a species or destroy or adversely modify Critical Habitat.

The USFWS defines temporary and permanent effects as areas denuded, manipulated, or otherwise modified from their pre-project conditions, thereby removing one or more essential components of a listed species' habitat as a result of project activities that include, but are not limited to, construction, staging, storage, lay down, vehicle access, parking, etc. According to the USFWS, temporary effects are limited to one construction season and, at a minimum, are fully restored to baseline habitat values or better within one year following initial disturbance. Permanent effects are not temporally limited and include all effects not fulfilling the criteria for temporary effects.

4.1.2 Federal Migratory Bird Treaty Act

The Migratory Bird Treaty Act (MBTA) (Title 16, United States Code [USC], Part 703) enacts the provisions of treaties between the United States, Great Britain, Mexico, Japan, and the Soviet Union and authorizes the U.S. Secretary of the Interior to protect and regulate the taking of migratory birds. It establishes seasons and bag limits for hunted species and protects migratory birds, their occupied nests, and their eggs (16 USC 703, 50 Code of Federal Regulations [CFR] 21, 50 CFR 10). Most actions that result in taking of, or the permanent or temporary possession of, a protected species constitute violations of the MBTA. The MBTA also prohibits destruction of occupied nests. The Migratory Bird Permit Memorandum (MBPM-2) dated April 15, 2003, clarifies that destruction of most unoccupied bird nests (without eggs or nestlings) is permissible under the MBTA; exceptions include nests of federally threatened or endangered migratory birds, bald eagles (*Haliaeetus leucocephalus*), and golden eagles (*Aquila chrysaetos*). USFWS is responsible for overseeing compliance with the MBTA.

4.1.3 Magnuson-Stevens Fishery Conservation and Management Act

The Magnuson-Stevens Fishery Conservation and Management Act (MSA)(Title 16, United States Code [USC], Part 1803), as amended by the Sustainable Fisheries Act of 1996 (Public Law 104-267) enacts the provisions of sovereign rights and exclusive fishery management authority over all fish, and all Continental Shelf fishery resources to promote the protection of essential fish habitat. The 1996 amendments to the Magnuson-Stevens Act set forth a number of new mandates for the National Marine Fisheries Service (NOAA Fisheries), eight regional fishery management councils (Councils), and other federal agencies to identify and protect important marine and anadromous fish habitat. The Councils, with assistance from NOAA Fisheries, are required to

delineate EFH for all managed species. Federal action agencies which fund, permit, or carry out activities that may adversely impact EFH are required to consult with NOAA Fisheries regarding the potential effects of their actions on EFH, and respond in writing to the NOAA Fisheries' recommendations.

4.1.4 Army Corps of Engineers

The Corps takes jurisdiction over navigable waters of the U.S., their tributaries and any adjacent wetlands. For tidal waters, the Corps jurisdiction extends to the high tide line or when adjacent non-tidal waters of the U.S. are present, the jurisdiction extends to the limits identified for non-tidal waters of the U.S.

For non-tidal waters, the Corps jurisdiction extends to the ordinary high water mark or, if wetlands are present, the jurisdiction extends beyond the ordinary high water mark to the limit of the adjacent wetlands. When the water of the U.S. consists only of wetlands the jurisdiction extends to the limit of the wetland.

Under Section 404 of the Clean Water Act the Corps regulates the disposal of dredge or fill material into waters of the U.S. This includes all filling activities such as utility lines, outfall structures, road crossings, beach nourishment, riprap, jetties, and some excavation activities.

Under Section 10 of the Rivers and Harbors Act of 1899 the Corps regulates all structures and work within tidal waters and freshwaters that involve dredging, marinas, piers, wharves, floats, intake and outtake pipes, pilings, bulkheads, ramps, fills, overhead transmission lines, etc.

Under Section 103 of the Marine Protection, Research and Sanctuaries Act of 1972 the Corps regulates ocean discharge of dredged material.

4.1.5 California Endangered Species Act (CESA)

The California Endangered Species Act (CESA (FGC §§ 2050–2116) is administered by CDFW. The CESA prohibits the "taking" of listed species except as otherwise provided in state law. The CESA includes FGC Sections 2050–2116, and policy of the state to conserve, protect, restore, and enhance any endangered species or any threatened species and its habitat. The CESA requires mitigation measures or alternatives to a proposed project to address impacts to any State listed endangered, threatened or candidate species, or if a project would jeopardize the continued existence of any endangered or threatened species or result in the destruction or adverse modification of habitat essential to the continued existence of those species, if there are reasonable and prudent alternatives available consistent with conserving the species or its habitat which would prevent jeopardy. Section 86 of the FGC defines take as "hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill." Unlike the ESA, CESA applies the take prohibitions to species under petition for listing (state candidates) in addition to listed species. Section 2081 of the FGC expressly allows CDFW to authorize the incidental take of endangered, threatened, and candidate species if all of the following conditions are met:

- The take is incidental to an otherwise lawful activity.
- The impacts of the authorized take are minimized and fully mitigated.
- Issuance of the permit will not jeopardize the continued existence of the species.
- The permit is consistent with any regulations adopted in accordance with §§ 2112 and 2114 (legislature-funded recovery strategy pilot programs in the affected area).
- The applicant ensures that adequate funding is provided for implementing mitigation measures and monitoring compliance with these measures and their effectiveness.

The CESA provides that if a person obtains an incidental take permit under specified provisions of the ESA for species also listed under the CESA, no further authorization is necessary under CESA if the federal permit satisfies all the requirements of CESA and the person follows specified steps (FGC § 2080.1).

4.1.6 California Fish and Game Code

The California Constitution establishes the California Fish and Game Commission (Commission) (CA Constitution Article 4, § 20). The California Fish and Game Code (FGC) delegates the power to the Commission to regulate the taking or possession of birds, mammals, fish, amphibian and reptiles (FGC § 200). The Commission has adopted regulations setting forth the manner and method of the take of certain fish and wildlife in the California Code of Regulations, Title 14.

4.1.7 California Fish and Game Code- Species Protection

The FGC establishes DFG (FGC § 700) and states that the fish and wildlife resources of the state are held in trust for the people of the state by and through DFG (FGC § 711.7(a)). All licenses, permits, tag reservations and other entitlements for the take of fish and game authorized by FGC are prepared and issued by DFG (FGC § 1050 (a)).

Provisions of the FGC provide special protection to certain enumerated species such as:
§ 3503 protects eggs and nests of all birds.
§ 3503.5 protects birds of prey and their nests.
§ 3511 lists fully protected birds.
§ 3513 protects all birds covered under the federal Migratory Bird Treaty Act.
§ 3800 defines nongame birds.
§ 4150 defines nongame mammals.
§ 4700 lists fully protected mammals.
§ 5050 lists fully protected amphibians and reptiles.
§ 5515 lists fully protected fish species.

4.1.8 Regional Water Quality Control Board

The nine state Regional Water Quality Control Boards regulate Section 401 of the Federal Clean Water Act (CWA). CWA Section 401(a)(1) specifies that any applicant for a federal license or permit to conduct any activity that may result in any discharge into navigable waters shall provide the federal licensing or permitting agency with a certification that any such discharge will not violate state water quality standards. The Regional Water Quality Control Boards (RWQCB) administer the Section 401 program with the intent of prescribing measures for projects that are necessary to avoid, minimize, and mitigate adverse impacts on water quality and ecosystems. The jurisdictional extent of Section 401 water quality regulation is typically the top-of-bank for creeks and streams.

The RWQCB has jurisdiction under the State Porter-Cologne Water Quality Control Act which provides the basis for water quality regulation within the state of California. This act allows the State Water Resources Control Board (SWRCB) to adopt statewide water quality control plans or basin plans. The purpose of the plans is to establish water quality objectives for specific water bodies. Most of the implementation of SWRCB's responsibilities is delegated to the nine regional boards.

The SWRCB, acting through the RWQCBs, must certify that a federal wetland permit action (i.e. Section 404 CWA permit or Section 10 of the Rivers and Harbors Act, described above) meets

state water quality objectives. Under the Porter-Cologne Water Quality Control Act, wetlands and drainages that are considered waters of the United States by USACE are also classified by the state as "waters of the state". The jurisdictional extent for creeks and streams is typically the top-of-bank; however, it can be extended to also include a buffer in riparian settings. No standard buffer distance is described in this law, and is usually at the discretion of the regulator assigned to each case. The selected minimum buffer distance is usually the minimum distance necessary to protect the creek from nearby construction effects, based on proposed type of construction activities and proximity of the creek, type, stability, and depth of creek channel, and overall potential for adverse effects (including protective measures).

4.2 SPECIAL-STATUS SPECIES REVIEWED

For the purposes of this Biological Resources Assessment for the Ukiah Sanitary landfill Closure project, special-status species include those that are federally listed as Endangered, Threatened or Proposed for federal listing (candidate) under the USFWS. Other species also evaluated in this Biological Assessment include non-listed federal and California Species of Special Concern (SSC) and those species that fall under the jurisdiction of the USFWS such as the Migratory Bird Treaty Act (MBTA) and the CDFW, such as CEQA Section 15380(d).

Impacts to special-status species were assessed if: (1) those species occurred in habitats similar to those of the landfill project area, and (2) were known to occur within the project area represented by the Ukiah 7.5-minute topographic quadrangle and within 5 miles, which includes the Cow Mountain, Purdy's Garden and Elledge Peak topographic quadrangles.

Federally Listed Plant Species. Review of the USFWS (USFWS 2012), the CDFW, and the CNDDB (CNDDB 2015) revealed that nine (9) federally listed plant species, one (1) federal candidate, three (3) state-listed species and twenty-two (22) CNPS ranked species have potential to occur in the area. Please refer to Table 2 for a list of these species.

None of the federally listed plant species were observed on the site nor or are expected to occur due to lack of suitable habitat. There are no coastal dunes, coastal prairie, coastal scrub, coastal bluff scrub, volcanic ash flow vernal pools, lower montane coniferous forest, upper montane coniferous forest, North Coast coniferous forest, or closed-cone coniferous forest, within the project area. In addition there is no serpentinite , substrates that would provide the type of microhabitat needed for some of the listed species.

Special Status Plant Species: All of the federally listed species are also state-listed species, except for Red Mountain stonecrop (*Sedum laxum* ssp. *eastwoodiae*) which is a federal candidate for listing with no state listing status. The remainder of the plants in Table 2 are either CNPS Rank 1A, 1B, 2B or 4species (Table 2). These species are protected under CEQA. As stated above there are no coastal dunes, coastal prairie, coastal scrub, coastal bluff scrub, volcanic ash flow vernal pools, lower montane coniferous forest, upper montane coniferous forest, North Coast coniferous forest, or closed-cone coniferous forest and no serpentinite within the project area that would provide habitat for many of these species. Two of the CNPS Ranked special status plants are considered to have a moderate potential to occur: Koch's cord moss (*Entosthodon kochii*); and Toren's grimmia (*Grimmia torenii*). No special status plants have been identified as part of the April and May plant surveys but one more survey will be conducted in June or July. Once the surveys are complete a separate plant survey report will be prepared. If any special status plants are found, once surveys are completed, they will be recorded and report in the special status plant survey report.

Table 2. Potentially Occurring Special-Status Plant Species in the Ukiah Sanitary Landfill Closure Study Area.

Scientific Name Common Name	Status USFWS/ CDFG/ CNPS Rank	Habitat Affinities and Blooming Period	Habitat Present/absent	Occurrence Potential
FEDERAL AND STATE LISTED SPECIES AND FEDERAL SPECIES OF CONCERN				
Arabis macdonaldiana McDonald's rock-cress	FE/CE/1B	Lower montane coniferous forest, upper montane coniferous forest on serpentinite. Blooms May to July. Elevation: 135-1800m.	A	None. No habitat on site.
Arenaria paludicola Marsh sandwort	FE/CE/1B	Marshes and swamps (freshwater or brackish), sandy, openings. Blooms May to August. Elevation 3-170m.	P	None. Potential freshwater marsh habitat on site but not known from Mendocino County. Not observed during surveys.
Chorizanthe howellii Howell's spineflower	FE/CE/1B	Coastal dunes, coastal prairie, coastal scrub. Blooms May to July. Elevation: 0-35m.	A	None. No habitat on site.
Eriogonum kelloggii Red Mountian (Kellogg's) buckwheat	FC/CE/1B	Lower montane coniferous forest (rocky, serpentinite). Blooms May to August.	A	None. No habitat on site.
Erysimum menziesii (includes ssp. yadonii) Menzies's wallflower	FE/CE/1B	Coastal dunes. Blooms March to September. Elevation: 0-35m.	A	None. No habitat on site.
Fritillaria roderickii Roderick's fritillary	-/CE/1B	Coastal bluff scrub, coastal prairie, valley and foothill grassland. Blooms March to May. Elevation: 15-400m.	P	None. Potential grassland habitat present but not observed during surveys.
Howellia aquatilis Water howellia	FT/-/2B	Freshwater marshes and swamps. Blooms June. Elevation: 1085-1290m.	P	None. Potential freshwater march habitat on site. Not observed during surveys.
Lasthenia burkei Burke's goldfields	FE/CE/1B	Meadows and seeps (mesic), vernal pools. Blooms April to June. Elevation: 15-600m.	A	None. Typical habitat not present in study area. Not observed during surveys.

Scientific Name Common Name	Status USFWS/ CDFG/ CNPS Rank	Habitat Affinities and Blooming Period	Habitat Present/absent	Occurrence Potential
Limnanthes bakeri Baker's meadowfoam	-/CR/1B	Meadows and seeps, freshwater marshes and swamps, valley and foothill grassland (vernally mesic), vernal pools. Blooms April to May. Elevation: 175-910m.	A	None. Typical habitat not on site. Not observed during surveys.
Navarretia leucocephala ssp. pauciflora Few-flowered navarretia	FE/CT/1B	Volcanic ash flow vernal pools. Blooms May to June. Elevation: 400-855m.	A	None. No habitat on site.
Navarretia leucocephala ssp. plieantha Many-flowered navarretia	FE/CE/1B	Volcanic ash flow vernal pools. Blooms May to June. Elevation: 30-950m.	A	None. No habitat on site.
Pleuropogon hooverianus North Coast semaphore grass	-/CT/1B	Chaparral, cismontane woodland, valley and foothill grassland/mesic. Blooms April to June. Elevation 10-671m.	P	None. Potential chaparral, cismontane woodland and grassland habitat on site but not observed during surveys.
Sedum laxum ssp. eastwoodiae Red Mountain stonecrop	FC/-/1B	Lower montane coniferous forest (serpentinite). Blooms May to July. Elevation: 600-1200m.	A	None. No habitat on site.
CNPS RANKED SPECIES				
Arctostapylos canescens ssp. sonomensis Sonoma canescent manzanita	-/-/1B	Chaparral, lower montane coniferous forest/sometimes serpentinite. Blooms January to June. Elevation: 180-1675m.	P	None. Potential chaparral habitat on site but not observed during surveys.
Arctostaphylos stanfordiana ssp. raichei Raiche's manzanita	-/-/1B	Chaparral, lower montane coniferous forest (openings)/rocky, often serpentinite. Blooms February to April. Elevation: 450-1000m.	P	None. Potential chaparral habitat on site but not observed during surveys.

Scientific Name Common Name	Status USFWS/ CDFG/ CNPS Rank	Habitat Affinities and Blooming Period	Habitat Present/absent	Occurrence Potential
Astragalus breweri Brewer's milk-vetch	-/-/4	Chaparral, cismontane woodland, meadows and seeps, valley and foothill grassland (open, often gravelly)/often serpentinite, volcanic. Blooms April to June. Elevation 90-730m.	P	None. Potential chaparral, cismontane woodland and grassland habitat on site but not observed during surveys.
Brasenia schreberi Watershield	-/-/2B	Marshes and swamps/freshwater. Blooms June to September. Elevation: 30-2200m.	P	None. Potential freshwater marsh habitat on site. Not observed during surveys.
Carex comosa Bristly sedge	-/-/2B	Coastal prairie, marshes and swamps (lake margins), valley and foothill grassland. Blooms May to September. Elevation: 0-625m.	P	None. Potential marsh and grassland habitat on site. Not observed during surveys
Ceanothus confusus Rincon Ridge ceanothus	-/-/1B	Closed-cone coniferous forest, chaparral, cismontane woodland/volcanic or serpentinite. Blooms February to June. Elevation: 75-1065m.	P	None. Potential chaparral and cismontane habitat on site but not observed during surveys.
Cuscuta jepsonii Jepson's dodder	-/-/1B	North Coast coniferous forest/streambanks. Blooms July to September. Elevation: 1200-2300m.	A	None. No habitat on site.
Entosthodon kochii Koch's cord moss	-/-/1B	Cismontane woodland (soil). Elevation: 180-1000m.	P	Moderate. Potential cismontane woodland habitat on site.
Fissidens pauperculus Minute pocket moss	-/-/1B	North Coast coniferous forest (damp coastal soil). Elevation: 10-1024m.	A	None. No habitat on site.
Grimmia torenii Toren's grimmia	-/-/1B	Chaparral, cismontane woodland, lower montane coniferous forest/openings, rocky, boulder and rock walls, carbonate, volcanic. Elevation: 320-1160m.	P	Moderate. Potential chaparral and cismontane woodland habitat on site.

Scientific Name Common Name	Status USFWS/ CDFG/ CNPS Rank	Habitat Affinities and Blooming Period	Habitat Present/absent	Occurrence Potential
Hemizonia congesta ssp. congesta Congested-headed hayfield tarplant	-/-/1B	Valley and foothill grassland/sometimes roadsides. Blooms April to November. Elevation: 20-560m.	P	None. Potential grassland habitat on site but not observed during surveys.
Hesperolinon adenophyllum glandular western flax	-/-/1B	Chaparral, cismontane woodland, valley and foothill grassland/usually serpentinite. Blooms May-Aug. Elevation: 150-1315 m.	A	None. No serpentinite in project area.
Horkelia bolanderi Bolander's horkelia	-/-/1B	Chaparral, lower montane coniferous forest, meadows and seeps, valley and foothill grassland/edges, vernally mesic areas. Blooms June-Aug. Elevation: 450-1100 m.	P	None. Potential chaparral and grassland habitat on site. Not observed during surveys.
Kopsiopsis hookeri Small groundcone	-/-/2B	North Coast coniferous forest. April-Aug. Elevation: 90-885 m.	A	None. No habitat on site.
Layia septentrionalis Colusa layia	-/-/1B	Chaparral, cismontane woodland, valley and foothill grassland/sandy, serpentinite. Blooms April to May. Elevation: 100-1098m.	A	None. No habitat on site – no serpentinite.
Malacothamnus hallii Halls' bush-mallow	-/-/1B	Chaparral, coastal scrub. Blooms May to September (October). Elevation: 10-650m.	P	None. Potential chaparral habitat present but not observed on site.
Malacothamnus mendocinensis Mendocino bush-mallow	-/-/1A	Cismontane woodland. Blooms May to June. Elevation: 425-575m.	P	None. Potential cismontane woodland habitat present but not observed on site.
Navarretia leucocephala ssp. bakeri Baker's navarretia	-/-/1B	Cismontane woodland, lower montane coniferous forest, meadows and seeps, valley and foothill grassland, vernal pools/mesic. Blooms April to June. Elevation: 5-1740m.	P	None. Potential cismontane woodland and grassland habitat on site but not observed during surveys.

Scientific Name Common Name	Status USFWS/ CDFG/ CNPS Rank	Habitat Affinities and Blooming Period	Habitat Present/absent	Occurrence Potential
Plagiobothrys lithocaryus Mayacamas popcorn-flower	-/-/1A	Chaparral, cismontane woodland, valley and foothill grassland/mesic. Blooms April to May. Elevation: 300-450m.	P	None. Potential cismontane woodland and grassland habitat on site but not observed during surveys.
Sanguisorba officinalis Great burnet	-/-/2B	Bogs and fens, broadleafed upland forest, meadows and seeps, marshes and swamps, North Coast coniferous forest, riparian forest/often serpentinite. Blooms July-October. Elevation: 60-1400m.	A	None. Typical habitat not on site. No serpentintie.
Traycina rostrata Beaked tracyina	-/-/1B	Cismontane woodland, valley and foothill grassland. Blooms May to June. Elevation: 90-790m.	P	None. Potential cismontane woodland and grassland habitat present on site but not observed during surveys.
Viburnum ellipticum Oval-leaved viburnum	-/-/2B	Chaparral, cismontane woodland, lower montane coniferous forest. Blooms May to June. Elevation: 215-1400m.	P	None. Potential chaparral and cismontane woodland habitat on site but not observed during surveys.

U.S. Fish and Wildlife Service

FE = federally Ranked Endangered
FT = federally Ranked Threatened
FPE = federally proposed Endangered
SC[1] = federally Species of Concern

California Department of Fish and Wildlife

CE = California Ranked Endangered
CR = California Ranked as Rare
CT = California Ranked as Threatened

California Native Plant Society

Rank 1A: Plants presumed extirpated in California and either rare or extinct elsewhere
Rank 1B: Plants rare and endangered in California and elsewhere

Rank 2B: Plants rare and endangered in California but more common elsewhere
Rank4: Plants that have a limited distribution – a watch list

Special Status Animal Species: Of the 19 special-status animal species identified as potentially occurring in the vicinity of the Ukiah Landfill Closure project area, including a 5 mile radius (CNDDB 2015, USFWS 2015), several additional species have potential to occur on or near the site based on the habitats present (please refer to Table 3). Other species prominent in today's regulatory environment, but with low potential to occur on the site, are also included in the table.

Table 3: Potentially Occurring Special-Status Animal Species in the Ukiah Sanitary Landfill Study area

Common Name Scientific Name	Status USFWS/ CDFG	Habitat Affinities/ Reported Localities in the Project Area	Habitat Present/absent	Occurrence Potential
FEDERAL				
Invertebrates				
Lotis blue butterfly Lycaeides argyrognomon lotis	FE/-	Occurs in wet meadows and sphagnum willow bogs and such. A relatively long adult flight period, extending from mid-April to early July. Host plants are likely native plants in the pea family (Fabaceae). The coast trefoil (also known as seaside bird's-foot trefoil) (*Lotus formosissimus*) is thought to be a larval food plant as well as lupine.	Absent	None: no suitable habitat present.
Behren's silverspot butterfly Speyeria zerene behrensii	FE	Larval host plants include Viola adunca, V. cuneata, V. lobata, V. nuttallii and V. purpurea.	Absent	None: no suitable habitat present.
California freshwater shrimp *Syncaris pacifica*	FE/SE	Endemic to Napa, Sonoma and Marin Counties. Occurs in low elevation and low gradient streams with moderate to heavy riparian cover.	Absent	None: no suitable habitat present.
Fish				
Delta smelt Hypomesus transpacificus	FT/-	Sacramento-San Joaquin delta. Seasonally in Suisun Bay, Carquinez Strait & San Pablo Bay. Seldom found at salinities > 10ppt. Most often at salinities <2ppt.	Absent	None: Outside species range.
Coho salmon - Central California Coast ESU *Onchorhynchus kisutch*	FT/SE	Occurs from Punta Gorda, in northern California, to the San Lorenzo River, in Santa Cruz County, and includes coho salmon populations from several tributaries of San Francisco Bay. Reported on west side of Sonoma County (NOAA 1999).	Absent	None: Outside species range.
steelhead - Central California Coast DPS *Onchorhynchus mykiss*	FT/-	Requires beds of loose, silt-free, coarse gravel for spawning. Also needs cover, cool water and sufficient dissolved oxygen. Fish barrier at Redeemer Road.	Absent	None: No suitable habitat present. Barrier more than 1 mile west of project site.
California coastal Chinook salmon *Oncorhynchus tshawytscha*	FT	Requires gravel diameter of 2 to 3 inches, with depths generally less than 36 inches but more than 20 inches and a velocity of more than 3 ft/sec. Requires water temperatures from 42°F to 51°F.	Absent	None: Outside species range.

Common Name Scientific Name	Status USFWS/ CDFG	Habitat Affinities/ Reported Localities in the Project Area	Habitat Present/absent	Occurrence Potential
Amphibians				
California red-legged frog *Rana draytonii*	FT/-	Prefers semi-permanent and permanent stream pools, ponds and creeks with emergent and/or riparian vegetation. Occupies upland habitat especially during the wet winter months. Outside species range (USFWS 2009).	Present	None: Outside species range.
Birds				
marbled murrelet Brachyramphus marmoratus	FT/SE	Nests in old growth forests and can migrate up to 20 miles inland. This species nests in mature conifer forests with open crown canopies or slopes to provide easy access, and large limbs in trees such as Douglas-fir, western hemlock, Sitka spruce, coastal redwood and mountain hemlock.	Absent	None: No suitable nesting habitat present.
Yellow-billed cuckoo Coccyzus americanus occidentalis	FT/SE	Nests in riparian jungles of willow, often mixed with cottonwoods, with lower story of blackberry, nettles or wild grape.	Absent	None: Habitat not dense enough to support species.
northern spotted owl Strix occidentalis caurina	FT, MB/-	Dense coniferous and hardwood forest, shaded, steep sided canyons.	Absent	None: No suitable nesting habitat present.
Mammals				
Pt Arena Mountain beaver *Aplodontia rufa nigra*	FE	Live in underground burrows dug in forest openings and dense thickets, feeding on various plants, including nettles, blackberry, poison oak, and coyote brush. Found on cool, moist, north-facing slopes in moderately dense coastal scrub.	Absent	None: No suitable nesting habitat present.
Pacific fisher Pekania pennanti	FPT/SCT	Intermediate to large-tree stages of coniferous forests & deciduous riparian areas with high percentage of canopy closure. This species uses cavities, snags, logs & rocky area for cover and denning. Needs large areas of mature, dense forest.	Absent	None: No suitable nesting habitat present.
STATE				
Amphibians				

Common Name Scientific Name	Status USFWS/ CDFG	Habitat Affinities/ Reported Localities in the Project Area	Habitat Present/absent	Occurrence Potential
foothill yellow-legged frog *Rana boylii*	-/SSC	Prefers permanent stream pools, and creeks with emergent and/or riparian vegetation.	Present	**Present**: observed on the site.
Reptiles				
western pond turtle *Emys marmorata*	-/SPT	Prefers permanent, slow-moving creeks, streams, ponds, rivers, marshes and irrigation ditches with basking sites and a vegetated shoreline. Requires upland sites for egg-laying. Species reported in Russian River in Ukiah (CNDDB 2015).	Present	**Low**: suitable aquatic habitat present in ponds.
Birds				
Sharp-shinned hawk *Accipiter striatus*	MB	Dense canopy pine or mixed conifer forest and riparian habitats. Water within one mile required.	Absent	None; no suitable nesting habitat within project area.
Red-shouldered hawk *Buteo lineatus*	MB	Nests in trees along riparian corridors and open fields.	Present	**Low**: suitable habitat occurs along ephemeral tributary.
Peregrine falcon Falco peregrinus anatum	MB	Nests and roosts on protected ledges of high cliffs, usually adjacent to lakes, rivers or marshes.	Absent	None: no suitable habitat present.
Osprey Pandion haliaetus	-/SSC	Nests in large trees within 15 miles of good fish-producing water body.	Absent	None: no suitable nesting habitat present.
grasshopper sparrow Ammodramus savannarum	MB/SSC	Typically found in tall, dense grass, nesting on the ground at the base of grass tuft.	Present	High: Observed on site.
Mammals				
pallid bat Antrozous pallidus	-/SSC	Day roosts include rock outcrops, mines, caves, buildings, bridges, and hollows and cavities in a wide variety of tree species (Reported from 8 mi NE of Ukiah (CNDDB 2015).	Absent	None: No suitable roosting trees present.

Common Name Scientific Name	Status USFWS/ CDFG	Habitat Affinities/ Reported Localities in the Project Area	Habitat Present/absent	Occurrence Potential
Townsend's big-eared bat *Corynorhinus townsendii*	-/SPT	Roosting sites include caves, mine tunnels, abandoned buildings and other structures. Species reported at Hopland field station, 2.7 mi NE of Hopland (CNDDB 2015).	Absent	None: No suitable roosting habitat present.
Fringed myotis Mytotis thysanodes	-/SSC	Roosts in colonies in caves, cliffs and attics of old buildings. Will also use trees as day roosts.	Absent	None: No suitable roosting habitat present.

* Includes bat species expected to occur in the project region and vicinity based on known roosting ecology and habitat relationships, but not reported in the CNDDB.

U.S. Fish and Wildlife Service

FE = federally listed Endangered
FT = federally listed Threatened
FC = federal candidate for listing
MB = Migratory Bird Treaty Act.

California Department of Fish and Wildlife

SE = State listed Endangered
ST = State listed as Threatened
SSC = State Species of Special Concern

Western Bat Work Group - Priority

California includes multiple regions where a species may have different WBWG Priority ranks, therefore the CNNDB includes categories for Medium-High, and Low-Medium Priority.

The following is a discussion of species having potential to occur on site and/or are species that are prominent in today's regulatory environment, such as the California red-legged frog. This document does not address impacts to species that may occur in the region but for which no habitat occurs on site.

4.3 FEDERALLY THREATENED AND ENDANGERED WILDLIFE SPECIES

Steelhead (*Oncorhynchus mykiss irideus*) Central California Coast Distinct Population Segment
Status: federally listed Threatened in 1997. Critical Habitat was designated in 2005.

Description: The steelhead, also known as coastal rainbow trout, has a more rounded snout, with a bright pink stripe along the lateral line with spotted dorsal fins and a square or slightly forked caudal fin (Behnke 2002).

General Ecology and Distribution: Winter steelhead enter streams from the ocean when rains have increased the stream flows (Moyle 2002). Spawning typically occurs in tributaries to mainstream rivers, after which they return to the ocean. A key characteristic of all breeding streams is cool temperatures, typically between 0° Celsius (winter) and 26°-27° C (summer) (Moyle 2002). Higher temperatures may reduce oxygen levels that are not population sustaining. Different size classes require different microhabitats that are defined by depth, water velocity, substrate and cover (Moyle 2002).

Occurrence in the project area: Although the ephemeral tributary is hydrologically connected to the Russian River, an 8-foot tall cement fish barrier occurs at the Redeemer Road crossing, located approximately 1.25 miles west of the project area, and is identified in the California Fish Passage Assessment Database as Number 23 (Passage ID 25199) in Mendocino County (CNDDB 2015). The crossing has been identified as "RED: the filter determined this crossing fails to meet fish passage criteria for adult steelhead and all age classes due to the extremely perched outlet (more than 7 feet)." No further action regarding this species is required.

California red-legged frog (*Rana draytonii*)(CRF)
Status: federally listed by as Threatened with associated critical habitat and is classified by the CDFG as a State Special Concern species.

General Ecology and Distribution: Breeding habitat for this frog is primarily in ponds, but they will also breed in slow moving streams, or deep pools in intermittent streams. Inhabited ponds are typically permanent and contain emergent and shoreline vegetation. Sufficient pond depth and shoreline cover are both critical, because they provide means of escape from predators for the frogs (Stebbins 1985, CDFG 1988, Tatarian 2008). Additionally, emergent vegetation is necessary for the deposition of eggs. The breeding period begins during heavy rains, from early to late winter, usually November through early May. The larvae mature in 11 to 20 weeks.

Non-breeding CRF have been found in both aquatic and upland habitats. The majority of individuals prefer dense, shrubby or emergent vegetation, closely associated with deep (>0.7 meters) still, or slow moving water. However, some individuals use habitats that are removed from aquatic habitats, seeking cover in ground squirrel burrows, under boulders and logs and in non-native grasslands (Tatarian 2008). Upland refugia habitat includes areas up to 90 meters from a stream corridor and includes natural features, such as boulders, rocks, trees, shrubs, and logs. Incised stream channels with portions narrower than 18 inches and depths greater than 18 inches may also provide habitat. In general, densely vegetated terrestrial areas within the riparian

corridor provide important sheltering habitat during the winter flooding of the streams (Tatarian 2008).

Occurrence in the project area: The project site is located outside the species range, as defined by the USFWS (USFWS 2009), which is located west of HWY 128. No further action for this species is required.

4.4 CRITICAL HABITAT

Critical habitat (CH) is designated for the survival and recovery of species listed as threatened or endangered under the Endangered Species Act (ESA). Critical habitat includes those areas occupied by the species, in which are found physical and biological features that are essential to the conservation of an ESA listed species and which may require special management considerations or protection. Critical habitat may also include unoccupied habitat if the Secretary determines that the unoccupied habitat is essential for the conservation of the species.

Steelhead (Central California Coast) – the project area is located outside the Russian River Hydrologic Unit 1114 (NOAA 2005).

4.5 OTHER SPECIAL-STATUS WILDLIFE SPECIES

Foothill Yellow-legged frog (*Rana boylii*) (FYF)
Status: State Species of Concern

General Ecology and Distribution: This species typically inhabits rocky streams, preferring streams with cobble sized substrates (Jennings and Hayes 1994). Occupied drainages range from sea level to 2,040 meters (6,700 feet) (Jennings and Hayes 1994). Streams in woodland, chaparral or forest with little to no bank vegetation cover are also preferred (Stebbins 1985). *R. boylii* prefers small to moderate sized streams with at least some cobble-sized substrate (Jennings and Hayes 1994). Breeding occurs from mid-March to May, depending on rains, with tadpoles metamorphosing in July or August.

Project Area Occurrence: Two subadult foothill yellow-legged frogs were observed in the ephemeral tributary within the project area.

Western Pond Turtle (*Actinemys marmorata*) (WPT)
Status: State Proposed listing as Threatened

General Ecology and Distribution: This medium sized turtle ranges in size to just over 8 inches (21cm) with a low carapace that is generally olive, brownish or blackish (Stebbins 1985, Jennings and Hayes 1994). Primary habits include permanent water sources such as ponds, streams and rivers. It is often seen basking on logs, mud banks or mats of vegetation, although wild populations are wary and individuals will often plunge for cover after detecting movement from a considerable distance. Although it is an aquatic species with webbed feet, it can move across land in response to fluctuating water level, an apparent adaptation to the variable rainfall and unpredictable flows that occur in many coastal California drainage basins (Rathbun, *et al.* 1993). In addition, it can over-winter on land or in water or remain active in the winter, depending on environmental conditions (Rathbun, *et al.* 1993; Jennings and Hayes 1994). Females travel from aquatic sites into open, grassy areas to lay eggs in a shallow nest (Holland 1992; Rathbun, *et al.* 1993). Nests have been reported from 2-400 meters or more away from water bodies (Jennings and Hayes 1994).

Project Area Occurrence: No individuals were detected during the surveys for this biological resource assessment. The closest reported sighting is more than 1.5 mi west in the Russian River (CNDDB 2015). Although the ponds on the site provide suitable habitat for this species the fish barrier on the ephemeral creek does not allow for upstream passage of turtles from the Russian River. There is potential for individuals to move up Sulphur Creek and then across the hill saddle to the easternmost pond on the site. It is unlikely that individuals would use the upland habitat of the landfill for egg laying based on the compaction of the soil and the steep slopes.

Nesting Passerines – including California towhee (*Pipilo crissalis*), grasshopper sparrow (*Ammodramus savannarum)* and song sparrow (*Melospiza melodia*), among others
Status: Protected under the Federal Migratory Bird Treaty Act and Fish and Game Code 3503.

General Ecology and Distribution: As early as February, passerines begin courtship and once paired, they begin nest building, often around the beginning of March. Nest structures vary in shapes, sizes and composition and can include stick nests, mud nests, matted reeds and cavity nests. Depending on environmental conditions, young birds may fledge from the nest as early as May and, if the prey base is large, the adults may lay a second clutch of eggs.

Project Area Occurrence: No surveys were conducted for these species as part of this biological resource assessment. Several passerine (perching birds) species were observed nesting on the site in the various habitats, including, but not limited to, grasshopper sparrows nesting in the grasslands on the landfill.

Nesting Raptors –Cooper's hawk (*Accipiter cooperii*)
Status: Protected under the Federal Migratory Bird Treaty Act and Fish and Game Code 3503.5

General Ecology and Distribution: Raptors nest in a variety of substrates including, cavities, ledges and stick nests. For example, Cooper's hawks are small bird hunters, hunting on the edges of forests and in broken forest where passerines forage for seeds and insects. In general, the breeding season for raptors occurs in late March through June, depending on the climate, with young fledging by early August.

Project Area Occurrence: No surveys were conducted for these species as part of this biological resource assessment. Suitable nesting trees occur along the ephemeral tributary adjacent and within 100 feet of the proposed project.

Roosting bats – including pallid bat, Townsend's big-eared bat, and western red bat
Status: California Species of Concern, State proposed Threatened, as well as Fish and Wildlife Code Sections 86, 2000, 2014, 3007, Title 14, Sections 15380, 15382.

General Ecology and Distribution: Bats in this region of California are not active year-round. During the maternity season, non-volant young of colonial bats remain in the roost until late summer (end of August), after which they may disperse from the natal roost or remain into or throughout the winter. Obligate tree-roosting bat species, and to some extent, colonial bats, may switch tree roosts frequently, particularly after young are volant, but are sometimes faithful for longer periods (weeks). During winter months, bats typically enter torpor, rousing only occasionally to drink water or opportunistically feed on insects. The onset of torpor is dependent upon environmental conditions, primarily temperature and rainfall. To prevent direct mortality of either non-volant young or torpid bats during winter months, roosts must not be disturbed or destroyed until bats are seasonally active, and only after they have been provide a means of

escape from the roost.

Pallid bats are eclectic in their roosting habitat selection, and to some extent distribution, and can be found in crevices and small cavities in rock outcrops, tree hollows, mines, caves, and a wide variety of man-made structures such as buildings, bridges and culverts, generally in lower to mid-elevation sites. This species forms maternity colonies, composed of dozens to sometimes hundreds of females and their young, and smaller bachelor colonies composed of males and not-yet reproductive females.

Western red bats have a broad, but disjunct, distribution throughout the state, and a wide range of elevations. Reproductive females are more common in the inland portions of the state than the Bay Area, where males are more common during the summer months. This is a foliage-roosting species typically associated with large-leaf trees, such as willows, cottonwoods, and sycamores, and is often found near riparian zones. Western red bats are typically solitary, however females give birth to two to five young, which is atypical compared to other bat species.

Project Area Occurrence: Pallid bats could roost in those trees with cavities, crevices and/or exfoliating bark; these could also support non-CSC bats such as hoary bats (*Lasiurus cinereus*), an obligate tree-roosting species, and Myotis species. In addition, western red bats could potentially roost in the foliage of larger mature trees throughout the project site.

Please refer to the Impacts and Mitigation Measures for details on avoidance measures of roosting bats in trees on this site.

4.6 SPECIAL STATUS NATURAL COMMUNITIES

The purple needle grass grassland is a special status vegetation community. This type occurs on the slopes of the existing former borrow area in the northeast portion of the study area. The sandbar willow thickets, cattail marsh, pale spike rush marshes and seasonal wetland areas are wetland vegetation types and even though they do not have a special status designation they are regulated by the Corps, RWQCB and CDFW and therefore are considered to be sensitive natural communities and any impacts to these communities type will require mitigation.

5.0 EFFECTS ANALYSIS AND MITIGATION MEASURES

This section summarizes the potential temporary biological effects from construction activities within the study area. The analysis of these effects is based on a single reconnaissance-level survey of the study area, a review of existing databases and literature, and personal professional experience with biological resources of the region. Potential effects to federally-listed special-status animal species may occur from the proposed project. Mitigations for these biological effects are provided below.

In addition, impacts to state protected special status species are also included in this section and mitigation measures are proposed to reduce the impacts to less than significant.

5.1 FEDERALLY PROTECTED RESOURCES

5.1.1 Wetlands and Waters of the U.S. and State

Potential Impact: Proposed drainage facilities consist of a network of benches, ditches and storm drain that drain to 18- and 24-inch diameter corrugated metal pipe (CMP) discharge culverts. These CMP culverts discharge to the unnamed creek channel at various locations along the length of the Landfill's northern boundary. The culverts that discharge into the creek will also have rock energy dissipaters. These will impact the bed, bank and ordinary high water mark of the creek falling within the jurisdiction of the Corps, RWQCB and CDFW. In addition, the regrading of Pond B and construction of the proposed new sedimentation basin will impact the wetland area around Pond B and two seasonal wetlands: W3 and W4. Proposed access improvements that include placing aggregate base over portion of the existing perimeter road and along benches to provide all-weather access will also impact seasonal wetland areas W1 and W5.

Mitigation Measure: The City is proposing to mitigate for any permanent loss of wetlands or waters of the U.S. and state on site. Mitigation will be in the form of on-site wetland creation which could occur as part of the sedimentation pond regarding and creation of a new sedimentation basin. Impacts to the creek channel could be mitigated by restoration and enhancement of areas within the project study area that would provide opportunities for riparian tree and shrub restoration. The unnamed tributary that goes to the east lacks any tree or shrub cover and would provide more than adequate areas for riparian tree enhancement and restoration. A wetland and riparian mitigation and monitoring plan will be prepared as part of the permit application process for a Section 404 permit from the Corps, a 401 water quality certification from the RWQCB and a Section 1600 Lake and Streambed Alteration Agreement from CDFW. The mitigation plan will include the following:

1. *Objectives*. A description of the resource type(s) and amount(s) that will be provided, the method of compensation (restoration, establishment, preservation etc.), and how the anticipated functions of the mitigation project will address watershed needs.
2. *Site selection*. A description of the factors considered during the site selection process. This should include consideration of watershed needs, onsite alternatives where applicable, and practicability of accomplishing ecologically self-sustaining aquatic resource restoration, establishment, enhancement, and/or preservation at the mitigation project site.
3. *Site protection instrument*. A description of the legal arrangements and instrument including site ownership, that will be used to ensure the long-term protection of the mitigation project site.
4. *Baseline information*. A description of the ecological characteristics of the proposed mitigation project site. This may include descriptions of historic and existing plant communities, historic and existing hydrology, soil conditions, a map showing the locations of the impact and

mitigation site(s) or the geographic coordinates for those site(s), and other characteristics appropriate to the type of resource proposed as compensation. The baseline information should include a delineation of waters of the United States on the proposed mitigation project site.
5. *Mitigation work plan*. Detailed written specifications and work descriptions for the mitigation project, including: the geographic boundaries of the project; construction methods, timing, and sequence; source(s) of water; methods for establishing the desired plant community; plans to control invasive plant species; proposed grading plan; soil management; and erosion control measures. For stream mitigation projects, the mitigation work plan may also include other relevant information, such as planform geometry, channel form (e.g., typical channel cross-sections), watershed size, design discharge, and riparian area plantings.
6. *Maintenance plan*. A description and schedule of maintenance requirements to ensure the continued viability of the resource once initial construction is completed.
7. *Performance standards*. Ecologically-based standards that will be used to determine whether the mitigation project is achieving its objectives.
8. *Monitoring requirements*. A description of parameters monitored to determine whether the mitigation project is on track to meet performance standards and if adaptive management is needed. A schedule for monitoring and reporting monitoring results.
9. *Long-term management plan*. A description of how the mitigation project will be managed after performance standards have been achieved to ensure the long-term sustainability of the resource, including long-term financing mechanisms and the party responsible for long-term management.
10. *Adaptive management plan*. A management strategy to address unforeseen changes in site conditions or other components of the mitigation project, including the party or parties responsible for implementing adaptive management measures.
11. *Financial assurances*. A description of financial assurances that will be provided and how they are sufficient to ensure a high level of confidence that the mitigation project will be successfully completed, in accordance with its performance standards.

5.2 STATE PROTECTED RESOURCES

5.2.1 Special-Status Natural Communities

Potential Impact: Impacts to riparian and wetland vegetation is discussed in section 5.2.1. Several areas of purple needle grass grassland were mapped for the borrow area. Any impacts to these plant communities will require compensation.

Mitigation Measure: The soil borrow area will be reclaimed by re-grading and re-vegetating (hydroseeding) with native grasses, specifically purple needlegrass. A mitigation plan will be required by CDFW and would have the following elements:

1. Objectives. A description of the resource type(s) and amount(s) that will be provided, the method of compensation (restoration, establishment, preservation etc.).
2. Site selection. A description of the factors considered during the site selection process.
3. Baseline information. A description of the ecological characteristics of the proposed mitigation project site. This may include descriptions of historic and existing plant communities, soil conditions, a map showing the locations of the impact and mitigation site(s) or the geographic coordinates for those site(s), and other characteristics.
4. Mitigation work plan. Detailed written specifications and work descriptions for the mitigation project, including: the geographic boundaries of the project; construction methods, timing, and sequence; methods for establishing the desired plant community; plans to control invasive plant species; proposed grading plan; soil management; and

erosion control measures.

5. Maintenance plan. A description and schedule of maintenance requirements to ensure the continued viability of the resource once initial construction is completed.
6. Performance standards. Ecologically-based standards that will be used to determine whether the mitigation project is achieving its objectives.
7. Monitoring requirements. A description of parameters monitored to determine whether the mitigation project is on track to meet performance standards and if adaptive management is needed. A schedule for monitoring and reporting monitoring results.
8. Long-term management plan. A description of how the mitigation project will be managed after performance standards have been achieved to ensure the long-term sustainability of the resource.
9. Adaptive management plan. A management strategy to address unforeseen changes in site conditions or other components of the mitigation project, including the party or parties responsible for implementing adaptive management measures.

5.2.2 Special-Status Plants

Potential Impact: No special status plants have been identified during the April and May plants surveys although two species have a moderate potential to occur: Koch's cord moss and Toren's grimmia. Additional plant surveys are scheduled for June or July 2015. If any special status plants are found during these surveys the following mitigation measures will be implemented.

Mitigation Measure: To ensure no take of individuals and be incompliance with CDFW and USFWS guidelines the following mitigation measures will be implemented based on the status of the plant observed:

Endangered, Threatened, or Rare Species and their Habitats: The project shall either avoid take or obtain formal incidental take coverage with the required compensatory measures where avoidance cannot be achieved for the affected categories: state and federally listed or proposed species, state candidates for listing, and California Native Plant Society (CNPS) Rank 1B species.

Listed or CNPS Rank 1B Plants: For species that do not have formal take protection (e.g., CNPS Rank 1B plants and federally-listed plants where there is no federal nexus), the City shall avoid, minimize, and/or compensate (in that order of preference) at the same level of mitigation as those species that are afforded formal take protection.

If listed plant species are found on the project site, then the project applicant shall prepare a mitigation plan that describes the avoidance or compensatory mitigation measures that would be implemented for these populations. As a performance standard, the plan shall provide for no net loss in the quantity or quality of plant populations. The mitigation plan shall be submitted to the USFWS and/or CDFW for approval for federal and state-listed plants, respectively. The mitigation plan shall include the mitigation measures, which are adopted from the CNPS Policy on *Mitigation Guidelines Regarding Impacts to Rare, Threatened and Endangered Plants* (CNPS 1998), described below, or equally effective alternative measures:

1. Mitigation for impacts to listed plants would include avoidance measures, when feasible, and compensatory mitigation when avoidance is not possible. Avoidance measures shall include buffer zones to avoid impacting listed plants; installing exclusion fencing around the existing plant populations prior to and during construction. Compensatory mitigation shall include replanting on site or propagation of plants at a nearby conservation site through seeding or translocation. Mitigation ratios shall be sufficient to achieve

performance criteria of no net loss of plants. Post-project monitoring shall verify that avoidance and mitigation measures are successful.

2. If mitigation for impacts to listed or List 1B plants occurs at a non-bank site, preference would be given to locating the mitigation site in an area as close to the project site as possible. If mitigation sites are not available in the vicinity of the project site, mitigation for listed plants may be accomplished at any site in Mendocino County that is suitable and supports the impacted plant population.

3. A long-term mitigation, monitoring, and management plan shall be developed for plant mitigation and submitted to the USFWS and/or CDFW for approval prior to initiation of construction activities. Mitigation sites shall be monitored for five years after installation. Depending on the actual case-by-case circumstances listed plants within the Project footprint may be salvaged and/or transplanted to a mitigation site approved by the CDFG and/or USFWS. When feasible, seed from plants unavoidably impacted shall be collected and preserved for planting on an approved mitigation site.

4. Impacted plants shall be mitigated at the ratio of 2:1, or as required by resources agencies, for both individuals and area.

5. All storage and staging areas shall be located outside of stands of listed plants.

CNPS Rank 2, 3, or 4 Plant Species: The project shall avoid significant loss of individuals of a CNPS Rank 2, 3, or 4 (sensitive) plant species, to the extent feasible.

Avoidance measures shall include, but not be limited to, buffer zones, to avoid impacting special status plants and installation of exclusion fencing around the existing plant populations prior to and during construction.

If the impacts from the project exceed 15% of the known occurrences or populations in Mendocino County, then plants shall be relocated or compensatory mitigation shall occur. The project applicant shall prepare a mitigation plan that describes the avoidance or compensatory mitigation measures that would be implemented for these populations. The mitigation plan would be submitted to the CDFW for approval and include the following, or equally effective alternative measures:

1. Prior to the initiation of construction, Rank 2, 3 or 4 plants that would be unavoidably impacted during construction shall be salvaged and transplanted or their seeds shall be collected and preserved for subsequent re-planting. The transplanted plants or seeds shall be reestablished on site if possible; otherwise, they shall be established on a mitigation parcel. Mitigation sites shall be monitored for five years after installation.

2. Impacted Rank 2, 3 or 4 plants shall be mitigated at a ratio of 1:1, or as required by resources agencies, for both individuals and area.

5.2.3 Wildlife

Potential Impact: The proposed project could result in "take" of **individual foothill yellow-legged frog** known to occur within this portion of the ephemeral tributary. There is potential for both adults and tadpoles to be affected by the proposed project.

Mitigation Measure: Construction will occur above any existing water. If this is not possible, measures will be taken to isolate the workspace from flowing water to prevent stream sedimentation and turbidity. To prevent take of individuals a pre-construction survey of the ephemeral tributary shall be conducted 3 months in advance of work proposed for the ephemeral tributary. The surveys will determine if individuals are present. If no individuals (e.g., adults, juveniles or tadpoles) are present, no further action is required. If adults are present work in the creek shall occur after the metamorph stage of development, typically after August. This timing will ensure that individuals can leave an area of the own volition.

The project site shall be restored to pre-construction condition or better. Streambank, ground and/or soil exposed as a result of construction, and soil within and above toe-rock shall be revegetated by live planting, seed casting, or hydroseeding prior to November 30 of the project year. All debris, sediment, rubbish, vegetation or other material removed from waterway shall be removed to a location where it will not re-enter the waters of the state.

Potential Impact: The proposed project could result in "take" of **individual western pond turtle** that may move along this portion of the ephemeral tributary and may use the ponds on the site.

Mitigation Measure: To prevent take of individuals a pre-construction survey of the ephemeral tributary and the ponds shall be conducted 3 months in advance of work proposed for either water body. The surveys will determine if individuals are present. If no individuals (e.g., adults, or juveniles) are present, no further action is required. If individuals are present measures to prevent take of individual foothill yellow-legged frog will address concerns for western pond turtle.

Potential Impact: The proposed project could result in the removal **of occupied passerine nests** in the trees and shrubs on the project site. Disturbance during the nesting season may result in nest abandonment and mortality of young. Bird species not protected under CESA or FESA, such as some passerines (including mourning dove and scrub jays) are protected under the Fish and Game Code 3503 and the MBTA, and some raptors (including American kestrel) are protected under Fish and Game Code 3503.5 and the MBTA. These aforementioned species may potentially be impacted by the removal of potential nesting habitat in the trees within the project area. Disturbance during the nesting season (February 15- August 15) may result in the potential nest abandonment and mortality of young, which is considered a "take" of an individual. This is a potentially significant impact.

Mitigation Measure: To avoid "take" and/or further evaluate presence or absence of passerines, the following measures are recommended:

1. Grading or removal of nesting trees should be conducted outside the nesting season, which occurs between approximately March 1 and August 15.
2. If grading between August 15 and March 1 is infeasible and groundbreaking must occur within the breeding season, a pre-construction nesting bird (both passerine and raptor) survey of the grasslands and adjacent trees shall be performed by a qualified biologist within 7 days of ground breaking. If no nesting birds are observed no further action is required and grading shall occur within one week of the survey to prevent "take" of individual birds that could begin nesting after the survey.
3. If bird nests (either passerine and/or raptor) are observed during the pre-construction survey, a disturbance-free buffer zone shall be established around the nest tree(s) until the young have fledged, as determined by a qualified biologist.
4. The radius of the required buffer zone can vary depending on the species, (i.e., 75-100 feet for passerines and 200-300 feet for raptors), with the dimensions of any required

buffer zones to be determined by a qualified biologist in consultation with CDFG.

5. To delineate the buffer zone around a nesting tree, orange construction fencing shall be placed at the specified radius from the base of the tree within which no machinery or workers shall intrude.
6. After the fencing is in place there will be no restrictions on grading or construction activities outside the prescribed buffer zones.

Potential Impact: Removal of trees containing **suitable bat roosting habitat** comprised of cavities, crevices, and/or exfoliating bark, may cause direct mortality of roosting bats if removed during maternity season prior to self-sufficient volancy of pups, or in winter during torpor or hibernation. Removal of larger mature trees has the potential of causing direct mortality of solitary tree-roosting species such as western red bat or hoary bat.

Mitigation Measure: Presence/absence surveys for bats in trees are extremely problematic for several reasons. First, only a small percentage of trees can be effectively surveyed by inspecting crevices or cavities due to limited physical access to the roost features, or complete visual access of the feature. As a result, in most cases, trees must be surveyed at night using night vision and bioacoustic equipment to observe any bats emerging from roost features. Typically, only one, or two adjacent trees can be surveyed by each observer each night. In addition, bats are less site-faithful to trees than other roost types like caves, mines, bridges or buildings, and switch tree roosts frequently when active. Therefore, trees must be removed no more than 24-48 hours after each night emergence survey, to ensure the tree is removed prior to bats moving in subsequent to surveys. Because of these logistical limitations, it is rarely safe to rely on emergence surveys of trees if more than a few are present on a project site. Instead, it is generally more cost-effective to presume presence of roosting bats, then conduct two-step tree removal during seasonal periods of bat activity, so that bats can safely abandon the tree prior to removal. These dates are:

A) between March 1 (or after evening temperatures rise above 45F and 72 hours after rains fall to less than 0.5” in 24 hours) and April 15 (maternity season), after which time non-volant pups are present in maternity roosts, and;

B) between September 1, after young are self-sufficiently volant, and October 15, or before evening temperatures fall below 45F, and 72 hours prior to onset of rains greater than 0.5” in 24 hours.

6.0 CONCLUSIONS AND DETERMINATIONS

6.1 CONCLUSIONS

This project will incorporate reasonable and prudent measures for avoidance and minimization, described in Section 1.4, and species-specific avoidance and minimization measures. As a result, the project is not anticipated to result in take of any of the listed species described in this biological assessment. The project effects are insignificant and primarily temporary in nature. All temporarily disturbed areas will be restored to pre-construction function.

6.2 DETERMINATIONS

A "may affect, but not likely to adversely affect" determination to special-status species is based on guidelines established by the USFWS under Section 7(a) of the Federal Endangered Species Act (FESA). FESA states that, "each federal agency shall…insure that any action authorized, funded, or carried out by such agency (hereinafter in this section referred to as an "agency action") is not likely to jeopardize the continued existence of any Endangered or Threatened species or result in the destruction or adverse modification of habitat of such species." In addition, the "may affect, but not likely to adversely affect" language means that all effects are either beneficial, insignificant, or discountable, or any combination thereof. Beneficial effects have contemporaneous positive effects without any adverse effects to the species or habitat. Insignificant effects relate to the size of the effect and include those effects that are undetectable, not measurable, or cannot be evaluated. Discountable effects are those extremely unlikely to occur. Thus, components of the proposed project were deemed to have an insignificant effect based on the size and temporal nature of the proposed project.

Steelhead – No suitable habitat occurs in the ephemeral tributary to the Russian River. As a result, we determine that the project *will not likely to adversely affect* steelhead.

California red-legged frog – The project is located outside the species range. No suitable habitat occur sin the ephemeral tributary to the Russian River. This project will not result in mortality of CRF and may result in insignificant effects to potential dispersal habitat. As a result, we determine that the project *will not likely to adversely affect* CRF

Critical Habitat - The Ukiah landfill project will not affect any critical habitat nor adversely modify any critical habitat for steelhead or California red-legged frog.

Appendix B

List of plant species observed on April 15, 21 and 29 and May 19, and 22, 2015.

Scientific Name	Common Name - * are non-native
Achillea millefolium	Yarrow
Achyrachaena mollis	Blow wives*
Acmispon americanus	Spanish clover
Acmispon brachycarpus	deervetch
Acmispon parviflorus	Small-flowered lotus
Adenostoma fasciculatum	Chamise
Adiantum jordanii	California maidenhair
Aegilops truncialis	Barbed goatgrass*
Aesculus californica	California buckeye
Aira caryophyllea	Silver European hairgrass*
Alisma sp.	Water plantain
Allium bolanderi var. *bolanderi*	Bolander's onion
Anisocarpus madioides	Woodland tarweed
Anthemis cotula	Mayweed*
Anthriscus caucalis	Bur-chervil*
Aphanes occidentalis	Lady's mantle
Arbutus menziesii	Madrone
Arctostaphylos manzanita ssp. *glaucescens*	White leaf manzanita
Artemisia douglasiana	Mugwort
Avena barbata	Slender wild oat*
Avena fatua	Wild oat
Baccharis glutinosa	Marsh baccharis
Baccharis pilularis	Coyote brush
Bellardia trixago	Mediterranean linseed*
Brassica nigra	Black mustard*
Briza maxima	Large quaking grass*
Briza minor	Small quaking grass*
Brodiaea elegans ssp. *elegans*	Harvey brodiaea
Bromus carninatus	California brome
Bromus caroli-henrici	Poverty brome*
Bromus diandrus	Rip-gut brome*
Bromus hordeaceus	Soft chess*
Bromus laevipes	Woodland brome
Bromus madritensis ssp. rubens	Foxtail chess*
Calochortus amabilis	Diogene's lantern
Calycadenia fremontii	Fremont's western rosinweed
Cardamine oligosperma	Bittercress
Carduus pycnocephalus	Itlaian thistle*
Carex tumulicola	Foothill sedge
Ceanothus cnuneatus ssp. *cuneatus*	Buckbrush
Centaurea soltitialis	Yellow star-sthistle*
Ceratium glomeraum	Chickweed*
Cercocarpus betuloides	Birch-leaf mountain mahogany
Chlorogalum pomeridianum	Soaproot

Cirsium vulgare	Bull thistle*
Clarkia purpurea ssp. *quadrivulnera*	Wine cups
Claytonia perfoliata	Miner's lettuce
Clinopodium douglasii	Yerba Buena
Collinsia heterophylla	Chinese houses
Cynodon dactylon	Bermuda grass*
Cynoglossum grande	Hound's tongue
Cynosurus echinatus	Hedgehog dotail grass*
Cyperus eragrostis	Umbrella sedge
Dactylis glomerata	Orchard grass*
Danthonia californica	California oat-grass
Datisca glomerata	Durango root
Daucus carota	Queen Anne's lace*
Daucus pusillus	Rattlesnake weed
Delphinium sp.	Larkspur
Deschampsia elongata	Slender hairgrass
Dichelosemma capitatum ssp. *capitatum*	Blue dicks
Dichelosemma congestum	Ookow
Dipascus fullonum	Wild teasel*
Distichlis spicata	Inland salt grass
Dodecatheon hendersonii	Shooting star
Draba verna	Whitlow-grass
Eleocharis macrostachya	Pale spike rush
Elymus caput-medusae	Medusa head grass*
Elymus glaucus ssp. *glaucus*	Blue wildrye
Epilobium brachycarpum	Panicaled willow herb
Epilobium ciliatum	Willow herb
Epilobium sp.	Willow herb
Epilobium torreyi	Torrey's willow herb
Equisetum hyemale ssp. *affine*	Tall scouring rush
Equisetum telemateia	Giant horsetail
Erigeron Canadensis	Horseweed*
Eriodictyon californicum	Yerba santa
Erodium bothrys	Broadleaf filaree*
Erodium cicutarium	Red-stemmed filaree*
Euphorbia crenulata	Chinese caps
Eurybia radulina	Broad-leafed aster
Festuca arundinacea	Tall fescue*
Festuca bromoides	Brome fescue*
Festuca idahoensis	Idaho fescue
Festuca microstachys	Small fescue
Festuca myuros	Rattail fescue*
Festuca perennis	Ryegrass*
Festuca rubra	Red fescue
Foeniculum vulgare	Fennel*
Galium aparine	Goose-grass*
Galium californicum	California bedstraw
Galium parisiense	Wall bedstraw
Galium porrigens	Climbing bedstraw

Gamochaeta ustulata	Spoon-leaf purple everlasting
Gastridium phleoides	Nit grass*
Genista monspessulana	French broom*
Geranium dissectum	Cut-leaf geranium*
Geranium molle	Dove-foot geranium*
Githopsis specularioides	Bluecup
Helenium puberulum	Sneezeweed
Helminthotheca echioides	Bristly ox-tongue*
Hesperevax sparsiflora var. *sparsiflora*	Erect evax
Heteromeles arbutifolia	Toyon
Hieracium album	Hawkweed
Hordeum marinum ssp. *gussoneanum*	Mediterranean barley*
Hordeum murinum ssp. *leporinum*	Hare barley*
Hypericum perforatum	Klamath weed*
Hypochaeris glabra	Smooth cat's-ear*
Hypochaeris radicata	Rough cat's-ear
Iris macrosyphon	Long-tubed iris
Juncus balticus ssp. *ater*	Baltic rush
Juncus bufonius var. *bufonius*	Toad rush
Juncus mexicanus	Mexican rush
Juncus occidentalis	Western rush
Juncus patens	Spreading rush
Juncus xiphioides	Iris-leaved rush
Kickxia elatine	Fluellein*
Lactuca saligna	Willowleaf lettuce*
Lactuca serriola	Pricklylettuce*
Lagophylla ramossisima	Common hareleaf
Lathyrus latifolia	Perennial sweet pea*
Lathyrus vestitus	Hillside pea
Leontodon taraxacoides	Hawkbit*
Leptosiphon bicolor	Bicolored linanthus
Leymus triticoides	Creeping wildrye
Linum bienne	Flax*
Logfia gallica	Narrowleaf cottonweed*
Lotus corniculatus	Bird's-foot trefoil*
Lupinus bicolor	Miniature lupine
Lupinus microcarpus var. *densiflorus*	Chick lupine
Luzula comosa	Wood rush
Lysimachia arvensis	Scarlet pimpernel*
Lythrum hyssopifolium	Hyssop loosestrife*
Madia exigua	Small tarweed
Madia sp.	Madia
Marah fabaceus	California man-root
Marsilea vestita ssp. *vestita*	Water clover
Medicago polymorpha	Bur clover*
Medicago praecox	Medicago*
Melica geyeri	Geyer's onion grass
Melica torreyana	Torrey's melic
Melilotus albus	White sweetclover*

Melilotus indicus	Sour clover*
Mentha pulegium	Penneyroyal*
Micranthes californica	California saxifrage
Micropus californicus	Slender cottonweed
Microseris douglasii	Douglas microseris
Mimulus aurantiacus	Bush monkeyflower
Mimulus guttatus	Seep monkeyflower
Mondardella villosa	Coyote mint
Navarretia intertexta	Needleleaf navarretia
Navarretia pubescens	
Navarretia squarrosa	Skunkweed
Navarretia tagetina	Marigold navarretia
Nemophila heterophylla	
Nemophila menziesii	Baby blue-eyes
Parentucellia viscosa	Yellow glandweed*
Pectocarya pusilla	Little pectocary
Pedicularis densilfora	Indian warrior
Pentagramma triangularis	Gold-back fern
Perideridia kelloggii	Yampa
Petrorhagia dubia	Grass pink*
Phalaris aquatic	Harding grass*
Phalaris paradoxa	Hood canary grass
Plantago coronopus	Cut-leaf plantain*
Plantago erecta	Erect plantain
Plantago lanceolata	English plantain*
Poa pratensis	Kentucky bluegrass*
Poa secunda	Pacific bluegrass
Polygala californica	California milkwort
Polygonum aviculare	Yard knotweed*
Polypogon monspeliensis	Rabbit's foot grass*
Populus fremontii	Fremont's cottonwood
Potamogeton nodosus	Long-leaved pondweed
Pseudognaphalium sp.	Cudweed
Psilocarphus tenellus	Woolly-heads
Quercus agrifolia	Coast live oak
Quercus douglasii	Blue oak
Quercus garryana	Oregon oak
Quercus kelloggii	Black oak
Quercus lobata	Valley oak
Quercus parvula var. *shrevei*	Shreve oak
Quercus wislizeni	Interior live oak
Ranunculus muricatus	Spiny-fruited buttercup*
Ranunculus occidentalis	Western buttercup
Rosa californica	California rose
Rosa gymnocarpa	Wood rose
Rubus armeniacus	Himalayan blackberry*
Rubus ursinus	California blackberry
Rumex crispus	Curly dock*
Salix exigua	Sandbar willow

Salix laevigata	Red willow
Salix lasiolepis	Arroyo willow
Sanicula bipinnata	Poison sanicle
Sanicula bipinnatifida	Purple sanicle
Sanicula crassicaulis	Gamble weed
Scandix pectin-veneris	Venus' needle
Sherardia arvensis	Field madder*
Sidalcea diploscypha	Fringed sidalcea
Sisrynchium bellum	Blue-eyed grass
Sonchus asper	Prickly sow-thistle*
Spergularia rubra	Red sand-spurrey*
Stachys ajugoides	Hedge-nettle
Stachys rigida var. *quercetorium*	Rough hedge-nettle
Stellaria media	Common chickweed*
Stipa lepida	Foothill needlegrass
Stipa pulchra	Purple needlegrass
Stuckenia pectinata	Fennel-leaf pondweed
Symphoricapos mollis	Creeping snowberry
Symphoricarpos albus var. *laegivatus*	Snowberry
Taraxia ovata	Sun cups
Tolpis barbata	European umbrella milkwort*
Torilis arvensis	Japanese hedge parsley*
Torilis nodosa	Short sock destroyer*
Toxicodendron diversilobum	Poison oak
Toxicoscordion sp.	Death camus
Tragopogon porrifolius	Salsify*
Trichostemma lanceolatum	Vinegar weed
Trientalis latifolia	Star flower
Trifolium bifidum var. *bifidum*	Pinole clover
Trifolium dubium	Little hop clover*
Trifolium hirtum	Rose clover*
Trifolium incarnatum	Crimson clover*
Trifolium oliganthum	Few-flowered clover
Trifolium subterraneum	Subterranean clover*
Trifolium willdenovii	Tomcat clover
Triphyseria eriantha ssp. *eriantha*	Butter n' eggs
Triteleia hyacinthine	White brodiaea
Tritelia laxa	Ithuriel's spear
Typha angustifolia	Narrow-leaved cattail
Umbellularia californica	California bay laurel
Uropappus lindleyi	Silver puffs
Vernonica arvensis	Common speedwell*
Vicia sativa ssp. *sativa*	Spring vetch*
Vicia villosa ssp. *villosa*	Hairy vetch*
Vitis californicus	Wild grape
Xanthium strumarium	Cocklebur*
Yabae microcarpa	Yabea
Zeltnera muehlenbergii	Monterey centaury

Appendix C

List of animal species observed on April 15, and 29, 2015.

Scientific Name	**Common Name**
Bufo boreas	Western toad
Pseudacris sierrae	Sierra treefrog
Taricha torosa	California newt
Gambusia affinis	Mosquitofish
Micropterus salmoides	Largemouth bass
Sceloporus occidentalis	Western fence lizard
Pipilo maculatus	Spotted towhee
Meleagris gallopavo	Turkey
Sayornis nigricans	Black phoebe
Buteo jamaicensis	Red-tailed hawk
Sialia mexicana	Western bluebird
Melozone crissalis	California towhee
Callipepla californica	California quail
Branta canadensis	Canada geese
Agelaius phoeniceus	Red-winged blackbird
Sayornis saya	Say's phoebe
Tyrannus verticalis	Western kingbird
Haemorhous maxicanus	House finch
Corvus brachyrhynchos	American crow
Chondestes grammacus	Lark sparrow
Melanerpes formicivorus	Acorn woodpecker
Corvus corax	Common raven
Spizella passerina	Chipping sparrow
Ammodramus savannarum	Grasshopper sparrow
Passerina amoena	Lazuli bunting
Calypte anna	Anna's hummingbird
Colaptes auratus	Northern flicker
Aphelocoma californica	Western scrub jay
Spinus tristis	American goldfinch
Setophaga petechia	American yellow warbler
Vermivora celata	Orange-crowned warbler
Polioptila caerulea	Blue-gray gnatcatcher
Cathartes aura	Turkey vulture
Zonotrichia leucophrys	White-crowned sparrow
Ardea herodias	Great blue heron
Aythya affinis	Lesser scaup

Figure 1: Project Site on USGS quadrangle
Exhibit A: Delineation of Waters of the United States, Including Wetlands

INTRODUCTION AND BACKGROUND INFORMATION

This report and attachments presents findings based on a delineation of potential U.S. Army Corps of Engineers (Corps) waters of the U.S., including wetlands, for the Ukiah Landfill Closure Project located at 3100 Vichy Springs Road, Ukiah, Mendocino County, CA (Figure 1). This work was conducted on behalf of the City of Ukiah, who is the project proponent or applicant. The assessor parcel number (APN) for the project study area is 027-020-069. All maps and appendices referred to in this report are provided at the end of the text.

The Ukiah Landfill Closure project is approximately three miles east of Ukiah in Mendocino County, California. The Landfill occupies approximately 40 acres of permitted landfill area on a 284-acre parcel. The Landfill has been graded to form a series of flat terraces stepping down from south to north. The Landfill surface is covered with seasonal grasses.

The proposed project includes closure of the Landfill which will be performed in accordance with the applicable regulatory standards prescribed in the California Code of Regulations (CCR) [i.e., 27 CCR, Chapters 3 and 4 and CFR, Subpart F]. The components and systems required for closure of the Landfill include the final cover and grading design to control storm water, potential infiltration and accommodate future settlement, drainage and erosion control systems, landfill slope stability, landfill gas (LFG) control systems, leachate control systems, and construction quality assurance (CQA).

Directions to the Site:
From San Francisco take Highway 101 North to the Perkins Rd/Vichy Springs Rd exit. Turn right and go east along Vichy Springs Rd about 1.1 miles. Turn right to stay on Vichy Springs Rd and go about 1.9 miles. The landfill will be off the left at 3100 Vichy Springs Rd.

This delineation was conducted according to the 1987 Corps of Engineers *Wetlands Delineation Manual* (Environmental Laboratory 1987), the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Western Mountains, Valleys, and Coast Region Version 2.0* (U.S. Army Corps of Engineers (2010), and U.S. Army Corps of Engineers, San Francisco District (2007) guidelines. The delineation should be considered preliminary until the U.S. Army Corps of Engineers, San Francisco District, issues a jurisdictional determination of the extent of jurisdictional waters, including wetlands, in the project area. A total of 32,623 square feet (sf) or 0.75 acres of non-vegetated other waters were mapped for the two unnamed tributary creek drainages, along with 44,383 sf (1.02 acres) of vegetated other waters, 119,010 sf (2.73 acres) of vegetated ponds, and 6,130 sf (0.14 acres. The total potential jurisdictional area is 202,146 sf or 4.64 acres.

The client contact for this report is: Mr. Richard J. Seanor, PE
Deputy Director of Public Works
City of Ukiah
300 Seminary Avenue
Ukiah, CA 95482

REGULATORY BACKGROUND

The U. S. Army Corps of Engineers (Corps) is responsible under Section 404 of the Clean Water Act to regulate the discharge of fill material into waters of the United States. Waters of the United States and their lateral limits are defined in 33 CFR Part 328.3(a) and include streams that are tributaries to navigable waters and their adjacent wetlands. The lateral limits of jurisdiction for a non-tidal stream are measured at the line of the Ordinary High Water Mark (OHWM) (33 CFR Part 328.3(e)) or the limit of adjacent wetlands (33 CFR Part 328.3(b)). Any permanent extension of the limits of an existing water of the United States, whether natural or man-made, results in similar extension of Corps jurisdiction (33 CFR Part 328.5).

Waters of the United States fall into two categories, wetlands and other waters. Wetlands include marshes, meadows, seep areas, floodplains, basins, and other areas experiencing extended seasonal soil saturation. Seasonally or intermittently inundated features such as seasonal pools, ephemeral streams, and tidal marshes are categorized as wetlands if they have hydric soils and support wetland plant communities. Other waters include water bodies and watercourses such as rivers, streams, lakes, springs, ponds, coastal waters, and estuaries. Seasonally inundated water bodies or watercourses that do not exhibit wetland characteristics are classified as other waters.

The Regional Water Quality Control Board (RWQCB) takes jurisdiction over the same areas as the Corps as “waters of the State” and in some cases will expand their jurisdiction beyond the Corps’ boundaries, although typically they will accept the Corps delineation. The main difference for this project is that the RWQCB will take jurisdiction over stream courses from top of bank to top of bank, which is a wider area than the OHWM.

The California Department of Fish and Wildlife (CDFW) is responsible for conserving, protecting, and managing California's fish, wildlife, and native plant resources. To meet this responsibility, the Fish and Game Code (Section 1602) requires an entity to notify DFG of any proposed activity that may substantially modify a river, stream, or lake. Notification is required by any person, business, state or local government agency, or public utility that proposes an activity that will: “substantially divert or obstruct the natural flow of any river, stream or lake; substantially change or use any material from the bed, channel, or bank of, any river, stream, or lake; or deposit or dispose of debris, waste, or other material containing crumbled, flaked, or ground pavement where it may pass into any river, stream, or lake.” The notification requirement applies to any work undertaken in or near a river, stream, or lake that flows at least intermittently through a bed or channel. If CDFW determines that the activity may substantially adversely affect fish and wildlife resources, a Lake or Streambed Alteration Agreement will be prepared.

DESCRIPTION OF SITE CHARACTERISTICS

General Description

The Landfill occupies approximately 40 acres of permitted landfill area on a 284-acre parcel having a maximum width of approximately 1,000 feet in the north-south direction and a maximum length of about 3,500 feet in the east-west direction. The project study area is located on a saddle, with Sulphur Creek located off-site to the south, and an unnamed tributary to the Russian River located on-site along the northern boundary. The Landfill has been graded to form a series of flat terraces stepping down from south to north and the Landfill surface is covered with a combination of native and non-native grasses and forbs. The project study area supports a blue line creek and was flowing at the time of the field work.

The project area is located in an unsectioned portion of the Yokaya Rancheria in the southeastern portion of the Ukiah 7.5-minute topographic quadrangle, within Township 15N and Range 12W. Surrounding land uses consist of mainly open space lands, ranches and vineyards. Land adjacent to the Landfill property is zoned primarily as rangeland and is used for grazing. Dwellings within 1,000 feet of the landfill property include a group of structures owned by the Vichy Springs Investment Group that are located within 500 feet of the Landfill's south property line and a single-family residence located approximately 900 feet west of the Landfill's western property boundary. A rural residential development is located approximately ¼-mile west of the Landfill property boundary. A housing development is also located along the south side of Vichy Springs Road and westward of the Vichy Springs Resort. The entire development is approximately 1,000 feet southward of the Landfill property boundary and is separated from the Landfill by an intervening ridge.

Hydrology and Topography

Existing ground surface elevations at the Landfill range from approximately 710 feet above mean sea level (MSL) near the western footprint, to about 970 feet MSL along the southeast footprint. The Landfill has been graded to form a series of flat terraces stepping down from south to north. The Landfill surface is covered with seasonal grasses.

Waste disposal operations at the Landfill began in 1955 at the eastern end of the landfill footprint and progressed upslope and westward. During the 1970's, the unnamed ephemeral creek was realigned northward to maximize the available fill area, and a soil berm was constructed along the toe of the landfill to separate the waste from the realigned creek channel. The method of operation during the Landfill's development was a fill and cover approach in a canyon/gully terrain. The Landfill operated as a nonhazardous Class III solid waste disposal site servicing Ukiah and the surrounding area. The Landfill ceased operations in September 2001.

Soils

There are three main soils types mapped for the Landfill project study area (Appendix B). These are: 1) pits and dumps; 2) Yorktree-Yorkville loams, 30 to 50 percent slopes; and 3) Yorkville-Hopland loams, 30 to 50 percent slopes. Three other soils types are shown on the soils map but they occur mostly outside of the project study area. One of these, Xerochrepts-Haploxeralfs-

Argixerolls complex, 9 to 30 percent slopes, occurs in the extreme northwestern end of the project area where the realigned creek is now situated.

The pits and dumps map unit covers much of the existing landfill area. Soil material was borrowed from the borrow site to cover the landfill so these are mixed soils. The Yorktree-Yorkville loams, 30 to 50 percent slopes, occurs in the northeastern and south-central portion of the study area. This map unit is on unstable side slopes of hills and mountains. This unit is 50 percent Yorktree loam and 25 percent Yorkville loam. The Yorktree soils is deep and well drained and formed in material weathered from greywacke, shale, siltstone, or sandstone. The Yorkville soils is very deep and moderately well drained and this soil formed in material weathered from graywacke, shale or chloritic schist. The Yorkville-Hopland loams, 30 to 50 percent slopes, occur in the western portion of the study area and include a portion of the landfill. This map unit occurs on spur ridges, ridgetops and unstable side slopes of hills and mountains. The unit is 35 percent Yorkville loam and 35 percent Hopland loam. Hopland soil is moderately deep and well drained and formed from material weathered from sandstone and shale. Xerochrepts-Haploxeralfs-Argixerolls complex, 9 to 30 percent slopes occurs on dissected stream terraces and terrace escarpments.

Vegetation
Several vegetation types occur within the study area. These are described below.

Wild oats grasslands is the dominant vegetation type within the project study area as this type covers most of the landfill area, borrow area and roadsides. The wild oats grassland is mixed in with the ruderal forbs type. The revegetated portions of the landfill have a mixture of non-native grasses and in some areas non-native forbs (ruderal forbs) are dominant. Plant species commonly found in the wild oats grasslands include wild oats (*Avena barbata, A. fatua*), rip-gut brome (*Bromus diandrus*), soft chess (*Bromus hordaceus*), hare barley (*Hordeum murinum* ssp. *leporinum*), Harding grass (*Phalaris aquatica*), orchard grass (*Dactylis glomerata*), ryegrass (*Festuca perennis*), tall fescue (*Festuca arundinacea*) and rattail fescue (*Festuca myuros*). A few native grass species were also noted in this type including purple needle grass (*Nasella pulchra*), California oatgass (*Danthonia californica*) and six weeks fescue (*Festuca microstachys*). A variety of non-native forb species also occur in this type including hairy vetch (*Vicia villosa*), cut-leaf plantain (*Plantago coronopus*), yellow star thistle (*Centaurea solsititalis*), European umbrella milkwort (*Tolpis barbata*), yellow glandweed (*Parentucellia viscosa*), Mediterranean linseed (*Bellardia trixago*), rose clover (*Trifolium hirtum),* filarees (*Erodium cicutarium, E. botrys*), and rough cat's-ear (*Hypochaeris radicata*). Native forb species included blow wives (*Achyrachaena mollis*), erect plantain (*Plantago erecta*), suncups (*Camissonia ovata*), blue-eyed grass (*Sisrynchium bellum*), soaproot (*Chloragalum pomeridianum*), Pacific sanicle (*Sanicula crassicaulis*), and California buttercup (*Ranunculus californicus*).

Ruderal forbs dominate the area on northeastern portion of the project study area in the flat area of the former borrow pit. This area is dominated primarily by non-native forb species such as European umbrella milkwort, lesser hawbit (*Leontodon taraxacoides* ssp. *taraxacoides*), cut-leaf plantain, hairy vetch, yellow star thistle, and rough cat's-ear.

Purple needle grass grassland was mapped in one location in the borrow pit area. Small areas of purple needlegrass occur in other locations on the site but are not large enough to map separately as a stand along grassland community. The area on the borrow site was large enough to map and identify as a separate plant community.

Blue oak woodland occurs along the southern portion of the project study area and also occurs along the northern bank of the unnamed creek that forms the northern boundary of the study area. Blue oak (*Quercus douglasii*) are the dominant species. Other trees and shrubs noted include interior live oak (*Quercus wislenzi* var. *wislizeni*), Shreve oak (*Quercus parvula* var. *shrevei*), buckeye (*Aesculus californica*), madrone (*Arbutus menziesii*), coyote brush (*Baccharis pilularis*), manzanita (*Arctostaphylos manzanita* ssp. *glaucescens*), toyon (*Heteromeles arbutifolia*), buckbrush (*Ceanothus cuneatus*), mountain mahogany (*Cercocarpus betuloides)* and poison oak (*Toxicodendron diversilobum*). A diversity of native grasses are found in this type include onion grass (*Melica* sp.), blue wildrye (*Elymus glaucus*), Nevada bluegrass (*Poa secunda*) and native fescues (*Festuca rubra, F. microstachys, F. idahoensis*). Native forbs include blue dicks (*Dichelostemma capitatum*), for-toothed ookow (*Dicelstemma congestum*), Ithuriels' spear (*Triteleia laxa*), phacelia (*Phacelia* sp.), Pacific sanicle, soaproot, Diogene's lantern (*Calochortus amabilis*), farewell to spring (*Clarkia gracilis*) and fringed checkerbloom (*Sidalcea diploscypha*).

Manzanita chaparral occurs primarily on the northern portion of the study area along the north bank of the unnamed creek. Whiteleaf manzanita (*Arctostaphylos manzanita* ssp. *glaucescens*) is dominant and includes other chaparral shrub species such as toyon, buckbrush, coyote brush, mountain mahogany, sticky monkeyflower (*Mimulus aurantiacus*), and snowberry (*Symphoricarpos albus* var. *laevigatus)*. A variety of native and non-native grasses and forbs occur as understory species including blue-eyed grass, Douglas iris (*Iris douglasiana*), phacelia, hound's tongue (*Cynoglossum grande*), blue dicks, farewell to spring, and Ithuriel's spear.

Sandbar willow thickets occur along unnamed creek that forms the northern boundary of the study area. Sandbar willow (*Salix exigua*), arroyo willow (*Salix lasiolepis*) and red willow (*Salix laevigata*) are dominant. Other tree and shrub species include valley oak (*Quercus lobata*), Fremont cottonwood (*Populus fremontii*), madrone, manzanita, coyote brush, Himalayan blackberry (*Rubus armeniacus*) and poison oak. Herbaceous wetland plants noted within the creek bed include scouring rush (*Equisetum hymale, E. telemateia*), rushes (*Juncus patens, J. balticus, J. mexicanus*), sedges (*Carex* spp.), pale spike rush (*Eleocharis macrostachya*) and cattails (*Typha angustifolia*).

Pale spike rush marshes occur along the pond margins along with the cattail marsh types and also within vegetated sections of the unnamed creek channel in the eastern portion of the study area. The dominant species is pale spike rush. Other wetland plants noted include penneyroyal (*Mentha pulegium*), curly dock (*Rumex crispus*), umbrella sedge (*Cyperus eragrostis*), rushes and water plantain (*Alisma* sp.).

Cattail marshes occur in conjunction with the pale spike rush vegetation type and include the same species. Narrowleaf cattail (*Typha angustifolia*) is dominant and can be a monotypic community type.

Seasonal wetlands were mapped in seven areas in the eastern portion of the study area. Six seasonal wetlands were mapped in the borrow area and one occurs along the entrance road on the southeastern side of the project study area. Seasonal wetlands occur as relatively small depressions in the flatter areas of the borrow area. The one along the road appears to have developed as a result of water flowing along the inside portion of the roadway. Plant species noted in these areas include penneyroyal, cocklebur (*Xanthium strumarium*), rabbitsfoot grass (*Polypogon monspeliensis*), small quaking grass (*Briza minor*), Mediterranean barley (*Hordeum marinum* ssp. *gussoneanum*), hyssop loosestrife (*Lythrum hyssopifolium*) and cut-leaf plantain.

METHODS

Literature Review

Prior to the delineation field survey, literature pertinent to identifying potential wetlands and other waters of the United States in the project area was reviewed, including the USGS 7.5 minute topographic quadrangle map for the area, the detailed topographic/aerial photograph base map prepared for the project area, the soil survey report, and the county hydric soils list.

Field Survey and Map Preparation

A formal delineation was conducted by Jane Valerius, botanist and wetland specialist on April 29, 2015 with additional areas added on May 22, 2015. Areas in which the topography or vegetation suggested that wetlands could exist were sampled using the routine onsite determination method procedures described in the 1987 Corps of Engineers *Wetlands Delineation Manual* (Environmental Laboratory 1987). The *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region (Version 2.0)* U.S. Army Corps of Engineers (2008), U.S. Army Corps of Engineers, San Francisco District (2000) delineation guidelines and the U.S. Army Corps of Engineers San Francisco District November 2007 *Information Requested for Verification of Corps Jurisdiction* guidance was also used as part of the on-site wetlands analysis and report preparation

Drainages within the project area designated as other waters of the United States have an ordinary high water mark (OHWM) that defines the extent of the Corps' jurisdiction of that feature. An OHWM refers to "that line on the shore established by the fluctuations of water and indicated by physical characteristics such as clear, natural line impressed on the bank, shelving, changes in the character of soil, destruction of terrestrial vegetation, the presence of litter and debris, or other appropriate means that consider the characteristics of the surrounding area" (33 CFR Section 328.3[e]). The width of the drainage was visually estimated and the average width of the OHWM was recorded for areas designated as other waters.

A total of eighteen (18) soil sample pits were recorded for the project study area. Data sheets are provided in Appendix A. Soils information is provided in Appendix B and site photographs are provided in Appendix C.

RESULTS

Table 1 provides the area calculations for wetlands and other waters as shown on the delineation map. There are two unnamed creek drainages within the project study. The eastern tributary drainage is an ephemeral drainage and is mapped as vegetated other waters. The upper portion of the main drainage that forms the northern boundary of the study area is dry with no wetland vegetation in the creek channel. The lower portion of the northern creek channel from the bridge to the western end of the study area has wetland vegetation within the creek bed and within the ordinary high water mark. The northern creek channel varies in width but has an average width of between 15 to 20 feet within the ordinary high water mark. The eastern tributary channel is more narrow and incised and varies from 8 to 10 feet in width

Areas mapped as potential jurisdictional wetlands include the three former sediment ponds that occur within the study area. A fourth pond, identified as the leachate pond, has not been identified as jurisdictional because this pond is part of the treatment system for the landfill, even though it supports wetland vegetation. Seven small seasonal wetland were also mapped.

A total of 32,623 square feet (sf) or 0.75 acres of non-vegetated other waters were mapped for the two unnamed tributary creek drainages, along with 44,383 sf (1.02 acres) of vegetated other waters, 119,010 sf (2.73 acres) of vegetated ponds, and 6,130 sf (0.14 acres. The total potential jurisdictional area is 202,146 sf or 4.64 acres.

Table 1: Area calculations for wetlands and other waters.

Seasonal Wetlands	Area in Square Feet	Acres
W1	1,117	0.03
W2	340	0.01
W3	1,417	0.03

Wetland Hydrology Indicators:

Primary Indicators (any one indicator is sufficient)

- ___ Surface Water (A1)
- ___ High Water Table (A2)
- ___ Saturation (A3)
- ___ Water Marks (B1) (**Nonriverine**)
- ___ Sediment Deposits (B2) (**Nonriverine**)
- ___ Drift Deposits (B3) (**Nonriverine**)
- ___ Surface Soil Cracks (B6)
- ___ Inundation Visible on Aerial Imagery (B7)
- ___ Water-Stained Leaves (B9)
- ___ Salt Crust (B11)
- X Biotic Crust (B12)
- ___ Aquatic Invertebrates (B13)
- ___ Hydrogen Sulfide Odor (C1)
- ___ Oxidized Rhizospheres along Living Roots (C3)
- ___ Presence of Reduced Iron (C4)
- ___ Recent Iron Reduction in Plowed Soils (C6)
- ___ Thin Muck Surface (C7)
- ___ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ___ Water Marks (B1) (**Riverine**)
- ___ Sediment Deposits (B2) (**Riverine**)
- ___ Drift Deposits (B3) (**Riverine**)
- ___ Drainage Patterns (B10)
- ___ Dry-Season Water Table (C2)
- ___ Thin Muck Surface (C7)
- ___ Crayfish Burrows (C8)
- ___ Saturation Visible on Aerial Imagery (C9)
- ___ Shallow Aquitard (D3)
- ___ FAC-Neutral Test (D5)

Field Observations:

Surface Water Present? Yes ____ No ✓ Depth (inches): ____

Water Table Present? Yes ____ No ✓ Depth (inches): ____

Saturation Present? Yes ____ No ✓ Depth (inches): ____

(includes capillary fringe)

Wetland Hydrology Present? Yes ✓ No ____

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL: http://websoilsurvey.nrcs.usda.gov
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Mendocino County, Eastern Part and Southwestern Part of Trinity County, California
Survey Area Data: Version 10, Sep 30, 2014

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Jun 16, 2010—Jun 27, 2010

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

HYDROLOGY CALCULATIONS

TECHNICAL MEMORANDUM

DATE:	August 31, 2015	**JOB #:** 02-907
PROJECT:	City of Ukiah Final Closure Construction Ukiah, CA	
PREPARED BY:	Damon Morelli, P.E. EBA Engineering 825 Sonoma Avenue Santa Rosa, CA 95404	
SUBJECT:	Final Closure Construction Hydromodification Impacts and Final Closure Best Management Practices	

PROJECT DESCRIPTION

The City of Ukiah Landfill is located at 3100 Vichy Springs Road, which is approximately two miles east of the City of Ukiah in Mendocino County, California. The City of Ukiah Landfill was operated as a Class III solid waste disposal facility and is comprised of a single waste management unit approximately 40 acres in size. The final closure construction will encompass the waste management unit and provide a cover consisting of a 1-foot thick foundation layer, a gas relief/venting system, a LLDPE geomembrane, and an engineered synthetic turf with specific grade and sand infill ballast. Accompanying the cover will be miscellaneous improvements including drainage and erosion control measures, sedimentation basin improvements, access roads, leachate collection system, and a landfill gas collection system.

The drainage improvements for the Final Closure Construction were designed to route off site drainage around the waste management while having the onsite drainage sheet flow to shallow swales and collect into and underground drainage system before out letting into an unnamed drainage course.

Hydromodification Impacts

One of the main purposes of the improvement associated with the Final Closure Improvements is to provide a cover for the waste management unit. When constructed, the cover will provide an impermeable surface protecting the waste management unit from storm water infiltration. As a result, the cover will also increase the amount of storm water leaving the project site. Although there will be an increase in the amount of storm water leaving the project site, when analyzing the watershed upstream of and including the project site, the hydromodification impacts are minimal.

Hydrographs were developed for the pre and post closure construction and when compared, the two showed that there would be an increase in approximately 182,577 cubic feet of storm water in the watershed for a 2 year-24 hour storm event. This is a 5.3% increase. To see how the 5.3% increase would affect the hydrology of the watershed upstream of and including the project site, further calculations were performed. The calculations show that time of concentrations changed from 38.8 minutes to 38.7 minutes or 0.3% increase and for a 2 year storm event, the flows intensities increase from 369.68 cfs to 388.08 cfs or an increase of 5.0%. Further hydraulic calculations were performed to determine the hydraulic capacity of the existing channel. These calculations found that for a 2 year storm event, the flow depth increase from 3.52 feet to 3.60 feet or a 2.2 % increase and the velocity increased from 8.90 feet per second to 8.98 feet per second or a 0.9% increase. All of these increases are considered to have an impact on the overall hydrology/hydraulics of the existing unnamed drainage course.

Hydrology and hydraulic calculations are provided and attached in the attachments.

FINAL CLOSURE BEST MANAGEMENT PRACTICES

To help alleviate some of the minor hydromodification impacts of the Final Closure Improvements, the improvements will include post construction best management practices through the use of a synthetic turf liner, routing portions of the surface drainage into an existing retention basin, and improvements to the existing drainage structures out letting into the unnamed drainage course.

The synthetic turf liner will reduce sediment loads by providing an impermeable liner on relatively steep 2:1 slopes (horizontal to vertical). Although the existing slopes are vegetated, the steep slopes provide a mechanism for sediments to enter the unnamed drainage course. This liner will protect the slopes from erosion and reduce the sediments that would come from them.

Since the project site is very congested, the design maximizes the use of storm water detention/retention through the use of an existing storm water retention basin. A portion of the site will be routed to this existing retention basin to provide storm water storage.

The Final Closure Improvements will also improve existing storm drain outlets into the unnamed drainage course. The existing outlets currently "shotgun" into the drainage course at five to six feet above the flow line, providing the potential for significant erosion. These outlets will be replaced with new ones that allow for the storm drain to outlet near the toe of the bank at an elevation of one foot above the flow line and with rock rip rap energy dissipaters at the end. This will reduce the potential for significant erosion at the storm drain outfalls.

Hydrograph Comparison
City of Ukiah Landfill Final Closure Construction
8/26/2015

Check Hydrograph Comparison for 2 year Storm Event:

Hydrogprahs were created for the pre-closure and post closure conditions for the 2 year-24 hour storm events using the computer program, "Hydrographs Extensions for AutoCAD Civil 3D 2013". The pre-closure and post closure hydrographs were then compared to determine how the closure improvements affected the storm water volumes just downstream of the project location.

Hydrograph Information:

Hydrogaph type:	SCS Runoff	
Storm Frequency:	2 year	
Storm Duration:	24 hour	
Total Precipitation:	3.57 inches	→ See NOAA Atlas 14, Volume 6, Version 2
Drainage Area:	882.55 acres	
Pre Closure Curve Number:	71	→ Based on Table 2-2c, Curve Numbers for other agriculture lands (Pasture Land) and information obtained from the USDA Wed Soil Survey for
Post Closure Curve Number:	72	→ Based on Table 2-2c, Curve Numbers for other agriculture lands (Pasture Land) and information obtained from the USDA Wed Soil Survey for

Pre-Closure Hydrograph:
Volume of storm water created by the 2 year-24 hour storm event just downstream of the project location:

Volume= 3,462,444 cubic feet

Post Closure Hydrograph:
Volume of storm water created by the 2 year-24 hour storm event just downstream of the project location:

Volume= 3,645,001 cubic feet

Comparison:

Pre-closure volume=	3,462,444	cubic feet
Post closure volume=	3,645,001	cubic feet
Difference in Volume=	182,557	→The increase in volume of 182,557 cubic feet (5.3%) is considered insignificant

[1] Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS).

Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values.

Please refer to NOAA Atlas 14 document for more information.

Table 2-2c Runoff curve numbers for other agricultural lands [1/]

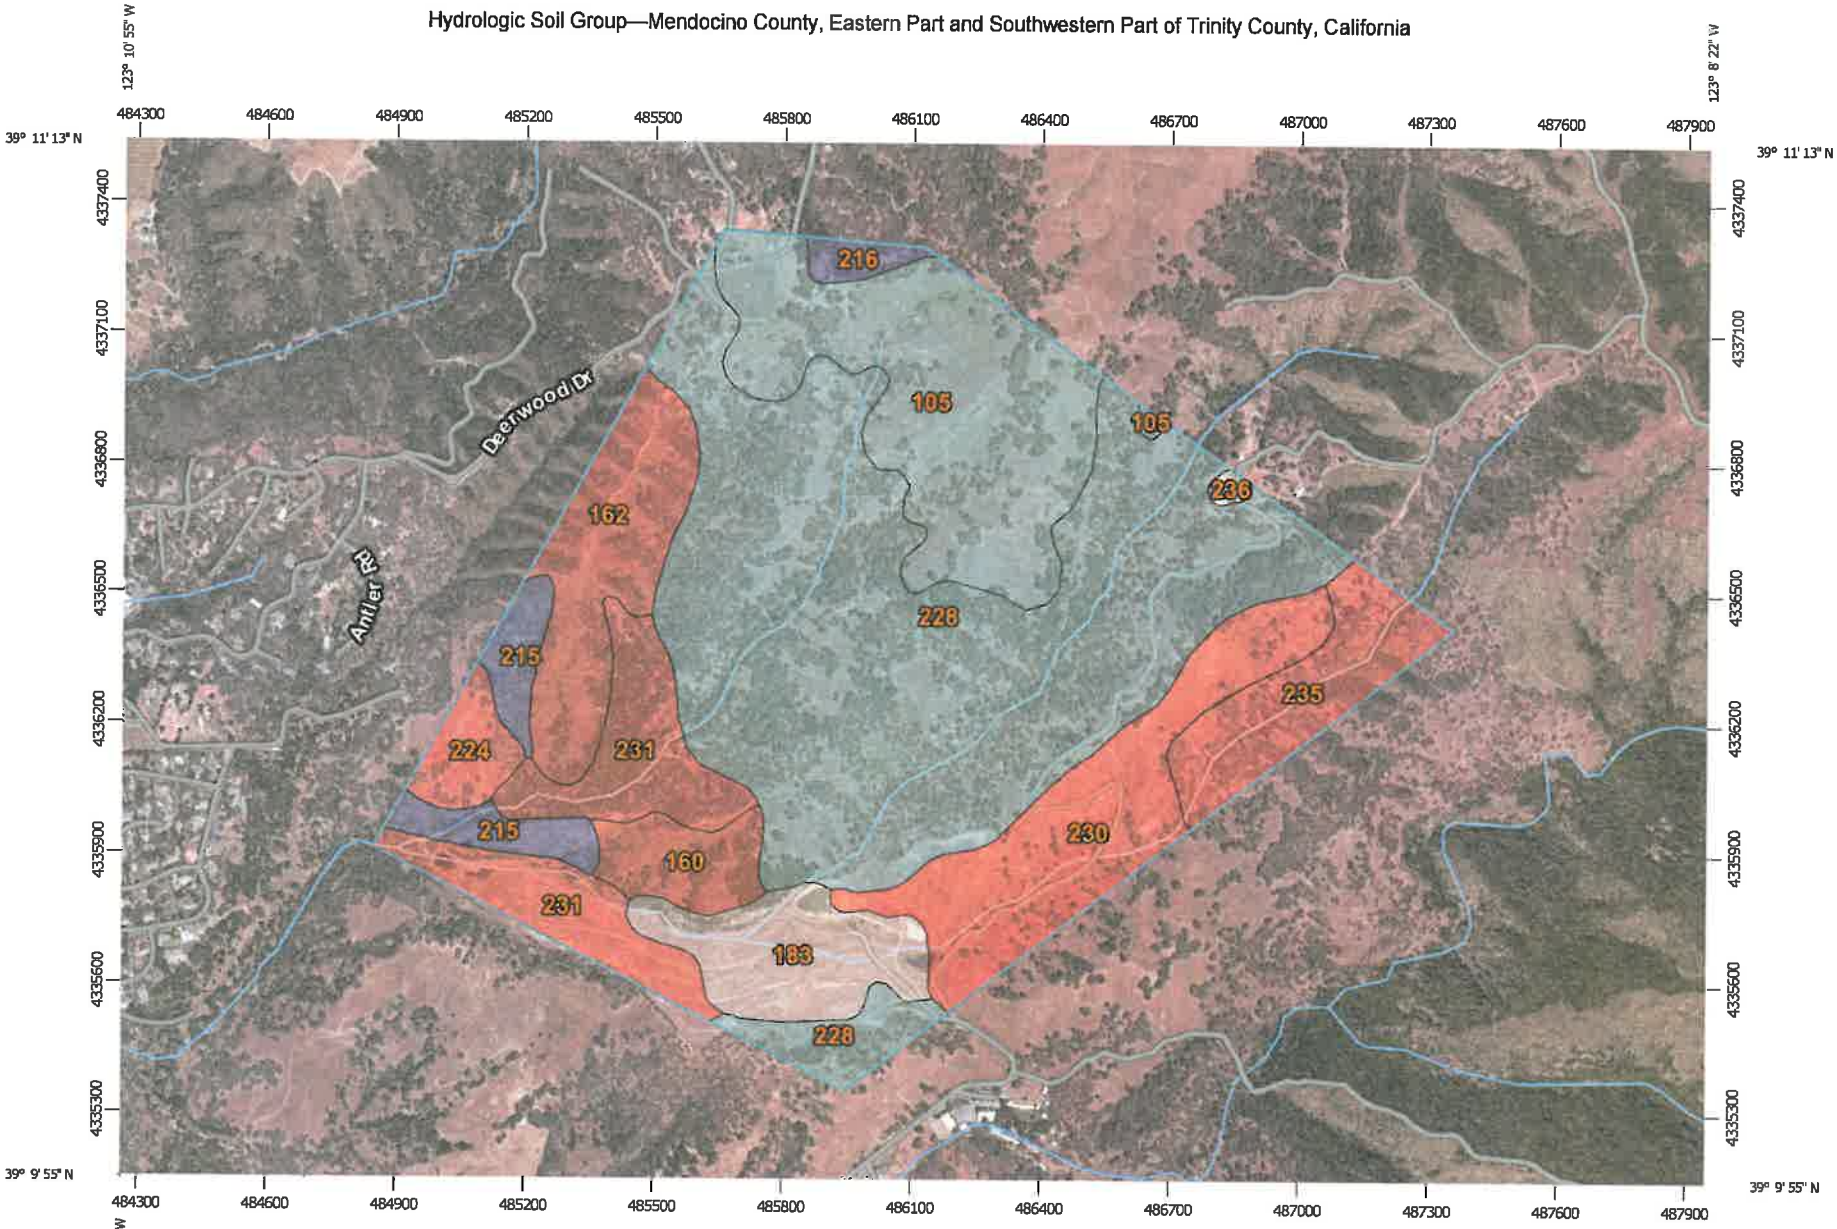
Cover description		Curve numbers for hydrologic soil group			
Cover type	Hydrologic condition	A	B	C	D
Pasture, grassland, or range—continuous forage for grazing. [2/]	Poor	68	79	86	89
	Fair	49	69	79	84
	Good	39	61	74	80
Meadow—continuous grass, protected from grazing and generally mowed for hay.	—	30	58	71	78
Brush—brush-weed-grass mixture with brush the major element. [3/]	Poor	48	67	77	83
	Fair	35	56	70	77
	Good	30 [4/]	48	65	73
Woods—grass combination (orchard or tree farm). [5/]	Poor	57	73	82	86
	Fair	43	65	76	82
	Good	32	58	72	79
Woods. [6/]	Poor	45	66	77	83
	Fair	36	60	73	79
	Good	30 [4/]	55	70	77
Farmsteads—buildings, lanes, driveways, and surrounding lots.	—	59	74	82	86

1 Average runoff condition, and $I_a = 0.2S$.

2 *Poor:* <50%) ground cover or heavily grazed with no mulch.
Fair: 50 to 75% ground cover and not heavily grazed.
Good: > 75% ground cover and lightly or only occasionally grazed.

3 *Poor:* <50% ground cover.
Fair: 50 to 75% ground cover.
Good: >75% ground cover.

4 Actual curve number is less than 30; use CN = 30 for runoff computations.



5 CN's shown were computed for areas with 50% woods and 50% grass (pasture) cover. Other combinations of conditions may be computed from the CN's for woods and pasture.

6 *Poor:* Forest litter, small trees, and brush are destroyed by heavy grazing or regular burning.
Fair: Woods are grazed but not burned, and some forest litter covers the soil.
Good: Woods are protected from grazing, and litter and brush adequately cover the soil.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL: http://websoilsurvey.nrcs.usda.gov
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Mendocino County, Eastern Part and Southwestern Part of Trinity County, California
Survey Area Data: Version 10, Sep 30, 2014

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Jun 16, 2010—Jun 27, 2010

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

14.

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

Estimated Q @ Point 2=	17.7	cfs
Average Q in reach=	9.8	cfs

** Based on 1 cfs/acre

Assume Triangular Channel Flow:

Q=	9.8	cfs
n=	0.035	
side slopes=	2:1	
slope=	0.2755	
velocity=	10.0	fps
flow length=	871	ft
travel time=	1.5	min

*** Per Channel Report, pg. 21

t_c @ Point 2= 16.5 min

Determine t_c from Point 2 to Point 3:

Q @ Point 2=	16.6	cfs	
Estimated Q @ Point 3=	86.9	cfs	** Based on 1 cfs/acre
Average Q in reach=	51.8	cfs	

Assume Triangular Channel Flow:

Q=	51.8	cfs	
n=	0.035		
side slopes=	2:1		
slope=	0.1384		
velocity=	11.8	fps	*** Per Channel Report, pg. 22
flow length=	2602	ft	
travel time=	3.7	min	

t_c @ Point 3= 20.2 min

Determine t_c from Point 3 to Point 4:

Q @ Point 3=	73.3	cfs	
Estimated Q @ Point 4=	162.2	cfs	** Based on 1 cfs/acre
Average Q in reach=	117.8	cfs	

Assume Triangular Channel Flow:

Q=	117.8	cfs	
n=	0.035		
side slopes=	2:1		
slope=	0.0560		
velocity=	10.4	fps	*** Per Channel Report, pg. 23
flow length=	2142	ft	
travel time=	3.4	min	

t_c @ Point 4= 23.6 min

Determine t_c from Point 4 to Point 5:

Q @ Point 4=	126.2	cfs	
Estimated Q @ Point 5=	247.5	cfs	** Based on 1 cfs/acre
Average Q in reach=	186.9	cfs	

Assume Triangular Channel Flow:

Q=	186.9	cfs	
n=	0.035		
side slopes=	2:1		
slope=	0.0144		
velocity=	7.0	fps	*** Per Channel Report, pg. 24
flow length=	3066	ft	
travel time=	7.3	min	

t_c @ Point 5= 30.9 min

Determine t_c from Point 5 to Point 6:

Q @ Point 5=	167.5	cfs	
Estimated Q @ Point 6=	635.1	cfs	** Based on 1 cfs/acre
Average Q in reach=	401.3	cfs	

Assume Triangular Channel Flow:

Q=	401.3	cfs	
n=	0.035		
side slopes=	2:1		
slope=	0.0099		
velocity=	7.4	fps	*** Per Channel Report, pg. 25
flow length=	3514	ft	
travel time=	7.9	min	

t_c @ Point 6= 38.8 min

NOTES:
Flow depths, velocities & top widths determined using Hydraflow Express
Initial Time of Concentration of 15 minutes was used based on Mendocino County Standards

$I=8.8428/(T_c)^{-0.5166}$

where I is intensity (in./hr.) and Tc is the time of concentration (County of Mendocino Std D11G)
Slopes are measured as Vertical/Horizontal.

Post Closure t_c Calculations
City of Ukiah Landfill Final Closure Construction
10 Year Storm Event
8/26/2015

Determine t_c:

t_c @ Point 1= 15.00 min

* Initial t_c per County of Mendocino Standards

Determine t_c from Point 1 to Point 2:

Q @ Point 1=	1.8	cfs
Estimated Q @ Point 2=	17.7	cfs
Average Q in reach=	9.8	cfs

** Based on 1 cfs/acre

Assume Triangular Channel Flow:

Q=	9.8	cfs
n=	0.035	
side slopes=	2:1	
slope=	0.2755	
velocity=	10.0	fps
flow length=	871	ft
travel time=	1.5	min

*** Per Channel Report, pg. 30

t_c @ Point 2= 16.5 min

Determine t_c from Point 2 to Point 3:

Q @ Point 2=	16.6	cfs	
Estimated Q @ Point 3=	86.9	cfs	** Based on 1 cfs/acre
Average Q in reach=	51.8	cfs	

Assume Triangular Channel Flow:

Q=	51.8	cfs	
n=	0.035		
side slopes=	2:1		
slope=	0.1384		
velocity=	11.8	fps	*** Per Channel Report, pg. 31
flow length=	2602	ft	
travel time=	3.7	min	

t_c @ Point 3= 20.2 min

Determine t_c from Point 3 to Point 4:

Q @ Point 3=	73.3	cfs	
Estimated Q @ Point 4=	162.2	cfs	** Based on 1 cfs/acre
Average Q in reach=	117.8	cfs	

Assume Triangular Channel Flow:

Q=	117.8	cfs	
n=	0.035		
side slopes=	2:1		
slope=	0.0560		
velocity=	10.4	fps	*** Per Channel Report, pg. 32
flow length=	2142	ft	
travel time=	3.4	min	

t_c @ Point 4= 23.6 min

Determine t_c from Point 4 to Point 5:

Q @ Point 4=	126.2	cfs	
Estimated Q @ Point 5=	247.5	cfs	** Based on 1 cfs/acre
Average Q in reach=	186.9	cfs	

Assume Triangular Channel Flow:

Q=	186.9	cfs	
n=	0.035		
side slopes=	2:1		
slope=	0.0144		
velocity=	7.0	fps	*** Per Channel Report, pg. 33
flow length=	3066	ft	
travel time=	7.3	min	

t_c @ Point 5= 30.9 min

Determine t_c from Point 5 to Point 6:

Q @ Point 5=	177.7	cfs	
Estimated Q @ Point 6=	635.1	cfs	** Based on 1 cfs/acre
Average Q in reach=	406.4	cfs	

Assume Triangular Channel Flow:

Q=	406.4	cfs	
n=	0.035		
side slopes=	2:1		
slope=	0.0099		
velocity=	7.4	fps	*** Per Channel Report, pg. 34
flow length=	3514	ft	
travel time=	7.9	min	

t_c @ Point 6= 38.8 min

ATTACHMENT D: HYDRAULIC CALCULATIONS

Hydraulic Calculations
City of Ukiah Landfill Final Closure Construction
8/26/2015

Check Channel Capacity for 2 year Storm Event:

Channel capacity checked at near Point 6.

Pre-Closure

Q_{10}=	530.73	cfs	→ See hydrology calcs. pg. 16
Q_1~	$0.65Q_{10}$		
Q_1~	344.97	cfs	

Use straight line interpolation between Q_1 and Q_{10} to determine Q_2

Q_2~	369.68	cfs

Assume trapezoidal channel flow to determine flow depth and velocity:

Q_2=	369.68	cfs	
side slopes=	2:1		
bottom width=	3	ft	
n=	0.035		
slope=	0.0189		
depth=	5.00	ft	
flow depth=	*3.52*	*ft*	→ SEE CHANNEL REPORT, PG. 44
velocity=	*8.90*	*ft/s*	→ SEE CHANNEL REPORT, PG. 44

Post Closure

Q_{10}=	557.14	cfs	→ See hydrology calcs. pg. 16
Q_1~	$0.65Q_{10}$		
Q_1~	362.14	cfs	

Use straight line interpolation between Q_1 and Q_{10} to determine Q_2

Q_2~	388.08	cfs

Assume trapezoidal channel flow to determine flow depth:

Q_2=	388.08	cfs	
side slopes=	2:1, 3:1		
bottom width=	3	ft	
n=	0.035		
slope=	0.0189		
depth=	5.00	ft	
flow depth=	*3.60*	*ft*	→ SEE CHANNEL REPORT, PG. 45
velocity=	*8.98*	*ft/s*	→ SEE CHANNEL REPORT, PG. 45

Comparison

Pre-closure flow depth=	3.52	ft
Post closure flow depth=	3.60	ft

Post closure flow depth increase=	0.08 ft	→The increase in flow depth of 0.08' (2.2%) is considered insignificant

Pre-closure velocity=	8.90	ft/s
Post closure velocity=	8.98	ft/s

Post closure velocity increase=	0.08 ft/s	→The increase in velocity of 0.08 ft/s (0.9%) is considered insignificant

Check Channel Capacity for 10 year Storm Event:

Channel capacity checked at near Point 6.

Pre-Closure

Q_{10}=	530.73	cfs	→ See hydrology calcs. pg. 16

Assume trapezoidal channel flow to determine flow depth:

Q_{10}=	530.73	cfs	
side slopes=	2:1		
bottom width=	3	ft	
n=	0.035		
slope=	0.0189		
depth=	5.00	ft	
flow depth=	*4.11*	*ft*	→ SEE CHANNEL REPORT, PG. 46
velocity=	*9.73*	*ft/s*	→ SEE CHANNEL REPORT, PG. 46

Post Closure

Q_{10}=	530.73	cfs	→ See hydrology calcs. pg.

Assume trapezoidal channel flow to determine flow depth:

Q_{10}=	530.73	cfs	
side slopes=	2:1, 3:1		
bottom width=	3	ft	
n=	0.035		
slope=	0.0189		
depth=	5.00	ft	
flow depth=	*4.19*	*ft*	→ SEE CHANNEL REPORT, PG. 47
velocity=	*9.87*	*ft/s*	→ SEE CHANNEL REPORT, PG. 47

Comparison

Pre-closure flow depth=	4.11	
Post closure flow depth=	4.19	
Post closure flow depth increase=	0.08 ft	→The increase in flow depth of 0.08' (1.9%) is considered insignificant
Pre-closure velocity=	9.73	ft/s
Post closure velocity=	9.87	ft/s
Post closure velocity increase=	0.14 ft/s	→The increase in velocity of 0.14 ft/s (1.4%) is considered insignificant

Check Channel Capacity for 100 year Storm Event:

Channel capacity checked at near Point 6.

Pre-Closure

Q_{10}=	530.73	cfs	→ See hydrology calcs. pg. 16
Q_{100}~	$1.5Q_{10}$		
Q_{100}~	796.10	cfs	

Assume trapezoidal channel flow to determine flow depth:

Q_{100}=	796.10	cfs	
side slopes=	2:1		
bottom width=	3	ft	
n=	0.035		
slope=	0.0189		
depth=	5.00	ft	
flow depth=	*4.87*	*ft*	→ SEE CHANNEL REPORT, PG. 48
velocity=	*10.77*	*ft/s*	→ SEE CHANNEL REPORT, PG. 48

Post Closure

Q_{10}=	557.14	cfs	→ See hydrology calcs. pg. 16
Q_{100}~	$1.5Q_{10}$		
Q_{100}~	835.71	cfs	

Assume trapezoidal channel flow to determine flow depth:

Q_{100}=	835.71	cfs
side slopes=	2:1, 3:1	
bottom width=	3	ft
n=	0.035	
slope=	0.0189	
depth=	5.00	ft

flow depth=	*4.96*	*ft*	→ SEE CHANNEL REPORT, PG. 49
velocity=	*10.94*	*ft/s*	→ SEE CHANNEL REPORT, PG. 49

Comparison

Pre-closure flow depth=	4.87	ft
Post closure flow depth=	4.96	ft

Post closure flow depth increase=	0.09 ft	→The increase in flow depth of 0.09' (1.8%) is considered insignificant

Pre-closure velocity=	10.77	ft/s
Post closure velocity=	10.94	ft/s

Post closure velocity increase=	0.17 ft/s	→The increase in velocity of 0.17 ft/s (1.6%) is considered insignificant

Notice of Preparation

NOTICE OF PREPARATION

ENVIRONMENTAL IMPACT REPORT
CITY OF UKIAH LANDFILL CLOSURE PROJECT

Pursuant to the California Environmental Quality Act (CEQA), the City of Ukiah (City) plans to prepare an environmental impact report (EIR) on its proposed Ukiah Landfill Closure Project (Project, or Proposed Project). The City will be the lead agency under CEQA.

Project Location and Background

As shown in Figure 1, the Ukiah Landfill is located approximately three miles east of the City of Ukiah within the unincorporated area of Mendocino County. The Ukiah landfill is part of a 283.5-acre parcel of land and has a physical address of 3100 Vichy Springs Road, Ukiah, California in the southeast ¼ of Section 10, Township 15 north, Range 12 west, Mount Diablo Base and Meridian. The property is further identified by Mendocino County Assessor's Parcel Number 178-130-01.

Waste disposal operations at the Landfill began in 1955 at the eastern end of the landfill footprint and progressed upslope and westward. During the 1970's, the unnamed ephemeral creek was realigned northward to maximize the available fill area, and a soil berm was constructed along the toe of the landfill to separate the waste from the realigned creek channel. The method of operation during the Landfill's development was a fill and cover approach in a canyon/gully terrain. The Landfill operated as a nonhazardous Class III solid waste disposal site servicing the City of Ukiah and the surrounding area. The types of waste received included garbage, rubbish, demolition and construction waste, brush, stumps, large appliances diverted as scrap metal and street refuse. The Landfill ceased operations in September 2001.

Environmental monitoring at the Landfill was originally regulated under Order 75-43 in conformance with Title 23 of the California Code of Regulations (23 CCR). In September 1993, Order 75-43 was amended by Order 93-83 as a mechanism to implement State Water Resources Control Board Resolution No. 93-62 and federal municipal solid waste regulations (i.e., "Subtitle D") per Title 40 of the Code of Federal Regulations (40 CFR), Parts 257 and 258. Concurrent with this amendment was the preparation of a Report of Waste Discharge for the purpose of formally updating the Landfill's WDRs and to address groundwater impacts previously identified at the site. The combination of these two documents was subsequently used by the NCRWQCB to issue new WDRs (Order 94-123) for the site in October 1994.

In the Fall of 1995, an Engineering Feasibility Study (EFS) was conducted to evaluate corrective action alternatives for the mitigation of groundwater impacts and to assess potential leachate management options. Findings from the EFS included recommendations to upgrade the groundwater monitoring network, performance of a health-based risk assessment, and modification of the leachate collection/management facilities. The monitoring system upgrades and health-based risk assessment were subsequently completed in the Fall of 1996. Modifications to the leachate collection/management facilities, which included the diversion of collected leachate to an aboveground storage tank and pumping to the City's sewer piping system via a combination force main/gravity drain, were also completed in the Fall of

1996.

Following completion of the respective corrective action measures, the site was monitored on a quarterly basis in accordance with Order 94-123. On June 27, 2002, the NCRWQCB adopted the current WDRs (Order R1- 2002-0061) for the site to address interim closure, corrective action needs, and submittal of plans to complete cap construction in accordance with 27 CCR. Order R1-2002-0061 is the currently monitoring document for the project site.

In 2014, the City prepared Final Construction Plans for the closure of the Ukiah Landfill and then in 2016, the City prepared an Initial Study/Mitigated Negative Declaration and through that process determined that the City would prepare an EIR to satisfy the requirements of CEQA. The Initial Study/Mitigated Negative Declaration is available for review by the public on the City's website at https://cityofukiah.box.com/UkiahLandfillClosureProject.

Goals and Objectives

The overall purpose of the Proposed Project is to close the Ukiah Landfill in accordance with the applicable regulatory standards. Specifically, the components and systems required for closure of the landfill include the final cover and grading design to control stormwater, potential infiltration and accommodate future settlement, landfill slope stability, construction quality assurance, drainage and erosion control systems, landfill gas (LFG) control and monitoring systems, groundwater/surface water monitoring systems, and site security.

Project Description

Closure of the Ukiah Landfill will be performed in accordance with the applicable regulatory standards. The components and systems required for closure of the landfill include the final cover and grading design to control stormwater, potential infiltration and accommodate future settlement, landfill slope stability, construction quality assurance, drainage and erosion control systems, LFG control and monitoring systems, groundwater/surface water monitoring systems, and site security. A description of each of these closure components will be included in the EIR. The final cover design is described below.

As outlined in 27 CCR, §20950, the primary performance goal for final closure is to minimize the infiltration of water into the waste, thereby minimizing the production of leachate and LFG. The proposed final cover design for the Landfill areas will consist of the following layers, from top to bottom:

- Synthetic erosion-resistant layer;
- A structured geomembrane low hydraulic-conductivity layer that includes a drainage layer; and
- A minimum one-foot thick foundation layer.

This final cover design for the Landfill areas is an engineered alternative final cover consistent with 27 CCR, §20080. A copy of the Final Grade Construction Plans are included on the City's website at https://cityofukiah.box.com/UkiahLandfillClosureProject. Several factors were taken into consideration is establishing the proposed final cover design for the Landfill, including the geometry of the existing landfill, local climatic conditions, final cover material availability, slope

stability, erosion protection, and construction cost.

Scope and Contents of the EIR

"Scope" is a term that describes the breadth and depth of an EIR (i.e. the content, as well as the level of analysis and discussion). The City identified the appropriate scope for this EIR by preparing an Initial Study/Mitigated Negative Declaration (see the City's website at https://cityofukiah.box.com/UkiahLandfillClosureProject.) and engaging appropriate state and local agencies and the public to provide input. As required by CEQA, this Draft EIR will focus on significant environmental effects expected to result from the Proposed Project (CEQA Guidelines, Section 15143).

Based on responses to and the results of the Initial Study/Mitigated Negative Declaration, the identified environmental resources that require further analysis in the EIR are as follows:

- Aesthetics/Visual
- Air Quality/Greenhouse Gasses
- Hydrology
- Geology
- Noise

Based on responses to and the results of the Initial Study/Mitigated Negative Declaration, substantial evidence exists to exclude the following identified environmental resources from further analysis in the EIR are as follows:

- Agriculture and Forest Resources
- Biological Resources
- Cultural Resources
- Hazards and Hazardous Materials
- Land Use and Planning
- Mineral Resources
- Population and Housing
- Public Services
- Recreation
- Transportation/Traffic
- Utilities and Service Systems

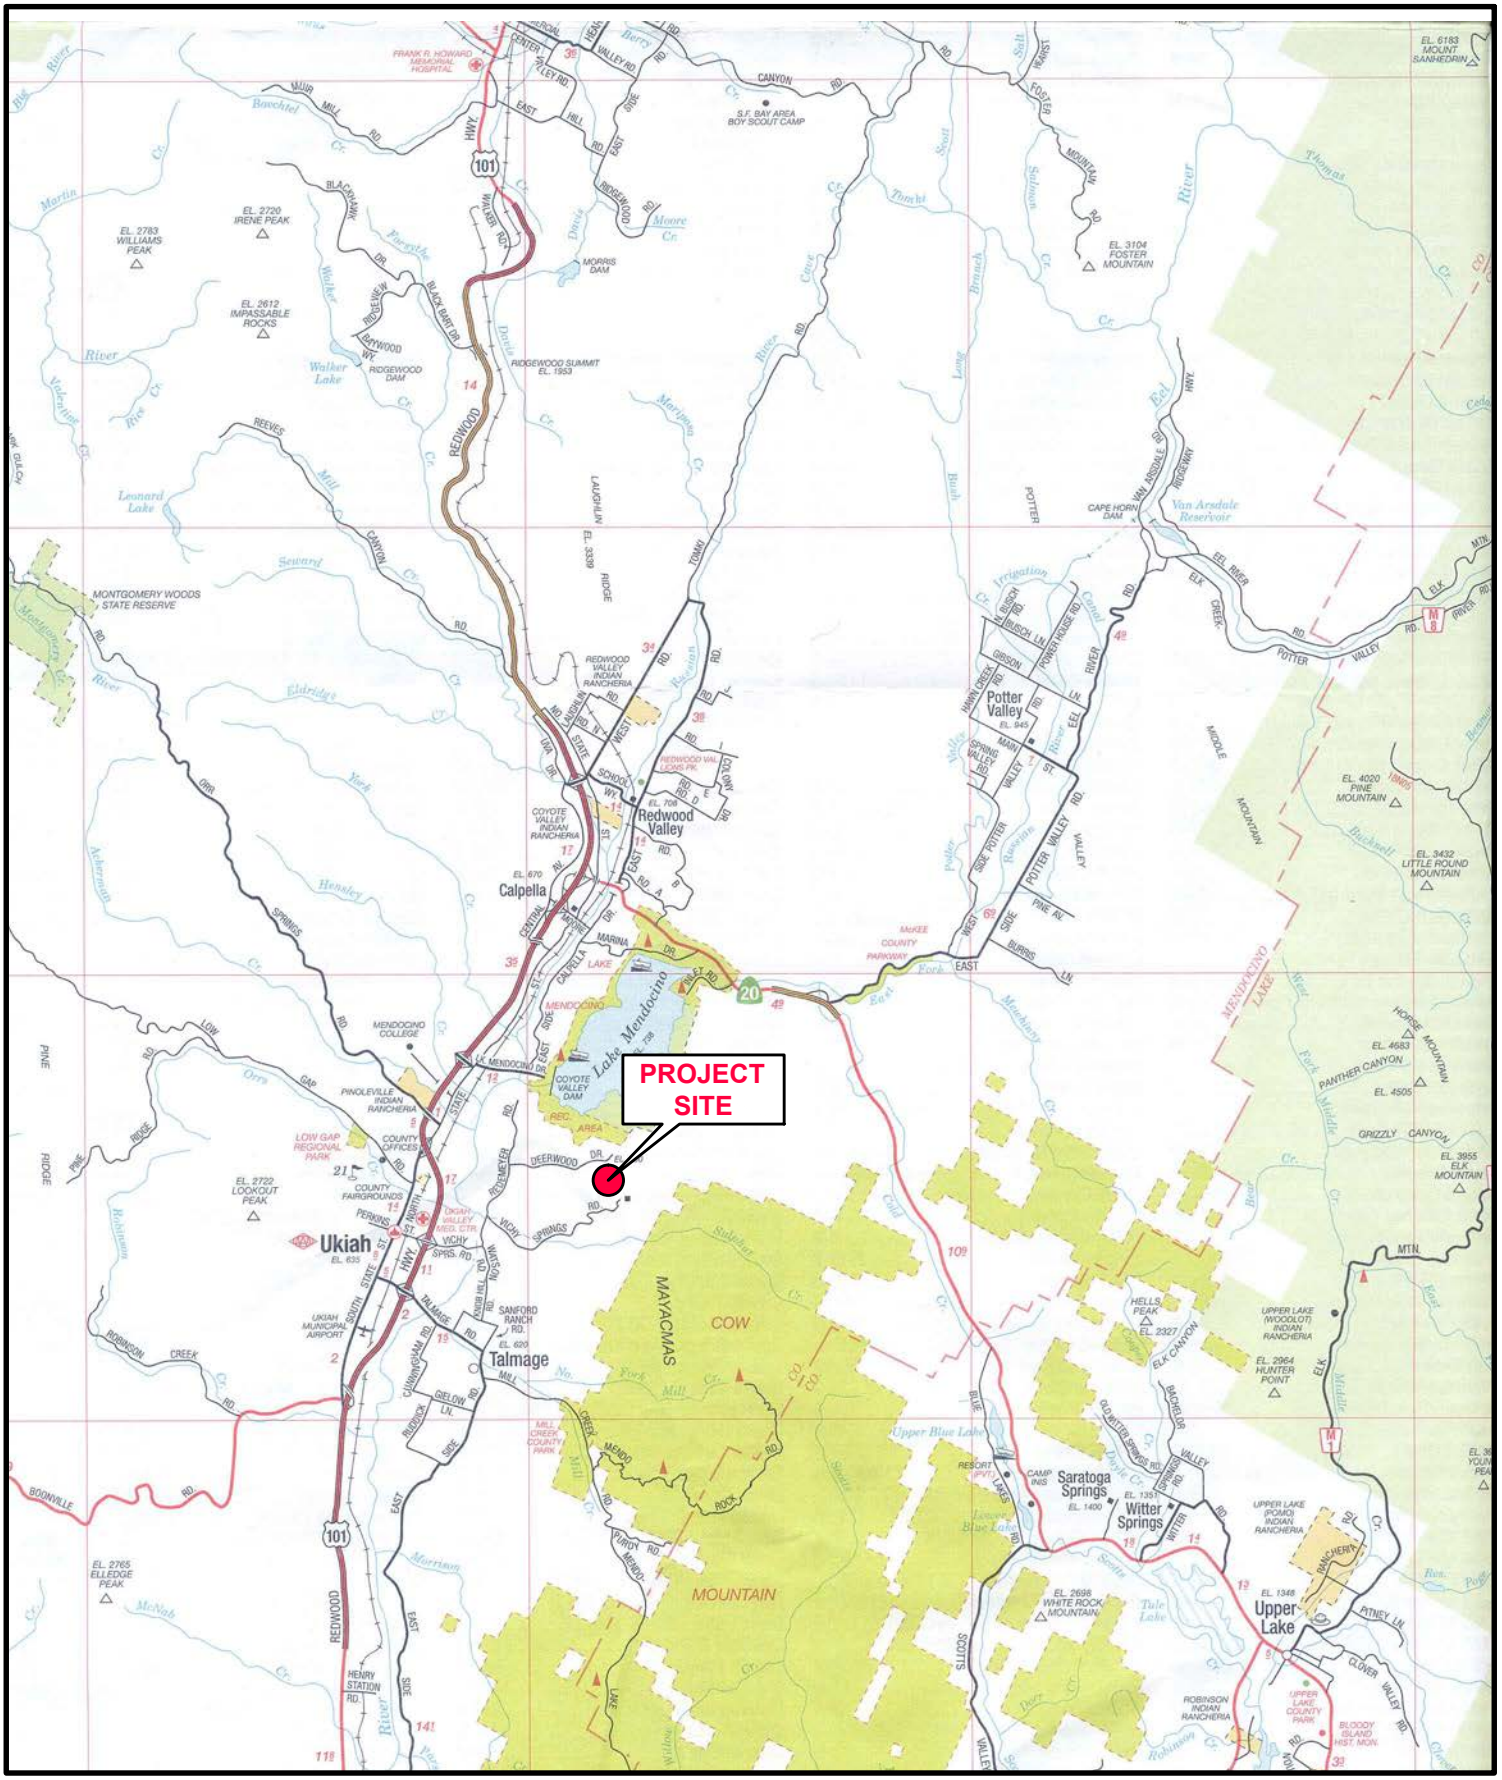
Any mitigation measures identified in the 2016 Initial Study/Mitigated Negative Declaration that are not revisited in the forthcoming EIR will be carried forward and will be included in the Mitigation Monitoring and Reporting Program to verify compliance.

Further, the Draft EIR will characterize the existing environmental resources within the vicinity of the Proposed Project, analyze potential impacts to those resources, and identify mitigation measures to reduce impacts. Other CEQA-related issues, such as cumulative and growth inducing effects that could result from the Proposed Project will also be analyzed. It is anticipated that at least two (2) alternatives, including a "No-Project" Alternative, will be analyzed in this Draft EIR.

Public Participation

As part of the environmental review process, the City would like to know the views of you and/or your agency as to the scope and content of the environmental information, which is germane to your interests or your agency's statutory responsibilities in connection with the Proposed Project. If you are representing an agency, your agency may need to use this EIR when considering your permit authority or approval of the Proposed Project. Whether you are a public agency, stakeholder, rate payer, adjacent landowner, and/or interested member(s) of the general public, you are encouraged to help participate in the preparation of the EIR by attending the scoping meetings and/or providing written comments as further discussed below.

Scoping Meetings. Two scoping meetings will be conducted to seek public and agency input on alternatives, environmental issues and concerns to be addressed in the EIR. The schedule and location of the scoping meetings are as follows:



2:00 pm Tuesday, February 21, 2017
City of Ukiah
300 Seminary Avenue.
Ukiah, CA 95482

6:00 pm Tuesday, February 21, 2017
City of Ukiah
300 Seminary Avenue
Ukiah, CA 95482

Written Comments. In addition to the opportunity to provide input during the scoping meetings, written comments on the scope, content, alternatives, and the environmental issues to be addressed in the EIR are also encouraged. Due to the time limits mandated by state law, your written response needs to be received by March 7, 2017. Please send your written comments to:

Jarod Thiele, Management Analyst
The City of Ukiah
300 Seminary Avenue
Ukiah, California 95482-5400

Please make sure that you provide your name, agency you are representing, title, as well as your address and phone number so that we can contact you and keep you informed throughout the EIR process. If you should have any questions or need additional information, please call Mr. Jarod Thiele at 707-463-6755. The City estimates that the Draft EIR will be available for public review in June/July 2017.

Ukiah Landfill Closure Construction Emissions - Mendocino-Rural Inland South County, Summer

Project Characteristics -

Land Use - Landfill and soil borrow area make up approximately 50 acres

Construction Phase - EBA Engineering, January 2016.

Off-road Equipment - EBA Engineering, 2019.

Off-road Equipment - EBA Engineering, 2019.

Off-road Equipment - EBA Engineering, 2019.

Off-road Equipment - EBA Engineering, 2019.

Off-road Equipment - EBA Engineering, 2019.

Off-road Equipment - EBA Engineering, 2019.

Off-road Equipment - EBA Engineering, 2019.

Off-road Equipment - EBA Engineering, 2019.

Grading - Lanfill and soil borrow area make up approixmately 50 acres

Trips and VMT - 723 trucks, 1,446 total one ways trips, all assumed to occur before final cover construction phase (over 35 days).

Construction Off-road Equipment Mitigation - Regulation 1, Rule 1-420 required BMPs for construction and grading activities.

Ukiah Landfill Closure Construction Emissions - Mendocino-Rural Inland South County, Winter

Project Characteristics -

Land Use - Landfill and soil borrow area make up approximately 50 acres

Construction Phase - EBA Engineering, January 2016.

Off-road Equipment - EBA Engineering, 2019.

Off-road Equipment - EBA Engineering, 2019.

Off-road Equipment - EBA Engineering, 2019.

Off-road Equipment - EBA Engineering, 2019.

Off-road Equipment - EBA Engineering, 2019.

Off-road Equipment - EBA Engineering, 2019.

Off-road Equipment - EBA Engineering, 2019.

Off-road Equipment - EBA Engineering, 2019.

Grading - Lanfill and soil borrow area make up approixmately 50 acres

Trips and VMT - 723 trucks, 1,446 total one ways trips, all assumed to occur before final cover construction phase (over 35 days).

Construction Off-road Equipment Mitigation - Regulation 1, Rule 1-420 required BMPs for construction and grading activities.

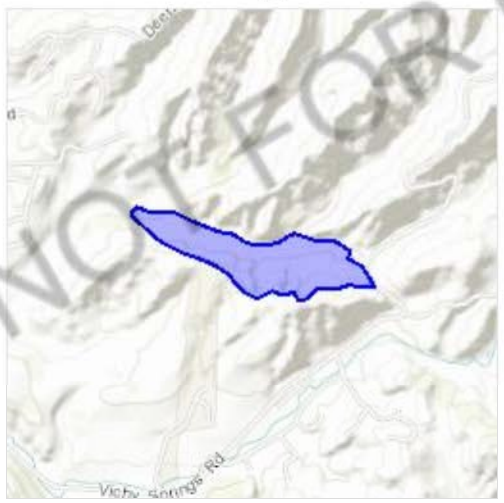
IPaC Information for Planning and Consultation **U.S. Fish & Wildlife Service**

IPaC resource list



This report is an automatically generated list of species and other resources such as critical habitat (collectively referred to as *trust resources*) under the U.S. Fish and Wildlife Service's (USFWS) jurisdiction that are known or expected to be on or near the project area referenced below. The list may also include trust resources that occur outside of the project area, but that could potentially be directly or indirectly affected by activities in the project area. However, determining the likelihood and extent of effects a project may have on trust resources typically requires gathering additional site-specific (e.g., vegetation/species surveys) and project-specific (e.g., magnitude and timing of proposed activities) information.

Below is a summary of the project information you provided and contact information for the USFWS office(s) with jurisdiction in the defined project area. Please read the introduction to each section that follows (Endangered Species, Migratory Birds, USFWS Facilities, and NWI Wetlands) for additional information applicable to the trust resources addressed in that section.

NOT FOR CONSULTATION

Location

Mendocino County, California

Local office

Arcata Fish And Wildlife Office

(707) 822-7201
(707) 822-8411

1655 Heindon Road

Arcata, CA 95521-4573

NOT FOR CONSULTATION

Endangered species

This resource list is for informational purposes only and does not constitute an analysis of project level impacts.

The primary information used to generate this list is the known or expected range of each species. Additional areas of influence (AOI) for species are also considered. An AOI includes areas outside of the species range if the species could be indirectly affected by activities in that area (e.g., placing a dam upstream of a fish population, even if that fish does not occur at the dam site, may indirectly impact the species by reducing or eliminating water flow downstream). Because species can move, and site conditions can change, the species on this list are not guaranteed to be found on or near the project area. To fully determine any potential effects to species, additional site-specific and project-specific information is often required.

Section 7 of the Endangered Species Act **requires** Federal agencies to "request of the Secretary information whether any species which is listed or proposed to be listed may be present in the area of such proposed action" for any project that is conducted, permitted, funded, or licensed by any Federal agency. A letter from the local office and a species list which fulfills this requirement can **only** be obtained by requesting an official species list from either the Regulatory Review section in IPaC (see directions below) or from the local field office directly.

For project evaluations that require USFWS concurrence/review, please return to the IPaC website and request an official species list by doing the following:

1. Draw the project location and click CONTINUE.
2. Click DEFINE PROJECT.
3. Log in (if directed to do so).
4. Provide a name and description for your project.
5. Click REQUEST SPECIES LIST.

Listed species[1] and their critical habitats are managed by the Ecological Services Program of the U.S. Fish and Wildlife Service (USFWS) and the fisheries division of the National Oceanic and Atmospheric Administration (NOAA Fisheries[2]).

Species and critical habitats under the sole responsibility of NOAA Fisheries are **not** shown on this list. Please contact NOAA Fisheries for species under their jurisdiction.

NOT FOR CONSULTATION

1. Species listed under the Endangered Species Act are threatened or endangered; IPaC also shows species that are candidates, or proposed, for listing. See the listing status page for more information.
2. NOAA Fisheries, also known as the National Marine Fisheries Service (NMFS), is an office of the National Oceanic and Atmospheric Administration within the Department of Commerce.

The following species are potentially affected by activities in this location:

Mammals

NAME	STATUS
Fisher Pekania pennanti No critical habitat has been designated for this species. https://ecos.fws.gov/ecp/species/3651	Proposed Threatened

Birds

NAME	STATUS
Northern Spotted Owl Strix occidentalis caurina There is **final** critical habitat for this species. Your location is outside the critical habitat. https://ecos.fws.gov/ecp/species/1123	Threatened
Western Snowy Plover Charadrius nivosus nivosus There is **final** critical habitat for this species. Your location is outside the critical habitat. https://ecos.fws.gov/ecp/species/8035	Threatened
Yellow-billed Cuckoo Coccyzus americanus There is **proposed** critical habitat for this species. Your location is outside the critical habitat. https://ecos.fws.gov/ecp/species/3911	Threatened

Amphibians

NAME	STATUS
California Red-legged Frog Rana draytonii There is **final** critical habitat for this species. Your location is outside the critical habitat. https://ecos.fws.gov/ecp/species/2891	Threatened

Flowering Plants

NAME	STATUS
Burke's Goldfields Lasthenia burkei No critical habitat has been designated for this species. https://ecos.fws.gov/ecp/species/4338	Endangered

NOT FOR CONSULTATION

Contra Costa Goldfields Lasthenia conjugens — Endangered
There is **final** critical habitat for this species. Your location is outside the critical habitat.
https://ecos.fws.gov/ecp/species/7058

Showy Indian Clover Trifolium amoenum — Endangered
No critical habitat has been designated for this species.
https://ecos.fws.gov/ecp/species/6459

Critical habitats

Potential effects to critical habitat(s) in this location must be analyzed along with the endangered species themselves.

THERE ARE NO CRITICAL HABITATS AT THIS LOCATION.

NOT FOR CONSULTATION

Migratory birds

Certain birds are protected under the Migratory Bird Treaty Act[1] and the Bald and Golden Eagle Protection Act[2].

Any person or organization who plans or conducts activities that may result in impacts to migratory birds, eagles, and their habitats should follow appropriate regulations and consider implementing appropriate conservation measures, as described below.

1. The Migratory Birds Treaty Act of 1918.
2. The Bald and Golden Eagle Protection Act of 1940.

Additional information can be found using the following links:

- Birds of Conservation Concern http://www.fws.gov/birds/management/managed-species/birds-of-conservation-concern.php
- Measures for avoiding and minimizing impacts to birds http://www.fws.gov/birds/management/project-assessment-tools-and-guidance/conservation-measures.php
- Nationwide conservation measures for birds http://www.fws.gov/migratorybirds/pdf/management/nationwidestandardconservationmeasures.pdf

The birds listed below are birds of particular concern either because they occur on the USFWS Birds of Conservation Concern (BCC) list or warrant special attention in your project location. To learn more about the levels of concern for birds on your list and how this list is generated, see the FAQ below. This is not a list of every bird you may find in this location, nor a guarantee

that every bird on this list will be found in your project area. To see exact locations of where birders and the general public have sighted birds in and around your project area, visit the E-bird data mapping tool (Tip: enter your location, desired date range and a species on your list). For projects that occur off the Atlantic Coast, additional maps and models detailing the relative occurrence and abundance of bird species on your list are available. Links to additional information about Atlantic Coast birds, and other important information about your migratory bird list, including how to properly interpret and use your migratory bird report, can be found below.

For guidance on when to schedule activities or implement avoidance and minimization measures to reduce impacts to migratory birds on your list, click on the PROBABILITY OF PRESENCE SUMMARY at the top of your list to see when these birds are most likely to be present and breeding in your project area.

NOT FOR CONSULTATION

NAME	BREEDING SEASON (IF A BREEDING SEASON IS INDICATED FOR A BIRD ON YOUR LIST, THE BIRD MAY BREED IN YOUR PROJECT AREA SOMETIME WITHIN THE TIMEFRAME SPECIFIED, WHICH IS A VERY LIBERAL ESTIMATE OF THE DATES INSIDE WHICH THE BIRD BREEDS ACROSS ITS ENTIRE RANGE. "BREEDS ELSEWHERE" INDICATES THAT THE BIRD DOES NOT LIKELY BREED IN YOUR PROJECT AREA.)
Allen's Hummingbird Selasphorus sasin This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska. https://ecos.fws.gov/ecp/species/9637	Breeds Feb 1 to Jul 15
Bald Eagle Haliaeetus leucocephalus This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities. https://ecos.fws.gov/ecp/species/1626	Breeds Jan 1 to Aug 31
California Thrasher Toxostoma redivivum This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.	Breeds Jan 1 to Jul 31

Clark's Grebe Aechmophorus clarkii This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.	Breeds Jan 1 to Dec 31
Common Yellowthroat Geothlypis trichas sinuosa This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA https://ecos.fws.gov/ecp/species/2084	Breeds May 20 to Jul 31
Costa's Hummingbird Calypte costae This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA https://ecos.fws.gov/ecp/species/9470	Breeds Jan 15 to Jun 10
Golden Eagle Aquila chrysaetos This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities. https://ecos.fws.gov/ecp/species/1680	Breeds Jan 1 to Aug 31
Lawrence's Goldfinch Carduelis lawrencei This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska. https://ecos.fws.gov/ecp/species/9464	Breeds Mar 20 to Sep 20
Lewis's Woodpecker Melanerpes lewis This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska. https://ecos.fws.gov/ecp/species/9408	Breeds Apr 20 to Sep 30
Nuttall's Woodpecker Picoides nuttallii This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA https://ecos.fws.gov/ecp/species/9410	Breeds Apr 1 to Jul 20
Oak Titmouse Baeolophus inornatus This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska. https://ecos.fws.gov/ecp/species/9656	Breeds Mar 15 to Jul 15

NOT FOR CONSULTATION

Rufous Hummingbird selasphorus rufus This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska. https://ecos.fws.gov/ecp/species/8002	Breeds elsewhere
Song Sparrow Melospiza melodia This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA	Breeds Feb 20 to Sep 5
Spotted Towhee Pipilo maculatus clementae This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA https://ecos.fws.gov/ecp/species/4243	Breeds Apr 15 to Jul 20
Tricolored Blackbird Agelaius tricolor This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska. https://ecos.fws.gov/ecp/species/3910	Breeds Mar 15 to Aug 10
Wrentit Chamaea fasciata This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.	Breeds Mar 15 to Aug 10

NOT FOR CONSULTATION

Probability of Presence Summary

The graphs below provide our best understanding of when birds of concern are most likely to be present in your project area. This information can be used to tailor and schedule your project activities to avoid or minimize impacts to birds. Please make sure you read and understand the FAQ "Proper Interpretation and Use of Your Migratory Bird Report" before using or attempting to interpret this report.

Probability of Presence (■)

Each green bar represents the bird's relative probability of presence in the 10km grid cell(s) your project overlaps during a particular week of the year. (A year is represented as 12 4-week months.) A taller bar indicates a higher probability of species presence. The survey effort (see below) can be used to establish a level of confidence in the presence score. One can have higher confidence in the presence score if the corresponding survey effort is also high.

How is the probability of presence score calculated? The calculation is done in three steps:

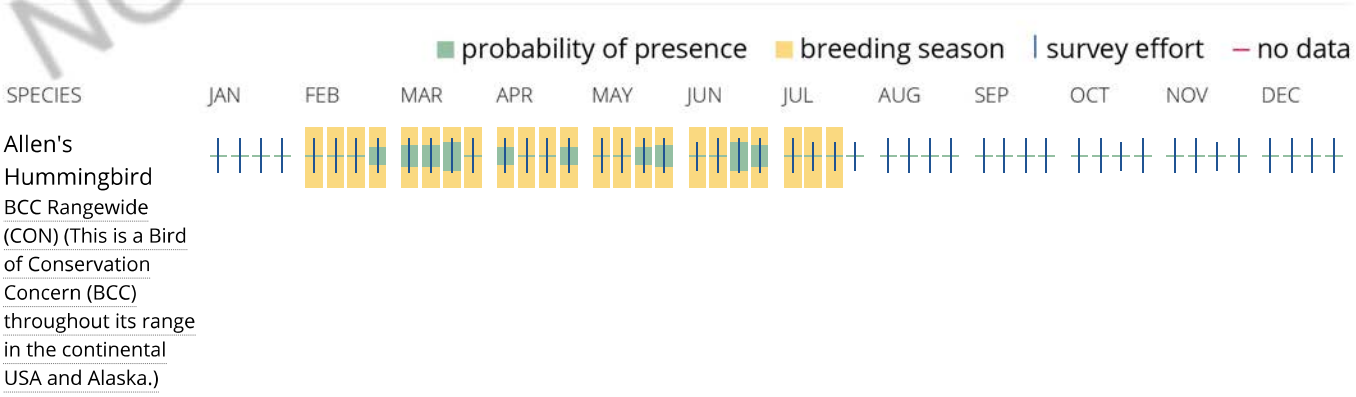
1. The probability of presence for each week is calculated as the number of survey events in the week where the species was detected divided by the total number of survey events for that week. For example, if in week 12 there were 20 survey events and the Spotted Towhee was found in 5 of them, the probability of presence of the Spotted Towhee in week 12 is

0.25.

2. To properly present the pattern of presence across the year, the relative probability of presence is calculated. This is the probability of presence divided by the maximum probability of presence across all weeks. For example, imagine the probability of presence in week 20 for the Spotted Towhee is 0.05, and that the probability of presence at week 12 (0.25) is the maximum of any week of the year. The relative probability of presence on week 12 is 0.25/0.25 = 1; at week 20 it is 0.05/0.25 = 0.2.
3. The relative probability of presence calculated in the previous step undergoes a statistical conversion so that all possible values fall between 0 and 10, inclusive. This is the probability of presence score.

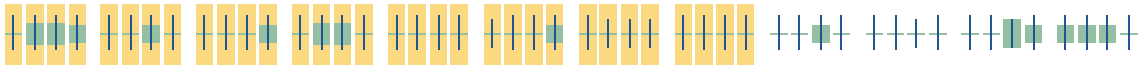
To see a bar's probability of presence score, simply hover your mouse cursor over the bar.

Breeding Season (▪)
Yellow bars denote a very liberal estimate of the time-frame inside which the bird breeds across its entire range. If there are no yellow bars shown for a bird, it does not breed in your project area.



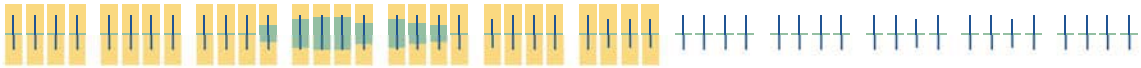
Survey Effort (|)
Vertical black lines superimposed on probability of presence bars indicate the number of surveys performed for that species in the 10km grid cell(s) your project area overlaps. The number of surveys is expressed as a range, for example, 33 to 64 surveys.

To see a bar's survey effort range, simply hover your mouse cursor over the bar.

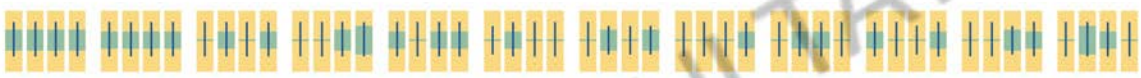


No Data (–)
A week is marked as having no data if there were no survey events for that week.

Survey Timeframe
Surveys from only the last 10 years are used in order to ensure delivery of currently relevant information. The exception to this is areas off the Atlantic coast, where bird returns are based on all years of available data, since data in these areas is currently much more sparse.



NOT FOR CONSULTATION



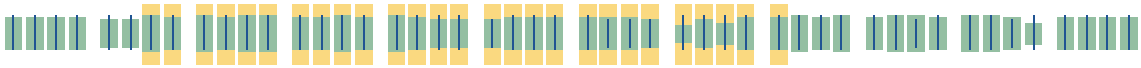
Bald Eagle
Non-BCC Vulnerable (This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities.)

California Thrasher
BCC Rangewide (CON) (This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.)

Clark's Grebe
BCC Rangewide (CON) (This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.)

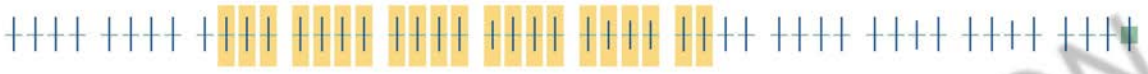
Common Yellowthroat
BCC - BCR (This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA)

Costa's Hummingbird
BCC - BCR (This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA)



NOT FOR CONSULTATION

NOT FOR CONSULTATION



Song Sparrow
BCC - BCR (This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA)

Spotted Towhee
BCC - BCR (This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA)

Tricolored Blackbird
BCC Rangewide (CON) (This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.)

Wrentit
BCC Rangewide (CON) (This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.)

NOT FOR CONSULTATION

Tell me more about conservation measures I can implement to avoid or minimize impacts to migratory birds.

Nationwide Conservation Measures describes measures that can help avoid and minimize impacts to all birds at any location year round. Implementation of these measures is particularly important when birds are most likely to occur in the project area. When birds may be breeding in the area, identifying the locations of any active nests and avoiding their destruction is a very helpful impact minimization measure. To see when birds are most likely to occur and be breeding in your project area, view the Probability of Presence Summary. Additional measures and/or permits may be advisable depending on the type of activity you are conducting and the type of infrastructure or bird species present on your project site.

What does IPaC use to generate the migratory birds potentially occurring in my specified location?

The Migratory Bird Resource List is comprised of USFWS Birds of Conservation Concern (BCC) and other species that may warrant special attention in your project location.

The migratory bird list generated for your project is derived from data provided by the Avian Knowledge Network (AKN). The AKN data is based on a growing collection of survey, banding, and citizen science datasets and is queried and filtered to return a list of those birds reported as occurring in the 10km grid cell(s) which your project intersects, and that have been identified as warranting special attention because they are a BCC species in that area, an eagle (Eagle Act requirements may apply), or a species that has a particular vulnerability to offshore activities or development.

Again, the Migratory Bird Resource list includes only a subset of birds that may occur in your project area. It is not representative of all birds that may occur in your project area. To get a list of all birds potentially present in your project area, please visit the AKN Phenology Tool.

What does IPaC use to generate the probability of presence graphs for the migratory birds potentially occurring in my specified location?

The probability of presence graphs associated with your migratory bird list are based on data provided by the Avian Knowledge Network (AKN). This data is derived from a growing collection of survey, banding, and citizen science datasets .

Probability of presence data is continuously being updated as new and better information becomes available. To learn more about how the probability of presence graphs are produced and how to interpret them, go the Probability of Presence Summary and then click on the "Tell me about these graphs" link.

How do I know if a bird is breeding, wintering, migrating or present year-round in my project area?

To see what part of a particular bird's range your project area falls within (i.e. breeding, wintering, migrating or year-round), you may refer to the following resources: The Cornell Lab of Ornithology All About Birds Bird Guide, or (if you are unsuccessful in locating the bird of interest there), the Cornell Lab of Ornithology Neotropical Birds guide. If a bird on your migratory bird species list has a breeding season associated with it, if that bird does occur in your project area, there may be nests present at some point within the timeframe specified. If "Breeds elsewhere" is indicated, then the bird likely does not breed in your project area.

What are the levels of concern for migratory birds?

Migratory birds delivered through IPaC fall into the following distinct categories of concern:

1. "BCC Rangewide" birds are Birds of Conservation Concern (BCC) that are of concern throughout their range anywhere within the USA (including Hawaii, the Pacific Islands, Puerto Rico, and the Virgin Islands);
2. "BCC - BCR" birds are BCCs that are of concern only in particular Bird Conservation Regions (BCRs) in the continental USA; and
3. "Non-BCC - Vulnerable" birds are not BCC species in your project area, but appear on your list either because of the Eagle Act requirements (for eagles) or (for non-eagles) potential susceptibilities in offshore areas from certain types of development or activities (e.g. offshore energy development or longline fishing).

Although it is important to try to avoid and minimize impacts to all birds, efforts should be made, in particular, to avoid and minimize impacts to the birds on this list, especially eagles and BCC species of rangewide concern. For more information on conservation measures you can implement to help avoid and minimize migratory bird impacts and requirements for eagles, please see the FAQs for these topics.

Details about birds that are potentially affected by offshore projects

For additional details about the relative occurrence and abundance of both individual bird species and groups of bird species within your project area off the Atlantic Coast, please visit the Northeast Ocean Data Portal. The Portal also offers data and information about other taxa besides birds that may be helpful to you in your project review. Alternately, you may download the bird model results files underlying the portal maps through the NOAA NCCOS Integrative Statistical Modeling and Predictive Mapping of Marine Bird Distributions and Abundance on the Atlantic Outer Continental Shelf project webpage.

Bird tracking data can also provide additional details about occurrence and habitat use throughout the year,

NOT FOR CONSULTATION

including migration. Models relying on survey data may not include this information. For additional information on marine bird tracking data, see the Diving Bird Study and the nanotag studies or contact Caleb Spiegel or Pam Loring.

What if I have eagles on my list?

If your project has the potential to disturb or kill eagles, you may need to obtain a permit to avoid violating the Eagle Act should such impacts occur.

Proper Interpretation and Use of Your Migratory Bird Report

The migratory bird list generated is not a list of all birds in your project area, only a subset of birds of priority concern. To learn more about how your list is generated, and see options for identifying what other birds may be in your project area, please see the FAQ "What does IPaC use to generate the migratory birds potentially occurring in my specified location". Please be aware this report provides the "probability of presence" of birds within the 10 km grid cell(s) that overlap your project; not your exact project footprint. On the graphs provided, please also look carefully at the survey effort (indicated by the black vertical bar) and for the existence of the "no data" indicator (a red horizontal bar). A high survey effort is the key component. If the survey effort is high, then the probability of presence score can be viewed as more dependable. In contrast, a low survey effort bar or no data bar means a lack of data and, therefore, a lack of certainty about presence of the species. This list is not perfect; it is simply a starting point for identifying what birds of concern have the potential to be in your project area, when they might be there, and if they might be breeding (which means nests might be present). The list helps you know what to look for to confirm presence, and helps guide you in knowing when to implement conservation measures to avoid or minimize potential impacts from your project activities, should presence be confirmed. To learn more about conservation measures, visit the FAQ "Tell me about conservation measures I can implement to avoid or minimize impacts to migratory birds" at the bottom of your migratory bird trust resources page.

NOT FOR CONSULTATION

Facilities

National Wildlife Refuge lands

Any activity proposed on lands managed by the National Wildlife Refuge system must undergo a 'Compatibility Determination' conducted by the Refuge. Please contact the individual Refuges to discuss any questions or concerns.

THERE ARE NO REFUGE LANDS AT THIS LOCATION.

Fish hatcheries

THERE ARE NO FISH HATCHERIES AT THIS LOCATION.

Wetlands in the National Wetlands Inventory

Impacts to NWI wetlands and other aquatic habitats may be subject to regulation under Section 404 of the Clean Water Act, or other State/Federal statutes.

For more information please contact the Regulatory Program of the local U.S. Army Corps of Engineers District.

Please note that the NWI data being shown may be out of date. We are currently working to update our NWI data set. We recommend you verify these results with a site visit to determine the actual extent of wetlands on site.

This location overlaps the following wetlands:

NOT FOR CONSULTATION

Data limitations

The Service's objective of mapping wetlands and deepwater habitats is to produce reconnaissance level information on the location, type and size of these resources. The maps are prepared from the analysis of high altitude imagery. Wetlands are identified based on vegetation, visible hydrology and geography. A margin of error is inherent in the use of imagery; thus, detailed on-the-ground inspection of any particular site may result in revision of the wetland boundaries or classification established through image analysis.

The accuracy of image interpretation depends on the quality of the imagery, the experience of the image analysts, the amount and quality of the collateral data and the amount of ground truth verification work conducted. Metadata should be consulted to determine the date of the source imagery used and any mapping problems.

Wetlands or other mapped features may have changed since the date of the imagery or field work. There may be occasional differences in polygon boundaries or classifications between the information depicted on the map and the actual conditions on site.

Data exclusions

Certain wetland habitats are excluded from the National mapping program because of the limitations of aerial imagery as the primary data source used to detect wetlands. These habitats include seagrasses or submerged aquatic vegetation that are found in the intertidal and subtidal zones of estuaries and nearshore coastal waters. Some deepwater reef communities (coral or tuberficid worm reefs) have also been excluded from the inventory. These habitats, because of their depth, go undetected by aerial imagery.

Data precautions

Federal, state, and local regulatory agencies with jurisdiction over wetlands may define and describe wetlands in a different manner than that used in this inventory. There is no attempt, in either the design or products of this inventory, to define the limits of proprietary jurisdiction of any Federal, state, or local

government or to establish the geographical scope of the regulatory programs of government agencies. Persons intending to engage in activities involving modifications within or adjacent to wetland areas should seek the advice of appropriate federal, state, or local agencies concerning specified agency regulatory programs and proprietary jurisdictions that may affect such activities.

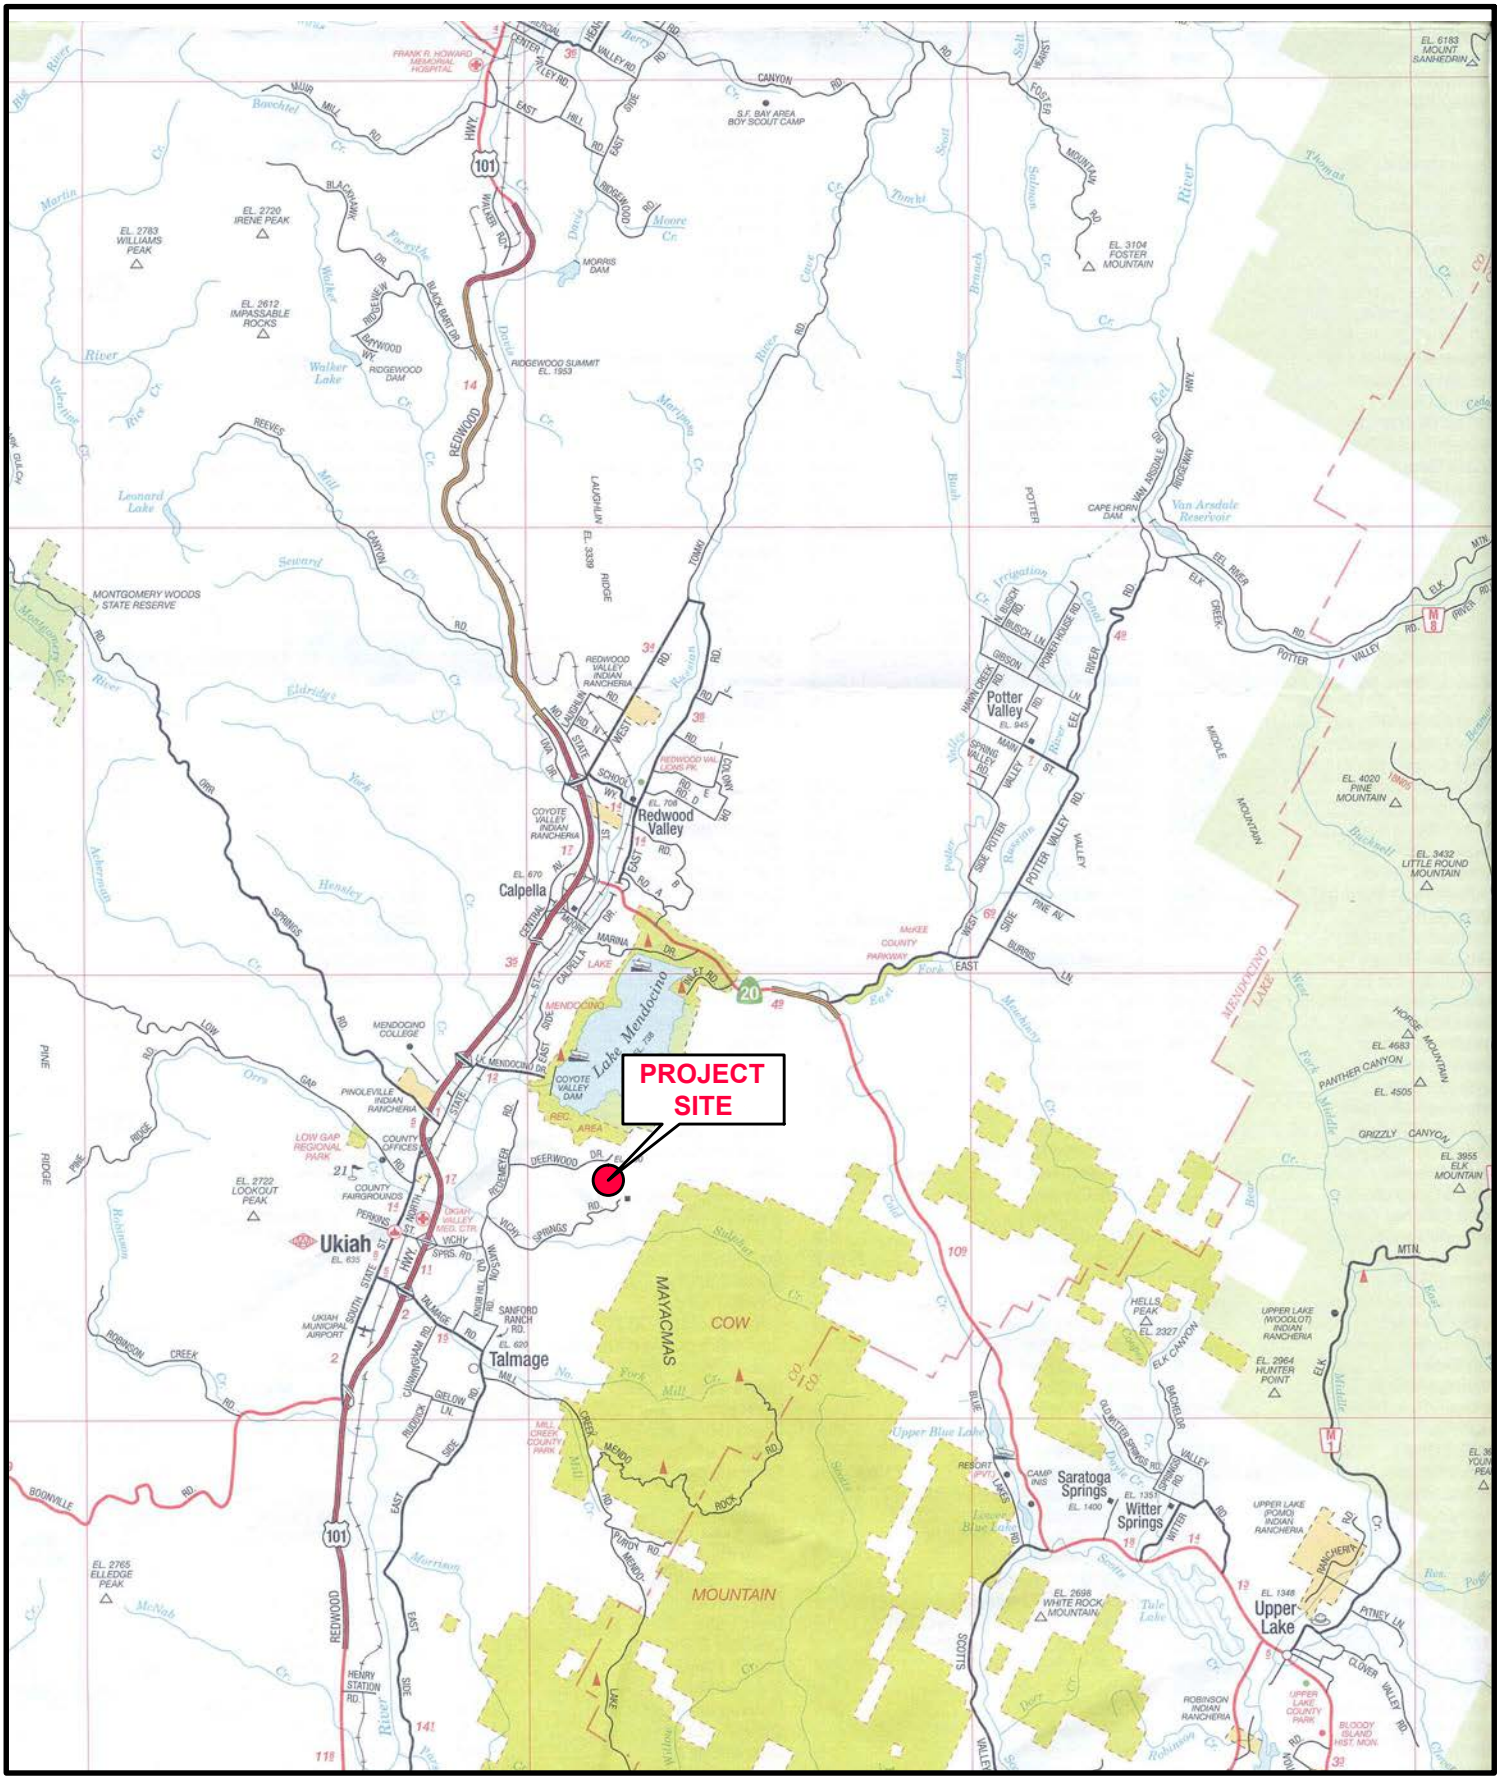
Native American Heritage Commission
1550 Harbor Blvd, Suite 100
West Sacramento, CA 95691

Subject: **Sacred Land Files and Native American Contact List Request for the City of Ukiah's Landfill Closure Project**

To Whom It May Concern:



SMB Environmental is assisting the City of Ukiah on its Landfill Closure Project. The Ukiah Landfill is located approximately three miles east of the City of Ukiah within the unincorporated area of Mendocino County. The Ukiah landfill is part of a 283.5-acre parcel of land and has a physical address of 3100 Vichy Springs Road, Ukiah, California in the southeast ¼ of Section 10, Township 15 north, Range 12 west, Mount Diablo Base and Meridian. The property is further identified by Mendocino County Assessor's Parcel Number 178-130-01. Please see the attached map.

For purposes of Section 106 compliance, we would appreciate your checking of the Sacred Lands Files to see if there are any culturally sensitive areas within the immediate project vicinity. We would also like to receive a list of Native American organizations that may have knowledge or interest in the Proposed Project area and we will attempt to contact them to solicit their written input/concerns about the Proposed Project.

Thank you for your cooperation and assistance. I look forward to your earliest possible reply. If any questions, please feel free to contact me at 916-517-2189 or at steve@smbenvironmental.com.

Sincerely,

Steve Brown

RE: Ukiah Landfill Closure Project, Mendocino County

Dear Mr. Brown,

Attached is a list of tribes that have cultural and traditional affiliation to the area of potential project effect (APE) referenced above. I suggest you contact all of those listed, if they cannot supply information, they might recommend others with specific knowledge. The list should provide a starting place to locate areas of potential adverse impact within the APE. By contacting all those on the list, your organization will be better able to respond to claims of failure to consult, as may be required under particular state statutes. If a response has not been received within two weeks of notification, the Native American Heritage Commission (NAHC) requests that you follow-up with a telephone call to ensure that the project information has been received.

The NAHC also recommends that project proponents conduct a record search of the NAHC Sacred Lands File (SLF) at the appropriate regional archaeological Information Center of the California Historic Resources Information System (CHRIS) (http://ohp.parks.ca.gov/?page_id=1068) to determine if any tribal cultural resources are located within the area(s) affected by the proposed action. The SFL, established under Public Resources Code section 5094, are sites submitted for listing to the NAHC by California Native American tribes. The SFL, established under Public Resources Code section 5094, are sites submitted for listing to the NAHC by California Native American tribes. A record search of the SLF was completed for the APE referenced above with negative results. Please note records maintained by the NAHC and CHRIS is not exhaustive, and a negative response to these searches does not preclude the existence of tribal cultural resources. A tribe may be the only source of information regarding the existence of tribal cultural resources.

If you receive notification of change of addresses and phone numbers from any of these tribes, please notify me. With your assistance we are able to assure that our lists contain current information. If you have any questions or need additional information, please contact via email: frank.lienert@nahc.ca.gov

Sincerely,

Frank Lienert

Subject: **Request for Government-to-Government Consultation under Assembly Bill 52 (AB-52) for City of Ukiah's Landfill Closure Project**

Dear Sir or Madam,

As shown in the attached figure, the Ukiah Landfill is located approximately three miles east of the City of Ukiah within the unincorporated area of Mendocino County. The Ukiah landfill is part of a 283.5-acre parcel of land and has a physical address of 3100 Vichy Springs Road, Ukiah, California in the southeast ¼ of Section 10, Township 15 north, Range 12 west, Mount Diablo Base and Meridian. The property is further identified by Mendocino County Assessor's Parcel Number 178-130-01. the overall purpose of the Proposed Project is to close the Ukiah Landfill in accordance with the applicable regulatory standards. Specifically, the components and systems required for closure of the landfill include the final cover and grading design to control stormwater, potential infiltration and accommodate future settlement, landfill slope stability, construction quality assurance, drainage and erosion control systems, LFG control and monitoring systems, groundwater/surface water/leachate monitoring systems, and site security.

The Native American Heritage Commission was contacted about the Proposed Project and provided us with a list of Native American individuals and organizations that may have knowledge of tribal and/or cultural resources in the Project Area as part of the AB52 requirements. As a result, we are requesting that you please provide us with any information you may have about cultural resources or sites in the project area so that we can determine ways to protect those sites, including archeological sites and other locations of special value to Native Americans.

Thank you for your cooperation and assistance. I look forward to your earliest possible reply. If we do not receive a request from you (or your organization) within 30 days, we will assume that you do not want to have a formal consultation and agree that the Proposed Project would not have any impacts to known Tribal Cultural Resources that you are aware of. If you have any questions, please feel free to contact me at 707-463-6755 or at jthiele@cityofukiah.com.

Sincerely,

Jarod Thiele

Dear Sir or Madam,

As shown in the attached figure, the Ukiah Landfill is located approximately three miles east of the City of Ukiah within the unincorporated area of Mendocino County. The Ukiah landfill is part of a 283.5-acre parcel of land and has a physical address of 3100 Vichy Springs Road, Ukiah, California in the southeast ¼ of Section 10, Township 15 north, Range 12 west, Mount Diablo Base and Meridian. The property is further identified by Mendocino County Assessor's Parcel Number 178-130-01. the overall purpose of the Proposed Project is to close the Ukiah Landfill in accordance with the applicable regulatory standards. Specifically, the components and systems required for closure of the landfill include the final cover and grading design to control stormwater, potential infiltration and accommodate future settlement, landfill slope stability, construction quality assurance, drainage and erosion control systems, LFG control and monitoring systems, groundwater/surface water/leachate monitoring systems, and site security.

The Native American Heritage Commission was contacted about the Proposed Project and provided us with a list of Native American individuals and organizations that may have knowledge of tribal and/or cultural resources in the Project Area as part of the AB52 requirements. As a result, we are requesting that you please provide us with any information you may have about cultural resources or sites in the project area so that we can determine ways to protect those sites, including archeological sites and other locations of special value to Native Americans.

Thank you for your cooperation and assistance. I look forward to your earliest possible reply. If we do not receive a request from you (or your organization) within 30 days, we will assume that you do not want to have a formal consultation and agree that the Proposed Project would not have any impacts to known Tribal Cultural Resources that you are aware of. If you have any questions, please feel free to contact me at 707-463-6755 or at jthiele@cityofukiah.com.

Sincerely,

Jarod Thiele

Appendix C – Examples of Artificial Synthetic Turf Used at Landfills……C-1
Appendix D – Ukiah Landfill Monitoring Wells and Vichy Springs Resort……D-1

Chapter 1 Introduction

On November 13, 2019, the City of Ukiah (City) released for public review the Draft Environmental Impact Report (Draft EIR or DEIR) (State Clearinghouse Number: 2017022009) to provide the public and responsible agencies with information about the potential environmental effects of the City's proposed Landfill Closure Project (Project or Proposed Project). The City is the lead agency under the California Environmental Quality Act (CEQA) and has principal responsibility for approving the Proposed Project.

1.1 Purpose of the Environmental Impact Report

The purpose of the EIR is to provide the public and responsible and trustee agencies with information about the potential environmental effects of the Proposed Project. The Draft EIR was prepared in compliance with the California Environmental Quality Act (CEQA) (Public Resources Code Section 21000et seq.) of 1970 (as amended), and the CEQA Guidelines (California Code of Regulations, Title 14). As described in CEQA guidelines Section 15121(a), an EIR is a public information document that assesses potential environmental effects of the Proposed Project, and identifies mitigation measures and alternatives to the Proposed Project that would reduce or avoid adverse environmental impacts. CEQA requires that state and local government agencies consider the environmental consequences of projects over which they have discretionary authority.

1.2 Public Review and Responses to Comments

In accordance with Sections 15087 and 15105 of the State CEQA Guidelines, the Draft EIR was circulated for public review and comment to lead and responsible agencies, as well as members of the public, for 45-days (November 13 through December 31, 2019 and was then extended through January 9, 2020). The City also held a public meeting on December 18, 2019 to receive comments on the Draft EIR. Written comment letters received on the Draft EIR are provided in their entirety in Chapter 2, "Comments Received". Chapter 3 "Responses to Comments" provides responses to each of the comments received and are provided in this document as part of the final environmental impact report (Final EIR). Although some of the comments have resulted in changes to the text of the Draft EIR (see Chapter 4, "Revisions to the Draft EIR"), none of the changes constitute "significant new information", which would require recirculation of the Draft EIR. Significant new information is defined in Section 15088.5(a) of the State CEQA Guidelines as follows:

(1) A new significant environmental impact would result from the project or from a new mitigation measure proposed to be implemented.

(2) A substantial increase in the severity of an environmental impact would result unless mitigation measures are adopted that reduce the impact to a level of insignificance.

(3) A feasible project alternative or mitigation measure considerably different from others previously analyzed would clearly lessen the environmental impacts of the project, but the project's proponents decline to adopt it.

(4) The Draft EIR was so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded.

None of these circumstances has arisen from comments on the Draft EIR; therefore, recirculation is not required. Copies of the Draft EIR and the Final EIR are available for review on line on the City's website at https://cityofukiah.box.com/s/riyausatlqil1qbjuk9v2a34ciipahh8 and at the address below.

City of Ukiah, Public Works Administration
300 Seminary Avenue
Ukiah, CA 95482

As required by State CEQA Guidelines Section 15088(b), the City has provided an electronic copy (through the City's website; see prior discussion) to each public agency that submitted written comments on the Draft EIR with written responses to that public agency's comments at least 10 days prior to certifying the Final EIR.

1.3 Organization of the Responses to Comments

Chapter 2 of the Final PEIR consists of the written comments received on the Draft EIR, and presents responses to environmental issues raised in the comments (as required by State CEQA Guidelines Section 15132). The focus of the responses to comments is on the disposition of significant environmental issues that are raised in the comments, as required by Section 15088(c) of the State CEQA Guidelines. Each comment letter has been given a letter designation in the order it was received and reproduced with individual comments bracketed and numbered. Responses to the comments follow each letter. For example, the response to the second comment of the first letter would be indicated as Response to Comment A-2. In some instances, clarifications of the text of the Draft EIR may be required. In those cases, the text of the Draft EIR is revised and the changes compiled in Chapter 4 - Revisions to the Draft EIR. The text deletions are shown in strikeout (~~strikeout~~) and additions are shown in underline (underline).

1.4 Project Decision Process

This document and the Draft EIR together constitute the Final EIR, which will be considered by the City prior to a decision on whether to approve the project. If deciding to approve the project, the City, as required by State CEQA Guidelines Section 15090, must first certify that the Final EIR was completed in compliance with CEQA's requirements, was reviewed and considered by the City, and reflects the City's independent judgment and analysis. The City would then be required to adopt Findings of Fact (a separate Document) on the disposition of each significant environmental impact, as required by State CEQA Guidelines Section 15091. If significant and unavoidable impacts (those that cannot be mitigated to less than significant) would result from the project and the City chooses to approve the project, the City would need to adopt a statement of overriding considerations, pursuant to Section 15093, explaining the overriding factors that the City deems allow the project to move forward. A Mitigation Monitoring and Reporting Program, which is required by CEQA Guidelines Section 15091(d), has been included as part of Appendix A of this Final EIR.

Chapter 2 Comments Received

During the 45-day public review period (November 13 through December 31, 2019 and then extended through January 9, 2020) the City received a total of four (4) comment letters on the Draft EIR and a letter from the State of California's Governor's Office of Planning and Research (i.e. State Clearinghouse) confirming the end of the 45-day public review period. The City also received verbal comments from Vichy Springs resort at the Public Hearing which was held on December 18, 2019 as well as two written comment letters. In comparing the notes from that meeting and the written comments provided by Vichy Springs Resort, it appears that all of the substantive elements of their verbal comments are covered by their written comment letters. As a result, this Final EIR addresses all of their comments through their written comment letters. The City has reviewed and considered all of the written comments received as follows in Table 2-1 below. The letters including the letter from the State Clearinghouse are attached.

TABLE 2-1
AGENCY COMMENT LETTERS RECEIVED

Date	Commenting Agency	Comment Letter
December 19, 2019	Christine Karl, Environmental Scientist California Department of Resources Recycling and Recovery 1001 I Street Sacramento, CA 95814	A
