Subject: SCH No. 2017022009 - Draft Environmental Impact Report (EIR) for the Ukiah Landfill Closure Project, Facility No. 23-AA-0019, Mendocino County

Dear Mr.Thiele:

Thank you for allowing the Department of Resources Recycling and Recovery (CalRecycle) to provide comments on the proposed project. CalRecycle staff offer the following comments for this proposed project as part of the California Environmental Quality Act (CEQA) process. If the proposed project description below varies substantially from the project as understood by CalRecycle as a responsible Agency, CalRecycle staff requests clarifications of any comments or interpretations of the project references be included in the Final Environmental Impact Report.

PROJECT DESCRIPTION

The proposed project is located at 3100 Vichy Springs Road Ukiah CA and is owned and operated by the City of Ukiah. The landfill operated from 1955 to September 2001. Closure of the Ukiah Landfill will be performed in accordance will applicable regulatory standards. The components and systems required for a landfill include final cover, and grading design to control storm water, prevent infiltration, and accommodate future settlement, landfill slope stability, construction quality assurance, drainage and erosion control systems, landfill gas (LFG) control and monitoring systems, ground water/surface water/leachate monitoring systems, and site security.

COMMENTS

A closure permit should be issued when the Final EIR is certified to enable the LEA to enforce the Final Closure Post Closure Maintenance Plan. **A-1**

Solid Waste Regulatory Oversight

The Mendocino County Department of Environmental Health is the Local Enforcement Agency (LEA) and is responsible for providing regulatory oversight of solid waste handling activities, including inspections. The contact person is Gary Leonard at 707-234-6649 or Leonardg@mendocounty.org. A-2

CONCLUSION

CalRecycle staff thanks the Lead Agency for the opportunity to review and comment on the environmental document. CalRecycle may have further comments on the project as proposed copies of the Final Environmental Impact Report, Findings and Statement of Overriding Considerations (if one is required), Mitigation Monitoring and Reporting Program, Public Notices and any Notices of Determination. A-3

If the environmental document is adopted during a public hearing, CalRecycle staff requests 10 days advance notice of this hearing. If the document is adopted without a public hearing, CalRecycle staff requests 10 days advance notification of the date of the adoption and proposed project approval by the decision-making body. A-4

If you have any questions regarding these comments, please contact me at 916.341.6305 or e-mail me at Christine.Karl@calrecycle.ca.gov.

Sincerely,

Christine Karl

Dear Mr. Eriksen and Mr. Thiele:

Subject: State Clearinghouse Document
Draft EIR, Ukiah Landfill Closure Project
(SCH# 2017022009)

File: Ukiah, City of, Solid Waste Disposal Site, 3100 Vichy Springs Road, Ukiah, CA Mendocino County; WDID No. 1B75043OMEN; Geotracker ID L10008371863

The North Coast Regional Water Quality Control Board (Regional Water Board) is a responsible agency under the California Environmental Quality Act (CEQA) and we appreciate the opportunity to comment. Regional Water Board staff has received the City of Ukiah's Draft Environmental Impact Report (DEIR) on November 18, 2019, titled, "Ukiah Landfill Closure Project" developed by SMB Environmental. The Proposed Project includes designs and plans to construct a landfill cap along with a landfill gas collection system and flare for the Ukiah Solid Waste Disposal Site (Site) located at 3100 Vichy Springs Road in Mendocino County. The landfill footprint occupies approximately 40 acres of the roughly 238 acre parcel within APN 178-130-01 outside the Ukiah City limits. Through circulation of the DEIR, the City of Ukiah is providing detailed information germane to our agency's statutory responsibilities for permitting considerations of the Proposed Project.

We have reviewed the DEIR for the Proposed Project and have the following permitting comments and considerations:

1. Waste Discharge Requirements, Superior Alternative and eliminated alternatives: **B-1**

The City of Ukiah operates the Ukiah Solid Waste Disposal Site under Waste Discharge Requirements Order No. R1-2002-0061 issued by our agency.

Closure requirements within the exiting Order permit and provide for the use of a prescriptive cap (compacted clay liner) in accordance with Title 27, California Code of Regulations (T27, CCR). Order No. R1-2002-0061 also has provisions for use of an Engineered Alternative Design cap subject to various demonstrations required under T27, CCR, Section 20080(b) including requirements for economic cost analyses, demonstration of equivalent protection, infeasibility, unnecessary burden etc.

In our February 27, 2018, project status review correspondence with the City of Ukiah we provided the following:

> *CEQA COMPLIANCE*
>
> *We understand the City of Ukiah has chosen to develop an Environmental Impact Report to comply with CEQA and that one of the project components will consider various closure design options. Please ensure that the analyses include review and consideration of a prescriptive cap, which is contained within the exiting Waste Discharge Requirements, Order No. R1-2002-0061, along with any other engineered alternative the City of Ukiah is considering.*

The DEIR proposes to construct a cap using a synthetic geomembrane liner with a turf and sand-based cover system as the Proposed Project and Superior Alternative. The use of this Proposed Project design is considered an Engineered Alternative Design under T27, CCR.

Of concern, the DEIR considers the Proposed Project turf cover design against a No Project Alternative opting for the Proposed Project design. As you are aware, the No Project Alternative is not a viable regulatory option. The Ukiah Solid Waste Disposal Site is required to construction close in accordance with T27, CCR and the No Project Alternative is not an alternative we can consider.

Further, based on a narrative discussion of potential impacts, maintenance considerations and economic factors the DEIR discusses, but dismisses and eliminates both the prescriptive liner (compacted clay liner) Alternative, as well as use of a geosynthetic clay liner (GCL) Alternative. And yet, no detailed economic analyses are provided within the DEIR in support of the narrative discussions and eliminated Alternatives. The DEIR would be improved, enhanced and better supported by including the economic cost analyses that supports each discussed Alterative including those that have been dismissed and eliminated.

Lastly, regarding the Proposed Project turf-based design, Regional Water Board staff has reviewed and expressed concerns unique to a turf-based system with the City of Ukiah representatives. Given the State of California's recent experiences with catastrophic wildland fires which resulted in significant infrastructure loss and damage, the Proposed Project's synthetic turf design has an inherent surface-based vulnerability in this regard. Also, the surface-based

turf system and underlying synthetic geomembrane liner have a greater exposure to ultraviolet light, weather/temperature impacts and potential degradation and cracking over the buried type of liner systems.

For these reasons we have requested the required financial assurance mechanism to address a possible replacement scenario in the event the surface-based liner systems fails. The Proposed Project description should adequately reflect this.

2. Post-Closure Land Use **B-2**

The Project as proposed is to cap and close the site as an industrial facility while maintaining engineered environmental controls systems, including active landfill gas collection systems with a landfill gas flare in a manner secured from the public.

In December of 2018 Regional Board staff commented on a City of Ukiah Mitigated Negative Declaration (SCH # 2018102056) to develop the same parcel, APN No 178-130-01 as a public park known as the Vichy Hills Trail Project. We wish to point out that the landfill design and post-closure land use proposed under this current DEIR and the Final Closure and Postclosure Maintenance Plan is to retain the site as a closed industrial facility with site security. The DEIR does not address development of the site as a park nor does it propose public uses or any needed environmental safety concerns, considerations, safety factors or mitigations that could result from public access. Should the City of Ukiah propose future development of the closed landfill site for public access all relative permitting considerations and any needed mitigations will need to be revisited and/or re-permitted at that time in accordance with T27, CCR.

3. Water Quality Certification: **B-3**

The Proposed Project will result in placement of fill within jurisdictional waters protected under Sections 401 and 404 of the Clean Water Act. Water Quality Certification (401 Certification) permitting is required for this work. Regional Board staff will continue to work with the City of Ukiah to address permitting requirements and any needed mitigations for work within jurisdictional waters requiring 401 Certification.

4. Construction Stormwater permitting: **B-4**

Disturbed soils on the Project will exceed one-acre in area, therefore, this project is required to obtain coverage under the General Permit for Discharges of Storm Water Associated with Construction Activity, Construction General Permit Order No. 2009-0009-DWQ (As amended by 2010-0014-DWQ and 2012-0006-DWQ): https://www.waterboards.ca.gov/water_issues/programs/stormwater/constpermits.shtml.

The Construction General Permit also requires the development of a Storm Water Pollution Prevention Plan (SWPPP) by a certified Qualified SWPPP Developer which must be implemented, monitored, and maintained.

We look forward to working closely with the City of Ukiah on this project. Please be aware that several departments within our office may ultimately be involved in this construction project and we would appreciate receiving two hard copies of all CEQA documents to assist with various department reviews.

Should you have any questions or concerns please feel free contact me at 707-576-2668 or Terri.Cia@waterboards.ca.gov .

Sincerely,

Re: Comments of Vichy Springs Resort on Draft Environmental Impact Report (DEIR) Prepared by City of Ukiah for Landfill Closure Plan

Dear Mr. Thiele:

This comment letter is submitted on behalf of Vichy Springs Resort, which is located immediately adjacent to the City of Ukiah landfill, and immediately adjacent to the site of the landfill closure plan that is the subject of the Draft Environmental Impact Report (the "DEIR"). This comment letter follows up and expands upon issues that I raised in my oral testimony at the December 17, 2019 hearing in Ukiah on the DEIR. As I noted at the December 17, 2019 hearing, in addition to working as an environmental attorney with Water and Power Law Group, I am also a professor of environmental law at Golden Gate University School of Law, where I teach a course on California Environmental Law that provides extensive coverage of the California Environmental Quality Act ("CEQA"). C-1

I. INTRODUCTION – ENSURING THE LANDFILL CLOSURE IS DONE CORRECTLY

For those us that work on issues related to compliance with CEQA, we are familiar with the NIMBY dynamic (and by NIMBY I mean "*Not In My Backyard*"). The NIMBY dynamics is where neighbors who are opposed to a particular project try to use the CEQA process and CEQA litigation to "stop" a project they do not want to go forward. It is important to highlight that this NIMBY dynamic is not what is involved with the Vichy Springs Resort's concerns regarding the proposed landfill closure project. C-2

More specifically, Vichy Springs Resort is not trying to "stop" or "prevent" the City of Ukiah from moving forward with its landfill closure plan. Quite to the contrary, for the past decade, Vichy Springs Resort has consistently pressed the City to properly close the landfill. While Vichy Springs Resort wants the landfill closure process to move forward, the Resort believes this closure needs to take place in an environmentally responsible manner – so that this closure does not leave a permanent visual eyesore on the landscape, so that this closure is scheduled to reduce impacts on hikers and recreational users, and so that this closure does not cause damage to the springs at the Resort.

Vichy Springs Resort's comments on the DEIR are therefore not about stopping the landfill closure plan but about ensuring the landfill closure plan is done correctly.

In this letter, in addition to noting some of the more technical issues related to the DEIR, Vichy Springs Resort also will address certain preliminary legal issues, particularly issues that relate to the range of alternatives evaluated in the DEIR. More specifically, it is the view of Vichy Springs Resort that the range of alternatives considered in the DEIR – which is really one alternative – is violative of the requirements of CEQA.

II. PREVIOUS WRITTEN COMMENTS SUBMITTED BY VICHY SPRINGS RESORT ON THE PROPOSED NEGATIVE DECLARATION AND ON THE SCOPING DOCUMENT FOR THE EIR

C-3

In 2016, in connection with the Landfill Closure Project, the City of Ukiah initially proposed to comply with CEQA not by preparing an Environmental Impact Report (an "EIR"), but by preparing a Negative Declaration. After receiving written comments from Vichy Springs Resort on the Negative Declaration in April 2016, the City of Ukiah decided to prepare an EIR.

In 2017, consistent with CEQA, the City of Ukiah then released a "Scoping Document" that discussed the scope of issues to be addressed and excluded in the EIR that would be prepared for the Landfill Closure Project. Again, Vichy Springs Resort submitted written comments to the City of Ukiah expressing concern about the proposed scope of the EIR.

In the 2016 written comments Vichy Springs Resort submitted on the Negative Declaration, and in the 2017 written comments Vichy Springs Resort submitted on the EIR Scoping Document, the following concerns were identified.

First, Vichy Springs Resort expressed concern about the adverse visual impact of the artificial synthetic cover that was proposed for the landfill. This artificial synthetic cover would be situated on a highly visible hillside, and would clash with the natural surrounding vegetation. For example, the proposed synthetic cover is green, and in late spring, summer, and early fall the surrounding hillsides are brown. Vichy Springs Resort suggested the alternative of a clay cover with natural vegetation on top – the cover used at most former landfill sites in California – be evaluated. With this natural cover, the color and texture of the vegetation growing on top of the landfill would be the same as the surrounding hillsides during all seasons, thereby reducing adverse visual impacts. **C-3a**

Second, Vichy Springs Resort explained that there are extensive hiking trails on the Vichy Springs property where guests come to enjoy the quiet and tranquility of the area. Vichy Springs Resort's peak season for guests is late spring through early fall. The sound impacts associated with the construction activities related to the landfill closure will be very noisy due to trucks and equipment. This noise will ruin the quiet and tranquility for Vichy Springs Resort guests using the hiking trails. Vichy Springs therefore proposed that the landfill closure construction activities take place "off-season" or during hours of the day when there would be fewer guests and/or less use of the hiking trails. In its previous comments on the Negative Declaration and EIR Scoping Document, Vichy Springs Resort had also proposed other measures to reduce the noise impacts on Resort guests, such as forgoing the use of back-up beepers on trucks and equipment (and instead using additional construction staff to address safety issues). **C-3b**

Third, Vichy Springs Resort noted that as part of the landfill closure process, groundwater monitoring wells will be operated. Many years ago, right after the groundwater monitoring wells were installed across the road from the Resort office, the springs at the resort suffered a drastic reduction in pressure and temperature. As the name Vichy Springs Resort **C-3c**

suggests, a major reason guests come to the Resort is to enjoy the springs. Vichy Springs therefore proposed that before operation of the existing wells was resumed, additional hydrology studies were needed to ensure the wells would not again adversely impact the pressure, flow and temperature of the springs.

Vichy Springs Resort has raised these concerns consistently for many years, and proposed specific feasible mitigation measures that would address these concerns. Vichy Springs Resort therefore reasonably expected that these concerns would be meaningfully addressed and considered as part of the EIR that was being prepared.

III. INADEQUATE RANGE OF ALTERNATIVES CONSIDERED IN THE DEIR

C-4

The DEIR for the landfill closure plan only considered two alternatives – (1) the proposed landfill closure plan; and (2) the "no project" alternative (which was not having any closure plan for the landfill). No other alternatives were considered. The limited alternatives analysis in the DEIR is violative of CEQA's requirements for several reasons.

First, pursuant to CEQA Guideline 151526(d)(5), an EIR is required to select and discuss a "reasonable range" of alternatives that is sufficient to foster public participation and "informed decision-making." Pursuant to the California Supreme Court's 1988 decision in *Laurel Heights Improvement Association v. Regents of the University of California*, an EIR must discuss project alternatives even if the project's significant environmental impacts will be avoided or reduced through mitigation measures. In this way, under CEQA, the alternatives analysis required in an EIR is different from the alternative analysis required in a Negative Declaration. Pursuant to CEQA, a Negative Declaration is not required to evaluate alternatives to the proposed project if it found that all significant environmental impacts have been reduced to a less than significant level. With an EIR, however, CEQA requires the evaluation of a reasonable range of alternatives even if the EIR asserts that all environmental impacts have been mitigated to a less than significant level.

C-4 Cont'd

Second, under the particular circumstances concerning the City's landfill, the "no project" alternative is in fact not an alternative at all because the California Health & Safety

C-4 Cont'd

Code requires the preparation and implementation of a landfill closure plan. This landfill closure plan is not something that the City of Ukiah can decide to do or not do, it is something that the law obligates the City of Ukiah to do. Under CEQA, the idea of the "no project" alternative relates to voluntary projects that are not required, such as the construction of new homes. With a voluntary project such as a new residential project, the "no project" alternative (not doing the project) is in fact a viable alternative. In the case of landfill closure plan, however, the "no project" alternative is in fact a "non-alternative" because the preparation and implementation of a landfill closure plan is required by law.

C-4 Cont'd

The fact that the "No Project" alternative is in fact a "non-alternative" in this situation was explicitly acknowledged in the DEIR for the landfill closure project. Section ES.8 of the DEIR's Executive Summary concedes: "The No Project alternative would not meet any of the goals and objectives of the Proposed Project. Under the No Project Alternative, the Ukiah Landfill would not be properly closed according to state and local regulations…Under the No Action Alternative, the City would be potentially susceptible for a variety of water quality and air quality violations and fines."

C-4 Cont'd

Third, CEQA Guideline 15126.6(e)(2) provides: "If the environmentally superior alternative is the 'no project' alternative, the EIR shall also identify an environmentally superior alternative among the **other** alternatives." (bold added.) This CEQA Guideline clearly anticipates that "other" alternatives will be considered in an EIR in addition to the "No Project" alternative.

C-4 Cont'd

Finally, the Association of Environmental Professionals ("AEP") has provided the following guidance in terms of CEQA alternative analysis: "It is generally uncommon…for an EIR to evaluate only the No Project alternative. In such a case, the Lead Agency has the relatively difficult legal burden of establishing that, given the circumstances at hand, no other feasible alternatives could satisfy the project objectives while resulting in fewer environmental impacts than the proposed project." (2014 AEP CEQA Portal Topic Paper, p. 3). A copy of the AEP CEQA Portal Topic paper is attached as **Exhibit A** to this letter.

C-4 Cont'd

Taken together, the fact that the DEIR for the City's landfill closure plan only considered the "No Project" alternative (which as explained is really a non-alternative in this situation), and considered no other alternatives, constitutes a black-letter violation of CEQA law. While there may be some room for disagreement about what constitutes a "reasonable range of alternatives," for a project such as the landfill closure project, it is clear that the consideration of no other alternative other than the proposed project is not a "reasonable range" of alternatives in this instance.

C-4 Cont'd

IV. FAILURE OF DEIR TO EVALUATE ALTERNATIVE OF NATURAL COVER VERSUS ARTIFICAL SYNTHETIC COVER

C-5

There are several flaws and defects in the section of the DEIR on "Aesthetic/Visual Impacts" (Section 3) as it relates to the artificial synthetic cover.

C-5a

First, the DEIR claims that the artificial synthetic green cover "is designed to look like an irrigated agricultural field." The DEIR states: "Olive green was chosen as the best color of the three options (olive green, tan, or blend) in order to blend into the natural surrounding environment. It was designed to blend into the olive-green grass in the winter or wet-season and look like an irrigated field in the summer dry months." This analysis is flawed, however, because the surrounding hills around the landfill are not in fact irrigated in the summer and dry season, and hence these surrounding hills are brown. The surrounding natural brown hills would therefore present a strikingly un-natural contrast with the artificial synthetic green cover over the landfill.

C-5b

The sharp visual contrast between the proposed artificial monotone green cover and the surrounding natural brown hillsides was made clear in the DEIR itself. More specifically, Figure 3.1-3 in the DEIR (titled 'Simulated Aerial View of Post-Constructed Ukiah Landfill') depicts a uniform synthetic monotone green cover set in the natural landscape of brown hillsides. As Figure 3.1-3 of the DEIR illustrates, there is nothing about the proposed artificial cover that "blends in" with its surroundings. To the contrary, the proposed artificial cover sticks out visually like a giant artificial green thumb.

C-5c

Not only are the hillsides surrounding the landfill site natural revegetation that changes color and texture with the seasons of the year, there is presently natural vegetation on the landfill itself that changes color and texture with the seasons of the year (and that blends in seamlessly with the surrounding hillsides). For purposes of CEQA compliance, the natural vegetation that is presently on the landfill constitutes the "baseline conditions" or "environmental setting" against which a comparative evaluation of the visual impacts of the proposed monotone artificial synthetic cover needs to be based. This aspect of CEQA compliance – comparison of the visual impacts of the artificial cover against current natural vegetation conditions – is something that Vichy Spring Resort has been highlighting for the City for many years. In its April 2016 letter to the City regarding landfill closure plans and CEQA requirements, legal counsel for Vichy Springs Resort explained:

C-5d

> In regard to the environmental setting (baseline conditions) against which scenic impacts are evaluated, the Initial Study has not provided adequate or accurate information about existing views. The Initial Study states that the "project site has been significantly altered by past landfilling activities" but does not actually provide any information about the current scenic conditions of the landfill property. More specifically, the Initial Study does not acknowledge that, since the landfill ceased operations in 2001, the area on top of the landfill has been naturally revegetated with grasses that have allowed the landfill site to increasingly blend in with its natural surroundings. The natural grass vegetation that has developed in the project area over the past 15 years is depicted in the photograph attached as Exhibit C to this letter.
>
> As part of the Final Landfill Closure Plan, the natural grasses that have returned to the landfill area since 2001 will be torn out and replaced with a "geosynthetic" cover – more commonly known as "astroturf." The result will be a 40-acre patch of geosynthetic astroturf in the middle of a natural grass landscape. The Initial Study section on aesthetics provides no information about the visual aspects of the proposed astroturf landfill cover to enable a determination to be made as to whether the astroturf cover results in a potentially significant adverse scenic impact vis-à-vis the existing natural grass conditions on the project site.

The missing aspects of the visual impact analysis in the 2016 CEQA Initial Study have unfortunately been carried forward into the 2019 CEQA DEIR – namely a failure to provide an accurate description and depiction of baseline visual conditions on the landfill site and to compare those baseline visual conditions to the artificial synthetic cover being proposed. A

C-5e

complete copy of Vichy Springs Resort's April 2016 letter to the City (including the photograph showing the natural revegetation conditions existing at the landfill site) is attached as **Exhibit B** to this letter.

Second, the DEIR contains claims that its impact analysis need not consider views of the artificial synthetic cover from more than 1,000 feet away on the following theory: "As demonstrated in Figure 3.1-2 [of the DEIR] anything over 1,000 feet is not considered to be a 'Known Observation Point' with a significant view." This 1,000-foot standard makes no sense in terms of an enormous 40-acre swatch of uniform synthetic color in the context of extensive natural hillsides. Clearly, this type of feature would be visible farther away than 1,000 feet. To support reliance on this 1,000-foot standard, Figure 3.2-2 of the DEIR shows photographs of man holding a sign (who becomes difficult to see 1,000 feet away). An individual person (six feet high) bears absolutely no relation to a 40-square acre synthetic green cover on a hillside. **C-5f**

Third, the DEIR claims that there were no "Known Observation Points" of the location of the landfill from either Vichy Springs Resort property or from any homes in the El Dorado Estates development or Deerwood Park development or from nearby public roads. The absence of any "Known Observation Points" was essential to the DEIR's determination that the proposed monotone artificial synthetic cover would not result in any significant adverse visual/scenic impacts. The DEIR's claims regarding the absence of "Known Observation Points," however, is incorrect. Attached as **Exhibit C** to this letter are photographs taken from various trails on the Vichy Spring Resort property, which have direct views of the landfill. Attached as **Exhibit D** to this letter are photographs taken from the road is front of residences in El Dorado Estates, which have direct views of the landfill. Attached as **Exhibit E** are photographs taken from residences in the Deerwood Park development, which have with direct views of the landfill. Attached as **Exhibit F** is a photograph taken from Vichy Spring Road, again with a direct view of the landfill. These photographs were taken in late December 2019 and early January 2020 by Gilbert Ashoff, owner of Vichy Springs Resort, with the areas where the landfill is located outlined in blue. As such, contrary to the claims in the DEIR, there are in fact numerous "Known Observation Points" of the landfill and the DEIR contains no analysis of how the views from **C-5g**

these locations would be adversely impacted by the proposed incompatible monotone artificial synthetic cover.

Fourth, Section 4.3 of the DEIR states that the document eliminated the natural cover from further consideration as an alternative because it was not "feasible" in that natural covers present an "unreasonably high risk" of slippage. Yet, the DEIR conveniently fails to disclose that the use of natural covers for former landfills is the standard default approach used on the vast majority of landfill sites around the State of California, and has been repeatedly approved by state regulators as an appropriate cover. Hundreds of former landfills all over the state (many of them on slopes) use natural covers. The DEIR's finding that such natural covers are not "feasible" because it presents an "unreasonably high risk" of slippage is contradicted by the widespread use of such natural covers throughout California. If natural covers presented such an "unreasonably high risk" they would not have been adopted by state regulators as the standard cover. **C-5h**

Title 27 of California Code of Regulations (27 CCR), section 21090, sets forth the standard requirements for a landfill cover. Section 21090 provides that this cover shall contain a top layer of soil at least 1 foot thick "capable of sustaining vegetation." Pursuant to this regulation, the State of California therefore anticipates that a landfill cover that will allow for natural revegetation is the standard approach, and that this approach is consistent with health and safety concerns. The DEIR's finding that this standard approach is in fact not "feasible" is in direct contradiction to the requirements of section 21090. While it is correct that in recent years a few landfill covers have been permitted that deviate from the prescriptive natural revegetation standards set forth in section 21090, the infrequent use of such alternative covers in no way suggests that the standard cover with natural revegetation is somehow "unfeasible." **C-5i**

To highlight this point, **Exhibit G** to this letter is a 2015 article from Waste 360 magazine, titled "*Clay Remains a Top Choice for Final Landfill Cover*." According to this article, "Despite the availability of a number of alternative landfill capping methods, clay covers are still the go-to system in most areas of the country." This article continues: "Other capping systems with man-made materials, such as high-density polyethylene (HDPE) have been tested, **C-5i Cont'd**

but it is uncertain that these systems can match federal requirements that they provide the same or better protective quality as clay." The DEIR's claim that the use of clay covers (with natural vegetation above the clay cover) is not a "feasible" alternative ignores the widespread use and regulatory/scientific acceptance of this landfill cover design.

Fifth, Section 4.3 of the DEIR claims that use of a natural cover is not "feasible" because of the additional costs it would add to the landfill closure project. Yet this claim is contradicted by information presented in the DEIR, in the table on page D-6 of the August 2015 Memo to city staff entitled "Engineered Alternative Analysis." This table of page D-6 of the memo indicates that cost of the "synthetic cover" option would be $7,348,890 while the cost of the "natural cover" option would be $7,768,500. So, according to the information presented in the DEIR, although the natural cover would cost about $420,000 more, the cost of the two options are comparable given the overall project costs involved. **C-5j**

On the question of "costs" associated with an alternative, and whether additional costs render an "alternative" unfeasible, the California Court of Appeals 1988 decision in *Citizens of Goleta Valley v. Board of Supervisors* is particularly worth noting. In *Citizens of Goleta Valley*, the Court held that an environmentally superior alternative cannot be considered economically unfeasible in the absence of evidence that the additional costs would be so severe that the project would not be economically viable. Clearly, no such showing can be made in this instance, where the additional costs for the natural cover versus the artificial synthetic cover are relatively small given the overall project budget (amounting to perhaps 5% of the total project costs). **C-5j Cont'd**

V. FAILURE OF DEIR TO EVALUATE ALTERNATIVE OF SCHEDULING CONSTRUCTION ACTIVITES TO AVOID ADVERSE NOISE IMPACTS ON RECREATIONAL RESOURCES **C-6**

In its written comments on both the Negative Declaration and the EIR Scoping Document, Vichy Springs Resort requested consideration of the alternative of scheduling the landfill closure plan construction activities outside of the resort's peak season or during limited hours during weekdays, to reduce noise impacts on the Resort's guests, particularly on persons using the hiking trails in close proximity to the project site. **C-6a**

There are clearly feasible alternatives that could have been evaluated, that would reduce the noise and recreational impacts of the project, yet the DEIR contains no analysis whatsoever of the alternative of scheduling construction activities outside Vichy Springs Resort's peak season or during limited hours of the day. The DEIR's defects in this regard relate both to its failure to analyze impacts on "recreational resources" and the inadequacy of its analysis of "noise impacts." **C-6b**

In terms of the DEIR's evaluation of project impacts on "recreational resources", there is none. Section 1.3.2 of the DEIR, titled "Scope of this EIR," states the following: "Substantial evidence exists to exclude the following identified resources from further analysis in the EIR…Recreation. Because no residential development that would create a demand for parks and recreational facilities in the County is proposed, the Proposed Project would not result in any impact to those facilities. Therefore, no mitigation measures are required." While it may be true the creation of new residential units can create additional demand for recreational resources, it does not follow that a non-residential project (such as the City's landfill closure project) may not create adverse environmental impacts (such as construction-related noise or degradation of viewsheds) on existing recreational resources. The DEIR's claim that its elimination of "recreational resources" from evaluation in the document is supported by "substantial evidence" is therefore without merit. The only "evidence" relied upon for this elimination was the observation that no additional demands on recreational resources would result because the landfill closure project was not a residential project. **C-6c**

Section 3.8 of the DEIR, on noise impacts, focused on what are referred to as "sensitive receptors." In terms of noise impacts on Vichy Springs Resort, the DEIR focuses exclusively on the "cabins" where guests at the Resort are staying and sleeping. These are the only "sensitive receptors" analyzed in regard to the project's noise impacts on the Resort. The DEIR states: "The majority of construction activities would occur greater than 1,000 feet from the northernmost cabin of Vichy Springs Resort. At this distance, maximum noise levels from construction (as shown in Table 3.8) would be…considered less than significant." **C-6d**

Yet, unlike in a standard motel, guests at the Vichy Springs Resort do not just stay in their cabin rooms. They come to enjoy the extensive outdoor recreational resources of the Resort, the springs and the hiking trails. They walk fence lines, the creek, to a waterfall, to enjoy the panoramic views of the surrounding hillsides (including views of the hillside where the landfill is located). In fact, many guests of the Resort come just for the day and do not stay overnight at all. And the Resort guests using the hiking trails at Vichy Springs Resort have ears. The quiet and tranquility of the experience these guests seek on these hiking trails will be adversely impacted by the truck and equipment noise associated with the landfill closure project. Yet, there is no mention or evaluation of this in the DEIR. **C-6e**

The DEIR's approach to noise impacts and recreational resource impact analysis resulting from landfill closure construction activities is inconsistent with CEQA Guidelines and with the approach taken in other CEQA EIRs. More specifically, Appendix G to the CEQA Guidelines sets forth a series of questions for lead agencies to ask to determine whether a proposed project may or will have significant adverse environmental impacts. In terms of "noise impacts" of proposed project, Appendix G to the CEQA Guidelines calls upon lead agencies to evaluate and determine whether there would be "a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?" Significantly, this evaluation of whether a project will result in "substantial temporary or periodic increases in ambient noise levels" is separate and distinct from Appendix G's requirement that CEQA lead agencies also evaluate and determine whether "exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies." **C-6f**

The City's DEIR for the landfill closure plan included analysis of whether construction activities might violate local noise ordinance levels, but contained no analysis (which Appendix G requires) of whether such construction activities would cause "substantial temporary or periodic increases in ambient noise levels" (such as substantial increased ambient noise levels on the recreational hiking trails on the Vichy Springs Property). The City DEIR improperly treated these two required noise impact inquiries as if they were one and the same – as if the absence of **C-6g**

data showing a specific violation of a local noise ordinance somehow also established that the project would not result in substantial increased ambient noise levels. But that is not what Appendix G of the CEQA Guidelines provides and requires.

C-6g Cont'd

An example of the approach to noise impact analysis that Appendix G of the CEQA Guidelines provides can be found in the 2004 CEQA EIR prepared for the Los Angeles International Airport Master Plan (the "LAX Master Plan EIR"). In Section 4.26.3 of the LAX Master Plan EIR (a complete copy of Section 4.26.3 is included as **Exhibit H** to this letter), the document discloses how it will approach CEQA thresholds of significance for evaluating project impacts on recreational resources, explaining that in addition to looking at impacts related to additional demand on recreational resources caused by potential project-related population growth, the EIR will also evaluate the extent to which project activities such as construction degrade recreational facilities or substantially and adversely alter recreational facilities. This approach to CEQA thresholds of significance for impact on recreational resources can be compared with the highly restrictive approach taken in the City's DEIR for the landfill closure plan, which only considered whether the project would create additional "demand" for recreational facilities.

C-6h

Section 4.26.3 of the LAX Master Plan EIR then went on to evaluate project impacts on eight (8) different recreation areas in the vicinity of the airport expansion project. For each of these eight (8) different recreation areas, Section 4.26.3 of the LAX Master Plan EIR evaluated the impacts of additional construction-related noise on the experience of users of these recreation areas, to determine whether construction noise would result in significant degradation or impairment of use of these different recreational resources. Section 4.26.3 of the LAX Master Plan EIR considered how these noise impacts on recreation areas might be reduced under some of the alternatives considered in the EIR, including Alternative D which would reduce construction hours to reduce construction-related noise impacts. The approach taken in the LAX Master Plan EIR provides a template for how the City's DEIR for the landfill closure plan could have and should have proceeded pursuant to CEQA – by identifying recreation areas in the vicinity of the landfill closure project (including Vichy Springs Resort's hiking trails), by

C-6h Cont'd

evaluating the construction-related noise impacts of the landfill closure project on these recreation areas, and by identifying feasible mitigation measures to reduce or avoid these construction-related noise impacts on recreational resources.

C-6h Cont'd

In addition to proposing changes in the season for construction activities, in its previous comments on the Negative Declaration and the EIR Scoping Document, Vichy Springs Resort had also proposed other measures to reduce noise impacts on guests. For example, Vichy Springs Resort proposed that instead of the use of backup beepers on trucks and equipment (which can be quite loud and noisy), additional construction staff could be used to address the safety concerns that the backup beepers are meant to address. As another example, instead of scheduling weekday construction activities from 7am to 7pm, construction activities could be scheduled either in the morning or the afternoon, so that guests at Vichy Springs Resort would be able to use the hiking trails in either the morning or the afternoon without being subject to construction-related noise from the adjacent property. These scheduling approaches to reducing construction noise impacts on nearby recreation areas were considered in Alternative D in the LAX Master Plan EIR discussed above (again highlighting the failure of the City's DEIR to consider a reasonable range of alternatives). These other mitigation measures would all reduce the adverse noise-related impacts on nearby recreational resources such as Vichy Springs Resort hiking trails, yet none of these other proposed measures were either incorporated into the proposed project or evaluated in the DEIR.

C-6i

Is it possible that the use of additional construction staff in lieu of backup beepers might result in some incremental additional costs for the landfill closure project? Yes, it is foreseeable that this approach might result in some incremental additional project costs. However, as discussed above (see discussion regarding 1988 *Citizens of Goleta Valley* case), the fact that an alternative or mitigation measure may involve some additional costs does not render the alternative or mitigation measure economically unfeasible absent information demonstrating that these additional costs are of such magnitude that the entire project would become financially unviable.

C-6i Cont'd

Consider if there was a construction project (say construction of a new road) with noise impacts that took place in Yosemite National Park, in close proximity to hiking trails in the Park. **C-6j**

- And imagine if the environmental impact document for the Yosemite road-building project eliminated consideration of impacts on recreational resources based on the logic that the new road was not a residential project and therefore did not create any new demand for parks and recreation.
- And imagine if an environmental impact document for the Yosemite road-building project was prepared that only considered the noise impacts on cabins many miles away down in Yosemite Valley, but completely ignored the noise impacts of park visitors using Yosemite's hiking trails near the road-building project. **C-6j Cont'd**
- And imagine if an environmental impact document for the Yosemite road-building project failed to evaluate the alternative of scheduling such road construction at times of the year or hours of the day when there was more limited use of these nearby hiking trails because there were less visitors to the Park or failed to consider alternatives to the use of truck/equipment backup beepers to reduce construction-related noise impacts. **C-6j Cont'd**

It seems clear that such a cramped and restrictive noise impact analysis – one that completely ignored the impacts on Yosemite's recreational resources and on those persons using Yosemite's hiking trails – would be legally inadequate. It also seems clear that the failure to consider the alternative of scheduling such activities or conducting such activities in a manner to avoid or lessen such impacts on recreational resources and hikers would also be inadequate. The same reasoning applies in the case of noise impacts on persons using the hiking trails at Vichy Springs Resort. The complete disregard of these recreational resource impacts, and the failure to consider these scheduling and operational alternatives, cannot be justified under CEQA. **C-6j Cont'd**

Based on consultations with Alisto Engineering, a revised DEIR should be prepared that includes noise impact modeling that considers the following: baseline noise levels on hiking trails at Vichy Springs Resort property; increase in noise levels on hiking trails at Vichy Springs **C-6k**

Resort due to construction activities including but not limited to back-up truck/equipment beepers used during construction; evaluation of whether increase in noise levels on such hiking trails is significant when compared to baseline noise conditions; reductions in noise levels on hiking trails at Vichy Springs Property that could be achieved by prohibiting use of backup beepers; additional costs associated with relying on additional construction staff versus use of backup beepers.

C-6k Cont'd

VI. FAILURE TO ANALYZE THE IMPACT OF PROJECT GROUNDWATER WELLS ON PRESSURE AND TEMPERATURE OF THE SPRINGS AT VICHY SPRINGS RESORT

C-7

Section 3.7 of the DEIR (on Hydrology) states that in 1994 the City of Ukiah commissioned a study on the impacts of landfill groundwater wells on the springs at Vichy Springs Resort. This study was prompted by the information provided to the City indicating that the springs at Vichy Springs Resort experienced dramatic and severe reductions in pressure and temperature when the landfill groundwater wells were installed. Damon Brown, the City's engineer, was warned by Gilbert Ashoff (owner of Vichy Springs Resort) that drilling in the vicinity of pressurized springs was dangerous and why so. The City ignored Ashoff's concerns and commenced the well drilling with the result being the springs' flow dropped by 50% and, due to an adiabatic reaction, the springs' temperature dropped 20 degrees Fahrenheit.

Relying on this 1994 study, Section 3.7 of the DEIR determined that there was not the potential for adverse impacts by the landfill closure project (which involved multiple groundwater wells) on the springs of Vichy Springs Resort because the chemical constituents of the water in the wells and in the spring water were different. This analysis of chemical constituents (even if correct), however, does not address the alleged causes of the impact on the springs, which was the wells' redirection of carbon dioxide ("CO2") that led to the pressure drop and flow decrease. An analysis of the respective chemical constituents of well water and spring water therefore does not address the problem involved, which is redirection of CO2, so therefore does not provide any support for the finding that the groundwater wells associated with the landfill do not have the potential to adversely impact the temperature and pressure of springs at Vichy Springs Resort.

In its April 2016 letter to the City (which is part of the administrative record for these CEQA proceedings), Vichy Springs Resort included as an attachment a letter from Al Sevilla of Alisto Engineering that specifically addressed these concerns regarding the impact of the landfill groundwater wells on the CO2 pressure for the springs at Vichy Springs Resort. This letter from Alisto Engineering detailed the ways that the groundwater wells previously impacted CO2 pressure with resulting reductions in flow and temperature for the springs. The DEIR's hydrology analysis is non-responsive to the technical analysis and information presented in the previous letter from Alisto Engineering, focusing on chemical constituents of waters in the springs and the groundwater wells rather than CO2 pressure interactions.

In its previous written comments on the Negative Declaration and the EIR Scoping Document, Vichy Springs Resort requested that additional testing and modeling of CO2 pressure and related adiabatic reactions (affecting temperature) be undertaken prior to committing to renewed long-term operation of the groundwater wells as part of the post-closure plan for the landfill. The DEIR ignored this recommendation, and it does not appear that testing or modeling of CO2 pressure and related adiabatic reactions was done or is proposed to be done. As a result, there is not substantial evidence to support the DEIR's determinations concerning the impact of the groundwater wells on the springs at Vichy Springs Resort. As such, the analysis and findings regarding this impact fail to satisfy CEQA.

More specifically, CEQA requires that the lead agency preparing the EIR provide an adequate description of "baseline conditions" – the environmental setting at the time the EIR is prepared. The EIR then must then compare the anticipated effects of a proposed project against these baseline conditions. If the EIR has not done a credible analysis of the baseline conditions regarding the hydrologic effect of the landfill closure groundwater wells on CO2 pressure for the adjacent springs at Vichy Springs Resort, however, then there is no basis to evaluate the impact of the continued operation of these groundwater wells on the springs. This is why Vichy Springs Resort has repeatedly asserted that this testing and analysis of CO2 pressure needs to be done before the groundwater wells are put back into operation, and this testing and analysis has yet to be done.

It should also be noted that there have been repeated problems with the link the City provided to the electronic copy of the DEIR, and these problems impacted the ability of Alisto Engineering to prepare a supplemental opinion letter on the issue of CO2 pressure impacts on the springs resulting from operation of the landfill groundwater wells. More specifically, in the period from January 17, 2019 until after the New Year, Alisto Engineering tried multiple times to open the DEIR link provided by the City but was unsuccessful (which delayed their review of the portions of the DEIR dealing with this issue). The City was eventually able to resolve the DEIR link the issue in early January 2020, but by that time Alisto Engineering no longer had availability to provide supplemental review and comments.

VII. IN CONCLUSION – THE DEIR NEEDS TO BE REVISED AND RECIRCULATED PRIOR TO CERTIFICATION

C-8

Per the issues addressed above in this letter and in the exhibits to this letter, the following have been established: that clay covers with natural vegetation on top is a feasible and commonly used option for landfill covers; that there are numerous “known observation points” with direct views of the landfill and the DEIR did not contain any analysis of adverse visual impacts from these locations associated with the proposed artificial monotone cover; that the analysis of construction noise impacts on existing recreation areas is standard practice in CEQA EIRs and was not undertaken in the City’s DEIR for the landfill closure plan; and that the testing and modeling of CO2 pressure impacts is needed to evaluate the impacts of project groundwater wells on the springs at Vichy Springs Resort and that this CO2 pressure testing and modeling were not done.

Beyond these more technical defects in the DEIR, however, there is the more glaring fundamental legal defect of the failure of the DEIR to evaluate a reasonable range of alternatives. The alternatives analysis in the DEIR, being limited to the proposed project and the No Project alternative (which as explained above is in fact a non-alternative because the City is legally obligated to implement a landfill closure plan) is simply not allowed under CEQA.

For these reasons, Vichy Springs Resort respectfully requests that a revised draft of the DEIR be prepared that corrects these defects, and that this revised DEIR be recirculated for public comment before being certified by the City of Ukiah.

Yours,

Paul Stanton Kibel

CEQA Portal Topic Paper

Alternatives

What Are Alternatives?

Alternatives, in the context of the California Environmental Quality Act (CEQA), are optional ways that the project proponent could achieve most of their objectives, while also reducing or eliminating the environmental impacts of the proposed project (California Public Resources Code [PRC] Section 21002; *see also Friends of the Old Trees v. Department of Forestry & Fire Protection* (1997)).

Alternatives typically involve changes to the location, scope, design, extent, intensity, or method of construction or operation of the proposed project. The Lead Agency is required to evaluate and compare the environmental impacts of alternatives to the proposed project in an Environmental Impact Report (EIR), though not at the same level of detail as the proposed project (CEQA Guidelines Section 15126.6(d)).

Why Are Project Alternatives Important?

A fundamental mandate of CEQA is that "public agencies should not approve projects as proposed if there are feasible alternatives or feasible mitigation measures available which would substantially lessen the significant environmental effects of the project" (PRC Sections 21002, 21081). Therefore, as part of the decision making process for projects involving the preparation of an EIR, governmental agencies are required under CEQA to consider alternatives to proposed actions affecting the environment (PRC Section 21001(g)).

One of the purposes of an EIR is to identify alternatives to a proposed project and evaluate the comparative merits of feasible alternatives (CEQA Guidelines Section 15126.6(d)). By examining a range of alternatives, the Lead Agency can demonstrate that it has taken a "hard look" at the project objectives to select alternatives that allow for meaningful comparison (*See Residents Ad Hoc Stadium Committee v. Board of Trustees* (1979)).

Courts have overturned many EIRs due to an improper or incomplete analysis of alternatives (*See Cleveland National Forest Foundation v. San Diego Association of Governments* (2017); *North Coast Rivers Alliance v. Kawamura* (2015); *Habitat and Watershed Caretakers v. City of Santa Cruz* (2013); *Watsonville Pilots Association v. City of Watsonville* (2010).

An EIR can also be overturned if it analyzes a range of alternatives, but fails to identify a preferred alternative as the project. A broad range of alternatives without a stable project presents the public with a moving target and an obstacle to informed participation. (See *Washoe Meadows Community v. Department of Parks & Recreation* (2017)).

Is an Analysis of Alternatives Required in an IS/MND?

No, the purpose of an alternative analysis is to look at ways to avoid or reduce the significant environmental impacts of a proposed project. Negative Declarations (NDs) or Mitigated Negative Declarations (MNDs) are only prepared for projects that are demonstrated not to have any significant environmental impacts, or where mitigation can be adopted to reduce all significant impacts to a less-than-significant level. Therefore, because projects supported by NDs or MNDs have been determined to have no significant environmental impacts, no analysis of alternatives is required in these documents.

However, although it is not required, a Lead Agency's consideration of alternatives in support of an ND is not prohibited. An exploration and analysis of alternatives to: a project; a specific aspect of a project with the most potential to result in environmental impacts; or methods or technologies used in project construction or operations (e.g., handling of contaminated sediments) may be useful to minimize the environmental impacts of a proposed project, even where such impacts are already less than significant. Such an exploration of alternatives to the proposed project may also be helpful to the Lead Agency in other ways, such as identifying alternative approaches, designs, or locations that would reduce environmental effects or are more efficient, effective, or cost effective.

Is an Analysis of Alternatives Required in an EIR?

Yes, an evaluation of alternatives is required in all EIRs. CEQA Guidelines Section 15126.6(a) states:

> "An EIR shall describe a range of reasonable alternatives to the project, or to the location of the project, which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project, and evaluate the comparative merits of the alternatives. An EIR need not consider every conceivable alternative to a project. Rather it must consider a reasonable range of potentially feasible alternatives that will foster informed decisionmaking and public participation. An EIR is not required to consider alternatives which are infeasible."

What Alternatives are Required in an EIR?

An EIR must always evaluate a "No Project" alternative (CEQA Guidelines Section 15126.6(e)(1)). Evaluation of a No Project alternative compares impacts of the proposed project with impacts that would occur if the proposed project were not approved and implemented. Beyond evaluation of the No Project alternative, CEQA requires that a "reasonable range" of alternatives be evaluated in an EIR, but does not specify other alternatives that must be evaluated (CEQA Guidelines Section 15126.6(a)).

How Do I Develop A Reasonable Range of Alternatives?

What is a "Reasonable Range" of Alternatives?

The EIR must always evaluate the No Project alternative as well as a "reasonable range" of feasible "build" alternatives (CEQA Guidelines Section 15126.6(e)). Apart from the analysis of the No Project alternative however, there is no ironclad rule governing the nature or scope of the "reasonable range" of other alternatives to be discussed, other than the "rule of reason" (CEQA Guidelines Section 15126.6(a) & (f); see also *Citizens of Goleta Valley v. Board of Supervisors (1990)*; *Laurel Heights Improvement Association v. Regents of the University of California (1988)*).

What constitutes a "reasonable range" of alternatives will vary with the facts of each project and should be guided only by the purpose of offering substantial environmental advantages over the project proposal which may be "feasibly accomplished in a successful manner" considering the economic, environmental, social and technological factors involved (See *Citizens of Goleta Valley v. Board of Supervisors (1990)* (citing PRC Sections 21002, 21061.1; CEQA Guidelines Section 15364)).

An EIR need not consider every conceivable alternative to a project (CEQA Guidelines Section 15126.6(a); *Mount Shasta Bioregional Ecology Center v. County of Siskiyou (2012)*). The alternatives considered may include alternative approaches, sites, or both (CEQA Guidelines Section 15126.6(a)).

Consistent with this rule of reason, it is generally uncommon (though not strictly prohibited) for an EIR to evaluate only the No Project alternative. In such a case, the Lead Agency has the relatively difficult legal burden of establishing that, given the circumstances at hand, <u>no</u> other feasible alternatives could satisfy the project objectives while resulting in fewer environmental impacts than the proposed project (S*ee Mount Shasta Bioregional Ecology Center v. County of Siskiyou* (2012)).

How Do I Develop Alternatives?

Because alternatives must meet most (though not all) of the project objectives, one should begin with reviewing the project objectives (CEQA Guidelines Section 15126.6(c); *In re: Bay-Delta etc.* (2008)). According to the CEQA Guidelines, "A clearly written statement of objectives will help the Lead Agency develop a reasonable range of alternatives to evaluate in the EIR . . . ." (CEQA Guidelines Section 15124(b)); *see also* Project Objectives Topic Paper).

Proper development and analysis of alternatives should also be tied closely to the known or likely significant environmental impacts of the proposed project, as the purpose of the alternatives is to reduce or eliminate these impacts. The project setting can also influence the choice of alternatives (e.g., infill vs. greenfield, site geotechnical constraints, slope, and presence of biological or cultural resources). When developing the alternatives:

- Identify the known or likely significant construction or operational impacts of the project;
- Focus on finding alternatives that avoid or minimize those significant impacts;
- Consider offsite locations, when possible;
- Consider alternative site plans on the proposed site;
- Consider reductions in project size or intensity of uses;
- Consider alternative construction methods or materials;
- Consider alternative project operations; and
- Confirm whether each alternative meets most of the basic project objectives.

How Do I Define The No Project Alternative?

The No Project alternative represents conditions in the study area in the absence of approval of the proposed project (CEQA Guidelines Section 15126.6(e)(1)). The No Project Alternative must discuss current conditions as well as reasonably foreseeable future conditions expected to occur if the project were not approved (CEQA Guidelines Section 15126.6(e)(2)).

However, the analysis of the No Project alternative should not be confused with comparison of the proposed project to Existing Conditions (the baseline for determining the project's environmental impacts) (CEQA Guidelines Section 15126.6(e)(1)). The purpose of describing and analyzing a No Project alternative is to allow decision makers to compare the impacts of approving the proposed project with the impacts of not approving the proposed project (*Id.*). The analysis of the No Project alternative, as with the analysis of other alternatives, is usually a comparative or qualitative assessment (CEQA Guidelines Section 15126.6(d)(e)).

The first step in the process is to establish the existing uses on the project site. The No Project alternative often represents conditions on the project site at the time the notice of preparation is published, or if no notice of preparation is published, at the time environmental analysis is commenced (CEQA Guidelines Section 15126.6(e)(2)).

If the proposed project is not expected to be completed and operating for many years, the next step is to determine what reasonably foreseeable changes to the project site and environs are likely to occur unrelated to the proposed project. This may include projects that have been approved, but not yet completed, projects that have been proposed but have not yet been approved, and infrastructure projects planned to be completed within the timeframe established for the evaluation (CEQA Guidelines Section 15126.6(e)(3)(C)).

The analysis of the impacts of the No Project alternative can be accomplished in two general ways, depending on the nature of the proposed project:

1. When the project involves the revision of an existing land use or regulatory plan, a policy, or ongoing operations, the No Project alternative will be defined as the continuation into the future of the existing plan, policy, or operation. The existing plan, policy, or operations should be assumed to continue and to apply to other projects implemented during the timeframe of the analysis. Thus, the projected impacts of the proposed plan or alternative plans would be compared to the impacts that would occur under the existing plan (CEQA Guidelines Section 15126.6(e)(3)(A)).

or,

2. If the project is a specific development project on identifiable property, the No Project alternative should be defined as the conditions that would occur if the proposed project were not implemented. The discussion should compare the environmental effects of the property remaining in its existing state against the environmental effects that would occur if the project were approved and implemented. If disapproval of the project under consideration would result in predictable actions by others, such as the proposal of some other project, the consequences of these actions should be discussed as part of the environmental effects of the No Project alternative. In some circumstances, the failure to proceed with the proposed project would not result in the preservation of existing environmental conditions, but perhaps in another project being implemented; the analysis in that case should identify the practical result of the project's non-approval based on current plans and consistent with available infrastructure and community services. However, the Lead Agency is not required to speculate, or create and analyze a set of

artificial assumptions about what would occur in the future, if it cannot reasonably be known (CEQA Guidelines Section 15126.6(e)(3)(B)).

After defining the No Project alternative using one of these approaches, the Lead Agency should proceed to analyze the impacts of the No Project alternative by projecting what would reasonably be expected to occur in the foreseeable future if the project were not approved. This can often be done based on projections in the Lead Agency's local planning documents (e.g., a General Plan or applicable Specific Plan, and/or the CEQA documents prepared for those documents) (CEQA Guidelines Section 15126.6(e)(3)(C)).

Do I Need to Consider Offsite Alternatives?

Offsite alternatives should be considered. Zoning, environmental conditions, and availability are significant factors in evaluating an offsite alternative. To be analyzed in the EIR, the offsite alternative must be "feasible", and it must be possible for the project proponent to acquire the property. The proposed uses on the property should either be consistent with the applicable general plan designation for the property, or it should be reasonable to expect that a general plan amendment would be successful. There may be situations, however, where an offsite alternative is not feasible, for example, because the primary objective of the project is a modification of an existing facility. (*California Native Plant Society v. City of Santa Cruz* (2009).

Do I Need to Consider Speculative Alternatives?

An EIR need not consider an alternative whose effects cannot be reasonably evaluated because insufficient detail regarding the alternative is available, and whose implementation is remote and speculative (CEQA Guidelines Sections 15126.6(f)(3), 15145; see also *Residents Ad Hoc Stadium Committee v. Board of Trustees* (1979)*; Laurel Heights Improvement Association v. Regents of the University of California* (1993)).

Do I Need to Consider Alternatives Recommended by Others?

A Lead Agency should consider alternatives brought to its attention during the public scoping process (in a draft EIR), or during the public review period (in a final EIR), provided that the alternatives meet the above criteria (CEQA Guidelines Section 15126.6(c)). While not required, alternatives brought to the lead agency's attention after the public review period of an EIR may also be considered (PRC Section 21091(d)(1) & (2); CEQA Guidelines Section 15162(a)(3)(C); see also *Citizens of Goleta Valley v. Board of Supervisors* (1990)). In such circumstances, the lead agency may address the alternative by means of administrative findings (*see Citizens of Goleta Valley v. Board of Supervisors* (1990)).

However, Lead Agencies need not respond to late comments suggesting new alternatives (PRC Section 21091(d)(1); CEQA Guidelines Section 15207). Indeed, a Lead Agency may properly reject alternatives raised after the close of the public comment period; in such instances, the Lead Agency is not required to provide reasons for rejecting those alternatives (*see South County Citizens for Smart Growth v. County of Nevada* (2013)).

Are All Changes To A Project Considered Alternatives?

No, not all changes made to a project should be considered as separate alternatives. For example, minor changes in methods used (or rejected) in carrying out the project are typically not considered alternatives to the project (*Town of Atherton v. California High-Speed Rail Authority* (2014)). However, a number or group of such minor changes taken together, especially if they result in changes to the types or intensity of environmental impacts, may be considered an alternative.

May A Lead Agency Include Alternatives that Do Not Result in Reduced Environmental Impacts?

Yes. While the analysis of an alternative that does not result in the reduction or elimination of an environmental impact of the proposed project is allowable, it is not a substitute for the consideration of other alternatives that reduce or eliminate the project's impacts (CEQA Guidelines Section 15126.6(a); *Cleveland National Forest Foundation v. San Diego Association of Governments* (2017)).

What Must Be Included in an Analysis of Alternatives in an EIR?

Under CEQA, alternatives do not need to be described or analyzed at the same level of detail as the proposed project (CEQA Guidelines Section 15126.6(d)). However, they need to be described in enough detail to allow a comparative analysis of the alternatives against the proposed project (*see Residents Ad Hoc Stadium Committee v. Board of Trustees* (1979). That is, it must be in sufficient detail for the Lead Agency to differentiate the impacts between the alternatives and to select the Environmentally Preferred Alternative (*see Laurel Heights Improvement Association v. Regents of the University of California* (1988)).

The EIR should briefly describe the rationale for selecting the alternatives to be discussed. The EIR should also identify any alternatives that were considered by the lead agency during the scoping process, but rejected as infeasible, and briefly explain the reasons why these alternatives were rejected (see *Alternatives Considered but Rejected* below for more detail). For an alternative suggested during the public comment period on the draft EIR, the final EIR should either analyze the suggested alternative at the appropriate level of detail, or explain that

the suggested alternative was considered but rejected from further analysis. Additional information explaining the choice of alternatives may be included in the administrative record (CEQA Guidelines Section 15126.6(c).

The EIR may include a summary comparison table that lists each environmental resource analyzed, the relative environmental impacts of each alternative with respect to each resource, and how they compare to the impacts of the proposed project (CEQA Guidelines Section 15126.6(d)). The following are useful ways to compare alternatives:

- Describe if impacts are greater, lesser, similar to the proposed project and other alternatives;
- Summarize the overall environmental impacts of each alternative;
- Discuss the extent to which each alternative attains project objectives;
- Discuss any concerns with the feasibility of each alternative; and
- Most importantly, support any conclusions with evidence and include such evidence in the administrative record.

The following is an abbreviated example of a summary table.

Topic	Project	No Project	Alt 1	Alt 2
Air Quality	S	LTS	SUI	SUI
Noise	LTS	LTS	LTSM	LTS
Biology	LTSM	LTS	LTSM	LTS
Geology	LTSM	LTS	LTSM	LTSM

S=Significant Impact; SUI=Significant Unmitigated Impact; LTS=Less Than Significant Impact; LTSM=Less Than Significant Impact with Mitigation

Alternatives Considered but Rejected.

An analysis of alternatives in an EIR should include a list of alternatives considered but rejected, and include an explanation of why alternatives were rejected. (If this discussion is not included in an EIR, it must exist elsewhere in the administrative record). The Lead Agency may, as part of the scoping process, make an initial determination as to which alternatives are potentially feasible and merit in-depth consideration, and which do not. (CEQA Guidelines Section 15126.6(c)).

As noted above, remote or speculative alternatives need not be considered and may be rejected from further evaluation.

What Factors May be Considered in Determining the Feasibility of Alternatives?

As statutorily defined, "'Feasible' means capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, social, and technological factors." (PRC Section 21061.1; see also CEQA Guidelines, Section 15364 [same definition but with addition of "legal" factors].) "'[F]easibility' under CEQA encompasses 'desirability' to the extent that desirability is based on a reasonable balancing of the relevant economic, environmental, social, and technological factors." (*City of Del Mar v. City of San Diego* (1982); *Sequoyah Hills Homeowners Association. v. City of Oakland* (1993)).

The issue of whether an alternative is feasible arises at two different points in the CEQA process: first, in the assessment of alternatives in the EIR; and second, during the Lead Agency's consideration of whether to approve the project. The standard for determining whether an alternative should be analyzed in an EIR is whether the alternative is *potentially* feasible. Subsequently, the Lead Agency must determine whether the alternatives included in the EIR are actually feasible, based on the analysis in the EIR as well as factors external to the environmental analysis, e.g., social or economic concerns (see *California Native Plant Society v. City of Santa Cruz* (2009)).

While there is no bright line between these two assessments, generally the EIR should refrain from reaching conclusions regarding *actual* feasibility and should focus the analysis on whether an alternative is *potentially* feasible, and then undertake the comparison of the environmental effects of the project and alternatives.

Screening criteria may be developed to determine the feasibility of potential alternatives. Among the factors that may be taken into account when addressing the feasibility of alternatives are:

- Site suitability for the proposed use(s);
- Economic viability;
- Availability of infrastructure to serve the site;
- General plan consistency, other plans or regulatory limitations;
- Jurisdictional boundaries (projects with a regionally significant impact should consider the regional context); and

- Whether the proponent can reasonably acquire, control or otherwise have access to an alternative site (or the site is already owned by the proponent)

(CEQA Guidelines Section 15126.6(f)(1); see also *Citizens of Goleta Valley v. Board of Supervisors* (1990); *Save Our Residential Environment v. City of West Hollywood* (1992).

By applying the criteria to each potential alternative, infeasible alternatives can be screened out, and a reasonable range of feasible alternatives that meet most of the project objectives and substantially avoid or lessen the proposed project's significant environmental effects will result (see *In re: Bay-Delta Programmatic Environmental Impact Report Coordinated Proceedings* (2008)).

Under CEQA, an alternative may be eliminated for any of the following reasons:

- The alternative fails to meet most of the basic project objectives;
- The alternative is infeasible;
- The alternative does not avoid significant environmental impacts; or
- Implementation of the alternative is remote and speculative and the effects cannot be reasonably ascertained.

(CEQA Guidelines Section 15126.6(f)).

Alternatives may not be rejected merely because they are beyond an agency's authority, would require new legislation, or would be too expensive (CEQA Guidelines Section 15126.6(f)(2)).

When economics is used as a factor to support a finding of infeasibility, the fact that an alternative may be more expensive than the project does not necessarily make it infeasible (*see Citizens of Goleta Valley v. Board of Supervisors* (1988); *Association of Irritated Residents v. County of Madera* (2003)). The Lead Agency must support the finding with specific data that shows the additional cost or lost profits are great enough to make it impractical to proceed with the project (see *Citizens of Goleta Valley v. Board of Supervisors* (1988)); *Foundation for San Francisco's Architectural Heritage v. City and County of San Francisco* (1980); *San Franciscans Upholding the Downtown Plan v. City and County of San Francisco* (2002)).

Identification of Environmentally Superior Alternative.

CEQA requires that EIRs identify the Environmentally Superior Alternative, and discuss the facts that support that selection. (*See* PRC Section 21081.5; CEQA Guidelines Sections 15091, 15126.6(e)(2)). The Lead Agency is not, however, obligated to select the Environmentally Superior Alternative for implementation if

it would not accomplish the basic project objectives and/or is infeasible (see State CEQA Guidelines Section 15126.6(a), (c) & (f)).

Selection of the Environmentally Superior Alternative may be difficult, especially when the differences between the impacts of the alternatives involve trade-offs between types of impacts (e.g., between impacts on traffic and impacts on cultural resources, or between impacts on one species or habitat and impacts on other species or habitats). As with other aspects of CEQA, an explanation of the decision is often more important than the decision itself; as long as the explanation in an EIR is supported with substantial evidence in the administrative record, decisions by Lead Agencies are afforded deference by reviewing courts (CEQA Guidelines Sections 15151, 15384).

In many cases, the No Project alternative would have the fewest or least intense impacts. However, the State CEQA Guidelines Section 15126.6(e)(2) states that "If the environmentally superior alternative is the 'no project' alternative, the EIR shall also identify an environmentally superior alternative among the other alternatives".

Should the Lead Agency change its determine of the Environmentally Superior Alternative ***after*** circulation of the draft EIR but before the EIR's certification by the Lead Agency, and that newly identified Environmentally Superior Alternative is ***not*** adopted as the proposed project, revisions to the draft EIR and recirculation of same are likely required (CEQA Guidelines Section 15088.5(a)(3); *South County Citizens for Smart Growth v. County of Nevada* (2013)). Arguably, recirculation is warranted even if the project proponent accepts the newly identified Environmentally Superior Alternative, in order to afford effective public comment on the Lead Agency's determinations (PRC Section 21092.1; CEQA Guidelines Section 15088.5(a)(4); see also *Vineyard Area Citizens for Responsible Growth v. City of Rancho Cordova* (2007)).

If the Lead Agency's determination of the Environmentally Superior Alternative changes ***after*** certification of the EIR, but before approval of the project, the proposed project likely requires CEQA to be re-opened and a subsequent or supplemental EIR to be prepared (CEQA Guidelines Sections 15162(a)(3)(C), 15163(a)(1)). Any subsequent EIR shall again be subject to the same public notice and review provisions (CEQA Guidelines Sections 15162(d), 15072)). However, "[o]nce a project has been approved, the Lead Agency's role in the project approval is completed, unless further discretionary approval on that project is required" (CEQA Guidelines Section 15162(c)). Therefore, if the Lead Agency's determination of the Environmentally Superior Alternative changes ***after*** the approval of the project, no additional CEQA review is required unless the project is subject to additional discretionary approvals (CEQA Guidelines Section 15162(c)). In this case, the Lead Agency with jurisdiction over the next discretionary approval shall conduct any additional CEQA review required.

Analysis of Alternatives Under NEPA

While Lead Agencies under CEQA are not required to evaluate the environmental impacts of alternatives to the same level of detail as the proposed project (CEQA Guidelines Section 15126.6(d)), the National Environmental Policy Act ("NEPA") requires a "co-equal" analysis of the alternatives (see 40 Code of Federal Regulations ("C.F.R.") Section 1502.14(b)). Stated differently, under NEPA, the analysis of the impacts of alternatives must be at the same level of detail as the analysis of impacts of the proposed action (NEPA's term for the proposed project).

This usually means that each alternative must be defined at a comparable level of detail. Section 1502.14 of the Council on Environmental Quality (CEQ) Guidelines states that in the "Alternatives" section of an Environmental Impact Statement (EIS), agencies shall "[d]evote substantial treatment to each alternative considered in detail including the proposed action so that reviewers may evaluate their comparative merits."

Whereas an analysis of alternatives is not required in an Initial Study under CEQA, an alternatives analysis is required in initial Environmental Assessments (EAs) . However, alternatives analyses in EAs are typically less rigorous than those contained in EISs (Federal Highway Administration *Alternatives Analysis White Paper*).

CEQ and the California Governor's Office of Planning and Research (OPR) have jointly prepared the February 2014 guidance document NEPA and CEQA: Integrating Federal and State Environmental Reviews (CEQA/NEPA Handbook). The handbook provides practitioners with an overview of NEPA and CEQA as well as suggestions for developing a single environmental review process that can meet the requirements of both statutes.

Table 1 summarizes the requirements for the analysis of alternatives under each type of environmental document under both CEQA and NEPA.

Table 1 – Alternatives Required In Each Type of Environmental Document

Document Type	**Alternatives Required**
CEQA	
Categorical Exemption	None
Initial Study	None
Environmental Impact Report	Reasonable range of alternatives, including those achieve would attain most of the basic project objectives while avoiding

	or reducing the environmental effects of the project. No-build must be considered. Comparative analysis. Analysis at same level of detail as proposed project not required.
NEPA	
Categorical Exclusion	None
Environmental Assessment	One build alternative is allowable, but for a complex or controversial project, more than one alternative is advised. No-Action alternative must be considered.
Environmental Impact Statement	All reasonable alternatives including No-Action Alternative. Each alternative must be considered and discussed at an equal level of detail.

Alternatives in Joint CEQA/NEPA Documents

The typical rule when preparing a joint CEQA/NEPA document is that when there is a difference between the requirements of the two laws, the Lead Agencies should prepare the document using the more stringent requirements (see *CEQA/NEPA Handbook* at 2, 20, 48). Because NEPA requires a more detailed alternatives analysis, joint EIR/EIS documents should be developed in a manner which satisfies NEPA requirements (40 C.F.R. Section 1502.14(b)).

Areas of Controversy Regarding Alternatives

Legal standards concerning alternatives analysis is one of the more settled areas of CEQA law. The two key issues in most CEQA decisions considering the adequacy of an EIR's analysis of alternatives are whether the EIR included a "reasonable range" of alternatives, including for example an alternative project site, and whether the level of detail of the alternatives analysis is sufficient. There is not "bright-line" rule for either of these issues, and the results tend to be fact-driven. It is critically important to not short-change the alternatives analysis in the EIR, however, either in terms of the number of alternative considered or the depth of analysis. The ultimate determination whether an alternative is actually feasible should be made by the decision-making body as part of its findings rather than in the EIR itself, which should present the information regarding alternatives in a clear and impartial way.

Alternatives in the CEQA Statute

Alternatives are described in many, sections of CEQA (PRC Sections 21000 *et. seq.*), including, but not limited to the following:

- § 21001(g) - Requires governmental agencies to consider alternatives to proposed actions affecting the environment.

- § 21002 - Public agencies should not approve projects, as proposed, if there are feasible alternatives or mitigation measures available that would substantially lessen the significant environmental impacts. Further states that projects that have significant impacts on the environment may be approved if alternatives are found to be infeasible.

- § 21002.1(a) - The purpose of an EIR is to identify the significant effects on the environment of a project, to identify alternatives to the project, and to indicate the manner in which those significant effects can be mitigated or avoided

- § 21002.1(e) - EIRs shall focus on the project's potentially significant effects on the environment.

- § 21003.1(a) - Public comments on environmental documents should be made as soon as possible to assist the Lead Agency in identifying potential significant effects of a project, alternatives, and mitigation measures which would substantially reduce the effects.

- § 21061 - The purpose of an EIR is to provide public agencies and the public in general with detailed information about the effect which a proposed project is likely to have on the environment; to list ways in which the significant effects of such a project might be minimized; and to indicate alternatives to such a project.

- § 21080.1(b) - The Lead Agency shall, upon the request of a potential applicant, provide for consultation prior to the filing of the application regarding the range of actions, potential alternatives, mitigation measures, and any potential and significant effects on the environment of the project.

- § 21080.5(d)(2)(A) - Requires that an activity not be approved or adopted pursuant to a certified regulatory program if there are feasible alternatives or mitigation measures that would substantially lessen environmental effects.

- § 21080.5(d)(3) - Requires environmental documents prepared pursuant to a certified regulatory program to include a description of alternatives to the proposed activity.

- § 21081 – In making findings regarding an EIR where more or more significant environmental impacts were identified, the Lead Agency may

include information as to why alternatives to the project are infeasible.

- § 21081.5 - In making findings regarding an EIR, including where alternatives are determined to be feasible, the Lead Agency must base its conclusions on substantial evidence in the record.

- § 21083.8.1 - Pertains to EIRs for military base reuse plans, including subsections regarding the analysis of alternatives.

- § 21091(d)(1) – The Lead Agency shall respond to comments received on a CEQA document if those comments are received during the public review period.

- § 21094 - Pertains to tiered EIRs and initial studies, including the analysis of alternatives in these documents.

- § 21100(b)(4) - Requires that EIRs contain an analysis of alternatives to the proposed project.

- § 21104(a) - Requires State Lead Agencies to provide for early consultation while preparing an EIR to, among other things, identify alternatives to the proposed project.

- § 21153 - Requires local Lead Agencies to consult with responsible and trustee agencies prior to completing and EIR to, among other things, identify alternatives to the proposed project.

- § 21154 - When local agencies prepare an EIR for a project required pursuant to an order from a state agency, the alternatives to be analyzed in the EIR shall not include those that are in conflict with the order.

Alternatives in the CEQA Guidelines

Alternatives are described in many, sections of the CEQA Guidelines, including, but not limited to the following:

- § 15002(a)(3) - Provides that one of the basic purposes of CEQA is the prevention or avoidance of avoidable significant damage to the environment by requiring changes in projects through the use of feasible alternatives or mitigation measures.

- § 15002(f) - Defines the EIR as the document by which a governmental agency analyzes the effects of a proposed project and identifies alternatives to the proposed project.

- § 15002(h)(4) - Identifies the selection of an alternative as a means of protecting the environment.

- § 15004(b) - Prohibits the Lead Agency from taking actions that would, among other things, limit the choice of alternatives, prior to completing CEQA compliance.

- § 15021 - Prohibits a Lead Agency from approving a project when a feasible alternative or mitigation measures exist that would lessen significant environmental effects.

- § 15041(c) – For projects that include housing development, a Lead or Responsible Agency shall not mitigate for significant environmental effects by reducing the number of units, unless no feasible alternatives exists that would provide comparable reductions in effects.

- § 15060.5 – The Lead Agency shall consult with the project sponsor prior to the filing of a formal application to, among other things, identify potential alternatives.

- § 15065(c)(2) - When making findings regarding an EIR, where significant environmental effects remain after the adoption of mitigation measures, the Lead Agency must make detailed findings, based on substantial evidence, regarding the feasibility of alternatives that would avoid or substantially lessen the effects.

- § 15082(b)(1)(A) - In preparing responses to a Notice of Preparation for an EIR, Responsible and Trustee Agencies and OPR shall provide the Lead Agency with information, including reasonable alternatives that should be analyzed in the EIR.

- § 15083(a) - Suggests that scoping prior to preparation of an EIR can assist Lead Agencies in identifying alternatives.

- § 15088.5(a) - Defines the presence of new information that may require recirculation of an EIR prior to certification, to include the identification of a new feasible alternative.

- § 15091(a)(3) - In making findings regarding an EIR where one or more significant environmental impacts were identified, the Lead Agency may

include information as to why alternatives to the project are infeasible.

- § 15091(c) - Where it shares jurisdiction with another agency for an alternative, the Lead Agency shall provide the specific reasons for rejecting mitigation measures or alternatives in their findings.

- § 15096(d) - Comments of Responsible Agencies on EIRs should focus their comments on, among other things, alternatives that the EIRs should include.

- § 15096(g) - Responsible Agencies shall not approve a project if they find that a feasible alternative is available that would avoid or substantially lessen a significant environmental effect.

- § 15124(b) - Defines the relationship between alternatives and the project objectives.

- § 15126.6 - Defines the general requirements of CEQA with regard to the analysis of alternatives.

- §15126.6(f)(2) - Alternatives may not be rejected merely because they are beyond an agency's authority, would require new legislation, or would be too expensive.

- § 15145 - If the Lead Agency determines that an impact is too speculative, it should indicate this and need not analyze that impact further.

- § 15151 - In evaluating the adequacy of an EIR, the courts have looked not for perfection but for adequacy, completeness, and a good faith effort at full disclosure.

- § 15162(a)(3)(C) - Subsequent CEQA documentation may be required if, after an EIR has been certified or an ND adopted for a project, alternatives previously found to be infeasible, are subsequently found to be feasible.

- § 15163(a)(1) – The Lead Agency or Responsible Agency may choose to prepare a supplemental EIR if any of the conditions described in Section 15162 would require the preparation of a subsequent EIR.

- § 15207 – The Lead Agency need not respond to late comments (including suggested alternatives), but may do so.

- § 15364 - Defines the term "feasible" within CEQA.

- § 15384 - Defines the term "substantial evidence" within CEQA.

Important Cases

The following are important published cases involving issues related to alternatives:

***Los Angeles Conservancy v. City of West Hollywood* (2017) 18 Cal.App.5th 1031:** Court held that EIR's analysis of the conservation alternative was detailed enough to permit informed decision making and public participation. Court found that City was not required to prepare a "conceptual design" for the alternative. Finally, Court stated that "[a]n agency's finding of infeasibility . . . is 'entitled to great deference' and 'presumed correct'" in determining whether Lead Agency's findings that an alternative is infeasible is supported by substantial evidence.

***Cleveland National Forest Foundation v. San Diego Association of Governments* (2017) 17 Cal.App.5th 413:** EIR that included analysis of project alternatives focused primarily on congestion relief was inadequate because it failed to analyze an alternative that could significantly reduce total vehicle miles.

***Washoe Meadows Community v. Department of Parks & Recreation* (2017) 17 Cal.App.5th 277:** Court found that the presentation of five very different alternative projects in the EIR without a stable project description was an obstacle to informed public participation, noting that a broad range of possible projects presents the public with a moving target and requires a commenter to offer input on a wide range of alternatives.

***Pesticide Action Network America v. Department of Pesticide Regulation* (2017) 15 Cal.App.5th 478:** Court held that Department "glaringly" failed to address any feasible alternative to registering proposed new uses for two pesticides as required by PRC Section 21001(g).

***Banning Ranch Conservancy v. City of Newport Beach* (2017) 2 Cal.5th 918:** EIR did not describe a range of reasonable alternatives where it failed to include analysis of the Coastal Act's environmentally sensitive habitat area (ESHA) requirements, including consideration of which project areas might qualify as ESHA or potential impacts on ESHAs for a project in the coastal zone.

***Bay Area Citizens v. Association of Bay Area Governments* (2016) 248 Cal.App.4th 966:** Court held that the "No Project" alternative appropriately captured the continuation of existing regional policy. Court found that because the plaintiff's proposed alternative double-counted statewide emissions mandates, it was not feasible in light of the emission reduction requirements of SB 375.

***North Coast Rivers Alliance v. Kawamura* (2015) 243 Cal.App.4th 647:** EIR failed to analyze a control program as an alternative to eradication of light brown apple moth. "Last-minute" adoption of a control program instead of eradication did not cure errors in alternatives analysis, which did not include analysis of the control program based on stated project objective to eradicate light brown apple moth.

***Town of Atherton v. California High-Speed Rail Authority* (2014) 228 Cal.App.4th 314:** Authority properly rejected alternatives proposed during public review process because substantial evidence showed proposed alternatives were substantially similar to alternatives considered in program EIR.

***California Clean Energy Committee v. City of Woodland* (2014) 225 Cal.App.4th 173**: City's findings that an alternative was environmentally inferior to proposed project were not supported by analysis in EIR, which rejected the alternative based on economic feasibility.

***Habitat and Watershed Caretakers v. City of Santa Cruz* (2013) 213 Cal.App.4th 1277**: EIR failed to discuss any feasible alternative, such as a "limited-water alternative," which would "partially meet the project's objectives," and EIR lacked analysis supporting agencies' conclusion that the alternative would not lessen or substantially avoid the significant impacts from the project.

***South County Citizens for Smart Growth v. County of Nevada* (2013) 221 Cal.App.4th 316**: When EIR includes a reasonable range of alternatives, but Lead Agency's staff suggests an additional alternative after release of the final EIR and Lead Agency chooses not to recirculate the EIR with the staff alternative, the agency is not required to make an express finding that the staff alternative is infeasible before it can approve the revised project.

***Mount Shasta Bioregional Ecology Center v. County of Siskiyou* (2012) 210 Cal.App.4th 184:** Court upheld EIR's analysis of alternatives, where infeasible alternatives were dismissed during scoping phase, finding challengers of EIR failed to identify any potentially feasible alternative that could satisfy the project objectives, and finding the EIR considered a "reasonable range" of alternatives given the circumstances presented, despite the fact that the only alternative considered in depth in the Draft EIR was the "No Project" alternative.

***Watsonville Pilots Association v. City of Watsonville* (2010) 183 Cal.App.4th 1059**: EIR for update of City's General Plan should have considered a "reduced development alternative." City's argument that it was not required to consider a "reduced development alternative" because such an alternative did not meet each of the 12 project objectives is contrary to requirement in CEQA Guidelines Section 15126.6(b) that a feasible alternative be considered even if it "would impede to some degree the attainment of project objectives." Further, City's

argument that the "No Project" alternative was in essence a "reduced development alternative" was rejected since the "No Project" alternative achieved none of the basic project objectives, and the fundamental role of the alternatives analysis is to identify alternatives that achieve most of the project objectives while also reducing the project's significant environmental effects.

***Jones v. Regents of the University of California* (2010) 183 Cal.App.4th 818**: EIR for long-range plan for the Lawrence Berkeley National Laboratory included a reasonable range of alternatives, including a "partial off-site alternative," and did not need to consider a "full off-site alternative" where such alternative was properly rejected because it failed to achieve a fundamental project objective.

***California Native Plant Society v. City of Santa Cruz* (2009) 177 Cal.App.4th 947:** EIR's alternatives analysis satisfied CEQA's informational mandates and City's decisions concerning which alternatives to analyze were supported by evidence in the administrative record. The alternatives selected need not satisfy every key objective of the project, and ranking the relative importance of the various objectives of the project is a policy decision entrusted to the city council. When assessing feasibility in connection with the alternatives analysis in the EIR, the question is whether the alternative is potentially feasible. When deciding on project approval, the question is whether the alternatives are actually feasible. Further, CEQA does not require an EIR to explore offsite project alternatives every case. The requirement that an EIR describe alternatives to the proposed project applies only to the project as a whole, not to the various facets of the projects, such as grading and access road.

Finally, the court held that City's rejection of Environmentally Superior alternatives as infeasible based on policy considerations – here, the City's interest in promoting transportation alternatives as well as access to its open space for persons with disabilities - was permissible under PRC Section 21081(a)(3).

***In re: Bay-Delta Programmatic Environmental Impact Report Coordinated Proceedings* (2008) 43 Cal.4th 1143**: Finding Program EIS/R discussed a reasonable range of alternatives to expansion of water storage facilities by dam construction. Failure to include a reduced exports alternative was not an abuse of discretion because CALFED properly applied the rule of reason when it decided to consider in the PEIS/R only alternatives that had the potential to both achieve ecosystem restoration goals and meet current and projected water export demands, and that would provide balanced progress in all four of the program areas.

***Association of Irritated Residents v. County of Madera* (2003) 107 Cal.App.4th 1383**: Agency properly rejected reduced-herd size alternative as

infeasible where substantial evidence demonstrated alternative was economically infeasible and would not achieve the basic objective of the project.

***San Franciscans Upholding the Downtown Plan v. City and County of San Francisco* (2002) 102 Cal.App.4th 656**: Appellants contention that EIR needed to include analysis of economic feasibility of alternatives was found to be without merit because it is the public agency, not the EIR, that bears responsibility for making "findings" as to whether "[s]pecific economic, legal, social, technological, or other considerations . . . make infeasible the mitigation measures or alternatives identified in the [EIR]," or whether there are "specific overriding economic, legal, social, technological, or other benefits of the project" that "outweigh the significant effects on the environment."

***Friends of the Old Trees v. Department of Forestry & Fire Protection* (1997) 52 Cal.App.4th 1383**: Defining alternative for the purposes of CEQA as “a description of another activity of project that responds to the major environmental issues identified during the planning process.” Finding that Lead Agency’s review of timber harvest plan (THP) pursuant to certified regulatory program is required to include analysis of alternatives, and inclusion of mitigation could not substitute for discussing project alternatives.

***Laurel Heights Improvement Association v. Regents of the University of California* (1993) 6 Cal.4th 1112**: Upholding Final EIR conclusion that potential cumulative impacts from toxic air emissions were too “speculative” for evaluation. Final EIR’s response to comment expanding on discussion of the possible environmental consequences of an alternative did not trigger recirculation because substantial evidence supported Lead Agency’s decision that there was no new adverse environmental effect or new feasible alternative that was not implemented by the project proponent.

***Sequoyah Hills Homeowners Association. v. City of Oakland* (1993) 23 Cal.App.4th 704**: EIR that did not examine additional “decreased density alternatives” satisfied the information goal of CEQA because the analysis of the additional alternatives would not have eliminated the significant visual impacts from the project. Further, City did not violate CEQA in concluding that a decreased density alternative would be legally infeasible because it would be prohibited by Government Code Section 65589.5(j), which prohibits a local agency from requiring as a condition of approval that the project be developed at a lower density unless the project would have a specific, adverse impact upon the public health or safety that cannot be mitigated without lowering the density.

***Save Our Residential Environment v. City of West Hollywood* (1992) 9 Cal.App.4th 1745**: Finding the extent to which alternatives must be considered in an EIR is governed by a rule of reason, the ultimate objective being whether a discussion of alternatives fosters informed decision-making and informed public

participation. Because EIR stated that no other site was available for proposed senior citizen housing development, and gave reasons for this conclusion, Court held EIR was adequate. The purpose of CEQA was not to generate paperwork, and EIR is not required to discuss infeasible alternatives.

***Citizens of Goleta Valley v. Board of Supervisors* (1990) 52 Cal.3d 553**: Finding EIR discussed a legally acceptable range of alternatives, that only reasonable alternatives need be examined in EIR, and that the administrative record substantially supported the conclusion that none of the additional sites represented a feasible project alternative or merited extended discussion in EIR. Although the alternatives were not barred from consideration simply because they were submitted by the citizens' group after the expiration of the comment period for EIR, the court held that the timing issue did justify the board's decision to address the alternative sites by means of administrative findings, rather than by commissioning yet another supplemental EIR.

The court held that the board properly relied on a local coastal program for analysis and conclusions in determining the feasibility of additional sites, finding no abuse of discretion in Lead Agency's finding of certain alternatives to be infeasible, based upon inconsistent land-use designations. Lead Agency could properly consider the fact that an alternative site was outside of that Lead Agency's jurisdiction and whether or not a site was owned by the project proponent, in making an assessment of feasibility.

***Citizens of Goleta Valley v. Board of Supervisors* (1988) 197 Cal.App.3d 1167**: Court held that the record failed to provide substantial evidence to support a finding that a scaled-down project alternative was economically infeasible. The fact that an alternative may be more expensive or less profitable is not sufficient to show that the alternative is financially infeasible. What is required is evidence that the additional costs or lost profitability are sufficiently severe as to render it impractical to proceed with the project.

***Laurel Heights Improvement Association v. Regents of the University of California* (1988) 47 Cal.3d 376**: Under CEQA an EIR must include a meaningful discussion of both project alternatives and mitigation measures. The range of alternatives needing to be analyzed is subject to a rule of reason. Equal level of detail not required in the analysis of alternatives, but is not prohibited. No purpose can be served by requiring EIR to engage in sheer speculation as to future environmental consequences.

Finding discussion of alternatives inadequate, where it identified three types of alternatives (no project anywhere, alternative sites at the university's existing campus, and alternative sites off-campus) but provided only one and one-half pages of textual analysis. The discussion of project alternatives must contain analysis sufficient to allow informed decision-making; conclusory comments in

support of environmental conclusions are generally insufficient. Lead Agency's responsibility to discuss alternatives was not dependent upon a showing by opponents of the relocation that feasible alternatives existed.

***City of Del Mar v. City of San Diego* (1982) 133 Cal.App.3d 401**: Court held that City properly rejected project alternatives as infeasible, explaining that the Lead Agency may reasonably rely on various "economic, environmental, social, and technological" factors in evaluating the feasibility of project alternatives. "Feasibility" under CEQA encompasses "desirability" to the extent that desirability is based on a reasonable balancing of such factors.

***Foundation for San Francisco's Architectural Heritage v. City and County of San Francisco* (1980) 106 Cal.App.3d 893**: Court held that Lead Agency made adequate findings that project alternatives were infeasible given their increased construction costs under PRC Section 21081.

***Residents Ad Hoc Stadium Committee v. Board of Trustees* (1979) 89 Cal.App.3d 274**: Discussion of alternatives need not be exhaustive, and is subject to a construction of reasonableness. It requires the production of information sufficient to permit a reasonable choice of alternatives so far as environmental effects are concerned. Alternatives discussion should support Lead Agency's "hard look" at environmental consequences in recognition of the factors described in CEQA.

There is no need for an extended discussion of speculative alternatives. Lead Agency need not devote itself to an extended discussion of the environmental impact of alternatives remote from reality such as those which are of speculative feasibility or could only be implemented after significant changes in governmental policy or legislation.

***County of Inyo v. City of Los Angeles* (1977) 71 Cal.App.3d 185**: EIR that lacks a genuine "No Project" alternative or alternatives tied to a reasonably conceived project fails to comply with CEQA's demand for meaningful alternatives.

Re: Vichy Springs Resort's Comments on Initial Study and Proposed Negative Declaration for Final Closure Plan for the Ukiah Landfill

Dear Mr. Eriksen and Mr. Theile:

This law firm represents Vichy Springs Resort, which is a property and business located at 2605 Vichy Springs Road immediately adjacent to the proposed location of the City of Ukiah's ("City") Final Closure/Post-Closure Maintenance Plan for the Ukiah Landfill ('Final Landfill Closure Plan"). The purpose of this letter is to provide comments on the Initial Study and proposed Negative Declaration prepared by the City in connection with the requirements of the California Environmental Quality Act ("CEQA").

This letter follows up on the previous January 2015 letter submitted by this law firm on behalf of Vichy Springs Resort to the City in conjunction with the landfill closure plan that was then under development. A copy of this January 2015 letter with its original attachments is attached as **Exhibit A**. In this January 2015 letter to the City, Vichy Springs Resort noted the aspects of the landfill closure plan with the potential to have significant adverse environmental impacts, and suggested ways to formulate the Final Landfill Closure Plan to reduce these impacts to less than significant levels. Vichy Springs Resort raised these considerations early in the planning process

with the aim that appropriate environmental mitigation would be incorporated into the Final Landfill Closure Plan such that preparation of an environmental impact report ("EIR") would not be required.

As set forth below, most of the environmental concerns and recommendation presented in Vichy Springs Resort's earlier January 2015 letter were unfortunately disregarded by the City in its preparation of the Final Landfill Closure Plan and associated CEQA Initial Study. Due to the failure to address these environmental concerns in these documents, there is not presently a proper basis for adoption of a Negative Declaration to satisfy CEQA's requirements in connection with the approval and implementation of the Final Landfill Closure Plan.

Moreover, as explained below, the City may not be the appropriate CEQA lead agency for this project given that the discretionary approval of the project rests with the Mendocino County Environmental Health Department which (along with the North Coast Regional Water Quality Control Board) has ordered the City to prepare and implement a Final Landfill Closure Plan. The City is therefore not making a discretionary decision to prepare and implement a landfill closure plan; it is complying with a legal obligation to do so.

The underlying objective of Vichy Springs Resort is neither to halt or delay the implementation of closure of the Ukiah landfill nor to require that an EIR be prepared in conjunction with the approval of the landfill closure plan. Rather, Vichy Springs Resort's underlying objective is to ensure that closure of the Ukiah landfill proceeds in a manner that does not result in significant adverse environmental impacts. If the Final Landfill Closure Plan had addressed the environmental concerns raised by Vichy Springs Resort back in January 2015 then the preparation of an EIR would not now be required. It follows then that, going forward, the necessity of preparing an EIR in in this instance can still be avoided if additional changes are made to the Final Landfill Closure Plan to reduce the environmental impacts discussed herein to a less than significant level.

I. The City May Not Be the Proper CEQA Lead Agency for the Final Landfill Closure Plan

CEQA's environmental impact assessment obligations apply only to "discretionary" projects. CEQA Guideline 15357, Section 21065(c) of California Public Resource Code. An agency that has a mandatory non-discretionary legal duty to undertake or carry out a particular project is, by definition, not exercising discretion.

For any given discretionary project, the agency responsible for preparing the documentation (whether it be an EIR or a Negative Declaration) to comply with CEQA is referred to as the "lead agency." CEQA Guideline 15367 defines a "lead agency" as the "public agency which has the principal responsibility for carrying out or approving a project."

Read together, the above CEQA provisions suggest that when one public agency is exercising its discretion to propose a new project that it would carry out, and another public agency has

responsibility for discretionary approval of a voluntary project proposed by another public agency, then the CEQA lead agency could either be the public agency carrying out the project or the public agency that approves the project. This, however, is not the situation involved with the closure plan for the Ukiah Landfill.

In the case of the Ukiah landfill, the Mendocino County Environmental Health Department and the North Coast Regional Water Quality Control Board have both *ordered* the City to prepare and implement a Final Landfill Closure Plan to avoid further violation of the California Health and Safety Code. As such, although the Mendocino County Environmental Health Department will exercise its discretion in its review and approval of the Final Landfill Closure Plan, the City is not exercising discretion in its decision to proceed with the preparation and implementation of a Final Landfill Closure Plan. The City has non-discretionary legal obligation to do so.

Due to the fact its decision to prepare and implement the Final Landfill Closure Plan is non-discretionary, the City should not serve as the CEQA lead agency for this project. Rather, for this project the CEQA lead agency should be the public agency that is exercising discretion in its review and approval of the Final Landfill Closure Plan – the Mendocino County Environmental Health Department.

II. Adoption of a Negative Declaration Is Improper Because There Is Not Substantial Evidence to Support the Initial Study's Finding Regarding the Absence of Potential Significant Adverse Environmental Effects

In determining whether CEQA requires preparation of an EIR instead of allowing adoption of a Negative Declaration, the critical inquiry is whether the proposed project has been designed and formulated to reduce the potential for adverse environmental impacts to below a level of significance. If there remains a fair argument that the proposed project may have potential significant environmental effects, CEQA requires preparation of an EIR instead of a Negative Declaration. Section 21080(a), 21080(d) and 21100(a) of the California Public Resources Code; *Friends of B Street v. City of Hayward*, 106 Cal.3d 988 (1980). Moreover, CEQA requires that all significant determinations and findings in Initial Studies (which are used to decide whether an EIR or Negative Declaration will be adopted) must themselves be supported by substantial evidence.

A. The Initial Study's Description of the Environmental Setting of the Project Is Inaccurate Due to Its Failure to Describe Vichy Springs Resort's Use on Lands Immediately Adjacent to the Project Site

CEQA Guideline 15125 is titled "Environmental Setting" and provides that CEQA environmental documents such as Initial Studies and EIRs "must include a description of the environment in the vicinity of the project as it exists before the commencement of the project." The official discussion accompanying CEQA Guideline 15125 explains: "Because the concept of significant effects on the environment focuses on changes in the environment, this section requires [CEQA documents] to describe the environmental setting of the project so that the changes can be seen in context." California court decisions have held that the failure to provide

an adequate and accurate description of the environmental setting taints the remainder of the CEQA significance and mitigation analysis due to the absence of proper baseline conditions upon which the environmental impacts of the project and the sufficiency of the proposed mitigation measures can be evaluated. *San Joaquin Raptor/Wildlife Rescue Center v. County of Stanislaus*, 27 Cal.App.4th 713 (1994). As noted below, the description of the environmental setting provided in the Initial Study for the Final Landfill Closure Project is inadequate and inaccurate.

Pages 3-4 of the Initial Study section titled "Environmental Setting" states: "Land adjacent to the landfill property is zoned primarily as rangeland and is used for grazing. Dwellings within 1,000 feet of the landfill property include a group of structures owned by the Vichy Spring Investment Group that are located within 500 feet of the landfill's south property line…" Similarly, the section of the Initial Study on "aesthetics" (which addresses scenic effects) states that "the landfill property is surrounded by rural agricultural and undeveloped lands." The Vichy Springs Resort parcel is rangeland but has a "resort overlay" zoning, and has been in continuous operation since 1854.

This description of the environmental setting of the landfill site fails to take account of the Vichy Springs Resort located immediately adjacent to the project site, which is a historic resort with extensive grounds where day and overnight visitors come to enjoy the healthful spring-fed baths, clear air, beautiful scenery and bucolic quiet of the location. The statement in the Initial Study that there are a "group of structures owned by the Vichy Springs Investment Group" within 500 feet of the property line" provides no information whatsoever as to the particular uses of this property, or how these particular uses might be impacted by adverse noise, dust, hydrologic and scenic impacts associated with the proposed Final Landfill Closure Plan. Furthermore, when the uses associated with the adjacent Vichy Springs Resort are taken into account, the Initial Study's statement that the landfill project site is "surrounded by rural agricultural and undeveloped lands" is plainly inaccurate, and misleadingly suggests the landfill closure activities will take place in a remote, undeveloped, uninhabited area rather than right next door to an active, well-established resort whose 50,000 visitors per year come for the clean air, quiet, natural hot mineral spring water and beautiful views.

It should also be noted that the Initial Study inaccurately states that the Vichy Springs Resort property is owned by the Vichy Springs Investment Group. In 1990, the Vichy Springs Investment Group was dissolved and title to the Vichy Springs Resort property was conveyed to Gilbert and Marjorie Ashoff (who remain the owners).

As explained further below, the failure of the Initial Study to take account of the adjacent uses by Vichy Springs Resort in its description of the environmental setting for the Final Landfill Closure Plan tainted the remainder of the Initial Study's analysis of potential noise, dust, hydrologic and scenic impacts.

In addition to the omission of any discussion of the adjoining Vichy Springs Resort, there are also certain other inaccuracies in the environmental setting sections of the Initial Study for the

Final Landfill Closure Plan that should be noted. The Initial Study refers to the "Gun Club Parcel" and alleges that this parcel was purchased by the City to create a buffer zone between the Ukiah Landfill and future development. The Initial Study did not disclose that the use of the Gun Club Parcel as a shooting range by a private club (that leases the property from the City) is now a non-conforming use under the County Code, and that expansion of the private club's facilities (including but not limited to unpermitted construction and/or renovation of new/old buildings and new shooting ranges) in recent years may be inconsistent with this non-conforming use status. The Initial Study also refers to the use of certain portions of the Ukiah landfill property as a shooting range for City of Ukiah police department personnel. The Initial Study did not disclose that utilization of the landfill property for this purpose is also a non-conforming use, and that the use permit for these shooting range activities expired years ago when the City police department discontinued its shooting activities on the site. As a result of the expiration of the use permit, the recent resumption of shooting range activities on the landfill property may also be unlawful.

B. There Is Not Substantial Evidence to Support the Initial Study's Finding Regarding the Potential Impact of Construction-Related Fugitive Dust on the Neighboring Vichy Springs Resort

The air quality section of the Initial Study acknowledges that the Mendocino County Air Quality Management District ("MCAQMD") is "currently defined as 'non-attainment' for the PM10 (particulate matter) standard" and that a primary source of particulate matter is "fugitive dust." The air quality section of the Initial Study also concedes: "It is noted that surface disturbances from the proposed project may create dust that would require mitigation and control." The air quality section further states (somewhat confusingly): "Thresholds [of significance for CEQA purposes] for fugitive dust are set at 54 and 82 pounds per day for indirect emissions. No emission thresholds are established for construction related fugitive dust emission which are set at levels that are controllable with the implementation of best management practices." This section is hard to follow, but it suggests the following: the area where the project is located is already out of attainment for particular matter, that a primary source of particular matter is fugitive dust, that the construction phase of the project may create dust, that the CEQA threshold of significance for fugitive dust is 54 and 82 pounds per day for indirect emissions, and that there may not be ways to bring project dust levels down below these thresholds of significance though best management practices.

The Initial Study includes the following mitigation measures to address fugitive dust: MM 4.3-5 ("All land clearing, grading or earth moving activities shall be suspended as necessary, based on site conditions, to prevent excessive windblown dust when winds are expected to exceed 20 mph"); and MM 4.3-6 ("All inactive portions of the construction site shall be covered, seeded, or watered until a suitable cover is established"). Winds in this area generally do not approach 20 miles per hour except during winter storms, when construction activities would likely be suspended.

From a CEQA compliance standpoint, there are several shortcomings to the Initial Study's analysis and mitigation of fugitive dust impacts, and its conclusory finding that the project will not have the potential for significant air quality impacts.

First, CEQA requires that an Initial Study analyze the potential for significant "cumulative" environmental impacts as well the potential for significant "project-specific" impacts. Section 21083(b) of the California Public Resources Code, CEQA Guideline 15065(c). CEQA Guideline 15065(c) provides that impacts are cumulatively significant when the following conditions exist: "The project has possible effects which are individually limited but cumulatively considerable. As used in the subsection, 'cumulatively considerable' means that the incremental effects of an individual project are considerable when viewed in connection with the effects of past projects, the effects of current projects and the effects of probable future projects." The Initial Study confirms that the area where the landfill closure project is located is already "non-attainment" for particulate matter, indicating already degraded local air quality conditions. Yet, the Initial Study does not contain any cumulative impact analysis to evaluate whether the incremental fugitive dust generated by landfill closure activities are considerable when considered in the context of past, present and probable future activities that have, are and/or will contribute additional particulate matter to air in the vicinity of the project.

Second, the Initial Study states the applicable CEQA threshold of significance for fugitive dust is "54 and 82 pounds per day." Is the applicable CEQA fugitive dust threshold for the Ukiah landfill closure project 54 pounds per day? 82 pounds per day? Somewhere in between 54 and 82 pounds per day? The Initial Study provides no clarification, so readers are not told what threshold is being looked to for purposes of making a CEQA significance determination.

Third, although the Initial Study reveals that 3,500 cubic yards of soil will be imported during the construction phase of the landfill closure project, the Initial Study does not provide a quantified estimate of the amount (in terms of pounds) of fugitive dust that will be generated daily during the six-month construction phase of the project. Without this quantified estimate, it cannot be determined whether the project's fugitive dust violates the "54 and 82 pounds" daily threshold for fugitive dust.

Fourth, MM 4.3-5 and MM 4.3-6 mitigation measures are worded in a way that suggests they may be of limited effect. For example, there are no criteria in these mitigation measures for determining what is meant by "as necessary, based on site conditions." As another example, the obligation to cover or water areas only applies to "inactive portions" but there are no criteria for determining which if any portion of the landfill area will be considered "inactive" during the construction phase of work. Presumably, during the construction phase of the project, the entire landfill might be deemed "active," rendering this mitigation measure entirely inapplicable to the project. Furthermore, to the extent that these mitigation measures are intended to reduce otherwise significant fugitive dust impacts to less than significant impacts, there is no analysis or data to support the finding that these mitigation measures will achieve this result (and in fact other parts of this section suggest that such best management practices will not bring dust levels below significance levels). CEQA mitigation measures that are vague or undefined have been

held inadequate. *San Franciscans for Reasonable Growth v. City & County of San Francisco*, 151 Cal.App.3d 61 (1984); *Kings County Farm Bureau v. City of Hanford*, 221 Cal.App.3d 692 (1990). As noted in §14.7 the CEB treatise Practice Under the California Environmental Quality Act, "[A]gencies should be cautious about relying on vague, incomplete or untested mitigation measures" because a court may find the CEQA document "inadequate if suggested mitigation measures are so undefined that it is impossible to evaluate their effectiveness."

Fifth, CEQA Guideline 15126 states: "The discussion of mitigation measures shall distinguish between measures which are proposed by the project proponents to be included in the project and other measures that are not included but could be reasonably expected to reduce adverse impacts if required as conditions of approving the project." The Initial Study does not indicate or discuss whether MM 4.3-5 and MM 4.3-6 are included in the actual Final Landfill Closure Plan.

Finally, given the proximity of the landfill project site to the Vichy Springs Resort, there is no analysis in the Initial Study of the levels of fugitive dust that would affect employees and visitors at the resort, in particular visitors using the outdoor baths and extensive landscaped grounds. As explained above, the absence of this analysis is due in part to the underlying failure of the Initial Study to identify the Vichy Springs Resort in its description of the environmental setting for the project.

C. There Is Not Substantial Evidence to Support the Initial Study's Finding Regarding the Potential Impact of Construction-Related Noise on the Neighboring Vichy Springs Resort

The Initial Study chapter on noise begins with a table, which asks whether the project would result in a "substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project,"

The Initial Study chapter on noise states (in terms of threshold criteria) that the proposed project would result in significant adverse noise impacts if: there is an increase of three decibels (dB) which creates an area of noise/land use incompatibility; the proposed project generates noise that would contribute to noise levels that exceed the State noise/land use compatibility guidelines which allow for exterior noise levels up to 70 dB; the proposed project generates noise that exceeds the thresholds prescribed in Appendix C of the Mendocino County Municipal Code (Title 20). The Initial Study chapter on noise further states that, pursuant to Appendix C of the County Municipal Code, the stationary noise standards for light and heavy industrial use are 70 and 75 dB and "these levels are not to be exceeded for more than 30 minutes in any hours throughout an entire day."

The Initial Study chapter on noise states: "Noise generation from the proposed project would result from construction activities including on-road trucking and from temporary operations such as grading and excavation and work related to placement and construction of the final cover."

In its analysis of whether the project would result in a "substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project" the Initial Study chapter on noise states: "The proposed project will include the use of various types and sizes of construction equipment…stationary equipment such as pile drivers, jackhammers, pavement breakers, blasting operations, etc. produce variable and sporadic noise levels and often produce impact-type noises…For impact equipment, the noise is produced by the impact of a mass on a surface, typically repeating over time…Mobile equipment such as bulldozers, excavators, scrapers, graders, etc. may operate in a cyclic fashion in which a period of full power is followed by a period of reduced power."

The Initial Study chapter on noise states (again somewhat confusingly): "The noise levels for the types of equipment expected to be used for the proposed project ranges from 60-90 decibels. These noise levels exceed the levels as set forth in the Mendocino General Plan; however due to the proximity of the project site in a rural area, with greater than 500 feet of separation to residential properties, construction noise levels that exceed 70 dB could result in potential impacts to residences and wildlife. However, maintaining separation from residences and noise-sensitive biotic habitat, plus implementation of the standard measures identified at the end of this section, will maintain construction equipment noise impacts at less than significant levels."

The Initial Study includes the following mitigation measures to address construction-related noise impacts: MM 4.12-1 ("Construction activities shall comply with Mendocino County conditions with respect to hours of lesser noise sensitivity") and MM 4.12-2 ("Noise generating activities at the construction site or in areas adjacent to the construction site associated with the project in any way should be restricted to the hours of 7:00 am to 6:00 pm, Monday through Friday. No construction activities should occur on weekends or holidays").

From a CEQA compliance standpoint, there are several shortcomings to the Initial Study's analysis and mitigation of construction-related noise impacts, and its conclusory finding that the project will not have the potential for significant construction-related noise impacts.

First, the Initial Study concedes that the equipment used during the construction phase of the landfill closure project will exceed the applicable 70 dB limit in the Mendocino County Municipal Code. However, beyond this concession, the Initial Study does not include quantitative analysis of which particular equipment used during the project will exceed the 70 dB limit, which should serve as threshold for determining whether the noise generated constitutes a significant adverse environmental impact. Without information as to which equipment exceeds this threshold there is not substantial evidence upon which to find that such exceedances have been mitigated/reduced to less than significant levels.

Second, the Initial Study notes provisions of the Mendocino County Municipal Code that prohibit industrial noise levels about 75 dB for more than 30 minutes a day. The Initial Study, however, does not then provide any quantitative information as to how many minutes/hours a day there will be exceedances of this 75 dB level, which should serve as a threshold for determining whether the noise generated constitutes a significant adverse environmental impact.

Without information as to how many minutes/hours a day there will be exceedances of this 75 dB level, there is not substantial evidence upon which to find that the periods of such exceedances have been mitigated/reduced to less than significant levels.

Third, give the proximity of the landfill project site to the Vichy Springs Resort, there is no analysis in the Initial Study of the construction-related noise impacts that would affect employees and visitors at the resort. More specifically, there are overnight guests at Vichy Springs Resort who come to vacation and frequently sleep in as late at 9:00/9:30 am (yet the Initial Study indicates construction activities will begin on weekdays at 7:00 am). Beyond interfering with the morning sleep of visitors to Vichy Springs Resort, there is also no analysis of how daytime construction noise will adversely affect the experience of resort visitors using the outdoor baths or enjoying the resort's extensive landscaped grounds. As explained above, the absence of this analysis of noise impacts is due in part to the underlying failure of the Initial Study to identify the Vichy Springs Resort in its description of the environmental setting for the project. In particular, in its section on noise impacts, the Initial Study refers to "the proximity of the project site in a rural area with greater than 500 feet of separation to residential properties" – a description that inexplicably ignores the presence of the Vichy Springs Resort and the resort's overnight visitors and day visitors that come for the quiet. These considerations are why, in its previous January 2015 letter to the City (see **Exhibit A**), Vichy Springs Resort had recommended a 9:00 am weekday start time for construction and a prohibition on construction activities in the May through September peak season for Vichy Springs Resort.

Fourth, the Initial Study concedes that the proposed project would use "pile drivers, jackhammers, pavement breakers, blasting operations, etc. produce variable and sporadic noise levels and often produce impact-type noises…For impact equipment, the noise is produced by the impact of a mass on a surface, typically repeating over time…Mobile equipment such as bulldozers, excavators, scrapers, graders, etc. may operate in a cyclic fashion in which a period of full power is followed by a period of reduced power." There is no analysis of these sporadic, repetitive, cyclic noises on neighboring properties in general, and on the visitors to the Vichy Springs Resort in particular.

Fifth, in addition to the operational noises related to construction equipment identified in the Initial Study, there is also noise associated with the reverse beepers on trucks and vehicles that will operate onsite. These are the loud beepers that go off whenever a construction truck or vehicle moves in reverse. In its January 2015 letter, Vichy Springs Resort had recommended that these reverse beepers be turned off/disabled to reduce noise impacts for resort visitors.

Sixth, as noted above, CEQA Guideline 15126 states: "The discussion of mitigation measures shall distinguish between measures which are proposed by the project proponents to be included in the project and other measures that are not included but could be reasonably expected to reduce adverse impacts if required as conditions of approving the project." The Initial Study does not indicate or discuss whether MM 4.12-1 and MM 4.12-2 are included in the actual Final Landfill Closure Plan.

Finally, to the extent that mitigation measures MM 4.12-1 and MM 4.12-2 are intended to reduce otherwise significant construction-related noise impacts to less than significant levels, there is no analysis, data or other substantial evidence to support the finding that these mitigation measures will achieve this result.

D. Due to the Lack of Any Analysis of the Impact of Project Groundwater Wells on the Pressure and Temperature of Hydrologically Connected Springs Essential to the Vichy Springs Resort, There Is Not Substantial Evidence to Support the Initial Study's Finding Regarding the Potential for Significant Adverse Hydrological Impacts

In the previous January 2015 letter submitted to the City on CEQA issues related to the closure plans for the Ukiah Landfill (see **Exhibit A**), we explained that in March 1993, as part of efforts to monitor the effect of the landfill on groundwater located beneath the site, the City installed and began operation of a series of groundwater wells located close the property line with Vichy Springs Resort. The wells installed and operated by the City in the 1993 resulted in a sudden and severe decrease in the pressure and temperature of the springs utilized by the Vichy Springs Resort. This decrease in the pressure and temperature of the spring water that serves Vichy Springs Resort had a devastating impact on the resort's business. According to Gilbert Ashoff, owner of the Vichy Springs Resort: "Under the direction of Damon Brown, testing wells were drilled that immediately impacted the springs. Right after the landfill wells went in, there was a 20 degree Fahrenheit drop in mineral water temperature and we lost more than half of the mineral water flow due to reduced pressure. It took more than a year for these temperature and flow conditions to recover, and during that year the resort lost one-third of its business because visitors come here for warm mineral waters, not cold mineral waters. The resort's long-term reputation was also damaged for many years as a result of this situation."

As explained in the attached letter by Alisto Engineering's Al Sevilla, included as **Exhibit B**, the presence and operation of these wells as part of the Final Landfill Closure Plan without adequate study of subsurface conditions continues to pose a serious and substantial potential ongoing threat to the pressure and temperature of the spring waters upon which the Vichy Springs Resort relies. This threat relates to what is called an "adiabatic reaction" that occurs when a pressurized underground fault (such as the one where the Vichy Springs mineral waters are located) is connected to a non-pressurized underground fault (such as the one created by the landfill wells installed by the City). In his letter attached as **Exhibit B**, Mr. Sevilla recommends that before proceeding with the landfill closure plan there should be a thorough investigation of the potential for the operation of the project wells to cause an adiabatic reaction in the pressurized mineral waters that serve Vichy Springs Resort.

In its previous January 2015 letter, Vichy Springs Resort called upon the City (and other agencies reviewing and approving the Ukiah landfill closure plan) to undertake a thorough analysis of the hydrologic connections between the groundwater under the landfill and the adjacent spring waters, and to determine the extent to which the continued operation of groundwater wells may impact the pressure and temperature of the spring waters on the Vichy

Springs Resort's property. The January 2015 letter also asked the landfill closure plan to include appropriate mitigation measures to address the potential impact identified in this analysis.

As detailed below, the spring water-related concerns and requests presented by Vichy Springs Resort in its January 2015 letter were disregarded altogether in the Final Landfill Closure Plan and Initial Study prepared by the City.

There is a section in the Initial Study (on pages 50-59) on "Hydrology and Water Quality." At the beginning of this section, there is table which lists 16 different potential hydrological impacts resulting from the landfill closure project (along with the City's determination of whether these potential effects of these 16 listed impacts were found to be less than significant). Importantly, the Initial Study's list of 16 potential hydrological impacts did not include any relating to potential project impacts on adjacent spring waters, impacts on the water pressure in such spring waters, or the impacts on the water temperature in such spring waters. As a result of these omissions, the "Hydrology and Water Quality" section of the Initial Study contains no analysis of these potential spring water impacts, no determinations of whether there is the potential for significant adverse impacts on spring water, and no mitigation measures to address potential impacts on spring waters.

As reflected in the attached letter by Al Sevilla of Alisto Engineering (see **Exhibit B**), and in the information presented in Vichy Springs Resort's January 2015 letter (see **Exhibit A**), the administrative record before the City presents a fair argument supported by expert opinion of the potential of the project's groundwater wells to have significant adverse impacts on the spring waters upon which Vichy Springs Resort relies. Under these circumstances, reliance on an Initial Study (and the related adoption of a Negative Declaration) for the Final Landfill Closure Plan that failed to identify, assess and properly mitigate these spring-related hydrologic impacts would violate CEQA.

E. There Is Not Substantial Evidence to Support the Initial Study's Findings Regarding the Potential for Significant Adverse Scenic Impacts of the Proposed Cover for the Landfill

In its previous January 2015 letter to the City on CEQA issues, Vichy Springs Resort included an attachment with a map showing those areas of the City's landfill property that are visible from the grounds of the Vichy Springs Resort (see **Exhibit A**). This attachment/map was provided to demonstrate that the property on which the landfill is located is visible from the Vichy Springs Resort. In its January 2015 letter, to address concerns about adverse scenic impacts, Vichy Springs Resort called for the articulation of objective revegetation benchmarks as part of a revegetation plan and setting aside adequate long-term funding to ensure post-construction revegetation occurs.

To provide a clearer sense of the current baseline scenic conditions of the landfill area, Vichy Springs Resort has attached an early April 2016 color photograph of the landfill area (see **Exhibit C**) which shows the natural grasses and green landscape that have developed on top of the landfill since its stopped operating 15 years ago. Parts of the landfill area depicted the

photograph attached as **Exhibit C** are visible from homes on Fawnwood Drive in Deerwood Park and Ridgeview Drive in El Dorado Estates.

The aesthetics section of the Initial Study states: "The project site property consists of a 283.5 acre rural parcel of land of which approximately 40 acres of the property is occupied by the landfill unit. The Ukiah Landfill began refuse disposal operations in 1955 and ceased operations in 2001. As discussed herein **the landfill property is surrounded by rural agriculture and undeveloped lands**…The project site property has been significantly altered by past landfilling activities and is not considered to be a scenic or aesthetic resources in its altered conditions. The proposed project includes the closure of the landfill that consists of the placement of final cover material…The landfill surface will consist of a **geosynthetic final cover layer**…Project implementation will not result in any potentially significant visual impacts. Therefore, no mitigation measures are required" (bold emphasis added).

From a CEQA compliance standpoint, there are several shortcomings to the Initial Study's analysis of scenic impacts, and its finding that the project will not have the potential for significant adverse scenic impacts.

First, in terms of scenic resources and impacts, the Initial Study's study description of the environmental setting (baseline conditions) for the project is inaccurate. The Initial Study's claim that "the landfill property is surrounded by rural agriculture and undeveloped lands" ignores the presence of the Vichy Springs Resort located adjacent to the landfill site as well as the views of the landfill site from several nearby residences and roads. The Initial Study makes no mention that visitors at the Vichy Springs Resort, the people who live in these nearby residences, and the neighborhood people who travel on the nearby public roads (in particular the public road that goes right through the landfill property) all have views of the area where the landfill closure project will take place.

Second, again in regards to the environmental setting (baseline conditions) against which scenic impacts are evaluated, the Initial Study has not provided adequate or accurate information about existing views. The Initial Study states that the "project site has been significantly altered by past landfilling activities" but does not actually provide any information about the current scenic conditions of the landfill property. More specifically, the Initial Study does not acknowledge that, since the landfill ceased operations in 2001, the area on top of the landfill has been naturally revegetated with grasses that have allowed the landfill site to increasingly blend in with its natural surroundings. The natural grass vegetation that has developed in the project area over the past 15 years is depicted in the photograph attached as **Exhibit C** to this letter. As part of the Final Landfill Closure Plan, the natural grasses that have returned to the landfill area since 2001 will be torn out and replaced with a "geosynthetic" cover – more commonly known as "astroturf." The result will be a 40-acre patch of geosynthetic astroturf in the middle of a natural grass landscape. The Initial Study section on aesthetics provides no information about the visual aspects of the proposed astroturf landfill cover to enable a determination to be made as to whether the astroturf cover results in a potentially significant adverse scenic impact vis-à-vis the existing natural grass conditions on the project site. For example, the natural grass of the

surrounding hillsides will be brown in the summer/early fall while the 40-acre synthetic astroturf landfill cover patch in this hillside landscape will be bright green during the summer/early fall.

Third, the Initial Study section on aesthetics confirms that the Policy RM-128 of the Resources Management Element of the County's General Plan provides for protection of the County's "natural landscapes." As noted above, the proposed Final Landfill Closure Plan calls for the removal of natural grasses on the landfill site that would be replaced with a geosynthetic astroturf cover. These changes are inconsistent with the protection of natural landscapes required under the County's General Plan.

For the reasons noted above, from the information in the administrative record, there is a fair argument that the proposed cover in the Final Landfill Closure Plan has the potential for significant adverse scenic impacts. Such potential adverse scenic impacts could be mitigated through the preparation and implementation of the revegetation plans focused on the restoration of natural grasses rather than the installation of a synthetic cover. The cost of developing and implementing a natural grass revegetation plan for the landfill cover may not be as inexpensive as simply putting on a synthetic astroturf cover, but this revegetation option is the type of feasible alternative and mitigation that must be considered under CEQA when there is the potential for such significant adverse scenic impacts.

III. Conclusion

For the reasons set forth in this letter, as well as other information in the administrative record, the Initial Study is legally inadequate and there is a fair argument that the proposed Final Landfill Closure Plan has the potential for significant adverse air quality, noise, hydrologic and scenic impacts. The adoption of a Negative Declaration based on the Initial Study would therefore be unlawful under CEQA. Vichy Springs Resort therefore requests either that the plan is modified so that the potential significant adverse environmental effects identified above are reduced to a less than significant level, or in the alternative, that an EIR is prepared prior to approval of the Final Landfill Closure Plan.

Yours,

Paul S. Kibel

Re: Ukiah Solid Waste Disposal Site, SWIS No. 23-AA-0019 – CEQA Review of Proposed Closure Plan

Dear Ms. Chambers, Mr. Eriksen, and Mr. Rapport:

This law firm represents Vichy Springs Resort ("Vichy Springs") located at 2605 Vichy Springs Road in the County of Mendocino. This letter concerns the development and implementation of a Closure Plan for the City of Ukiah's ("City") Ukiah Solid Waste Disposal Site ("Ukiah Landfill") located at 3100 Vichy Springs Road, which is adjacent to Vichy Springs. This letter supplements the letter sent to the City by Gilbert Ashoff (the owner of Vichy Springs) on October 22, 2014 (see Attachment 1).

Given its border with the Ukiah Landfill, Vichy Springs will be acutely and directly impacted by activities and permanent features on the Ukiah Landfill site. Vichy Springs is encouraged that, 14 years after the Ukiah Landfill stopped accepting garbage and solid waste deliveries, the City appears finally to be moving ahead with the completion and implementation of a Closure Plan. Vichy Springs intends to work closely and collaboratively with the City (and with the other agencies involved in reviewing and approving the Closure Plan) to ensure that the

Closure Plan is adequate and appropriately addresses several issues affecting Vichy Springs. Addressing these issues early on will help ensure that implementation of the Closure Plan can proceed expeditiously.

By this letter, Vichy Springs requests that the City's review of the Ukiah Landfill Closure Plan pursuant to the California Environmental Quality Act ("CEQA") properly mitigate the adverse traffic, spring water, noise, dust, and scenic impacts on the neighboring Vichy Springs property. As discussed below, if appropriate mitigation of such impacts is properly incorporated into the Closure Plan, this should enable the City to comply with CEQA's environmental impact assessment requirements via adoption of a Negative Declaration, rather than through preparation of an environmental impact report ("EIR"). Proceeding via a Negative Declaration, in turn, would enable the City to put its resources into the actual implementation of the Closure Plan, rather than into the preparation of an EIR.

II. CEQA Review of the Proposed Ukiah Landfill Closure Plan

In September 2014, the North Coast Regional Water Quality Control Board ("Regional Water Board") issued an order to the City requiring the preparation and implementation of a Closure Plan for the Ukiah Landfill (Attachment 2). The Mendocino County Environmental Health Division also issued a notice requiring the City to finalize and implement a Closure Plan for the Ukiah Landfill. In its September 2014 order to the City, the Regional Water Board clarified that CEQA review would be required for all project components associated with the approval of the Closure Plan. Some additional background information is useful to appreciate the Regional Water Board's finding regarding the need for CEQA review in connection with the Ukiah Landfill closure.

The City has been working on its plans for the closure of the Ukiah Landfill since the late 1990s. On July 20, 2000, before the City had finalized or obtained approval of a closure plan for the Ukiah Landfill, the City issued a Notice of Determination for the "Ukiah Landfill Final Closure and Post-closure Maintenance Plan" (Attachment 3), finding that the project would not have a significant effect on the environment and adopting a Negative Declaration. For three reasons, the July 2000 Negative Declaration does not satisfy the City's current CEQA obligations in connection with the Closure Plan now being developed.

First, under CEQA, the time period in which to challenge an adopted Negative Declaration does not begin to run until the underlying project (that is the subject of the Negative Declaration) has first been approved. This is made clear in California Public Resources Code sections 21167 and 21152 and CEQA Guideline section 15112, which all provide that the limitations period to challenge an adopted Negative Declaration is contingent on the actual approval of the project in question. Pursuant to these CEQA provisions, a challenge to a Negative Declaration for a project that had not been approved would not be ripe (would be premature). In the case of the Ukiah Landfill, as evidenced by the September 2014 Regional Water Board order and the 2014 Mendocino County Environmental Health Division order, to date the City's Closure Plan has never been finalized or approved. As such, the limitations

period to challenge the July 2000 Negative Declaration (before the Closure Plan was finalized and approved) has not yet even begun to run.

Second, quite apart from the fact that the City's Closure Plan for the Ukiah Landfill has never been finalized or approved, the scope of the Closure Plan being considered back in 2000 is considerably different and more limited than the scope of the Closure Plan the Regional Water Board called for in its September 2014 order to the City, particularly in regard to the rigor and scope of CEQA analysis required for projects with water resource impacts. Additionally, obligations under CEQA have changed since 2000. Pursuant to section 21166 of the California Public Resources Code and CEQA Guideline section 15162, when there are significant changes to a proposed project for which previous CEQA environmental review has taken place, CEQA requires that "supplemental" environmental review take place (through either a supplemental Negative Declaration or a supplemental EIR that assesses the impacts associated with these project changes).

Finally, in adopting the prior negative declaration, the City did not provide notice to Vichy Springs or an opportunity to comment as required by law. *See* Cal. Pub. Res. Code § 21092, CEQA Guidelines § 15072. Because Vichy Springs' property is contiguous with that of the landfill, the City should have directly notified Vichy Springs of its adoption of a negative declaration. Cal. Pub. Res. Code § 21092(b)(3)(C). This notice was not provided prior to adoption of the negative declaration.

Going forward, in terms of whether CEQA requires preparation of an EIR instead of allowing adoption of a Negative Declaration, the critical inquiry is whether the proposed project has been designed and formulated to reduce all adverse environmental impacts to below a level of significance. If there remains a fair argument that there is substantial evidence that the proposed project may have significant environmental impacts, then CEQA requires the preparation of an EIR instead of a Negative Declaration. Cal. Pub. Res. Code §§ 21080(a), 21080(d), 21100(a); *Friends of B Street v. City of Hayward*, 106 Cal.App.3d 988 (1980). For the City to lawfully meet its CEQA obligation by adopting a Negative Declaration for its proposed Ukiah Landfill Closure Plan, the City will therefore need to design and formulate the Closure Plan so that there is not a fair argument that there is substantial evidence that the plan could have significant environmental effects. The points below will help the City to prepare a Closure Plan that would allow for the adoption of a Negative Declaration.

II. Ukiah Landfill Closure Plan Impacts of Concern to Vichy Springs

Vichy Springs is a natural warm mineral springs resort located in the County of Mendocino. It has operated uninterrupted since 1854. The first accommodations buildings were constructed in 1852 and are the oldest standing structures in Mendocino County. The pool at Vichy Springs is the oldest pool in California north of San Francisco. It is designated by Mendocino County as a cultural and historical resource and by California as a historical landmark. Vichy Springs offers the only naturally warm and carbonated "Vichy" mineral baths in North America.

The entrance to the Ukiah Landfill adjoins Vichy Springs. Its entrance is approximately 200 feet from Vichy Springs, and the farthest point of Ukiah Landfill is approximately a half-mile from Vichy Springs. We attach a series of maps (Attachments 4 – 7) to show the relative locations of Vichy Springs and the Ukiah Landfill and to serve as a point of reference for the concerns discussed below.

A. Spring Water Impacts on Vichy Springs

As the name "Vichy Springs Resort" suggests, the reputation of the resort is tied to its steady supply of high quality natural warm and carbonated mineral spring water. The opportunity to bathe in this water is one of the primary reasons people come to stay at the resort. Reductions in the supply, quality, or temperature of this "Vichy" water, therefore, have a direct impact on the resort's operations and economic viability.

On March 15, 1993, as part of its effort to monitor the effects of the Landfill on groundwater beneath the site, the City installed a series of monitoring wells, on property later acquired by the City, that were close to the property line with Vichy Springs, against the wishes of Vichy Springs. The installation of the monitoring wells caused the pressure of the springs at Vichy Springs to drop from 65 gallons per minute to 30 gallons per minute. The pressure remained at 30 gallons per minute for two months before gradually climbing back to 65. The monitoring wells also caused the temperature of the spring water to drop from 90^{o} to 72^{o} Fahrenheit. Over two months it slowly recovered to 80^{o}, taking a year to fully recover to 90^{o}. There is a fragile pressure zone where the Vichy Springs water originates that the monitoring wells damaged. The locations of the monitoring wells and fragile mineral springs are shown in Attachment 4. The drop in pressure and temperature adversely affected the business of Vichy Springs, which, as noted above, relies on consistent, warm spring water for its guests. It took approximately one year for the pressure and temperature of the springs to return to normal levels.

The experience in the early 1990s confirms the connection between groundwater on the Ukiah Landfill property and the springs on the Vichy Springs' property. Given this phenomenon, the operation of any groundwater monitoring or treatment wells as part of the Ukiah Landfill Closure Plan has the potential to interfere with the supply and temperature of the spring water on Vichy Springs' site. Any contamination that leaks from the Ukiah Landfill into groundwater beneath it, and any drilling that creates pathways for these contaminants, also has the potential to contaminate the spring water on the Vichy Springs property.

In light of these circumstances, Vichy Springs requests that the City (and other agencies reviewing the Ukiah Landfill Closure Plan) undertake comprehensive and thorough analysis of the hydrologic connections between the groundwater under the landfill and the adjacent spring waters. Vichy Springs further requests comprehensive and thorough analysis of the extent to which the installation and operation of groundwater wells and the remedy for the landfill itself (e.g., lining/encasement) may impact the supply, temperature, and quality of spring waters on the adjacent Vichy Springs property. The final Ukiah Landfill Closure Plan should then include appropriate mitigation measures to address potential impacts identified in this analysis.

B. Noise Impacts on Vichy Springs

Vichy Springs' guests expect quiet, rest, and relaxation when visiting the resort. Given that peaceful tranquility is an essential reason for why guests visit, Vichy Springs is a particularly noise-sensitive area. We anticipate that implementation of the landfill closure will require the use of heavy equipment, the noise of which could disturb guests of Vichy Springs and adversely affect their experience while visiting. Guest sleeping areas are shown on the map in Attachment 5.

To address these concerns, Vichy Springs requests that City (and other agencies reviewing the Ukiah Landfill Closure Plan) undertake comprehensive and thorough technical analysis of the noise impacts of closure plan implementation on guests and visitors to the adjacent Vichy Springs, with particular attention to the effects of construction equipment on Vichy Springs guests that are using the mineral baths and swimming pool, hiking or walking the 700-acre reserve land, or staying overnight. This analysis should include detailed information about the noise levels and noise types associated with landfill closure activities, the proximity of the sources of these noises to the baths and sleeping quarters at Vichy Springs, and an assessment of how these noises/noise levels are likely to impact persons using the baths or sleeping overnight (from 9 pm to 9 am). The final Ukiah Landfill Closure Plan should then include appropriate mitigation measure to address potential impacts identified in this analysis. These appropriate mitigation measures may include the following: (1) prohibiting the use of heavy-equipment back-up beepers; (2) restricting the idling of trucks and other heavy-equipment; (3) scheduling work outside of the Vichy Springs' peak season which is from May through September; (4) limiting closure plan activities that will be audible at Vichy Springs, including delivery and pick-up by heavy trucks, to weekdays between 9:00 am and 5:00 pm and prohibit such work on weekends.

C. Dust Impacts on Vichy Springs

The use of heavy equipment and other construction activities (e.g., soil excavation and stockpiling) may disturb dirt and dust, which could then travel to and affect air quality at Vichy Springs. The airborne dust and dirt could adversely impact the experience of visitors to the resort (especially swimming pool and mineral bath usage) and could also contaminate the mineral springs. The landfill and the dump borrow area are both areas of concern for dust and are indicated on the map in Attachment 6.

To address these concerns, Vichy Springs requests that the City (and other agencies reviewing the Ukiah Landfill Closure Plan) undertake comprehensive and thorough analysis of the dust (airborne particulate matter) impacts of closure plan implementation on guests and visitors to the adjacent Vichy Springs, with particular attention to the effects on mineral pool quality, persons using the swimming pools and baths, and guests hiking on the 700-acre reserve. The final Ukiah Landfill Closure Plan should then include appropriate mitigation measures to address potential impacts identified in this analysis. These appropriate mitigation measures may include: (1) limiting or prohibiting excavation and other dust-inducing activities in areas in close

proximity to the property line with Vichy Springs; and (2) the use of water and tarps to prevent dust on the Ukiah Landfill site from drifting onto the Vichy Springs property.

D. Scenic and Visual Impacts on Vichy Springs

Vichy Springs resort is known for its bucolic grounds, scenery, and surrounding vistas. If the proposed landfill plan results in an adjacent property of barren and unvegetated land, this may result in an eyesore for guests and visitors to the resort (as well as for the larger surrounding community). CEQA requires assessment of project impacts on viewsheds. *Quail Botanical Gardens Foundation v. City of Encintas*, 29 Cal.App.4th 1597, 1604-05 (Cal. Ct. App. 1994). The viewshed is indicated on the map in Attachment 7 with a long arrow and extends to the southeast property line.

To address these concerns, Vichy Springs requests that the City (and other agencies reviewing the Ukiah Landfill Closure Plan) undertake comprehensive and thorough analysis of the scenic and visual impacts of closure plan implementation on guests and visitors to the adjacent Vichy Springs, with particular attention to the extent to which existing vegetated areas (with trees, grasses, plants, bushes, flowers) will be adversely impacted and the extent to which the closure plans includes detailed plans to revegetate disturbed areas. A starting point for this analysis should be a detailed inventory and description of current baseline scenic conditions and views onto the landfill property from Vichy Springs and other nearby locations. The final Ukiah Landfill Closure Plan should then include appropriate mitigation measure to address potential impacts identified in this analysis. These appropriate mitigation measures may include: (1) limiting or prohibiting disturbance of existing vegetated areas of the landfill site visible from Vichy Springs; (2) articulating objective revegetation benchmarks as part of a revegetation plan; and (3) setting aside of adequate long-term funding to ensure post-construction revegetation occurs.

III. Conclusion

We look forward to working with the City to ensure that the Landfill Closure Plan complies with CEQA and avoids impacts to Vichy Springs and its guests. Pursuant to CEQA Guideline section 15063, it is Vichy Springs' expectation that the City's decision about whether to proceed with a Negative Declaration or an EIR in this instance will be based on the information and analysis set forth in an Initial Study. As the California Court of Appeal clarified in *Citizens Association for Sensible Development of Bishop Area v. County of Inyo*, an Initial Study must "disclose the data or evidence upon which the persons conducting the study relied. Mere conclusions simply provide no vehicle for judicial review." 171 Cal.App.3d 151, 171 (Cal. Ct. App. 1985). In the unfortunate event that the environmental impacts noted in this letter are not mitigated to a level that is less than significant, Vichy Springs will insist upon compliance with CEQA's obligation to prepare an EIR prior to project approval.

By this letter, and as required by Section 21092 of the California Public Resources Code and CEQA Guidelines Section 15072, Vichy Springs requests that it be notified in writing of the release of any scoping documents or drafts associated with any Initial Study, Negative

Declaration, or EIR pertaining to the Ukiah Landfill Closure Plan. Vichy Springs also requests that a copy of this letter and its attachments be placed in the administrative record of the City and all other agencies (including the Regional Water Board and the Mendocino County Environmental Health Division) involved in preparing, reviewing, or approving the Ukiah Landfill Closure Plan. Please feel free to contact us if you would like to discuss these issues further.

Respectfully submitted,

REF: Dump CEQA

Dear Ms. Chambers and To Whom It May Concern:

It has come to our attention the City of Ukiah has a planned project on the adjacent Dump property next to the historic Vichy Springs Resort. I bring this to your attention as this resort is in a quiet neighborhood except for the unregulated and obnoxious gun club also located on city property.

This letter is to request formal notification under CEQA of the project planned for the "Dump" property.

We are aware of the recorded notice of determination done in 2000 where Vichy Springs Resort was not given notice nor were any other neighbors. We are also aware the project has substantially changed and will impact our resort operations that are 24 hours per day. Our guests sleep until 9am regularly as they are on vacation.

Our request is that the CEQA document that will be prepared for the changed new project (the dump closed in 2001 thirteen years ago) regarding applicable soil cover movement, gas plan and well drilling and final closure include protections for our unique Mineral Springs, the guests of our resort and the peaceful operation of our resort.

Our concerns include but not limited to:
No construction before 9am or after 5pm.
No back-up beepers.
Dust control at all times. i.e., zero dust.
No visible change to the view shed of the historic resort i.e., trees, ground or vegetation.
Emergency contact telephone number should an issue arise. If subsequent action does not occur please provide the contact and phone number of that person's supervisor.

Traffic on Vichy Springs road be limited to 8:30 am to 5:30 pm and no heavy trucks or equipment delivery or pickup other than after 9am or before 5pm.

Can you also please provide us with a copy of the CEQA document that led to the notice of determination.

Sincerely,

Gilbert Ashoff
Proprietor

North Coast Regional Water Quality Control Board

September 2, 2014

Tim Eriksen
Director of Public Works
300 Seminary Avenue
Ukiah, CA 95482-5400

Dear Mr. Eriksen:

Subject: Final Closure Plans for the Ukiah Solid Waste Disposal Site

File: Ukiah, City of, Solid Waste Disposal Site, Mendocino County
WDID No. 1B75043OMEN

This letter is a follow-up to our July 24, 2014 conference call to discuss the status of final Closure Plans for the City of Ukiah Solid Waste Disposal site located at the end of Vichy Springs Road in Ukiah. This letter also confirms our support for the request made by California Department of Resources Recycling and Recovery (Cal-Recycle) and Mendocino County Environmental Health, Local Enforcement Agency staff that you amend the Joint Technical Document (JTD) with all relevant changes and resubmit the revised JTD for the proposed landfill closure as an updated stand-alone project. The JTD amendments are necessary for us to move toward permitting this project for construction in 2015. We look forward to working closely with the City of Ukiah on the proposed closure project for the Ukiah Solid Waste Disposal Site.

Regional Water Board staff have reviewed the City of Ukiah's Closure Plans several times, along with various documents relevant to amending a Report of Waste Discharge (ROWD). With the submittal of the following items discussed during our conference call, Regional Water Board staff expect to be able to find the project plans sufficiently complete to begin our process of drafting tentative Waste Discharge Requirements (WDRs):

1) An updated construction schedule for the 2015 season.
2) All proposed changes and updates to the landfill gas collection system design, operations plans and cost estimates.
3) Updated financial assurance package with adequate coverages.

4) Updated CEQA review for all project components submitted within the JTD and ROWD.

We understand that the City of Ukiah is working on the above-mentioned items and anticipates submitting the required updates within the coming month. We look forward to receiving your updates and to working closely with you on updating the WDRs for closure of this landfill.

Please call me at (707) 576- 2668 if I can assist or if you should have any questions or concerns.

Sincerely,

Terri Cia
Engineering Geologist

Ukiah Landfill Final Closure and Postclosure Maintenance Plan
Project Title

200052079	Charles Stump	(707) 463-6219
State Clearinghouse Number	**Lead Agency Contact Person**	**Telephone**

The property is located at 3100 Vichy Springs Road, Ukiah, Mendocino County
Project Location (include county)

The project entails the closure and postclosure maintenance of the Ukiah Class III municipal solid waste landfill. Final closure of the landfill will entail the construction of a final cover over the entire landfill surface. Elements of the closure construction operations will include the following tasks: 1) clearing and stripping of existing vegetation from the landfill surface designated to receive final cover; 2) placing and compacting foundation layer material over the entire landfill surface, followed by a 1-foot of low permeability layer material and 1-foot of vegetative layer material; 3) hydroseeding the vegetative layer with native grasses; 4) reclaiming existing and proposed on-site borrow areas; 5) construction of drainage system components; 6) placing aggregate base rock over portions of existing perimeter roadways; 7) removing existing structures from the site; and 8) installing fencing for site security.

Project Description

This is to advise that the CITY OF UKIAH adopted the Mitigated Negative Declaration on July 19, 2000 and has made the following determinations regarding the above described project:

1. The project will ____ will not __X__ have a significant effect on the environment.
2. __X__ A Mitigated Negative Declaration was prepared for the project pursuant to the provisions of CEQA.
3. Mitigation measures were __X__ were not ____ made a condition of the approval of the project.
4. A statement of Overriding Considerations was ____ was not __X__ adopted for this project.
5. Findings were __X__ were not ____ made pursuant to the provisions of CEQA.

The Mitigated Negative Declaration is available to the General Public and may be examined at the Ukiah Planning Department - City of Ukiah Civic Center, 300 Seminary Avenue, Ukiah, CA.

Subject: City of Ukiah Proposed Mitigated Negative Declaration for Landfill Closure and Post Closure Maintenance Plan

Dear Mr. Ashoff:

As requested, I reviewed the Initial Study Proposed Mitigated Negative Declaration for the Proposed Final Closure and Post-Closure Maintenance Plan for the Ukiah Landfill, prepared for the City of Ukiah dated January 2016. My review of the Initial Study focused on the environmental impact analysis of the landfill closure and maintenance plan on geology and soils and hydrology and water quality issues.

Following are issues and concerns regarding the scope of the environmental analysis and findings, which should be addressed before finalizing the mitigated negative declaration and during the implementation and maintenance of the closure and post closure plan:

- There was no discussion as the geology and hydrogeology of the landfill site and surrounding areas, and relationship to the potential source and quality of spring water at the nearby Vichy Spring.
- The environmental analysis on hydrology and water quality did not address impact on groundwater and/or spring water quality and any hydrogeologic connection/relationship between the water bearing zones beneath the landfill and the source of Vichy Spring water.
- The analysis also did not indicate if water quality analysis/study has been performed to compare the quality of groundwater beneath the landfill and the spring water.

Unless the following studies or investigations have already been performed, the City should complete them at the minimum before issuing the final mitigated negative declaration and implementing the closure and post-closure maintenance plan:

- Conduct a detailed geologic study and mapping of the landfill and surrounding areas including Vichy Spring.
- As part of the mitigation measure, conduct a water quality study to establish the “signature” constituents of the Vichy Springs water compared to the groundwater at the landfill and include these constituents in the compliance monitoring program.

- Evaluate both the soil characteristics and water quality during any intrusive activities of the subsurface to ensure no impact or breach into the source formation of Vichy Spring water, if any.

Sincerely,

ALISTO ENGINEERING GROUP

Al Sevilla, P.E.
Principal

Clay Remains a Top Choice for Final Landfill Cover

Rachael Zimlich | Aug 11, 2015

18-22 minutes

The waste and recycling industry kicked off the new year with a full plate, and industry experts project 2020 could be a transformative one.

The industry continues to respond to the cyclical impact of China's National Sword and subsequent volatility in recycling markets. Plus, talk of an economic slowdown and the potential for new legislation and regulation in an election year, the impacts of increased merger and acquisition activity and heightened awareness of "forever chemicals" and their potential ramifications for waste management remain top of mind for industry stakeholders this year.

In this two-part series, industry experts discuss emerging trends and their outlook for 2020.

Recycling Markets: Domestic, China and Southeast Asia

From a recycling perspective, 2018 started off unstable due to the implementation of China's import ban. But 2019 wasn't much better.

"When you have something bad, the only thing you can do is try to

predict something more cheerful, so we, along with a lot of other people, said 2019 will be better. And 2019 was worse," says Anne Germain, vice president of technical and regulatory affairs for the National Waste & Recycling Association (NWRA). "Commodity prices did not recover; prices for everything went down, with the exception of plastics."

Germain projects that in 2020, metals prices will stabilize; however, her outlook for cardboard remains bleak.

"Even if China delays an import ban on all fiber, fiber permits are still expected to be reduced. Because of that, we expect commodity prices to remain in the doldrums, and we are hoping that they won't get any worse," she says. "But it's going to be another challenging year from a commodities pricing perspective."

Longtime industry veteran and *Waste360* columnist Chaz Miller also predicts 2020 will be another challenging year for recyclers, with paper markets remaining flat throughout the year. There are, however, some glimmers of hope of rising prices later in the year.

The Pratt Industries mill in Wapakoneta, Ohio, opened in October 2019 and will process 180,000 tons of mixed paper in its first year of operation. That will steadily increase to 360,000 tons in 10 years, says Miller.

“That’s the start of the market for mixed paper, but it’s not enough to buoy markets,” he explains.

Two new paper mills are expected to open at the end of 2020 or in early 2021—the Green Bay Packaging mill in Wisconsin and the Cascades mill in Virginia. Three new Nine Dragons mills have been opaque about when those mills will be fully operational in terms of buying mixed paper, according to Miller, making it difficult to predict what impact they’ll have.

“I think markets will stay relatively flat through 2020. Maybe, at the end of 2020 and early 2021, we’ll start seeing things get better for mixed paper,” Miller projects. “Corrugated will pretty much stay the way it is.”

“I don’t expect China to ban the imports of all recyclables,” he adds. “The paper mills depend too much on it. I am more inclined to think they will ban waste but continue to accept raw materials.”

Plastic markets, however, are a little harder to predict. With a surge in new virgin resin capacity coming online, prices for those resins are likely to drop and depress recycled resin prices, says Miller.

“Many consumer brands announced aggressive goals for the use of recycled plastic,” he explains. “2020 will test their willingness to increase recycled content even if it means paying more for raw materials. I think it’s clearly time for them to step up and start buying now.”

Robin Weiner, president of the Institute of Scrap Recycling Industries (ISRI), anticipates that there will be a continued trend of seeking new global and domestic recycling markets.

“There has been a significant amount of investment in the U.S. in the past year, and I would imagine that we would continue to see that—with investment on both the consumption side and within recycling itself,” explains Weiner. “This will be an expansion for existing facilities as well as greenfield operations. We’re excited about that because the greater market improvements we see, the stronger the business will be. And we will be pushing for any opportunity to strengthen market demand in recycled content and design for recycling.”

ISRI also expects continued challenges for international recycling markets.

“The issue of import restrictions is being discussed in a lot of

different markets, and we are being very proactive in Indonesia, Malaysia and other countries discussing the difference between legitimate scrap trade and waste that has been illegally shipped," says Weiner. "I think one of our biggest challenges going forward is helping importing countries understand the difference. That continues to be a big focus for us."

David Biderman, executive director and CEO for the Solid Waste Association of North America (SWANA), notes that in 2020, the industry will continue to respond to the evolving impact of China's National Sword on local recycling programs.

"The inaccurate media narrative that recycling was in some sort of national 'crisis' appears to have been effectively rebutted, as new domestic capacity coming online and reductions in contamination levels reported throughout the United States had led to a reduction in the pace of local governments suspending curbside collection," explains Biderman. "In addition, EPA [the U.S. Environmental Protection Agency] announced at the America Recycles Day (ARD) Summit in November 2019 that it would be proposing national recycling goals this year, and I expect that, together with implementation of the EPA Recycling Framework released at the ARD Summit, will encourage local governments to continue with their recycling programs."

Bryan Staley, president and CEO of the Environmental Research & Education Foundation (EREF), expects to see more nuanced conversations happening around recycling and sustainable materials management.

"I think some of the issues with the domestic recycling markets and China's National Sword have really put the spotlight on recycling

and asking some hard questions that I don't think have been asked in the past," he says. "I think the industry has the opportunity to lead that conversation."

"I think recycling markets will improve, but I think it will be slow," adds Staley. "In order to strengthen domestic markets and recycling overall, the best feedstock is going to result in the best end materials and end markets. And that doesn't seem to be happening right now."

Economic Outlook, Legislation and Regulation

Another top trend to watch in 2020 is the overall health of the economy. The industry also is watching certain legislative and regulatory activity but doesn't expect too much to pass in the upcoming presidential election year.

"Later this year or in 2021, there could be a sufficient cooldown for the economy that will impact the industry; we don't know yet," explains Staley. "With various geopolitical things happening, you never know how that will affect the economy—good or bad."

Biderman points out that if the U.S. and Canadian economies continue to hum along at the 2 to 2.5 percent growth range, there will be plenty of waste and recyclables to go around. However, 2019 was the 10th consecutive year of economic growth following the 2008-09 Great Recession, and eventually, the tide will turn, he says.

“Solid waste owners, local governments and others interested in the overall health of the industry should keep a close eye on GDP [gross domestic product] numbers, as they will determine whether the United States or Canada will have a record-breaking 11th consecutive year of economic growth, or if a long-predicted economic downtown is at hand in either late 2020 or 2021,” says Biderman.

In terms of legislation for 2020, Jim Riley, chief counsel and senior vice president of government affairs for NWRA, says a couple things immediately come to mind.

NWRA has been lobbying to get tax extenders renewed since they expired at the end of 2017. NWRA also had its eye on a federal infrastructure bill—both for surface transportation and a broadly defined infrastructure measure that would encompass domestic recycling infrastructure capabilities.

In addition, NWRA ended 2019 on a high note. In November, the Federal Motor Carrier Safety Administration (FMCSA) announced it would grant NWRA an hours of service (HOS) exemption exclusively for its members. The exemption eliminates the need for NWRA member companies to use electronic logging devices (ELDs) in their trucks.

"Congress will not be in session very much next year. We already looked at the 2020 calendar and calculated back in terms of how many days they are going to be there," explains Riley. "One of the reasons we do that is because of the rulemaking underway from the U.S. Department of Transportation in terms of hours of service. We already have our [HOS] exemption, which is good for five years. But there are some broader hours of service changes that FMCSA is trying to make. And if a Democrat were to win the White House and had control of both the House and Senate after the 2020 election, they could invoke the Congressional Review Act (CRA). That gives them so many days to go back and basically repeal any kind of new rules implemented by the various agencies."

"That's why it's so important that NWRA got its exemption for member companies," he adds.

Kirk Sander, NWRA's chief of staff and vice president of safety and standards, explains it's hard to say how the CRA play would impact the industry.

"We will just be watching if the change is in the next five years. We don't think it'll change much, but we haven't seen the final rule," he says. "The same thing goes for FMCSA's entry-level driver training. Indications are there will be pushback, but nothing is official until it's in the [Federal] Register."

Typically, not much is accomplished during a presidential election year, but Riley says he wouldn't rule out passage of a highway bill, which would be separate from the bigger, broader infrastructure package. Riley adds that NWRA has had conversations with people on both sides of the aisle to ensure the passage of a surface transportation infrastructure bill.

"Aside from that, we made sure that domestic recycling infrastructure was included in any broader package," he says.

As for recycling, NWRA doesn't anticipate much regulatory activity from the federal government, but Germain projects there will likely be movement put forth at the state level. Congress may also pass either the RECOVER (Realizing the Economic Opportunities and Value of Expanding Recycling) or the RECYCLE (Recycling Enhancements to Collection and Yield through Consumer Learning and Education) Acts, which provide financial support to local government recycling efforts.

Sander says the industry will continue tracking Move Over laws and whether a measure will expand to all vulnerable road workers, including those in waste and recycling.

In addition to the RECOVER and RECYCLE Acts, Miller projects that Congress will pass the Save Our Seas 2.0, which expands the 2018 law.

At the local level, New York City will start the implementation of its controversial commercial waste zone (CWZ) system this year, with a request for proposal (RFP) likely to be issued by June, notes Biderman.

"Although the changes aren't expected to be fully finalized until 2022 at the earliest, the specter of CWZ, also known as 'franchising,' will likely impact the hyper-competitive New York City market, as some carters go out of business and others battle for advantage in this large, important market," he says.

Mergers and Acquisitions

Another key area to watch is the pace of acquisitions, which has

been accelerating over the past few years and has industrywide ramifications. The biggest merger to keep an eye on this year is Waste Management's acquisition of Advanced Disposal (ADS).

"Acquisitions like the Waste Management/Advanced deal have major ripple effects throughout the industry on the OEM [original equipment manufacturer] side and even on the competitor side and for haulers as well," explains Staley. "That has impacts on the trade associations and on EREF as an organization."

In June 2019, ADS' stockholders voted to adopt the merger agreement with Waste Management. The transaction is expected to close by the first quarter of 2020.

"Large national companies, regional players and private equity are all aggressively buying companies, and I expect this will continue in 2020," says Biderman. "The pending acquisition of Advanced

Disposal by Waste Management is expected to result in the divesture of solid waste assets (e.g., disposal facilities and collection) in several markets, which will create additional opportunities for companies to grow. The possibility of a Democrat being elected in November 2020, and a potential subsequent increase in the capital gains or federal income tax rates, may fuel even more deals, at higher multiples, as Election Day nears."

PFAS and Waste Management

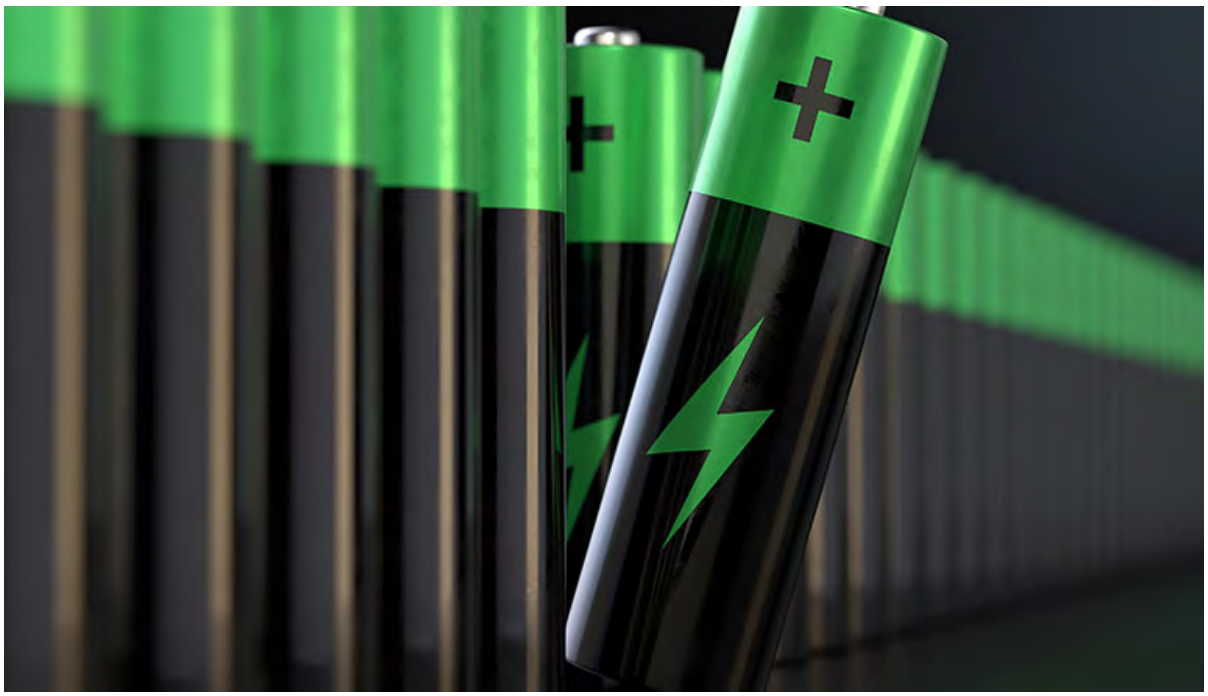
Issues surrounding per- and polyfluoroalkyl substances (PFAS)—known as "forever chemicals"—really began to gain public attention in 2019 with movies like "Dark Waters" and the Netflix documentary, "The Devil We Know." EREF, which has released an RFP targeting PFAS research, predicts PFAS will be in the crosshairs of the industry for the foreseeable future.

EREF is working on funding for three new contracts to study PFAS in landfill leachate. EREF's goal is to get a better understanding of PFAS and their impacts on the industry in order to answer looming questions.

"There are still a lot of questions that need to be answered," stresses Staley. "I've had conversations with folks who suggest that the answers are in on PFAS, and I disagree with that. There's still a lot of scientific research that is necessary to understand the actual health implications on low-level exposures that we are seeing in our everyday lives."

Although the House of Representatives passed a bill that included language designating PFAS compounds as hazardous substances under Superfund and directing EPA to set a maximum contaminant level for PFAS under the Safe Drinking Water Act, the language was dropped from the National Defense Authorization Act due to opposition in the Senate.

"SWANA expects this bill to re-emerge this month in the House, but it will likely have difficulty getting traction in the Republican-controlled Senate," explains Biderman. "Also, EPA is expected to finalize a regulatory determination for certain PFAS compounds this year, and states are aggressively moving forward to fill the void created by federal inaction. Several northeastern and midwestern states have issued or are proposing PFAS standards for drinking water. SWANA is closely monitoring PFAS issues and is developing new resources for members to help them address rising concerns over PFAS in leachate."



Safety & Technology

At the end of 2019, the U.S. Department of Labor's Bureau of Labor Statistics released its 2018 National Census of Fatal Occupational Injuries, which revealed an increase in waste collection fatalities.

As safety remains top of mind for industry associations, NWRA is working on an RFP for a 10-year review of safety data on the industry and figuring out where the gaps are, explains Sander. “We are going to announce that winner early in 2020 and our selection on that. So, starting that process and hopefully getting preliminary data in 2020 is exciting for me,” he says.

In addition, Biderman says he hopes the joint SWANA-NWRA Alliance with the U.S. Occupational Safety & Health Administration will help reduce the frequency of fatalities, accidents and injuries in the sector.

At the end of 2019, NWRA also released its best practices guide for materials recovery facilities and temp workers. Sander adds that lithium-ion battery safety will also be a continuing safety trend.

ISRI also projects that the dual issue of lithium-ion batteries and fires will continue to be a huge issue for ISRI moving forward and for all in the stream—whether it’s residential, commercial or industrial. Weiner points out that the waste stream will now include larger ELD batteries and those from electric vehicles, as well as

smaller lithium-ion batteries.

“Both are causing safety and fire risks,” she says. “We are being very proactive to try and address the issue from both a policy perspective and operational perspective.”

EREF is also looking to mandate some work in 2020 to drill down fatality statistics.

When it comes to technology, Arnold Bowers, business solutions director at ENGIE Impact, formerly ENGIE Insight, anticipates that bigger, bolder technology solutions will eventually relieve the pressure of municipalities and communities having to enforce plastics bans and legislation. He points to renewed investment in chemical recycling as an efficient way for bottlers to recapture plastic.

Bowers also points out that the proliferation of Internet of Things (IoT) has been a longstanding expansion in the industry. Prior to his work at ENGIE Impact, Bowers worked with an IoT company that builds and supports smart bins.

“There are all these new kinds of monitoring technologies growing,

and we are piloting these technologies today to figure out if there is a one size fits all or if there will be different technologies for these sorts of things," says Bowers.

Technologies include cameras revealing material in a bin, which can help combat contamination. Others are more sonar based and provide more feedback of how full a bin is.

"All this data is closed loop, and it's from the point of generation, whether it be a bin, at a park, on a college campus or industrial setting, where that bin is being monitored and that data is being sent back to a system that someone is watching," says Bowers. "Then, resources can be deployed more on-demand rather than the old, historical routing and collection loops. Using the IoT and monitoring technology allows us to conserve our resources as we go out and move materials."

Bowers also broached the idea of building an "Uber for waste" concept, where trucks are deployed only when bins are full.

"Maybe in the future of waste that could be possible, but the model that collection is built on today is not really prepared for that Uber-type situation," he says. "But I think we're prepared for that IoT data to feed back into our collection and help us address and adjust where we can focus our attention. The expansion of all our technology and focus today, in my view, will impact the waste business tremendously over the next decade."

Part two of this series will highlight the industry's goals for 2020.

Exhibit H

4.26.3 Parks and Recreation (CEQA)

4.26.3.1 Introduction

The parks and recreation analysis focuses on the potential for the Master Plan alternatives to create or exacerbate deficiencies in public parks and recreation areas through increased demand for facilities, acquisition, construction activities, or alteration of existing facilities. Conclusions regarding the significance of impacts provided in this section are strictly for the purposes of CEQA. Technical Report 16*, Public Services Technical Reports,* contains detailed information on baseline conditions and regulations related to parks and recreation. Section 4.8, *Department of Transportation Act, Section 4(f)* addresses potential impacts on public park and recreational facilities as required by Section 4(f) of the U.S. Department of Transportation Act, which includes an assessment of acquisition, noise, access, and other indirect effects. Impacts on bikeways are analyzed in Section 4.2, *Land Use* and in Section 4.14, *Coastal Zone Management and Coastal Barriers*. Direct and indirect growth in the vicinity of LAX and elsewhere in the region associated with the Master Plan would also result in increased demand for parks and recreational facilities. Potential indirect influences on park demand, such as those associated with new employee households that could be generated off of the airport, are addressed in Section 4.5, *Induced Socio-Economic Impacts (Growth Inducement)*, and in subsection 4.26.3.7, *Cumulative Impacts*.

4.26.3.2 General Approach and Methodology

To assess the potential direct effects of the proposed Master Plan alternatives associated with physical changes in the environment and increases in demand for public park and recreational facilities, 1996 baseline conditions were compared with conditions expected with implementation of the No Action/No Project Alternative and four build alternatives. Characterization of the environmental baseline included a discussion of parkland dedication/fee ordinances, descriptions of park and recreational facilities at and adjacent to LAX, and a summary of the sufficiency of existing parklands in meeting user demands. Information was obtained from park and recreation agencies within the study area.

The parks and recreation study area has been defined to incorporate areas immediately surrounding the LAX property potentially affected by direct impacts (e.g., acquisition) or increased demand for facility use associated with implementation of the proposed Master Plan build alternatives. The study area includes the LAX property, the southern portion of the community of Westchester, the area between the western airport boundary and the Pacific Ocean, the area adjacent to the southern boundary of the airport, and the area to the east of the airport that includes parks adjacent to the proposed LAX Expressway. The public park and recreational facilities within the study area are shown in **Figure F4.26.3-1**, Public Parks and Recreation Facilities Within Study Area. Parks and recreation areas outside of this study area potentially affected by noise are identified and addressed in Section 4.8, *Department of Transportation Act, Section 4(f)*. The primary public park and recreation providers within the parks and recreation study area are the County of Los Angeles and the cities of Los Angeles, El Segundo, and Inglewood. Direct and indirect growth in the vicinity of LAX and elsewhere in the region associated with the Master Plan would also result in increased demand for parks and recreation. Potential impacts are addressed in Section 4.5, *Induced Socio-Economic Impacts (Growth Inducement)*, and subsection 4.26.3.7, *Cumulative Impacts.*

Impacts on public parks and recreation areas were determined by evaluating whether the Master Plan build alternatives would create or exacerbate deficiencies in public park and recreational facilities through increased demand, or whether construction activities, acquisition, or alteration of a facility would significantly compromise its use or create the need for new public parks and recreational facilities. Assessment of demand for public park or recreational facilities is based on increases in employees, airport users, or changes in population resulting directly from project development, and whether such demand would conflict with standards established in applicable plans and ordinances.

4.26.3.3 Affected Environment/Environmental Baseline

The Quimby Act, a section of the California Subdivision Map Act adopted by the California State Legislature, empowers local governments to require a property owner or developer to dedicate land for public park or recreational use or to pay a parkland fee. Communities with parkland dedication or "Quimby" ordinances have the ability, through fees or land dedications, to keep pace with increases in demand for public park and recreational facilities generated from residential development. Identifying

jurisdictions that have such ordinances in place is directly relevant to assessing the effects of the Master Plan on such jurisdictions.

Within the study area, the County of Los Angeles and the City of Los Angeles currently have developer fees in place for parkland development or improvement.

Parks and recreation areas within the study area range in size from less than two acres to over 200 acres. Facilities and services range from landscaped passive recreation areas to parks with ball fields, tennis courts, gymnasiums, and swimming pools. Jurisdictions may augment their parks and recreational facilities available to the general public by shared-use arrangements with local school districts and private entities. **Table F4.26.3-1**, Public Parks and Recreation Areas Within Study Area, lists the parks and recreation areas and their jurisdictions and sizes within the parks and recreation study area.

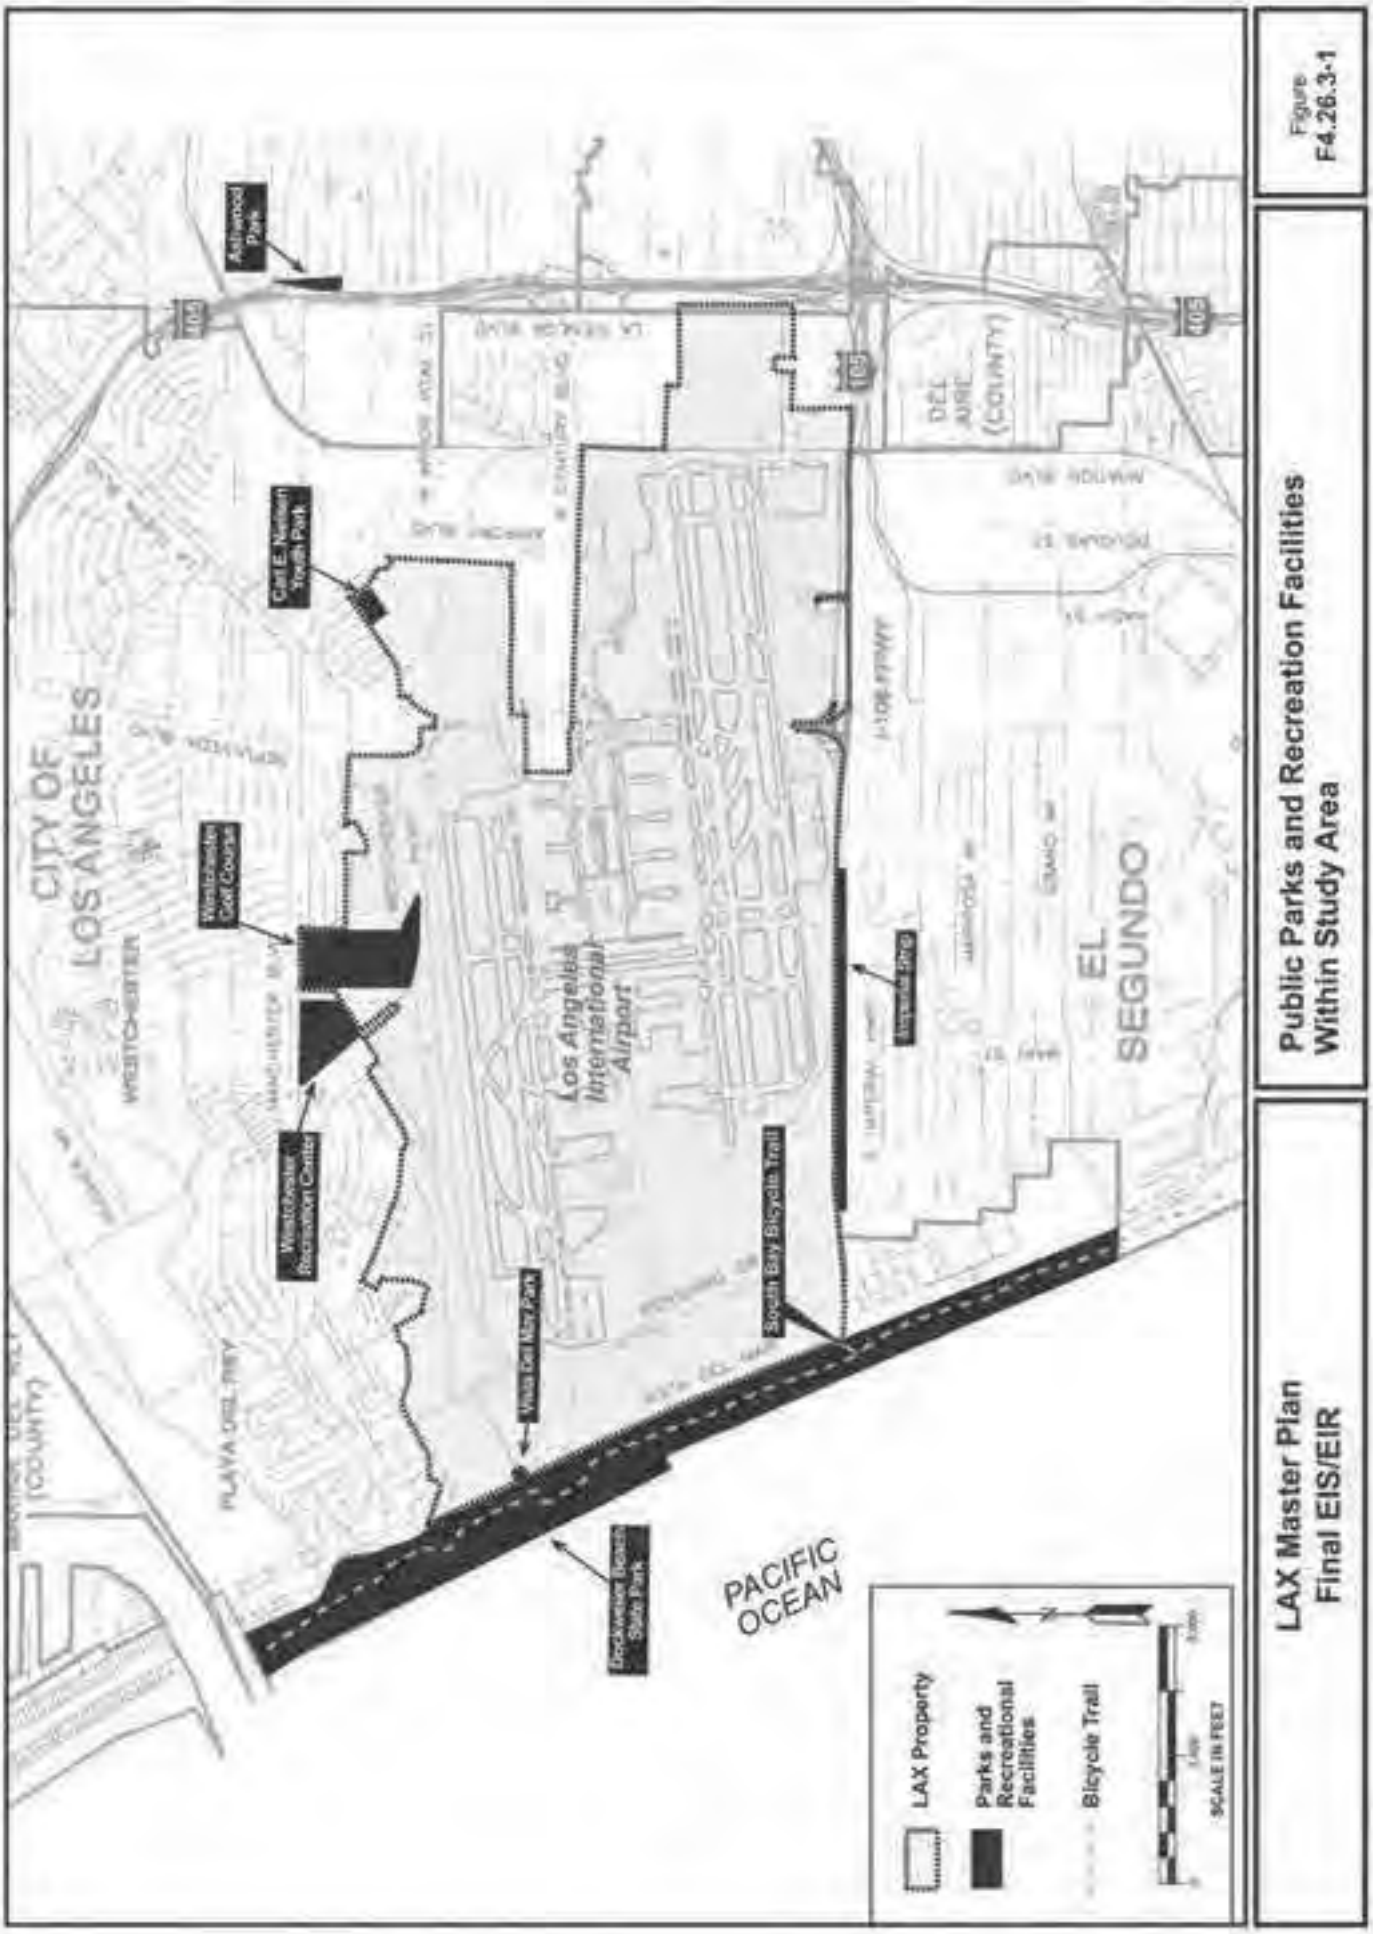
Table F4.26.3-1

Public Parks and Recreation Areas Within Study Area

Name	Jurisdiction	Size (acres)
Ashwood Park	City of Inglewood	1.3
Carl E. Nielson Youth Park	City of Los Angeles	7.0
Isidore B. Dockweiler State Beach	State of California	288
Imperial Strip	City of El Segundo	7.4
South Bay Bicycle Trail	County of Los Angeles	N/A[1]
Vista del Mar Park	City of Los Angeles	1.8
Westchester Golf Course	City of Los Angeles	69.0
Westchester Park Recreation Center	City of Los Angeles	22.0
Total		**396.5**

[1] South Bay Bicycle Trail is contained within Dockweiler State Beach.

Source: PCR Services Corporation, 2000.



Parks and recreation plans, regulations, and facilities for each jurisdiction located within the study area are described below.

State of California

Isidore B. Dockweiler State Beach (Dockweiler State Beach) is the only state park or recreational facility within the study area. Located directly west of LAX, Dockweiler State Beach is maintained by the Los Angeles County Department of Beaches and Harbors. Dockweiler State Beach is 4.05 miles long and approximately 550 feet wide over much of its length, encompassing 288 acres. The main beach entrance is located at the western end of Imperial Highway. Multiple pedestrian entries and restrooms, parking lots, and concession stands are spread out along its length to accommodate beach visitors along the oceanfront. There are also showers, playground and volleyball facilities, and fire pits on the beach. The six parking lots provide a total of 1,523 parking spaces. Dockweiler State Beach had an attendance of 2,993,330 in 1997.

County of Los Angeles

The County of Los Angeles maintains a bicycle trail that traverses Dockweiler State Beach. The South Bay Bicycle Trail runs along Santa Monica Bay from Torrance County Beach to Will Rogers State Beach, with benches and bicycle racks along its path. It is maintained by the Los Angeles County Department of Public Works, with the exception of a short section between Culver Boulevard and the Marina del Rey entrance channel, which is under the control of the Los Angeles County Department of Beaches and Harbors. In unincorporated areas of Los Angeles County, developer fees for parkland improvement or development are required for residential developments of more than one unit; no fees are imposed for commercial or industrial projects.

Public Parks and Recreation Facilities Within Study Area
Figure F4.26.3-1

City of Los Angeles

The City of Los Angeles Zoning Code (Section 17.12) requires that a percentage (0.9 to 32 percent) of the gross area of a residential subdivision be dedicated for park and recreational uses, or a fee may be paid in lieu of park dedication. Parkland dedication or payment of fees is not required for non-residential development in the city.

The City of Los Angeles Community Plan Standards[988] call for a minimum of two acres of neighborhood park and two acres of community park per 1,000 population. According to the City's Public Recreation Plan,[989] neighborhood recreation sites serve residents of all ages within a radius of approximately one-half mile. The optimum site would be 5 to 10 acres and provide space and facilities for outdoor and indoor recreational activities. Community recreation sites would be 15 to 20 acres and serve residents of all ages with a broad interest range in several surrounding neighborhoods within a two-mile radius.

Based on these adopted standards, the City of Los Angeles is deficient in parkland: no area of the city is adequately served by recreation and park facilities.[990] The city has an overall deficiency of 11,404 acres of neighborhood and community parkland.[991]

In the City of Los Angeles, on and adjacent to LAX property, there are four parks, totaling approximately 100 acres, including the 69-acre Westchester Golf Course. Two of these parks, Westchester Park Recreation Center and Vista del Mar Park, are located immediately adjacent to the LAX property. The Westchester Park Recreation Center is a 22-acre park with many facilities, including tennis, basketball, and volleyball courts, baseball fields, children's play and picnic areas, a swimming pool, and a community building. Vista del Mar Park is a 1.8-acre passive, landscaped park with picnic tables and a tot lot located east of Vista del Mar Boulevard, next to the El Segundo Blue Butterfly Habitat Restoration Area. The Westchester Golf Course and Carl E. Nielson Youth Park are located on LAX property. The Westchester Golf Course, a public facility leased by LAWA, is within the proposed Westchester Southside project area. Carl E. Nielsen Youth Park, a private facility leased by LAWA, is on the northeast corner of the LAX property. The park occupies approximately seven acres, and includes a soccer field and two baseball diamonds that are used for organized youth sports.

Within the Westchester/Playa del Rey communities, the parkland acreage in combination with the Westchester Golf Course currently provides approximately 2.3 acres of parkland per 1,000 population. Based on the city's adopted standards, this is a deficit of approximately 1.7 acres per 1,000 population or approximately 82 acres.

City of El Segundo

The City of El Segundo's park and recreation inventory totals approximately 213 acres, including private recreational facilities. City public park and recreational facilities total 91 acres, including ten public parks, three school sites, a utility transmission corridor, a golf driving range, a recreational facility, and a beach area.

El Segundo's General Plan Open Space and Recreation Element sets forth a standard parkland ratio of 5 acres per 1,000 population. The City of El Segundo, with a ratio of 5.7 acres per 1,000 population, is currently meeting its adopted standard.[992] Although the City of El Segundo does not have developer fees for parkland improvement or development, the city has adopted standards for new non-residential development to provide recreational facilities for the daytime employee population.[993]

The only City of El Segundo park within the parks and recreation study area is Imperial Strip, a 7.35-acre passive open space corridor consisting of cultivated lawn, trees, and benches, which serve to buffer the city from LAX. This open space corridor is on the southern boundary of LAX between Imperial Highway, Imperial Avenue, Hillcrest Street, and Center Street. This area is frequently used by the public to observe

aircraft activities at LAX and take in long-range views of Santa Monica Bay and areas of the Los Angeles basin.

City of Inglewood

The City of Inglewood has ten parks with a total of 86.6 acres. Ashwood Park, a 1.3-acre park located between I-405 and Ash Avenue, is the only City of Inglewood park or recreation area within the study area. Ashwood Park contains a wading pool, basketball court, volleyball court, tennis court, and picnic area. The Inglewood standard for parks is one acre per 1,000 residents.[994] The current ratio is 0.8 acres of parkland per 1,000 residents, a deficit of 0.2 acres per 1,000 residents.[995] There is no developer fee program for city park development.

4.26.3.4 Thresholds of Significance

4.26.3.4.1 CEQA Thresholds of Significance

A significant impact on parks and recreation areas would occur if the direct and indirect changes in the environment that may be caused by the particular build alternative would potentially result in one or more of these conditions:

- Directly generate a substantial increase in the population of the project area that creates or exacerbates deficiencies in parkland as determined by the applicable ordinances and/or adopted standards.
- Directly results in the need for new parks or recreational facilities due to degradation or acquisition of parkland or substantially alters existing parks or recreational facilities so that it would decrease the use of the park or recreational facility.

These thresholds are utilized because they address the concerns for parks and recreation areas potentially directly affected by the proposed Master Plan build alternatives. The first threshold is a modification of a threshold in the *Draft L.A. CEQA Thresholds Guide,* which states that the "demand for recreation and park services anticipated at the time of project buildout" be "compared to the expected level of service available."[996] In the following analysis, demand is based on whether the public park or recreational facilities would serve the surrounding population as determined through adopted ordinances and standards. Assessment of demand for recreational facilities is based on increases in employees, airport users or changes in population resulting directly from project development. The second threshold was derived from Appendix G of the State CEQA Guidelines, which states that a project would have a significant impact on parks if it results in the "need for new or physically altered" facilities and/or results in "substantial physical deterioration of the facility." Physical deterioration in this analysis includes acquisition, decreased access, or a change in the use of a park or recreational facility.

4.26.3.4.2 Federal Standards

The FAA *Airport Environmental Handbook* does not require that this environmental topic be addressed; therefore, no federal standards apply to the following analysis. Environmental effects on parks and other resources associated with acquisition, noise, access, and other indirect effects are, however, addressed pursuant to federal standards in Section 4.8, *Department of Transportation Act, Section 4(f).*

994 Parcells, Lori, Planning Manager, City of Inglewood, Letter, January 20, 1998.

995 City of Inglewood, Community Development and Housing Department, Open Space Element, Inglewood General Plan, December 1995.

996 City of Los Angeles, Draft L.A. CEQA Thresholds Guide, Section J.4. Recreation and Parks, J.4-3, May 14, 1998.

4.26.3.5 Master Plan Commitments

No Master Plan commitments for parks and recreation are proposed. However, the following Master Plan commitments from other environmental disciplines are relevant to this analysis.

- **LU-3. Comply with City of Los Angeles Transportation Element Bicycle Plan (Alternatives A, B, and C).**
- **LU-5. Comply with City of Los Angeles Transportation Element Bicycle Plan (Alternative D).**
- **ST-18. Construction Traffic Management Plan (Alternatives A, B, C, and D).**

The above commitments are provided in their entirety in Chapter 5, *Environmental Action Plan.*

4.26.3.6 Environmental Consequences

4.26.3.6.1 No Action/No Project Alternative

Project Development

The No Action/No Project Alternative (described in Chapter 3, *Alternatives*) contains various features that are especially pertinent to the analysis of parks and recreation impacts. Some of these features are increases in passenger activity and property acquisition. The No Action/No Project Alternative would not result in any physical alteration to Carl E. Nielson Youth Park.

Service Effects

Although projected increases in passengers may increase demand for public park and recreation areas due to possible daytime or lunchtime use by visitors to the airport, any increase is expected to be small. Furthermore, there would be a reduction in demand from employment with a projected decline in on-airport employees under the No Action/No Project Alternative. Moreover, there would be reduced local demand on parks associated with the ongoing voluntary relocation of 4,987 residents under LAWA's existing Aircraft Noise Mitigation Program (ANMP) (see Section 4.4.2, *Relocation of Residences or Businesses)*. There are no public parks within the LAWA ANMP acquisition areas.

LAX Northside Project

Approximately 4.5 million square feet (MSF) of commercial and research/development uses would be constructed on 358-acres under the LAX Northside project. Although no residential uses are proposed, the *LAX North Side Development Project Final EIR* indicated that the project would increase the use of public parks and recreational facilities in the Westchester/Playa del Rey area due to daytime or lunchtime employee use. Consistent with the conclusions in the *LAX North Side Development Project Final EIR*, incidental increases in daytime employee demand for public parks and recreational facilities would be minimal and demand would be offset by the construction of a 2.3-mile bikeway.[997]

Continental City

At buildout, approximately 3.1 MSF of the Continental City site would be developed with office and retail uses. No residential uses and no associated park and recreation demand would result from the development of the Continental City site under the No Action/No Project Alternative. Furthermore, the Continental City project includes a proposal for a 1.9-acre park, referred to as the Central Green,[998] in the center of the proposed building towers to serve employees and visitors. The *Continental City EIR* did not include an analysis of parks and recreational facilities as the *Continental City Initial Study* determined that impacts would not be significant.

---

997 City of Los Angeles, Department of Airports, Final Environmental Impact Report LAX North Side Development Project, p. IV-102, April 1993.

998 City of Los Angeles, Draft Environmental Impact Report EIR No. 407-82 SUB Continental City, p. III-29, August 1984.

Construction

Construction of the LAX Northside project may temporarily impair access to Westchester Park Recreation Center (via Lincoln Boulevard). However, alternate routes or detours would be provided if access is impaired as part of the standard planning and environmental review processes.

4.26.3.6.2 Alternative A - Added Runway North

Project Development

Alternative A (described in Chapter 3, *Alternatives*) contains various features that are especially pertinent to the analysis of parks and recreation impacts. Some of these features are increases in employees, construction, and property acquisition.

Although airport activity and the number of passengers and employees in the study area would increase between 1996 and 2015, no residential development or acquisition of park or recreational facilities is proposed. Both the Westchester Golf Course and Carl E. Nielson Youth Park would be expanded. The implementation of Alternative A would involve acquisition and the relocation of 84 residential units and relocation of 172 residents. Various transportation improvements both on and off the airport property would be implemented with Alternative A, some of which would be adjacent to parks and recreational facilities.

Service Effects

Without any residential development proposed, increases in on-airport employment and passengers, compared to baseline conditions, would increase demand for parks and recreational facilities due to daytime or lunchtime use. However, this increase is not expected to be substantial. Demand for park or recreational facility use from passengers is not considered significant as most visitors to the airport are focused on arriving or departing directly from the immediate area. While there would be an estimated increase in on-airport employment of 11,824 individuals compared to baseline conditions, it is doubtful, based on field observation,[999] that a meaningful number of these new employees would frequent off-airport parks at lunchtime such that demand would place constraints on these facilities. Due to time limitations, it is expected that such use would not likely involve active sports or require recreational facilities. As a result, impacts on parks and recreational facilities due to increases in on-airport employment would be less than significant.

Accepting that there would be some increased demand for park and recreational facilities, such increases would be more than offset by proposed increases in park and recreational facilities and the reduced local demand associated with residential acquisition. By 2015, Carl E. Nielson Youth Park would be expanded by 5 acres to approximately 12 acres. The expanded park would continue to be used for organized youth sports or other active recreational activities. Additional proposals for new park and recreational facilities are described below under Westchester Southside Project.

The reduced demand for local public park and recreational facilities would correspond to the land acquisition proposed under Alternative A, which would involve the relocation of 84 residential units with an estimated population of 172. As previously stated for the No Action/No Project Alternative, local demand would also be reduced with the relocation of 4,987 residents, independent from the Master Plan, under LAWA's existing acquisition program.

Imperial Highway would be improved by 2005; however, Imperial Strip would not be altered with implementation of any of the alternatives. Furthermore, there would be no changes or access constraints posed to the Westchester Park Recreation Center, Vista del Mar Park, Dockweiler State Beach, or the South Bay Bicycle Trail. Effects on parks and recreational facilities associated with the LAX Expressway and State Route 1 improvements under Alternative A are described in Appendix K, *Supplemental Environmental Evaluation for LAX Expressway and State Route 1 Improvements*.

As further described in Section 4.8, *Department of Transportation Act, Section 4(f)*, within the Section 4(f) study area, park use would not be significantly impacted by noise. As further described in Section 4.14, *Coastal Zone Management and Coastal Barriers*, under Alternatives A, B, and C, bicycle access to

[999] Field observation of park use in the LAX vicinity was conducted by PCR Services Corporation on September 5, 2000, between 12:00 and 2:00 p.m.

Dockweiler State Beach via Imperial Highway and Westchester Parkway would be temporarily impaired with development of the ring road. However, implementation of Master Plan Commitment LU-3, Comply with City of Los Angeles Transportation Element Bicycle Plan (Alternatives A, B, and C), would ensure that new bicycle lanes would be provided along Imperial Highway and incorporation of a bike path into the Westchester Southside development would maintain and improve access between Sepulveda Boulevard and Dockweiler State Beach along the north side of LAX.

Westchester Southside Project

By 2015, the Westchester Southside project would be built out with 2.62 MSF of office, hotel, retail, restaurant, and business park uses. Westchester Southside does not include residential development and, therefore, would have only limited increased demand for parks and recreational facilities from daytime or lunchtime employee use. Development of Westchester Southside includes expansion of the existing Westchester Golf Course by approximately 6 acres and would include 3 new holes. Within the remaining 91 acres of proposed open space, pedestrian and bike paths are proposed along greenbelts and there is potential for development of a public park and/or other recreational facilities. These proposed park improvements would increase the capacity of park and recreational facilities and more than offset the limited increase in demand expected from daytime employee and visitor use. As a result, impacts from Westchester Southside on parks and recreation are considered to be less than significant.

In conclusion, although Alternative A would increase park and recreational facility use with new employees and visitors to the area, this demand is not considered to be substantial and is not expected to have an adverse effect on park and recreational facilities. Furthermore, increases in demand would be more than offset through new and expanded park and recreational facilities proposed for Carl E. Nielson Youth Park, the Westchester Golf Course, and other areas within Westchester Southside. As a result, potential impacts to park recreational facilities would be less than significant. Potential impacts associated with Alternative A are consistent with those of the No Action/No Project Alternative; although Alternative A would, in comparison, provide more park amenities through the expansion of Carl E. Nielson Youth Park and the Westchester Golf Course.

Construction

Construction activities would occur throughout the airport vicinity on an ongoing basis through 2015. Construction of transportation facilities and other improvements in proximity to park and recreational facilities are not expected to restrict access to area parks and recreation areas. A possible exception would be construction associated with the expansion of Carl E. Nielson Youth Park; although, it is expected that LAWA would time the construction of these improvements so they would minimally interfere with youth sports. As described in Section 4.1, *Noise*, construction noise impacts would occur at Imperial Strip, just south of Imperial Highway in the City of El Segundo. However, Imperial Strip serves as a buffer between the airport and the City of El Segundo and much of its use is for viewing aircraft. Furthermore, construction noise at Imperial Strip would be temporary. Therefore, construction noise impacts at Imperial Strip relative to park use are considered less than significant. Construction of the Westchester Southside Development may temporarily impair access to Westchester Park Recreation Center (via Lincoln Boulevard). However, implementation of Master Plan Commitment ST-18, Construction Traffic Management Plan (Alternatives A, B, C, and D) would ensure that alternate routes or detours would be provided if access is impaired. Furthermore, as the focus of construction would be largely on airport property and within immediately adjacent acquisition areas, there would be no significant impacts on Vista del Mar Park, Dockweiler State Beach, or the South Bay Bicycle Trail. (See Section 4.20, *Construction Impacts*, for additional information.)

4.26.3.6.3 Alternative B - Added Runway South

Project Development

With implementation of Alternative B, Master Plan features influencing demand for parks and recreational facilities would be similar to Alternative A, with no acquisition of parkland, relocation of the same 84 residential units, and equivalent expansion of recreational facilities.

Service Effects

Increases in on-airport employment and proposals for 11 acres of new and expanded park facilities (i.e., Carl E. Nielson Youth Park and Westchester Golf Course) would be equivalent to those described for Alternative A, relative to the baseline conditions. Consistent with conclusions for Alternative A, impacts on park and recreational facilities would be considered less than significant, with incidental increases in demand from employees and visitors more than offset by new and expanded recreational facilities. Alternative B would provide greater park and recreational amenities than the No Action/No Project Alternative.

As further described in Section 4.8, *Department of Transportation Act, Section 4(f)*, within the Section 4(f) study area, no parks would be significantly impacted by noise. Impacts on bikeways, as further discussed in Section 4.14, *Coastal Zone Management and Coastal Barriers*, would be avoided through implementation of Master Plan Commitment LU-3 and incorporation of a bike path into the Westchester Southside development.

Westchester Southside Project

The Westchester Southside development proposal's effects on parks and recreational facilities would be equivalent to those described for Alternative A. Consistent with conclusions for Alternative A, proposed park improvements would increase the capacity of park and recreational facilities and more than offset the limited increase in demand expected from daytime employee and visitor use. As a result, impacts from Westchester Southside on parks and recreation are considered to be less than significant.

Construction

Impacts to parks and recreation areas resulting from construction activities would be similar to Alternative A. Therefore, as described for Alternative A, impacts due to construction are considered less than significant.

4.26.3.6.4 Alternative C - No Additional Runway

With implementation of Alternative C, Master Plan features influencing demand for parks and recreational facilities would be similar to Alternatives A and B with the primary difference focusing on changes in on-airport employees, and acquisition activities, and the provision of park and recreational amenities would be equivalent.

Project Development

Other than the difference in on-airport employment, there are no other components under Alternative C that would change previously identified effects on park and recreational facilities. The proposals for new and expanded park facilities in this alternative are the same as described above under Alternative A.

Service Effects

There would be an increase of 6,421 on-airport employees compared to baseline conditions and the same 172 residents would be relocated under Alternative C. This net increase in demand (compared to baseline conditions) would not alter the conclusions reached under Alternatives A and B regarding impacts on park and recreational facilities.

As previously stated, the increase in demand on park and recreational facilities associated with employees and visitors is not expected to be substantial, and with the proposed new and expanded facilities, impacts would be less than significant.

Compared to the No Action/No Project Alternative, Alternative C would have more beneficial effects with greater provision of recreational amenities.

As further described in Section 4.8, *Department of Transportation Act, Section 4(f)*, within the Section 4(f) study area, park use would not be significantly impacted by noise. Impacts on bikeways, as further discussed in Section 4.14, *Coastal Zone Management and Coastal Barriers*, would be avoided through implementation of Master Plan Commitment LU-3 and incorporation of a bike path into the Westchester Southside development.

Westchester Southside Project

The Westchester Southside development proposal's effects on parks and recreational facilities would be equivalent to those described for Alternatives A and B. Consistent with conclusions for Alternatives A and B, proposed park improvements would increase the capacity of park and recreational facilities and more than offset the limited increase in demand expected from daytime employee and visitor use. As a result, impacts from Westchester Southside on parks and recreation areas are considered to be less than significant.

Construction

Impacts to parks and recreation areas resulting from construction activities would be similar to Alternatives A and B. Therefore, as described for Alternatives A and B, impacts due to construction are considered less than significant.

4.26.3.6.5 Alternative D - Enhanced Safety and Security Plan

Project Development

A complete description of the facilities associated with Alternative D is provided in Chapter 3, *Alternatives*. The features of Alternative D that are relevant to the analysis of parks and recreation are summarized herein. Under Alternative D, no residential development or acquisition of park or recreational facilities is proposed. The Westchester Golf Course would be expanded by 6 acres, with the addition of 3 holes. Alternative D does not propose acquisition or relocation of residences.[1000] Under Alternative D, no changes to Carl E. Nielson Youth Park would occur.

Service Effects

Although no residential development is proposed, increases in passenger activity may increase demand for parks and recreation. However, demand from passengers is not considered substantial as most visitors to the airport are focused on arriving or departing directly from the immediate area. In addition, this increase is expected to be offset by a decrease of 9,261 on-airport employees that would occur under Alternative D.[1001] Furthermore, expansion of the Westchester Golf Course and provision of a bikeway and other recreational amenities within LAX Northside would offset the potential demand for parks and recreation that could occur from passengers. Local demand would also be reduced with the relocation of 4,987 residents, independent from the Master Plan, under LAWA's existing acquisition program. As a result, impacts on parks and recreational facilities due to changes in passenger activity would be less than significant.

Access to public parks or recreation areas within the study area would not be impaired with implementation of Alternative D. As described in Section 4.14, *Coastal Zone Management and Coastal Barriers*, Alternative D would not inhibit bicycle access to Dockweiler State Beach. Furthermore, implementation of Master Plan Commitment LU-5, Comply with City of Los Angeles Transportation Element Bicycle Plan (Alternative D), as further described in Section 4.2, *Land Use* (subsection 4.2.5), would support incorporation of bicycle paths and lanes as part of the Master Plan circulation system.

As further described in Section 4.8, *Department of Transportation Act, Section 4(f)*, within the Section 4(f) study area, park use would not be significantly impacted by noise.

1000 Although no residential acquisition is proposed under Alternative D, if surface transportation mitigation measure MM-ST-13, Create A New Interchange at I-405 and Lennox Boulevard (Alternative D), recommending a new interchange at I-405 and Lennox Boulevard is carried forward, it is possible that 9 to 12 homes may need to be acquired. Also, if ANMP land acquisition for Manchester Square cannot be completed by the time the Master Plan is approved, the City of Los Angeles will use the most appropriate and practical measures available (e.g., voluntary acquisition, leasing, and/or public condemnation) to ensure that the designated areas are vacated consistent with the Construction Sequencing Plan. These measures would be available to pursue any needed acquisition that cannot be obtained through negotiations. This would be the case for the majority of the build alternatives (i.e., Alternatives B, C, and D), the only exception being Alternative A where no new development within Manchester Square is proposed.

1001 The decline in employment in spite of increasing aviation activity reflects productivity increases (i.e., producing more economic output per worker within manufacturing industries related to LAX that would outpace increases in employment).

LAX Northside Project

Similar to the No Action/No Project Alternative, approximately 4.5 MSF of commercial and research/development uses would be constructed on 340-acres under the LAX Northside project. Although no residential uses are proposed, the *LAX North Side Development Project Final EIR* indicated that the project would increase the use of public parks and recreational facilities in the Westchester/Playa del Rey area due to daytime or lunchtime employee use. Consistent with the conclusions in the *LAX North Side Development Project Final EIR*, incidental increases in daytime employee demand for public parks and recreational facilities would be minimal and demand would be offset by the construction of a 2.3-mile bikeway.[1002] Demand would also be offset by a 6 acre expansion of the Westchester Golf Course. As a result, impacts on parks and recreational facilities from development of LAX Northside would be less than significant.

Construction

The extent and duration of construction would be reduced under Alternative D when compared to the other build alternatives. Construction of transportation facilities and other improvements in proximity to park and recreational facilities are not expected to restrict access to area parks and recreation areas.

As shown in Figure F4.1-10, Potential Construction Noise Impacts - Alternative D, in Section 4.1, *Noise* (subsection 4.1.6.4.3), construction noise impacts would occur at a small portion of Imperial Strip, just south of Imperial Highway in the City of El Segundo. However, Imperial Strip serves as a buffer between the airport and the City of El Segundo and much of its use is for viewing aircraft, rather than quiet activities. Furthermore, construction noise at Imperial Strip would be temporary and additive to a currently noisy environment. Therefore, construction noise impacts at Imperial Strip relative to park use are considered less than significant.

Construction of the LAX Northside project may temporarily impair access to Westchester Park Recreation Center (via Lincoln Boulevard). However, Master Plan Commitment ST-18, Construction Traffic Management Plan (Alternatives A, B, C, and D), would provide alternate routes or detours if access is impaired. Therefore, potential impacts to the Westchester Park Recreation Center would be less than significant.

As the focus of construction would be largely on airport property and within immediately adjacent acquisition areas, there would be no significant impacts on Vista del Mar Park, Dockweiler State Beach, or the South Bay Bicycle Trail (see Section 4.20, *Construction Impacts* (subsection 4.20.6.3), for additional information).

4.26.3.7 Cumulative Impacts

When considering cumulative impacts to parks and recreation associated with the No Action/No Project Alternative and Alternatives A, B, C, or D, in combination with other past, present, and probable future projects, as discussed under subsection 4.26.3.3, *Affected Environment/Environmental Baseline*, there are deficiencies in parkland relative to community goals in the Cities of Los Angeles and Inglewood and a surplus of parkland in the City of El Segundo. Under baseline conditions, there are 76 acres of parkland on LAX property between the 69-acre Westchester Golf Course and the 7-acre Carl E. Nielson Youth Park. Beyond the parks and recreation study area, the City of Los Angeles has an overall deficit of parkland, and the supply of parkland varies from surplus to deficit conditions in other jurisdictions in the region.

4.26.3.7.1 No Action/No Project Alternative

Under the No Action/No Project Alternative, there would be a reduction in direct employment generated by LAX due to increases in worker productivity with advances in technology among affected industries. As a result, employment-related demand for parkland would decrease. While passenger activity would increase, associated use of local parks and recreation areas by visitors to LAX is expected to be small. The acquisition of properties and relocation of 4,987 residents from the Manchester Square and Belford areas would substantially reduce local neighborhood demand for parkland. This demand would shift to

[1002] City of Los Angeles, Department of Airports, Final Environmental Impact Report LAX North Side Development Project, IV-102, April 1993.

other jurisdictions, which may or may not be faced with parkland deficiencies. Considering the above and the No Action/No Project Alternative's provision of a 2.3-mile bike path within the LAX Northside project and a 1.9-acre park within the Continental City site, the No Action/No Project Alternative's impacts on parkland would be offset or minimal, and would not contribute considerably to cumulative effects associated with other local and regional projects.

4.26.3.7.2 Alternatives A, B, and C

As previously discussed under subsection 4.26.3.3, *Affected Environment/Environmental Baseline*, increases in demand for parkland associated with new employees and visitors at LAX would be small, and would be more than offset through new and expanded park and recreational facilities proposed for Carl E. Nielson Youth Park, the Westchester Golf Course, and areas within the Westchester Southside development.

Although direct impacts on parkland would be less than significant under Alternatives A, B, and C, increases in employment generated by these alternatives would indirectly result in new households that could increase demand for parkland in the region. Depending on the alternative, LAX-related increases in population associated with increases in direct employment could range from 38,017 to 86,806 within the five-county region. This population increase, which represents less than 1 to approximately 2 percent of forecasted population growth for the region from 1996 to 2015, would generate demand for 114 to 258 acres of parkland. Within a ten-mile radius of LAX, population growth associated with new employment at LAX would represent approximately 3 to 5 percent of forecasted growth, generating demand for 21 to 40 acres of parkland. The potential impacts associated with these increases are difficult to predict, although it is clear that a large portion of this demand would be offset in areas where parkland dedication fee ordinances are in place, including the County and City of Los Angeles and numerous other jurisdictions. Within a ten-mile radius of LAX, only two out of 16 jurisdictions, the cities of Compton and Hawthorne, representing less than 5 percent of the area, do not have parkland dedication fee ordinances and are also deficient in parkland. Furthermore, the small increase in growth that might occur within these jurisdictions would only translate to demand for parkland where provisions for parkland are not included with new housing or through environmental review requirements.

In the more immediate LAX vicinity it is expected that independent project effects on parkland would be limited. For instance, the Playa Vista project, one of the few large areas available in the vicinity for residential development, is subject to parkland dedication or fees to offset project demand, and would not contribute to localized cumulative effects. The built-out nature of the surrounding communities is such that new residential development opportunities would be limited to small infill projects.

As Alternative A, B, or C's contribution to demand for parkland would be indirect, very small, and almost entirely covered by parkland dedication fees or special taxes, and the demand from related projects would be similarly offset through development fees, cumulative impacts on parkland are considered less than significant.

4.26.3.7.3 Alternative D - Enhanced Safety and Security Plan

Similar to the No Action/No Project Alternative, employment-related demand for parkland would decrease due to a reduction in direct employment generated by LAX. While passenger activity would increase, use of local park and recreation areas by visitors to LAX is expected to be small and would be offset by proposed recreational facility improvements. The acquisition of residential properties and relocation of 4,987 residents from the Manchester Square and Belford areas would also substantially reduce local demand for parkland. Therefore, the potential impacts of Alternative D on parks and recreation would be fully offset and less than significant, and would not contribute to cumulative effects associated with other local or regional projects.

4.26.3.8 Mitigation Measures

Alternatives A, B, C, and D would not have a significant impact on parks and recreation, therefore, no mitigation is required.

Comment Letter D

Vichy Springs
Resort

2605 Vichy Springs Road, Ukiah, CA 95482
707-462-9515 * 707-462-9516 (fax)
www.vichysprings.com

January 9, 2020

Mr. Jared Thiel
Public Works
Ukiah, CA 95482

Dear Jared,

Please find my observations, critiques and requests attached relative to the DEIR for the closure of the Ukiah Landfill.

It turns out Al Sevilla, Alisto Engineering, was unable to open and review the DEIR with the addresses given although we did utilize some of his comments.

He will be available again in a few weeks and thereafter. We feel the DEIR is defective and should be modified and recirculated with the adjustments, omissions and factual corrections it may yield a good result.

Thank you,

Gilbert Ashoff
President
Vichy Springs Resort, Inc

January 9, 2020

Page 10 E5.2 3rd Paragraph

Land adjacent to land fill property is zoned primarily as range land and is used for grazing.

a) This is not true
b) Only land north is used for grazing majority is not. Resort is zoned commercial Resort (overlay zoning) property west is zoned residential.
c) Resort building this is true, but the dump can be seen from many locations on the Resort property.

D-1

Page 14 E5.2 2nd paragraph

The Concerns were not expressed by non-existent (1990) Vichy Springs Investment Group. Concerns are from 166-year-old Vichy Springs Resort. The resort adjoins the dump property (not 500 feet from the southern property line).

D-2

Page 15 E5.6

"Alternatives considered but eliminated. Compacted clay and/or geo synthetic clay liners with natural vegetation." This is the standard for closure why not studied so City Council is informed?

D-3

Page 16 E5.7 Table E5.1

Impact 3.1 – 1

Many neighbors either look directly at the dump from their house or see it several times per day when they drive by. Residents, tourists who use Vichy Springs Road will see the dump. It will be bright and very ugly in late spring, summer and fall.

D-4

Page 19 E5.7 Table E5.1

Impact 3.1 – 3

Of course, this ugly cover will impact a historical resource the Resort. View shed from trails and guests walking or driving on Vichy springs Road will experience the blight.

D-5

Page 21 E5.7 Table E5.1

Impact 3.7 – 2

This project has already damaged substantially the fragile pressurized springs at Vichy. Continued drilling may further impact the pressure zone from which they originate. Study is needed by pressure zone experts. **D-6**

Table E5.1

Impact 3.8 – 1

There is zero noise at Vichy Springs at night. 7 am start will severely impact sleeping conditions. At 8 am added to the unpermitted unregulated Gun Club will be a dramatic increase. All day it will impact walkers and hikers at the Resort. **D-7**

Page 23 E5.8

No valid alternatives including the standard clay cover were included in this DEIR therefore this section is simply false. **D-8**

Page 39 2.3.2

The proposal is for gradient no steeper than 2:1 which means the dump is less than 2:1 in most of its area. Further the synthetic cover "will essentially eliminate the discharge of sediment" which is a natural occurrence. No place is it mentioned the effect of a forty-acre impermeable barrier on stream flows already under cutting the downstream areas especially west of Redemeyer Road to the Russian River. **D-9**

How will this be mitigated? It would not happen with a natural cover allowing water to penetrate.

Page 46 2.3.3 Third Paragraph

Hours are simply incompatible with a quiet Resort a few 100 feet away – when an environment is quiet any noise carries and is noticeable. **D-10**

We have proposed previously a 9am start and no back up beepers (this has applications and OSHA allows it).

Saturdays are the Resort's busiest day. Request no Saturdays.

Page 51 Chapter Three 3.0.3

Project area is not within and around the City of Oxnard! **D-11**

Seems this is not an original DEIR (see future references)

Page 53 3.0.6

The referred to “reasonable range of alternatives” is not included in this DEIR **D-12**

Page 54 3.1.1

Visual quality and visual sensitivity.

It seems neither of these were addressed not mitigated in this DEIR **D-13**

Page 57 3.1.2.2

Existing visual proposed project site. This again purposely misrepresents adjacent property as zoned rangeland and used for grazing. Property south, east and west of the dump is not used for grazing land. **D-14**

Page 62 3.1.4.3 Impacts and mitigation measures

The 2’ x 3’ sign is slightly smaller than the 40 acres that will be seen from Vichy Springs Road and the hiking property at Vichy Springs. Completely a misrepresentation. Needs to reflect what 40 acres looks like from 1,000 feet. **D-15**

Page 65

The “Green Blob” photo is self-explanatory. It is gross, unappealing and not acceptable next to a 165-year-old State Landmark. **D-16**

Page 66 3.1 Aesthetics

D-17

False statements as follows:

a) The landfill is visible from the landfill gate. One looks directly at it.
b) Vichy Springs Resort from its property sees the same as a) above sees it from a great percentage of their property.
c) The author did not hike all around the property or he would have seen the dump easily from many vantage points.
d) His comment “no visual sighting” is simply untrue. Photos will be presented by our legal counsel demonstrating 4-5 areas of over 100 where the dump can be seen in all its glory.
e) 40 acres are easily seen from 1,000 feet away, another untruth.

Page 72 Photo

The boundary line is misrepresented it is approximately where the 50' plus elevation barrier is. See fence line located which means the gate and dump are visible from the Vichy Springs property. **D-18**

Page 73 Photo

The arrow points at the visible dump. Please correct this error/misrepresentation. **D-19**

Page 84 3.2.2.5

Once again, the land use west, south and east is misrepresented to soften impacts. It is not used for grazing but for a private resort, a private gun range and residential. **D-20**

Page 102 3.3.2.3 Wildlife Movement

No mention of the huge quality of wild boar weighing up to 400 pounds or large elk at 650 pounds that graze and root (boar) the area and what that will do to plastic astroturf cover vs. clay. **D-21**

133 3.4.2 Key Concepts

Historic resource one again this cracker jack box DEIR refers to "Ventura County Historical Landmarks, or City of Oxnard points of interest." Really? May want to use another or a freshly created DEIR. Please correct this **D-22**

Page 136 3.4 Cultural . . . .

Vichy Springs did not begin in 1888 but in 1852-1854 as Day's Soda Springs. William Doolan renamed it Doolan's Ukiah Vichy Springs after selling the lands of Cayetano Juarez to the squatters on Juarez's Ukiah Valley Mexican Land Grant in about 1866. He acquired Vichy from Juarez. Day was a squatter. **D-23**

Page 139 3.4.3.6 Project Site Setting

The author correctly elicits Vichy Springs is a California State Landmark on page 136. Then, in the second paragraph, misrepresents "just outside the project area Vichy Springs resort established in 1857 (remember he said 1888 on page 136) is listed on the National Register of Historic Places (National Park Service 1985) <u>It is not</u> true. He then blanket states "the proposed project is not located in Vichy Springs Resort property (true) and would not involve any activities that would affect this historical place and/or **D-24**

buildings. He ignores all our comments especially the delicate pressure zone of the only springs of their type in North or South America. Really? Needs study, analysis and mitigation measures.

Page 140 3.4.4.2

"CEQA requires that lead agencies determine weather their projects may cause a substantial adverse change to a historical resource." **D-25**

Where is this shown, studied? Please study, indicate impacts and show mitigations.

Page 144 3.4.5.2 Approach to Analysis

Two places in paragraph 2 the author mentions .25-mile radius then 1/8-mile radius and again the 1857 date (1854) and the National Register – (not true). What does this actually prove? Please expand show study, results and any mitigations. **D-26**

Page 187 3.7 Hydrology

2nd paragraph last sentence this describes the main vent of water called Vichy Springs. The pressure zone extends 1/3 mile east to the base of the Mayacamas Mountains and west to the subdivision all along the Sulphur Creek. Free CO2 is seen all along this line. **D-27**

Page 189 3.7 Hydrology

Top of the page it mentions volatile organic compounds (vocs) found in 90-8 and 92.4. It states, "generally consistent with historical conditions and do not appear related to the landfill." Based on what? These are not normally found in shallow ground water. Please provide a study or documentation to back up this blanket statement and mitigations. **D-28**

Pages 189-190 Same for Tables 3.7.2

Please provide background study for these assumptions and any mitigations to prevent this from spreading to neighboring lands and water sources. **D-29**

Pages 190-191

This is addressed in our legal counsel's report. Is this just a magical coincidence drilling in the pressure zone of Vichy springs and its results? This needs to be studied by on expert who understands pressure zones not simply hydrology as that is not the issue. **D-30**

Pages 199 3.7

The mitigated negative declaration does not apply to a plastic cover. It applies to a clay cover. Please readdress this issue. D-31

Page 205 3.7.3

This project already illegally (with no Fish and Game permit) moved the steam channel and flow, from its natural channel, north to create a larger base for garbage. This needs to be studied and approved by Fish and Game, meaning what long term affects has the improper realigning of the stream had on the environment. What affects has dumping garbage in a streambed had and is having on the environment. D-32

Page 222 3.8.4.3 Noise

Sleeping guests will not appreciate 7am trucking and construction noise. An easy mitigation would be a 9am start and no back up beepers. This is a big deal. For the historical use of Vichy Springs. D-33

Page 223 3.8 Noise

The noise at 7am (City's ordinance, the DEIR report is in the county at a quiet location) is simply incompatible and is an impact that requires mitigation. Please study, show impacts and mitigation measures to zero out the problem that will be existing. D-34

Page 227 Chapter 4 Alternatives

Please see our legal council's report on the lack of alternatives. D-35

Page 257 2.9.1

This states gas well probes will extend 250 feet below surface. This may cause, once again, upset of Vichy Springs' pressure zone and needs study and mitigation measures. D-36

Page 706 Section 01800 Health and Safety

There is nothing in his section that addresses the lack of safety for workers behind the hugely increased unpermitted use of the City owned privately operated Gun Club. D-37

Old-time workers at the Dump will attest to the then, from a club with a fraction of today's use, bullets and ricochets flying around as they worked directly in the line of firing from the Gun Club. This needs to be studied and mitigated.

Note this northerly trajectory of bullets affects all activities including residences and ranchland north and east of the Gun Range. Vichy Springs can provide names of people who have experienced this past and present.

Nowhere could be found safety and mitigation measures should the well drilling affect the spring waters at Vichy Springs. The springs should be monitored and drilling immediately stopped should pressure be encountered (pressure sensitive instruments should be used when drilling) and remediation immediately implemented. Drilling close to springs like Vichy is prohibited in enlightened parts of Europe. D-38

This is extremely important and is a formal request.

Pages 1014 & 1015 Post closure Cost

This should be done with clay cover for comparison and evaluation by public – This is a major defect in the DEIR. D-39

Page 1039 2.2

Tis is a huge misrepresentation. It makes the gun range, which is adjacent (not 2000 feet away) to the "Waste Management" and is south not northeast. Once again land surrounding is <u>not</u> primarily used for grazing but resort, gun range and residential homes. There are also homes on the only area north and northeast of dump used for grazing. D-40

Please correct all of these inferences and stop misrepresenting them.

Page 1056 (20) section d

This is simply false. It is in an urban area with 100's of homes and a resort within 1,000 to 4,000 feet with sewer, water, gas and electricity, hardly rural. D-41

Please correct, address, impacts and mitigations with the correction in all of the following pages and other locations.

Page 1111 (75) section c second paragraph

Stream bed alteration agreement should include a clearance for the illegal diverting of tributary and burying the original stream bed with garbage. This is imperative as the new permit should not be issued without the previous alteration being studied, certified and accepted as having no impact on the environment. D-42

Page 1113 5.0 conclusions 5.1 c

This is simply is not true. It will have adverse impact on human beings. The transfer from bucolic grasslands to ugly plastic is huge. D-43

Please address impacts, alternatives and mitigations.

Page 1114 c Less than significant impact

D-44

The first sentence is a statistical impossibility.

Please see comments and requests herein and those of our legal counsel. There are significant impacts address them please.

Page 1281 1.1

See previously mentioned concerns related to the second sentence. This creek was moved illegally now is the time to address it. D-45

Page 1344 site characteristics Gen. Desc.

2nd paragraph again repeats misinformation Vichy Springs Investment Group (does not now exist (since 1990). First mention of home(s) 900 feet west of landfill. This was not included in impacts before and it is addressed in our legal counsel's report with photos, as are homes (several) in El Dorado Estates that look directly at the dump. D-46

Pages 1411, 1413, 1414 Mendocino County, CA ……Part of Trinity County, CA

D-47

Again, the cracker jack box DEIR appears. May want to correct this.

Thank you,

Gilbert Ashoff
President
Vichy Springs Resort, Inc

Chapter 3 Responses to Comments

This chapter evaluates and provides responses to the comments received on the 2019 Public Draft EIR (DEIR) during the 45-day public review period (November 13 through December 31, 2019 and then extended through January 9, 2020). The City also received verbal comments from Vichy Springs resort at the Public Hearing which was held on December 18, 2019 as well as four written comment letters. In comparing the notes from that meeting and the written comments provided by Vichy Springs Resort, it appears that all of the substantive elements of their verbal comments are covered by their written comment letters. The City has reviewed and considered all of the comments received and provides a response to each of those comments as provided for below.

COMMENT LETTER A – CALRECYCLE

Response to Comment A-1. Thank you for your letter and the information regarding that a closure permit should be issued when the Final EIR is certified to enable the Lead Environmental Agency (LEA) to enforce the Final Closure Post Closure Maintenance Plan.

Response to Comment A-2. The City acknowledges that the Mendocino County Department of Environmental Health is the Local Enforcement Agency (LEA) and is responsible for providing regulatory oversight of solid waste handling activities, including inspections. The City looks forward to working with the Mendocino County Department of Health on this Project.

Response to Comment A-3. The City understands that CalRecycle may have further comments on the Proposed Project. Please feel free to continue to contact Jarod Thiele at 707-463-6755 or by e-mail at jthiele@cityofukiah.com.

Response to Comment A-4. As required by the California Environmental Quality Act (CEQA), the City will provide CalRecycle and all other commenting agencies with a minimum of 10-days advance notification of the time, date, and location of the adoption of the Proposed Project by the City Council, along with an electronic copy of the Final EIR, which includes responses to comments received.

COMMENT LETTER B – NORTH COAST REGIONAL WATER QUALITY CONTROL BOARD

Response to Comment B-1. The comment is correct in that the City is proposing to use an engineered alternative design cap rather than a prescriptive compacted clay layer cover for the closure of the Ukiah landfill pursuant to the provisions Order No. R1-002-0061 and Title 27 of the California Code of Regulations (T27 CCR), §20080(b). The City agrees that the No Project Alternative is not a viable regulatory alternative that can legally be implemented as the Ukiah Landfill is required to be closed in accordance with T27 CCR. Please be advised that the City has revised Chapter 4 – Alternatives in the DEIR to expand on the evaluation of the clay layer/natural cover alternative. Specifically, the City has moved the clay layer/natural cover alternative from Section 4.4 - Alternatives Considered and Eliminated to Section 4.3 - Alternatives Carried Forward. Please see Chapter 4 – Revision to the DEIR (of this Final EIR) for changes to the DEIR.

The City's selection of the Proposed Project - including the use of engineered alternative design cap cover and the ClosureTurf® product as the artificial synthetic turf cover was evaluated by EBA Engineering in a Joint Technical Document ("JTD") Addendum No. 2, submitted to the Local Enforcement Agency ("LEA") on August 14, 2015 (See Appendix B to this Final EIR) as environmentally and functionally superior to the prescriptive compacted clay liner (CCL) cover. EBA proposed ClosureTurf® after evaluating other alternatives, including the prescriptive clay cover and other traditional geomembranes

and geosynthetic clay liners (GCLs), as well as a rock-armored surface in lieu of a vegetative soil cover to address the susceptibility of soil creep and veneer failures on the steep slopes.

Findings from the aforementioned research concluded that a GCL final cover system represented a suitable alternative. Based on this finding, the City proceeded with the submittal of an engineered alternative analysis (EAA) on March 11, 2003 to the North Coast Regional Water Quality Control Board (RWQCB), California Integrated Waste Management Board (now CalRecycle), and the Mendocino County Environmental Health Department (LEA). The EAA was prepared in accordance with Title 27 of the California Code of Regulations (27CCR), §20080(b) and included comparisons of pertinent properties related to physical, mechanical, and hydraulic conductivity characteristics, construction/installation, and other miscellaneous performance features, as well as an economic analysis. Conclusions from the EAA demonstrated that the proposed GCL alternative met or exceeded the performance criteria addressed by the prescriptive standard and would result in a reduced economic commitment of tax payers' dollars on the order of $461,000. This same EAA was included in the January 2008 Joint Technical Document (JTD) requested by the RWQCB.

In 2015, the final cover design was reviewed once again to consider the potential application of the ClosureTurf® product. Whereas the GCL final cover system was demonstrated to be an appropriate upgrade to the prescriptive standard, the stability characteristics of the system only marginally exceeded the minimum design standards. Further research by EBA of the ClosureTurf® final cover system revealed that the use of this product would provide significantly higher stability characteristics than the GCL and other geosynthetic products. It would also offer a number of other advantages as compared to the GCL and the prescriptive CCL standard. These advantages include the following:

Performance

- ClosureTurf® exhibits substantially lower infiltration rates as compared to the prescriptive CCL standard and offers more efficient removal of moisture above the low-hydraulic conductivity layer (LHCL) component, thereby reducing the amount of potential infiltration into the waste management unit (WMU).
- The engineered turf component eliminates the potential for soil creep and veneer failures resulting from saturation of the vegetative soil cover that is a required component of the prescriptive Subtitle D final cover and other traditional geosynthetic cover systems. This potential is exacerbated by the very steep slopes that exist at the Ukiah Landfill.
- The drainage aspects of the ClosureTurf® are designed to allow rainfall to penetrate rapidly through the sand infill layer and into the structured drain liner below which has a very high transmissivity for subsequent conveyance of the water off of the liner system. The sand infill has been demonstrated to handle over six inches per hour of rainfall intensity without erosion when applied on three horizontals to one vertical (3H:1V) slopes. Such rainfall energy conditions on a traditional vegetative soil cover would likely result in significant erosional damage.
- The drainage aspects of the ClosureTurf® promote very "clean" and low turbidity stormwater run-off, which represents a beneficial feature since the collected run-off is subsequently discharged to the ephemeral creek that borders the northern boundary of the WMU. Achieving comparable stormwater run-off quality from a traditional vegetative soil cover would be difficult. It should be noted that the unnamed creek is a tributary to the Russian River which is listed as impaired for excessive sediment pursuant to 303d of the Federal Clean Water Act.
- ClosureTurf® is designed to provide weathering resistance and geomembrane protection when exposed to extreme heat and ultra-violet (UV) exposure. Based on results of independent, real-world weathering tests and data from existing projects, ClosureTurf® can provide decades of

reliable performance beyond the standard 30-year postclosure maintenance period.

- ClosureTurf® has been tested for wind uplift resistance and demonstrated no uplift when exposed to 120 miles per hour wind. As such, the ClosureTurf® can withstand most wind conditions that could realistically be encountered at the site.

Installation

- ClosureTurf® deployment is very straightforward, both from a placement and seaming standpoint. Furthermore, heavy equipment requirements for ClosureTurf® deployment are limited primarily to a rubber-tire forklift or equivalent. Conversely, CCL construction is very labor intensive with substantial reliance on heavy equipment (i.e., scrapers, dozers, compactors, etc.).
- Less construction quality assurance (CQA) is required for ClosureTurf® due to the consistency of the materials and manufacturing process. CQA testing for a CCL, in turn, is more extensive and occurs at a higher frequency to verify the consistency of borrow source materials and the contractor's ability to achieve moisture content, compaction, and hydraulic conductivity during construction.
- Installation of a sealed, double-ring infiltrometer (SDRI) is required to test the field permeability of CCLs, which is costly and time consuming. Such a provision is not required for ClosureTurf®.
- In comparison to other geosynthetic liner systems, ClosureTurf® is slightly more labor intensive due to the placement of the sand infill layer. However, this increased labor is more than offset by the elimination of the vegetative soil layer. Similar to the CCL construction, construction of a vegetative soil layer is also very labor intensive with substantial reliance on heavy equipment. In addition, in the case of the GCL final cover system that was previously proposed for the landfill, the gas relief layer material and labor requirements are significantly greater as compared to the ClosureTurf®. Thus, the ClosureTurf® final cover system installation represents the least intensive approach from an installation standpoint.

Maintenance

- ClosureTurf® offers a significant maintenance advantage over a prescriptive Subtitle D final cover and any other traditional geosynthetic cover systems that require a vegetative soil cover. In essence, vegetative soil covers often require regular maintenance related to the repair of erosional damage, installation of erosion control measures (i.e., silt fences, hay bales, wattles, etc.), slope repairs, and revegetation. Erosion from the vegetative soil cover also causes siltation of drainage ditches and culverts that require subsequent repair. Such provisions are not required with the ClosureTurf® product, thereby providing a significant cost savings over the course of the postclosure maintenance period.

Based on the aforementioned considerations, the City proceeded with the submittal of a second EEA to demonstrate equivalency to the prescriptive standard and to meet the criteria specified in 27CCR, §20080(b). As required in 27CCR, an economic analysis was included that compared the closure construction costs for ClosureTurf® versus the GCL final cover system. Note that this cost comparison focused on the GCL scenario since it was previously demonstrated as part of the March 2003 EEA that the GCL was more economical than the prescriptive standard. The results of the comparison revealed that the construction cost for ClosureTurf® was approximately $420,000 less than the GCL final cover system. In addition, the 30-year postclosure maintenance costs associated with ClosureTurf® were estimated to be approximately $277,000 less than any final cover system that requires an erosion-resistant layer comprised of a vegetative soil cover. Thus, the overall cost savings resulting from replacing the previously proposed

GCL final cover system with ClosureTurf® is approximately $697,000. This EEA was included as part of a *Final Closure Submittal Package* issued to the RWQCB, CalRecycle, and LEA on August 14, 2015.

After the aforementioned submittal, two additional versions of the FCPMP were prepared in March and May, 2016 at the request of CalRecycle. The content of these versions was similar to the information contained in the August 2015 submittal, with modifications pertaining to formatting issues and incorporating miscellaneous comments issued by the various regulatory agencies. However, following submittal of the May 2016 FCPMP and prior to regulatory approval of the design, a prolonged period of negotiations occurred that focused on the thickness of the foundation layer (1-foot versus 2 feet) and geomembrane liner (50 mil versus 60 mil). In a meeting with the RWQCB on October 11, 2018, an agreement was reached on both issues (2 feet foundation layer and 50 mil geomembrane liner), as well as a provision to address a possible replacement scenario as part of financial assurance.

After the final negotiations and agreements reached during the October 11, 2018 meeting with RWQCB staff, the City was directed by CalRecycle, LEA, and RWQCB to proceed with updating the FCPMP for the ClosureTurf® final cover system design by April 30, 2019. The City met this deadline. That directive confirms that each agency was satisfied with the previous EEA demonstrations and the corresponding conclusions that the ClosureTurf® final cover system as proposed is adequately protective of the environment.

As demonstrated above, EBA has evaluated potential alternatives multiple times over the course of this project under the regulatory framework of 27CCR and the various regulatory agencies. The scope of the analyses performed complied with 27CCR, §20080(b) which requires that the proposed engineered alternative be consistent with the performance goal addressed by the prescriptive standard and afford equivalent protection against water quality impairment, while also demonstrating that the construction of the prescriptive standard is unreasonably and unnecessarily burdensome and will cost substantially more than the proposed alternative. While these analyses have been performed and subsequently approved by the regulatory agencies, including the RWQCB and are part of the administrative record and now contained as part of the Final EIR.

In its evaluation, EBA found that the low hydraulic conductivity layer (LHCL) geomembrane component of the ClosureTurf® system is fully protected from ultra-violet (UV) degradation and other environmental stresses by the engineered turf and specified infill. Watershed*Geo* (ClosureTurf® manufacturer) has completed extensive testing that shows the protective turf cover with sand infill will last longer than 100 years. This testing has been conducted at third-party laboratories and the results have been audited by other third parties. (See Appendix B.) As such, the design-life of the engineered turf layer ensures that the LHCL geomembrane component will remain covered for that period.

The City also shares concerns about catastrophic wildfires and its potential to adversely impact the landfill cover. As such and as standard City practice, the City has addressed the maintenance and replacement costs and values in the Final Closure and Postclosure Maintenance Plan (FCPMP) and will take out adequate insurance policy(s) to cover the costs for replacement in the event of a catastrophic event such as a wildfire.

Response to Comment B-2. The comment is correct in that in 2018, the City had proposed to develop portions of the same parcel APN No. 178-130-01 as a public park known as the Vichy Hills Trail Project. However, according to the City Public Works Director, the City has dropped/abandoned that Proposed Project due to environmental and public safety concerns that could result from allowing public access. As a result, the Proposed Vichy Hills Trail Project is cancelled/abandoned and the City property will remain closed to public access. That project is no longer a probable future project that requires further consideration in this EIR.

Response to Comment B-3. The City looks forward to continue to work with the Regional Board to address the permitting requirements and mitigation measures for work in the jurisdictional water requiring 401 Certification.

Response to Comment B-4. The City acknowledges that disturbed soils on the Proposed Project will exceed 1 acre in area and thus will require to obtain coverage under the General Permit for Discharges of Storm Water Associated with Construction Activity, Construction General Permit Order No. 2009-0009-DWQ (As amended by 2010-0014-DWQ and 2012-0006-DWQ). In addition, the City acknowledges that the Construction General Permit also requires the development of a Storm Water Pollution Prevention Plan (SWPPP) by a certified SWPPP Developer which must be implemented, monitored, and maintained. The City looks forward to working closely with the various departments within the Regional Board on this Project.

COMMENT LETTER C – WATER AND POWER LAW GROUP/VICHY SPRINGS RESORT

Response to Comment C-1. Thank you for your comment letter and similar oral comments at the December 17, 2019 Public Hearing in Ukiah, California on the DEIR.

Response to Comment C-2. Comments noted. The City appreciates Vichy Springs Resort's assertion that its comments on the DEIR are not about stopping the Landfill Closure Plan, but instead are more about ensuring that the Landfill Closure Plan is done correctly. Specifically, the City intends to close the Ukiah Landfill in an environmentally responsible and safe manner so that the Proposed Project will not cause any significant environmental and/or physical impacts to the Vichy Springs Resort including its guests, hikers, and recreational users.

Response to Comment C-3. The City acknowledges that Vichy Springs has previously provided written comments on the 2016 IS/MND and the 2017 Notice of Preparation to prepare an EIR (i.e. "Scoping Document") that discussed the scope of the issues to be addressed and excluded in the EIR that would be prepared for the Landfill Closure Project. The City responds to these comments in its responses to Comments C-3a to C-3c, below.

Response to Comment C-3a. The City disagrees that the Proposed Project's artificial synthetic cover would have an adverse visual impact. Figure 2-2 in the DEIR provides two recent examples of artificial synthetic turf covers being successfully used for landfill closures and which look very natural and blends well into the surrounding natural environment. The City's proposed artificial synthetic turf cover would look very similar and would be designed to fit into the surrounding environment. The City agrees that the artificial synthetic turf cover will not change color with the change of seasons. However, there are many instances throughout Northern California where there are green grass/vegetation features contrasted by or along-side brown hills in the late summer early fall timeframe. This phenomenon occurs naturally around water features such as rivers, lakes, streams, creeks, marshes, wetlands, etc. as well as manmade features through irrigation practices. These instances create contrast in the landscape and are not considered to have a significant adverse aesthetic impact(s). Further, the proposed artificial synthetic turf cover is designed to look like natural grass and the technology has improved so that it is almost impossible to tell the difference unless you are standing on the artificial synthetic turf. As an example, see the picture below of an artificial baseball field where the entire infield (including home plate area and base paths) is made out of artificial turf. The outfield is natural grass and the pitcher's mound is dirt/clay. This picture was taken from on the field near the backstop, where the outfield grass is approximately 110-feet away. From that distance, it is virtually impossible to tell the difference between the artificial turf and the outfield grass. Certainly, at any partial views from of over 500-feet away, it would be difficult or impossible to tell the difference between artificial synthetic turf and real/natural grass. As a result, the City proposed the olive-green color option as the olive-green color would blend into the natural surrounding environment the best. Also, as described in Section 2-Project Description, a sand layer will be put on top of the turf to serve as a ballast and help hold

the turf down. This sand ballast will be a soft tan/brown color and will help dampen any harsh olive-green color contrast concerns and will help to make the artificial synthetic turf look even more natural. Please refer to Chapter 4 of this Final EIR for additional documentation and photos describing how and why the Proposed Project would not have a significant visual impact on the Vichy Springs Resort. In short, it is the City's determination that the Proposed Project's artificial synthetic turf would not have an adverse aesthetic impact on any viewshed. Further, the fact that the City has not received ay other comments from other potential sensitive receptors, further supports that the proposed Project would not have any significant adverse aesthetic impacts.

Example of Artificial Turf Infield and Natural Grass Outfield
McBean Baseball Field, Lincoln, CA

Response to Comment C-3b. The City acknowledges that Vichy Springs Resort has explained numerous times that there are extensive hiking trails on the Vichy Springs property where guests come to enjoy the quiet and tranquility of the area. However, as disclosed in the DEIR and discussed more fully in Response to Comment C-6e below, the proposed construction activities would not provide a significant source of noise that would exceed the Mendocino County noise ordinance and would not ruin the "quiet and tranquility" for Vichy Springs Resort guests staying overnight and/or using the hiking trails.

Once constructed, the Proposed Project would not have any activities that would make any noise that could be heard by Vichy Springs Resort's guests and hiking trail users, except for the basic ongoing maintenance and inspection activities that currently exists and which are well within the Mendocino County noise ordinance restrictions. As a result, the Proposed Project would not have any adverse noise effects on Vichy Springs Resort, its guests, and/or hiking trail users. Therefore, no mitigation measures are necessary. Further, the City would certainly not condone or advise its contractors to remove their back-up beepers. Please see response to Comment C-6i.

Response to Comment C-3c. The City agrees that for many years Vichy Springs Resort has raised concerns that the City's existing groundwater monitoring wells impact Vichy Spring Resort's spring water. Please see response to Comment C-7 that addresses this concern.

Response to Comment C-4. The City respectfully disagrees that the DEIR did not consider the Compacted Clay and/or GeoSynthetic Clay Covers with Natural Vegetation Closure Alternative. The DEIR did in fact "consider" and "evaluate" numerous alternatives, including the clay layer/natural cover alternative. Under CEQA, alternatives can be "eliminated from further consideration" based on rationale provided for elimination of the alternative. This in and of itself is an "evaluation". Further, CEQA, unlike NEPA, does not require that alternative discussions be presented in/at the same level of detail as the assessment of the Proposed Project.

As disclosed in Section 4.3 of the DEIR, the clay layer/natural cover alternative was eliminated due to a variety of technical and environmental concerns including, site suitability, increased costs from both a construction and maintenance perspective, and increased environmental impacts to air quality, biological resources, water quality, noise, and traffic, among others. Even though the clay layer/natural cover alternative was eliminated, it has been adequately "considered" and "evaluated". Also, please refer to Appendix B of this Final EIR for specifics and history of how the City has further considered the clay layer/natural cover alternative through the years.

Nevertheless, in an attempt to help resolve this issue, the City has revised Chapter 4 – Alternatives to move the clay layer/natural cover alternative to be included in the DEIR as an alternative carried forward instead of being eliminated. Specifically, the City has moved the clay layer/natural cover alternative as a Section 4.4 - Alternatives Considered and Eliminated and moved it to Section 4.3 - Alternatives Carried Forward. Please see Chapter 4 – Revision to the DEIR (of this Final EIR). Specifically, the City has expanded on its evaluation of the clay layer/natural cover alternative in the DEIR. However, the conclusion is the same in that the clay layer/natural cover alternative would have increased environmental impacts to air quality, biological resources, water quality, noise, and traffic, among others than the Proposed Project.

Response to Comment C-5. See responses to C-5a to C-5j below.

Response to Comment C-5a. The City respectfully disagrees with the comment that the DEIR has several flaws and defects in Section 3.1 – Aesthetics/Visual Resources as it relates to the artificial synthetic cover. Please see responses to C-5b through C-5j below.

Response to Comment C-5b. The comment is correct in that the City did in fact choose the "olive-green" color as the best color option to blend into the natural surrounding environment. It was selected to blend into the olive-green grass in the winter or wet-season and look like an irrigated field in the summer dry months. This is not a flawed concept because it is very common to find irrigated fields, pastures, agricultural crops, golf courses, and landscape designs using grass adjacent to the natural brown/tan hillsides throughout Northern California in the summer or dry months. This is common place throughout Northern California and specifically in the Ukiah area and therefore does not present an uncommon contrast. For example, the DEIR provided a comparison of the Proposed Project's proposed olive-green color scheme blends in with other local irrigated areas such as the Ukiah Valley Golf Course and the local surrounding areas. Please see Chapter 4 of this Final EIR for additional photos and analysis of the aesthetic features of the Proposed Project. Further, Vichy Springs Resort itself has a relatively large grass area that is kept green all year long, due in part, because it provides it guests with a natural, aesthetically appealing, contrast to the natural brown/tan landscape surrounding the resort. Color contrasts in natural green and brown/tan contrasts are prevalent throughout northern California and is not considered to be a significant environmental impact. The City has used the CEQA guidelines in the DEIR for establishing the environmental standards for evaluating whether a change to the physical environment is significant and adverse. The City's DEIR (and as revised through this Final EIR) concluded that the color contrast in the dry season would not be a significant environmental impact and/or would impact a designated view by Mendocino County. Please see comments C-3 and C-3a above as well as C-5c through C-5j below.

The City has only received comments from Vichy Springs Resort expressing these concerns. The comment also does not provide any evidence such as pictures or testimony from technical experts that it would be a significant environmental impact and or that a view to the Ukiah Landfill is considered by Mendocino County as a scenic resource of significance.

Response to Comment C-5c. Please see response to comment C-5b above. The proposed olive-green artificial turf cover will look like real or natural grass. Please see and revisit Figure 2-2 as real-life examples of it being used on existing landfills and how well they look like real or natural grass. The proposed olive-green artificial turf cover will appear to be an area of irrigated land. Please see Chapter 4 of this Final EIR for additional photos and analysis of the aesthetic features of the Proposed Project.

Response to Comment C-5d. Please see response to comment C-5a and C-5b above. The overall comment correctly points out that the existing vegetation on the surface of the landfill and on the surrounding land represents the baseline or existing environmental condition. The City agrees that the EIR must evaluate the impact of the Proposed Project on existing conditions. As such, the DEIR acknowledged that the Proposed Project cover will change the existing condition from the natural vegetation to an artificial synthetic turf cover and provided several examples in the DEIR of how that would look in comparison to the existing conditions.

As discussed above, the proposed artificial/synthetic turf cover is designed to and will blend into the surrounding area as an irrigated grass field, which is very common throughout Northern California and the surrounding Ukiah region. The Aesthetic Chapter 3.1 includes Figure 3.1-1 (page 3.1-6) of the DEIR that shows a 2018 view of the landfill (the existing condition on the day of the aerial photo). The baseline condition changes from season to season, but the landfill will always stand out from the surrounding area, because the landfill is the largest continuous area in this viewshed with no trees. The existing landfill already is distinct from the existing natural landscape as it is a landfill with waste underneath the existing vegetation and there are no trees on top of the landfill. As a result, the 40-acre area of the closed landfill will always be in contrast to the surrounding natural environment (with sparse or dense stands of trees) – even with a clay/natural cover. The DEIR provides several examples of how the Proposed Project would compare and contrast with the existing conditions. Specifically, the DEIR shows recent examples of where artificial synthetic turf is being successfully used. For instance, and as provided in Figure 2-2 of the DEIR, artificial/synthetic turf covers have been and are being successfully used for landfill covers and provide a very natural, aesthetically appealing, looking cover. The City maintains that the Proposed Project's proposed artificial/synthetic turf cover would look very similar to the two artificial/synthetic covered landfills examples provided in the DEIR (see Figure 2-2).

Please see Chapter 4 of this Final EIR for additional photos and analysis of the aesthetic features of the Proposed Project. As explained in response to comments C-3, C-.3a, and C-5b above as well as in Section 3.1 of the DEIR and as revised in this Final EIR, the City has determined that the change is not environmentally significant and provides substantial evidence that it does not at other landfills and would not adversely affect Vichy Springs Resort. Further, the comments from Vichy Springs Resort contain the only opinion and/or evidence received by the City during the several public comment periods over the years that the color contrast between the Proposed Project and surrounding land during the dry season should be considered environmentally significant. Further, the comment does not provide any evidence other than Vichy Springs Resort's opinion to support this claim.

Response to Comment C-5e. Please see response to Comment C-5d regarding baseline conditions and response to Comment C-5b regarding evaluation of the future visual landscape to the surrounding areas.

Response to Comment C-5f. As discussed in the DEIR, the primary purpose of the 1,000-foot example is to provide some context to the reader as to what can reasonably be seen by the naked eye from within and up to 1,000-feet away. Further, the demonstration shows how, even without obstruction, objects are harder

and harder to see or notice as one moves farther and farther away. Views of the proposed artificial turf cover from over 500-feet away would look like a natural olive-green grass or irrigated field off in the distance that is aesthetically appealing against a brown/tan natural hillside environment. The City maintains that the Proposed artificial synthetic turf will not result in significant adverse visual impacts based on the applicable CEQA standards and thresholds of significance as well as the environmental setting.

Response to Comment C-5g. Thank you for the photographs attached as Exhibits C-F to your comments. However, these photos do not change the determination that the impact to viewshed is not environmentally significant. Also, the DEIR does in fact consider potential views from houses in the El Dorado Estates and Deerwood Park. These are referred to as Key Observation Points (KOPs) F and G in Table 3.1-1 in the DEIR, and which are almost 2,000-feet away. The author of that section did not have access to the balconies of private individual homes with the partial views of the landfill area. The author did not find any public vantage point where the landfill area could be readily seen. However, it should be pointed out that these residents all received notification of this DEIR and none have expressed concerns with the Proposed Project, including concerns with the color contrast of an olive-green artificial/synthetic turf cover with the natural surroundings and environment. As a result, the City has received only one opinion that the Proposed Project would have an adverse viewshed impact from distant private property from over 2,000-feet away and no evidence that viewsheds from public property to which the public has access would be adversely affected.

Response to Comment C-5h. Please refer to responses to comment C-4 above.

Response to Comment C-5i. The City agrees that the prescriptive natural cover has been the standard for numerous years. However, as pointed out in the DEIR, there is growing concerns and evidence that the prescriptive natural cover does not perform as well on steep slopes like the slopes at the Ukiah Landfill and an engineered alternative is the preferred alternative in this situation. The engineered alternative cover meets Title 27 requirements, and is conditionally approved by all of the necessary regulatory agencies, including Cal Recycle. Please see Response to Comment C-2 above and Appendices B and C of examples where artificial synthetic turf covers are being successfully used over the prescriptive clay natural cover.

The advantages of an artificial synthetic turf landfill cover system over traditional clay cover layer/natural vegetation cover system include the following:

- **Long Life.** Durable, high-strength system components ensure a long-life (100-year design life) of protection against operational and natural forces while maintaining a natural looking appearance with less maintenance than will likely be required for the prescriptive clay cover or a different artificial cover.
- **Soil Cover Savings**. Eliminates the need for high maintenance vegetative soil covers and increases weather resistance. Since final cover soils are challenging to locate and expensive to place in the final stages of the landfill's lifespan, the resulting savings can be significant.
- **Environmentally Friendly.** The system is better for landfills in sensitive areas like the Ukiah Landfill where soil erosion and sedimentation are a major concern due to steep canyon slopes. Soil loss is non-existent during operations and post-closure. Eliminates the need for borrow sources, and siltation ponds can be converted to simple stormwater retention ponds. As a direct result, associated environmental construction impacts are much easier to manage.
- **Slope Stability.** While a prescriptive clay cover in pristine condition is the most stable landfill cover, it is possible that over time, the clay cover will desiccate and become less stable. Moreover, with the landfill's steep slopes, failures over time are likely. When those failures occur, less material will be required to repair the damage to the ClosureTurf® cover and the repair will require less heavy equipment with less cost and less risk of damage caused by the equipment. Soil stability

problems either rain/storm events, through earthquake, and/or gas pressure buildup is reduced.

- **Weather Resistant**. The components of an artificial synthetic cover system work in conjunction to seal the waste mass from the destructive forces of high rainfall intensities and hurricane force winds.
- **Reduced Wildlife Impacts**. By reducing organic matter and food sources, fewer animals, including birds, are attracted to the site. This is important at landfills located in coastal areas or near airports. Because the components of an artificial synthetic cover system do not pass on the animals' smell/taste test, they do not usually bother with it or return to it.
- **Eliminates Cap Infiltration**. Since surface water is not restricted by the hydraulic conductivity of a vegetative cover drainage system, and can no longer infiltrate into the waste, leachate production is cut off at the source. (See Appendix B.)
- **Enhanced Visual Inspection**. Because the synthetic materials are not covered with thick soil profiles, they are easily inspected for damage, which, if identified, may be easily and inexpensively repaired. Also, significant additional damage to clay layer caps can be done by earthwork equipment during repair and soil placement maintenance activities. By replacing the soil layer with an artificial synthetic cover system, this risk is eliminated.
- **Easier Reclamation**. Landfill materials are readily accessible in the event of landfill reclamation for future piggyback areas or future waste lifts due to waste settlement or vertical expansion. The composite nature of an artificial synthetic cover system allows owners access to the waste without having to remove the existing cover soils of a typical and traditional final cover system. (See Appendices B and C.)

Response to Comment C-5j. Thank you for the 2015 article from Waste 360 magazine. As discussed above, capital cost is and was not the only issue in the selection of the Proposed Project and is not really a factor in the environmental review. Slope stability issues are the primary concern. With that said, the Proposed Project would help the City save significant amounts of money in capital cost as well as with the long-term and ongoing maintenance and operations costs, by significantly reducing the need to repair failing slopes, avoiding potential water quality issues, inundation of the refuse zone with rain/stormwater, and potential water quality fines from regulatory agencies. In its assessment of the advantages of the Proposed Project's ClosureTurf® cover system over the prescriptive clay cover, the City relies on the analysis conducted by EBA in (Appendix B) as well as the facts and environmental analysis in the DEIR and as revised in this final EIR.

Response to Comment C-6. The DEIR demonstrates that the Proposed Project would not have any adverse noise impacts on the recreational uses at Vichy Springs Resort, including to the users of the hiking trails. As a result, there was/is no need to include an analysis of alternative scheduling construction activities. For instance, the City would not be permitted to construct the Proposed Project in the winter or wet season as any grading would be susceptible to water quality and soil erosion restrictions as well as allowing unpredictable rain or stormwater entering into the waste management unit (garbage) of the landfill. This and other reasons are further explained in response to comments C-6a through C-6k below.

Response to Comment C-6a: As noted on Page 3.8-6 of the DEIR, the Proposed Project would limit construction truck traffic to the hours of 7 a.m. to 7 p.m. As noted on Page 3.8-7 of the DEIR, the use of construction equipment for the Proposed Project would also be restricted to the hours of 7 a.m. to 7 p.m. As noted on Page 3.8-7 of the DEIR, since the Proposed Project would comply with the construction hours within both the City of Ukiah and the Mendocino County Noise Ordinance (7 a.m. to 7 p.m.) the Proposed Project would not exceed any noise thresholds or result in any significant effects relating to construction noise. The cabins and hiking trails of the Resort are much farther than 1,200-feet from the closest part of

the Proposed Project's construction activities. At this distance, greater than the length of three football fields, the cabins and hiking trails are not really in close proximity to construction activities. Table 3.8-3 of the DEIR shows that the noise levels with an intervening ridge would be approximately 39 to 48 dB, L_{max} at 1,000-feet. Because of the low background levels in the project vicinity, these noise levels might be audible, but they would not interfere with off-site normal conversations or be a substantial increase over other ambient noise from daily activities – specifically at the Vichy Springs Resort. Since construction activities would comply with the acceptable hours for construction in the City of Ukiah and the Mendocino County Noise Ordinance (7 a.m. to 7 p.m.) and would not exceed the normally accepted compatibility standards for Vichy Springs Resort (65 dB, Ldn), or be a substantial increase above ambient levels, the Proposed Project would not result in any significant effects relating to construction noise.

Response to Comment C-6b: See Response to Comment C-6a. The DEIR found no significant noise impacts, thus there was no need to include an analysis of alternative scheduling construction activities. Construction activities would be restricted to limited hours during the day (daytime hours) – See Response to Comment C-6a.

Response to Comment C-6c: The Appendix G Checklist Questions for Recreation of the *CEQA Guidelines* are the following:

"a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

b) Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?"

The Recreation section is intended to analyze a project's increase in use of existing recreational facilities and a project's direct or indirect construction of recreational facilities that could potentially have an adverse physical effect to the environment. The Recreation section is not the appropriate EIR section to discuss potential noise or visual impacts. Therefore, because the Proposed Project would result in no impacts related to the Appendix G Checklist Questions for Recreation of the *CEQA Guidelines*, recreation was excluded from further analysis in the EIR. Furthermore, it should be noted that the Proposed Project would not stop any recreational activities from taking place, such as hiking at the Resort. Generating construction noise from far away would not stop anyone from hiking and hikers may hardly notice the distant noise.

Response to Comment C-6d: Section 3.8, the noise analysis of the DEIR, focused on the "cabins" of the Resort because they are the closest sensitive receptor to proposed construction activities. It is common practice in CEQA analyses to analyze the closest sensitive receptors to a given project. If a noise analysis determines that a project would have less than significant noise impacts on the closest receptor, a noise analyst can rule out the possibility of potentially significant impacts at sensitive receptors farther away from the project. Noise levels attenuate (lessen) as distance from a noise source increases (this is explained on page 3.8-1 of the DEIR).

Response to Comment C-6e: Section 3.8, the noise analysis of the DEIR, analyzed if project construction activities would cause an exceedance of the Land Use Compatibility Standards in the Mendocino County General Plan for the closest sensitive receptor (the northernmost cabin of the Resort). The Land Use Compatibility Standards are exterior noise standards, which assume that if a project complies with the exterior noise standard then interior noise levels will be appropriate for the given land use. As noted on page 3.8-5 of the DEIR, "For residential uses this would be 60 dB, Ldn and for Transient Lodging – Motels, Hotels this would be 65 dB."

Table 3.8-3 of the DEIR displays typical construction equipment of the Proposed Project and associated estimated maximum noise level at the closest construction activities (600 feet) and the distance that the majority of construction activities would occur from (1,000 feet). Note, that the majority of construction

would occur much greater than 1,000 feet from the northernmost cabin of the Resort and approximately half of the landfill area to be covered is greater than 2,000 feet from the northernmost cabin of the Resort. The estimated maximum construction noise levels in Table 3.8-3 of the DEIR along with the noise conclusions on page 3.8-7 indicate that construction activities "would not exceed the normally accepted compatibility standards for Vichy Springs Resort (65 dB, Ldn), or be a substantial increase above ambient levels."

As shown in Table 3.8-3, the estimated maximum construction noise levels would also be below the Residential (Low density single family, duplex, mobile homes) standard of 60 dB, Ldn if one wanted to consider the Resort a "residential land use" since residential land uses have outdoor areas that are enjoyed by residents and often have outdoor recreational resources within a residential neighborhood. The Land Use Compatibility Standards in the Mendocino County General Plan do not contain noise standards for hiking trails, but they do contain noise standards for playground/neighborhood parks (70 dB, Ldn) and golf courses/riding stables/water recreation/cemeteries (75 dB, Ldn), which construction activities would comply with.

The hiking trails of the Resort are much farther than 1,000 feet from the project construction activities. Onsite noise measurements displayed in Table 3.8-2 of the DEIR indicate that existing noise levels in areas far away from major roads (Site 1 and 2), such as trails, are approximately 42-52 dB Leq. As indicated in Table 3.8-3 and on page 3.8-7, estimated maximum construction noise levels would be approximately 39 to 48 dB, Lmax. This supports the DEIR's noise conclusions on page 3.8-7 that construction activities would not cause a substantial noise increase above ambient levels and that the Proposed Project would not result in any significant effects relating to construction noise. As noted in Table 3.8-1 of the DEIR, normal speech at three feet is 60 to 70 dB. Hikers would be able to walk and talk normally with the predicted construction noise levels at 1,000 feet.

Response to Comment C-6f: The Appendix G checklist questions of the *CEQA Guidelines* were updated in 2019 during preparation of the DEIR. The question "would the project result in "a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?" was removed from the Appendix G checklist and the appropriate Appendix G question to consider when analyzing temporary noise impacts such as construction activities is now "Would the project result in generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?". The updated Appendix G checklist questions of the *CEQA Guidelines* are clearly defined as significance thresholds for use in the noise analysis on page 3.8-5 of the DEIR.

Response to Comment C-6g: See Responses to Comments C-6d, C-6e and C-6f. With the adaptation of the 2019 CEQA Guidelines[1] these two noise impact inquiries are linked and not evaluated separately.

Response to Comment C-6h: The comment states that an example approach to noise impact analysis for the Proposed Project is the recreation section of a Master Plan EIS/EIR prepared in 2004 for the Los Angeles International Airport (LAX). The project analyzed in the example 2004 Master Plan EIS/EIR is for a multiphase project spanning greater than 10 years at the busiest airport in California, which proposed to increase capacity at LAX and included the construction and operation of new runways, parking garages/lots, access roads, buildings, terminals, etc. The example Master Plan EIS/EIR analyzed impacts to recreation facilities adjacent to or within the airport property. Furthermore, the example 2004 Master Plan EIS/EIR only considered noise impacts to existing recreational areas near LAX because the project was subject to Department of Transportation Act, Section 4(f), which is required for projects that receive funding from or require the approval by an agency of the United States Department of Transportation. Section 4(f) requires

[1] California Code of Regulations, Title 14, Division 6, Chapter 3, Appendix G.
http://resources.ca.gov/ceqa/docs/2018_CEQA_FINAL_TEXT_122818.pdf

analysis of noise, visual intrusions, or other indirect effects that substantially impair the value of a publicly owned park or recreation area, in terms of its environmental, recreational, ecological, or historical significance. The Master Plan EIS/EIR also used the outdated Appendix G checklist questions of the *CEQA Guidelines* were for determining significant impacts. Airports are very loud and are a permanent noise source. The Ukiah Landfill Closure project was analyzed using the Appendix G checklist questions of the *CEQA Guidelines* that were updated in 2019. Proposed Project construction activities would occur for approximately six months and would not cause a substantial noise increase above ambient levels. It is not appropriate to use the recreation section of a Master Plan EIS/EIR prepared in 2004 for LAX as a guide to prepare a noise analysis of a project-level EIR prepared in 2019 for a landfill closure project of short duration. See Responses to Comments C-6c, C-6d, C-6e and C-6f.

Response to Comment C-6i: See Responses to Comments C-6a and C-6b. Also see Response to Comment C-6h, it is not appropriate to use the recreation section of a Master Plan EIS/EIR prepared in 2004 for LAX as a guide to prepare a noise analysis of a project-level EIR prepared in 2019 for a landfill closure project of short duration. The Master Plan EIS/EIR prepared in 2004 for LAX did not include a mitigation measure restricting use of backup beepers and did not include a mitigation measure restricting construction activities to either the morning or afternoon. The Master Plan EIS/EIR prepared in 2004 for LAX contained four construction mitigation measures[2] and only for construction activities within 600-feet of sensitive receptors:

1. A noise control plan to use noise control devices such as mufflers, barriers and enclosures;
2. Staging construction as far from noise-sensitive uses as feasible;
3. Replacing noisy equipment with quieter equipment when technically feasible; and
4. Limiting the noisiest construction activities to 7 a.m. to 9 p.m. on weekdays and to 6.am. to 8 p.m. on Saturday.

Replacing backup beepers would introduce unnecessary risks to construction workers. Backup beepers/alarms at other solid waste sites have been measured anywhere from 71 to 88 dB, Lmax at a distance of 50-feet from the rear of the construction vehicle[3], which is close to the range of estimated maximum noise levels from typical construction equipment at 50-feet shown in Table 3.8-3 of the DEIR. Backup beepers at 1,000-feet would be close to the range of estimated maximum noise levels from typical construction equipment at 1,000-feet indicated in Table 3.8-3 and on page 3.8-7 (39 to 48 dB, Lmax). Backup beepers would be audible at this distance, but they would be limited to 7 a.m. to 7 p.m. Hikers would be able to walk and talk normally with the predicted construction noise levels at 1,000 feet (see Response to Comment C-6e).

Response to Comment C-6j: The hypothetical road project in Yosemite National Park dreamed up in this comment is an apples to oranges comparison to construction activities of the Ukiah Landfill Closure. A road construction project within a national park is very different from a landfill closure project over 1,000 feet away from hiking trails. A road construction project has potential operational noise implications after the road construction would be completed, while the Proposed Project would generate no new operational noise once construction is complete. See Responses to Comments C-6a, C-6b, C-6d, C-6e and C-6f.

Response to Comment C-6k: See Responses to Comments C-6a, C-6b, C-6c, C-6d, C-6e, C-6h, C-6i and C-6f.

Response to Comment C-7. The analysis of groundwater resource impacts in the DEIR (*Hydrology and Water Quality, Section 3.7*) were informed by the hydrogeologic analysis presented in a report prepared by

[2] Los Angeles International Airport, LAX Master Plan Alternative D Mitigation Monitoring and Reporting Program, https://www.lawa.org/en/lawa-our-lax/studies-and-reports/mitigation-monitoring-reporting-program

[3] Behrens and Associates, Inc., Lopez Canyon Equipment Acoustical Analysis, October 29, 2010. https://www.lacitysan.org/cs/groups/public/documents/document/y250/mda4/~edisp/cnt008843.pdf

EBA Waste Technologies (EBA) in 1994 (EBA, 1994) and the declaration under penalty of perjury by Damon Brown of EBA Engineering filed in Ashoff and Vichy Springs Resort v. City of Ukiah, Mendocino County Case No. 70873 (Brown Declaration"). EBA evaluated data regarding the potential for groundwater impacts to Vichy Springs from groundwater monitoring activity on the Ukiah Landfill (landfill) property. The 1994 EBA report was requested by the California Regional Water Quality Control Board – North Coast Region (RWQCB) in its letter dated August 1, 1994 (RWQCB, 1994). In that letter, the RWQCB acknowledged that work to investigate groundwater contamination at the landfill had been delayed by concerns expressed by Mr. Gilbert Ashoff, owner of the Vichy Springs Resort. Mr. Ashoff was concerned that monitoring wells placed at the landfill were damaging the geothermal well supplying spring water to his resort. The RWQCB stated that it wanted these concerns resolved so that a groundwater contamination investigation could continue (RWQCB, 1994). Mr. Ashoff claimed that drilling monitoring wells on the landfill property was reducing flow and temperature at the geothermal springs. Specifically, Mr. Ashoff blamed an immediate temperature decline of 12 degrees and a 30 percent reduction in geothermal spring flow on the installation of landfill monitoring well 92-4 and 90-8. In its report, EBA reviewed the site geology, investigated potential for heat loss and flow reduction, discussed natural carbon dioxide pressure releases, analyzed groundwater chemical data and reported on results of groundwater isotope testing. EBA concluded from its evaluation that there was no evidence to support the claim that installation of monitoring wells on the landfill property was lowering the temperature or reducing the flow in the Vichy geothermal spring. EBA's conclusion was based on compelling technical evidence that the water-bearing zone feeding the Vichy geothermal spring and the water encountered in the landfill wells were from distinct, separate sources and that monitoring wells could not account for the observed heat loss in the springs. As stated in the DEIR, the State Water Resources Control Board (SWRCB) reviewed the 1994 EBA report, as well as other reports and letters regarding this issue, and concluded that they did not see "convincing evidence to support the conclusion that the drilling of this monitoring well [monitoring well 92-4] could have impacted the temperature and flow rate of the hot spring."

The comment suggests that the DEIR's conclusion that the Proposed Project would not impact the Vichy geothermal spring was based solely on the differences in chemical constituents in the two groundwater-bearing zones and did not address the "redirection of Carbon Dioxide (CO2)" that allegedly "led to the pressure drop and flow decrease". On the contrary, the impact analysis in the EIR considered all lines of evidence supporting the overall conclusions that the monitoring wells did not impact the Vichy geothermal spring, including the unsupported claim that the alleged temperature and flow reduction in the geothermal spring resulted from a drop in formation pressure and release of carbon dioxide after drilling a monitoring well. EBA addressed this hypothesis in its 1994 report and dismissed it because no site-specific data was presented to support the conclusion or the recommendation that no further drilling be permitted in the Vichy Springs area. Furthermore, no significant changes in pressure (other than barometric variations) were observed by EBA during drilling or following installation of monitoring well 92-4 (EBA, 1994).

The comment discusses the hypothesis presented by Al Sevilla of Allisto Engineering that addressed how the landfill groundwater wells affected natural carbon dioxide gas pressure in the Vichy geothermal spring. The issue of whether the monitoring well at the landfill tapped into the subsurface gases that drive Vichy Springs was discussed in the Brown Declaration. Please see Appendix D of this Final EIR. In his court declaration, Mr. Brown stated that while tectonic overpressure zones in the Coast Ranges, such as the geothermal fields near Geyserville, are well documented, he believed that Mr. Sevilla's hypothesis that the monitoring wells are responsible for the release of gases that migrated from the springs to the wells through faults and fractures is "clearly flawed and not worth serious consideration." Mr. Brown's conclusion was based on: 1) A review of published maps that do not show faults or fracture sets through the Vichy Springs and landfill area; 2) Past review of high and low altitude aerial photographs that indicate no photo-lineaments in the Continental Basin Deposits that could be a migration pathway for gases; 3) Observations during geologic field mapping that noted no faults, fractures, or joint sets; 4) Material extracted during well

drilling that did not indicate the presence of Franciscan bedrock or any confining layer capable of trapping the gases; 5) Field evidence of a pressure release if, in fact, a pressure confining layer had been penetrated; and 6) EBA's experience with methane gas migration that reflect the Continental Basin Deposits underlying the landfill are not capable of holding gas under pressure.

The DEIR's compelling substantial evidence that monitoring well drilling did not impact the geothermal spring at Vichy Springs Resort is the distinct difference between the water-bearing zone feeding the geothermal source and the water encountered in the wells. This conclusion is based on the review of EBA's investigations, the results of the SWRCB technical review of this issue, Mr. Brown's expert witness testimony, and EBA's analysis and dismissal of the hypothesis that well drilling at the landfill released gas and lowered the temperature and pressures in the Vichy geothermal spring.

The Proposed Project would include drilling and installation of shallow gas monitoring wells, which would be placed within the waste layers beneath the landfill cover. These gas wells would not extend into the groundwater bearing zones of the Continental Basin Deposits. Therefore, because no additional groundwater wells are proposed, it would not be warranted to perform a new hydrogeologic analysis, conduct groundwater isotope testing, or perform carbon dioxide pressure testing. As stated in the DEIR, Impact 3.7-2, based on the evidence, it is reasonable to conclude that the grading, cover installation, and the post-closure maintenance condition proposed under the Project would not influence or adversely impact spring temperature or discharge rate at the Vichy Springs Resort.

Response to Comment C-8. Please see above responses. Please see Chapter 4 of this Final EIR for additional photos and documentation that the Proposed Project would not have a significant aesthetic impact on Vichy Springs Resort, including its guests and hiking trail users. The noise concerns are addressed with responses to comments C-6a thru C-6k. Response to Comment C-7 evaluates comments regarding potential impacts of project groundwater wells on the springs at Vichy Springs Resort. The City asserts that the Proposed Project is the environmentally superior alternative and has selected the Proposed Project as the alternative to move forward with. Finally, the prescriptive cover Alternative has been carried through for a more detailed analysis as a Project Alternative (see Chapter 4 of this Final EIR).

None of the new information in responses to Comments to Letter C identified substantial adverse environmental effects (CEQA Guidelines 15088.5). Therefore, significant new information has not been added in a way that deprives the public of meaningful opportunity to comment upon a substantial adverse environmental effect. There are no significant unavoidable environmental impacts identified in the Final EIR. Therefore, recirculation of the DEIR is not necessary.

COMMENT LETTER D – VICHY SPRINGS RESORT

Response to Comment D-1. Thank you for your comment letter. Please see Chapter 4 – Revision to the Draft EIR for specific and minor changes to the DEIR. Further, the City agrees that the baseline or existing condition is that Vichy Springs Resort is and has been located adjacent to the Ukiah Landfill and an active private gun range – the Ukiah Rifle and Pistol Club for numerous years.

Response to Comment D-2. Comment Noted. Please see Chapter 4 – Revision to the Draft EIR for specific and minor changes to the DEIR. Further, the City agrees that the City and Vichy Springs Resort's property lines adjoin. However, and to the point, Vichy Springs Resort's property line is more than 500-feet away from the actual landfill area where the Proposed Project will be performed. The landfill area is located on the City's 283.5-acre property, which provides a buffer area between the property line and the actual 40-acre landfill area. Further, the closest building at Vichy Springs Resort is approximately 1,200-feet away and its partial view is obscured by trees, elevation, and sheer distance.

Response to Comment D-3. Please see Chapter 4 – Revision to the Draft EIR for specific and minor changes to the DEIR. This alternative is now further evaluated as requested.

Response to Comment D-4. Please see previous responses to Comments C-5a-5j and additional pictures in in Chapter 4 of this Final EIR. The City disagrees with the assertion that the Proposed Project would be bright and very ugly in late spring, summer, and fall. The proposed olive-green artificial turf cover is designed to look like and will look like real or natural grass, which is very common even in the late summer or dry months when the surrounding landscape is brown or tan.

Response to Comment D-5. Please see Responses to Comments D-4 and C-3a above. The City disagrees that the Proposed Project would have any significant negative environmental impacts on or to Vichy Springs Resort, its guests, and hiking trail users. First, the Proposed Project would not change the historical significance of the Vichy Springs Resort. The Vichy Springs Resort has been in operation during the time period when the Ukiah Landfill was an active landfill and did not change the historical significance. Closing the landfill in accordance with Title 27 of the CCR will also not affect the Vichy Spring Resort's historical significance. Second, the hiking trails are not located on Vichy Springs Road and not Vichy Springs Resort's property. Vichy Springs Road is a public road that dead ends at the landfill gate, which is over 200 to 300-feet from the actual landfill and only provides a small obscured view of the actual 40-acre landfill area. This is not where Vichy Springs Resort's guest pay money to hike or use any Vichy Springs resort's amenities. Third, the Vichy Springs Resort's main hiking trails are well over 2,000-feet away and any partial and/or obscured views from that distance would not be readily noticeable to its guests and hiking trail users.

Response to Comment D-6. Please see Responses to Comments C-7 above. Further and to the point, the Proposed Project does not propose any new groundwater monitoring wells and does not propose to change any operations of the existing groundwater monitoring wells. The new wells included in the Proposed Project would only extend into the waste management unit/refuse portion of the landfill. As a result, the Proposed Project would not impact any pressure zones as Vichy Springs Resort has unsuccessfully alleged over the years. No additional study is needed by pressure zone experts.

Response to Comment D-7. Please see Noise Responses to Comments C-6a, C-6b, C-6c, C-6d, C-6e, C-6f, C-6g, C-6h, C-6i, C-6j, and C-6k.

Response to Comment D-8. Please see Chapter 4 – Revision to the Draft EIR for specific and minor changes to the DEIR.

Response to Comment D-9. Please see Response to Comment B-1 for a discussion as to how and why the Proposed Project was selected over the Compacted Clay and/or Geo Synthetic Clay Layers with Natural Vegetation Closure Alternative and how it out performs the Compacted Clay and/or Geo Synthetic Clay Layers with Natural Vegetation Closure Alternative. The primary purpose is to provide an impermeable layer (even with clay) to prevent rain or stormwater penetrating into the waste management unit (i.e. garbage) of the landfill and mixing with the waste. The comment is correct that the Proposed Project will essentially eliminate the discharge of sediment. The comment misunderstands that this is considered to be a beneficial impact and not an adverse impact to downstream surface water quality. The analysis in the DEIR and Appendix B finds the water diverted from penetrating the landfill by the Proposed Project cover will be cleaner with less potential to pollute surface water(s) than the prescriptive clay cover.

Response to Comment D-10. However, see Responses to Comments D-4 and C-6a, C-6b, C-6c, C-6d, C-6e, C-6f, C-6g, C-6h, C-6i, C-6j, and C-6k above. The DEIR analysis shows that the Proposed Project would not have any significant noise impacts on Vichy Springs Resort, its guests, and hiking trail users.

Response to Comment D-11. Please see Chapter 4 – Revision to the Draft EIR for specific and minor changes to the DEIR.

Response to Comment D-12. Please see Chapter 4 – Revision to the Draft EIR for specific and minor changes to the DEIR.

Response to Comment D-13. Please see Chapter 3.1 of the DEIR (Aesthetic/Visual Resources).

Response to Comment D-14. Please see Chapter 4 – Revision to the Draft EIR for specific and minor changes to the DEIR.

Response to Comments D-15 and D-16. Please see responses to visual comments C-5a-j.

Response to Comments D-17. The City agrees that there are partial, distant, and obscured views of the Ukiah Landfill from Vichy Springs Resort property. However, the landfill gate is on public land and Vichy Springs Road and is not on Vichy Springs Resort's property. The additional information provided by your attorney in Comment Letter C does not change the determination that the Proposed Project would not have any significant effect on a viewshed. Please see responses to comment C-5a-j. Vichy Springs Resort's property line is more than 500-feet away from the actual landfill that is located on the City's 283.5-acre property, which provides a buffer area between the actual 40-acre landfill area and the property line. Further, the closest building at Vichy Springs Resort is approximately 1,200-feet away from the actual 40-acre landfill site and its view is obscured by trees, elevation, and sheer distance. The hiking trails are much further away and any partial views from that distance would not be readily noticeable or considered to be an eyesore to the guests and hiking trail users over the existing condition, even in the dry season. These partial views are not considered to be significant and any views to the Ukiah Landfill is not considered to be a scenic viewshed by Mendocino County. Please see Chapter 4 – Revision to the Draft EIR for specific changes to Section 3.1 - Aesthetics/Visual Resources in the DEIR.

Response to Comments D-18 and D-19. Please see Response to Comment D-17 above.

Response to Comment D-20. Please see Chapter 4 – Revision to the Draft EIR for specific and minor changes to the DEIR.

Response to Comment D-21. The City is unaware of such specific sized animals grazing the area. However, the artificial synthetic turf cover is made of durable material that is designed to last over 100-years in the harsh natural environment and would be less likely to attract animals such as pigs and elk over a natural cover as there would be no actual vegetation for them to eat or root under for food. By not having or significantly reducing the organic matter and food sources, fewer animals, including birds, are attracted to the site. Also, because the components of an artificial synthetic cover system do not pass on the animals' smell/taste test, they do not usually bother with it or return to it. Further, if a section of turf is compromised by animals or for any other reason, it is much easier to identify and any repairs are much easier and do not require heavy equipment to come in to do the repairs, which can create additional damages to a prescriptive clay cover layer system[4].

Response to Comment D-22. Please see Chapter 4 – Revision to the Draft EIR for specific and minor changes to the DEIR.

Response to Comment D-23. The source indicated that Vichy Springs started as a "Resort" in 1888. The EIR does not further respond to the historical statements in the comment, since they do not have a direct or material effect the DEIR's environmental analysis or findings.

Response to Comment D-24. Please See Responses to Comments C-7 and D-23 above.

Response to Comment D-25. Please see Impact Statement 3.4-1 on page 3.4-14 and Responses to Comments C-7 and D-23 above.

Response to Comment D-26. This is a standard approach/requirement to search beyond the main area to include a buffer area around the Proposed Project location.

[4] Personal Communication with David Cieply, Vice President Waste Operations, WatershedGeo

Response to Comment D-27. Not sure of the point that is being made and does not affect the environmental analysis of or in the DEIR.

Response to Comment D-28. Please refer to references provided.

Response to Comment D-29. Please refer to references provided.

Response to Comment D-30. Please see response in Comment C-7 above.

Response to Comment D-31. The "plastic cover" or artificial synthetic turf cover has no bearing on the hydrology discussion at hand.

Response to Comment D-32. That was done decades ago. This is the current baseline condition(s) and the Proposed Project would not involve the alteration of a stream or river course (DEIR, page 3.7-26). The Proposed Project is intended to properly close the landfill to prevent any future impacts to downstream water resources.

Response to Comment D-33. Please see response C-6a, and C-6b regarding scheduling of construction, and C-6i regarding noise from back up beepers.

Response to Comment D-34. Please see response C-6a and C-6b.

Response to Comment D-35. Please see Responses to comments to Letter C above and Chapter 4 of this Final EIR for specific revisions.

Response to Comment D-36. Please see Response to comment C-7 above. The new wells included in the Proposed Project would only extend into the waste management unit/refuse portion of the landfill. No new groundwater monitoring wells are proposed as part of the Proposed Project.

Response to Comment D-37. Comment noted. While the comment does not provide any evidence to substantiate its claims regarding gun club activity and the project site, the contractor is legally required to maintain the safety of the worksite and the City will be required to cooperate with the contractor to maintain the safety of the worksite.

Response to Comment D-38. Please see Response to comment C-7 above. The new wells included in the Proposed Project would only extend into the waste management unit/refuse portion of the landfill. No new groundwater monitoring wells are proposed as part of the Proposed Project.

Response to Comment D-39. See response to Comment B-1. As indicated in that response (and copied directly below, the Proposed Project's ClosureTurf® cover system offers significant maintenance advantages over the prescriptive cover.

Maintenance

- ClosureTurf® offers a significant maintenance advantage over a prescriptive Subtitle D final cover and any other traditional geosynthetic cover systems that require a vegetative soil cover. In essence, vegetative soil covers often require regular maintenance related to the repair of erosional damage, installation of erosion control measures (i.e., silt fences, hay bales, wattles, etc.), slope repairs, and revegetation. Erosion from the vegetative soil cover also causes siltation of drainage ditches and culverts that require subsequent repair. Such provisions are not required with the ClosureTurf® product, thereby providing a significant cost savings over the course of the postclosure maintenance period and fewer environmental effects.

Response to Comment D-40. Please see changes in Chapter 4 of this Final EIR. Please consider them all corrected.

Response to Comment D-41. Please see changes in Chapter 4 of this Final EIR. Please consider them all corrected.

Response to Comment D-42. Please see response to Comment D-32.

Response to Comment D-43. Please see visual responses C-5a –j.

Response to Comment D-44. This comment refers to part of the 2016 IS/MND which was provided as background information and is not the 2019 DEIR analysis.

Response to Comment D-45. That was done years/decades ago. This is the current baseline condition(s) and the Proposed Project would not involve the alteration of a stream or river course (DEIR, page 3.7-26). The Proposed Project is intended to properly close the landfill to prevent any future impacts to downstream water resources.

Response to Comments D-46. Comment noted. The comment regards part of the 2016 IS/MND and not the 2019 DEIR.

Response to Comments D-47. This table came from the Natural Resources Conservation Service as the reference material indicates. It is was provided as background information and is not part of the main 2019 DEIR.

Chapter 4 Revisions to the Draft EIR

This chapter shows revisions to the November 2019 Public Draft EIR (DEIR), subsequent to the document's publication and public review. The revisions are primarily from comments received. Other minor edits that do not substantially change the importance of or conclusions made in the DEIR have not been reflected in this document. The revisions are presented in the order in which they appear in the DEIR and are identified by section and page number in respective chapters. These revisions are shown as excerpts from the Public DEIR, with strikethrough (~~strikethrough~~) text in indicate deletions and underlined (underlined) text to indicate additions. If whole sections are deleted and replaced, only the replacement text will be shown to avoid confusion and redundancy. It is assumed all subsequent page, figure, and table numberings are changed accordingly. The following revisions are shown below.

Executive Summary

On Page ES-1, the last paragraph is hereby changed as follows:

~~Land adjacent to the Ukiah Landfill property is zoned primarily as rangeland and is used for grazing.~~ Dwellings around the Ukiah Landfill property include a group of structures owned by the Vichy Springs Resort that are located within 500-feet of the City's south property line, but are well over 1,250 feet from the actual Ukiah Landfill area that is also separated visually by an elevation barrier/ridge. A rural residential development is located approximately one-quarter mile west of the Ukiah Landfill property boundary. A housing development is also located along the south side of Vichy Springs Road and westward of the Vichy Springs Resort. The entire development is approximately 1,000-feet southward of the Ukiah Landfill property boundary and is also separated from the Landfill by an intervening ridge.

On Page ES-5, the second paragraph is hereby changed as follows:

In January 2016, EBA prepared an Initial Study/Mitigated Negative Declaration (2016 IS/MND) for the City on a Final CPMP (See Appendix B). Subsequently, the City determined that an EIR should be prepared due in part to concerns expressed by Vichy Springs ~~Investment Group/~~Resort that ~~is located within approximately 500 feet of~~ borders the Ukiah Landfill's southern property line. These concerns included issues regarding aesthetic/visual resources, air quality and geology/hydrology concerns. Subsequently, the City prepared a Notice of Preparation (NOP) of the Draft EIR and published it on February 2, 2017 (SCH #2017022009). Please see Appendix C.

On Page ES-6, Section ES.6 is hereby changed as follows:

As detailed in Chapter 3 – Environmental Analysis, the construction and operation of the Proposed Project would have several potentially significant impacts to the environment. However, with the implementation of the identified and corresponding mitigation measures, all of the potentially significant impacts can be reduced to less-than-significant levels. As a result, the only alternative that needs to be evaluated in this EIR is the CEQA required No Project Alternative. However, the Compacted Clay and/or Geo Synthetic Clay Layers with Natural Vegetation Closure Alternative was also evaluated and would have increased impacts to air quality, biological resources, water quality, and noise impacts, among others. ~~Among others,~~ Other alternatives considered, but eliminated from further consideration include the following:

- ~~Compacted Clay and/or Geo Synthetic Clay Layers with Natural Vegetation Closure Alternative~~
- Relocation of the Ukiah Landfill
- Alternative/Synthetic Specialized Tufted Geotextile Landfill Turf Cover Color.

The No Project Alternative and the Compacted Clay and/or Geo Synthetic Clay Layers with Natural Vegetation Closure Alternative are discussed below.

No Project Alternative

Under the CEQA required No Project Alternative, the City would not close the Ukiah Landfill in accordance with the applicable regulatory standards. Specifically, none of the components and systems required for closure of the landfill would be implemented. This includes, but is not limited to the final cover and grading design to control stormwater, potential infiltration and accommodate future settlement, and landfill slope stability as well as drainage and erosion control systems, landfill gas (LFG) control and monitoring systems, and groundwater/surface water monitoring systems.

The No Project Alternative would result in less significant temporary construction related impacts than the Proposed Project. All of the potentially significant impacts associated with the construction and operation of the Project would not occur under this alternative. However, the No Project Alternative would fail to meet any and/or all of the objectives of the Project. Under the No Project Alternative, the Ukiah Landfill would not be properly closed according to state and local regulations and would be susceptible to slope instability, potential water quality impacts to surface water and groundwater resources due to inadequate cover leading to drainage and erosion issues during inclement weather/stormwater, and the potential for inadequate LFG control and monitoring leading to air quality issues and impacts. Under the No Action Alternative, the City would be potentially susceptible for a variety of water quality and air quality violations and fines.

Compacted Clay and/or Geo Synthetic Clay Layers with Natural Vegetation Closure Alternative

The Natural or Clay Layer closure option was a 1974 standard that was officially adopted in 1985 as part of then Subchapter 15 of Title 27 of the California Code of Regulations (27 CCR). However, over the last 35-plus years, the waste industry, along with the regulatory agencies and surrounding communities has recognized that there are serious short-falls with compacted clay layers from both a performance and cost perspective – especially on sites with slope stability issues. The Ukiah Landfill is located on steep, 2:1 plus, slope and the potential for a clay and/or geosynthetic clay layer alternative failure is . significant. Such a failure could degradation of the water quality in the unnamed creek alongside the Ukiah Landfill, which drains into Sulfur Creek and then the Russian River. Further, forensic analyses of a number of natural landfill cover slope failures over the last 20-plus years has shown that both Compacted Clay and Geosynthetic Clay Liners fail due to pore water pressure rise in saturated cover soils building up beneath the clay layers; particularly on steep slopes such as the conditions of the Ukiah Landfill. In short, the heavy clay layers increase the probability of slope failure. Further, CalRecycle has approved numerous alternative landfill covers that are similar to the Proposed Project throughout the State of California and they have proven to be a viable alternative, especially on landfills with steep slopes. See Appendices B and C of this Final EIR.

From an environmental perspective, the compacted clay and/or geo synthetic clay layer alternative would also cause a substantial increase in temporary construction impacts to air quality, biological resources, water quality, and noise as compared to the Proposed Project as it would create the need to excavate and/or import (transport) significant quantities of clay and natural vegetation cover soils to the site and to spread and compact them over the 40-acre Ukiah Landfill. Also, from an operational standpoint, this alternative would result in increased maintenance impacts and costs to maintain and repair slope failures as well as to maintain the natural grass/vegetation to prevent fires and keep rodents from compromising the clay layer structure, which would then contribute to a substantial increase in air quality, biological resources, water quality, noise, and other potential environmental impacts.

The City has proposed the Proposed Project and artificial cover alternative because it has many advantages over the compacted clay and/or geo synthetic clay layer alternative. Te Proposed Project provides: 1) A proven stable cover on steep slopes due to the elimination of low interface strength pore water pressure and gas relief layers, 2) Decreased exposure to construction-related air quality, noise, and traffic impacts and potential long-term water quality impacts to surface and groundwater resources which could lead to significant fines, and 3) significant lower capital and on-going/perpetual maintenance costs. As a result, this compacted clay and/or geo synthetic clay layer alternative has been considered, but is not selected as it does not perform as well as the Proposed Project.

On Page ES-7, Table ES-1 is revised as follows:

Table ES-1
Summary of Environmental Impacts and Mitigation Measures

Potential Environmental Impact	Level of Significance Before Mitigation	Mitigation Measure(s)	Level of Significance After Mitigation
3.1 Aesthetic/Visual Resources			
Impact 3.1-1: Would the Proposed Project have a substantial adverse effect on a scenic vista?	No Impact	None Required.	No Impact
Impact 3.1-2: Would the Proposed Project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a State scenic highway.	Less-than-Significant Impact	None Required	Less-than-Significant Impact
Impact 3.1-3: Would the Proposed Project substantially degrade the existing visual character or quality of the site and its surroundings.	Less-than-Significant Impact	None Required ~~Precautionary Mitigation Measure 3.1-1: Provide Proper Fencing and/or Shielding from Sensitive Receptors.~~	Less-than-Significant Impact ~~No Impact with Mitigation~~
Impact 3.1-4: Would the Proposed Project create a new source of substantial light or glare, which would adversely affect day or nighttime views in the area?	No Impact	None Required	No Impact

Table ES-1
Summary of Environmental Impacts and Mitigation Measures

Potential Environmental Impact	Level of Significance Before Mitigation	Mitigation Measure(s)	Level of Significance After Mitigation
3.2 Air Quality			
Impact 3.2-1: Would the Proposed Project Conflict with or Obstruct Implementation of the Applicable Air Quality Management Plan?	Less-than-Significant Impact	None Required	Less-than-Significant Impact
Impact 3.2-2: Would Construction of the Proposed Project Result in a Cumulatively Considerable Net Increase of any Criteria Pollutant Under an Applicable Federal or State Ambient Air Quality Standard?	Potential Significant Impact	Mitigation Measure 3.2-1: Fugitive Dust Control Measures	Less-than-Significant Impact
Impact 3.2-3: Would Operation of the Proposed Project Result in a Cumulatively Considerable Net Increase of any Criteria Pollutant Under an Applicable Federal or State Ambient Air Quality Standard?	Less-than-Significant Impact	None Required	Less-than-Significant Impact
Impact 3.2-4: Would Construction and/or Operation of the Proposed Project Expose Sensitive Receptors to Substantial Pollutant Concentrations?	Less-than-Significant Impact	None Required	Less-than-Significant Impact
Impact 3.2-5: Would Construction and/or Operation of the Proposed Project Result in Other Emissions (Such as Those Leading to Odors) Adversely Affecting a Substantial Number of People?	Less-than-Significant Impact	None Required	Less-than-Significant Impact
Impact 3.2-6: Would Construction of the Proposed Project Result in Other Emissions (Such as Naturally Occurring Asbestos) Adversely Affecting a Substantial Number of People?	Potential Significant Impact	Mitigation Measure 3.2-6: Develop and Submit NOA Dust Mitigation Plan	Less-than-Significant Impact
3.3 Biological Resources			

Table ES-1
Summary of Environmental Impacts and Mitigation Measures

Potential Environmental Impact	Level of Significance Before Mitigation	Mitigation Measure(s)	Level of Significance After Mitigation
Impact 3.3-1: Would the Proposed Project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?	Potential Significant Impact	Mitigation Measure 3.3-1a: Conduct A Preconstruction Survey for Special Status Wildlife Species. Mitigation Measure 3.3-1b: Conduct Bird Breeding and Nesting Surveys Mitigation Measure 3.3-1c: Conduct a Bat Habitat Assessment of Trees Mitigation Measure 3.3-1d: Environmental Awareness Training Mitigation Measure 3.3-1e: Biological Monitor Mitigation Measure 3.3-1f: Staging Areas and Access Routes	Less-than-Significant Impact
Impact 3.3-2 Would the Proposed Project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations adopted by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?	~~Potential Significant Impact~~ Less-than-Significant Impact	None Required	Less-than-Significant Impact
Impact 3.3-3: Would the Proposed Project have a substantial adverse effect on federally protected waters of the U.S. as defined by Section 404 of the federal Clean Water Act or protected waters of the state as defined by Section 1600 et seq. of the California Fish and Game Code (including, but not limited to, marshes, vernal pools, and coastal wetlands) through direct removal, filling, hydrological interruption, or other means?	Potential Significant Impact	Mitigation Measure 3.3-3a: Protect Jurisdictional Waters and Sensitive Habitat Areas	Less-than-Significant Impact

Table ES-1
Summary of Environmental Impacts and Mitigation Measures

Potential Environmental Impact	Level of Significance Before Mitigation	Mitigation Measure(s)	Level of Significance After Mitigation
Impact 3.3-4: Would the Proposed Project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	Less-than-Significant Impact	None Required	Less-than-Significant Impact
Impact 3.3-5: Would the Proposed Project conflict with any local policies or ordinances protecting biological resources?	Less-than-Significant Impact	None Required	Less-than-Significant Impact
Impact 3.3-6: Would the Proposed Project conflict with an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?	No Impact	None Required	Less-than-Significant Impact
3.4 Cultural, Paleontological, and Tribal Resources			
Impact 3.4-1: Would the Proposed Project cause a substantial adverse change in the significance of an historical resource as defined in State CEQA Guidelines §15064.5?	Less-than-Significant Impact	None Required	Less-than-Significant Impact
Impact 3-4.2: Would the Proposed Project cause a substantial adverse change in the significance of an archaeological resource pursuant to CEQA Guidelines §15064.5?	Potential Significant Impact	Mitigation Measure 3.4-2: Halt work if cultural resources are discovered	Less-than-Significant Impact
Impact 3.4-3: Would the proposed Project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	Potential Significant Impact	Mitigation Measure 3.4-3: Stop Work if Paleontological Remains are Discovered	Less-than-Significant Impact

Table ES-1
Summary of Environmental Impacts and Mitigation Measures

Potential Environmental Impact	Level of Significance Before Mitigation	Mitigation Measure(s)	Level of Significance After Mitigation
Impact 3.4-4: Would the Proposed Project disturb any human remains, including those interred outside of formal cemeteries?	Potential Significant Impact	Mitigation Measure 3.4-4: Halt Work if Human Remains are Found	Less-than-Significant Impact
Impact 3.4-5: Would implementation of the Proposed Project cause a substantial adverse change in the significance of a tribal cultural resource?	Potential Significant Impact	Mitigation Measure 3.4-5: Halt Work if Tribal Cultural Resources are Discovered	Less-than-Significant Impact
3.5 Geology Soils and Seismicity			
Impact 3.5-1: Would the Proposed Project expose people to injury or structures to damage from potential rupture of a known earthquake fault, strong ground shaking, seismic-related ground failure, or landslides?	Less-than-Significant Impact	None Required	Less-than-Significant Impact
Impact 3.5-2: Would construction grading and long-term closure conditions at the Landfill expose soils to erosion and result in the loss of topsoil?	Less-than-Significant Impact	None Required	Less-than-Significant Impact
Impact 3.5-3: Would the Proposed Project be located on a unit or soils that are potentially unstable, or that could become unstable as a result of the Project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse?	Less-than-Significant Impact	None Required	Less-than-Significant Impact
Impact 3.5-4. Would the Proposed Project make a cumulatively considerable contribution to cumulative effects associated with increased seismic risk, landsliding, erosion, topsoil	Less-than-Significant Impact	None Required	Less-than-Significant Impact

Table ES-1
Summary of Environmental Impacts and Mitigation Measures

Potential Environmental Impact	Level of Significance Before Mitigation	Mitigation Measure(s)	Level of Significance After Mitigation
loss or increased exposure to seismic or other risks?			
3.6 Greenhouse Gases			
Impact 3.6-1: Would Implementation of the Proposed Project generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment?	Less-than-Significant Impact	None Required	Less-than-Significant Impact
Impact 3.6-2: Would the Proposed Project conflict with any applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHG?	Less-than-Significant Impact	None Required	Less-than-Significant Impact
3.7 Hydrology and Water Quality			
Impact 3.7-1: Would the Proposed Project violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality?	Less-than-Significant Impact	None Required	Less-than-Significant Impact
Impact 3.7-2: Would the Proposed Project substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the Project may impede sustainable groundwater management of the basin?	Less-than-Significant Impact	None Required	Less-than-Significant Impact
Impact 3.7-3: Would the Proposed Project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner that would result in substantial erosion, siltation, polluted runoff or flooding on- or off-site?	Less-than-Significant Impact	None Required	Less-than-Significant Impact
Impact 3.7-4: Would the Proposed Project conflict with or obstruct implementation of	Less-than-Significant Impact	None Required	Less-than-Significant Impact

Table ES-1
Summary of Environmental Impacts and Mitigation Measures

Potential Environmental Impact	Level of Significance Before Mitigation	Mitigation Measure(s)	Level of Significance After Mitigation
a water quality control plan or sustainable groundwater management plan?			
3.8 Noise			
Impact 3.8-1: Would the Proposed Project generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the Proposed Project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	Less-than-Significant Impact	None Required	Less-than-Significant Impact
Impact 3.8-2: Would the Proposed Project generate excessive groundborne vibration or groundborne noise levels?	Less-than-Significant Impact	None Required	Less-than-Significant Impact
Impact 3.8-3: Would the Proposed Project be located within the vicinity of a private airstrip or an airport land use plan, or where such a plan has not been adopted, within two miles of a public airport or public use airport, and/or expose people residing or working in the project area to excessive noise levels.	No Impact	None Required	No Impact
Growth Inducement Effects			
Project implementation includes the final closure of the Ukiah landfill in accordance with local, regional, state and federal requirements. No residential or other development is proposed that would result in additional population growth. No infrastructure is required to be extended to the site that would induce population growth in the area. Therefore, the Proposed Project or the official and proper closing of	No Impact	None Required	No Impact

Table ES-1 Summary of Environmental Impacts and Mitigation Measures			
Potential Environmental Impact	**Level of Significance Before Mitigation**	**Mitigation Measure(s)**	**Level of Significance After Mitigation**
the Ukiah Landfill will not indirectly or directly remove barriers to population growth and/or encourage and facilitate other activities that could significantly affect the environment, either individually or cumulatively.			
Cumulative Effects			
As described in Chapter 3 – Environmental Analysis, the construction and operation of the Proposed Project would have less-than-significant effects to the environment with the implementation of the identified mitigation measures. There are no known projects that would be constructed at the same time and within the same vicinity of the Proposed Project that would or could create any additional or cumulative construction related impacts. Once constructed the Proposed Project would not have any significant impacts. As a result, the Proposed Project would not have any direct, indirect, short-term and/or long-term cumulative impacts.	No Impact	None Required	No Impact

On Page ES-14, Section ES.8 is hereby changed as follows:

ES.8 Environmentally Superior Alternative

Section 15126.6(e)(2) of the CEQA Guidelines requires an EIR to identify an environmentally superior alternative. Of the ~~two~~ three alternatives considered ~~in this section~~ (Proposed Project, the Compacted Clay and/or Geo Synthetic Clay Layers with Natural Vegetation Closure Alternative, and the No Project Alternative), the Proposed Project would be the environmentally superior ~~to the No Project~~ Alternative.

The Proposed Project would be environmentally superior to the No Project Alternative. The No Project Alternative would not be a legally acceptable alternative. The No Project Alternative would not meet any of the goals and objectives of the Proposed Project. Under the No Project Alternative, the Ukiah Landfill would not be properly closed according to state and local regulations and would be susceptible to slope instability, potential water quality impacts to surface water and groundwater resources due to inadequate cover leading to drainage and erosion issues during inclement weather/stormwater, and the potential for inadequate LFG control and monitoring leading to air quality issues and impacts. Under the No Action

Alternative, the City would be potentially susceptible for a variety of water quality and air quality violations and fines.

The Proposed Project would be environmentally superior to the Compacted Clay and/or Geo Synthetic Clay Layers with Natural Vegetation Closure Alternative due to the fact that the Compacted Clay and/or Geo Synthetic Clay Layers with Natural Vegetation Closure Alternative would have more slope stability issues that could cause significant water quality issues and concerns of sediment discharging into the ephemeral creek that discharges to the Russian River. This is considered to be a potentially significant and unavoidable impact that cannot be mitigated as it is impossible to predict when and where theses potential slope stability issues will occur. The slope stability issues will also require more maintenance which will cause an increase in noise, and air quality impacts and concerns as compared to the Proposed Project.

As a result, the Proposed Project is considered to be the environmentally superior alternative compared to both the No Action Alternative and the Compacted Clay and/or Geo Synthetic Clay Layers with Natural Vegetation Closure Alternative.

Chapter 1 Introduction

On Page 1-1, the 3rd paragraph in Section 1.1Project Location and Background is hereby changed as follows:

~~Land adjacent to the Ukiah Landfill property is zoned primarily as rangeland and is used for grazing.~~ Dwellings around the Ukiah Landfill property include a group of structures owned by the Vichy Springs Resort that are located within 500-feet of the City's south property line, but are well over 1,250-feet from the actual Ukiah Landfill area that is also separated visually by an elevation barrier/ridge. A rural residential development is located approximately one-quarter mile west of the Ukiah Landfill property boundary. A housing development is also located along the south side of Vichy Springs Road and westward of the Vichy Springs Resort. The entire development is approximately 1,000-feet southward of the Ukiah Landfill property boundary and is also separated from the Landfill by an intervening ridge.

Chapter 3 Environmental Analysis

On Page 3.0-1, the 1st Sentence in Section 3.0.3 Definition of Project Area and Study Area is hereby changed as follows:

The project area consists of areas within and around the City of ~~Oxnard~~ Ukiah as were previously described in Chapter 2, Project Description, and are further described throughout this section.

Section 3.1 Aesthetics/Visual Resources

On Page 3.1-4, the last paragraph is hereby changed as follows:

~~Land adjacent to the landfill property is zoned primarily as rangeland and is used for grazing.~~ Vichy Springs Resort is a California Registered Historical Location (No. 980) that is located approximately 500~~625~~ feet from the Ukiah Landfill's south property line. A single-family residence located approximately 1,000-feet west of the landfill's western property boundary. A rural residential development is located approximately one-quarter-mile west of the landfill property boundary. A housing development is also located along the south side of Vichy Springs Road and westward of the Vichy Springs Resort. The entire residential

development is approximately 1,000-feet southward of the landfill property boundary and is separated from the Ukiah Landfill by an intervening ridge. It should be noted that the City owns an approximate 97-acre parcel (Assessor's Parcel No. 178-210-01) that adjoins a portion of the Ukiah Landfill's southern property boundary. This property, which is now known as the Ukiah Rifle and Pistol Club, was purchased as a buffer zone to limit future development adjacent to the Landfill. The Gun Club Parcel is a separate parcel and is not considered part of the landfill property or part of this Proposed Project.

On Page 3.1-10, the last paragraph is hereby changed as follows:

The Project Site is located at the end of Vichy Springs Road, which is not identified in the Mendocino County General Plan as a Scenic Vista or Resource. The Ukiah Landfill is, has been, and will always be a landfill site and is not, nor will ever be, considered to be a scenic resource. Further, the Proposed Project would not be visible from the main lodges and primary facilities of Vichy Springs Resort. However, there are some distant partial views of the Ukiah Landfill from some vantage points on Vichy Springs Resort's 700-acres, which include hiking trails for its guests. Figure 3.1-5 provides several photos of these partial views from Vichy Springs Resort property which were taken by Vichy Springs Resort's President and Owner, Mr. Gilbert Ashoff. However, these are partial views from 1) either a distance of more than 2,000-feet or 2) from the edge of the property lines adjacent to the landfill property, which are not the main areas visited by most, if not all, of Vichy Springs Resort guests and hiking trail users. While the proposed project using artificial grass with a 5/8-inch sand cover will remain green in the dry season and contrast with the surrounding landscape which turns brown in the summer and early fall, that color contrast has been determined not to be environmentally significant. Green grass commonly contrasts with surrounding dry areas in Northern California and is not regarded as unattractive. Moreover, the views from these locations are not recognized as designated scenic views or vistas by Mendocino County. Further, the artificial grass cover will blend into the existing environment, in the same way green grass surrounding rivers, lakes or ponds or in irrigated landscapes, such as golf courses, blend with surrounding dry areas. Moreover, at these distances and partial views, the artificial grass is indistinguishable from natural grass and, thus, will not cause an environmentally significant change to the existing landscape. For these reasons, no impacts would occur to a designated scenic vista and Project implementation will not adversely affect existing views from any designated scenic corridors/roads.

Significance: No Impact.

Starting on Page 3.1-11, Impact 3.1-3 is hereby replaced in its entirety as follows:

Impact 3.1-3: Would the Proposed Project substantially degrade the existing visual character or quality of the site and its surroundings.

The Ukiah Landfill began refuse disposal operations in 1955 and ceased operations in 2001. As discussed herein, the Ukiah Landfill is approximately 40-acres and is located on a 283.5-acre-parcel that provides no public access and is surrounded by rural buffer area of land (i.e. approximately 240-acres), which is owned by the City. As indicated above, no development (i.e., facilities, structures or vertical features) are proposed for the Proposed Project, other than the landfill gas flare station, which would not be visible/noticeable from surrounding areas and would not affect the aesthetic character either of the project site or the surrounding area. Furthermore, the Ukiah Landfill is, has been, and will always be a landfill site and is not, nor will it ever be, considered to be a scenic resource. The 40-acre landfill area is and will

always be devoid of trees and will always stick out from the rest of the surrounding area. The area is not considered to be a source of scenic beauty by the County of Mendocino.

As for potential sensitive receptors, there is the Vichy Springs Resort, the Ukiah Rifle and Pistol Club, and the residential housing developments off to the south and west of the landfill. Vichy Springs Resort and some of the residential houses to the west have distant partial views of the landfill. Vichy Springs Resort in particular has expressed concern that an artificial synthetic turf cover would provide a negative view to its guests and hiking trail users. Table 3.1-1 provides a summary of the ability to see the Ukiah Landfill from KOPs within approximately 2,000-feet. As demonstrated in Figure 2-2, and Figure 3.1-2 above as well as Figures 3.1-3 and 3.1-4 below, any partial view of the landfill from over 500-feet would, however, not be able to distinguish artificial synthetic turf from natural grass and thus is not considered to be a key observation point (KOP) with a significant view. As a result, the Proposed Project would not have any significant visual impacts which would significantly affect the views the Vichy Springs Resort (including its guests and hiking trail users), the Ukiah Rifle and Pistol Club, the residential developments to the south and the west, and/or any other potentially sensitive receptor(s).

Table 3.1-1
Key Observation Points (KOPs) with 2,000-feet of the Ukiah Landfill

KOP Location	Elevation	Coordinates	Distance (feet)	Is Ukiah Landfill Visible?	Comments
A	800	39.10.01.60 N 123.09.30.30 W	1,061	No	60-foot +/- Elevation Barrier/Ridge Blocks View
B	815	39.10.04.31 N 123.09.29.02 W	963	Partial	Partial View from Edge of Vichy Springs Resort's Adjacent Property Line, But Not Part of the Active Part of the Resort or Hiking Trails
C	812	39.10.01.79 N 123.09.26.63 W	1,270	No	45-foot +/- Elevation Barrier/Ridge Blocks View
D	873	39.10.04.07 N 123.09.22.03 W	1,459	No	Distance and Trees Obstruct View
E	792	39.10.08.79 N 123.09.32.60 W	1,064	No	60-foot (+/-) Elevation Barrier/Ridge Blocks View
F	791	39.10.32.07 N 123.10.28.27 W	1,390	Partial	Partial Views from Some Private Residential Homes and Roads where Distance and Trees Obscures Views
G	803	39.10.23.33 N 123.10.43.75 W	1,892	Partial	Partial Views from Some Private Residential Homes and Roads where Distance and Trees Obscures Views

Note: Due to distance and map scale issues, KOPs F, G (residential development(s) to the west) and distant partial views from Vichy Springs Resort property from over 2,000-feet away are not practical or useful to put on a map.

Most importantly to Vichy Springs Resort's expressed concerns, the Proposed Project would not be visible from the main lodges and primary facilities of Vichy Springs Resort. However, there are some distant partial views of the Ukiah Landfill from some vantage points on Vichy Springs Resort's 700-acre property, which include hiking trails for its guests. Figure 3.1-5 provides several photos of these partial views from Vichy Springs Resort property which were taken by Vichy Springs Resort's President and Owner, Mr. Gilbert Ashoff. However, these are partial views from 1) either more than 2,000-feet or 2) from the edge of Vichy Springs Resort's property lines adjacent to the landfill property, which are not the main areas visited or used

by most, if not all, of Vichy Springs Resort guests and hiking trail users. The closest viewpoint from any potential sensitive receptor is from approximately 500-feet from the edge of Vichy Springs Resort's property and or the landfill gate as it bumps up to the City's buffer area from the City Landfill. Also, and more importantly, these views are not recognized as designated scenic views or vistas by Mendocino County. Therefore, no significant impacts will occur either to the aesthetic character of a designated ~~the~~ site or to that of the surrounding area and no mitigation measures are required.

Vichy Springs Resort has also expressed concerns that artificial synthetic turf cannot and would not fit into the local landscape or look like natural vegetation. However, as discussed in Chapter 2 – Project Description, the Proposed Project includes the construction of a permanent olive-green artificial/synthetic specialized tufted geotextile turf/grass cover instead of a clay layer with a natural grass cover. Figure 2-2, provides two recent examples of where olive-green artificial/synthetic specialized tufted geotextile turf has been and is being successfully used. Further, Figure 3.1-6 provides a visual comparison of artificial synthetic turf actually used in actual landfill closures and natural grasses, demonstrating that artificial turf can and does look like natural grass, especially at distances of over 500-feet, which is the closest view point from the Vichy Springs Resort Property and/or any other potential sensitive receptor. Figure 3.1-7 provides an up-close view of the existing Ukiah Landfill and a simulated view of it with an olive-green artificial/synthetic specialized tufted geotextile turf cover. Based on this analysis, the Proposed olive-green artificial/synthetic specialized tufted geotextile turf cover would have less-than-significant impacts on the existing visual character or quality of the site and its surroundings.

Vichy Springs Resort has also expressed concerns that an olive-green artificial synthetic turf would not blend into the surrounding environment in the summer or dry months when the hills turn brown. However, this is commonplace throughout northern California, California in general, the American West, and throughout the world where irrigation takes place in arid or semi-arid areas. Figure 3.1-8 provides several examples of arguably beautiful, scenic views, of olive-green colored irrigated grass adjacent to brown grass or hillsides. As a result, no significant visual impacts would occur as a result of having natural looking olive-green grass adjacent to brown hills or surroundings in the dry or summer/late fall months.

As a result, the implementation of the Proposed Project, including the olive-green natural looking artificial synthetic turf would not substantially degrade the existing visual character or quality of the site and its surroundings. Further, the Project site is a landfill and is not considered a designated scenic view by Mendocino County. Any partial, distant, views from Vichy Springs Resort's property or the residents to the west would not be considered significant. Furthermore, the natural looking olive-green artificial synthetic turf/grass would blend into the existing environment and would not have any noticeable or negative views from any vantage point. Also, the sand ballast on top layer of the artificial synthetic turf would help dampen any harsh color contrasts and provides a mix of green and brown colors, which matches the natural surrounding environment – especially at views from more than 500-feet away from the 40 acre site. Any impacts are considered to be less-than-significant and no mitigation is required. The City would, however, be willing to work with Vichy Springs Resort to help choose a color option that works best for them if they still have concerns with the olive-green color option. Figure 3.1-9 provides an example of the three-color pallet's available for the artificial synthetic turf/grass cover.

Significance: Less-than-Significant Impact.

Section 3.2 Air Quality

On Page 3.2-10, the 2nd paragraph is hereby changed as follows:

~~Land adjacent to the landfill property is zoned primarily as rangeland and is used for grazing.~~ The nearest sensitive receptor is the Vichy Springs Resort and Spa, located approximately 500-~~600~~-feet south of the landfill's entrance. A rural residential development is located approximately one-quarter mile west of the landfill property boundary. A housing development is also located along the south side of Vichy Springs

Road and westward of the Vichy Springs Resort and Spa. The entire development is approximately 1,000-feet southward of the landfill property boundary and is separated from the landfill by an intervening ridge.

Section 3.4 Cultural and Tribal Resources

On page 3.4-2, the 7th bullet is hereby revised as follows:

- Historic Resource. A property, site, or district listed in, or determined to be eligible for listing in, the National Register of Historic Places, California Register of Historical Resources (CRHR), ~~Ventura~~ Mendocino County Historical Landmarks, or City of ~~Oxnard~~ Ukiah Points of Interest.

Specifically, On July 5, 2019, a records search was conducted by staff at the Northwest Information Center (NWIC), Sonoma State University, Rohnert Park, California (NWIC File # 19-0004). The record search included the project Area of Potential Effect (APE) and a 0.25-mile radius outside the project boundaries. The record search included reviewing pertinent NWIC base maps that reference cultural resources records and reports, historic period maps, and literature for Mendocino County including current inventories of the National Register of Historic Places (NRHP), the California Register of Historical Resources (CRHP), the California Inventory of Historical Resources, California State Historic Landmarks, and the California Points of Historical Interest. No cultural resources are known within this search radius. Two previous studies have examined the project area in part. In 1975, the Bureau of Land Management prepared a high-level overview of archaeological sites in its Cow Mountain Planning Unit (Keesling and French 1975). A small portion of the project area was also surveyed on foot in 1994 (Roybal 1994). Neither study identified cultural resources in the project area. Just outside of the 0.25-~~1/8~~-mile search radius is Vichy Springs Resort, established in 1854 ~~1857~~. Vichy Springs Resort (P-23-001793) is listed on the National Register of Historic Places (National Park Service 1985). Given this information it appears that the project area is not sensitive for prehistoric or historical cultural resources

Chapter 4 – Alternatives

Pages 4-2 through 4-5 of the DEIR are hereby changed as follows:

4.2 Alternatives ~~Evaluated~~ Carried Forward in this DEIR

As described in **Chapter 1 – Introduction and Chapter 2 – Project Description**, the overall purpose of the Proposed Project is to close the Ukiah Landfill in accordance with the applicable regulatory standards. Specifically, the components and systems required for closure of the landfill include the final cover and grading design to control stormwater, potential infiltration and accommodate future settlement, landfill

slope stability, construction quality assurance, drainage and erosion control systems, landfill gas (LFG) control and monitoring systems, groundwater/surface water monitoring systems, and site security. The Final CPMP for the Ukiah Landfill has been prepared for and conditionally approved by the following agencies:

- California Department of Resources Recycling and Recovery (CalRecycle)
- Mendocino County Department of Public Health
- North Coast Regional Water Quality Control Board
- Mendocino County Air Quality Management District

The Final CPMP has been prepared in accordance with Title 27 of the California Code of Regulations (27 CCR), and Chapters 3 and 4 and the Code of Federal Regulations (CFR) 40, Subpart F. The objectives of the plan are identified below.

- To provide a detailed plan and schedule for closure implementation.
- To provide a plan and schedule for the inspection, maintenance and monitoring procedures to be implemented during the post-closure maintenance period.
- To allow the applicable agencies to monitor closure and post-closure activities to determine that all landfill closure and post-closure maintenance and monitoring requirements are being followed in accordance with the approved plan.
- To provide a basis for the establishment of an accurate detailed cost estimate for closure and post-closure maintenance.

As detailed in Chapter 3 – Environmental Analysis, the Proposed Project would have several potentially significant impacts to the environment. However, with the implementation of the identified and corresponding mitigation measures, all of the potentially significant impacts can be avoided or reduced to less-than-significant levels. Therefore, and as consistent with CEQA regulations, in the selection of alternatives, there is really no need to identify or further evaluate alternatives because no ~~unavoidable~~ significant and unavoidable impacts have been identified with the Proposed Project. However, due to the fact that Vichy Springs Resort has argued for a compacted clay layer/natural cover alternative be further evaluated, the Final EIR includes the further evaluation of a compacted clay layer/natural cover alternative as provided in Section 4.2.2 below and removed from Section 4.3 – Alternatives Considered and Eliminated. ~~Also, as explained in more detail in 4.3 Alternatives Considered and Eliminated, only the Proposed Project is determined to be potentially feasible. An EIR need not consider an alternative whose effect cannot be reasonably ascertained and whose implementation is remote and speculative (CEQA, 15126.6 (f)(3)). As a result, for this Proposed Project, the only alternative that needs to be evaluated in this Draft EIR is the CEQA required No Project Alternative (Mount Shasta Bioregional Ecology Center v. County of Siskiyou, 2012). CEQA does not require the analysis of the other considered alternatives that are not potentially feasible.~~ The No Project Alternative and the Compacted Clay Layer/Natural Cover Alternative are discussed below. In addition, below we have also provided a discussion of the other alternatives that were considered and eliminated - along with the rationale.

4.2.1 No Project Alternative

CEQA Guidelines §15126.6(e) provides that a No Project Alternative shall also be evaluated along with its impact. According to the CEQA Guidelines, the No Project Alternative shall discuss the existing conditions at the time the Notice of Preparation was published, as well as what would be reasonably expected to occur in the foreseeable future if the Project were not approved, based on current plans and consistent with available infrastructure and community services.

Under the No Project Alternative, the City would not close the Ukiah Landfill in accordance with the applicable regulatory standards. Specifically, none of the new components and systems required for closure of the landfill would be implemented. This includes, but is not limited to the final cover and grading design to control stormwater, potential infiltration and accommodate future settlement, and landfill slope stability as well as drainage and erosion control systems, landfill gas (LFG) control and monitoring systems, and groundwater/surface water monitoring systems. The on-going maintenance of the landfill, would probably continue in a manner similar to existing maintenance of the landfill, since it ceased receiving waste.

The No Project Alternative would result in less significant temporary construction related impacts than the Proposed Project. All of the potentially significant impacts associated with the construction and operation of the Project would not occur under this alternative. However, the No Project Alternative would fail to meet any and/or all of the objectives of the Project. Under the No Project Alternative, the Ukiah Landfill would not be properly closed according to state and local regulations and would be susceptible to slope instability, potential water quality impacts to surface water and groundwater resources due to inadequate cover leading to drainage and erosion issues during inclement weather/stormwater, and the potential for inadequate LFG control and monitoring leading to air quality issues and impacts. Under the No Project Alternative, the City would be potentially susceptible for a variety of water quality and air quality violations and fines.

4.2.2 Compacted Clay and/or Geo Synthetic Clay Layers with Natural Vegetation Closure Alternative

The Compacted Clay and/or Geo Synthetic Clay Layers with Natural Vegetation Closure Alternative was a 1974 standard that was officially adopted in 1985 as part of then Subchapter 15 of Title 27 of the California Code of Regulations (27 CCR). This alternative would require a 2-foot thick clay foundation layer over the entire landfill area and then another 2-foot thick soil and vegetation layer on top of the clay, thus requiring approximately 2.5 million cubic yards of material to properly cover the approximately 40- acre landfill area. Once constructed the Compacted Clay and/or Geo Synthetic Clay Layers with Natural Vegetation Closure Alternative would soon return to the existing condition as currently exists with the landfill covered with natural vegetation. The construction duration would be extended by another 2-months. Detailed below is an evaluation of the Compacted Clay and/or Geo Synthetic Clay Layers with Natural Vegetation Closure Alternative would perform as compared to the Proposed Project in each of the environmental resource areas. As consistent with CEQA requirements, alternatives do not need to be evaluated to the same level of detail as the Proposed Project, but are rather evaluated to compare and contrast to the Proposed Project and/or the No Action Alternative.

4.2.2.1 Aesthetics/Visual Resources

Construction of the Compacted Clay and/or Geo Synthetic Clay Layers with Natural Vegetation Closure Alternative would have generally the same, but slightly increased temporary construction related aesthetic/visual impacts as compared to the Proposed Project because the excavation of the additional clay foundation layer would increase the visual footprint of the construction area and would also increase the time that the area is exposed. However, similar to the Proposed Project, there are few, if any, sensitive receptors that would actually see or notice the construction activities. And as the construction activities would be temporary, any temporary or partial views of the construction activities of the Compacted Clay and/or Geo Synthetic Clay Layers with Natural Vegetation Closure Alternative would be similar, but slightly increased and considered to be less-than-significant.

Once constructed, the Compacted Clay and/or Geo Synthetic Clay Layers with Natural Vegetation Closure Alternative would return to the Landfill's existing condition and would have less-than-significant to no significant aesthetic/visual impacts. Any partial views of the landfill would be of the landfill, which is a 40-acre area that would remain a landfill with a natural vegetation cover and devoid of any trees.

Of particular concern to the Vichy Springs Resort is the comparison of the Compacted Clay and/or Geo Synthetic Clay Layers with Natural Vegetation Closure Alternative with the Proposed Project's artificial synthetic turf cover. The DEIR and the Final EIR provide compelling evidence and proof that any partial views would be from a distance of over 500- and up to 2,500-feet away cannot distinguish between an olive-green artificial/synthetic turf cover and natural grass. Please refer to the real-life examples of where artificial/synthetic turf covers have been successfully used and which are displayed in Figure 2-2 of the DEIR, Appendix B of this Final EIR, and the figures in the revised Section 3.1 – Aesthetics/Visual Resources above. Of particular concern to the Vichy Springs Resort, is the notion that an olive-green color would not blend into the landscape when the season changes and where the surrounding hills would be brown and any partial views they have would be green. As provided in the revised aesthetics/visual resources section, there are numerous examples of beautiful views of green/irrigated grass adjacent next to brown/dry hills. This type of view is common in northern California and the semi-arid west. Further, from over 500-feet it is virtually impossible to tell the difference between artificial/synthetic turf and natural grass. As a result, the Compacted Clay and/or Geo Synthetic Clay Layers with Natural Vegetation Closure Alternative, once constructed would have less-than-significant to no significant aesthetic/visual impacts and would look very similar to the Proposed Project.

4.2.2.2 Air Quality

Construction of the Compacted Clay and/or Geo Synthetic Clay Layers with Natural Vegetation Closure Alternative would have generally the same, but slightly increased temporary construction related air quality impacts as the Proposed Project as the excavation of the additional clay foundation layer would increase the construction emissions including criteria pollutants such as ROG, NOx, PM_{10} and $PM_{2.5}$. However, these emissions can be reduced to less-than-significant levels with the incorporation of Mitigation Measure 3.2-1: Fugitive Dust Control Measures and Mitigation Measure 3.2-6: Develop and Submit Naturally Occurring Asbestos (NOA) Dust Mitigation Plan as discussed in Section 3.2 of the DEIR.

Once constructed, the Compacted Clay and/or Geo Synthetic Clay Layers with Natural Vegetation Closure Alternative would produce slightly more emissions as compared to the Proposed project, due to increased

maintenance activities associated with ongoing and potential future slope stability issues using natural cover which would require more machinery and manpower than the Proposed Project.

4.2.2.3 Biological Resources

Construction of the Compacted Clay and/or Geo Synthetic Clay Layers with Natural Vegetation Closure Alternative would have generally the same, but increased temporary construction related biological resources impacts as compared to the Proposed Project as the excavation of the additional clay foundation layer would increase the construction impacts. Specifically, the excavation of the clay borrow material (assuming that it can all be located on-site) would result in the expansion of the construction footprint with additional impacts to riparian and wetlands resources resulting in additional impacts to biological resources. However, with the implementation of the following mitigation measures for the Proposed Project, construction impacts can be reduced to less-than-significant levels. (i.e. Mitigation Measure 3.3-1a: Conduct A Preconstruction Survey for Special Status Wildlife Species, Mitigation Measure 3.3-1b: Conduct Bird Breeding and Nesting Surveys, Mitigation Measure 3.3-1c: Conduct a Bat Habitat Assessment of Trees, Mitigation Measure 3.3-1d: Environmental Awareness Training, Mitigation Measure 3.3-1e: Biological Monitor, Mitigation Measure 3.3-1f: Staging Areas and Access Routes, and Mitigation Measure 3.3-3a: Protect Jurisdictional Waters and Sensitive Habitat Areas).

Once constructed, the Compacted Clay and/or Geo Synthetic Clay Layers with Natural Vegetation Closure Alternative would have increased water quality impacts as compared to the Proposed Project as placing a heavy clay layer on steep side slopes has a tendency to fail more often than artificial/synthetic turf covers. Such failures would most often occur during rain or storm events, resulting in uncontrollable erosion and sedimentation that would make its way to the local creek(s) which drains into the Russian River, which is an impaired water body. This is considered to be a potentially significant and unavoidable impact. Under such conditions, the City would be subject to water quality fines that can be as much as $25,000 per day. Due to the fact that these events cannot be predicted as to when or where they will occur, there are no technically viable mitigation measures to reduce these potentially significant and unavoidable impacts.

4.2.2.4 Cultural and Tribal Resources

Construction of the Compacted Clay and/or Geo Synthetic Clay Layers with Natural Vegetation Closure Alternative would have generally the same, but increased, potential to affect cultural and/or tribal resources as compared to the Proposed Project as the excavation of the additional clay foundation layer would increase the construction footprint and thus would have more potential to inadvertently discover cultural and/or tribal resources. However, with the implementation of the Proposed Project's Mitigation Measure 3.4-2: Halt Work if Cultural Resources are Discovered, Mitigation Measure 3.4-3: Stop Work if Paleontological Remains are Discovered, Mitigation Measure 3.4-4: Halt Work if Human Remains are Found, and Mitigation Measure 3.4-5: Halt Work if Tribal Cultural Resources are Discovered any impacts would be reduced to less-than-significant levels.

Once constructed, the Compacted Clay and/or Geo Synthetic Clay Layers with Natural Vegetation Closure Alternative would not have any impacts to cultural and tribal resources.

4.2.2.5 Geology, Soils, and Seismicity

The Compacted Clay and/or Geo Synthetic Clay Layers with Natural Vegetation Closure Alternative would have increased slope stability and soil erosion impacts as compared to the Proposed Project. Specifically, a natural cover alternative would increase the discharge of sediment from the waste management unit over a artificial synthetic turf cover alternative. In addition, the natural cover system would have increased slope stability issues and concerns as the landfill has very steep, 2:1, slopes and would be subject to increased slope failure, sluffing, exposing refuse, leachate seeps, loss of top soil, and soil erosion/sediment transport of material to the creek, which drains to the Russian River. This would be considered to be a *significant and unavoidable impact.* Due to the fact that these events cannot be predicted as to when or where they will occur, there are no technically viable mitigation measures to reduce these potentially significant and unavoidable impacts.

4.2.2.6 Greenhouse Gases

Construction of the Compacted Clay and/or Geo Synthetic Clay Layers with Natural Vegetation Closure Alternative would have increased greenhouse gas emissions as compared to the Proposed Project due to the increase in excavation activities to find clay and increased vehicle/equipment usage to transport and spread and compact the clay layer over the 40-acre landfill site area. However, this increase is considered to be less-than-significant.

Once constructed, the Compacted Clay and/or Geo Synthetic Clay Layers with Natural Vegetation Closure Alternative would have slightly increased greenhouse gas emissions as compared to the Proposed Project as a natural cover alternative would require increased operations and maintenance activities to ensure slope stability and repair any slope failures as they occur. However, this increase is considered to be less-than-significant.

4.2.2.7 Hydrology and Water Quality

As discussed above in the Biological resources section, the Compacted Clay and/or Geo Synthetic Clay Layers with Natural Vegetation Closure Alternative would have increased water quality impacts as compared to the Proposed Project as placing a heavy clay layer on steep side slopes has a tendency to fail more often than artificial/synthetic turf covers. Such failures would most often occur during rain or storm events, resulting in uncontrollable erosion and sedimentation that would make its way to the local creek(s) which drains into the Russian River, which is an impaired water body. Under such conditions, the City would be subject to water quality fines that can be as much as $25,000 per day. This is considered to be a potentially *significant and unavoidable impact.* Due to the fact that these events cannot be predicted as to when or where they will occur, there are no technically viable mitigation measures to reduce these potentially significant and unavoidable impacts.

4.2.2.8 Noise

Construction of the Compacted Clay and/or Geo Synthetic Clay Layers with Natural Vegetation Closure Alternative would have increased noise as the excavation and compaction of the clay layer would generate more noise and ground vibration as compared to the Proposed Project. Also, the construction time would be extended by 2-months, thus increasing the duration of the construction activities and noise. However, the nearest sensitive receptor structure is approximately 600-feet away from the nearest proposed construction activity at the landfill. The potential vibration levels caused by the equipment at the landfill would be much less than the threshold of perceptibility. As a result, potential vibration effects associated with construction

truck traffic or the use of construction equipment at the landfill would not result in any potentially significant groundborne vibration impacts to structures or people. Therefore, vibration impacts would be a less than significant and no mitigation measures are required.

Once constructed, the Compacted Clay and/or Geo Synthetic Clay Layers with Natural Vegetation Closure Alternative would have slightly increased noise as a natural cover alternative would require increased operations and maintenance activities as compared to the Proposed Project to ensure slope stability and repair any slope failures as they occur. However, this increase is considered to be less-than-significant.

4.3 Alternatives Considered and Eliminated

Summarized below are the alternatives that were considered and eliminated from further consideration – along with the rationale for elimination.

~~**Compacted Clay and/or Geo Synthetic Clay Layers with Natural Vegetation Closure Alternative.** The Natural or Clay Layer closure option was a 1974 standard that was officially adopted in 1985 as part of then Subchapter 15 of Title 27 of the California Code of Regulations (27 CCR). However, over the last 35-plus years, the waste industry, along with the regulatory agencies and surrounding communities has recognized that there are serious short falls with compacted clay layers from both a performance and cost perspective – especially on sites with slope stability issues. The Ukiah Landfill is located on steep, 2:1 plus, slope and the potential for a clay and/or geosynthetic clay layer alternative failure is unreasonably quite high. Such a failure would result in significant water quality issues to the unnamed creek alongside the Ukiah Landfill, which drains into Sulfur Creek and then the Russian River. Further, forensic analyses of a number of natural landfill cover slope failures over the last 20-plus years has shown that both Compacted Clay and Geosynthetic Clay Liners fail due to pore water pressure rise in saturated cover soils building up beneath the clay layers; particularly on steep slopes such as the conditions of the Ukiah Landfill. In short, the heavy clay layers assist in the probability in slope instability. Further, CalRecycle has approved numerous alternative landfill covers that are similar to the Proposed Project throughout the State of California and they have proven to be a viable alternative, especially on landfills with steep slopes.~~

~~From an environmental perspective, this compacted clay and/or geo synthetic clay layer alternative would also cause a substantial increase in temporary construction impacts to air quality, noise, and traffic issues over the Proposed Project as it would require the need to excavate and/or import (transport) significant quantities of clay sources and natural vegetation cover soils of to the site and spread them over the 40-acre Ukiah Landfill. Also, from an operational standpoint, this alternative would result in increased maintenance impacts and costs to maintain the natural grass/vegetation to prevent fires and keep rodents from compromising the clay layer structure, which would then contribute to a substantial increase in traffic, air quality, noise, and other potential environmental impacts.~~

~~The City has proposed the Proposed Project and artificial cover alternative because it has many beneficial advantages over the compacted clay and/or geo synthetic clay layer alternative as the Proposed Project provides: 1) A proven stable cover on steep slopes due to the elimination of low interface strength pore water pressure and gas relief layers, 2) Decreased exposure to construction related air quality, noise, and traffic impacts and potential long term water quality impacts to surface and groundwater resources which could lead to significant fines, and 3) significant lower capital and on-going/perpetual maintenance costs. As a result, this compacted clay and/or geo synthetic clay layer alternative has been considered, but is~~

~~eliminated from further consideration as it does not perform as well as the Proposed Project. This alternative is not considered feasible because it is not capable of being accomplished in a successful manner within a reasonable period of time, taking into account environmental, economic and technological factors (CEQA Guidelines, Section 15364).~~

Relocation of the Ukiah Landfill. Moving all the waste from one landfill to another is often referred to as a Clean Closure. It is typically only done on small unpermitted landfills or dumping areas. The relocation of the solid waste in the Ukiah Landfill is considered to be a technically unfeasible alternative. In addition to being cost prohibitive, it would require countless truck trips causing significant and unavoidable traffic and noise impacts. In addition, there is no nearby approved or permitted place to relocate the solid waste material. Further, there are countless unknown hazards and hazardous waste risks that could affect the health and safety of the construction workers, Vichy Springs Resort and nearby residents. As a result, this alternative has been eliminated from further consideration. This alternative is not considered feasible because it is not capable of being accomplished in a successful manner within a reasonable period of time, taking into account environmental, economic and technological factors (CEQA Guidelines, Section 15364).

Alternative/Synthetic Specialized Tufted Geotextile Landfill Turf Cover Color. The Proposed Project's alternative/synthetic specialized tufted geotextile turf landfill cover of the Proposed Project was selected to provide a natural shade of color in order to help mimic the existing natural color and blend into the surrounding environment. Artificial or synthetic specialized tufted geotextile covers generally come in three (3) natural colors – olive-green, tan, and a blend of olive-green and tan. For the Proposed Project the olive-green color was selected as the preferred color as it provides arguably the best color option to blend into the natural and surrounding environment. With the required minimum of a 5/8 thick sand infill layer on top, the cover will look like a blend of olive-green and tan. No other <u>non-natural looking</u> colors such as black, blue, red, orange, grey, white or various color pallets of those or other color options are available in alternative/synthetic specialized tufted geotextiles for landfills and would not provide any better ability to blend into the surrounding environment. ~~Further, the 40-acre Ukiah Landfill is not accessible and visible from anywhere on the Vichy Springs Resort Property and/or the general public. The 40-acrte Ukiah Landfill is and will remain inaccessible to the general public and is and will not be visible or from anywhere from a public access point as well as anywhere on the Vichy Springs Resort~~. As a result, this alternative has been duly considered but eliminated from further consideration because it would not avoid any significant environmental (aesthetic) impacts.

4.4 Environmentally Superior Alternative

Section 15126.6(e)(2) of the CEQA Guidelines requires an EIR to identify an environmentally superior alternative. Of the ~~two~~ <u>three</u> alternatives considered in this section (Proposed Project<u>,</u> ~~and~~ the No Project Alternative, <u>and the Compacted Clay and/or Geo Synthetic Clay Layers with Natural Vegetation Closure Alternative</u>), the Proposed Project would be the environmentally superior to <u>both</u> the No Project Alternative <u>and the Compacted Clay and/or Geo Synthetic Clay Layers with Natural Vegetation Closure Alternative</u>. <u>The advantages of an artificial synthetic turf landfill cover system over traditional clay cover layer/natural vegetation cover system, include the following:</u>

- **Long Life.** The durable, high-strength system components ensure a long-life (100-year design life) of protection against operational and natural forces while maintaining an excellent natural looking appearance with greatly reduced maintenance.
- **Soil Cover Savings**. Eliminates the need for high maintenance vegetative soil covers and increases weather resistance. Since final cover soils are challenging to locate and expensive to place in the final stages of the landfill's lifespan, the resulting savings can be significant.
- **Environmentally Friendly.** The system is better for landfills in sensitive areas like the Ukiah Landfill where soil erosion and sedimentation are a major concern due to steep canyon slopes. Soil loss is non-existent during operations and post-closure. Eliminates the need for borrow sources, and siltation ponds can be converted to simple stormwater retention ponds. As a direct result, associated environmental construction impacts are much easier to manage.
- **Increased Slope Stability**. Soil stability problems either rain/storm events, through earthquake, and/or gas pressure buildup is reduced.
- **Weather Resistant**. The components of an artificial synthetic cover system work in conjunction to seal the waste mass from the destructive forces of high rainfall intensities and hurricane force winds.
- **Reduced Wildlife Impacts**. By reducing organic matter and food sources, fewer animals, including birds, are attracted to the site. This is important at landfills located in coastal areas or near airports. Because the components of an artificial synthetic cover system do not pass on the animals' smell/taste test, they do not usually bother with it or return to it.
- **Eliminates Cap Infiltration**. Since surface water is not restricted by the hydraulic conductivity of a vegetative cover drainage system, and can no longer infiltrate into the waste, leachate production is cut off at the source.
- **Enhanced Visual Inspection**. Because the synthetic materials are not covered with thick soil profiles, they are easily inspected for damage; which, if identified, may be easily and inexpensively repaired. Also, significant additional damage to clay layer caps can be done by earthwork equipment during repair and soil placement maintenance activities. By replacing the soil layer with an artificial synthetic cover system, this is no longer an issue.
- **Easier Reclamation**. Landfill materials are readily accessible in the event of landfill reclamation for future piggyback areas or future waste lifts due to waste settlement or vertical expansion. The composite nature of an artificial synthetic cover system allows owners access to the waste without having to remove the existing cover soils of a typical and traditional final cover system.

Further, the comparison and rationale for each alternative including the Proposed Project is discussed below.

4.4.1 No Project Alternative

The No Project Alternative would not meet any of the goals and objectives of the Proposed Project. Under the No Project Alternative, the Ukiah Landfill would not be properly closed according to state and local regulations and would be susceptible to slope instability, potential water quality impacts to surface water and groundwater resources due to inadequate cover leading to drainage and erosion issues during inclement weather/stormwater, and the potential for inadequate LFG control and monitoring leading to air quality issues and impacts. Under the No Action Alternative, the City would be potentially susceptible for a variety

of water quality and air quality violations and fines. As a result, the Proposed Project is considered to be the environmentally superior alternative.

4.4.2 Compacted Clay and/or Geo Synthetic Clay Layers with Natural Vegetation Closure Alternative[1]

The Natural or Clay Layer closure option was a 1974 standard that was officially adopted in 1985 as part of then Subchapter 15 of Title 27 of the California Code of Regulations (27 CCR). However, over the last 35-plus years, the waste industry, along with the regulatory agencies and surrounding communities, has recognized that there are serious short-falls with compacted clay layers from both a performance and cost perspective – especially on sites with slope stability issues. The Ukiah Landfill is located on steep, 2:1 plus, slope and the potential for a clay and/or geosynthetic clay layer alternative failure is unreasonably quite high. Such a failure would result in significant water quality issues to the unnamed creek alongside the Ukiah Landfill, which drains into Sulfur Creek and then the Russian River. Further, forensic analyses of a number of natural landfill cover slope failures over the last 20-plus years has shown that both Compacted Clay and Geosynthetic Clay Liners fail due to pore water pressure rise in saturated cover soils building up beneath the clay layers; particularly on steep slopes such as the conditions of the Ukiah Landfill. In short, the heavy clay layers assist in the probability in slope instability. Further, CalRecycle has approved numerous alternative landfill covers that are similar to the Proposed Project throughout the State of California and they have proven to be a viable alternative, especially on landfills with steep slopes.

From an environmental perspective, the compacted clay and/or geo synthetic clay layer alternative would also cause a substantial increase in temporary construction impacts to air quality, biological resources, water quality, and noise, issues over the Proposed Project as it would require the need to excavate and/or import (transport) significant quantities of clay sources and natural vegetation cover soils to the site and spread them over the 40-acre Ukiah Landfill. Also, from an operational standpoint, this alternative would result in increased maintenance impacts and costs to maintain and repair slope failures as well as to maintain the natural grass/vegetation to prevent fires and keep rodents from compromising the clay layer structure, which would then contribute to a substantial increase in traffic, air quality, noise, and other potential environmental impacts.

4.4.3 Proposed Project Alternative

As shown in Table 4-1, the City has proposed the Proposed Project and artificial cover alternative because it has many advantages over the Compacted Clay and/or Geo Synthetic Clay Layer with Natural Vegetation Closure Alternative and the No Project Alternative as the Proposed Project provides: 1) A proven stable cover on steep slopes due to the elimination of low interface strength pore water pressure and gas relief layers, 2) Decreased exposure to construction-related air quality, noise, and traffic impacts and potential significant and unavoidable long-term water quality impacts to surface and groundwater resources which could lead to significant fines, and 3) significant lower capital and on-going/perpetual maintenance costs. As a result, the compacted clay and/or geo synthetic clay layer alternative has been considered, but is not

[3] Information of history and rationale for the selection of the Proposed Project and artificial synthetic turf cover was provided by the City's engineering consultant, Mike Delmanowski, C.E.G., C.Hg. Senior Hydrogeologist of EBA Engineering located at 825 Sonoma Avenue Santa Rosa, CA 95404. See Appendices B and C of this Final EIR as well as appendices in the DEIR

selected as it does not perform as well as the Proposed Project. The No Project Alternative is not a legally implementable alternative. As a result, the Proposed Project remains the City's selected alternative.

Table 4-1
Comparison of Alternatives

	Proposed Project	**Compacted Clay/Natural Cover Alternative**	**No Project Alternative**	**Comments**
Meets Project Objectives?	Yes	No/Partial	No	The No Project Alternative would not be a legally implementable alternative. The CCL/Natural Cover Alternative would have less slope stability than the proposed project and would require increased future maintenance than over the Proposed Project.
3.1 Aesthetic/Visual Resources				
Impact 3.1-1: Would the Proposed Project have a substantial adverse effect on a scenic vista?	LSI	Equal	N/A	The Proposed Project is located on an existing dump and is not considered to be a scenic view area by the County of Mendocino.
Impact 3.1-2: Would the Proposed Project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a State scenic highway.	LSI	Equal	N/A	The Proposed Project is located on an existing dump and is not considered to be a scenic view area by the County of Mendocino.
Impact 3.1-3: Would the Proposed Project substantially degrade the existing visual character or quality of the site and its surroundings.	LSI	Equal	N/A	The Proposed Project is located on an existing dump and is not considered to be a scenic view area by the County of Mendocino.
Impact 3.1-4: Would the Proposed Project create a new source of substantial light or glare, which would adversely affect day or nighttime views in the area?	LSI	Equal	N/A	The Proposed Project is located on an existing dump and is not considered to be a scenic view area by the County of Mendocino.
3.2 Air Quality				
Impact 3.2-1: Would the Proposed Project Conflict with or Obstruct Implementation of the Applicable Air Quality Management Plan?	LSI	Equal	N/A	The Proposed Project and/or the CCL/Natural Cover Alternative would not conflict with or obstruct implementation of the Applicable Air Quality Management Plan.
Impact 3.2-2: Would Construction of the Proposed Project Result in a Cumulatively Considerable Net Increase of any Criteria Pollutant Under an Applicable Federal or	LSM	Equal/PG	N/A	The Proposed Project and/or the CCL/Natural Cover Alternative would not result in a Cumulatively Considerable Net Increase of any Criteria Pollutant Under an Applicable Federal or State Ambient Air Quality Standard. However, the CCL/Natural Cover Alternative would have slightly increased emissions due to

Table 4-1

State Ambient Air Quality Standard?				increased construction and maintenance activities.
Impact 3.2-3: Would Operation of the Proposed Project Result in a Cumulatively Considerable Net Increase of any Criteria Pollutant Under an Applicable Federal or State Ambient Air Quality Standard?	LSI	Equal/PG	N/A	The Proposed Project and/or the CCL/Natural Cover Alternative would not result in a Cumulatively Considerable Net Increase of any Criteria Pollutant Under an Applicable Federal or State Ambient Air Quality Standard. However, the CCL/Natural Cover Alternative would have slightly increased emissions due to increased construction and maintenance activities.
Impact 3.2-4: Would Construction and/or Operation of the Proposed Project Expose Sensitive Receptors to Substantial Pollutant Concentrations?	LSI	Equal/PG	N/A	The Proposed Project and/or the CCL/Natural Cover Alternative would not expose sensitive receptors to substantial pollutant concentrations. However, the CCL/Natural Cover Alternative would have slightly increased emissions due to increased construction and maintenance activities.
Impact 3.2-5: Would Construction and/or Operation of the Proposed Project Result in Other Emissions (Such as Those Leading to Odors) Adversely Affecting a Substantial Number of People?	LSI	Equal/PG	N/A	The Proposed Project and/or the CCL/Natural Cover Alternative would not expose sensitive receptors to substantial pollutant concentrations causing odors. However, the CCL/Natural Cover Alternative would have slightly increased emissions due to increased construction and maintenance activities.
Impact 3.2-6: Would Construction of the Proposed Project Result in Other Emissions (Such as Naturally Occurring Asbestos) Adversely Affecting a Substantial Number of People?	LSM	Equal/PG	N/A	With mitigation, the Proposed Project and/or the CCL/Natural Cover Alternative would not expose sensitive receptors to substantial naturally occurring asbestos. However, the CCL/Natural Cover Alternative would have slightly increased emissions due to increased construction and maintenance activities.
3.3 Biological Resources				
Impact 3.3-1: Would the Proposed Project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the California Department of Fish and	LSM	Equal/PG	N/A	With mitigation, the Proposed Project and/or the CCL/Natural Cover Alternative would not have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service. However, the CCL/Natural Cover Alternative would have slightly increased effects due to

Proposed Project cause a substantial adverse change in the significance of a tribal cultural resource?				change in the significance of a tribal cultural resource. However, the CCL/Natural Cover Alternative would have slightly increased effects due to increased construction and maintenance activities.
3.5 Geology Soils and Seismicity				
Impact 3.5-1: Would the Proposed Project expose people to injury or structures to damage from potential rupture of a known earthquake fault, strong ground shaking, seismic-related ground failure, or landslides?	LSI	Equal/PG	N/A	The Proposed Project and/or the CCL/Natural Cover Alternative would not expose people to injury or structures to damage from potential rupture of a known earthquake fault, strong ground shaking, seismic-related ground failure, or landslides. However, the CCL/Natural Cover Alternative would have slightly increased effects due to increased construction and maintenance activities.
Impact 3.5-2: Would construction grading and long-term closure conditions at the Landfill expose soils to erosion and result in the loss of topsoil?	LSI	PG	N/A	The CCL/Natural Cover Alternative would have greater potential to expose soils to erosion.
Impact 3.5-3: Would the Proposed Project be located on a unit or soils that are potentially unstable, or that could become unstable as a result of the Project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse?	LSI	PG	N/A	The CCL/Natural Cover Alternative would have greater potential to become unstable and potentially resulting in on-site landslides, sluffing, and failure due to the steep slopes.
Impact 3.5-4. Would the Proposed Project make a cumulatively considerable contribution to cumulative effects associated with increased seismic risk, landsliding, erosion, topsoil loss or increased exposure to seismic or other risks?	LSI	PG	N/A	The CCL/Natural Cover Alternative would have greater potential to become unstable and potentially resulting in on-site landslides, sluffing, and failure due to the steep slopes.
3.6 Greenhouse Gases				
Impact 3.6-1: Would Implementation of the Proposed Project	LSI	Equal/PG	N/A	The Proposed Project and/or the CCL/Natural Cover Alternative would not generate GHG emissions, either directly or

Table 4-1
Comparison of Alternatives

	Proposed Project	Compacted Clay/Natural Cover Alternative	No Project Alternative	Comments
generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment?				indirectly, that may have a significant impact on the environment. However, the CCL/Natural Cover Alternative would have slightly increased effects due to increased construction and maintenance activities.
Impact 3.6-2: Would the Proposed Project conflict with any applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHG?	LSI	Equal/PG	N/A	The Proposed Project and/or the CCL/Natural Cover Alternative would not conflict with any applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHG. However, the CCL/Natural Cover Alternative would have slightly increased effects due to increased construction and maintenance activities.
3.7 Hydrology and Water Quality				
Impact 3.7-1: Would the Proposed Project violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality?	LSI	Equal/PG	N/A	The CCL/Natural Cover Alternative would have greater potential to violate water quality standards or waste discharge requirements due to on-site landslides, sluffing, and slope failures.
Impact 3.7-2: Would the Proposed Project substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the Project may impede sustainable groundwater management of the basin?	LSI	Equal	N/A	The Proposed Project and/or the CCL/Natural Cover Alternative would not substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the Project may impede sustainable groundwater management of the basin.
Impact 3.7-3: Would the Proposed Project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner that would result in substantial erosion, siltation, polluted runoff or flooding on- or off-site?	LSI	Equal/PG	N/A	The Proposed Project and/or the CCL/Natural Cover Alternative would not substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner that would result in substantial erosion, siltation, polluted runoff or flooding on- or off-site. However, the CCL/Natural Cover Alternative would have slightly increased water quality effects due to increased construction and maintenance activities as well as increased susceptibility to slope failures leading to increased erosion and sedimentation.

Table 4-1
Comparison of Alternatives

	Proposed Project	Compacted Clay/Natural Cover Alternative	No Project Alternative	Comments
Impact 3.7-4: Would the Proposed Project conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?	LSI	Equal/PG	N/A	The Proposed Project and/or the CCL/Natural Cover Alternative would not conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan. However, the CCL/Natural Cover Alternative would have slightly increased water quality effects due to increased construction and maintenance activities as well as increased susceptibility to slope failures leading to increased erosion and sedimentation.
3.8 Noise				
Impact 3.8-1: Would the Proposed Project generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the Proposed Project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	LSI	Equal/PG	N/A	The Proposed Project and/or the CCL/Natural Cover Alternative would not generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the Proposed Project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies. However, the CCL/Natural Cover Alternative would have slightly increased noise effects due to increased construction and maintenance activities.
Impact 3.8-2: Would the Proposed Project generate excessive groundborne vibration or groundborne noise levels?	LSI	Equal/PG	N/A	The Proposed Project and/or the CCL/Natural Cover Alternative would not generate excessive groundborne vibration or groundborne noise levels. However, the CCL/Natural Cover Alternative would have slightly increased noise effects due to increased construction and maintenance activities.
Impact 3.8-3: Would the Proposed Project be located within the vicinity of a private airstrip or an airport land use plan, or where such a plan has not been adopted, within two miles of a public airport or public use airport, and/or expose people residing or working in the project area to excessive noise levels.	LSI	Equal	N/A	The Proposed Project and/or the CCL/Natural Cover Alternative would not be located within the vicinity of a private airstrip or an airport land use plan, or where such a plan has not been adopted, within two miles of a public airport or public use airport, and/or expose people residing or working in the project area to excessive noise levels.
Growth Inducement Effects				
Would the Proposed Project indirectly or directly remove barriers	LSI	Equal	N/A	The Proposed Project and/or the CCL/Natural Cover Alternative would not indirectly or directly remove barriers to

Mitigation Monitoring and Reporting Program

MITIGATION MONITORING AND REPORTING PROGRAM

City of Ukiah
Landfill Closure Project
Final Environmental Impact Report

SCH#: 2017022009

Prepared for:
City of Ukiah
300 Seminary Avenue
Ukiah, CA 95482-5400

Prepared by:

SMB Environmental, Inc.

April 2020

INTRODUCTION

On November 13, 2019, the City of Ukiah (City) released for public review the Draft Environmental Impact Report (Draft EIR) (State Clearinghouse Number: 2017022009) to provide the public and responsible agencies with information about the potential environmental effects of the City's proposed Landfill Closure Project (Project or Proposed Project). The City is the lead agency under the California Environmental Quality Act (CEQA) and has principal responsibility for approving the Proposed Project.

The overall purpose of the Proposed Project is to close the Ukiah Landfill in accordance with the applicable regulatory standards. Specifically, the components and systems required for closure of the landfill include the final cover and grading design to control stormwater, potential infiltration and accommodate future settlement, landfill slope stability, construction quality assurance, drainage and erosion control systems, landfill gas control and monitoring systems, groundwater/surface water monitoring systems, and site security.

CEQA Guidelines require public agencies to adopt a Mitigation Monitoring and Reporting Program (MMRP) for changes to the project, which it has adopted or made a condition of project approval in order to mitigate or avoid significant effects on the environment. A MMRP is required for the Proposed Project because the Draft PEIR identifies potentially significant adverse impacts related to project implementation, and mitigation measures have been identified to reduce those impacts.

On November 13, 2019, to initiate public review of the Draft EIR, the City filed a Notice of Completion (NOC) for the project with the Governor's Office of Planning and Research (State Clearinghouse or SCH) and a Notice of Availability (NOA) with the County of Mendocino and released the Draft EIR for a 45-day public review. The State Clearinghouse identified the project with SCH #2017022009. The 45-day public review period was established between November 13 through December 31, 2019 and was then extended through January 9, 2010, with copies of the Draft PEIR available for review on the City's website at at https://cityofukiah.box.com/UkiahLandfillClosureProject; the City's front desk at 300 Seminary Avenue, Ukiah, CA 95482; and the Main Branch Library, 105 North Main Street, Ukiah, CA 95482.

In March 2020, the City prepared a Final PEIR according to CEQA Guidelines and incorporated all comments received by the State Clearinghouse and the City during the 45-day public review period. As a result, some of the mitigation measures identified in the Public Draft EIR have been revised to reflect those comments. Based on the Final EIR, the Proposed Project would not result in new significant impacts, substantially increase the severity of previously disclosed impacts, or involve any of the other conditions related to changed circumstances or new information that can require recirculation pursuant to Section 15088.5(a) of the State CEQA Guidelines.

PURPOSE OF MITIGATION MONITORING AND REPORTING PROGRAM

This MMRP has been prepared to ensure that all required mitigation measures are implemented and completed in a satisfactory manner before and during project construction and operation. The MMRP may be modified by the City during project implementation, as necessary, in response to changing conditions or other refinements. Table A (included at the end of this document) has been prepared to assist the responsible parties in implementing the mitigation measures. The table identifies individual mitigation measures, monitoring/mitigation timing, responsible person/agency for implementing the measure, monitoring and reporting procedure, and space to confirm implementation of the mitigation measures. The numbering of mitigation measures follows the numbering sequence found in the Public Draft EIR.

ROLES AND RESPONSIBILITIES

Unless otherwise specified herein, the City is responsible for taking all actions necessary to implement the mitigation measures under its jurisdiction according to the specifications provided for each measure and for demonstrating that the action has been successfully completed. The City, at its discretion, may delegate implementation responsibility or portions thereof to a licensed contractor or other designated agent. The City would be responsible for overall administration of the MMRP and for verifying that City staff members and/or the construction contractor has completed the necessary actions for each measure.

The City would designate a project manager to oversee implementation of the MMRP. The City is primarily responsible for implementing the mitigation

measures for the Proposed Project as described in this MMRP. Duties of the project manager include the following:

- Ensure that routine inspections of the construction site are conducted by appropriate City staff; check plans, reports, and other documents required by the MMRP; and conduct report activities.
- Serve as a liaison between the City and the contractor or project applicant regarding mitigation monitoring issues.
- Complete forms and maintain reports and other records and documents generated by the MMRP.
- Coordinate and ensure that corrective actions or enforcement measures are taken, if necessary.

The responsible party for implementation of each item shall identify the staff members responsible for coordinating with the City on the MMRP.

REPORTING

The City's Director of Public Works shall prepare a monitoring report, upon completion of the project, on the compliance of the activity with the required mitigation measures. Information regarding inspections and other requirements shall be compiled and explained in the report. The report shall be designed to simply and clearly identify whether mitigation measures have been adequately implemented. At a minimum, each report shall identify the mitigation measures or conditions to be monitored for implementation, whether compliance with the mitigation measures or conditions has occurred, the procedures used to assess compliance, and whether further action is required.

MITIGATION MONITORING AND REPORTING PLAN TABLE

The categories identified in Table A are described below.

- **Mitigation Measure –** This column provides the text of the mitigation measures identified in the Draft EIR.
- **Timing –** This column identifies the time frame in which the mitigation will take place.
- **Implementation** – This column identifies the party responsible for implementing compliance with the requirements of the mitigation measure
- **Enforcement –** This column identifies the party responsible for enforcing compliance with the requirements of the mitigation measure.
- **Dated Signature for Verification of Compliance –** This column is to be dated and signed by the person (either project manager or his/her designee) responsible for verifying compliance with the requirements of the mitigation measure.

Mitigation Measure	Timing	Implementation[1]	Enforcement[1]	Dated Signature for Verification of Compliance
3.3 AIR QUALITY				
Mitigation Measure 3.2-1: Fugitive Dust Control Measures*:* The following airborne dust control measures shall be required during all construction operations, grading of roads, or the clearing of land (MCAQMD Rule 1-430-Fugitive Dust Emissions): • All visibly dry disturbed soil road surfaces shall be watered to minimize fugitive dust emissions. • All unpaved surfaces, unless otherwise treated with suitable chemicals or oils, shall have a posted speed limit of 10 miles per hour. • Earth or other material that has been transported by trucking or earth moving equipment, erosion by water, or other means onto paved streets shall be promptly removed. • Asphalt, oil, water or suitable chemicals shall be applied on materials stockpiles, and other surfaces that can give rise to airborne dusts. • All earthmoving activities shall cease when sustained winds exceed 15 miles per hour. • The operator shall take reasonable precautions to prevent the entry of unauthorized vehicles onto the site during non-work hours. • The operator shall keep a daily log of activities to control fugitive dust.	During construction.	City of Ukiah	City of Ukiah	
Mitigation Measure 3.2-6: Develop and Submit NOA Dust Mitigation Plan. Prior to construction of the Proposed Project (if an exemption is not granted because it is determined that NOA is not found on the project site), the City shall submit a NOA Dust Mitigation Plan to the MCAQMD and comply with NOA requirements of the MCAQMD and Title 17 California Code of Regulations §93105. Specifically, the MCAQMD requires that the following control measures are implemented at the start and maintained throughout the duration of the construction or grading activity (one acre or greater), in accordance with Title 17 California Code of Regulations §93105: • Submittal of an Asbestos Dust Mitigation Plan in accordance with Section 93105(e)(4)	During construction.	City of Ukiah	City of Ukiah	

[1] The City of Oxnard's Director of Public Works is primarily responsible for implementing the mitigation measures for the Proposed Project as described in this MMRP.

Table A
Mitigation Monitoring and Reporting Plan for the City of Ukiah's Landfill Closure Project
Final Environmental Impact Report

Mitigation Measure	Timing	Implementation[1]	Enforcement[1]	Dated Signature for Verification of Compliance
• All Asbestos Dust Mitigation Plan requirements must be implemented and maintained throughout project. • Stabilize disturbed areas after construction. • Report and record all geologic survey and sampling analysis results. • All fill removed from areas containing NOA must be disposed of in accordance with all applicable laws and regulations. • Approved dust suppressants are to be used on all unpaved surfaces annually. • Construction within ¼ mile of a school, hospital, or other sensitive receptors can occur only with a District permit. • Discovery of NOA after start of a project requires stoppage of work, notification to the District and implementation of NOA requirements for the project size prior to restarting of work. • All on-site workers must be notified of the presence or possible presence of NOA per OSHA requirements.				
3.4 BIOLOGICAL RESOURCES				
Mitigation Measure 3.3-1a: Conduct A Preconstruction Survey for Special Status Wildlife Species. A qualified biologist shall conduct a pre-construction survey for state and federal special status wildlife species no more than 10-days prior to construction. A combination of visual and trapping surveys may be performed with authorization from CDFW and/or USFWS. If a wildlife special species such as the western pond turtle, and/or the yellow-legged frog is found near any proposed construction areas, impacts on individuals and their habitat shall be avoided to the extent feasible. If occupied habitat can be avoided, an exclusion zone shall be established around the habitat and temporary suitable/authorized fencing shall be installed around the buffer area with "Sensitive Habitat Area" signs posted and clearly visible on the outside of the fence. If avoidance is not possible and the species is determined to be present in work areas, the biologist with approval and permits from CDFW may capture the wildlife special status species prior to construction activities and relocate them to nearby, suitable habitat a minimum of 300-feet from the work area. Exclusion fencing shall then be installed if feasible to prevent them from reentering the work area. For the duration of work in these areas, the biologist shall conduct regular follow-up visits during and throughout construction activities to monitor effectiveness.	Prior to and/or during construction.	City of Ukiah	City of Ukiah	

Table A

Mitigation Measure	Timing	Implementation[1]	Enforcement[1]	Dated Signature for Verification of Compliance
Mitigation Measure 3.3-1b: Conduct Bird Breeding and Nesting Surveys. For construction activities that occur between February 1 and August 31, preconstruction breeding and nesting bird surveys shall be conducted by a qualified biologist prior to and within 3-days of any initial ground-disturbance activities to prevent birds from nesting between the survey and the start of construction. Typically, nesting birds can build a nest in approximately 4 days. Surveys shall be conducted within all suitable nesting habitat within 250-feet of the activity. All active, non-status passerine nests identified at that time shall be protected by a 75-100-foot radius minimum exclusion zone. Active raptor or special-status species nests shall be protected by a buffer with a minimum radius of 200-feet. CDFW and USFWS recommend that a minimum 500-foot exclusion buffer be established around active special-status species nests. The following considerations apply to this mitigation measure: • Survey results are valid for 7-days from the survey date. Should ground disturbance commence later than 7-days from the survey date, surveys should be repeated. If no breeding birds are encountered, then work may proceed as planned. • Exclusion zone sizes may vary, depending on habitat characteristics and species, and are generally larger for raptors and colonial nesting birds. Each exclusion zone would remain in place until the nest is abandoned or all young have fledged. • The non-breeding season is defined as September 1 to January 31. During this period, breeding is not occurring and surveys are not required. However, if nesting birds are encountered during work activities in the non-breeding season, disturbance activities within a minimum of 50-feet of the nest should be postponed until the nest is abandoned or young birds have fledged.	Prior to and during construction.	City of Ukiah	City of Ukiah California Department of Fish and Wildlife U.S. Fish and Wildlife	
Mitigation Measure 3.3-1c: Conduct a Bat Habitat Assessment of Trees: Removal of trees containing suitable bat roosting habitat comprised of cavities, crevices, and/or exfoliating bark, may cause direct mortality of roosting bats if removed during maternity season (April 15 to August 31) prior to self-sufficient volancy of pups, or in winter during torpor or hibernation (October 16 to February 28). Removal of larger mature trees has the potential of causing direct mortality of solitary tree-roosting species such as western red bat or hoary bat. Minimization Measures identified in Sections 1.3.7, and 1.3.8 will reduce these impacts to less than significant. However, if the construction timing is changed and construction must occur between April 15 and August 31 or October 15 and February 29, a bat habitat assessment will be conducted.	Prior to and during construction.	City of Ukiah	City of Ukiah California Department of Fish and Wildlife U.S. Fish and Wildlife	

Table A Mitigation Monitoring and Reporting Plan for the City of Ukiah's Landfill Closure Project Final Environmental Impact Report				
Mitigation Measure	Timing	Implementation[1]	Enforcement[1]	Dated Signature for Verification of Compliance
For those trees with suitable potential habitat, presume presence of roosting bats, then conduct two-step tree removal during seasonal periods of bat activity, so that bats can safely abandon the tree prior to removal. These dates are: A) between March 1 (or after evening temperatures rise above 45F and 72 hours after rains fall to less than 0.5-inches in 24 hours) and April 15 (maternity season), after which time non-volant pups are present in maternity roosts, and; B) between September 1, after young are self-sufficiently volant, and October 15 (winter hibernation), or before evening temperatures fall below 45F, and 72 hours prior to onset of rains greater than 0.5-inches in 24 hours. A qualified bat biologist experienced with two-step removal procedures is required to instruct and provide initial supervision of tree cutting crews on Day 1 so that they do not accidentally remove potential habitat features, which could result in direct mortality of bats. On Day 2, the day following trimming and removal of non-habitat roost features on habitat trees, the tree is removed. Any new tree cutting crew members added to the crew will require instruction and initial supervision by a qualified bat biologist.				
Mitigation Measure 3.3-1d: Environmental Awareness Training. All construction personnel shall be given environmental awareness training by the Proposed Project's environmental inspector or biological monitor before the start of construction. The training will familiarize all construction personnel with the federally listed species that may occur in the Action Area, their habitats, general provisions and protections afforded by the Endangered Species Act, measures to be implemented to protect these species, and the project boundaries. This training will be provided to any new worker before they are authorized to perform project work. As part of the environmental awareness training, construction personnel will be notified that no dogs or any other pets under control of construction personnel will be allowed in the Project Area, and that no firearms will be permitted in the Project Area, unless carried by authorized security personnel or law enforcement.	Prior to construction.	City of Ukiah	City of Ukiah	

Table A
Mitigation Monitoring and Reporting Plan for the City of Ukiah's Landfill Closure Project
Final Environmental Impact Report

Mitigation Measure	Timing	Implementation[1]	Enforcement[1]	Dated Signature for Verification of Compliance
Mitigation Measure 3.3-1e: Biological Monitor. A CDFW -approved Biological Monitor will be present on site for all construction activities that occur within 100-feet of suitable habitats for state and/or federally listed species that may be present during the Proposed Project. The City will submit the Biological Monitor's qualifications to the CDFW for approval 30-days prior to project construction. The Biological Monitor will ensure that all applicable avoidance and minimization measures are implemented during project construction. Specifically, the Biological Monitor will also ensure that: • All vehicles entering the site are free of debris that may harbor organisms that could be introduced to the site, such as vegetation or mud from other areas. • Turbidity, sedimentation, and the release of materials such as dust or construction runoff are controlled, and that spill control measures are enacted properly. • No state or federally listed species and/or their habitats experience unintended effects. The Biological Monitor will have the authority to stop any work activities that could result in unintended adverse effects to covered species and/or their habitats.	During construction.	City of Ukiah	City of Ukiah	
Mitigation Measure 3.3-1f: Staging Areas and Access Routes. Placement of all staging areas, access roads, and other facilities will avoid and limit disturbance-sensitive habitats (e.g., riparian habitat, suitable habitats) as much as possible. All staging and material storage areas, including the locations where equipment and vehicles are parked overnight, will be placed outside of the flood zone of a watercourse, away from riparian habitat or wetland habitat, and away from any other sensitive habitats. When possible, staging and access areas will be situated in areas that are previously disturbed, such as developed areas, paved areas, parking lots, areas with bare ground or gravel, and areas clear of vegetation.	Prior to and/or during construction.	City of Ukiah	City of Ukiah	
Mitigation Measure 3.3-3a: Protect Jurisdictional Waters and Sensitive Habitat Areas. The City shall implement the following measures to protect jurisdictional waters and sensitive habitats. • Request a verification of the pre-construction delineated boundaries from the Corps. Following verification of the delineation boundaries from the Corps, the City shall develop measures to avoid impacts to jurisdictional wetlands.	Prior to construction.	City of Ukiah	City of Ukiah California Department of Fish and Wildlife U.S. Army Corps of Engineers	

Table A
Mitigation Monitoring and Reporting Plan for the City of Ukiah's Landfill Closure Project
Final Environmental Impact Report

Mitigation Measure	Timing	Implementation[1]	Enforcement[1]	Dated Signature for Verification of Compliance
• After final design, quantify impacts to wetlands and other waters. Submit to the Corps a permit application for discharge of fill material into waters of her United States, pursuant to Section 404 of the Clean Water Act. • Install and maintain appropriate erosion and sedimentation controls during and following construction. • Obtain a streambed alteration agreement with the California Department of Fish and Wildlife, pursuant to Section 1601 of the Fish and Game Code, before initiating construction within the 100-year floodplain of any stream crossing. • Develop and implement mitigation plans for impacts to wetlands. Replace eliminated wetlands at a 1:1 ratio so there is no net loss of wetlands. Temporarily impacted wetlands should be restored onsite. Stockpile topsoil removed from wetlands and store in upland landscape positions. Following construction disturbance, restore the land surface contours and backfill the top 6- to 12-inches with stockpiled topsoil. • Following Project completion, monitor the site to assess mitigation success. Success criteria should be clearly defined for all measures implemented to mitigate for project impacts to wetlands. Yearly reports should be submitted to the Corps until implementation has been determined to be successful.			U.S. Fish and Wildlife	
3.4 CULTURAL AND TRIBAL RESOURCES				
Mitigation Measure 3.4-2: Halt Work if Cultural Resources are Discovered. In the event that any prehistoric or historic subsurface cultural resources are discovered during ground disturbing activities, all work within 100-feet of the resources shall be halted and after notification, the City shall consult with a qualified archaeologist to assess the significance of the find. If any find is determined to be significant (CEQA Guidelines 15064.5[a][3] or as unique archaeological resources per Section 21083.2 of the California Public Resources Code), representatives of the City and a qualified archaeologist shall meet to determine the appropriate course of action. In considering any suggested mitigation proposed by the consulting archaeologist in order to mitigate impacts to historical resources or unique archaeological resources, the lead agency shall determine whether avoidance is necessary and feasible in light of factors such as the nature of the find, project design, costs, and other considerations. If avoidance is infeasible, other appropriate measures (e.g., data recovery) shall be instituted. Work may proceed on other parts of the project	During construction.	City of Ukiah	City of Ukiah

site while mitigation for historical resources or unique archaeological resources is carried out.				
Mitigation Measure 3.4-3: Stop Work if Paleontological Remains are Discovered. If paleontological resources, such as fossilized bone, teeth, shell, tracks, trails, casts, molds, or impressions are discovered during ground-disturbing activities, work will stop in that area and within 100-feet of the find until a qualified paleontologist can assess the significance of the find and, if necessary, develop appropriate treatment measures in consultation with the City.	During construction.	City of Ukiah	City of Ukiah	
Mitigation Measure 3.4-4: Halt Work if Human Remains are Found. If human remains are encountered during excavation activities conducted for the Proposed Project, all work in the adjacent area shall stop immediately and the Mendocino County Coroner's office shall be notified. If the Coroner determines that the remains are Native American in origin, the Native American Heritage Commission shall be notified and will identify the Most Likely Descendent, who will be consulted for recommendations for treatment of the discovered human remains and any associated burial goods.	During construction.	City of Ukiah	City of Ukiah Mendocino County Coroner's Office Native American Heritage Commission Most Likely Descendent	
Mitigation Measure 3.4-5: Halt Work if Tribal Cultural Resources are Discovered. In the event that any tribal cultural resources are discovered during ground disturbing activities, all work within 100-feet of the resources shall be halted and after notification, the City shall consult with a qualified archaeologist and local tribes to assess the significance of the find. If any find is determined to be significant as a unique tribal cultural resource, the City shall treat the resource with culturally appropriate dignity, taking into account the tribal cultural values and meaning of the resource, including to, but not limited to, the following: • Protecting the cultural character and integrity of the resource; • Protecting the traditional use of the resource; and • Protecting the confidentiality of the resource. In considering any suggested mitigation proposed by the consulting archaeologist and/or the appropriate tribe in order to mitigate impacts to any tribal cultural resources find, the City shall determine whether avoidance is feasible in light of factors such as the nature of the find, project design, costs, and other considerations. If avoidance is infeasible, other appropriate measures (e.g., data recovery) shall be instituted and coordinated with the appropriate tribe(s). Work may proceed on other parts of the project site while mitigation	During construction.	City of Ukiah	City of Ukiah Mendocino County Coroner's Office Native American Heritage Commission Most Likely Descendent

Engineered Alternative Analysis

EBA ENGINEERING
CIVIL & ENVIRONMENTAL ENGINEERS

March 11, 2003

Ms. Terri Kinney
California Regional Water Quality Control Board
North Coast Region (RWQCB)
5550 Skylane Blvd., Ste. A
Santa Rosa, CA 95403

RE: ENGINEERED ALTERNATIVE ANALYSIS
CITY OF UKIAH LANDFILL, MENDOCINO COUNTY, CALIFORNIA
EBA Project No. 02-907 (Task 5)

Dear Ms. Kinney:

This letter is being submitted by EBA Engineering (EBA) on behalf of the City of Ukiah, Department of Public Works (City) for purposes of presenting an engineered alternative cover for final closure of the City of Ukiah Landfill (Landfill). The proposed engineered alternative presented herein substitutes a geosynthetic clay liner (GCL) in lieu of the prescriptive standard (i.e., compacted clay liner [CCL]) required under Title 27 of the California Code of Regulations (27 CCR). Regulatory consideration of an engineered alternative is allowed under 27 CCR, §20080(b), which stipulates that that an engineered alternative may be considered if construction of the prescriptive standard is unreasonably and unnecessarily burdensome and will cost substantially more than the proposed alternative. Furthermore, the engineered alternative must be consistent with the performance goal addressed by the prescriptive standard and afford equivalent protection against water quality impairment. The following information has been compiled to demonstrate compliance with these criteria and includes data regarding the properties of GCLs, as well as comparisons of performance and site-specific construction costs of the proposed GCL engineered alternative to that of the prescriptive standard.

DESCRIPTION OF PROPOSED ENGINEERED ALTERNATIVE

As outlined above, the engineered alternative cover proposed for the Landfill incorporates a GCL in lieu of the CCL prescriptive standard. The design characteristics of the proposed alternative cover includes the following final cover system components (in ascending order):

- A 24-inch-thick vegetative layer, track-walked to achieve a firm consistency;

825 Sonoma Avenue, Suite C Santa Rosa, California 95404 (707) 544-0784 FAX (707) 544-0866
Also in Southern California

- A geonet composite drainage layer consisting of a high-density polyethylene (HDPE), high capacity drainage net (geonet) heat bonded with a non-woven, needle-punched polyester geotextile filter fabric;

- A reinforced, double non-woven, needle-punched GCL; and

- A 12-inch-thick (minimum) foundation layer moisture conditioned and compacted to 90 percent relative compaction.

The GCL represents the primary component of the alternative cover design that will dictate compliance equivalency with respect to the prescriptive standard. A detailed discussion of the GCL performance characteristics as compared to the CCL prescriptive standard is presented in the following subsection. However, it should be noted that the alternative cover design also incorporates several other characteristics that deviate from the prescriptive standard. These design components and the corresponding rationales are as follows:

- The proposed foundation layer thickness of 12 inches is half of the prescriptive standard thickness of 24 inches. The primary purpose of the foundation layer for the prescriptive standard scenario is to provide a firm surface for compaction of a CCL. However, based on the physical characteristics and installation procedures associated with a GCL, the construction of a 24-inch-thick foundation layer is not necessary or critical in the overall performance of the GCL. Thus, a minimum12-inch-thick foundation layer is considered sufficient to provide protection from differential settlement, given the proposed postclosure land use, and to provide a firm and smooth surface upon which to place the GCL.

- The geonet composite drainage layer is proposed as a mitigation measure against the potential development of excessive pore pressures in the overlying vegetative layer material. This design feature is considered critical due to the steep nature of the final cover slopes (2 horizontal to 1 vertical [2H:1V]). Since the potential development of excessive pore pressures would also apply to a prescriptive standard final cover system, a geonet composite drainage layer would also be required under the CCL scenario. In addition, the presence a geonet composite provides additional protection to the GCL from potential rodent damage and, combined with the selection of shallow rooted plant species for reseeding, protects against tap root damage from deeper rooted plants.

- The proposed vegetative cover thickness of 24 inches is double the prescriptive standard thickness of 12 inches. The bottom 12 inches will serve to provide confining overburden pressure for the GCL material, whereas the upper 12 inches will serve to harbor vegetative growth. In addition, the increase in vegetative cover thickness is intended to further reduce the potential for damage to the GCL by rodents and/or deeper rooted plants. Furthermore, the overburden pressure induced by the 24 inches of vegetative cover material will serve to counteract any landfill gas (LFG) pressures that may develop below the GCL and aid in maintaining the integrity of GCL seam areas.

It should be noted that in the Fall of 2001, Rau and Associates, Inc. (RAI) of Ukiah, California conducted a comprehensive survey of the landfill surface to evaluate the thickness of existing

interim soil cover (RAI, 2001). The survey consisted of a series of shallow borings drilled at a spacing of approximately 50 feet apart on the roads and benches and approximately 100-foot spacing on the slopes. A total of 433 borings were drilled using a hydraulic drill motor (mounted on a backhoe boom) equipped with 4-inch diameter solid-stem augers. A hand-operated post-hole digger was used in areas not accessible by the backhoe-mounted drill. Findings from the survey revealed that the existing interim soil cover thickness is equal to or greater than 12 inches for over 90 percent of the landfill surface. Based on these conditions, the existing interim soil cover will be scarified, moisture conditioned within 3 percent of optimum moisture content and recompacted to 90 percent relative compaction to meet the minimum 12-inch-thick foundation layer requirement. Those areas determined by RAI's survey to have an existing interim cover thickness of less than 12 inches, additional foundation layer material will be placed and subsequently prepared and compacted according to the same specifications described above.

REGULATORY HISTORY

Since 1995, more than 31 GCL landfill final cover closures have been approved by various RWQCBs and constructed in California. Additional GCL caps have been approved by the Department of Toxic Substances Control (DTSC), and the U.S. Environmental Protection Agency (USEPA) for landfills, hazardous waste sites, and remediation sites in California. Overall, GCLs have been used in landfill applications since 1986 (Koerner, 1996).

COMPARISON OF GCL AND CCL PROPERTIES

The following subsections provide a comparison of pertinent properties of the GCL and CCL prescriptive standard as a mechanism to demonstrate equivalency. The various properties compared include physical and mechanical, hydraulic, stability, installation and repair. Also addressed are some miscellaneous issues that have been raised by the RWQCB during previous correspondence regarding the potential application of GCL at the site.

Physical and Mechanical Properties

- GCLs are generally considered superior to CCLs in terms of their ability to resist damage from differential settlement. Laboratory testing of GCLs has demonstrated its ability to withstand relatively high levels of tensile strain (at least 5 percent) without undergoing significant increases in permeability (Koerner and Daniel, 1993). Standard CCLs, in turn, generally cannot tolerate strains approaching 1 percent without cracking (LaGatta et al., 1997).

- GCLs outperform CCLs with respect to desiccation caused by repeated wetting and drying cycles. CCLs are subject to desiccation from above and/or below and crack unless adequately protected from changes in moisture content following construction or as caused by climate changes (Koerner and Daniel, 1992). The GCL's ability to expand upon hydration and "self-heal" reduces detrimental effects to the GCL that may occur during and after installation.

- As a result of the "self-healing" characteristics described above upon rewetting, GCLs also outperform CCLs with respect to freeze-thaw conditions (Koerner and Daniel, 1993; and Daniel, 1996).

- The bearing capacity of GCLs under hydrated conditions is less than that of CCLs, thereby making the GCL more susceptible to physical damage due to heavy loads. However, laboratory testing (Narejo et al., 1996) and field observations (Brown et al., 2001) has demonstrated that such concerns are negated provided that the cover soil thickness is greater than the footprint of any concentrated bearing load on the GCL (i.e., vehicle tires). The 24-inch-thick vegetative layer proposed as part of the final cover design satisfies the concentrated bearing load criteria stated above and should be more than sufficient to provide adequate protection.

  Please note that the construction specifications for the GCL will include protocols designed to protect the GCL from excessive load damage during installation. These protocols will include: 1) deployment of the GCL under unhydrated conditions; 2) placement of vegetative layer material onto the GCL by spreading each full lift thickness in advance of a low ground pressure, wide-tracked bulldozer (Maximum Size: Caterpillar D6 or equivalent); 3) covering of all GCL installed during any given working day with vegetative layer material to protect against overnight hydration due to precipitation, condensation, or other causes; and 4) prohibiting vehicle access onto the GCL until the placement of vegetative layer material is complete. Furthermore, upon completion of the final cover system installation, future vehicle access within the limits of the GCL footprint will be limited to designated access roadways constructed as part of the final closure activities.

- GCLs are more vulnerable to puncturing than CCLs. The primary potential sources of puncturing include manufacturing defects, subgrade protrusions, and penetration by sharp objects through the foundation and/or vegetative layers. However, protection against these sources can be provided through the employment of quality assurance procedures and design controls. As a mechanism to protect against manufacturing defects, a comprehensive manufacturer's quality control (MQC) program will be implemented to monitor the quality and integrity of the GCL material delivered to the site. Prior to installation, the completed foundation layer surface (i.e., GCL subgrade) will be inspected for the identification and subsequent removal of any sharp objects that could puncture the GCL. Finally, in regards to penetration of sharp objects through the foundation and/or vegetative layers, such an incident is considered unlikely following installation based on the thickness of the respective layers.

Hydraulic Properties

- For equivalence to a 12-inch CCL with a hydraulic conductivity of 1×10^{-6} centimeters per second (cm/sec), the required hydraulic conductivity of a GCL is 3.9×10^{-8} cm/sec. Typical hydraulic conductivities for CGLs range from 1 to 5×10^{-9} cm/sec under low compressive stresses with a conservatively high 12-inch hydraulic head of water (Koerner and Daniel, 1993). More recent testing of various GCLs found that hydraulic conductivities range from 2×10^{-10} to 1×10^{-9} cm/sec under a compressive stress of 150 pounds per square foot (psf)

(Daniel, 1996), conservatively less than the anticipated normal load for the proposed engineered alternative for the Ukiah landfill.

- It has been documented that certain chemical interactions between the GCL and the permeating liquid can adversely affect the hydraulic conductivity performance of the GCL (GSE Lining Technology, 2001). Parameters of concern with respect to the permeating liquid include its dielectric constant, salt concentration, pH, and cation exchange capacity. However, these chemical interactions only come into play with highly concentrated liquids such as leachates or brines. Since the permeating liquid for the final cover system corresponds to percolating rainwater, the potential for adverse chemical interactions with the final cover system's GCL component is negligible.

Stability Properties

Interface direct shear tests were conducted to evaluate the interface shear strength between the GCL and underlying site soil subgrade. Sample preparation and testing conditions were selected to simulate field conditions. Interface direct shear tests (ASTM D5321) were conducted at normal compressive stresses of 100 psf, 400 psf, and 800 psf. The GCL samples were tested under conservatively hydrated conditions by allowing the GCL sample to hydrate for 24 hours under no confining load prior to shear testing. A bulk sample of representative site subgrade soil was remolded to 90 percent R.C. at just below optimum moisture content to simulate in-place prepared subgrade. Results of the interface shear testing indicate a peak friction angle of 30.3° and a residual friction angle of 28.8°. Peak and post-peak adhesion was measured at 114.1 psf and 107.5 psf, respectively. A summary of laboratory test results is presented in Appendix A. The following values were used in performing the stability analyses, as described below:

Unit Weight of Soil	110.0 pcf
Cohesion	107 psf
Friction Angle	28.0 degrees

Final cover requirements stipulated in 27 CCR, §21090(a) require that a slope stability analysis be performed for final cover systems equipped with a geosynthetic component. Based on this requirement, the stability of the proposed GCL final cover system was evaluated using an infinite slope stability analysis. This method assumes failure of an infinitely long block and neglects resisting forces at the toe and along the sides of the failure. Hence, this analysis provides a conservative stability evaluation for shallow failures of constant thickness and slope. Analyses were performed for the proposed GCL final cover system using a soil thickness of 2 feet and a maximum slope 26.5 degrees (2H:1V). Findings from the analysis revealed that the lowest factor of safety during trial runs occurred for failures passing through the soil/GCL interface. The corresponding minimum factor of safety for this scenario is 2.28 under unsaturated conditions.

Determination of the yield acceleration for the GCL final cover system was accomplished through performance of a psuedo-static, infinite slope stability analysis. The yield acceleration was determined by iteratively choosing a horizontal acceleration that reduced the factor of safety to unity. The resulting yield acceleration for the proposed GCL final cover system for unsaturated conditions was 0.51 g. Using this value and time histories of horizontal acceleration

at the top of the refuse mass as determined from previous seismic analyses (EBA, 2000b), a deformation analysis was performed to evaluate permanent seismic displacements at the soil/GCL interface during dynamic loading. The analysis was performed using the computer model YSLIP_PM (Matasovic, 1997). Findings from this analysis indicate that permanent seismic displacements at the soil/GCL interface for the proposed GCL final cover system will be less than 2 inches.

In summary, findings from the stability analyses reveal that the proposed GCL final cover system is statically stable and will yield less than 2 inches of permanent displacement under seismic loading conditions. Based on these characteristics, the proposed GCL final cover system is considered feasible from a technical standpoint. Please refer to Appendix A of this report for supporting documentation and data used in the respective analyses.

Installation/Repair Properties

- The installation of a GCL is significantly easier than a CCL. Particularly on steeper slopes such as those at the Ukiah landfill. In general, GCL deployment is very straightforward, both from a placement and seaming standpoint. Furthermore, heavy equipment requirements for GCL deployment are limited primarily to a rubber-tire forklift or equivalent. Conversely, CCL construction is very labor intensive with substantial reliance on heavy equipment (i.e., scrapers, dozers, compactors, etc.).

- Less construction quality assurance (CQA) is required for GCLs due to the consistency of the materials and manufacturing process. CQA testing for a CCL, in turn, is more extensive and occurs at a higher frequency to verify the consistency of borrow source materials and the contractor's ability to achieve moisture content, compaction, and hydraulic conductivity during construction.

- Installation of a sealed, double-ring infiltrometer (SDRI) is required to test the field permeability of CCLs, which is costly and time consuming. Such a provision is not required for a GCL.

- Postclosure repair of a GCL final cover is less involved than the repair of a CCL final cover system. Repair of a GCL is performed by exposing the damaged liner, rolling out new GCL material, and covering the damaged portion of the liner with a GCL patch. Repair of a CCL, in turn, requires the procurement of low-hydraulic conductivity material, mobilization of heavy equipment, moisture conditioning, compaction, and CQA testing to verify placement in accordance with the original specifications.

Miscellaneous Issues

A number of site-specific issues with regards to the potential application of GCL at the site have been previously raised by the RWQCB. These issues include the potential for damage to the GCL by rodent activity and deep penetrating roots, as well as the ability to retrofit the landfill in the future with a LFG collection system if deemed necessary. Evaluations regarding each of these issues are provided below.

- *Rodent Damage:* Based on the thickness of the vegetative cover (24 inches) for the proposed GCL final cover system, the GCL is no more susceptible to burrowing rodent damage than the CCL prescriptive standard. In fact, the GCL final cover system is probably less susceptible since rodents would have to penetrate a full 24 inches of vegetative cover material and the geonet composite drainage layer before reaching the GCL. In the case of the CCL prescriptive standard, a similar burrowing depth would result in complete penetration of the CCL.

  One other aspect that should be noted is that the GCL does not contain any plasticizers. The breakdown of plasticizer products has been documented to serve as a potential food source to rodents in some cases. As a result of its absence in the GCL materials, there is no physical aspect of the GCL component that would attract or promote rodent activity.

- *Root Damage:* The GCL's potential vulnerability to root damage should be effectively negated by the final cover revegetation provisions. As outlined in the Final Closure and Postclosure Maintenance Plan (FCPMP) (EBA, 1999), the vegetative layer will be reseeded with plant species having shallow root systems. Furthermore, the geonet composite drainage layer will also inhibit penetration of the GCL by root systems. Whereas the potential exists for the introduction of different plant species with deeper root systems via wind-blown seed deposition, such conditions have not been observed to date in the soil borrow areas that have undergone comparable reseeding processes. Thus, there is no current evidence to suggest that the site will be susceptible to this concern.

- *Retrofitting of LFG Collection System:* As discussed in the previous subsection, repairs to the GCL final cover system are relatively simple to implement based on the nature of the installation process. As a result, the same conditions apply to penetrating and resealing the GCL for the purpose of installing LFG extraction wells if such provisions are necessary in the future. Installation of an extraction well would require exposing a small portion of the GCL and cutting a hole slightly larger than the diameter of the drill auger or bucket. Following drilling and installation, a polyvinyl chloride (PVC) well bore seal would be placed around the casing and secured, followed by placement of a GCL patch over the PVC well bore seal. Finally, the seams along the edges of the GCL patch would be augmented with powdered bentonite and the area backfilled with vegetative layer material. Appropriate precautions would be implemented to ensure that mobilization of the drill rig to the respective drill sites does not damage the underlying GCL.

ECONOMIC ANALYSIS

As noted at the outset of this report, one of the criteria for an engineered alternative approval corresponds to cost and demonstration that the proposed alternative offers a significant cost savings as compared to the prescriptive standard. Based on this criterion, an economic analysis was performed to compare overall closure costs for the CCL prescriptive standard and the proposed GCL final cover system alternative. The results of the economic analysis are presented below in Table 1. Please refer to Appendix B for a more detailed breakdown and supporting data for the costs presented in Table 1.

TABLE 1
ECONOMIC ANALYSIS OF FINAL CLOSURE COSTS
PRESCRIPTIVE STANDARD vs. ENGINEERED ALTERNATIVE

Item	Prescriptive Standard[1]	Engineered Alternative[2]
Construction Facilities and Controls	$ 45,000	$ 45,000
General Earthwork and Test Pad[3]	$ 60,300	$ 45,300
Foundation Layer	$ 764,731	$ 192,971
Low Hydraulic Conductivity Layer	$ 2,036,904	$ 1,917,623
Vegetative Layer	$ 428,820	$ 857,640
Drainage System	$ 336,070	$ 336,070
Site Security	$ 2,000	$ 2,000
Revegetation	$ 428,020	$ 428,020
Access Roads	$ 16,500	$ 16,500
Sedimentation Basins	$ 36,500	$ 36,500
Borrow Area Reclamation	$ 229,700	$ 205,700
Final Design and Construction Quality Assurance	$ 316,321	$ 233,007
Subtotal	$ 4,700,866	$ 4,316,331
20 Percent Contingency	$ 940,173	$ 863,266
TOTAL	**$ 5,641,039**	**$ 5,179,597**

[1]Design includes the following construction (in ascending order): 24" foundation layer; 12" compacted clay liner; geonet composite drainage layer; and 12" vegetative layer.

[2]Design includes the following construction (in ascending order): 12" foundation layer; geosynthetic clay liner; geonet composite drainage layer; and 24" vegetative layer.

[3]Test pad only pertains to the prescriptive standard scenario.

As presented in Table 1, the proposed engineered alternative offers a significant cost savings as compared to the prescriptive standard. The cost differential between the two final cover systems is approximately $461,000. The items primarily responsible for the difference in cost include: reduction in foundation layer thickness for the GCL scenario ($571,800 cost savings); lower installation costs for the low hydraulic conductivity layer component ($119,300 cost savings); and lower design/CQA costs ($83,300 cost savings). The one cost item for the engineered alternative that exceeds the prescriptive standard by approximately $428,800 is the vegetative layer component due to the need for 24 inches of vegetative layer material as opposed to 12 inches for the prescriptive standard. However, based on the overall reduction in cost of almost 10 percent, the proposed engineered alternative meets the cost savings criteria specified in 27 CCR, §20080(b).

It should be noted that the cost differential calculated in the economic analysis is considered to represent a conservatively low difference because the bid cost of installing a CCL can vary widely. Estimates of the cost to excavate and place a 12-inch thick CCL at the Ukiah landfill were provided by five different earthwork contractors surveyed for this project. Cost estimates ranged from $6 per cubic yard (cy) to $25/cy. The variation in costs illustrates the uncertainty inherent in estimating earthwork on steep slopes. For this analysis, EBA used an median cost of $15/cy. It is probable that the cost for placement of CCL will be significantly higher at the time of construction bidding. In contrast, the variance in cost of GCL procurement and placement has historically been relatively low and stable.

In addition, the potential exists for higher CCL costs due to variability of the clay borrow source. As referenced in the borrow source investigation conducted by EBA in 1999 (EBA, 1999 and EBA, 2000a), the excavation of low hydraulic conductivity materials may be hindered by conglomerate beds occurring at various depths in the borrow source area. Such conditions, if encountered, would result in higher material handling costs, as well as higher CQA inspection and testing costs. Since GCL is a manufactured product, such concerns are not an issue. As a result, actual GCL costs are more predictable and not subject to significant change due to conditions encountered in the field.

REVISIONS TO FINAL CLOSURE AND POSTCLOSURE MAINTENANCE PLAN

Since the proposed engineered alternative represents a significant design change to the current final cover system design presented in the FCPMP, a Revised FCPMP would have to be prepared and submitted for regulatory approval to meet the requirements set forth in 27 CCR, §21890. Preparation of such a document would be contingent upon approval of the engineered alternative by the RWQCB. Specific sections and appendices of the FCPMP requiring revisions would include the following:

- Proposed Final Cover Design and Construction *(Section 2.9.2)*
- Proposed Final Cover Material Specifications *(Section 2.9.3)*
- Slope Stability *(Section 2.10.4 and Appendix C)*
- Construction Quality Assurance (CQA) Plan *(Section 2.16.1 and Appendix F)*
- Closure Construction Schedule *(Section 2.17)*
- Final Cover Inspection and Maintenance Program *(Section 3.9)*
- Closure and Postclosure Maintenance Cost Estimates *(Section 4 and Appendix G)*
- Fund Disbursement Schedule for Closure *(Section 5)*
- Final Closure Plan Drawings *(Section 8 and Sheets 1 through 5)*

As stipulated in 27 CCR, §21890(a), the Revised FCPMP would be submitted to the RWQCB, California Integrated Waste Management Board, and the Mendocino County Environmental Health Department (i.e., Local Enforcement Agency [LEA]) for final approval.

CONCLUSIONS

As demonstrated by the comparative information presented herein, the proposed GCL engineered alternative meets or exceeds the performance criteria addressed by the prescriptive standard. Furthermore, the economic analysis comparing construction costs for the two scenarios clearly shows that the CCL prescriptive standard is unreasonably and unnecessarily burdensome and will exceed the GCL engineered alternative construction cost by a conservative estimate of approximately $461,000. Based on these circumstances, it is EBA's conclusion that the GCL engineered alternative meets the qualifying criteria specified in 27 CCR, §20080(b).

CLOSING

We trust that this submittal includes all the necessary information and data needed for the RWQCB to approve the engineered alternative proposal. If you should have any questions regarding the information contained herein or need additional information, please do not hesitate to contact us.

Sincerely,
EBA ENGINEERING

City of Ukiah

August 14, 2015

Mr. Trey Strickland
Mendocino County Environmental Health (County)
860 North Bush Street
Ukiah, CA 95482

RE: FINAL CLOSURE SUBMITTAL PACKAGE AND EXTENSION REQUEST
CITY OF UKIAH LANDFILL
MENDOCINO COUNTY, CALIFORNIA

Dear Mr. Strickland:

This submittal package, identified herein as Joint Technical Document (JTD) Addendum No. 2, has been prepared in response to the County's letter dated June 18, 2015 inquiring about the status of the final closure project for the City of Ukiah Landfill and requesting information from the City of Ukiah (City) to demonstrate that a "good faith effort" is being put forth to complete the project in order to justify the granting of an extension to the previously agreed upon construction start date of August 15, 2015. Included in the County's letter is a request for submittal of miscellaneous documentation that is needed for the County and California Department of Resources Recycling and Recovery (CalRecycle) to approve the final closure project. The following provides a list of the documentation requested and the current status of their development:

- *Complete Final Closure Plan:* Updated closure and postclosure maintenance information is attached herein that incorporates changes from the previously submitted Final Closure and Postclosure Maintenance Plan (FCPMP) included as part of the January 2008 Joint Technical Document (JTD). The updated information provides supporting documentation for a revised final cover system. Also included are the corresponding Construction Drawings, Technical Specifications, Construction Quality Assurance (CQA) Plan, and updated final closure and postclosure maintenance cost estimates.

- *Financial Assurance:* The requested financial assurance documents will be prepared utilizing the enclosed updated final closure and postclosure maintenance cost estimates. The financial assurance documents will be submitted to CalRecycle Financial Assurances Unit by no later than October 9, 2015.

300 Seminary Avenue • Ukiah • CA • 95482-5400
Phone: (707)463-6200 · Fax: (707)463-6204 ·www.cityofukiah.com

- *California Environmental Quality Act (CEQA):* Consistent with the information outlined in the County's letter, provisions are being made to update CEQA that include the development of an updated Initial Study that incorporates changes that have occurred since the previous CEQA determination in 2000, as well as the performance of studies for special status plant/wildlife species, wetland delineation of the creek, and greenhouse gas emissions. In addition, permits are being obtained through the California Regional Water Quality Control Board – North Coast Region (RWQCB)(401 Permit), US Army Corps of Engineers (404 Permit), and California Department of Fish and Wildlife (1602 Permit) to accommodate discharge modifications to the creek. All the field studies for the above work have been completed. The new CEQA determination and acquisition of the various permits will be completed before the end of this calendar year (2015).

- *Waste Discharge Requirements (WDRs):* The information provided herein associated with the updated FCPMP should be sufficient for the RWQCB to develop closure WDRs. Whereas the City has no control over the RWQCB's schedule and priorities, the issuance of closure WDRs by the end of this calendar year (4.5 months) is considered a reasonable time frame for this to occur.

As demonstrated above, progress has been made with respect to implementing the final closure project. Whereas the City will be unable to meet the existing August 15, 2015 closure construction start date, this should not be perceived as a lack of commitment by the City. As the County is aware, a revised final cover system has been identified for the site which represented the primary cause of the noted delays. However, the additional time expended in researching potential alternatives proved to be highly beneficial from a performance (higher stability), maintenance, and cost perspective. Based on the revised closure and postclosure maintenance cost estimates presented in the attached addendum, the cost reductions related to the revised final cover system equate to approximately $696,960, which represents a significant savings of tax payer dollars. In addition, the City has already committed $50,750 towards the CEQA and permitting process, and $186,520 for the design and fabrication of a totally-enclosed vertical ground flare. These provisions clearly demonstrate that the City is committed to moving forward on this project and that a "good faith effort" has been made in this regard.

Based on the circumstances presented herein, the City would like to respectfully request that the closure construction start date be extended to May 1, 2016. This extension will allow sufficient time for regulatory review and approval of this submittal package, the development of closure WDRS, completion of the CEQA and permitting process, the procurement of contractor bids, and awarding of the construction contract.

Thank you for your understanding and consideration of this extension request. If you should have any questions regarding the information contained herein or need additional information, please contact our office accordingly.

Respectfully,
CITY OF UKIAH

Tim Eriksen, P.E.
Director of Public Works / City Engineer

cc: Mr. Andy Marino, California Department of Resources Recycling and Recovery
Mr. Trey Strickland, Mendocino County Health & Human Services Agency
Mr. Robert Scaglione, Mendocino County Air Quality Management District
Ms. Terri Cia, RWQCB, North Coast Region
Mr. Damon Brown, EBA Engineering

Enclosure: Joint Technical Document Addendum No. 2 (August 2015)

August 14, 2015

Mr. Tim Eriksen, P.E.
City of Ukiah, Department of Public Works (City)
300 Seminary Avenue
Ukiah, CA 95482

RE: JOINT TECHNICAL DOCUMENT (JTD) ADDENDUM No. 2
FINAL CLOSURE CONSTRUCTION SUBMITTAL
CITY OF UKIAH LANDFILL, MENDOCINO COUNTY, CALIFORNIA
EBA JOB No. 02-907

Dear Mr. Eriksen:

This addendum has been prepared to respond to a request by the Mendocino County Health & Human Services Agency (Local Enforcement Agency [LEA]) in a letter dated June 18, 2015 to submit a complete Final Closure Plan (FCP) for the City of Ukiah Landfill (Landfill). Modification of the FCP has become necessary based on a proposed revision to the final cover system design. The proposed revision will also require an update to the Final Postclosure Maintenance Plan (FPMP). In this regard, it is important to note that the existing FCP and FPMP are part of the January 2008 Joint Technical Document (JTD, EBA Engineering [EBA], 2008), with various closure and postclosure maintenance details included in Section 5. Based on this circumstance, this addendum has been prepared to update Section 5 of the January 2008 JTD and associated Addendum No. 1 (EBA, 2013) as they pertain to closure and postclosure maintenance.

Please note that this document is also intended to serve as a *Final Closure Construction Submittal* for review and approval by the LEA, California Department of Resources Recycling and Recovery (CalRecycle), California Regional Water Quality Control Board, North Coast Region (RWQCB), and Mendocino County Air Quality Management District (MCAQMD). As such, included herein are a final cover stability analysis, updated final closure and postclosure maintenance cost estimates, updated FPMP, Technical Specifications, Construction Quality Assurance (CQA) Plan, and Construction Drawings. These documents are hereby incorporated into the January 2008 JTD by reference herein.

825 Sonoma Avenue, Suite C • Santa Rosa, California 95404
(707) 544-0784 • FAX (707) 544-0866 • www.ebagroup.com

EBA appreciates the opportunity to be of service to the City on this project. If you should have any questions regarding the information contained herein, please contact our office at (707) 544-0784.

Sincerely,
EBA ENGINEERING

Mike Delmanowski, C.E.G., C.Hg.
Senior Hydrogeologist

Damon F. Brown, C.E.G., C.Hg.
President

cc: Mr. Andy Marino, California Department of Resources Recycling and Recovery
Mr. Trey Strickland, Mendocino County Health & Human Services Agency
Mr. Robert Scaglione, Mendocino County Air Quality Management District
Ms. Terri Cia, RWQCB, North Coast Region

ATTACHMENT 1

UPDATED JTD SECTION 5
CLOSURE & POSTCLOSURE MAINTENANCE

CITY OF UKIAH LANDFILL
MENDOCINO COUNTY, CALIFORNIA

SECTION 5
CLOSURE & POSTCLOSURE MAINTENANCE
(Updated)

This section addresses the general closure and postclosure maintenance requirements for landfills as stipulated in Title 27, California Code of Regulations (27CCR), Division 2, Chapter 3, Subchapter 5. As outlined in 27CCR, §20950, the primary performance goal for closure is to minimize the infiltration of water into the waste, thereby minimizing the production of leachate and landfill gas (LFG). The primary performance goal for postclosure maintenance, in turn, is to assure that the waste management unit (WMU) continues to comply with the aforementioned closure performance goal. In order to meet these objectives, Dischargers who are implementing final closure of a new or existing classified solid WMU must carry out the closure in accordance with a Final Closure and Postclosure Maintenance Plan (FCPMP) which the RWQCB finds meets all applicable requirements. In general, the FCPMP shall provide for continued compliance with the applicable SWRCB-promulgated performance standards for waste containment, precipitation and drainage controls, and monitoring throughout the closure and postclosure maintenance period, which shall extend as long as the wastes pose a threat to water quality.

A FCPMP (EBA Engineering [EBA], 1999) was prepared and submitted for the Landfill in August 1999. This was followed by the submittal of a final cover Engineered Alternative Analysis dated March 11, 2003 (EBA, 2003). Copies of these documents are enclosed as Appendices M and N, respectively, of the January 2008 Joint Technical Document (JTD, EBA, 2008). This updated section has been prepared to address a revision to the final cover system design for the WMU. Details regarding this revision is presented in Subsection 5.1.1 (*Final Cover Requirements*).

In addition to closure of the WMU, the surface impoundment formerly used as a leachate holding pond will be closed in accordance with requirements for surface impoundments as stipulated in 27CCR, §21400. Closure of this surface impoundment was not addressed in the August 1999 FCPMP. Details regarding the proposed closure activities for the surface impoundment are summarized herein under Subsection 5.3 (*Closure Requirements for Surface Impoundments*).

5.1 CLOSURE & POSTCLOSURE MAINTENANCE REQUIREMENTS FOR SOLID WASTE LANDFILLS 27CCR, §21090

5.1.1 Final Cover Requirements *27CCR, §21090(a)-(a)(2)*

The proposed final cover system will consist of a patented geosynthetic product identified as "ClosureTurf™". ClosureTurf™ is a three-component system comprised of a structured geomembrane, a specialized tufted geotextile, and a sand infill layer. The structured geomembrane component serves as the low-hydraulic conductivity layer (LHCL), whereas the specialized tufted geotextile and sand infill layer represent the erosion-resistant layer as defined in 27CCR. Literature for the ClosureTurf™ product is enclosed in Attachment 2 of this Addendum.

Overall, the proposed final cover system design can be summarized as follows (in ascending order):

- Minimum 1-foot thick soil foundation layer.
- 50 mil linear low-density polyethylene (LLDPE) geomembrane liner (Super Gripnet® with Spike Down).
- Specialized tufted geotextile (Engineered Turf).
- Minimum ½-inch thick sand infill layer.

In addition to the above features, the final cover system will also be equipped with a gas relief component. This component will consist of a series of 3.5-foot wide collection strips placed parallel and/or perpendicular to slopes and spaced at maximum 220-foot intervals. The collection strips, which will be constructed of the same Super Gripnet® with Spike Down material described above for the geomembrane liner component, will be connected to the LFG collection system to prevent the build-up of gas pressures beneath the final cover system. Pressure release valves will also be installed at regular intervals between the collection strips as an additional precautionary measure.

Please refer to the Technical Specifications (Attachment 6), Construction Quality Assurance (CQA) Plan (Attachment 7), and Construction Drawings (Attachment 8) of this Addendum for details regarding material and installation specifications for the respective final cover system components described above.

The proposed final cover system presented herein represents an engineered alternative design to the prescriptive standard (i.e., compacted clay liner [CCL]) and therefore requires regulatory approval. In this regard, an engineered alternative analysis is presented in the following subsection that demonstrates its viability as a final cover alternative.

5.1.1.1 Engineered Alternative Analysis

As presented in Subsection 5.1.1 (*Final Cover Requirements*), the proposed engineered alternative presented herein substitutes the patented geosynthetic product ClosureTurf™ in lieu of the LHCL prescriptive standard (i.e., CCL) required under 27CCR. Regulatory consideration of an engineered alternative is allowed under 27CCR, §20080(b), which stipulates that an engineered alternative may be considered if construction of the prescriptive standard is unreasonably and unnecessarily burdensome and will cost substantially more than the proposed alternative. Furthermore, the engineered alternative must be consistent with the performance goal addressed by the prescriptive standard and afford equivalent protection against water quality impairment. The following information has been compiled to demonstrate compliance with these criteria and includes data regarding the properties of the ClosureTurf™, as well as comparisons of performance and costs of the proposed ClosureTurf™ engineered alternative to that of the prescriptive standard and the previously proposed geosynthetic clay liner (GCL) final cover system.

Performance

One of the primary variables for demonstrating equivalency to the prescriptive standard is infiltration through the final cover system. In this regard, infiltration equivalency analyses have been performed on the ClosureTurf™ product versus a prescriptive Subtitle D cover system. The analyses have included the use of two methodologies: 1) the Hydrologic Evaluation of Landfill Performance (HELP) Model; and 2) the Giroud Method (Giroud et al., 1997). Both methods were employed for a generic landfill site in Texas. Findings from these analyses revealed the following:

INFILTRATION EQUIVALENCY ANALYSIS
ClosureTurf™ vs. SUBTITLE D FINAL COVER SYSTEMS

Methodology	***ClosureTurf™ Final Cover System***	***Prescriptive Subtitle D Final Cover System***
HELP Model for Site in Texas – Average Annual Infiltration (Cubic Feet)	8.3	347
Giroud Method with Silty-Sandy Soil below the ClosureTurf™ (Gallons per Day)	1.33	4.51
Giroud Method with Silty-Sandy Soil with Some Clay below the ClosureTurf™ (Gallons per Day)	0.24	4.51

As demonstrated in the above table, the ClosureTurf™ product exhibits substantially lower infiltration rates for the respective scenarios as compared to the prescriptive standard. This can be attributed to the lower hydraulic conductivity characteristics of the LLDPE geomembrane liner as compare to a CCL, as well as the more efficient removal of moisture above the LHCL component, thereby reducing the amount of

potential infiltration into the WMU. Based on these circumstances, the ClosureTurf™ product meets the required performance goal for an engineered alternative by providing equal to or greater protection against potential water quality impairment. Other features afforded by ClosureTurf™ that demonstrate its suitability as an engineered alternative from a performance perspective can be summarized as follows:

- The slope stability characteristics of ClosureTurf™ far exceeds those provided by other geosynthetic products (including GCLs), which is very important based on the steep slopes that exist at the Landfill. The bottom spiked friction surface of the Super Gripnet® provides maximum interface friction and a high factor of safety against sliding at the liner/foundation layer soil interface.

- The Engineered Turf component eliminates the potential for soil creep and veneer failures resulting from saturation of the vegetative soil cover that is a required component of the prescriptive Subtitle D final cover and other traditional geosynthetic cover systems. As noted in the previous bullet item, this potential is exacerbated by the very steep slopes that exist at the Landfill.

- The drainage aspects of the ClosureTurf™ are designed to allow rainfall to penetrate rapidly through the sand infill layer and into the structured drain liner below which has a very high transmissivity for subsequent conveyance of the water off of the liner system. The sand infill has been demonstrated to handle over six inches per hour of rainfall intensity without erosion when applied on three horizontal to one vertical (3H:1V) slopes. Such rainfall energy conditions on a traditional vegetative soil cover would likely result in significant erosional damage.

- The drainage aspects of the ClosureTurf™ as described above promote very "clean" and low turbidity stormwater run-off, which represents a beneficial feature since the collected run-off is subsequently discharged to the ephemeral creek that borders the northern boundary of the WMU. Achieving comparable stormwater run-off quality from a traditional vegetative soil cover would be difficult.

- ClosureTurf™ is designed to provide weathering resistance and geomembrane protection when exposed to extreme heat and ultra-violet (UV) exposure. Based on results of independent, real-world weathering tests and data from existing projects, ClosureTurf™ can provide decades of reliable performance beyond the standard 30-year postclosure maintenance period.

- ClosureTurf™ has been tested for wind uplift resistance and demonstrated no uplift when exposed to 120 miles per hour wind. As such, the ClosureTurf™ can withstand most wind conditions that could realistically be encountered at the site.

As presented in the product literature data enclosed in Attachment 2 of this Addendum, ClosureTurf™ has been approved for use as an engineered alternative by the RWQCB at two sites in California. These sites correspond to the Crazy Horse Landfill and Portola Landfill located Monterey County and Plumas County, respectively. This product has also been successfully employed at a number of landfill sites throughout the United States, including sites in the southeast and east that are subject to much harsher weather conditions than would be experienced at the Landfill.

Installation

The installation and CQA testing of the ClosureTurf™ product at the Landfill would be significantly easier than for a CCL. The following provides a summary to support this position:

- In general, ClosureTurf™ deployment is very straightforward, both from a placement and seaming standpoint. Furthermore, heavy equipment requirements for ClosureTurf™ deployment are limited primarily to a rubber-tire forklift or equivalent. Conversely, CCL construction is very labor intensive with substantial reliance on heavy equipment (i.e., scrapers, dozers, compactors, etc.).

- Less CQA is required for ClosureTurf™ due to the consistency of the materials and manufacturing process. CQA testing for a CCL, in turn, is more extensive and occurs at a higher frequency to verify the consistency of borrow source materials and the contractor's ability to achieve moisture content, compaction, and hydraulic conductivity during construction.

- Installation of a sealed, double-ring infiltrometer (SDRI) is required to test the field permeability of CCLs, which is costly and time consuming. Such a provision is not required for ClosureTurf™.

In comparison to other geosynthetic liner systems, ClosureTurf™ is slightly more labor intensive due to the placement of the sand infill layer. However, this increased labor is more than offset be the elimination of the vegetative soil layer. Similar to the CCL construction, construction of a vegetative soil layer is also very labor intensive with substantial reliance on heavy equipment. In addition, in the case of the GCL final cover system that was previously proposed for the Landfill, the gas relief layer material and labor requirements are significantly greater as compared to the ClosureTurf™. Thus, the ClosureTurf™ final cover system installation represents the least intensive approach from an installation standpoint.

Maintenance

ClosureTurf™ offers a significant maintenance advantage over a prescriptive Subtitle D final cover and any other traditional geosynthetic cover systems that require a vegetative soil cover. In essence, vegetative soil covers often require regular

maintenance related to the repair of erosional damage, installation of erosion control measures (i.e., silt fences, hay bales, wattles, etc.), slope repairs, and revegetation. Erosion from the vegetative soil cover also causes siltation of drainage ditches and culverts that require subsequent repair. Such provisions are not required with the ClosureTurf™ product, thereby providing a significant cost savings over the course of the postclosure maintenance period.

Cost

The cost of the final cover system using ClosureTurf™ was compared to the GCL final cover system as previously proposed in the January 2008 JTD and subsequent October 31, 2013 *Final Closure Construction Submittal Package* (EBA, 2013b). Since the different products influence other aspects of the final cover construction (i.e., foundation layer, gas relief layer, erosion-resistant layer, drainage, access roads, etc.), the cost comparison included these variables in the analysis. Conversely, those final closure construction items not influenced by the final cover system design (i.e., mobilization, leachate control system improvements, LFG collection and control system, etc.) are not included in the analysis. The corresponding estimated construction costs for the two final cover systems are presented in the following table.

CONSTRUCTION COST COMPARISONS
ClosureTurf™ vs. GCL FINAL COVER SYSTEMS

Item	*ClosureTurf™ Final Cover System*	*GCL Final Cover System*
Foundation Layer / Engineered Fill	$594,530	$465,890
Gas Relief Layer	$86,200	$2,290,360
Low-Hydraulic Conductivity Layer (LHCL)(1)	$2,034,620	$1,493,690
Erosion-Resistant Layer(2)	$3,807,850	$1,866,300
Drainage System Components	$552,910	$695,590
Erosion Control	$100,300	$581,930
Access Roads	$172,580	$374,790
EXTENDED TOTAL	***$7,348,990***	***$7,768,550***

GCL: Geosynthetic Clay Liner

(1) The LHCL component for the ClosureTurf final cover system includes the Super Gripnet® with Spike Down, while the GCL final cover system includes the GCL.

(2) The erosion-resistant layer component for the ClosureTurf final cover system includes the Engineered Turf and sand infill layer, while the GCL final cover system includes a geonet composite drainage layer and vegetative soil layer.

As presented in the above table, the cost for the ClosureTurf™ final cover system is approximately $419,560 less than the GCL final cover system. In addition, as noted in the previous subsection, long-term maintenance associated with ClosureTurf™ is substantially less than any final cover system that requires an erosion-resistant layer comprised of a vegetative soil cover. The estimated cost savings from a maintenance perspective over the 30-year postclosure maintenance period equates to approximately $277,400. Thus, the overall cost savings resulting from replacing the previously proposed GCL final cover system with ClosureTurf™ is approximately $696,960.

Conclusions

As demonstrated by the comparative information presented herein, the proposed ClosureTurf™ engineered alternative meets or exceeds the performance criteria addressed by the prescriptive standard. Furthermore, the cost analysis comparing construction costs for the ClosureTurf™ versus the previously proposed GCL final cover system reveals that a significant cost savings can be realized through implementation of the ClosureTurf™ option. Based on these circumstances, it can be concluded that the ClosureTurf™ engineered alternative meets the qualifying criteria specified in 27CCR, §20080(b).

5.1.2 Erosion-Resistant Layer
27CCR, §21090(a)(3)-(a)(3)(A)

The erosion-resistant layer for the proposed final cover system is comprised of the Engineered Turf and sand infill layer. As presented in Subsection 5.1.1.1 (*Engineered Alternative Analysis*), the combination of these components are designed to provide weathering resistance and geomembrane protection when subjected to the most extreme conditions, including rain, wind, heat, and UV exposure. Based on the absence of a traditional erosion-resistant layer constructed of soil, the proposed system is not subject to erosional channeling that can lead to exposure of the geomembrane component. As a result of the aforementioned characteristics, the proposed system meets the performance criteria specified in 27CCR with regard to resisting the foreseeable erosion effects by wind-scour, raindrop impact, and run-off. Please refer to the Technical Specifications (Attachment 6) of this Addendum for further details regarding the material specifications.

5.1.3 Cover Maintenance Plan
27CCR, §21090(a)(4)-(a)(4)(D)

This section requires FPMPs to incorporate a cover-integrity monitoring and maintenance program that includes the following components: periodic leak search; periodic identification of other problem areas; prompt cover repair; and vegetation maintenance. Details regarding periodic leak search procedures is outlined in the following paragraph. The identification of other problem areas and cover repairs, in turn, are addressed under Section 5.1.8 (*General Postclosure Duties*) of this

Addendum. Finally, vegetation maintenance does not apply since the erosion-resistant layer for the proposed final cover system is comprised of Engineered Turf material.

Integrity monitoring of the LHCL (i.e., Super Gripnet® with Spike Down) will be accomplished using LFG as a surrogate for determining potential leaks. In essence, the detection of elevated methane (primary component of LFG) at concentrations in excess of 5 percent by volume on the surface of the waste management unit (WMU) would be indicative of a possible breach in the LHCL. Monitoring will be accomplished using a portable hydrocarbon detector (calibrated to methane) meeting the requirements of Assembly Bill 32 (AB32) for measuring methane emissions from municipal solid waste landfills. The monitoring pattern across the WMU will also coincide with AB32 requirements. It is EBA's opinion that the walking pattern required under AB32 is adequate for providing a reasonable survey of the WMU surface conditions. In addition, under AB32 requirements, the frequency of monitoring ranges from quarterly to annual, thereby providing a robust monitoring program that is suitable for complying with the period leak search regulations.

5.1.4 Discharges of Liquids to Covers (Leachate & Condensate) *27CCR, §21090(a)(5)(A)*

The discharge of leachate, LFG condensate or other waste liquids onto the final cover is not proposed at the Landfill. Instead, these liquids will be processed through the facility's existing leachate collection and pumping system as described in Subsection 2.9 (*Leachate Collection and Removal Systems [LCRS]*) of the January 2008 JTD.

5.1.5 Discharges of Liquids to Covers (Other Liquids) *27CCR, §21090(a)(5)(B)*

The discharge of other liquids onto the final cover is also not proposed at the Landfill. Postclosure land use will be non-irrigated open space. As a result, monitoring of potential liquid through flow to the underlying waste will not be necessary.

Please note that the need for dust control provisions (other than during final closure construction) as outlined in CalRecycle citations 27CCR, §20800 and §21600(b)(8)(D) during the postclosure maintenance period is not anticipated based on the placement of aggregate base rock on all access roads at the time of closure. In regards to final closure construction, the Technical Specifications for construction stipulate that dust control provisions must be such as to protect against excess water application that could result in potential through flow into underlying waste or run-off into surface water drainages.

5.1.6 Stability Analysis
27CCR, §21090(a)(6)

Please refer to the stability analysis enclosed in Attachment 3 of this Addendum for details regarding stability determinations for the proposed final cover system.

5.1.7 Grading Requirements
27CCR, §21090(b)-(b)(3)

Please refer to the Construction Drawings (Attachment 8) in this Addendum for updated grading plans for the WMU, sedimentation ponds, and associated borrow areas.

5.1.8 General Postclosure Duties
27CCR, §21090(c)-(c)(5)

General postclosure duties will be performed in accordance with the Facility's FPMP, which was previously presented in the January 2008 JTD. However, due to a variety of changes that have taken place since its submittal, an updated FPMP has been prepared and is enclosed in Attachment 5 of this Addendum.

One substantive change in the updated FPMP as compared to the FPMP presented in the January 2008 JTD corresponds to the elimination of stormwater monitoring during the 30-year postclosure maintenance period. Since submittal of the January 2008 JTD, a Notice of Termination (NOT) for the existing stormwater permit (WDID Number 123I001656) has been granted approval by the RWQCB on the basis that industrial activity no longer occurs at the site, nor will it occur in the future as the end use of the Landfill during the postclosure maintenance period will be non-irrigated open space. Furthermore, surface water monitoring and inspection will be performed as part of the Landfill's postclosure Monitoring and Reporting Program (M&RP), thereby providing long-term provisions for monitoring surface water quality. Approval of the NOT was issued on July 30, 2015.

5.1.9 Landfill Closure Deadline & Extension
27CCR, §21090(d)

The existing closure construction start date was previously established as August 15, 2015. However, adherence to this start date became unattainable due to delays related to pursuing a more economical final cover alternative. The proposed final cover system presented herein represents the outcome of those efforts. In response to this circumstance, the City has requested an extension from the LEA and CalRecycle to revise the closure construction start date to May 1, 2016. Based on an estimated construction period of eight months, the corresponding completion date for the final closure project is December 2016.

5.1.10 Final Cover Survey(s)
27CCR, §21090(e)-(e)(4)

A topographic map of the completed final cover grades will be produced at a minimum scale of one inch to 100 feet and accompany the Final Documentation Report. In addition, iso-settlement maps will be produced every five (5) years thereafter to calculate any differential settlement. The iso-settlement maps will be prepared with a maximum contour interval of two (2) feet and a scale of one inch equals 60 feet.

5.1.11 Operational Clean Closure
27CCR, §21090(f)-(f)(2)

Not Applicable

5.2 Landfill Emergency Response Plan Review 27CCR, §21132

Please refer to the updated FPMP in Attachment 5 of this Addendum for a copy of the Facility's Emergency Response Plan.

5.3 Closure Requirements for Surface Impoundments 27CCR, §21400

As part of the January 2008 JTD, recommendations were provided for assessing the unlined leachate surface impoundment for potential environmental impacts. Authorization to proceed with the assessment was issued by the RWQCB in their letter dated April 24, 2013. The work was subsequently implemented by EBA on August 6, 2013. The scope of work entailed the advancement of four (4) soil borings within the footprint of the surface impoundment to depths ranging from 11.5 to 16.5 feet below ground surface (BGS) and the collection of four (4) soil samples from each borehole for chemical analysis. All soil samples from each borehole were analyzed for volatile organic compounds (VOCs), arsenic, and barium. In addition, one (1) soil sample from each borehole was analyzed for organochlorine pesticides, polychlorinated biphenyls, organophosphorus pesticides, chlorinated herbicides, and oil and grease.

Findings from the aforementioned investigation were summarized in a technical report dated October 3, 2013 (EBA, 2013a) and submitted to the RWQCB, CalRecycle and LEA. Results from the soil sampling activities did not reveal any evidence of appreciable residual contamination associated with the former leachate surface impoundment operations. Based on these results, it was concluded by EBA that no further assessment or remedial actions were necessary. Furthermore, it was recommended that the leachate surface impoundment be backfilled with "clean" engineered fill and the final ground surface graded to promote positive drainage and prevent ponding. These

provisions are included in the Technical Specifications (Attachment 6) and Construction Drawings (Attachment 8) of this Addendum.

Infiltration Equivalency Analysis

The minimum technical requirements as defined by the EPA for Subtitle D Final Cover Systems are contained in 40 CFR 258.60. This regulation allows for an alternative (performance based) cover system. One of the requirements for determining equivalency is infiltration. Typically, this is evaluated using two methodologies – (i) the Hydrologic Evaluation of Landfill Performance (HELP) Model and (ii) the Giroud Method1. Both of these methods have been used to compare the infiltration performance of the **ClosureTurf®** Final Cover System to the Prescriptive Subtitle D Cover. A comparison of infiltration rates is shown in the Table for both methodologies for a generic site in Texas.

The results demonstrate that the **ClosureTurf®** Final Cover System provides superior protection against infiltration when compared to the Prescriptive Subtitle D Standard landfill final closure systems.

Infiltration Equivalency Analysis	ClosureTurf® Cover System	Prescriptive Subtitle D Cover System
HELP Model for Site in Texas – Average Annual Infiltration (Cubic Feet)	8.3	347
Giroud Method with Silty-Sandy Soil below the ClosureTurf® (Gallons / day)	1.33	4.51
Giroud Method with Silty-Sandy Soil with Some Clay below the ClosureTurf® (Gallons / day)	0.24	4.51

Summary of Results for Infiltration Equivalency Analyses for a Generic Site in Texas

Sliding Slope.
Stable Slope.
ClosureTurf™
Brought to you by Agru America
U.S. Patent Nos. 7,682,105 & 8,585,322 • Canada Patent No. 2,663,170 • Other Patents Pending

Soil slopes don't work, although they keep you working.

Soil erosion continually plagues the ongoing management of landfills, industrial waste sites, CCR storage areas, and other environmental containment applications requiring constant rebuilding of slopes weakened by rain and wind. In addition to ongoing maintenance headaches, traditional systems utilizing soil as their main component are costly to maintain, slow to install, and introduce unwanted slope instabilities.

There is an alternative solution available for these challenging applications which address the lessons learned by the industry since the implementation of Subtitle D. The innovative solution is called ClosureTurf™ which meets and/or exceeds the requirements set forth by the EPA in Subtitle D. A three component system, ClosureTurf is revolutionizing the way engineers, owners, government agencies and many others solve containment challenges. The ClosureTurf system offers exceptional durability and pleasing aesthetics at a lower cost than traditional practices.

ClosureTurf™ makes fast, cost-efficient erosion control so easy—it's virtually install and that's all.

ClosureTurf is a patented three component system comprised of a structured geomembrane, an engineered turf, and a specialized sand infill. The ClosureTurf system provides many advantages over a typical Subtitle D landfill cover such as:

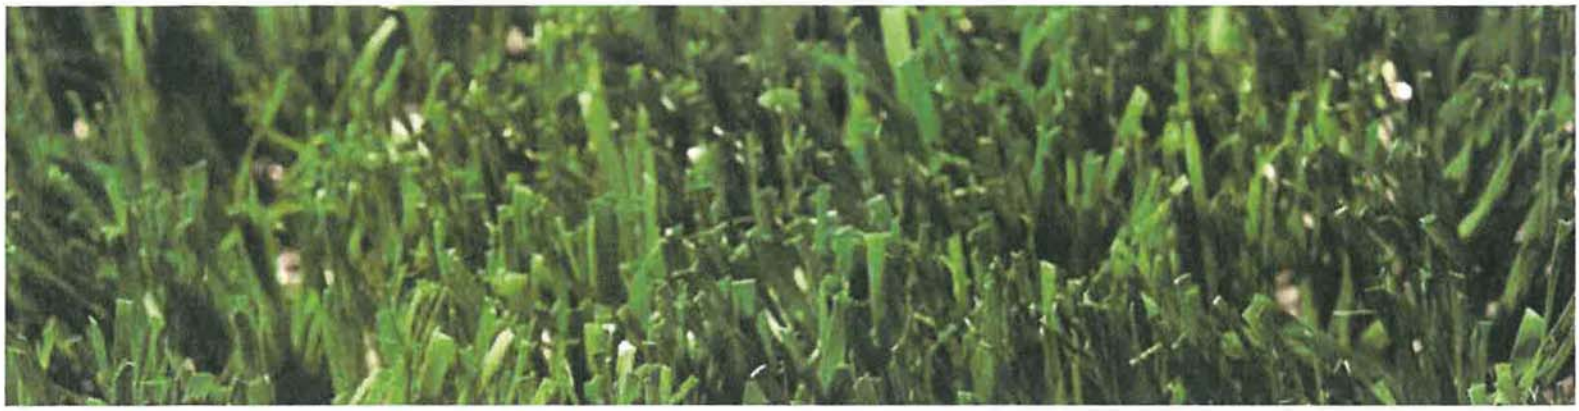
- Reduces construction and long-term maintenance costs
- Improves short term and long term slope stability
- Excellent performance in extreme weather conditions
- Provides for enhanced gas collection (when applicable)
- Improves stormwater quality
- Incremental closures for odor control and leachate reduction (close as you go)

With several square miles of installed product, ClosureTurf has proven to be superior in performance when compared to other cover solutions—not only in the laboratory but also in real life applications where it counts. The system has a proven track record to significantly outperform traditional vegetative closure methods with regard to installation, maintenance and environmental compliance.

ClosureTurf™ delivers superior performance

Performance:

- Prevents common erosion, storm water and siltation problems–even during severe weather events.
- Utilizes the highest interface friction geomembrane available in the market which provides greater stability on steeper grades and reduces the need to rebuild slopes.
- The lifespan of the ClosureTurf system extends well beyond the required 30 year post closure maintenance period. It protects against driving forces, severe weather conditions, heat and wind uplift.



Timber Ridge Landfill

Cost Savings:

- Significantly lowers upfront capital costs.
- Dramatically reduces maintenance costs.
- Reduces the cost associated with the repair of significant failures.

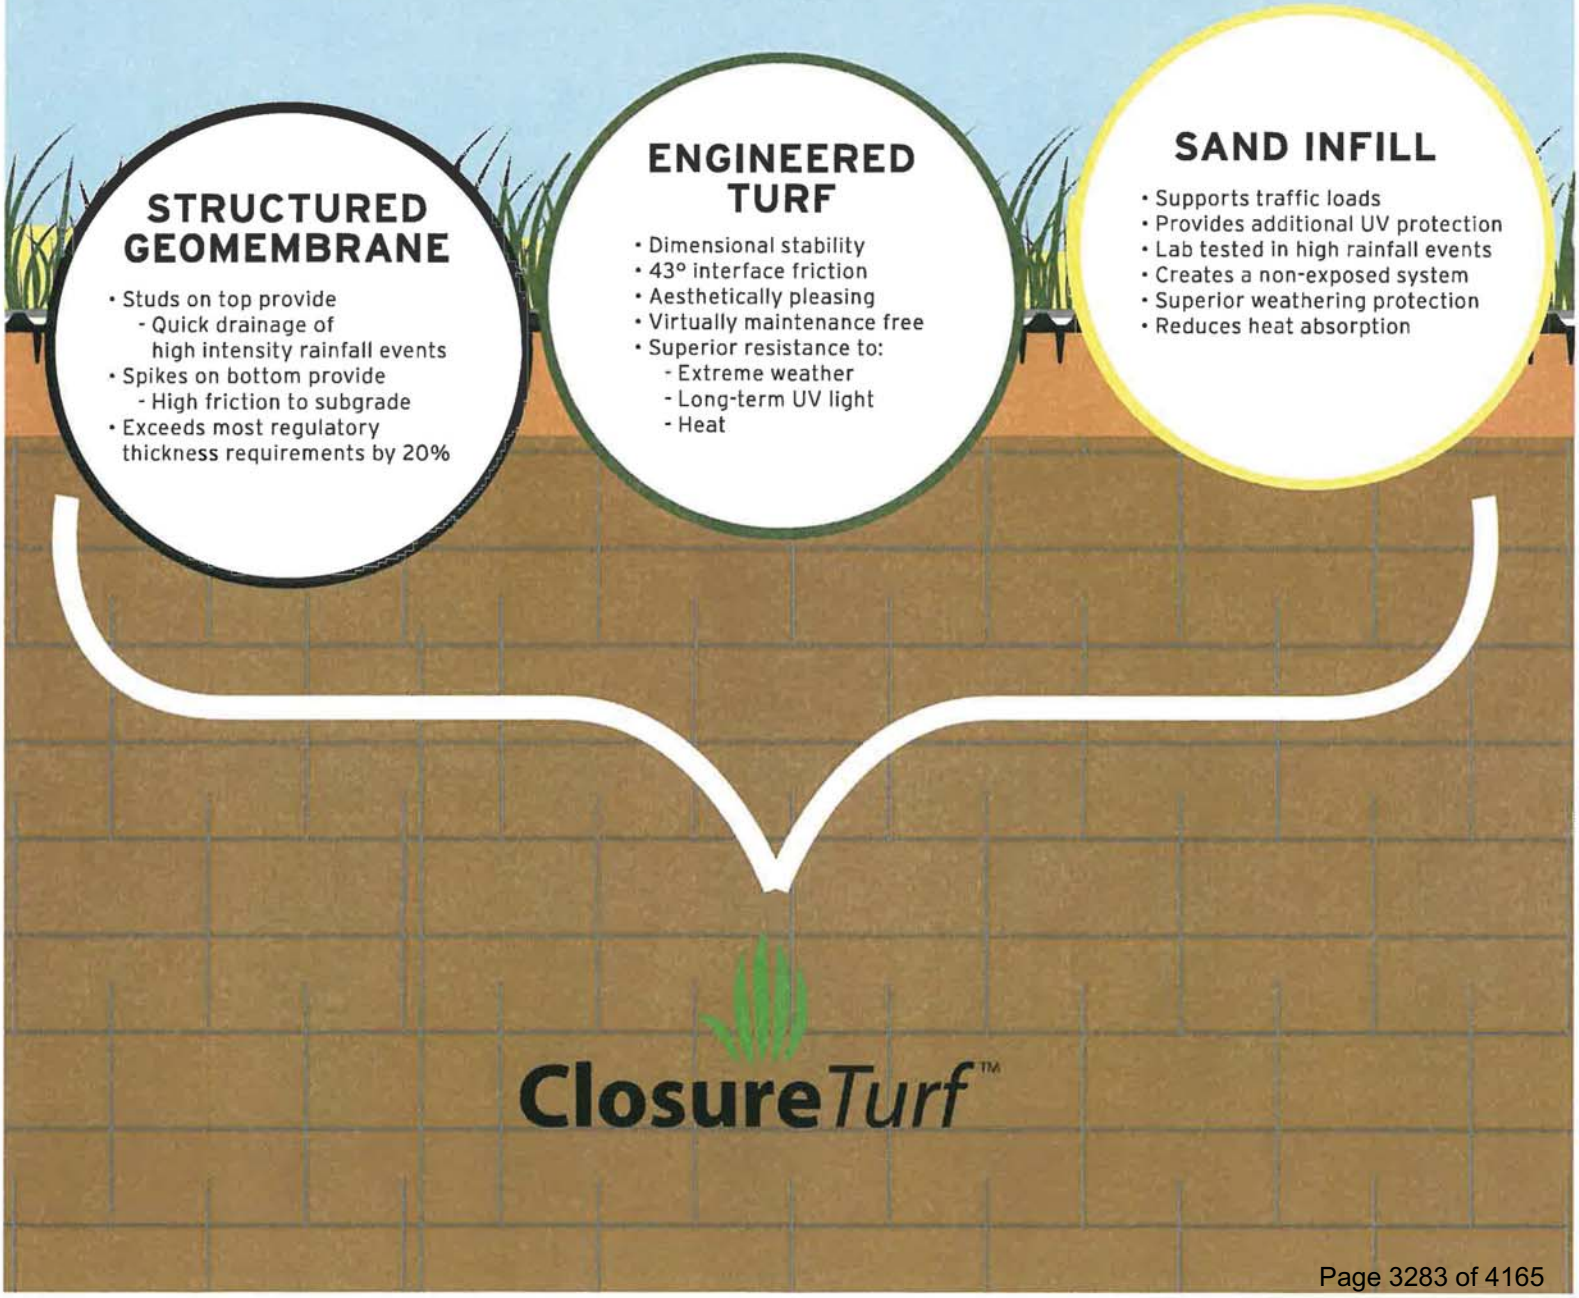
Saufley Landfill

Environmental Benefits:

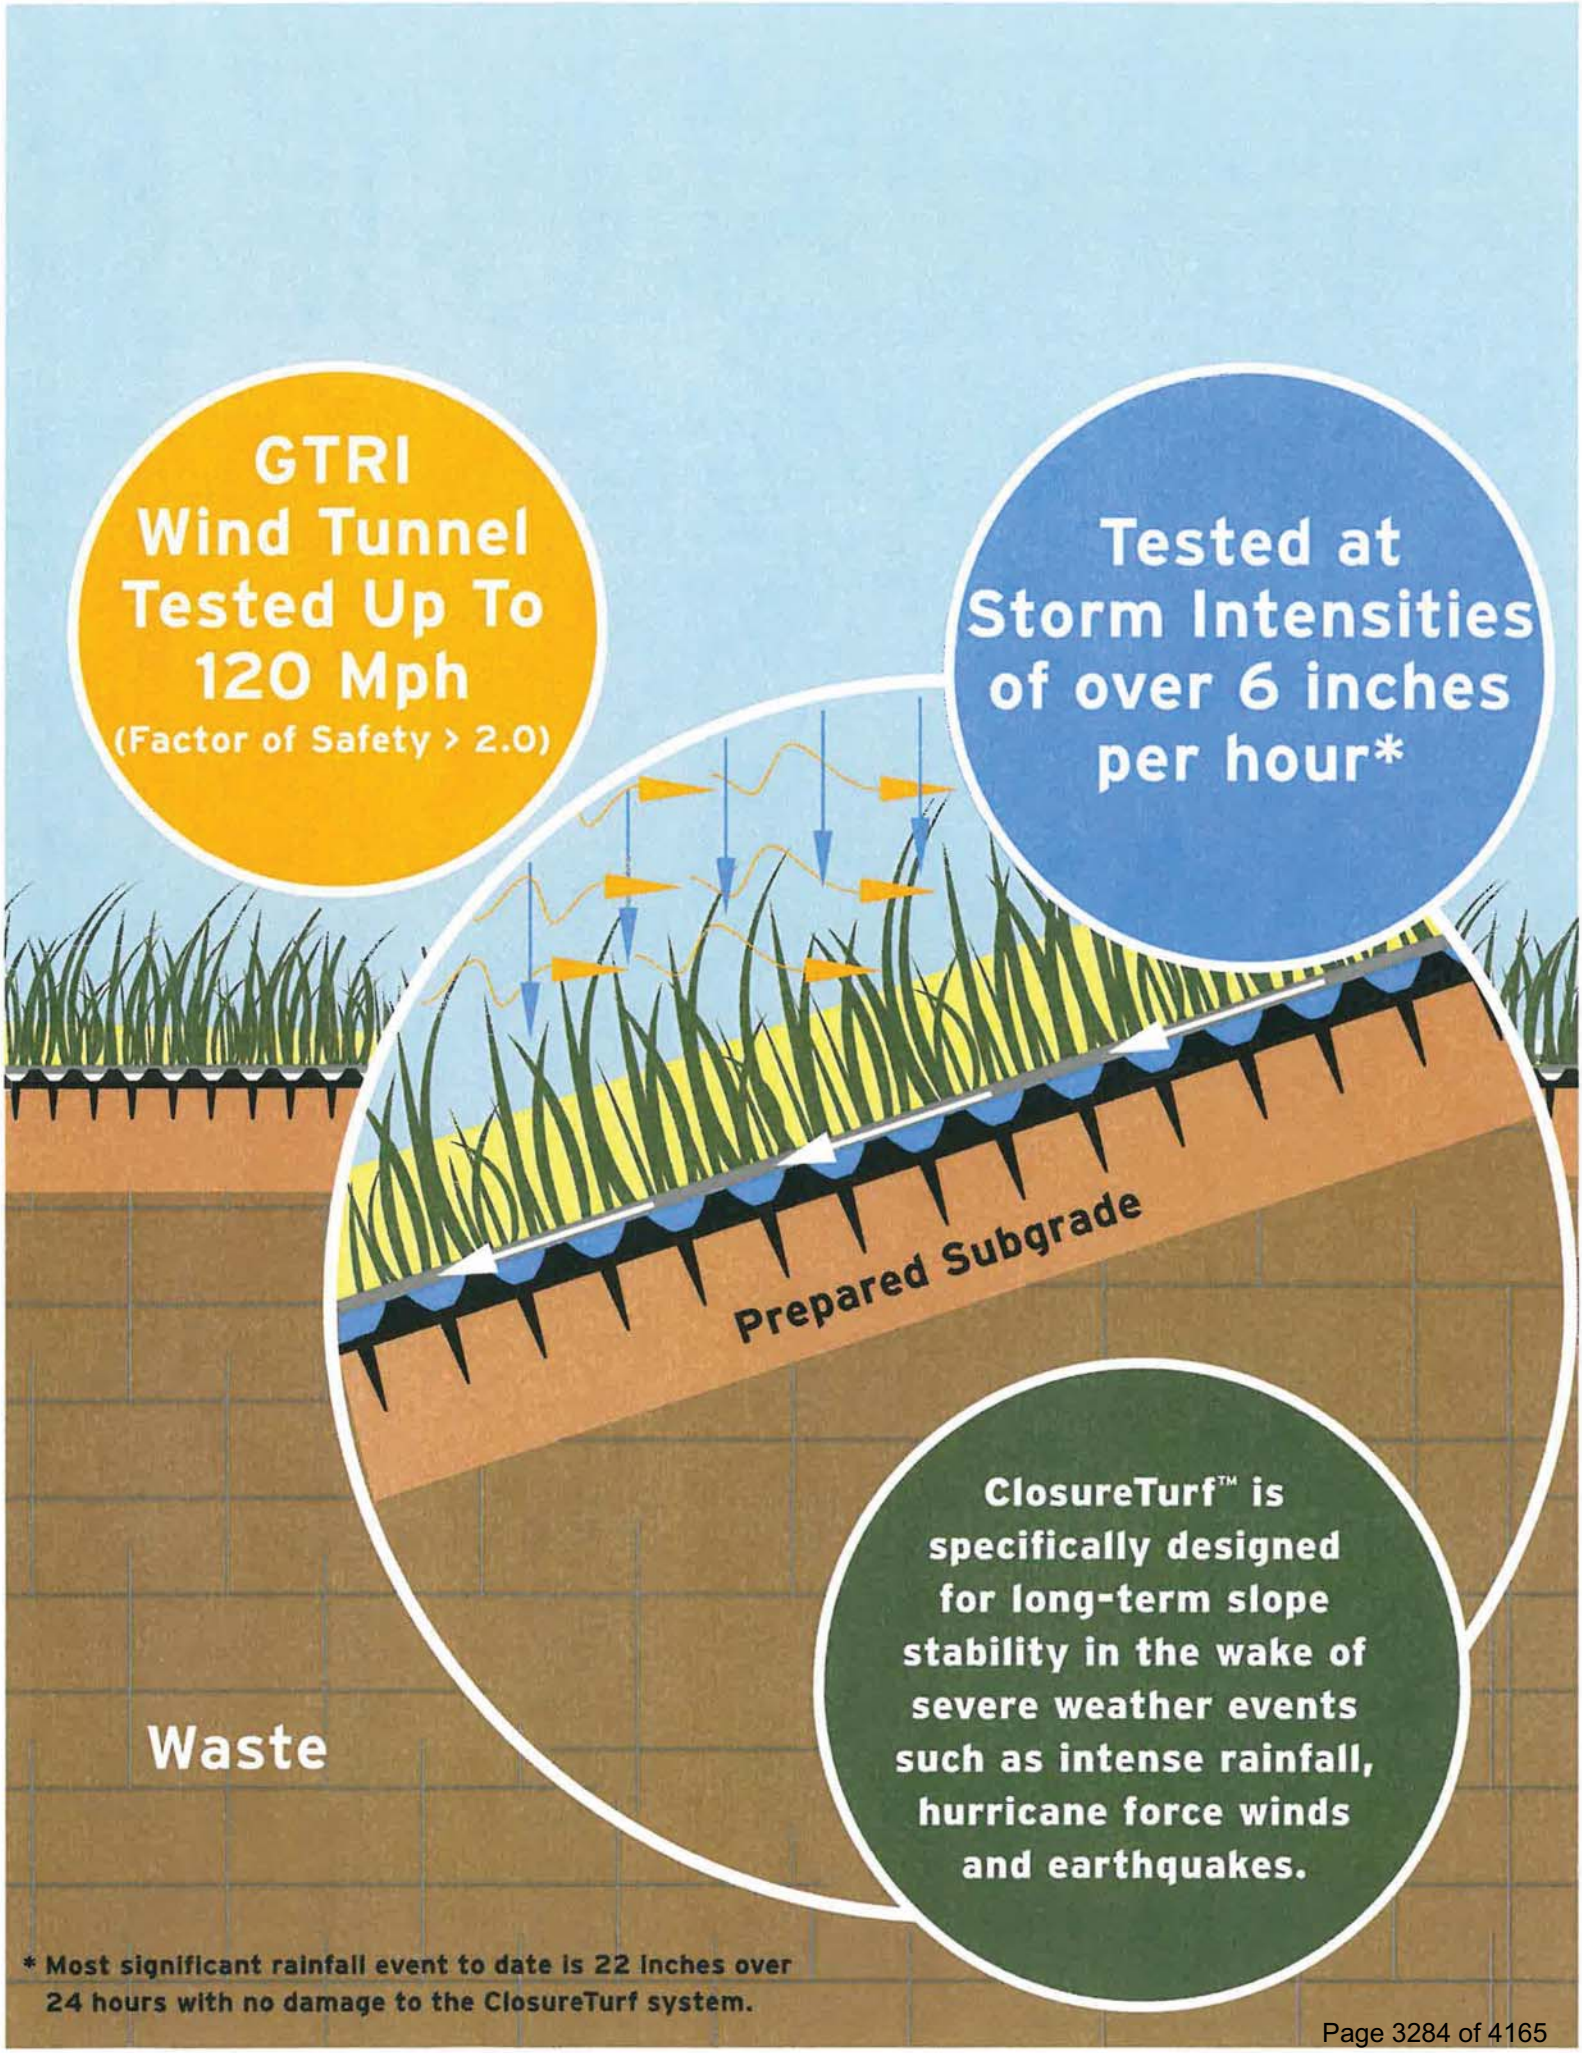
- Obtain control over gas collection sooner than later ("close as you go").
- Reduces environmental carbon footprint by up to 75% during construction.
- Lowers the production of leachate by allowing incremental closures.
- Durable system construction designed to safely convey internal gas pressures, reduce unwanted releases and avoid slope stability issues.
- The ClosureTurf system requires no irrigation, fertilizing, seeding or mowing.
- Provides filtration resulting in clean storm water runoff.

Crazy Horse Landfill

Other Benefits:



- Reduces overall surface emissions.
- Easily adapted during or after construction for solar field development.
- Rapid, low-impact construction.



Hartford Landfill

Take a closer look at ClosureTurf™

ClosureTurf™ is a patented, three component system comprised of a structured geomembrane, an engineered turf, and a specialized sand infill. The foundation of the system is an impermeable, highly transmissive structured geomembrane. It provides for the highest interface friction values available in the market. The engineered turf component gives the system its natural look and feel of grass while protecting the geomembrane from extreme weather conditions for the long term. The specialized sand infill component is placed between the blades of the engineered turf and allows the system to be trafficked while also providing additional protection from weathering. When required, ClosureTurf's patented surficial gas system is included with the system to vent landfill gas emissions. ClosureTurf is fast and easy to install for an aesthetically pleasing, cost-effective landfill closure solution.

More engineered solutions...

CLOSURETURF™ SURFICIAL GAS COLLECTION SYSTEM

ClosureTurf's patented surficial gas collection system reduces, and in some cases, eliminates the need for traditional gas wells and piping. It can function as a standalone system or in conjunction with a traditional system. Underneath the ClosureTurf system, gas is generated and rises to the surface where a vacuum created by the differential pressures is vented through the surficial gas collection foot. This method provides an efficient method of gas collection while reducing the amount of condensate that needs to be managed.

The unique design of the ClosureTurf Surficial Gas Collection System resulted in one landfill winning an International Achievement Award for a combined gas collection and closure system and the Solid Waste Association of North America (SWANA) Gold Excellence Award for landfill gas collection in 2012.

VERSACAP™

VersaCap is a low-cost, intermediate landfill cover solution designed to help prevent erosion, infiltration, runoff and gas emissions during the operational phases of the landfill.

Fast and easy to install, VersaCap is a wind-resistant membrane comprised of a synthetic turf and specially-formulated polymer backing that improves the quality of surface water runoff and eliminates downstream siltation by preventing erosion of the cover soils. VersaCap does not require tires or sandbags to keep it in place and can easily be taken up and reused in future areas.

HYDROTURF™

HydroTurf is an economical, environmentally-friendly alternative revetment to rock riprap and piped channels. It is a patented three component system made up of a structured geomembrane, an engineered turf and a specialized pozzolanic infill (HydroBinder™). Created specifically for bench drains, downchutes and perimeter channels on landfill covers, HydroTurf will flex and move with typical differential settlements that occur on landfill covers. It provides superior hydraulic performance capable of handling large velocity and large flows resulting in very high velocities.

Delivering the same advantages as ClosureTurf, HydroTurf offers rapid, low impact installation that's significantly less costly than hard armor and piping, and is projected to last more than 100 years when properly maintained. Best of all, unlike hard armor riprap channels, HydroTurf improves the environment by producing cleaner storm water runoff.

SOLAR

The nature of the ClosureTurf system provides an excellent opportunity for generating environmentally friendly renewable energy through the implementation of solar panel arrays. ClosureTurf's geosynthetic cover enables panels to operate in a clean environment significantly reducing dust and erosion. The engineered turf provides an excellent surface for easy access and eliminates the risk of panel damage from mowing and maintenance required for other types of ground cover.

The exceptionally durable heavy load bearing ClosureTurf platform enables complete accessibility for installation, maintenance and replacement of PV panels.

ClosureTurf's proven technology is working hard for these landfills.

Industrial Ash and Sludge Lagoon, Southeast USA

- Saved 20 acres of land from destruction for borrow.
- Created a 70-acre watershed of clean runoff.
- Unique lightweight construction allowed for closure on soft, weak subgrade.

Crazy Horse Landfill, Salinas, CA

- Eliminated 26,000 truck trips for soil borrow (equivalent to 660,000 miles).
- Combination of soil import elimination and reduced heavy equipment needs reduced the project's carbon footprint by 70%.
- Eliminates dirty storm water run-off by replacing cover soils with a cover system that produces very clear and clean water free of fertilizer and muddy runoff.
- Provided the perfect foundation for solar panel racking system.
- Eliminated slope veneer failures high seismic loads (site is adjacent to San Andreas Fault).

LaSalle Landfill, Jena, LA

- Endured more than 330 inches of rainfall since installation in 2008.
- Survived a tornado when 70 mph winds hit across the front of landfill.
- Sand infill remained in place with no erosion when a levee broke releasing 5 acres of water across the turf.
- Eliminated annual slope rebuilding—a savings of over $300,000 to date.

Timber Ridge Landfill, Richwoods, MO

- Proprietary ClosureTurf system collected 500 SCFM of gas over a ten-acre closure with no vertical wells.
- Winner of the International Achievement Award for combined gas collection and closure system.
- Winner of the Solid Waste Association of North America (SWANA) Gold Excellence Award for landfill gas collection.

Based on these and other successes, ClosureTurf exceeds requirements of EPA Subtitle D and has been approved and installed in many states.

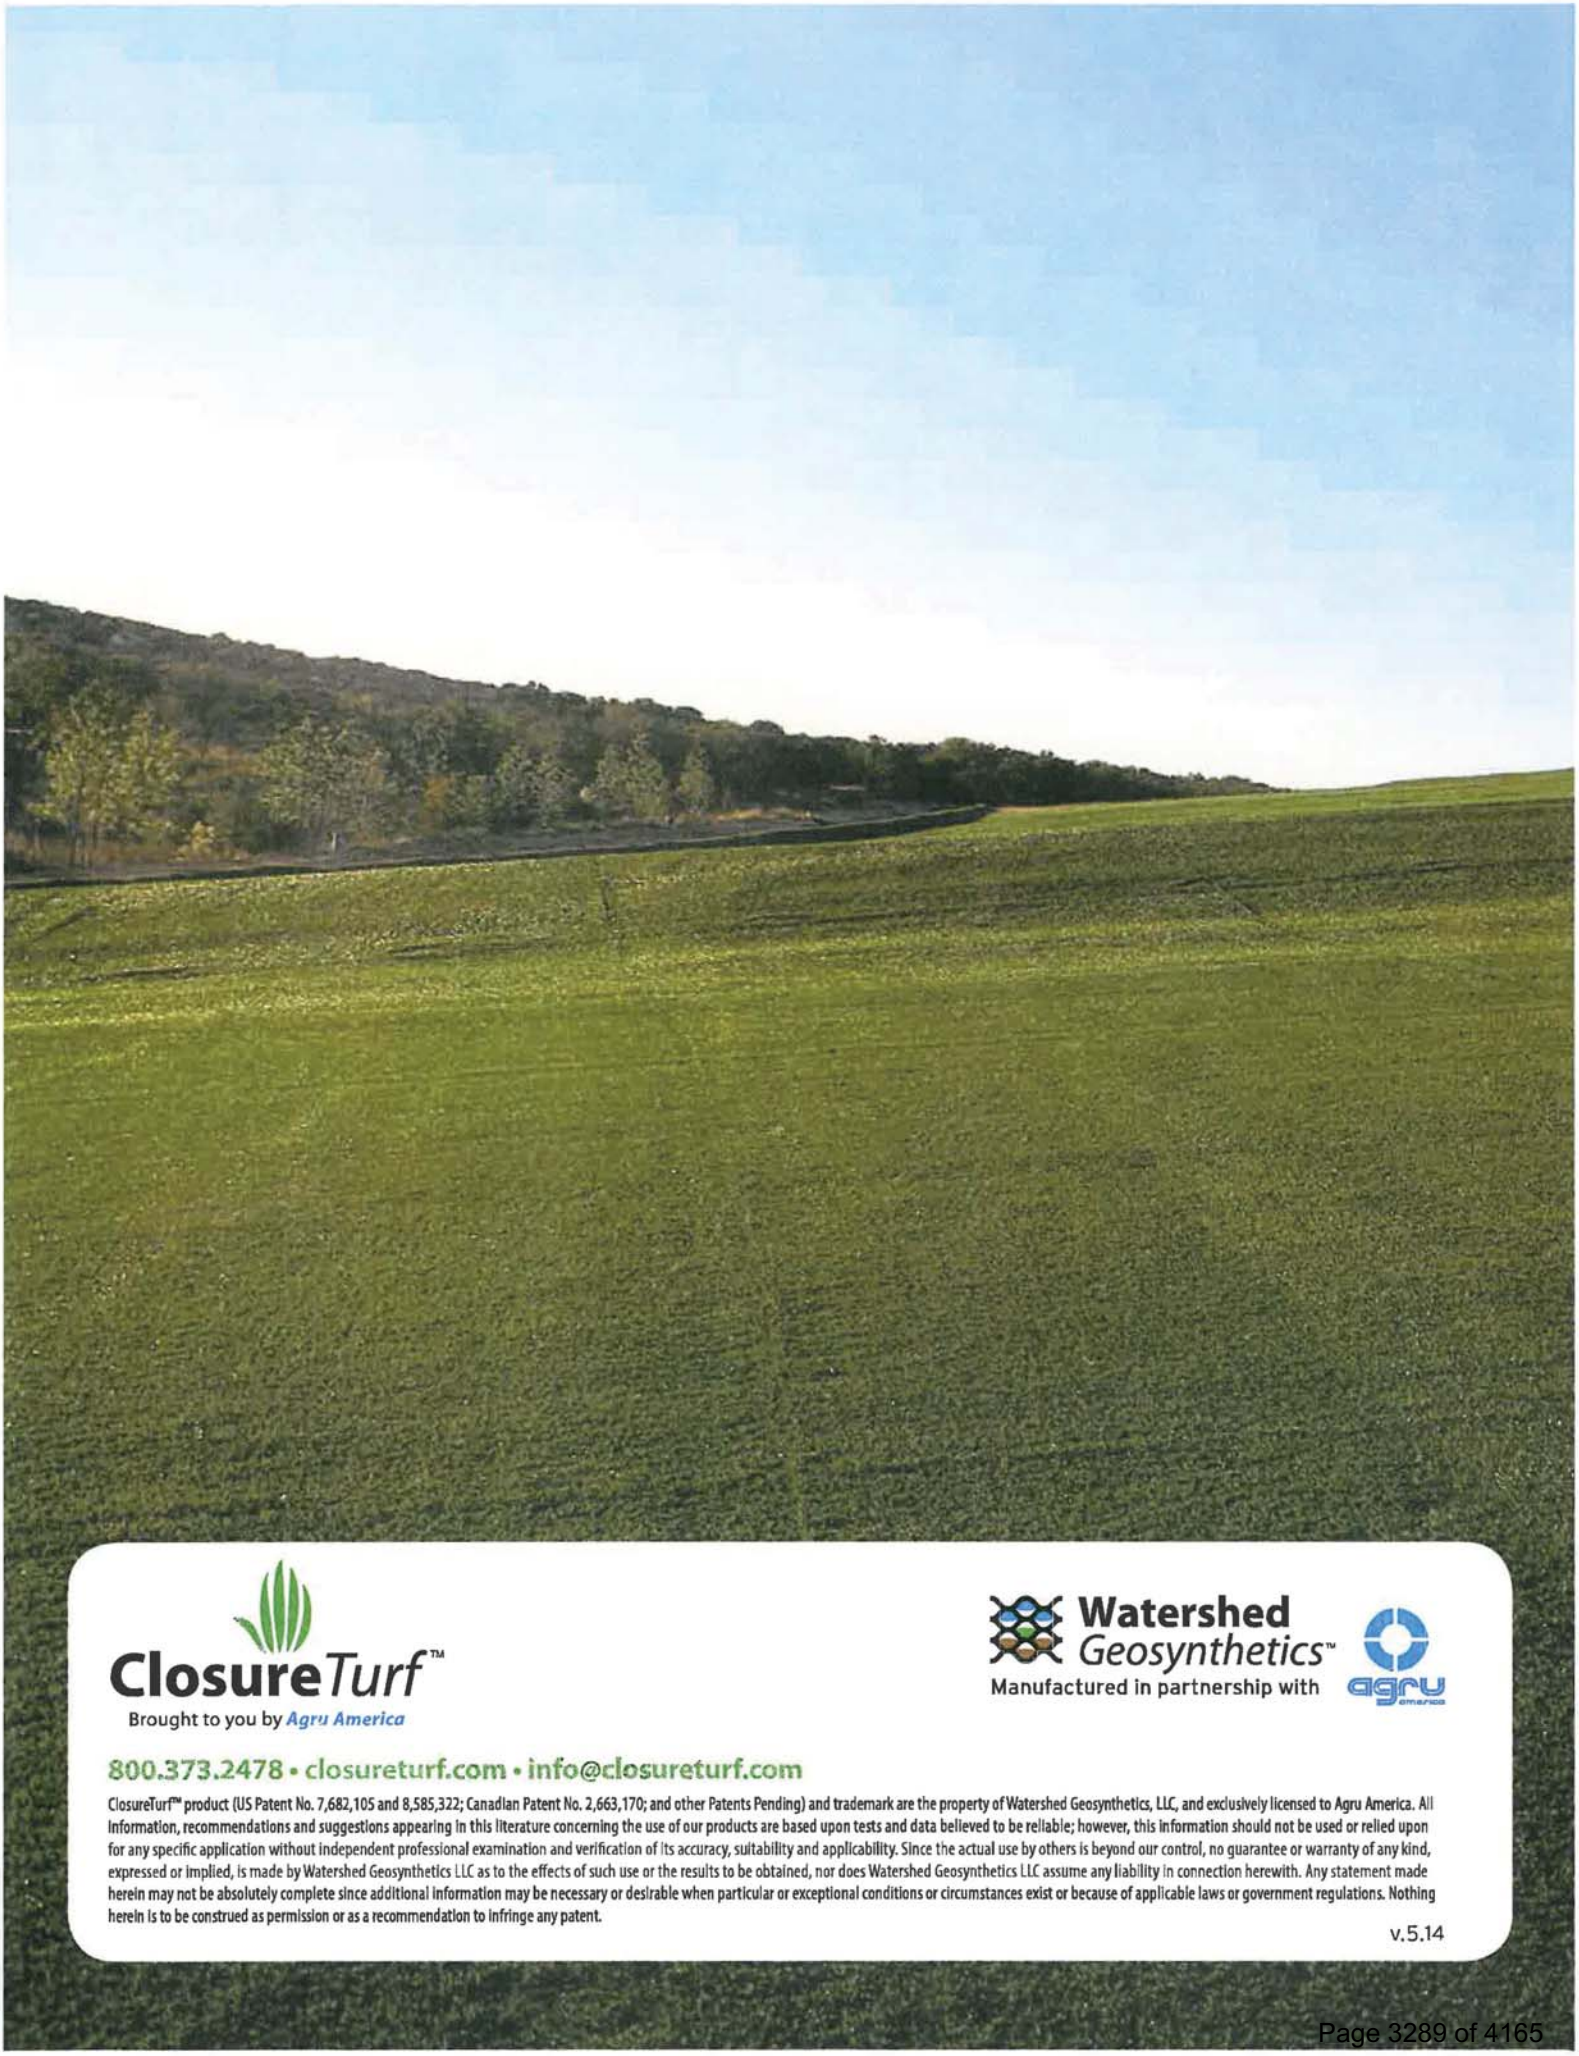
ClosureTurf™



The cost-efficient, compliance-driven, environmentally-friendly landfill solution.

With slope erosion and vegetative maintenance an ongoing battle, and compliance issues ever looming, choose the cover solution designed to eliminate the most common problems associated with landfill management.

ClosureTurf is specifically designed to solve soil erosion, slope instability, gas emissions, and high costs of installation and maintenance. Discover the solution that makes your job a lot easier, keeps you compliant and makes you look good in the process.

For more information on ClosureTurf, visit closureturf.com, email us at info@closureturf.com or call 800-373-2478.

ALL ClosureTurf COMPONENTS ARE PROUDLY MADE IN THE USA.

Over 13 million square feet and closing...

ClosureTurf PERFORMS IN REAL WORLD SITUATIONS.

ClosureTurf™ ensures fast, cost-efficient and environmentally-friendly erosion control—even in some of the toughest applications.

ClosureTurf™ is a three component system comprised of an impermeable, highly transmissive structured geomembrane, a specialized engineered turf, and sand infill. The structured geomembrane component is the foundation of the system and provides for the highest interface friction values available in the market. The engineered turf component is placed on top of the geomembrane giving the system its natural look and feel of a grass while protecting the geomembrane component from extreme weather conditions for the long term. Finally, the sand infill placed in the engineered turf enables the system to be trafficked, while also providing for additional protection and an additional factor of safety against weathering. A virtually maintenance free technology designed to last, ClosureTurf has proven to be the most sustainable closure option available for the waste industry. See how ClosureTurf performs in some of the most demanding applications.

1

LASALLE-GRANT LANDFILL

QUICK STATS

Location: Jena, LA
Completed: 2009
Owner: Progressive Waste Solutions
Size: 9 acres

PROJECT SCOPE

The soil of the LaSalle-Grant Landfill in central Louisiana was highly erodible, had a high plasticity index, and had a natural pH of 4.0, so its characteristics weren't conducive to side slope maintenance. In fact, every spring the existing vegetative slopes required slope repair, reseeding and liming in order to remain intact. Pressure to find a more stable solution led the operator to implementing Closure Turf's 43 degree interface friction technology, which is more than a 3.0 factor of safety against sliding failure, over 10 acres of the landfill.

2

CRAZY HORSE LANDFILL

QUICK STATS

Location: Salinas, CA
Completed: 2013
Owner: Progressive Waste Solutions
Size: 68 acres

PROJECT SCOPE

Situated adjacent to the San Andreas Fault in California, the Crazy Horse Landfill in Salinas, CA, required a solution that would enable capping without modifying steep slopes of 2.25H:1V. And, since most available borrow soil was expensive and environmentally impacted with agricultural chemicals, the site was especially challenged in producing surface water quality that met the regulations. The 65-acre landfill is also situated in a residential area that demanded a final cover system that was aesthetically-pleasing and not subjected to on-going erosion and maintenance noise.

3

TIMBER RIDGE LANDFILL

QUICK STATS

Location: Richwoods, MO
Completed: 2010
Owner: Progressive Waste Solutions
Size: 10 acres

PROJECT SCOPE

Due to its location in a seismic area, concerns over slope stability that could compromise gas collection and containment was a major concern for this landfill. The lack of quality borrow soil and the high cost of procuring it made a ClosureTurf system an easy choice. Likewise, gas collection using deep wells would drastically increase installation costs and compromise speed of closure. A system that could perform effectively without deep vertical wells was greatly advantageous.

4

HARTFORD LANDFILL

QUICK STATS

Location: Hartford, CT
Completed: 2013
Owner: Connecticut Resources Recovery Authority
Size: 38 acres

PROJECT SCOPE

The vision that the owner had for the Hartford Landfill was one where they would be able support the initiatives to promote renewable energy that were consistent with both the CTDEEP and the City of Hartford, CT. ClosureTurf enabled them to do just that, by providing for the best closure technology available and is capable of incorporating traditional rigid or flexible solar photovoltaic panels.

RESULTS

Operators quickly learned of Closure Turf's ability to provide long-term erosion control as the system controlled rainfall runoff in excess of 4 inches per hour at times during it's first year in action. In fact, the system has endured more than 300 inches of rainfall since 2008. And, three months after phase one of the project was completed, a tornado producing shear winds of 70 mph hit across the front of the landfill without damaging the turf cap. Finally, the LaSalle sand infill remained in place with no erosion when a levee broke, releasing water over 5 acres of the project area.

The Closure Turf system requires no mowing, little maintenance, and has remained in tact even under the most extreme weather conditions. Low maintenance costs can relate to significant savings over the 30 year post closure period. Best of all, soil erosion, water infiltration, leachate reduction and fugitive gas emissions were immediately controlled once the ClosureTurf system was installed.

"We'd been killing ourselves working and reworking our slopes, but after we installed the Closure Turf system we didn't have to do anything to it again. The grass looks great, the sand hasn't moved and there's no erosion."

Delaney Lewis,
District Landfill Manager,
IESI Corp, A Progressive Waste Solution Company

RESULTS

Installation of the ClosureTurf system was successfully achieved with currently developed slopes under earthquake loading, eliminating 11,000 round trip truck loads (equivalent to 660,000 miles) that would have been required for soil borrow. The combination of soil import elimination and reduced heavy equipment needs reduced the project's carbon footprint by 70%.

ClosureTurf eliminated dirty storm water runoff by replacing a traditional vegetated cover with a cover system that produces very clear and clean water free of fertilizer and muddy runoff. In addition, ClosureTurf eliminated slope veneer failures from high seismic loads and reduced yearly maintenance activities for the SVSWA to essentially zero. These would have included rebuilding slopes because of erosion, revegetation, dust control efforts, mowing of weeds and grasses to reduce fire danger, and controlling rodent populations.

"We've been extremely impressed with the stability of our slopes and quality of the water runoff. Plans now include a 2 mega-watt solar array system down the road, which will mean this land will produce renewable energy source that gives back to the environment."

Dave Meza, P.E.
Project Manager
Salinas Valley Solid Waste Authority

RESULTS

ClosureTurf's patented system precluded the need for gas wells or piping. This resulted in a cost savings of $15,000 per acre that would have been required for installing deep gas wells. ClosureTurf's structured membrane reduces oxygen in the system that results in higher quality methane gas to be vented for flaring or alternative energy generation.

Under the ClosureTurf system, the gas rises to the surface due to positive pressure and generates little condensate to be collected and managed. The Timber Ridge system is consistently venting 500 SCFM of gas over a ten-acre closure with no vertical wells. This achievement has resulted in Timber Ridge winning an International Achievement Award for a combined gas collection and closure system and the Solid Waste Association of North America (SWANA) Gold Award for landfill gas collection in 2012.

"Capturing 100% of methane has provided options for carbon credits and given us more fuel to burn for generating energy. As soon as an area is closed, all emissions can be controlled which is great. And, the structured membrane protects against oxygen infiltration, eliminating that as a fire pathway."

Mike Freisen, P.E.
Regional Engineer
IESI Corp, A Progressive Waste Solution Company

RESULTS

ClosureTurf was selected for use by the owner for the following reasons: ClosureTurf's geomembrane component had a proven track record in landfill closure applications, the engineered turf with sand infill was durable and strong protecting the underlying geomembrane from ultraviolet degradation while also enabling the system to be driven across by light rubber tire vehicles without damaging the SGN required for normal solar field operations. As the best long-term solution for Hartford, ClosureTurf also provided for an aesthetically-pleasing environment in a high-profile area.

Engineering Report

ClosureTurf™ has been extensively tested in the lab and in "real-world" applications for performance and durability.

The goal was to produce a system that performs better than current "Subtitle D" requirements and can resist the many common failure modes of today's closure covers. Traditional approaches to landfill closure have customarily involved the use of a vegetative cover. However, many of these cover systems have failed as a result of excessive erosion, gas pressure buildup, earthquake loads, poor maintenance and inadequate oversight procedures after site closure.

In response to numerous failures of these closure systems and associated rising costs, engineers have looked at new approaches in establishing a more stable and environmentally sound solution. An old solution to address cover failures and the associated environmental impacts is the implementation of exposed geomembranes. However, exposed geomembrane systems are still costly to maintain, are not wind resistant, and do not provide for an aesthetically pleasing solution. For these reasons, many state agencies do not grant final cover status to exposed geomembrane cover systems. After all, the geomembrane is still exposed to the elements for the entire duration of the application. The best approach still involves covering and protecting the underlying geomembrane, however instead of using two feet of soil to do it, it can be done with a specialized tufted geotextile ("engineered turf"), infilled with sand that has been engineered to perform better than the traditional soil cover.

Combining an engineered turf infilled with sand and a highly transmissive structured geomembrane forms a system known as ClosureTurf. The next generation closure system, ClosureTurf has proven to be environmentally protective and more stable than traditional vegetative/soil solutions as a cover system.

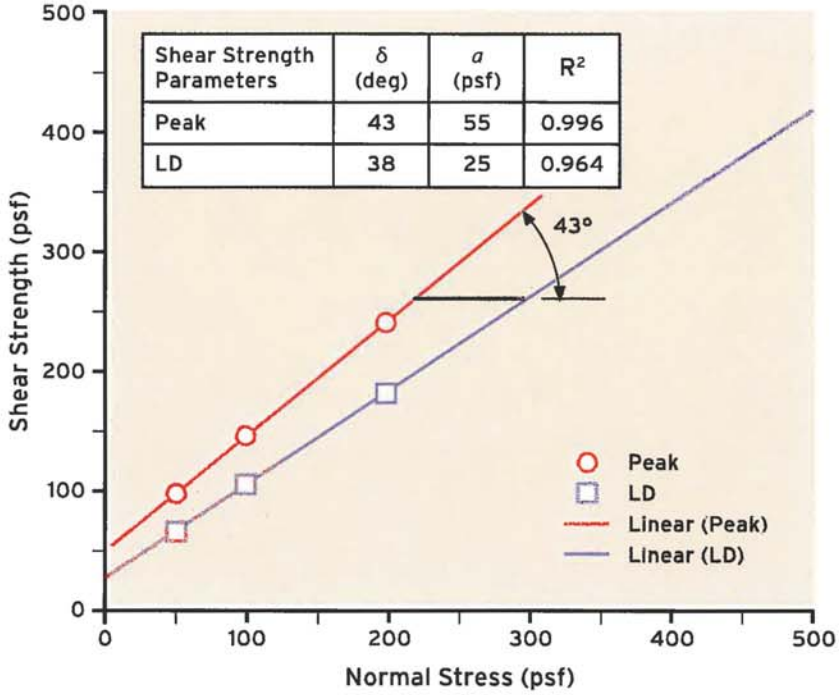
The engineered turf technology was originally developed for professional sports venues. Over the last decade the market has expanded greatly and technology has improved dramatically. The latest generation of polyethylene material now provides excellent residual strength and color durability against UV light.

By combining the newest technology of engineered turf with a 50 mil thick geomembrane that has the highest interface friction available in the market, and adding approximately a 0.5 inch of sand for infill, the ClosureTurf system is quickly becoming the preferred choice among the engineering community for covering landfills, mines, industrial waste sites, and CCR storage areas. The product is proven to significantly outperform current closure methods while allowing engineers to deliver a sound solution with net savings to their clients.

The driving performance criteria for the product are stability, transmissivity and durability. These criteria serve to mitigate LFG emissions and liquid infiltration for a duration that extends well beyond the post-closure period. The graphs and charts represent a summary of the performance.

U.S. Patent Nos. 7,682,105 & 8,585,322
Canada Patent No. 2,663,170
Other Patents Pending

Stability

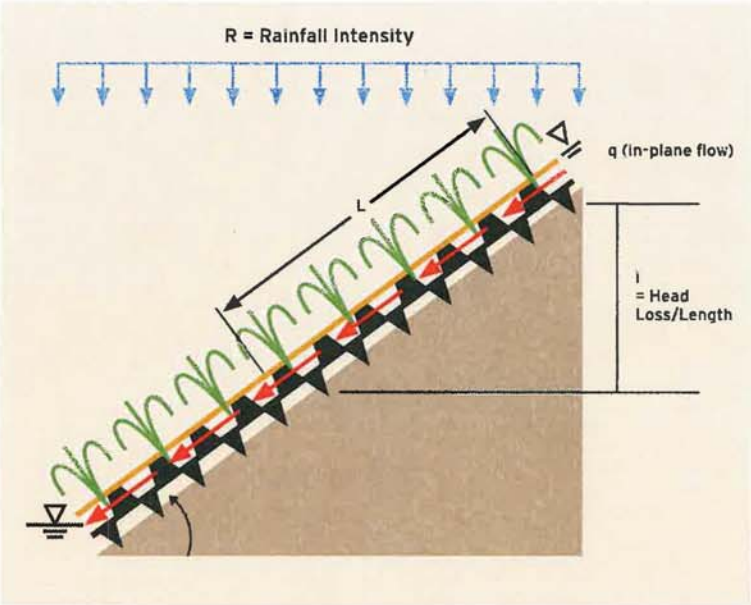


On landfills and mine piles, sliding of the soil cover along steep side slopes is of primary concern, particularly after major storm events. During a rain event, **the rainfall will penetrate quickly through the sand infill and drain directly in the drainage system below avoiding sand erosion and maintaining stability** of the sand infill. **"The infill is also held in place by the unique structure of the engineered turf** that traps the sand to anchor and ballast the engineered turf to the surface it covers. Note that:

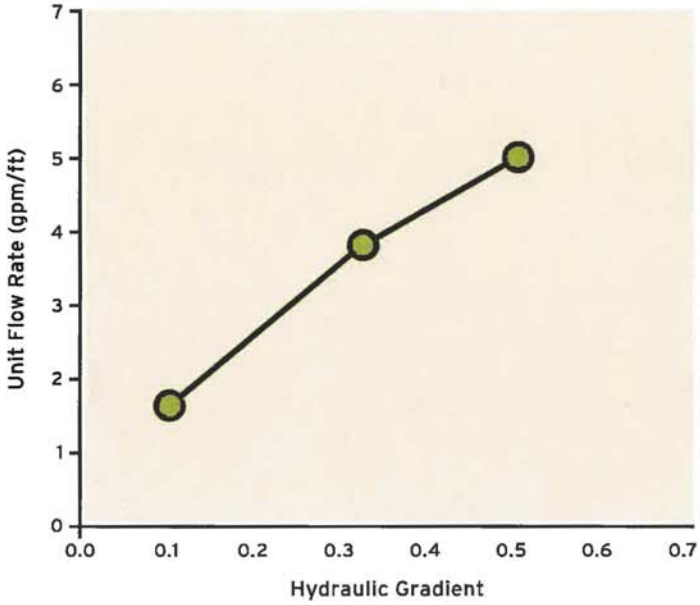
- **ClosureTurf™ can be placed on very steep slopes**
- **Tests indicate 43 degrees interface friction value**
- **The slope stability safety factor can be calculated from the chart using the equation:**

  SF= tan φ/tan α

ClosureTurf System Interface Evaluation



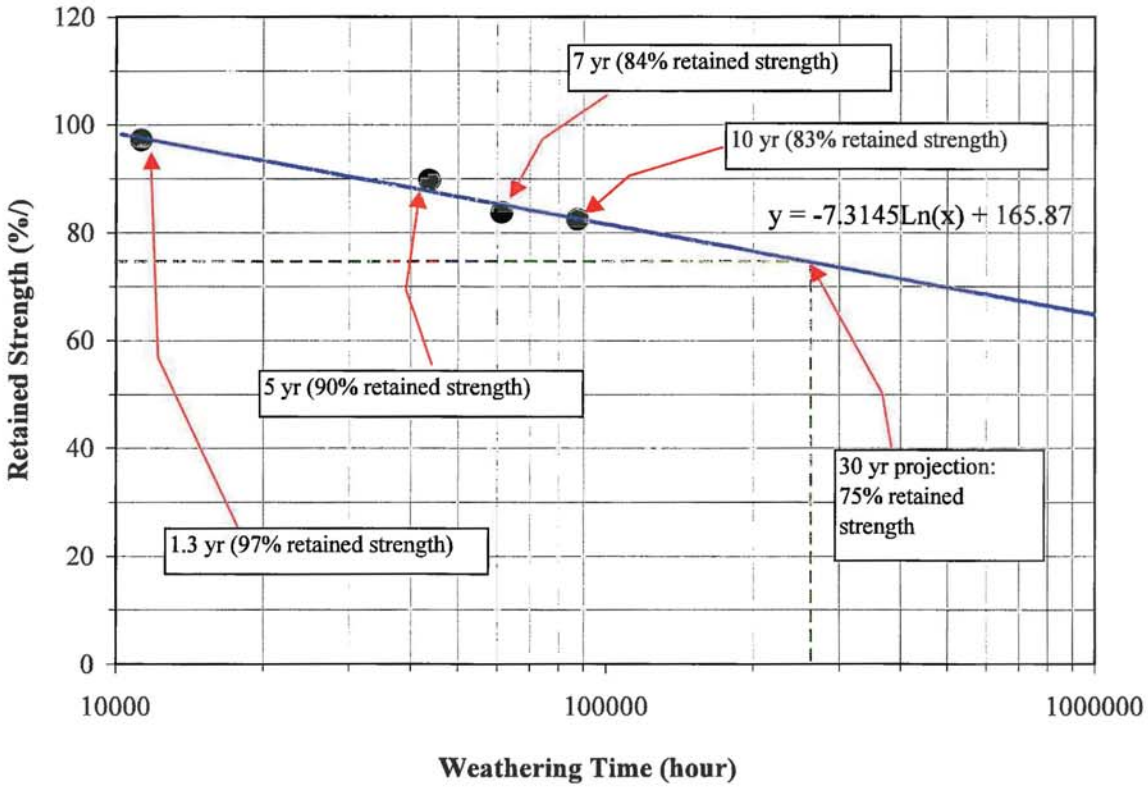
Slope angle	Slope	SF
34	1.5H: 1V	1.4
27	2.0H : 1V	1.9
18	3.0H: 1V	2.8
14	4.0H: 1V	3.7



Drainage

ClosureTurf™ sand infill material is **stable on steep slopes under severe weather conditions.** The stability of the sand infill is controlled by the following product characteristics:

- **Percolation/Permeability**
- **Transmissivity**
- **Sand friction**
- **Grass interlocking grid**
- **Sand gradation**

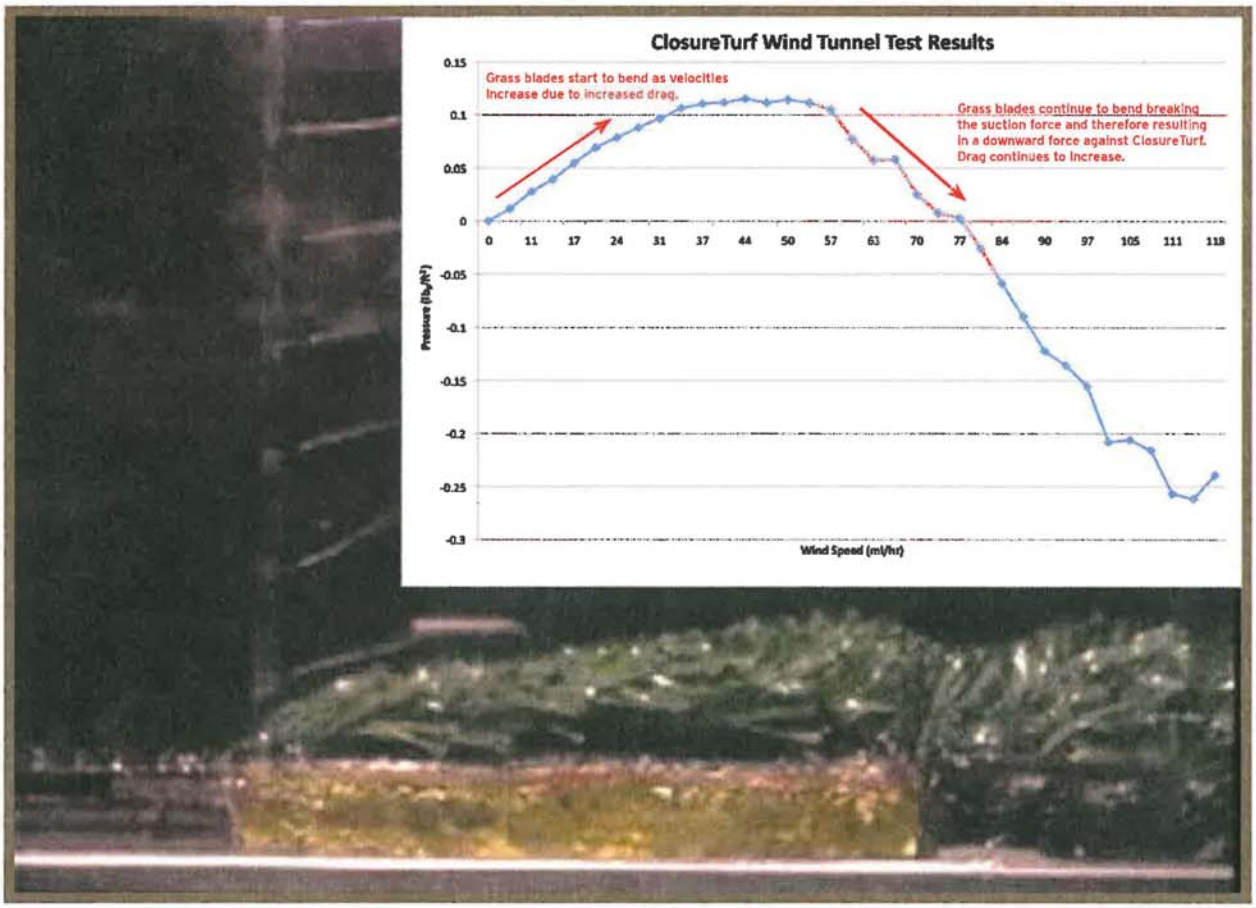


ClosureTurf was designed with the above characteristics in mind. The sand infill can handle **over six inches per hour of rainfall intensity without erosion** when applied on 3H:1V slopes.

Rainfall penetrates quickly through the sand and into the structured drain liner below which has a very high transmissivity. The energy that could cause erosion is on the structured geomembrane and not on the surface of the sand. The transmissivity is presented in the graphic at left.

Weathering

Weathering Resistance For a Long Life

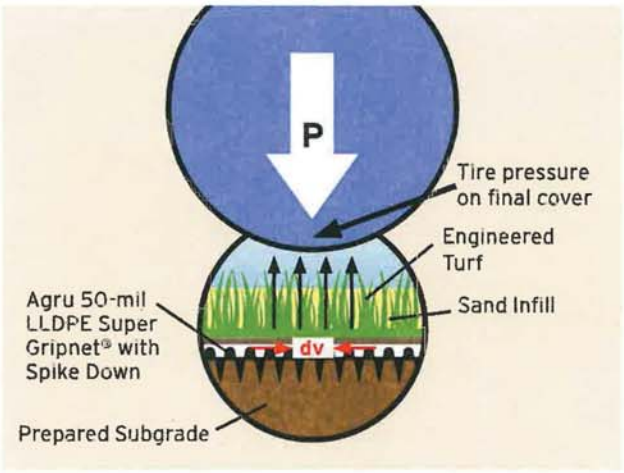


ClosureTurf™ is designed to provide weathering resistance and geomembrane protection when exposed to the **most extreme conditions.** Based on independent, real-world weathering tests performed at Atlas Material Testing Laboratories in New River, AZ. The tensile strength of the engineered turf fibers is projected to have 75% retention after 30 years. This means that with typical traffic loading forces, the material can provide over **four times the strength required after thirty years of extreme heat and UV exposure.** Based on the testing data collected and shown in the graph above, and data from many existing ClosureTurf projects, the system can **provide decades of reliable performance beyond the standard thirty-year post-closure maintenance period.**

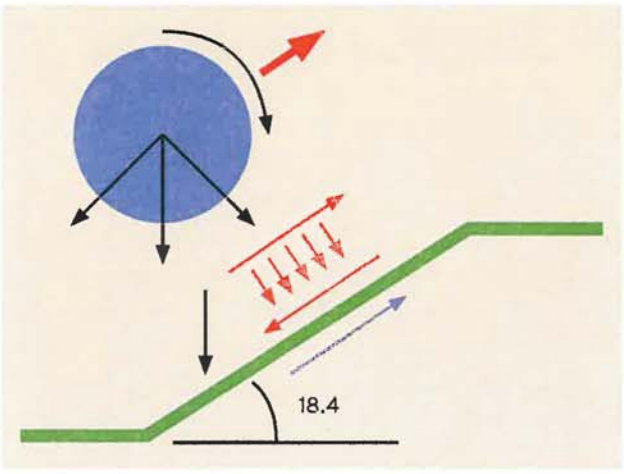
Wind Uplift Resistance

Wind Tunnel Testing at GTRI

Since all exposed geomembranes are susceptible to damage from high winds, the technology must withstand these forces. A study was performed on the wind uplift reactions by Georgia Tech Research Institute. To complete their evaluation wind tunnel testing was performed. The ClosureTurf™ product indicated no uplift when exposed to 120 mph winds. This is in contrast with exposed geomembrane systems where extensive anchoring is required even for 30 mph winds.

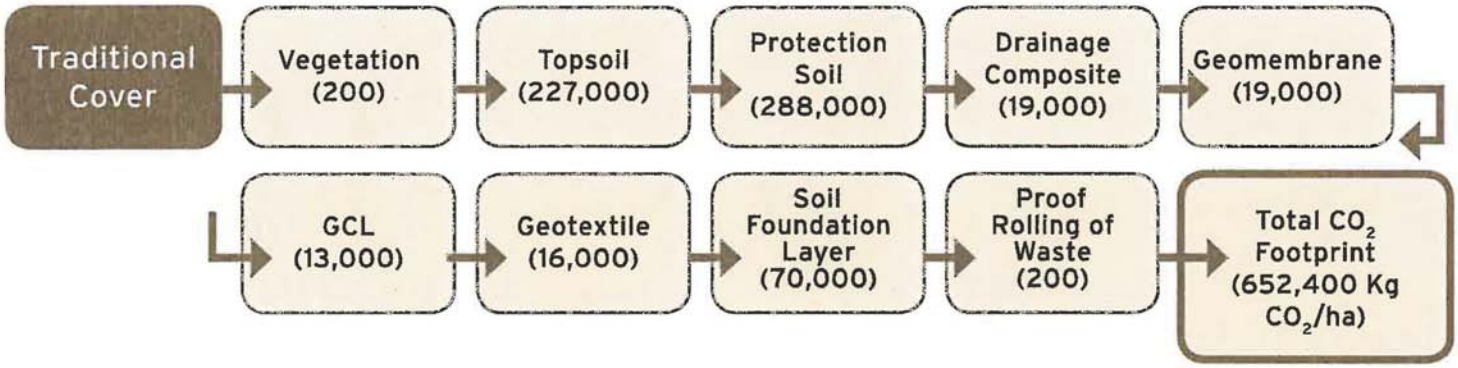


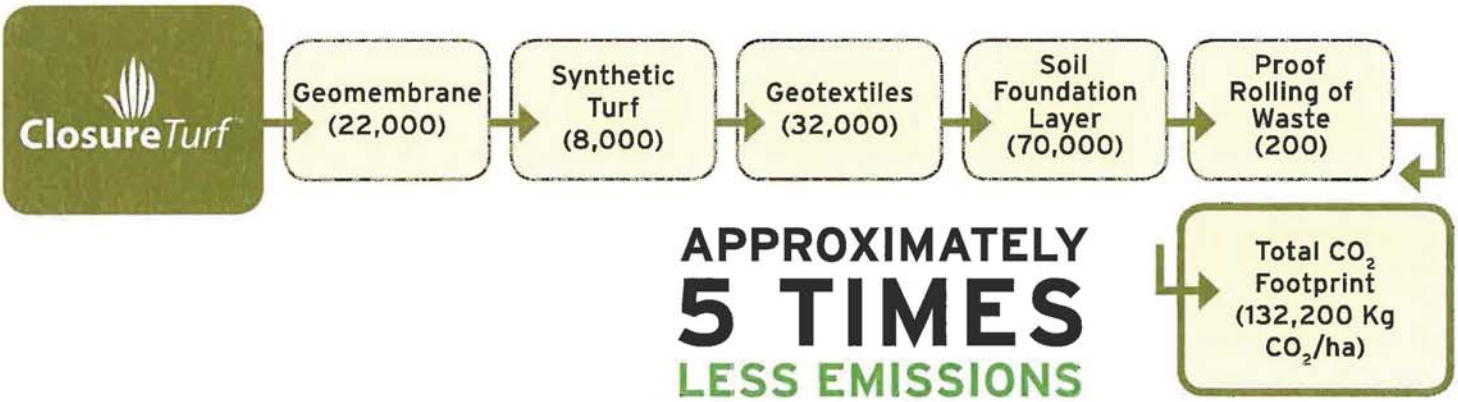
ClosureTurf technology provides features that help mitigate the forces of wind, such as a porous surface to break vacuum and engineered turf blades that will increase the aerodynamic boundary conditions and blades bending and reacting against the wind causing a resistance to the uplift.



Drivability

Gas system monitoring locations or wells in the landfill will have to be accessed by persons on foot or in vehicles. The typical exposed geomembrane closures, being fully exposed, would likely be damaged during access. Further, the geomembrane can be damaged by birds or other animals. All such damage to the geomembrane would have to be continually repaired and replaced at additional costs after construction. The ClosureTurf™ is thicker, covered with sand infill that not only ballast the system but also allows for access of a 60 psi tire pressure vehicle on 3:1 slopes and up to 90 psi tire pressure in flatter areas without being susceptible to damage.





Sustainability

ATTACHMENT 3

FINAL COVER STABILITY ANALYSIS

FINAL COVER STABILITY ANALYSIS
UKIAH LANDFILL CLOSURE
February 2015

WASTE MASS SLOPE STABILITY

A stability and seismic hazards analysis has been performed for the final closure of the Ukiah Landfill and is presented in the JTD Final Closure Plan (EBA, 2008). A summary of the static stability and seismic response of the final landfill waste mass configuration presented in the JTD is as follows:

- A seismic hazards analysis concluded that the design earthquake is a Maximum Credible Earthquake (MCE) with an estimated magnitude 7.1Mw occurring on the Maacama Fault, resulting in an average peak bedrock acceleration of 0.66g derived from multiple attenuation relationships.

- Slope stability of the entire waste mass was modeled by evaluating failure mechanisms passing through refuse and the base of the landfill and indicate a static factor of safety greater than 1.7 for failure through the base of the landfill.

- Pseudo-static analyses performed to determine the yield acceleration (Ky) and evaluate the stability of the waste mass under seismic conditions was also performed. The yield acceleration calculated for the entire waste mass was 0.13g.

- Seismic displacement analyses using the program YSLIP_PM (Matasovic, 1997) indicate that permanent seismically induced displacements will be less than 8 inches for failure through the base of the landfill.

FINAL COVER SYSTEM SLOPE STABILITY

The shear strength of the various interfaces present in the proposed alternative final cover system were evaluated and the resulting static and psuedo-static slope stability analyzed. The design characteristics of the current proposed alternative final cover system includes the following components (in descending order):

- An engineered synthetic turf cover with sand infill ballast.

- A linear low-density polyethylene structured geomembrane liner

- A landfill gas pressure relief layer consisting of strip drains, pressure relief values, and associated collection piping components; and

- A 12-inch-thick (minimum) foundation layer moisture conditioned and compacted to 90 percent relative compaction.

Shear Strength Properties

Geosynthetic material interfaces, whether between two geosynthetic materials or between a geosynthetic and native or compacted soil material are typically the weakest interfaces in a final cover system, causing block-type or wedge failures to occur. Table 1 presents the shear strength properties use in the slope stability analysis

Table 1
Slope Stability Properties and Stability Results

INTERFACE[1]	FRICTION ANGLE (Φ°)	COHESION/ADHESION (PSF)	STATIC (FS)[4,5]	PSEUDO-STATIC (FS)[4,5]	SEISMIC PERMANENT DISPLACEMENT (Inch)
Foundation Soil/LLDPE	32°[2]/28°[3]	3[2]/3[3]	2.8[3]	1.0[3]	<1
Internal shear strength[(6)]	35°[3]	3°[3]	3.3[3]	1.2[3]	<1

(1) LLDPE= linear low-density polyethylene geomembrane;
(2) Peak shear strength
(3) Post-peak shear strength (large displacement)
(4) Factor of Safety
(5) For maximum sideslope of 2:1 (26.5°)
(6) Interface of combined geosynthetic components (LLDPE/turf/sand ballast)

Stability Analysis

Slope stability of the proposed final cover system was modeled using the infinite slope method. This method provides a conservative approach to the evaluation of the stability of shallow failures of constant thickness along a defined interface. This method assumes the failure block is infinitely long and neglects resisting forces at the toe and along the sides. Analyses were performed for a LLDPE geomembrane/artificial turf with sand infill ballast cover system using a critical slope angle of 26.5 degrees (2H:1V).

The stability analysis was performed using a spreadsheet based on the principles and equations of the infinite slope stability analysis. Results of the infinite slope stability analysis indicate a minimum static factor of safety of 2.8 for failure at the LLDPE/subgrade interface and a minimum static factor of safety of 3.3 for failure above the LLDPE geomembrane (see Table 1). Spreadsheet files and equations used in the analysis are appended to this technical memorandum.

A pseudo-static analysis was performed to determine the yield acceleration (K_y) for the cover. The yield acceleration was determined using a trial and error procedure in which the seismic coefficient was varied until a factor of safety of 1.0 was obtained. The lowest yield acceleration calculated for the LLDPE geomembrane/artificial turf cover system was 0.70g. Because the maximum horizontal acceleration of 0.66g predicted by the site response analysis does not exceed the calculated yield acceleration, permanent seismic displacements of the LLDPE

geomembrane/artificial turf cover system are highly unlikely. The stability of slopes subject to seismic loading conditions can be further evaluated in terms of permanent displacements (deformations) that are expected to occur. The Newmark Method (1965) is commonly used to evaluate slopes under seismic loading conditions. The method evaluates the stability of slopes in terms of permanent deformations that result when seismically induced ground accelerations exceed the yield acceleration of the slope mass. The total amount of slope deformation is estimated by summing only the down-slope displacements that occur during each brief period of time when the yield acceleration of the slope mass is exceeded. As stated above, a pseudo-static analysis of the site determined that the yield acceleration is not exceeded by seismically induced strong ground motions, therefore no permanent displacements of the final cover system are predicted by the Newmark Method.

CONCLUSIONS

Results of the slope stability analysis using the infinite slope method indicate a minimum factor of safety of 2.8 for failure of the cover system utilizing a LLDPE geomembrane/artificial turf engineered alternative cover system constructed on maximum 2H:1V slopes under static conditions. These results suggest that the final landfill configuration will be stable throughout the postclosure maintenance period following closure in accordance with the Final Closure Plan Drawings and Technical Specifications.

The yield acceleration calculated for failure of the cover system is greater than the PGA predicted by the site response analysis, indicating that permanent seismic displacements of the LLDPE geomembrane/artificial turf cap are highly unlikely.

Facility Operator:	City of Ukiah, Department of Public Works
Site Owner:	City of Ukiah, Department of Public Works
Site Location (CA coordinates, township & range or longitude/latitude, preferred)	SE 1/4, Section 10 Township 15 North, Range 12 West
Assessors Parcel Number:	178-130-010
Site Address :	3100 Vichy Springs Road Ukiah, CA

FINAL CLOSURE COSTS

1. Final Closure Costs			
a. Miscellaneous - Mobilization, Removal, Adjustment, Demolition	$	129,680	See Cost Estimate Worksheet - Item 1-13
b. Final Cover	$	6,752,703	See Cost Estimate Worksheet - Items 14-19, 33-39, 41
c. Drainage Facilities	$	552,908	See Cost Estimate Worksheet - Items 21-32
d. Access Roads	$	172,575	See Cost Estimate Worksheet - Item 20
e. Landfill Gas Extraction System	$	599,535	See Cost Estimate Worksheet - Items 42-68
f. Landfill Leachate Collection System Modifications	$	52,965	See Cost Estimate Worksheet - Items 69-73
g. Revegetation	$	27,000	See Cost Estimate Worksheet - Item 40
Contractor Bid Subtotal	$	8,287,366	
2. Design Support Engineering	$	15,000	
3. Construction Quality Assurance for Closure Construction	$	317,040	See Cost Estimation Backup
4. Landfill Structure Removal	$	-	Included in Above
5. Groundwater Monitoring Installations	$	-	None
6. Security	$	-	Included in Above
Final Closure Subtotal	$	8,619,406	
Final Closure Subtotal 20% Contingency	$	1,723,881	
TOTAL FINAL CLOSURE	$	10,343,287

FINAL POSTCLOSURE MAINTENANCE COST ESTIMATE WORKSHEET
CITY OF UKIAH LANDFILL

PROJECT DESCRIPTION

The information presented herein provides an itemized breakdown of costs to implement postclosure maintenance activit for the City of Ukiah Landfill during the 30-year postclosure maintenance period.

PREPAREAD BY: EBA ENGINEERING

GENERAL SITE INFORMATION

Name of Solid Waste Landfill: City of Ukiah Landfill

Solid Waste Facilities Permit Number: 23-AA-0019

Facility Operator: City of Ukiah, Department of Public Works

Site Owner: City of Ukiah, Department of Public Works

Site Location (CA coordinates, township & range or longitude/latitude, preferred): SE 1/4, Section 10
Township 15 North, Range 12 West

Assessors Parcel Number: 178-130-010

Site Address: 3100 Vichy Springs Road
Ukiah, CA

FINAL POSTCLOSURE MAINTENANCE COSTS

1. Revegetation		
a. Regrading	$	1,185
b. Erosion Control	$	-
c. Reseeding	$	-
2. Leachate Management		
a. Leachate System Maintenance	$	2,600
b. Leachate/Condensate Disposal	$	690
c. Leachate Monitoring and Reporting	$	2,193
d. Leachate 5-year Constituents of Concern Testing (normalized to cost per year)	$	354
3. Environmental Monitoring		
a. LFG Collection System Operation, Monitoring and Maintenance	$	29,707
b. Annual Source Testing of Flare	$	3,860
c. AB32 Surface Emissions Monitoring and Reporting	$	11,632
d. Perimeter LFG Monitoring and Reporting	$	4,931
e. Perimeter Monitoring Probe Replacement (normalized to cost per year)	$	3,717
f. Perimeter Monitoring Probe Maintenance	$	299
g. Groundwater Monitoring and Reporting	$	41,998
h. Groundwater 5-year Constituents of Concern Testing (normalized to cost per year)	$	3,104

3. Environmental Monitoring *(continued)*		
i. Monitoring Well Replacement (normalized to cost per year)	$	5,724
j. Monitoring Well Maintenance	$	515
k. Surface Water Monitoring and Reporting	$	2,432
l. Surface Water 5-year Constituents of Concern Testing (normalized to cost per year)	$	365
4. Drainage Maintenance	$	2,720
5. Security	$	1,226
6. Inspection	$	3,152
7. Other		
a. 5-year Iso-Settlement Analysis (normalized to cost per year)	$	1,667
Final Postclosure Maintenance Subtotal	$	124,072
Subtotal x 30 years Postclosure Care	**$**	**3,722,158**

CITY OF UKIAH LANDFILL
MENDOCINO COUNTY, CALIFORNIA

FINAL POSTCLOSURE MAINTENANCE PLAN
27CCR, §21769(c)(2) and §21830

INTRODUCTION

The contents of this Final Postclosure Maintenance Plan (FPMP) for the City of Ukiah Landfill (Landfill) have been developed to comply with the requirements and applicable subsections set forth in 27CCR, §21180, §21190, §21769, and §21830. The following information describes the responsibilities and resources for carrying out postclosure maintenance upon closure. Specific inspection and maintenance activities are detailed in the subsequent sections.

Responsibilities

Maintenance responsibilities following landfill final closure will be assigned to the City of Ukiah Public Works Department (Public Works Department). The Public Works Department will be responsible for all inspection, maintenance and monitoring activities related to the Landfill such as:

- Final cover
- Drainage systems
- Final grading
- Landfill environmental control systems
- Emergency response

Resources

Current resources of the Public Works Department for inspection, maintenance and monitoring of the Landfill are as follows:

- *Technical Services Staff*:
  - Public Works Director/City Engineer (Registered Civil Engineer)
  - Deputy Director of Public Works (Registered Civil Engineer)
  - Engineering Technicians

- *Annual Maintenance Contracts*:
  - Gas control system

- *Annual Consultant Agreement for Environmental Monitoring and Consulting Services*:
  - Detection and corrective action monitoring systems
  - Gas monitoring system

EMERGENCY RESPONSE PLAN
27CCR, §21830(b)(1)

An Emergency Response Plan has been prepared for the Landfill in accordance with 27CCR, §21130 and is presented in Appendix C of this document. This plan identifies steps to be taken in the event of a failure or breakdown of the waste management unit (WMU) under potential contingency situations. Appropriate agency and business points of contact are also included in this plan.

INSPECTION RESPONSIBILITIES AND FREQUENCIES
27CCR, §21830(b)(2)

Routine and periodic inspection will be conducted by an Engineering Technician. At least twice a year and immediately after any special events such as major earthquakes, storms, and fires, a thorough and comprehensive inspection will be conducted by one of the two Registered Civil Engineers. Inspection frequency will be as shown in the following table:

TABLE 1
INSPECTION RESPONSIBILITIES AND FREQUENCIES

Activities	*Immediately*	*Monthly*	*Quarterly*	*Semi-Annually*
Special Events	RCE			
Security		ET(1)	ET(2, 3)	RCE
Final Cover		ET(1)	ET(2)	RCE
Final Grading		ET(1)	ET(2)	RCE
Drainage System		ET(1)	ET(2)	RCE
Leachate Control System		ET(1)	ET(2)	RCE
Detection and Corrective Action Monitoring System			C	
Gas Monitoring System			C	
Gas Control System		C		

RCE: Registered Civil Engineer
ET: Engineering Technician
C: Consultant

(1) During the wet season (October 1 through April 30)
(2) During the dry season (May 1 through September 30)
(3) Assumes consultant will check security monthly between quarterly inspections as part of gas control system monitoring.

PERSONS RESPONSIBLE FOR POSTCLOSURE MAINTENANCE
27CCR, §21830(b)(2)

The Landfill is wholly owned by the City of Ukiah (City) and operated and maintained by the Public Works Department. Personnel responsible for the postclosure maintenance of the landfill and their emergency phone numbers are as follows:

Name	Position	Emergency Phone Numbers
Rick Seanor	Deputy Director of Public Works	(707) 463-6296

The address for the person above is:

- City of Ukiah
  Public Works Department
  300 Seminary Avenue
  Ukiah, CA 95482

The listed number is for working hours. For off-hour emergencies, the City has an established notification procedure initiated by calling (707) 463-6281.

POSTCLOSURE LAND USE
27CCR, §21190 and §21830(b)(3)

The end use of the Landfill is a non-irrigated open space. The area will be returned to a natural setting with the exception that all necessary access roads, monitoring wells and drainage structures will remain.

CURRENT MONITORING AND CONTROL SYSTEMS
27CCR, §21830(b)(4)

Description of Systems

Current monitoring and control provisions at the Landfill include a leachate control system, a detection and corrective action monitoring system, a gas monitoring system, and a gas control system. Details of these respective systems are provided in the following subsections. A site plan showing the locations of the current monitoring and control systems is presented as Figure A-1 in Appendix A of this document.

Leachate Control System

The Landfill is unlined and is not equipped with an engineered or traditional blanket leachate collection and removal system (LCRS). Instead, leachate collection at the Landfill currently consists of a series of polyvinyl chloride (PVC) piping and French drain systems installed to collect leachate from seeps occurring along existing WMU slope faces. Leachate collected by these components is then conveyed by gravity flow to a primary buried pipeline located along the northern toe of the WMU. The buried pipeline, in turn, drains the leachate westward and ultimately discharges to the leachate management facilities located at the western toe of the WMU. A description of the leachate management facilities is as follows:

- Discharge from the primary buried pipeline is diverted to a subsurface concrete sedimentation chamber equipped with a valved sediment drain at its base. The clarified leachate within the chamber is then discharged (by gravity flow) to an adjacent pump station wet well (identified herein as the "leachate wet well") via a 10-inch diameter overflow line.

- Clarified leachate discharged to the leachate wet well is then pumped to a 63,500-gallon leachate aboveground storage tank (AST) for temporary storage. The leachate wet well is equipped with two (2) 25-gallon per minute (gpm), low-head, submersible pumps that are actuated by high/low water level controls. If the clarified leachate discharge rate exceeds the leachate wet well's pumping capacity (50 gpm), the excess leachate is currently diverted to an emergency leachate pond via a 10-inch diameter overflow line.

- As noted above, leachate from the leachate wet well is diverted to the leachate AST. The leachate AST is constructed of AWWA factory epoxy lined and coated bolted steel. As was the case for the leachate wet well, the AST is also equipped with a 10-inch diameter overflow line that diverts leachate to the emergency leachate pond in the case of an emergency.

- Leachate stored in the leachate AST is subsequently pumped to a sewer line connection located on Vichy Springs Road via a force main/gravity drain. The force main/gravity drain is constructed of 4-inch diameter PVC and is approximately 5,200 feet in length. The pump lift station for the leachate AST is equipped with two (2) 45-gpm pumps (one duty, one standby), thereby giving the system a total pumping capacity of 90 gpm.

Several upgrades to the leachate control system as described above will be implemented as part of the final closure construction project. These upgrades will include lining the existing leachate wet well and sedimentation chamber to provide a higher degree of containment. In addition, the emergency leachate pond will be backfilled and an underground storage tank (UST) system installed to provide new overflow protection provisions. Finally, the leachate wet well and leachate storage tank will be retrofitted with communication telemetry to enhance emergency capabilities.

Detection and Corrective Action Monitoring System

The current detection and corrective action monitoring system is designed to comply with the Landfill's existing Monitoring and Reporting Program (M&RP) per Waste Discharge Requirements Order No. R1-2002-0061. No changes to the monitoring system components are proposed as part of postclosure maintenance. Monitoring points associated with the current system can be summarized as follows:

- Leachate: The leachate wet well as described in the previous subsection is utilized as the leachate monitoring point. In addition, three leachate level monitoring wells (LW-1, LW-2 and LW-3) have been installed at the Landfill as part of a previous study. However, these leachate wells have not been used historically for monitoring as they are not identified in the existing M&RP.

  Groundwater: The groundwater monitoring system is comprised of 14 detection monitoring wells (87-1, 90-1, 90-2, 90-5, 90-6, 90-7, 90-8, 92-2, 92-3, 94-1, 94-2, 96-1, 96-2 and 96-3) and four corrective action monitoring wells (90-3, 90-4, 92-1 and 92-4). Seven of the aforementioned monitoring wells (87-1, 90-2, 90-3, 90-4, 90-5, 90-7 and 90-8) also serve as point of compliance wells.

- Surface Water: The surface water monitoring system consists of one upstream (S-1) and one downstream (S-2) monitoring point located along the ephemeral creek that flows along the northern margin of the WMU.

Table B-1 in Appendix B of this document provides a summary of the groundwater monitoring well construction characteristics. Please refer to the *January 2008 Joint Technical Document* (EBA Engineering [EBA], 2008) for copies of exploratory boring logs for the respective groundwater monitoring wells.

Gas Monitoring System

The gas monitoring system consists of ten gas monitoring points (GAS-1 through GAS-10) located at various locations along the Landfill property boundary. No changes to the monitoring system components are proposed as part of postclosure maintenance. Each of the gas monitoring points are equipped with one to four individual monitoring probes constructed of ¾-inch diameter PVC casing and capped with labcock valves. The monitoring probes range in depth from approximately 9 to 250 feet below ground surface (BGS). The number and depth of monitoring probes at each location are based on site lithology (i.e., permeable zones) and the maximum depth of refuse as measured within 1,000 feet of the monitoring point in question.

Table B-2 in Appendix B of this document provides a summary of the gas monitoring point construction characteristics. Please refer to the *January 2008 Joint Technical Document* (EBA, 2008) for copies of exploratory boring logs for the respective gas monitoring points.

Gas Control Systems

The Landfill is currently equipped with a partial perimeter gas collection system that was installed between the southwestern edge of the WMU and the property line in 1997 as a mitigation measure against subsurface gas migration. The system consists of 17 vertical extraction wells installed in native geologic materials and completed at depths ranging from 35 to 133 feet BGS. The wells are connected to a 6-inch diameter, high-density polyethylene (HDPE) header pipe that leads to a vacuum blower located at the western end of the WMU. The vacuum blower creates a vacuum in the header pipe that draws the gas from the soil through the extraction wells and subsequently to the blower. Discharge from the system is vented directly to the atmosphere via a 4-foot tall, 4-inch diameter stack. This system continues to operate on an intermittent basis. Please refer to Table B-3 in Appendix B of this document for individual gas extraction well construction characteristics.

A full-scale gas control system for the entire WMU is planned for installation as part of the final closure construction project. This system as currently proposed will consist of 18 extraction wells (EW-1 through EW-18), aboveground conveyance piping, and a flare station that will include a totally-enclosed vertical ground flare for combustion of the collected gas. Information pertaining to this system, including design criteria/rationale and details for the various system components, are presented in the *Design Plan for Landfill Gas Collection and Control System (Design Plan)* dated October 2013 (EBA, 2013). Technical Specifications and Construction Drawings for the system are also included as part of the Addendum No. 2 submittal.

It should be noted that once the full-scale gas control system is installed and operational, the need to operate the partial perimeter gas collection system may no longer be necessary. Under this scenario, the partial perimeter gas collection system will either abandoned or maintained for emergency use only.

Monitoring Tasks and Frequencies

The monitoring tasks and frequencies associated with the monitoring and control systems are in accordance with applicable regulations and corresponding facility/operating permits. Regulations and permits governing the respective monitoring/collection systems are summarized as follows:

- *Leachate Monitoring/Control:* Current WDR/M&RP
- *Groundwater Monitoring:* Current WDR/M&RP
- *Surface Water Monitoring:* Current WDR/M&RP
- *Gas Monitoring:* 27CCR, §20921
- *Gas Control:* Mendocino County Air Quality Management District (MCAQMD) – Permit to Operate

INSPECTION AND MAINTENANCE PROGRAM
27CCR, §21830(b)(5)

The following subsections provide a summary of the inspection and maintenance program that will be employed as part of postclosure maintenance. Specific features and components to be targeted by the program include the final cover, final grading, drainage system, leachate control system, detection and corrective action monitoring system, gas monitoring system, and security.

Final Cover

The final cover is designed to limit water infiltration, minimize leachate generation, prevent exposure of waste to people and animals, limit gas emissions, minimize odor, control fires and provide for a pleasant appearance. As such, the postclosure maintenance program will be instituted to ensure that the final cover continues to meet these objectives. The final cover areas will be visually inspected on a monthly or quarterly basis as previously outlined in Table 1 and evaluated for:

- Breaches in the liner system
- Odors
- Exposed refuse
- Slope failure
- Leachate seeps

Based on the nature of the final cover system and the absence of a vegetative soil layer, erosional damage does represent a potential concern at the Landfill. Thus, from an integrity perspective, a physical breach in the final cover's liner system would be the most probable cause prompting the need for final cover maintenance. In this regard, the detection of odors, exposed refuse and/or leachate seeps would be indicative of a potential breach. In the event a breach is identified, the damaged portion of the liner will be repaired as soon as practical depending upon contractor availability and liner material delivery, as well as weather. With that being said, every effort will be made to implement the repairs as soon as practical. In the interim, provisions will be employed to temporarily tarp and secure the area to prevent water infiltration into the refuse. All repairs to the liner will be to design conditions and in accordance with the Technical Specifications for the respective final cover components. Any underlying subgrade improvements will also be repaired in accordance with the foundation layer Technical Specifications.

Final Grading

Surface grading of a closed landfill, when properly designed and constructed, can be an economical method of controlling infiltration and promoting surface water run-off. The final grading configuration is designed to compensate for the effects of settlement, thereby preventing the need for difficult and costly maintenance and repair. Thus, the postclosure maintenance program will be implemented to ensure that the landfill final grades are maintained properly to ensure final cover integrity and effectiveness. The final cover areas

will be visually inspected on a monthly or quarterly basis as previously outlined in Table 1 and evaluated for:

- Visible depressions
- Ponded water
- Settlement and subsidence

Based on the steep slopes that exist throughout the WMU, any settlement that might occur that could potentially compromise drainage or induce ponding would likely be limited to bench areas. If such deficiencies are identified, provisions will be made to repair and restore the conditions as soon as practical, weather permitting. Repairs would entail the placement of suitable material (i.e., fine-grained soil, base rock with appreciable fines, etc.) within the limits of the deficient area to restore positive drainage conditions.

As an additional means of monitoring settlement and subsidence, the entire site will be aerially photographed every five years during the postclosure maintenance period and iso-settlement maps prepared to calculate any differential settlement. The iso-settlement maps will be generated with a maximum contour interval of 2 feet and a scale of 1 inch equal to 60 feet.

Drainage System

Drainage control problems can result in accelerated erosion of a particular area. In addition, differential settlement of drainage control structures can limit their usefulness and may result in failure to direct stormwater properly off of the site. Therefore, the postclosure maintenance program will be implemented to ensure that the integrity and effectiveness of the final drainage system are maintained throughout the postclosure maintenance period. The final drainage system will be inspected on a monthly or quarterly basis as previously outlined in Table 1 and evaluated for:

- Evidence of erosion
- Standing water
- Formation of gullies
- Settlement, blockage of and damage to drainage channels, structures, swales and culverts

Deficiencies, damage to and failure of the drainage system will be repaired and restored within two weeks, weather permitting, to design conditions and in accordance with construction specifications. Temporary repairs may be made until permanent repairs can be scheduled. Culverts and drainage basins will be cleaned of sediments before they are no longer able to function properly. Drainage inlet grates will be kept free of debris. Drainage channels will be maintained to permit free flow and sealed or repaired to maintain structural integrity of the system.

Leachate Control System

The leachate control system will be inspected on a monthly or quarterly basis as previously outlined in Table 1. In addition, preventive maintenance will be carried out on all components of the system at regular intervals to ensure proper operations. This consists of performing manufacturer's recommended maintenance on the pump system and monthly/quarterly (depending upon frequency shown in Table 1) inspection of the collection and storage system. This inspection includes assessing the condition of system components for possible leakage, failure, or damage, and adjusting individual pump controls or liquid levels for optimum performance. Any potential or existing failure points will be noted and repairs implemented promptly. The leachate collection lines will be flushed as needed to remove any sediment buildup in the piping system.

Detection and Corrective Action Monitoring System

The leachate wet well will be inspected on a monthly or quarterly basis in conjunction with the leachate control system inspection as described in the previous subsection. The surface water monitoring system, in turn, requires no maintenance since there is no dedicated equipment or features. Finally, in regards to groundwater, the monitoring wells will be inspected regularly in conjunction with the scheduled monitoring tasks (quarterly) for signs of failure or deterioration. If damage is discovered, the nature and extent of the problem will be recorded. A decision will be made to replace or repair the monitoring well. Possible repairs include redevelopment, chemical treatment, partial casing replacement or repair, resealing the annulus, pumping and testing. If a monitoring well needs to be replaced, it will be properly decommissioned. Damaged monitoring wells will be scheduled for repair or replacement within one (1) month after identifying the problem. As for general maintenance, the following provisions will be performed on a quarterly basis:

- Cut weeds in 2-foot radius around each well, as needed.
- Replace locking well caps, as needed.
- Lubricate enclosure locks and hinges, as needed.

As previously noted, three leachate level monitoring wells exist that have not been used historically for monitoring purposes. While these monitoring wells will be preserved as part of the final closure construction, it remains uncertain whether they will be incorporated into the site's future M&RP. In this regard, if damage is discovered during informal inspection of these monitoring wells, the nature and extent of the problem will be recorded and a decision will be made regarding their replacement, repair or abandonment.

Gas Monitoring System

The gas monitoring system will be inspected quarterly in conjunction with scheduled monitoring tasks. System components will be repaired and replaced as required to maintain full system capabilities as intended at initial installation. Quarterly maintenance provisions will include the following:

- Cut weeds in 2-foot radius around each point, as needed.

- Replace probe parts, as needed.
- Lubricate enclosure locks and hinges, as needed.

Site Security

Site security upon closure will conform with the requirements of 27CCR, §21135. Perimeter fencing will be maintained to exclude cattle from the site. Other security provisions will include:

- Lockable gate at the site entrance.

- Lockable utility boxes, or gates, or both, enclosing the environmental control systems.

- At least one sign posted in a visible location at the site access road indicating where the Final Closure Plan and FPMP are located. The sign will also include a telephone number for emergency notification and will remain throughout the postclosure maintenance period.

OPERATIONS AND MAINTENANCE PLAN FOR GAS CONTROL SYSTEM *27CCR, §21830(b)(6)*

Preventive maintenance for the existing partial perimeter gas collection system will be carried out on all mechanical equipment at manufacturer's recommended intervals. This includes cleaning, lubrication, and replacement of worn parts. The accessible portions of gas collection piping will be thoroughly inspected on a regular basis for detection of potential failure points and necessary repairs will be noted and implemented. System failures, such as pipe leaks or breaks that reduce gas collection efficiency and control effectiveness will be addressed to operating permit conditions. As previously noted, this system may become obsolete upon installation and operation of the full-scale gas control system. If that is the case, the maintenance provisions described above will be suspended accordingly.

The full-scale gas control system, including the totally-enclosed vertical ground flare, is currently under design and has yet to be formally approved by the MCAQMD. Thus, until the system is formally approved through the issuance of an Authority to Construct Permit, a formal Operations and Maintenance Plan for the system will be not be prepared. Upon its preparation, the Operations and Maintenance Plan will be submitted to the LEA, CalRecycle and MCAQMD under separate cover for incorporation into the FPMP.

REPORTING
27CCR, §21830(b)(7)

With the exception for the gas monitoring system (see below), the reporting requirements for the leachate control system, detection and corrective action monitoring system, and gas control system are permit specific. Under the current WDR/M&RP (Order No. R1-2002-0061), the leachate, groundwater, and surface monitoring and/or control data are reported to the RWQCB on a quarterly basis. However, a semi-annual reporting frequency is being requested as part of the new WDR to be issued for postclosure maintenance. As for gas control, documentation as to operation of the existing partial perimeter gas collection system is included as part of the perimeter gas monitoring reports prepared for 27CCR. As for the proposed full-scale gas control system, reporting will be dictated by the Permit to Operate to be issued by the MCAQMD. The reporting frequency recommended in the *Design Plan* (EBA, 2013) is annually.

In regards to the gas monitoring system, the scope and frequency of reporting is dictated by 27CCR, §20934, which requires quarterly report submittals within a time period specified by the Local Enforcement Agency (LEA) but no more than within 90 days of sampling. Each report shall include methane concentrations, documentation of sampling conditions (i.e., barometric pressure, atmospheric temperatures, general weather conditions, and probe pressures), instrumentation utilized, monitoring personnel, and a brief description of methods.

UPDATED POSTCLOSURE MAINTENANCE COST ESTIMATE
27CCR, §21830(b)(8)

An updated postclosure maintenance cost estimate is enclosed in Attachment 3 of this Addendum. In accordance with 27CCR, §21840(a)(2), the cost was calculated by multiplying the annual cost for maintenance and monitoring by 30 years (duration of postclosure maintenance period). As presented in Attachment 3, the updated postclosure maintenance cost in current dollars is $3,722,158.

APPENDIX C

EMERGENCY RESPONSE PLAN

Emergency Response Plan

City of Ukiah Landfill

Mendocino County, California

August 2015

Prepared For:

City of Ukiah
Public Works Department
Ukiah, California

Prepared By:

EBA ENGINEERING
825 Sonoma Avenue
Santa Rosa, California
EBA Job No. 02-907

1.0 INTRODUCTION

Division 2, Title 27, Article 2, Section 21130 of the California Code of Regulations (effective date: 7/18/98) requires the development of an Emergency Response Plan at landfill closure to address potential events that could impact the integrity of the landfill cover and related appurtenances resulting in the release of waste products. These regulations are included here for review.

27CCR, §21130

(a) the operator shall maintain a written postclosure Emergency Response Plan at the facility or at an alternate location as approved by the EA. The Emergency Response Plan must identify occurrences that may exceed the design of the site and endanger public health or the environment. The plan shall describe specific procedures that minimize these hazards to protect public health and safety. The events that the plan shall address include, but are not limited to: vandalism, fires, explosions, earthquakes, floods, the collapse or failure of artificial or natural dikes, levees or dams; surface drainage problems; and other waste releases.

(b) The Emergency Response Plan shall contain the following:

(1) identification of events which could require the implementation of emergency response actions: This section shall not apply to the gas monitoring provisions;

(2) a description of the actions to be taken, and the sequence and implementation timetable needed to mitigate the conditions;

(3) a statement regarding the general availability of equipment required to mitigate each type of emergency.

(c) The operator shall amend the Emergency Response Plan under the following conditions:

(1) whenever a failure or release occurs for which the plan did not provide an adequate response;

(2) when the postclosure land use and/or structures on the site change and these changes are not addressed in the existing plan; or

(3) if the EA notifies the operator in writing that the current Emergency Response Plan is inadequate under the provision of this section. The notifying agency shall include within the written notice the items that plan needs to consider for it to comply with this section. The operator shall submit an amended Emergency Response Plan to the EA within thirty (30) days of notification of an inadequacy.

(d) Whenever the operator amends the Emergency Response Plan pursuant to (c) (1 or 2), the operator shall submit a written copy of the amended plan to the EA.

2.0 SPECIFIC EVENTS AND RESPONSES

The following presents a summary of specific events requiring correction action at the City of Ukiah Landfill (Landfill) and actions to be taken to minimize the release of waste products.

Earthquake

Given the final closure configuration of the Landfill, a seismic event within the area should not result in slope failure or a release of waste products; however, such an event could impact the integrity of the final cover, drainage conveyance systems, or monitoring systems. The following is the sequence and schedule of actions to be taken in the event of an earthquake to minimize potential hazards.

- In event of an earthquake, the site will be inspected by a qualified engineer within 24-hours to evaluate the integrity of the landfill cover, ancillary facilities and the potential for hazardous conditions.
- Within 5 days, notify the Local Enforcement Agency (LEA), the Sheriff's Department, California Regional Water Quality Control Board – North Coast Region (RWQCB), and the California Department of Resources Recycling and Recovery (CalRecycle) of any failure.
- Contact with areas of damaged landfill cover or potentially hazardous areas/conditions will be limited.
- Areas of concern will be stabilized pending reconstruction activities.
- Reconstruction requirements and construction scheduling will be evaluated and prepared for submittal to the LEA, RWQCB, and CalRecycle within 7 days.
- Areas requiring repair will be reconstructed in accordance with the Construction Quality Assurance Plan to original design specifications and contours, or the Final Closure Plan will be amended/revised and approved by the LEA, CalRecycle, and RWQCB.
- The LEA, RWQCB and CalRecycle will be notified as to completion of construction activities.

Fires, Subsurface Fire, or Explosion

The potential for fire, subsurface fire, and/or explosion exists due the presence of landfill gas. In the event of a fire or explosion, mitigative actions, sequence of actions, and timetable to minimize potential hazards will include the following:

- Immediately make a determination of the severity of the fire or explosion.

- If the fire or explosion is deemed severe, the Sheriff's Department and the Fire Department will be immediately notified. Also notify CalRecyle, RWQCB, LEA and Mendocino County Air Quality Management District, and other authorities necessary to evaluate extent of damage.

- In the case of a surface fire or explosion, an area will be cordoned off from the incident and personnel will be retained on-site until the area has been declared safe.

- In the case of a subsurface fire that is not deemed severe, within 24 hours, turn off extraction wells in the adjoining area, then proceed with locating the source of the oxygen infiltration and repair the breach accordingly. If repair of breach will take longer than 48 hours, temporarily cover area of breach with soil to minimize further oxygen intrusion.

- If a subsurface fire is deemed severe:

  A. Secure the services of a consultant experienced in subsurface fires.

  B. Identify surface fractures, geologic features, or other cover features which may act as a conduit for oxygen infiltration.

  C. Determine the extent of subsurface fire through subsurface vapor and temperature monitoring.

  D. Cordon off area affected by fire.

  E. Evaluate the feasibility of extinguishing the fire by 1) remediation of conduits of air infiltration, 2) excavation of affected areas and extinguishing the fire using conventional means (water or foam vapor suppressant), 3) extinguishing the fire through CO2 injection, or 4) other methods identified by the consultant.

  F. Implement procedures to extinguish the fire.

- Repairs shall be made in accordance with the Construction Quality Assurance Plan.

- The LEA, RWQCB and CalRecycle will be notified as to completion of construction activities.

Surface Drainage Failures and Floods

In the event of a wash out due to a surface drainage failure or flood, mitigative actions, sequence of actions, and timetable to minimize potential hazards will include the following:

- Inspection and evaluation of any damage incurred to the landfill cover and determination of the potential for hazardous conditions.
- Areas identified as potentially hazardous will be cordoned off.
- The LEA, RWQCB, and CalRecycle will be notified of the failure.
- Reconstruction requirements and construction scheduling will be evaluated and prepared for submittal to the LEA, RWQCB, and CalRecycle within 7 days.
- Repairs will be made in accordance with the Construction Quality Assurance Plan.
- The LEA, RWQCB and CalRecycle will be notified as to completion of construction activities.

Vandalism

In the event that vandalism occurs that impacts the integrity of landfill closure facilities, mitigative actions, sequence of actions, and timetable to minimize potential hazards include the following:

- Inspection and evaluation of any damage incurred to the landfill cover and determination of the potential for hazardous conditions.
- Areas identified as potentially hazardous will be cordoned off.
- The LEA, RWQCB, and CalRecycle will be notified of the vandalism.
- Reconstruction requirements and construction scheduling will be evaluated and prepared for submittal to the LEA, RWQCB, and CalRecycle within 7 days.
- Repairs shall be made in accordance with the Construction Quality Assurance Plan.
- The LEA, RWQCB and CalRecycle will be notified as to completion of construction activities.

3.0 AVAILABLE EQUIPMENT

Standby equipment is available from the City of Ukiah Public Works Department on a priority basis.

GENERAL REQUIREMENTS

SECTION 01010
SUMMARY OF WORK

PART 1 GENERAL

1.01 SUMMARY

A. Project description.

B. Work by Contractor

C. Work by Owner.

D. Work by Others.

1.02 PROJECT DESCRIPTION

A. The Project is titled "City of Ukiah Landfill Final Closure Construction". The City of Ukiah Landfill is located in Mendocino County, California approximately two miles east of the City of Ukiah. The Work site address is 3100 Vichy Springs Road, Ukiah, California 95482 (Sheet 1). The City of Ukiah Landfill was operated as a Class III solid waste disposal facility and is comprised of a single waste management unit that is approximately 40 acres in size. The Final Closure generally consists of the following construction features:

Site Preparation:
- Refuse excavation and relocation.
- Interim cover preparation.

Closure Turf Final Cover System (in ascending order):
- 1-foot thick foundation layer.
- Gas relief/venting system.
- LLDPE geomembrane liner.
- Engineered synthetic turf with specific grade sand infill ballast.

Miscellaneous items:
- Drainage and erosion control measures.
- Sedimentation basin improvements.
- Access roads.
- General earthwork, including various excavations and fills.
- Leachate overflow collection and storage system, including installation of a leachate underground storage tanks (UST).
- Landfill gas (LFG) collection system, including condensate drainage components.
- Installation of flare and blowers provided by others.
- Borrow area reclamation.
- Seeding and fertilizing.
- Security fencing.

1.03 WORK BY CONTRACTOR

A. Unless noted otherwise, the Contractor shall perform, or subcontract to perform, all Work shown on the Plans in accordance with the Technical Specifications.

B. The geosynthetics installation subcontractor or Installer and the Installer's foreman must have experience in placing 1,000,000 square feet of geomembrane material on at least three (3) landfill projects and at least on project installing closure turf.

C. Except as specifically noted, the Contractor shall provide the following Work:
   1. All labor and materials.
   2. All tools, construction equipment, and machinery.
   3. Any water, heat, and utilities required.
   4. All other facilities and services necessary for proper execution and completion of the Work.

D. The Contractor shall pay legally required sales, consumer, and use taxes.

E. The Contractor shall secure and pay for, as necessary for proper execution and completion of the Work, all applicable permits and licenses.

F. The Contractor shall comply with the requirements of all permits.

G. The Contractor shall give all required notices.

H. The Contractor shall comply with all codes, ordinances, rules, regulations, orders, and other legal requirements of public authorities which bear on performance of the work.

I. The Contractor shall within five (5) calendar days, submit written notice to the Design Engineer of observed variance of Contract Documents from legal requirements.

J. The Contractor shall give written notice to the Design Engineer of any conditions encountered at the Work site which are unforeseen, concealed, or materially different from those set forth in the Plans or Technical Specifications, or ordinarily encountered and generally recognized as inherent in the Work. Such written notice shall be given to the Design Engineer within five (5) calendar days of the discovery of any such facts.

K. If any Subcontractor or person employed by the Contractor appears to the Design Engineer to be incompetent or to act in a disorderly or improper manner, he or she shall be discharged immediately at the request of the Design Engineer, and such person shall not again be employed on the Work. This provision does not impose an obligation upon the Design Engineer to ensure proper or orderly behavior on the part of the Contractor's employees or the employees of the Contractor's subcontractors, nor shall the Engineer's failure to make such a request relieve the Contractor of the obligation to require employees and subcontractor employees to refrain from engaging in disorderly or improper conduct.

1.04 WORK BY OWNER

A. All portions of the Work specified to be performed by the "Owner" refers to the responsibilities of the City of Ukiah, Department of Public Works and are not the responsibility of the Contractor.

B. The Owner will award a contract to the Contractor for construction of the project, administer the contract, measure quantities for progress payments and final payment, and manage the contract. Performance of the Work will commence as indicated in the Bid Documents.

1.05 WORK BY OTHERS

A. All portions of the Work specified to be performed by the "Design Engineer", "CQA Officer", "CQA Monitor", "CQA Surveyor", "Soils Testing Laboratory" or "Geosynthetics Testing Laboratory" refer to the responsibilities of EBA Engineering (EBA, or subcontractors to EBA) which have contracted separately and directly with the Owner and are not the responsibility of the Contractor.

END OF SECTION

SECTION 01039
PROJECT MEETINGS

PART 1 GENERAL

1.01 SUMMARY

A. Preconstruction meeting.

B. Progress meetings.

C. Preparatory meetings.

1.02 PRECONSTRUCTION MEETING

A. The Design Engineer will schedule the preconstruction meeting after awarding the Contract to the Contractor. The objectives of this meeting are to:
   1. Clearly define the roles, responsibility, and authority of each organization and individual involved in the project.
   2. Review details of the Construction Quality Assurance (CQA) program.
   3. Establish a foundation of cooperation to achieve quality construction.

B. The following agenda, as related to CQA, will be addressed by the Design Engineer or CQA Officer.
   1. Introduce and discuss role, authority, and responsibilities of each organization and individual involved in the project.
   2. Establish lines of communication.
   3. Review Technical Specifications and Plans.
   4. Distribute of the CQA Plan.
   5. Review of CQA activities to be performed.
   6. Discuss Contractor's construction schedule and workplan.
   7. Discuss Contractor's Construction Quality Control (CQC) procedures and responsibilities.
   8. Discuss submittal review and approval procedures.
   9. Discuss non-conformance and corrective action procedures.
   10. Discuss construction restrictions due to weather conditions.
   11. Discuss and schedule weekly progress meetings.
   12. Discuss health and safety issues.

C. Meeting minutes and items for resolution will be recorded by the Design Engineer and distributed to all parties in attendance.

D. The following representatives from each organization are required to attend the preconstruction meeting.
   1. Owner's Project Manager or representative.
   2. Contractor's Project Manager and on-site Superintendent.
   3. Installer's Project Manager and on-site Superintendent.
   4. Design Engineer's Project Manager and CQA Officer.

E. The Contractor's attendance at the preconstruction meeting is not a payable item. Any costs incurred by the Contractor for attendance at the preconstruction meeting should be included in the Contract Lump Sum Price for "Mobilization".

1.03 PROGRESS MEETINGS

A. In coordination with the Engineer, the CQA Officer will schedule and administer weekly progress meetings. The objectives of these meetings are to: 1) maintain lines of communication; 2) review procedures and results of the CQA program; and 3) maintain and improve the established foundation of cooperation to achieve quality construction. The following agenda will be addressed by the CQA Officer.

1. Review minutes of previous progress meeting.
2. Review work progress.
3. Review and update construction schedule and obtain a schedule from the Contractor, listing the construction activities for the following two (2) weeks.
4. Discuss CQA and CQC related field observations, testing results, problems, decisions, and conflicts.
5. Review and update Submittal Log.
6. Review status of pending Change Orders.

B. Meeting minutes and items for resolution will be recorded by the CQA Officer and distributed to all parties in attendance.

C. The following representatives from each organization are required to attend the weekly progress meetings.

1. Owner's Project Manager or representative.
2. Contractor's on-site Superintendent.
3. Installer's on-site Superintendent (during geosynthetics installation).
4. Design Engineer's Project Manager and CQA Officer.
5. Representative of major subcontractors performing work during the week of the weekly progress meeting

D. The Contractor's attendance at the progress meetings is not a payable item. Any costs incurred by the Contractor for attendance at the progress meetings should be included in the Contract Lump Sum Price for "Mobilization".

1.04 PREPARATORY MEETINGS

A. In coordination with the Design Engineer, the CQA Officer will schedule and administer, as needed, informal preparatory meetings prior to construction of the following items.

1. Refuse excavation and interim cover preparation.
2. Foundation layer placement.
3. GRL placement.
4. LLDPE Geomembrane and Engineered Turf installation.
6. General earthwork, drainage and erosion control, and access road construction, as needed.
7. Sedimentation basin improvements.
8. Leachate overflow collection and storage system installation.
9. LFG collection system installation.
10. Borrow area reclamation and Seeding and fertilizing.

B. The objective of the preparatory meetings is to establish a complete understanding of the upcoming unit of construction and CQA procedures and testing that will be implemented during construction. To achieve this objective, the following agenda will be addressed by the CQA Officer.
   1. Review "Products" section of the applicable Technical Specifications.
   2. Review "Execution" section of the applicable Technical Specifications.
   3. Discuss any construction and grade control staking needed to complete the Work.
   4. Discuss CQA testing, observation, and surveying to be performed.
   5. Verify that all submittals have been or will be received and approved by the CQA Officer in accordance with the schedule.
   6. Discuss Contractor's CQC responsibilities.
   7. Discuss Contractor's coordination, scheduling, and sequencing of the Work.
   8. Discuss Contractor's proposed equipment and manpower.

C. Meeting minutes and items for resolution will be recorded by the CQA Officer and distributed to all parties in attendance.

D. The following representatives from each organization are required to attend the preparatory meetings.
   1. Design Engineer's Project Manager or representative.
   2. Contractor's on-site Superintendent.
   3. On-site Superintendent of any Subcontractor, as applicable to the unit of construction.
   4. CQA Officer.
   5. CQA Monitor(s), as applicable to the unit of construction.

E. The Contractor's attendance at the preparatory meetings is not a payable item. Any costs incurred by the Contractor for attendance at the preparatory meetings should be distributed and included in the Contract Unit Price for the item for which the meeting is held.

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION (NOT USED)

END OF SECTION

SECTION 01060
SURVEYING AND FIELD ENGINEERING

PART 1 GENERAL

1.01 SUMMARY

A. Surveying and field engineering. All survey and layout for all improvements are to be provided by the Contractor.

B. Quality assurance.

C. Submittals.

D. Project record documents.

E. Examination.

F. Survey reference points.

G. Survey requirements.

H. Surveying accuracy and tolerances in setting of survey stakes.

I. Surveys for record drawings.

J. Payment.

1.02 RELATED SECTIONS

A. Information Available to Bidders: Topographic survey.

B. Section 01720 - Record Documents.

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION

3.01 DESCRIPTION

A. Reference points: Reference points to be provided by Design Engineer pursuant to the General Conditions will include referenced monuments and elevation benchmarks in the vicinity of the Project. If displaced by Contractor, replacement of these reference points will be at the expense of Contractor.

B. Contractor will furnish all necessary detail surveys including all lines, grades, and elevation appropriate to control construction. At a minimum, construction surveys are required for top of foundation layer.

C. Use by Design Engineer: Design Engineer may at any time use line and grade points and markers established by Contractor. Contractor's surveys are a part of the Work and may be checked by Engineer at any time. Contractor is responsible for any lines, grades, or measurements which do not comply with specified or proper tolerances, or which are otherwise defective, and for any resultant defects in the Work. Contractor will be required to conduct re-surveys or check surveys to correct errors indicated by review of the field notebooks or otherwise detected.

3.02 QUALITY ASSURANCE

A. Employ a Land Surveyor or eligible Engineer registered in the State of California and acceptable to the Design Engineer to perform survey work of this Section.

B. Submit evidence of Land Surveyor's or eligible Engineer's Errors and Omissions insurance coverage in the form of an Insurance Certificate.

C. Provide instruments and other survey equipment that are accurate, suitable for the surveys required in accordance with recognized professional standards, and in proper condition and adjustment at all times. Perform surveys under the direct supervision of a licensed Land Surveyor or eligible Engineer.

D. Record surveys in field notebooks.

3.03 SUBMITTALS FOR REVIEW

A. Submit name, address, and telephone number of Land Surveyor or eligible Engineer before starting survey work.

B. On request, submit documentation verifying accuracy of survey work.

C. Submit a certificate signed by the Land Surveyor or eligible Engineer, that the elevations and locations of the Work are in conformance with Contract Documents.

3.04 RECORD DOCUMENTS

A. Maintain a complete and accurate log of control and survey work as it progresses.

B. Submit record documents under provisions of Section 01720.

3.05 EXAMINATION

A. Verify locations of survey control points prior to starting work.

B. Promptly notify Design Engineer of any discrepancies discovered.

3.06 SURVEY REFERENCE POINTS

A. Contractor to locate and protect survey control and reference points.

B. Control datum for survey is that indicated on the Plans.

C. Protect survey control points prior to starting site work; preserve permanent reference points during construction.

D. Promptly report to Design Engineer the loss or destruction of any reference point or relocation required because of changes in grades or other reasons.

E. Replace dislocated survey control points based on original survey control. Make no changes without prior written notice to Owner.

3.07 SURVEY REQUIREMENTS

A. Provide field engineering services for all proposed improvements. Utilize recognized engineering survey practices.

B. Establish a minimum of two (2) permanent bench marks on site, referenced to established control points. Record locations, with horizontal and vertical data, on record documents.

C. Establish elevations, lines and levels. Locate and lay out by instrumentation and similar appropriate means:
   1. Site improvements including: stakes for grading, fill, slopes, and all site improvements.

D. Periodically verify layouts by same means.

E. Contractor's layout work will include the following:
   1. Slope staking for top of erosion-resistant layer at 50-foot grid and grade breaks.
   2. All as-built surveys as specified here in.
   3. Surveys to measure completed units of Work specified here in.

F. Contractor must perform all additional slope staking, off-setting and other control staking necessary to perform the Work.

3.08 SURVEYING ACCURACY AND TOLERANCES IN SETTING OF SURVEY STAKES

A. Perform control traverse field surveys and computations to an accuracy of at least 1:10,000.

B. The tolerances applicable in setting survey stakes are as set forth below. Such tolerances cannot supersede stricter tolerances required by the Plans or Technical Specifications, and cannot otherwise relieve the Contractor of responsibility for measurements in compliance therewith.

Type of Mark	Horizontal Position	Elevation
Permanent reference points	1 in 10,000	±.01 ft
General excavation and earthwork	1 in 2,000	±.10 ft

C. Tolerances for the thickness of earthen layers shown on Plans and for elevations shown on the Plans are ±0.10 foot unless otherwise specified.

3.09 SURVEYS FOR RECORD DRAWINGS

A. Provide the Design Engineer with as-built record drawings (field surveyed) for items that were revised during construction and differ from the Plans including the following items:
1. Topography that depicts the top of the foundation layer.
2. Topography of ditches.
3. Locations of catch basins.
4. Alignment, ends, and invert elevations of pipes and culverts.
5. Topography of storm water retention basins and borrow area.
6. Locations of LFG collection system components, including collection system piping, LFG extraction wells, above ground condensate drain lines, condensate discharge points, flare station concrete pads, and flare station security fencing.
7. Location of leachate UST manway.

B. The Design Engineer may perform independent checks.

C. Provide record documents on 24" x 36" size drawings, and on a computer disk in AutoCAD. Use the coordinate system shown on the drawings.

PART 4 MEASUREMENT AND PAYMENT

4.01 PAYMENT

A. Payment for providing all surveying and field engineering is included in the Contract Unit Price paid for the various items of Work for which they are required. No separate or additional payment will be made therefore.

END OF SECTION

SECTION 01300
SUBMITTALS

PART 1 GENERAL

1.01 SECTION SUMMARY

A. Submittal Control Log.

B. Submittal review and approval procedures.

1.02 SUBMITTAL CONTROL LOG

A. All submittals required by the Technical Specifications are included in individual sections. A Submittal Control Log will be maintained by the CQA Officer in coordination with the Contractor during construction. The Submittal Control Log documents: 1) submittal number; 2) referenced specification section; 3) submittal description; 4) submitter; 5) date received; 6) reviewer; 7) action taken determination; and 8) return date.

1.03 SUBMITTALS - GENERAL REQUIREMENTS

A. The Contractor shall submit to the Engineer all submittals required by the Contract Documents and as required herein, or subsequently required by modifications. All such items required to be submitted for review shall be furnished by and at the expense of the Contractor, and any work affected by them shall not proceed without such review. Submittals and their contents shall be properly prepared, identified, and transmitted as provided herein or as the Engineer may otherwise direct. Except for record documents, and instructional manuals for operation and maintenance, each submittal shall be approved before the material or equipment covered by the submittal is delivered to the site.

B. Unless otherwise specified, three (3) sets of printed submittals shall be submitted.

C. Contractor shall allow a total period of not less than two (2) calendar weeks for review and approval of submittals by the Engineer, not including the time necessary for delivery or mailing, and shall cause no delay in the Work. Extension of the Contract Time will not be granted because of the Contractor's failure to make timely and correctly prepared and presented submittals with allowance for the checking and review periods.

D. At the time of the submission, the Contractor shall give notice, in writing, in the submittal, of any deviation from the requirements of the Contract Documents. The deviations shall be clearly indicated or described. The Contractor shall state in writing, all variation in costs occasioned by the deviations, and his assumption of the cost of all related changes if the deviation is approved.

E. The Contractor shall deliver submittals by means of dated, signed, and sequence numbered transmittals on the Engineer provided forms, identifying as to initial or resubmittal status, and fully describing the submittal contents. In each transmittal, the Contractor shall state the Project Number and Name, Name and Address of Contractor, Name and Address of Sub-Contractor, Manufacturer, Distributor, and specification Section (as applicable), Articles, and

paragraphs to which the submittal pertains; accompanying data sheets, catalogs, and brochures shall be identified in the same manner. Where several types or models are contained in the literature, the Contractor shall delete non-applicable portions, or specifically indicate which portions are intended and applicable. Submittal transmittals shall fully index all items submitted.

1. Incomplete Submittals, including those not correctly transmitted, not correctly titled and identified, or not bearing the Contractor's review and approval stamp, will be returned to the Contractor without review.
2. Interrelated Submittals: Except where the preparation of a submittal is dependent upon the approval of a prior submittal, all submittals pertaining to the Work, shall be submitted simultaneously.

F. Every submittal of shop drawings, samples, materials lists, equipment data, instruction manuals, and other submittals upon which the proper execution of the Work is dependent, shall bear the Contractor's review and approval stamp certifying that the Contractor: 1) has reviewed, checked and approved the submittal and has coordinated the contents with the requirements of the Contract Documents, 2) has determined and verified all quantities, field measurements, field construction criteria, materials, equipment, catalog numbers, and similar data, or will do so, and 3) states the Work covered by the submittal is recommended by the Contractor and the Contractor's guarantee will fully apply thereto. Contractor's stamp shall be dated and signed by the Contractor in every case.

G. Submittals will be reviewed only for conformance with the design concept of the Project and with the information given in the Contract Documents. The approval of a separate item, as such, will not indicate approval of the assembly in which the item functions, nor shall approval be construed as revising, in any way, the requirements for a fully integrated and operable system, as specified. The approval of submittals shall not relieve the Contractor of responsibility for any deviation from the requirements of the Contract Documents, or for any revision in resubmittals, unless the Contractor has given notice, in writing, of the deviation or revision at the time of submission or resubmission, and written approval has been given to the specific deviation or revision, nor shall any approval relieve the Contractor of responsibility for errors or omissions in the submittals, or for the accuracy of dimensions and quantities, the adequacy of connections, and the proper and acceptable fitting, execution, and completion of the Work.

H. The Contractor shall make all required corrections and shall resubmit the required number of corrected submittals until approved by the Engineer. The Contractor shall direct specific attention, in writing, to revisions other than the corrections called for on previous submittals, and shall state, in writing, all variations in costs, and his assumption of the cost of related changes. Identify each resubmittal with number of the original submittal, followed by consecutive letters starting with "A" for first resubmittal, "B" for second resubmittal, etc. Note that in addition to any applicable liquidated damages, the Owner reserves the right to deduct monies from the amounts due to Contractor to cover the cost of Engineer's review time beyond the second submission.

I. The Contractor shall check submittals returned to him for correction and ascertain if the corrections result in extra cost to him above that included under the Contract Documents, and shall give written notice to the Engineer within five (5) days, if in his opinion, such extra cost results from corrections. By failing to notify the Engineer or by starting any Work covered by a submittal, the Contractor waives all claims for extra costs resulting from required

corrections.

J. No Work represented by required submittals shall be purchased, or paid for, or commenced until the applicable submittal has been approved. Work shall conform to the approved submittals and all other requirements of the Contract Documents, unless subsequently revised by an appropriate modification, in which case, the Contractor shall prepare and submit revised submittals as may be required. The Contractor shall not proceed with any related Work which may be affected by the Work covered under submittals until the applicable submittals have been approved.

K. Piecemeal submittals will be returned unreviewed. However, for mechanical equipment and the like, separate submittals for embedded items, embedded metal work and anchors, will be reviewed, as applicable.

1.04 OTHER SUBMITTALS.

A. Provide no less than two (2) copies of other submittals such as calculations, manufacturer's certified reports, operational demonstration and system validation reports specified elsewhere in the Contract Documents, one (1) of which will be retained by the Engineer and the rest of which will be returned to the Contractor marked to show the required corrections.

1.05 FORM OF APPROVAL.

A. Copies of submittals which are returned to the Contractor and which are subject to approval will be marked with notations (1), (2), (3) or (4), and may also be marked with notation (6), in which case the action so indicated shall be taken by the Contractor.
   1. No Exceptions Taken.
   2. Furnish as Corrected
   3. Revise and Resubmit.
   4. Not reviewed.
   5. Rejected.

B. Returned copies of drawings marked with either notation (1), or (2) authorize Contractor to proceed with the fabrication, or construction, or any combination thereof, covered by such returned drawings, provided, that such fabrication, or construction shall be subject to the comments, if any, shown on such returned copies.

C. Returned copies of drawings marked with notation (3), (4) or (5) shall be corrected as necessary and a revised submittal shall be submitted in the same manner as before.

D. Returned copies of drawings marked with either notation (3), (4) or (5) shall be resubmitted not later than seven (7) days after date of transmittal by Engineer.

E. The Submittal Control Log will be reviewed and updated in coordination with the Contractor at the weekly progress meetings.

END OF SECTION

SECTION 01500
MOBILIZATION

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall provide all services associated with the mobilization and demobilization of personnel, equipment, supplies, and incidentals to the Work site in accordance with this Section.

B. The Contractor shall supply and implement all construction facilities and temporary controls in accordance with this Section and as shown on the Plans.

1.02 REFERENCES

A. *Caltrans Standard Specifications.* California Department of Transportation, 2010.

B. *Standard Plans Book.* California Department of Transportation, 2010.

1.03 SUBMITTALS

A. At least 14 calendar days prior to mobilizing to the Work site, the Contractor shall submit a Dust Control Plan for approval by the Design Engineer prior to commencement of the Work. The plan shall comply with the requirements of the Mendocino County Air Quality Management District and shall identify procedures to minimize dust related impacts with the intent of eliminating dust nuisance complaints from adjacent areas or regulatory agencies.

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION

3.01 MOBILIZATION

A. The Contractor shall perform preparatory work and operations, including, but not limited to, those necessary for the movement of personnel, equipment, supplies, and incidentals to the Work site; for the establishment of all offices, buildings, and other facilities necessary for execution of the Work; and for all other work and operations which must be performed or costs incurred prior to beginning the Work in accordance with Section 11 of the Standard Specifications.

B. The Contractor shall give written notice to the Design Engineer at least 48 hours prior to transporting oversize and/or overload equipment to the Work site.

3.02 DEMOBILIZATION

A. The Contractor shall perform any work and operations, including, but not limited to, those necessary for the removal of personnel, equipment, supplies, temporary utilities (underground

and above ground), construction facilities, excess, surplus, waste materials and incidentals from the Work site prior to application for final payment.

B. The Contractor shall clean and repair damage caused by installation or use of construction facilities or temporary controls.

3.03 CONSTRUCTION FACILITIES

A. General
1. Unless noted otherwise within these Technical Specifications or allowed through specific agreement with the Design Engineer, the Contractor shall provide and pay for all labor, materials, tools, equipment, machinery, necessary permits, water, heat, utilities, and any other facilities or services necessary to complete the Work in accordance with these Technical Specifications and as shown on the Plans.
2. Provision of all construction facilities shall be coordinated with the Design Engineer.

B. Access Roads
1. The Contractor may construct and maintain any haul road necessary to execute the Work or use existing haul and access roads at the Work site.
2. The Contractor shall repair any existing roads damaged by the Contractor during construction, as directed by the Design Engineer.

C. Staging Area
1. The Contractor shall utilize a staging area for equipment and materials storage, and personnel parking. The location of the staging area shall be determined in coordination with the Design Engineer.

D. Temporary Buildings
1. The Contractor may provide and maintain a weather-tight temporary office trailer, for the use of the Contractor and any Subcontractors, equipped as desired by the Contractor.
2. The Contractor shall provide a weather-tight temporary office trailer, for the use of the Owner and CQA representatives, equipped with a table, desk, and chairs. The Contractor shall locate the trailer at a location approved by the Design Engineer.
3. The Contractor's office trailer shall be located adjacent to the CQA office trailer as determined by the Design Engineer.
4. The Contractor shall install a security fence around their office trailer and the CQA Office, as directed by the Design Engineer. The fences shall be chain link, a minimum 6 feet in height with three strands of barbed wire and a minimum 12-foot-wide gate.

E. Temporary Utilities
1. Electricity
   a. The Contractor shall provide and pay to connect to electrical power required for construction facilities and execution of the Work including, but not limited to, a temporary electric feeder from electrical service, adequate power outlets with branch wiring and distribution boxes located as required, flexible power cords as required, and main service disconnect and overcurrent protection at convenient location.

b. The Contractor shall provide and pay for the electrical service and all power required for the temporary office trailer for use by the Owner and CQA representatives for the duration of the project.

2. Telephone and Facsimile
   a. The Contractor shall provide, maintain, and pay for separate telephone and facsimile service for the Contractor's office trailer and the CQA Officer's trailer, as needed.
3. Water
   a. Construction Water
      1. The Contractor shall be responsible for developing a water supply for construction water and dust control and delivering and applying water as needed. Full compensation for developing a water supply and delivering and applying water shall be considered as included in the Contract Unit Price paid for the various contract items requiring water.
   b. Drinking Water
      1. Drinking water shall be provided by the Contractor from a potable source so piped or transported as to keep it safe, fresh, and served from single service containers or satisfactory types of sanitary drinking stands or fountains. Drinking water services and facilities shall be furnished in strict accordance with existing governing health regulations.
4. Sanitary Facilities
   a. The Contractor shall furnish, install, and maintain ample sanitary facilities as required for the Contractor's and Design Engineer's employees and for the employees of any Subcontractors.
   b. A sufficient number of enclosed temporary toilets shall be conveniently placed as required by the sanitary codes of state and local government.

3.04 TEMPORARY CONTROLS

A. General
   1. The Contractor shall comply with all codes, ordinances, rules, regulations, orders, or other legal requirements of public authorities, which bear on performance of the Work.
   2. The Contractor shall instruct all personnel and maintain strict control of all Work activities to protect and maintain the integrity of all existing environmental monitoring and control systems for the landfill.

B. Safety
   1. The Contractor shall submit a Health and Safety Plan with an Emergency Contact List to the Design Engineer prior to commencement of the Work and in accordance with Section 01800 (Health and Safety) of these Technical Specifications.
   2. The entire Work site is subject to shutdown, at the discretion of the Design Engineer, due to heavy rain, high winds, or other inclement weather.
   3. The Contractor's equipment and vehicles shall not travel at speeds of more than 20 miles per hour within 200 feet of any active work areas, equipment, or personnel.

C. Equipment Fueling and Maintenance
   1. The Contractor shall perform equipment fueling and maintenance within a contained

area, to be constructed by the Contractor in a location approved by the Design Engineer to prevent any release of fuel or other contaminants. The Contractor shall immediately remediate any leaks, spills, or other release of fuel or other contaminants as directed by the Design Engineer.

D. Drainage Control

1. The Contractor shall provide ample means and devices with which to promptly remove and dispose of all water from any source entering the Work areas and maintain these at all times during execution of the Work and until the final Work has been approved by the Design Engineer.

E. Erosion and Sediment Control

1. Temporary erosion and sediment control measures shall be implemented by the Contractor for all Work areas in accordance with the SWPPP prepared as part of Section 01550 (Storm Water Pollution Prevention) of these Technical Specifications.

F. Dust Control

1. Dust control measures shall be implemented by the Contractor for all Work areas in accordance with the Contractor's approved Dust Control Plan submitted under Section 14-9.02A of the Standard Specifications.

PART 4 MEASUREMENT AND PAYMENT

2.01 MOBILIZATION

A. Payment for mobilization, demobilization, construction facilities and temporary controls including temporary erosion control described in these Technical Specifications is considered as included in the Contract Lump Sum Price paid for "Mobilization" and includes all compensation for providing all materials, labor, equipment, tools, and incidentals required to complete the Work specified herein and as directed by the Design Engineer. No additional compensation will be allowed therefore.

B. Payment for "Mobilization" shall be as follows:

1. When the monthly partial payment estimate exceeds 5% the contract amount, not including any amount paid for Mobilization, 5% of the contract amount or 50% of the amount bid for Mobilization shall be included in the progress payment, whichever is lesser.

2. When the monthly partial payment estimate exceeds 10% the contract amount, not including any amount paid for Mobilization, 7.5% of the contract amount or 75% of the amount bid for Mobilization shall be included in the progress payment, whichever is lesser.

3. When the monthly partial payment estimate exceeds 20% the contract amount, not including any amount paid for Mobilization, 9.5% of the contract amount or 95% of the amount bid for Mobilization shall be included in the progress payment, whichever is lesser.

4. When the monthly partial payment estimate exceeds 50% the contract amount, not

including any amount paid for Mobilization, 10% of the contract amount or 100% of the amount bid for Mobilization shall be included in the progress payment, whichever is lesser.

5. After the Engineer determines that the work is substantially complete, any amount bid for Mobilization exceeding 10% of the contract amount will be paid in the final payment.

END OF SECTION

SECTION 01550
STORM WATER POLLUTION PREVENTION

PART 1 GENERAL

1.01 SUMMARY

A. Preparation, implementation, and monitoring of the Storm Water Pollution Prevention Plan (SWPPP) for the purpose of preventing the discharge of pollutants from the Work site into receiving waters. This includes, but is not limited to the prevention of sedimentation from the Work site into storm drains and natural drainages and the prevention of pollution discharges derived from equipment fueling and maintenance/repairs, improper dumping, spills, or leakage from storage tanks or transfer areas.

B. Prohibit illicit discharge (non-rainwater) into the storm drain system or natural drainages.

C. Construct any and all necessary systems to eliminate contaminants from entering the storm drain system or natural drainages.

D. Clean up and control of Work site materials, spoils, and debris.

E. Removal of contaminants produced by the Project.

F. Implement erosion and sediment control measures to prevent discharge of sediment to the storm drain system and natural drainages (see Section 02960 [Temporary Erosion and Sediment Controls] of these Technical Specifications).

G. The Work shall include the provision of all labor, materials, equipment, and apparatus not specifically mentioned herein or noted on the Plans, but which are incidental and necessary to complete the Work specified.

1.02 REFERENCES

A. *California's General Permit for Storm Water Discharges Associated with Construction and Land Disturbance Activities (General Permit) Order No. 2009-0009-DWQ as amended by Order No. 2010-0014-DWQ (NPDES No. CAS000002)*. State Water Resources Control Board, 2010.

B. *California Storm Water Best Management Practice Handbooks:*
   1. Municipal
   2. Industrial/Commercial
   3. Construction Activity

1.03 REGULATORY REQUIREMENTS

A. Contractor shall comply with the State Water Resources Control Board (SWRCB), Regional Water Quality Control Board (RWQCB), county, city, municipal, and other local agency requirements regarding storm water discharges and management. The State does not obtain

local permits.

1.04 STORM WATER POLLUTION PREVENTION PLAN (SWPPP)

A. A SWPPP shall be prepared for the Project by the Contractor. SWPPP preparation includes obtaining SWPPP acceptance, amending the SWPPP, preparing a Construction Storm Water Management Plan (CSMP) and a Storm Water Action Plan (SAP), and monitoring and inspecting Water Pollution Control (WPC) practices at the Work site and shall include:

1. Storm water sampling and analysis including reporting of storm water quality per qualifying rain event. If specified for the risk level, the work includes preparation, collection, analysis, and reporting of storm water samples for turbidity, pH, and other constituents.
2. Preparation of the Storm Water Annual Report including certifications, monitoring and inspection results, and obtaining Storm Water Annual Report acceptance.
3. If specified for the project risk level, preparation of a Rain Event Action Plan (REAP) including preparing and submitting REAP forms and monitoring weather forecasts.

B. The Contractor shall amend the SWPPP, as necessary, during construction showing the best management practices (BMPs) for the prevention and control of pollutants and erosion of the Work site. The SWPPP shall be in accordance with all of the requirements of the General Construction Storm Water Permit (Permit). Contractor is responsible to implement the SWPPP and make revisions to the SWPPP as necessary until completion of the Project. Information on the Permit can be found on the internet at http://www.swrcb.ca.gov/stormwtr/construction.htm. The Contractor shall prepare the Notice of Intent (NOI) to the SWRCB and provide to the Owner for filing at the SWRCB.

1.05 RISK LEVEL

A. The Risk Level for this Project is Level D.

1.06 QUALITY ASSURANCE

A. All work performed under this Contract and all Contractors and their associates and/or employees are required to comply with all applicable storm water regulations and to implement BMPs at all times.

B. A SWPPP shall be provided by the Contractor for the proposed control of contaminants entering the storm water system and natural drainages. The SWPPP must be approved by the Design Engineer prior to commencement of work.

C. All employees and subcontractors shall be trained on the storm water pollution prevention requirements contained in these Technical Specifications.

D. A supply of spill clean-up materials such as rags or absorbents shall be kept readily accessible on-site at all times.

1.07 SUBMITTALS

A. The Contractor shall submit a site-specific SWPPP prepared by a Qualified SWPPP Developer (QSD). The Contractor shall amend the SWPPP when required, prepare a CSMP, and perform water pollution control work under the oversight of a Qualified SWPPP Practitioner (QSP), as specified in the General Permit. All reports and data that must be submitted to the SWRCB will be uploaded by the Contractor's QSP to the Storm Water Multiple Application and Report Tracking System (SMARTS) website for final submittal. Final submittal and certification will be performed by the Owner.

B. Within 14 calendar days of Authorization to Proceed, the Contractor shall submit three (3) printed copies of the SWPPP and Site Map and one (1) electronic copy in a Portable Document Format (PDF) to the Design Engineer for review. The Contractor shall allow five (5) working days for the Design Engineer's review. If revisions are required, the Design Engineer will provide comments, and the Contractor shall revise and resubmit the SWPPP and Site Map in printed and electronic form within five (5) working days of receipt of the Design Engineer's comments. Within three (3) working days of receipt of the Design Engineer's approved SWPPP, the Contractor shall submit three (3) paper copies of the approved SWPPP to the Design Engineer and prepare the NOI and upload all pertinent documentation to SMARTS for final submittal and certification by the Design. The SWRCB will review the NOI and the issue a Waste Discharge Identification (WDID) number for the Project.

C. The Contractor shall not perform work that may cause water pollution until the state has issued a WDID number for the Project. The Design Engineer's review and approval of the SWPPP shall not waive any contract requirements and shall not relieve the Contractor from complying with Federal, State and local laws, regulations, and requirements.

D. The Contractor shall keep a copy of the approved SWPPP at the Work site. The SWPPP shall be made available when requested by a representative of the RWQCB, SWRCB, United States Environmental Protection Agency, or the local storm water management agency. Requests from the public shall be directed to the Owner.

E. The Contractor shall submit a Construction Management Plan that includes proposed provisions to prevent pollution and debris from reaching the water channel and shall include wet weather protection, erosion measures, methods, and location for cleaning tools and equipment dust control, litter prevention, debris collection and removal, location of portable toilets, storm water management controls, and hazardous material (including fuel) management at the Work site.

F. The Contractor shall submit Storm Water Training Records including training dates and subjects for employees and subcontractors including:
   1. Within five (5) working days of SWPPP acceptance for existing employees.
   2. Within five (5) working days following training of all new employees (Contractor and subcontractors).
   3. At least five (5) working days prior to subcontractors starting work for subcontractor's employees.

G. The SWPPP including the CSMP and SAP, SWPPP amendments, training records, REAPs, sampling and analysis results, exceedance reports, visual monitoring reports, inspection reports, BMP status reports, annual reports, and reporting on Storm Water Pollution Control (SPC) practices, shall be prepared and submitted to the Design Engineer under the direction of a QSD.

1.08 PERMIT

A. Within three (3) working days of receipt of the Design Engineer's approved SWPPP, the Contractor shall submit three (3) paper copies of the approved SWPPP to the Owner and prepare the NOI and upload all pertinent documentation to SMARTS for final submittal and certification by the Owner. The SWRCB will review the NOI and the issue a WDID number for the Project.

B. The Owner shall pay required fees and pay annual renewal fees until completion of the Project.

1.09 LIABILITIES AND PENALTIES

A. Review of the SWPPP, amended and finalized by the Contractor from an initiated plan, shall not relieve the Contractor from liabilities arising from non-compliance of storm water pollution regulations.

B. Contractor will be held responsible for paying penalties for violations of permit conditions. In the event of any fines against the City, due to non-compliance by the Contractor, the City shall recover all costs of the fines from the Contractor.

1.10 IMPLEMENTATION

A. The Contractor shall not perform work that may cause water pollution until the SWRCB has issued a WDID number for the Project. The City's review and approval of the SWPPP shall not waive any contract requirements and shall not relieve the Contractor from complying with Federal, State, and local laws, regulations, and requirements.

B. Contractor shall comply with the requirements of the Permit and the SWPPP. Contractor shall update the SWPPP and have the SWPPP map available at the Work site at all times.

C. Contractor shall implement BMPs for control of all pollutants including sediment, fuel and other petroleum and non-petroleum hydrocarbon products, concrete waste, fertilizers, soil amendments and other construction related pollutants.

D. Contractor shall implement an effective combination of erosion and sediment controls by stabilizing all disturbed soil, paying particular attention to exposed slopes. Back up erosion prevention measures with sediment control measures. Ensure all control measures are adequate, in place, and in operable condition.

E. Contractor shall conduct site inspections before, during extended storm events, and after each storm event to identify areas that may contribute to erosion and sediment problems or any other pollutant discharges. If additional control measures are needed, implement them

immediately. Document all inspection findings and actions taken in detailed, site specific inspection reports. These reports must be maintained on site for review.

F. Contractor shall maintain and repair all erosion prevention and sediment control measures throughout the season and until completion of the project. Replacement supplies shall be kept on the Work site.

G. Contractor shall train all site personnel in erosion prevention and sediment control techniques, and the responsibilities under the Permit.

H. Contractor shall conduct weekly training meetings and training for personnel collecting water samples.

I. Contractor shall immediately report to the RWQCB office any instances of sediment or other pollutant discharges from the Work site.

J. Contractor shall obtain services and pay for any sampling, testing, and analysis of storm water as required for compliance with the General Permit and the SWPPP.

K. Contractor shall make the SWPPP available to the RWQCB staff and correct any requirements imposed as a result of their inspections.

1.11 CERTIFICATION AND REPORTS

A. Prior to July 1 of each year during the construction period, submit two (2) copies of the Annual Report that the construction activities are in compliance with the General Permit and the SWPPP to the Design Engineer for review.

B. At Completion of the Project, submit records of all inspections, compliance certifications and noncompliance reports to the SWRCB.

C. Upon Completion of the Project, the Contractor shall file a Notice of Termination with the SWRCB.

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION

3.01 HAZARDOUS MATERIAL/WASTE MANAGEMENT/MATERIALS MANAGEMENT

A. Designated areas of the Work site shall be proposed by the Contractor for approval by the Design Engineer suitable for material delivery, storage, and waste collection as far from catch basins, drainage inlets, and natural drainages as possible.

B. All hazardous materials such as fuels and solvents and all hazardous waste such as waste oil and antifreeze shall be labeled and stored in accordance with State and Federal regulations.

C. All hazardous materials and all hazardous waste shall be stored in accordance with secondary containment regulations, and it is recommended that these materials and waste be covered as needed to avoid potential management of collected rainwater as a hazardous waste.

D. Regular hazardous waste collection shall be arranged for to comply with time limits on the storage of hazardous waste.

E. Granular materials shall be stored a minimum 10 feet from the closest catch basin and drainage inlet associated with the storm drain system. The Contractor shall not allow these granular materials to enter the storm drain system or natural drainages.

F. Warning signs shall be posted in areas containing or treated with chemicals.

G. An accurate up-to-date inventory, including Material Safety Data Sheets (MSDSs) of hazardous waste stored on site shall be kept and available to assist emergency response personnel in the event of a hazardous materials incident.

H. Maintenance and fueling of vehicles and equipment shall be performed in a designated, bermed area, or over a drip pan that will not allow run-off of spills. Vehicles and equipment shall be regularly checked and have leaks repaired promptly. Secondary containment shall be used to catch leaks or spills any time that vehicle or equipment fluids are dispensed, changed, or poured.

3.02 DUST CONTROL

A. The Contractor's Dust Control Plan required under Section 01500 (Mobilization) of these Technical Specifications shall comply with the requirements of the Mendocino County Air Quality Management District.

B. A minimum of two (2) water trucks with operators shall be in operation at all times during excavation to provide dust control at all excavation, haul road, stockpile and staging areas. If necessary, additional water trucks or other equipment with operators shall be provided and used by the Contractor to maintain these areas in a misted condition at all times during excavation.

C. Access and haul roads shall be watered on a continuous basis to control dust.

D. The Contractor will be restricted from areas where dust cannot be controlled and excessive equipment speeds, which cause dust, may be regulated by the Owner.

E. The Design Engineer will require all excavation activities to cease if the Contractor's dust control efforts do not follow the approved SWPPP, or fail to meet any of the requirements of this Part, until such time that the Contractor can demonstrate a return to compliance.

F. Other methods of dust control and suppression may be used, however; Design Engineer approval must be obtained prior to such use.

3.03 CONCRETE WASTE MANAGEMENT

A. Concrete trucks shall not be washed out into storm drains or natural drainages.

B. Concrete trucks and equipment shall be washed out off-site or in a designated area on-site where the water will flow onto dirt or into a temporary pit or bermed area. The water shall percolate into the soil and the hardened concrete placed in a waste container for disposal. If a suitable soil or bermed area is not available on-site, the wash water shall be collected and removed off-site and disposed of properly.

3.04 EROSION AND SEDIMENT CONTROL

A. Stabilize all denuded areas and install and maintain all temporary erosion and sediment control continuously between October 15th and April 15th of each year, until permanent erosion controls have been installed (see Section 02960 [Temporary Erosion and Sediment Controls] of these Technical Specifications).

B. Divert on-site runoff around exposed areas and divert off-site runoff around the Work site (e.g., swales and dikes).

C. Incorporate provisions for preventing erosion and trapping sediment on-site, such as sediment basins or traps, earthen dikes or berms, silt fences, check dams, storm drain inlet protection, soil blankets or mats, covers for soil stock piles, and/or other measures.

3.05 CONSTRUCTION SITE BMPs

A. Store, handle, and dispose of construction materials and waste properly, so as to prevent their contact with storm water.

B. Control and prevent the discharge of all potential pollutants, including concrete, petroleum products, chemicals, washwater or sediments, and non-storm water discharges to storm drains and natural drainages.

C. Use sediment controls or filtration to remove sediment when dewatering site and obtain all necessary permits.

D. Avoid cleaning, fueling, or maintaining vehicles on-site, except in a designated area where washwater is contained and treated.

E. Delineate with field markers clearing limits, easement, setbacks, sensitive or critical areas, buffer zones, trees, and drainage courses.

F. Protect adjacent properties and undisturbed areas from construction impacts using vegetative buffer strips, sediment barriers or filters, dikes, mulching, or other measures as appropriate.

G. Perform clearing and earth moving activities only during dry weather.

H. Limit and time applications of fertilizers to prevent polluted runoff.

I. Limit construction access routes and stabilize designated access points.

J. Avoid tracking dirt or other materials off-site; clean off-site paved areas using dry sweeping methods.

K. The Contractor shall train and provide instruction to all employees and subcontractors regarding the construction BMPs.

3.06 SITE CLEANUP

A. The cleaning of equipment or materials shall not be performed on-site using soaps, solvents, degreasers, steam cleaning, or equivalent methods.

B. All cleanup must be performed in a designated area that will not allow the cleaning rinse to flow off-site or into on-site storm drains or natural drainages.

3.07 PERFORMANCE REQUIREMENTS

A. The SWPPP is a minimum requirement. Revisions and modifications to the SWPPP are acceptable only if they maintain levels of protection equal to or greater than originally specified.

B. Read and be thoroughly familiar with all of the requirements of the SWPPP.

C. Inspect and monitor all work and storage areas for compliance with the SWPPP prior to any anticipated rain.

D. Complete any and all corrective measures as may be directed by regulatory agencies.

E. Costs: Contractor to pay all costs associated with the implementation of the requirements of the SWPPP in order to maintain compliance with the Permit. This includes installation of all Housekeeping BMPs, General Site and Material Management BMPs, inspection requirements, maintenance requirements, and all other requirements specified in the SWPPP.

PART 4 MEASUREMENT AND PAYMENT

4.01 STORM WATER POLLUTION PREVENTION

A. Measurement and payment for storm water pollution prevention shall be considered as included in the Contract Lump Sum Price paid for "Temporary Erosion and Sediment Controls" addressed in Section 02960 (Temporary Erosion and Sediment Controls) of these Technical Specifications.

END OF SECTION

SECTION 01720
RECORD DOCUMENTS

PART 1 GENERAL

1.01 SUBMITTALS

A. Quality Control Submittals: Written procedures for maintaining and markup of record documents.

B. Contract Closeout Submittal: Submit record documents in accordance with the requirements of this section. Submit prior to application for final payment.

1.02 QUALITY ASSURANCE

A. Furnish qualified and experienced person, whose duty and responsibility shall be to maintain record documents.

B. Accuracy of Records:

1. Coordinate changes within record documents, making legible and accurate entries on each page of Technical Specifications and each sheet of Plans and other documents where such entry is required to show change.
2. Purpose of Project record documents is to provide factual information regarding aspects of Work, both concealed and visible, to enable future modification of Work to proceed without lengthy and expensive site measurement, investigation, and examination.

C. Make entries within 24 hours after receipt of information that a change in Work has occurred.

D. Prior to submitting each request for progress payment, request Design Engineer's review and approval of current status of record documents. Failure to properly maintain, update, and submit record documents may result in delay of Progress Payment made by the Owner.

1.03 DELIVERY, STORAGE, AND HANDLING

A. Maintain record documents completely protected form deterioration, loss, and damage until completion of Work.

B. In event of loss of recorded data, use means necessary to again secure data to Design Engineer's acceptance.

1. Such means shall include, if necessary in Design Engineer's opinion, removal and reconstruction of covering materials, at no cost to Owner.

PART 2 PRODUCTS

2.01 RECORD DOCUMENTS

A. Promptly following commencement of Contract Times, secure from Owner at no cost to Contractor, one complete set of Contract Documents. Plans will be full size.

PART 3 EXECUTION

3.01 MAINTENANCE OF RECORD DOCUMENTS

A. General:
1. Label or stamp each record document with title, "RECORD DOCUMENTS," in neat large printed letters.
2. Record information concurrently with construction progress and within 24 hours after receipt of information that change has occurred. Do not cover or conceal Work until required information is recorded.

B. Preservation
1. Maintain record documents in a clean, dry, legible condition and in good order. Do not use record documents for construction purposes.
2. Make record documents and samples available at all times for observation by Design Engineer.

C. Making Entries on Plans
1. Using an erasable colored pencil (not ink or indelible pencil), clearly describe change by graphic line and note as required.
   a. Color Coding:
      i. Green when showing information deleted from Plans.
      ii. Red when showing information added to Plans.
      iii. Blue and circled in blue to show notes.
2. Date entries
3. Call attention to entry by "cloud" drawn around area or areas affected.
4. Legibly mark to record actual changes made during construction, including but not limited to:
   a. Horizontal and vertical locations of existing and new underground facilities and appurtenances, and other underground structures, equipment or Work. Reference to at least two measurements of permanent surface improvements.
   b. Location of internal utilities and appurtenances concealed in the construction referenced to visible and accessible features of the structure.
   c. Locate existing facilities, piping, equipment, and items critical to the interface between existing physical conditions or construction and new construction.
   d. Changes made by Addenda and Field Orders, Work Change Directive, Change Order, Written Amendment, and Design Engineer's written interpretation and clarification using consistent symbols for each and showing appropriate document tracking number.

5. Dimensions on Schematic Layouts: Show on record documents, by dimension, the centerline of each run of items such as described in the previous subparagraph above.
   a. Clearly identify the item by accurate note such as "cast iron drain," galv. water," and the like.
   b. Show, by symbol or note, vertical location of item ("under slab", "exposed", and the like).
   c. Make identification sufficiently descriptive that it may be related reliably to the Technical Specifications.

D. Make entries in other pertinent record documents as accepted by Design Engineer.

E. If record documents are not accepted by Design Engineer, secure a new copy of that record document from Design Engineer at Design Engineer's usual charge for reproduction and handling, and carefully transfer change data to new copy to acceptance of Design Engineer.

END OF SECTION

SECTION 01800
HEALTH AND SAFETY

PART 1 GENERAL

1.01 SUMMARY

A. Site safety.

B. LFG hazards.

C. Other landfill related hazards.

1.02 SITE SAFETY

A. All safety requirements are applicable to the Work to be performed under the Contract and any subsequent addenda, modifications, alterations, and extensions thereto.

B. The Contractor shall be solely and completely responsible for conditions of the Work site, including the safety of all persons and property during performance of the Work and provision of safety measures on weekends and holidays. This requirement will apply continuously and shall not be limited to normal working hours.

C. The Contractor shall comply with all federal, state, and local safety codes, ordinances, and regulations, including the requirements of the Occupational Safety and Health Agency, and Division of Industrial Safety, State of California, and other such safety measures as may be required by the above mentioned regulatory agencies.

D. Contractor shall be solely and completely responsible for the safety of all construction personnel performing the Work, including all Subcontractors. Contractor shall be ultimately responsible for any and all necessary safety precautions and safety programs.

E. Contractor shall also be held responsible for their own compliance with the provisions of this Section, as well as the compliance of all Subcontractors with the provisions of this Section. Contractor shall be held responsible for any and all violations of the provisions of this Section, as well as violations of any federal, state, and local safety codes, ordinances, and regulations, including the requirements of the Occupational Safety and Health Agency, and Division of Industrial Safety, State of California, and other such safety statutes and requirements which apply to the Work.

F. No act, service, drawing review or construction review by the Owner, Design Engineer, CQA Officer or their Consultants is intended to include review of the adequacy of the Contractor's safety measures in, on, or near the Work site.

G. If a conflict should occur between the safety requirements of the Standard Specifications, these Technical Specifications, the approved Health and Safety Plan, Referenced Standards, or other federal, state, and local safety codes, ordinances, and regulations, the more stringent requirement shall prevail.

1.03 LFG HAZARDS

A. The Contractor is advised that decomposing refuse produces LFG, which is approximately 50 percent methane and 50 percent carbon dioxide by volume. LFG may be present in the Work area. LFG is colorless, can be odorless, may contain benzene, vinyl chloride, hydrogen sulfide, and other toxic constituents, is combustible, and contains little or no oxygen. LFG can migrate through soil near the surface so the Contractor is therefore advised of the need for precautions against fire, explosion, and asphyxiation when working in or near excavations which are in or near refuse fill areas.

B. The Contractor shall be responsible for informing his or her employees and Subcontractors and their employees of the potential danger of LFG on and near landfills.

C. Smoking shall be prohibited at all times and at all locations within the limits of the Work shown on the Plans.

D. The Contractor shall be familiar with "A Compilation of Landfill Gas Field Practices and Procedures" as prepared by the Solid Waste Association of North America (SWANA).

E. LFG has the potential to create hazardous conditions if not controlled or recognized. Some of the hazards of LFG include:
   1. Fires which may start spontaneously from exposed and/or decomposing refuse.
   2. Fires and explosions which may occur from the presence of methane gas.
   3. Oxygen deficiency in underground trenches, excavations, vaults, conduits and structures.
   4. The potential presence of hydrogen sulfide, a highly toxic and flammable gas.
   5. The potential presence of benzene, vinyl chloride, and other toxic gases which are known to the State of California to cause cancer, birth defects, and reproductive harm.
   6. Water vapor in LFG often becomes over saturated and condenses as a liquid in contained pipes and vessels. This condensate may contain the toxic constituents found in LFG.

1.04 OTHER LANDFILL-RELATED HAZARDS

A. The Contractor is advised that solid waste fills and the decomposing refuse therein may present other unique health and safety considerations. Such considerations include, but are not limited to:
   1. Unstable ground and surface cave-ins due to decomposition and differential settlement of refuse when working over, in, or near refuse fill areas.
   2. Possible caving of trenches and excavations when working over, in, or near refuse fill areas.
   3. Potentially hazardous materials in or near refuse fill areas.

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION

3.01 HEALTH AND SAFETY PLAN

A. Prior to start of construction, the Contractor shall submit a written Health and Safety Plan, to the Design Engineer indicating all proposed safety measures. Said plan shall be prepared in accordance with the requirements of Part 29 of the Code of Federal Regulations (29 CFR) 1910.120.

B. The Health and Safety Plan shall comply with all federal, state, and local safety codes, ordinances, and regulations, including the requirements of the Occupational Safety and Health Administration (OSHA), and Division of Industrial Safety, State of California. The Contractor shall comply with Section 5-1.02A of the Standard Specifications for safety plan requirements for trenches and excavations. Contractor's attention is further directed to Section 6705 of the Labor Code concerning trench excavation safety plans.

3.02 SITE SAFETY MONITOR

A. The Contractor shall provide a person who will be designated as the Site Safety Monitor.

B. The Site Safety Monitor shall be thoroughly trained in rescue procedures, and use of safety equipment and gas detectors as required by the Health and Safety Plan.

C. At a minimum the Site Safety Monitor shall have taken a certified 40-hour OSHA safety course and 8-hour supplementary health and safety supervisor course which meets the requirements of 29 CFR 1910.120. Certificates of participation shall be submitted to the Design Engineer prior to start of construction.

D. The Site Safety Monitor shall have the delegated authority to order any person or worker to follow safety rules related to LFG or other site safety hazards. Failure to observe these rules shall be sufficient cause for removal of the person or worker from the Work site.

E. Supplemental to the Contractor's regular safety program, the Site Safety Monitor shall develop and institute procedures to inform all workers and the public visiting the Work site of the potential for the presence of methane and other landfill gases emanating from the natural decomposition of refuse buried at or near the Work site, and the importance of safety precautions to provide for the safety of workers and the public.

3.03 TRENCH AND EXCAVATION SAFETY

A. Contractor shall comply with all requirements of the trench and excavation safety, including provisions of Section 5-1.02A of the Standard Specifications and all occupational safety and health requirements of the Labor Code. In particular, the Contractor shall:

1. Submit to the Design Engineer at least 14 calendar days in advance of excavation, a detailed plan showing the design of sheeting, shoring, bracing, slopes, or other provisions to be made for worker protection from the hazard of caving ground during excavation. Sheeting and shoring plans shall be designed and stamped by a Registered Civil or Structural Engineer with experience in shoring design. The Contractor shall be solely responsible for ensuring the safety of any excavation. Shoring and submittal of any plans for sheeting, shoring,

bracing, slopes, or other provisions to be made for worker protection shall not relieve the Contractor from this responsibility.

2. If required, obtain a permit from the division of Industrial Safety for the construction of excavations that are 5 feet in depth or deeper and into which a person or persons is (are) required to descend.

B. Contractor shall provide all necessary materials to sheet, shore, brace, or otherwise provide for worker protection in temporary excavations as well as may be required to prevent adjacent surface settlement or damage to public and private property and to ensure safe working conditions at the Work site.

C. Contractor shall remove all sheeting, shoring, bracing or similar structures in accordance with the above requirements and in such a manner as to prevent any damage to the Work.

D. The Contractor shall repair all damages resulting from improper sheeting, shoring, bracing or similar measures, or damages resulting from failure to provide such measures at no expense to the City.

PART 4 MEASUREMENT AND PAYMENT

4.01 HEALTH AND SAFETY

A. Payment for providing all health and safety measures, including preparation of required Health and Safety Plan, is included in the Contract Unit Price paid for the various items of Work for which they are required. No separate or additional payment will be made therefore.

END OF SECTION

DIVISION 2

SITE WORK

SECTION 02200
REMOVAL, REPLACEMENT, AND ADJUSTMENT OF EXISTING FACILITIES

PART 1 GENERAL

1.01 SUMMARY

A. Existing facilities that interfere with the Work shall be removed, reset, relocated, adjusted, or otherwise modified as specified herein, as shown on the Plans, or as directed by the Engineer. The Contractor shall perform all removal, replacement, abandonment, and adjustment of existing facilities in accordance with this Section and at the locations and details shown on the Plans including the following:

1. Adjust three (3) existing groundwater monitoring wells to grade;
2. Adjust two (2) existing leachate wells to grade;
3. Remove existing CMP and HDPE downdrains and drain outlets to creek;
4. Remove and/or abandon existing leachate piping;
5. Adjust of five (5) existing leachate manholes to grade;
6. Remove and replace existing vault boxes;
7. Install G5 traffic vault with checker plate top over existing valve;
8. Adjust existing gas vault to grade;
9. Adjust existing air release valve and vault to grade;
10. Adjust four (4) existing landfill gas perimeter monitoring wells/vaults to grade;
11. Remove existing fencing at site entrance; and
12. Demolish existing scale house structure.

B. The Contractor shall furnish all labor, supervision, tools, materials, equipment, transportation, and incidentals necessary to implement the respective removal, replacement, and adjustment activities outlined above and within this Section.

1.02 REFERENCES

A. *Caltrans Standard Specifications.* California Department of Transportation, 2010.

B. *Standard Plans Book.* California Department of Transportation, 2010.

1.03 SUBMITTALS

A. At least 14 calendar days prior to beginning any replacement work in accordance with the requirements of this Section, the Contractor shall provide three (3) copies to the Design Engineer manufacturer's product data sheets for any new materials used in the replacement or adjustment of existing facilities.

1.04 PROJECT CONDITIONS

A. Except for materials indicated to be stockpiled or to remain the City's property, cleared materials are the Contractor's property. Remove cleared materials from the project site and dispose of in lawful manner.

B. Salvaged Materials: Carefully remove items indicated to be salvaged and store where indicated on Plans or where designated by the City. Avoid damaging materials designated for

salvage.

C. Unidentified Materials:
   1. If unidentified materials are discovered, including hazardous materials that may require additional removal other than is required by the Contract Documents, immediately report the discovery to the City.
   2. I necessary, the City will arrange for any testing or analysis of the discovered materials and shall provide instruction regarding the removal and disposal of unidentified materials.

PART 2 PRODUCTS

2.01 SOIL MATERIAL

A. Backfill excavations resulting from removal operations with onsite or import materials conforming to the specification for compacted engineered fill as described in Section 02224 (Engineered Fill).

2.02 VAULT BOXES

A. New or replacement vault boxes shall be pre-cast boxes with solid concrete or steel lids at the sizes and dimensions as indicated on the Plans. Extension risers shall be used as necessary to raise vault box to grade. Vault boxes shall be Christy boxes or equivalent with traffic rated cover where indicated.

PART 3 EXECUTION

3.01 GENERAL

A. Items demolished or removed that are not to be salvaged or reused in the Work shall become the property of the Contractor and shall be legally disposed of or recycled.

B. Verify that utilities have been disconnected and capped before starting demolition operations.

3.02 DOWNDRAIN AND DRAIN OUTLET REMOVAL

A. Unless indicated on the Plans to remain, all existing aboveground and below ground CMP and HDPE downdrains and drain pipe including any hardware shall be removed within the limits of Work.

B. Backfill trench excavations resulting from removal operations with onsite or import materials conforming to the specification for compacted engineered fill as described in Section 02224 (Engineered Fill). Compact to 90% relative compaction.

3.03 LEACHATE PIPING REMOVAL/ABANDONMENT

A. Cut existing leachate pipe at points shown on the Plans. The pipe cuts shall be square, perpendicular to the center of the pipe. Cap or plug with concrete the ends of the piping where indicated.

B. Unless piping is shown on the Plans to be abandoned in place, excavate and remove piping for disposal per section 1.04A.

C. Backfill excavations resulting from removal operations with onsite or import materials conforming to the specification for compacted engineered fill as described in Section 02224 (Engineered Fill). Compact to 90% relative compaction.

3.04 LEACHATE MANHOLE ADJUSTMENT

A. Frames and covers of existing leachate manholes shall be adjusted to grade with new materials similar in character to those in the original structure in accordance with the provisions of these specifications.

C. After the existing cover and frame has been removed, the top of the structure to be raised shall be trimmed to provide a suitable foundation for the new material.

D. When reconstruction or adjustment of a concrete structure requires partial removal of concrete, sufficient concrete shall be removed to permit new reinforcing steel to be spliced to existing reinforcing steel. Existing reinforcement that is to be incorporated in new work shall be protected from damage and shall be thoroughly cleaned of adhering material before being embedded in new concrete.

E. Concrete removal shall be performed without damage to the portion that is to remain in place. Damage to the existing concrete, which is to remain in place, shall be repaired to a condition equal to that existing prior to the beginning of removal operations. The cost of repairing existing concrete damaged by the Contractor's operations shall be at the Contractor's expense.

F. At the option of the Contractor, raising devices may be used in place of adjusting manholes to grade with new materials similar in character to those in the original structure.

G. The shape and size of the raising devices shall match the existing frame and shall produce an installation which is equal to or better than the existing installation in stability, support and non-rocking characteristics. Each section of the raising device shall be fastened securely to the existing frame.

3.05 DEMOLITION

A. Demolish indicated existing buildings as shown on the Plans. Use methods required to complete the Work within limitations of governing regulations.

B. Use water mist and other suitable methods to limit spread of dust and dirt. Comply with governing environmental protection regulations. Do not use water when it may damage construction or create hazardous or objectionable conditions, such as ice, flooding, and pollution.

C. Proceed with demolition of structural framing members systematically, from higher to lower level.

D. Remove below-grade construction, including footings and foundation walls completely.

E. Remove existing utilities within limits of structure completely. Fill depressions and voids

with onsite or import fill compacted to a relative compaction of 90%.

F. Completely fill below-grade areas and voids resulting from building demolition operations with satisfactory onsite or import fill compacted to a relative compaction of 90%.

PART 4 MEASUREMENT AND PAYMENT

4.01 ADJUST GROUNDWATER MONITORING WELLS TO GRADE

A. Adjustment of groundwater monitoring wells to grade shall be measured by each well that is adjusted. Payment shall be included in the Contract Unit Price per each well adjusted for "Adjust Groundwater Monitoring Wells to Grade" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to complete the adjustment as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.02 ADJUST LEACHATE WELLS TO GRADE

A. Adjustment of leachate wells to grade shall be measured by each well that is adjusted. Payment shall be included in the Contract Unit Price per each well adjusted for "Adjust Leachate Wells to Grade" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to complete the adjustment as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.03 REMOVE EXISTING CMP AND HDPE DOWNDRAINS AND DRAIN OUTLETS

A. Measurement and payment for removal of existing above ground and underground CEP and HDPE downdrains and drain outlets shall be included in the Contract Lump Sum Price for "Remove Existing CMP and HDPE Downdrains and Drain Outlets" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to complete the removal as shown on the Plans, as specified herein, and as directed by the Design Engineer, including pipe removal, excavations, disposal, and trench backfill and compaction. No additional compensation will be allowed therefore

4.04 REMOVE EXISTING LEACHATE PIPING

A. Measurement and payment for removal and abandonment of existing leachate piping shall be included in the Contract Lump Sum Price for "Remove Existing Leachate Pipe" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to complete the removal as shown on the Plans, as specified herein, and as directed by the Design Engineer, including cutting and capping pipe, excavation, pipe removal, and trench backfill and compaction. No additional compensation will be allowed therefore.

4.05 ADJUST LEACHATE MANHOLES

A. Adjustment of leachate manholes to grade shall be measured by each manhole that is adjusted. Payment shall be included in the Contract Unit Price per each manhole adjusted for "Adjust Leachate Manhole to Grade" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to

complete the adjustment as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.06 INSTALL G5 TRAFFIC VAULT WITH CHECKER PLATE COVER

A. Installation of G5 traffic vault with checker plate cover shall be measured by each vault that is installed. Payment shall be included in the Contract Unit Price per each vault removed and replaced for "Install G5 Traffic Vault with Check Plate Cover" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to complete the replacement as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.07 ADJUST EXISTING GAS VAULT TO GRADE

A. Adjustment of gas vault to grade shall be measured by each vault that is adjusted. Payment shall be included in the Contract Unit Price per each manhole adjusted for "Adjust Existing Gas Vault to Grade" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to complete the adjustment as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.08 INSTALL B2436 GAS EXTRACTION VAULT WITH CHECKER PLATE TOP

A. Installation of B2436 gas extraction vault with checker plate cover shall be measured by each vault that is installed. Payment shall be included in the Contract Unit Price per each vault removed and replaced for "Install B2436 Gas Extraction Vault with Check Plate Cover" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to complete the replacement as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.09 ADJUST EXISTING AIR RELEASE VALVE AND VAULT TO BOX GRADE

A. Adjustment of existing air release valve and vault box to grade shall be measured by each valve adjustment that is performed. Payment shall be included in the Contract Unit Price per each vault removed and replaced for "Adjust Existing Air Release Valve and Vault Box to Grade" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to complete the replacement as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.10 ADJUST LFG PERIMETER MONITORING WELLS

A. Adjustment of LFG perimeter monitoring wells to grade shall be measured by each well that is adjusted. Payment shall be included in the Contract Unit Price per each well adjusted for "Adjust LFG Monitoring Wells to Grade" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to complete the adjustment as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.11 REMOVE EXISTING FENCING

A. Measurement and payment for removal of existing fencing shall be included in the Contract Lump Sum Price for "Remove Existing Fencing" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to complete the removal as shown on the Plans, as specified herein, and as directed by the Design Engineer, including cutting and capping pipe, excavation, pipe removal, and trench backfill and compaction. No additional compensation will be allowed therefore.

4.12 STRUCTURE DEMOLITION

A. Measure and payment for the demolition of the existing scale house structure shall be included in the Contract Lump Sum Price for "Structure Demolition" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to complete the demolition as shown on the Plans, as specified herein, and as directed by the Design Engineer, including demolition of structure and foundation, removal of utilities, disposal of materials, and backfill and compaction of voids and depressions. No additional compensation will be allowed therefore.

END OF SECTION

SECTION 02207
AGGREGATE MATERIALS

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall furnish, transport to the Work site, and install all aggregate materials, including aggregate base for the construction of access roads and placement within and around the flare station, pipe bedding for trenches, gravel for the GRL, rock riprap for lined swales and outfalls, gravel pack material for LFG extraction wells, coarse rock for the construction entrance, concrete sand for the GCL, and tank bedding and backfill for the leachate UST, in accordance with this Section and at the locations and to the dimensions shown on the Plans. The Contractor shall furnish all labor, supervision, tools, materials, equipment, transportation, and incidentals necessary to install the respective aggregate materials.

1.02 REFERENCES

A. *Caltrans Standard Specifications.* California Department of Transportation, 2010.

B. *Caltrans Standard Plans*. California Department of Transportation, 2010.

C. *American Society for Testing and Materials.* Current Edition.

D. *California Test Methods*. California Department of Transportation, Current Edition.

1.03 APPLICABLE STANDARDS AND SPECIFICATIONS

A.	ASTM C 33	Standard Specification for Concrete Aggregates.
B.	ASTM C 136	Sieve Analysis of Fine and Coarse Aggregates.
C.	ASTM D 2434	Standard Test Method for Permeability of Granular Soils (Constant Head).
D.	CTM 229	Method of Test for Durability Index.
E.	CTM 301	Method for Determining the Resistance "R" Value of Treated and Untreated Bases, Subbases, and Basement Soils by the Stabilometer.

1.04 SUBMITTALS

A. At least 14 calendar days prior to beginning any aggregate material installation, the Contractor shall provide three (3) copies of the name and location of the proposed borrow source, and laboratory test results on the aggregate materials from the proposed borrow source to the Design Engineer which show that the aggregate materials have the properties specified in Part 2 of this Section. The Design Engineer will provide the

Contractor with an approval or rejection of the borrow source and aggregate materials within two (2) working days of receipt of the borrow source information and laboratory test results.

1.05 QUALITY ASSURANCE

A. Testing of the aggregate materials shall be conducted in accordance with the CQA Plan.

B. If the Design Engineer's review of Contractor's submittals indicates that an aggregate material(s) does not meet specified requirements, the Contractor shall provide an alternative material(s) and submit corresponding test results to the Design Engineer for approval.

PART 2 PRODUCTS

2.01 GENERAL

A. Each aggregate product shall come from the same source throughout the Work.

2.02 AGGREGATE BASE

A. The aggregate base material shall be clean, hard, sound, durable, uniform in quality, free of any surface coatings, and free of any detrimental quantity of soft, friable, thin, elongated, or laminated pieces, disintegrated material, organic matter, oil, alkali, or other deleterious substance. The aggregate base material may contain Portland cement concrete and asphalt concrete meeting the grading specifications.

B. Aggregate base shall conform to requirements of Section 26 of the Standard Specifications and these Technical Specifications. Aggregate base shall meet the requirements for Class 2, ¾-inch maximum per the Standard Specifications.

2.03 SAND BALLAST INFILL

A. Sand Ballast Infill will meet Particle Size Parameters of ASTM C-33 for fine aggregates as shown in Table 1 below:

Table 1: Sand Ballast Infill ASTM C-33-03 Particle Size Distribution

ASTM C-33-03	
Sieve	Percent Passing
9.5 mm (3/8 in.)	100
4.75 mm (No. 4)	95 to100
2.36 mm (No. 8)	80 to 100

1.18 mm (No. 16)	50 to 85
600 µm (No. 30)	25 to 60
300 µm (No. 50)	5 to 30
150 µm (No. 100)	0 to 10

2.04 HYDROBINDER INFILL

A. HydroBinder™ is a cementious product used as the infill component for surface drainage conveyance areas.

B. HydroBinder™ infill Shall be HydroBinder™ Cementitious Infill. The HydroBinder™ infill material may be delivered in either pallet form of 80 lb. bags or 3000 lb. bulk super sacks.

C. Cement, except as otherwise specified herein, will be a brand of Portland Cement, meeting ASTM C 150 and will be Type I or Type II. Only one brand of cement will be used throughout the duration of this Contract.

D. The cementitious infill mix design will conform to the requirements of ASTM C 387 for high strength mortars.

E. The cementious infill will have a minimum 28 day compressive strength of 5000 psi.

2.05 PIPE BEDDING

A. Pipe bedding material shall conform to Section 19-3.02E(2) of the Standard Specifications.

2.06 LOOSE ROCK RIPRAP

A. Stone and/or recycled concrete for loose rock riprap shall conform to Section 72-5.02 of the Standard Specifications and the following size requirements:

Screen Size	% (By Weight) Retained Above
4" x 4"	95-100
6" x 6"	75-100
9" x 9"	25-100

2.07 GROUTED ROCK RIPRAP

A. Stone and/or recycled concrete for grouted rock riprap shall be "Light" class rock per Section 72-2.02 of the Standard Specifications.

2.08 GRAVEL PACK

A. Gravel pack material for the LFG extraction wells shall be 1- to 2-inch diameter non-calcareous washed rock.

2.09 CONCRETE AGGREGATE

A. Coarse and fine aggregate for concrete shall conform to ASTM C 33 as determined by the Supplier. All aggregate shall be thoroughly washed. Maximum aggregate size shall be 3/4 inches in diameter.

2.10 COARSE ROCK FOR CONSTRUCTION ENTRANCE

A. Coarse rock for construction entrance shall be 2- to 3-inch crushed stone.

2.11 TANK BEDDING AND BACKFILL

A. Tank bedding shall consist of filter sand.

B. Tank backfill shall be clean naturally rounded aggregate with a mix of particle sizes not less than 1/8-inch or more than ¾-inch (pea gravel) in accordance with the tank manufacturer's specifications.

PART 3 EXECUTION

3.01 GENERAL

A. The Contractor shall provide all construction, grading control, and other staking necessary to construct the aggregate materials to the lines, grades, and thickness shown on the Plans.

3.02 STOCKPILING

A. Materials shall be stockpiled at the Work site at a location(s) designated by the Design Engineer.

B. Stockpiles shall be of sufficient quantity to meet Project schedule and requirements.

C. Surface water shall be directed away from stockpile site(s) so as to prevent erosion or deterioration of materials.

3.03 STOCKPILE CLEANUP

A. Surplus aggregate material stockpiles shall be removed or left in a clean and neat condition. Stockpile area surface(s) shall be graded to prevent free standing surface water.

3.04 PLACEMENT

A. Aggregate base shall be placed in accordance with the requirements for aggregate base placement in Section 02310 (Access Roads) and Section 15300 (Flare Station) of these Technical Specifications.

B. Pipe bedding shall be placed in accordance with the requirements for backfilling in Section 02225 (Trenching and Backfilling) of these Technical Specifications.

C. Sand ballast infill and HydroBinder infill shall be placed in accordance with the requirements for infill placement, respectively in Section 02773 (Engineered Turf) of these Technical Specifications.

D. Rock riprap shall be placed in accordance with the requirements for placement in Section 02722 (Drainage and Erosion Controls) of these Technical Specifications.

E. Gravel pack material shall be placed in accordance with the requirements for backfilling in Section 15100 (Landfill Gas [LFG] Extraction Wells) of these Technical Specifications.

F. Coarse rock shall be placed at the construction entrances in accordance with the requirements of Section 02960 (Temporary Erosion and Sediment Controls) of these Technical Specifications.

G. Concrete sand shall be placed in accordance with the requirements of Section 02774 (Geosynthetic Clay Liner [GCL]) of these Technical Specifications.

H. Tank bedding and backfill shall be placed in accordance with the requirements of Section 15500 (Leachate Overflow and Collection System) of these Technical Specifications.

PART 4 MEASUREMENT AND PAYMENT

4.01 AGGREGATE BASE

A. Measurement and payment for aggregate base shall be included in the Contract Unit Prices for "Access Roads" addressed in Section 02310 (Access Roads) and "Flare Station" addressed in Section 15300 (Flare Station) of these Technical Specifications.

4.02 SAND BALLAST INFILL

A. Measurement and payment for sand ballast infill shall be included in the Contract Unit Prices for "Engineered Turf " addressed in Section 02773 (Engineered Turf) of these Technical Specifications

4.03 HYDROBINDER INFILL

A. Measurement and payment for HydroBinder infill shall be included in the Contract Unit Prices for "Engineered Turf " addressed in Section 02773 (Engineered Turf) of these Technical Specifications

4.04 PIPE BEDDING

A. Measurement and payment for pipe bedding shall be included in the Contract Unit Price paid for the various items of Work for which pipe bedding is required.

4.04 LOOSE AND GROUTED ROCK RIPRAP

A. Measurement and payment for loose and grouted rock riprap shall be included in the Contract Unit Price paid for the various items of Work for which loose and grouted riprap is required.

4.05 GRAVEL PACK

A. Measurement and payment for gravel pack shall be included in the Contract Unit Price for "LFG Extraction Wells" addressed in Section 15100 (Landfill Gas [LFG] Extraction Wells) of these Technical Specifications.

4.06 CONCRETE AGGREGATE

A. Measurement and payment for concrete aggregate shall be included in the Contract Unit Price paid for the various items of Work for which concrete aggregate is required.

4.07 COARSE ROCK FOR CONSTRUCTION ENTRANCE

A. Measurement and payment for coarse rock for the construction entrance shall be considered as included in the Contract Lump Sum Price paid for "Mobilization" addressed in Section 01500 (Mobilization) of these Technical Specifications.

4.09 TANK BEDDING AND BACKFILL

A. Measurement and payment for tank bedding and backfill for the leachate UST installation shall be considered as included in the Contract Unit Price paid for "Leachate UST" addressed in Section 15500 (Leachate Overflow and Collection System) of these Technical Specifications.

END OF SECTION

SECTION 02222
EXCAVATION

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall perform all excavation work including clearing, grubbing, stripping, excavation, and grading of the on-site borrow area and construction of the final cover Closure Turf Cap System soil layers (i.e., foundation layer), sedimentation basins, drainage and erosion control structures, LFG collection system and condensate drain/discharge components, and leachate UST in accordance with this Section and at the locations and to the dimensions shown on the Plans.

B. The Contractor shall excavate refuse in selected areas and relocate the refuse to the designated refuse relocation area shown on the Plans. Incidental refuse excavation and disposal shall also be performed as part of the installation of drainage, LFG collection system, and condensate drain/discharge components.

C. Excavation to be performed by the Contractor shall also include construction of any necessary haul roads, stockpiling of all excavated materials, hauling and disposal of any excavated refuse, and provisions for temporary dust, erosion, and drainage control measures.

D. The Contractor shall furnish all labor, supervision, tools, materials, equipment, transportation, and incidentals necessary to implement the respective excavation activities outlined above and within this Section.

1.02 REFERENCES

A. *Caltrans Standard Specifications.* California Department of Transportation, 2010.

B. *Caltrans Standard Plans*. California Department of Transportation, 2010.

1.03 SUBMITTALS

A. Temporary erosion and sediment control measures associated with excavation activities shall be addressed in the Work site's SWPPP prepared as part of Section 01550 (Storm Water Pollution Prevention) of these Technical Specifications.

B. The Contractor shall provide the Design Engineer with certified weight tags issued by the permitted transfer station or solid waste disposal facility for all loads of refuse transported off-site for disposal.

1.04 QUALITY ASSURANCE

A. Observation

1. The CQA Monitor will periodically observe performance of the excavations to verify conformance with the execution requirements in Part 3 of this Section.

2. If any portion(s) of the excavations are determined by the CQA Monitor to not meet the requirements of this Section, the Contractor, at his expense, shall rework or replace that portion(s) to meet the requirements of this Section as directed by the Design Engineer.

B. Surveying

1. The Contractor shall provide all construction staking, grading control, and other staking necessary to construct the excavations to the lines, grades, and dimensions shown on the Plans. The Design Engineer will provide data on existing control points in the vicinity of the Project for use by the Contractor's Land Surveyor or eligible Engineer.
2. All grades and dimensions of completed areas of the excavations shall be verified by the Design Engineer or CQA Monitor by field survey.
3. If it is demonstrated by the CQA field surveying that any portion(s) of the excavations does not meet the required lines, grades, or dimensions shown on the Plans, the Contractor, at his expense, shall rework or replace that portion(s) to bring the deficient area(s) to grade or the proper dimension in accordance with all requirements of this Section. A deduction will be made from the Contractor's compensation (based on standard wage rates) to retest the materials and re-verify the grade or the proper dimension by survey.

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION

3.01 GENERAL

A. Unless provided otherwise within this Section, all excavation activities shall conform to the applicable requirements of Section 16 and 19 of the Standard Specifications.

B. The Contractor shall instruct all personnel and maintain strict control over all excavation activities to protect and maintain the integrity of all existing environmental monitoring and control systems and any other facilities for the existing landfill. The cost of repairing any damage to these existing features will be determined by the Owner and be borne by the Contractor. The total repair cost to be borne by the Contractor will include those for exploration to determine extent of damage, mobilization of work crews, materials, material delivery, CQA testing and observation, and additional design.

3.02 CLEARING AND GRUBBING

A. The existing interim cover soil on the landfill surface and natural ground surface within the limits of the on-site borrow area as depicted on the Plans shall be cleared of all vegetative growth, such as brush, grass, weeds, or other deleterious material.

B. Clearing and grubbing shall be performed prior to beginning excavation in any area.

C. Cleared and stripped topsoil shall be stockpiled separately from excavated material or disposed of in accordance with this Section.

3.03 REFUSE EXCAVATION AND RELOCATION

A. Refuse shall be excavated at the designated locations beneath the existing power lines to the lines, grades and dimensions shown on the Plans.

B. Excavated refuse shall be relocated to the designated refuse relocation area shown on the Plans.

C. Relocated refuse placed within the designated refuse relocation area shall be spread in uniform lifts not to exceed 2 feet in thickness and each lift compacted with a minimum of four (4) passes using a dozer.

D. Relocated refuse lifts shall be covered with a minimum of 6 inches of soil at the end of each working day to minimize vector hazards and odor nuisance.

E. Within five (5) working days of completing the refuse excavation work beneath the existing power lines, the refuse relocation area shall be completely covered with a minimum of 12 inches of prepared and compacted foundation layer material in accordance with Section 02240 (Foundation Layer) of these Technical Specifications.

3.04 INCIDENTAL REFUSE EXCAVATION AND DISPOSAL

A. Refuse shall be excavated as necessary to accommodate the installation of drainage, LFG collection system, and condensate drain/discharge components at the locations and to the details shown on the Plans.

B. Excavated refuse may be temporarily stockpiled on and covered with visqueen at a designated location on-site, or discharged directly into a roll-off bin or dump truck. If temporarily stockpiled, the refuse must be removed by the end of each working day and transferred into a roll-off bin or dump truck for subsequent transport and disposal by the Contractor to a permitted transfer station or solid waste disposal facility. Refuse remaining on-site overnight in a roll-off bin or dump truck shall be covered at the end of each working day. Excavated refuse shall not remain on-site for more than a 48-hour period.

C. The Contractor shall not mix excess, surplus, or waste materials from other general construction activities with the refuse derived from the excavation work described in this Section. Those materials shall be managed and paid for separately under the Contract Lump Sum Price for "Mobilization" as outlined in Section 01500 (Mobilization) of these Technical Specifications.

3.05 SOIL EXCAVATION

A. The horizontal control points and one (1) benchmark shall be provided by the Design Engineer in the vicinity of the Work site. It shall be the responsibility of the Contractor to maintain control points and property line markers and to provide and maintain construction staking, grading control, or other staking necessary to perform the excavation and construct the stockpile.

B. Control points and property line markers that are removed, damaged, or destroyed by the Contractor shall be reestablished by the Contractor at the Contractor's expense.

C. Boulders encountered by the Contractor during excavation shall be removed, separated by size as directed by the Design Engineer, and stockpiled separately from excavated material or disposed of in accordance with this Section.

D. Excavation for drainage and erosion control structures shall conform to Section 19-1.03E of the Standard Specifications.

3.06 GRADING

A. The excavation shall be constructed in conformance with the lines, grades, and dimensions shown on the Plans; all distances and measurements, except elevations and structural dimensions, shall be made on a horizontal plane unless otherwise stated in this Section.

B. When completed, the grading plane for the drainage channels and sedimentation basins at any point shall not vary more than 0.10 foot above or below the grade shown on the Plans on slopes less than 10 percent nor vary more than 0.20 foot above or below the grade shown on the Plans on slopes greater than 10 percent.

C. Unsuitable materials, as determined by the Design Engineer, encountered at the subgrade elevation shall be removed and stockpiled separately from excavated material or disposed of in accordance with this Section. If, after removal of the unsuitable materials, a surface in accordance with Part 3 of this Section does not result, overexcavation correction procedures in this Section shall be followed.

D. If any portion of the excavation area is excavated by the Contractor below the design (prepared subgrade) elevations shown on the Plans, the Contractor shall perform overexcavation correction procedures, resulting in a surface which meets the requirements of Part 3 of this Section, as directed by the Design Engineer. Overexcavation correction procedures may consist of excavating, grading, and surface preparation of the entire overexcavated slope, or some portion thereof, to a lower subgrade elevation determined by the Design Engineer; backfilling with engineered fill and compacting to provide a firm and unyielding subgrade in accordance with the requirements of Section 02224 (Engineered Fill) of these Technical Specifications; or as otherwise directed by the Design Engineer. The cost of overexcavation correction procedures, redesign, additional surveying, and other incidental fees resulting from the overexcavation shall be paid by the Contractor, unless the overexcavation is performed at the direction of the Design Engineer to remove unsuitable materials at the subgrade elevation.

3.07 HAUL ROAD CONSTRUCTION

A. The Contractor shall construct and maintain any haul roads necessary to perform excavation.

B. The location of all haul roads proposed for construction and use by the Contractor must be approved by the Design Engineer.

3.08 DUST CONTROL

A. Dust control shall comply with the Contractor's approved Dust Control Plan.

B. A minimum of two (2) water trucks with operators shall be in operation at all times during excavation to provide dust control at all excavation, haul road, stockpile and staging areas. If

necessary, additional water trucks or other equipment with operators shall be provided and used by the Contractor to maintain these areas in a misted condition at all times during excavation.

C. The Design Engineer will require all excavation activities to cease if the Contractor's dust control efforts do not follow the approved Dust Control Plan, or fail to meet any of the requirements of this Part, until such time that the Contractor can demonstrate a return to compliance.

3.09 EROSION AND SEDIMENT CONTROL

A. Erosion and sediment control measures shall be implemented by the Contractor in accordance with the approved SWPPP, and as directed by the Design Engineer for all excavation work areas including haul roads and stockpile areas, adjacent areas which have been disturbed, or other affected areas.

B. The Contractor shall maintain erosion and sediment control measures until the final graded surface of the excavation is approved by the Design Engineer. If erosion creates a final subgrade surface which is not in accordance with any requirements of this Section, overexcavation correction procedures in this Section shall be performed by the Contractor, at the expense of the Contractor, including payment of all incidental fees.

3.10 DRAINAGE CONTROL

A. The Contractor shall provide ample means and devices with which to promptly remove and dispose of all water from any source entering the excavation or stockpile area(s) and maintain these at all times during excavation and until the final graded surface of the excavation and stockpile are approved by the Design Engineer. The Contractor shall perform excavation in the borrow source area in a manner that allows for the discharge and retention of storm water that does no conflict with the Contractor's excavation activities in the borrow area.

3.11 ARCHAEOLOGICAL AND PALEONTOLOGICAL RESOURCES

A. The Design Engineer shall serve as the Archaeological and Paleontological Monitor. The Contractor shall notify the Design Engineer in the event that he suspects that an archaeological or paleontological discovery is found during excavation for the Design Engineer's investigation. Should a paleontological or archaeological discovery be made during excavation, the Contractor shall cease work in that area until the discovery is evaluated or recovered. The Contractor may resume work elsewhere on the Work site that does not disturb the discovery until the evaluation or recovery is completed. Should the discovery result in an unavoidable delay to the Contractor, the Contractor shall immediately notify the Design Engineer of the delay in writing. Additional working days will be allowed for such a delay. The Contractor shall not charge the Owner for the delay under Sections 8-1.09 or 8-1.10 of the Standard Specifications until such delay exceeds a total of 20 hours for the Project, after which the Contractor may be entitled to compensation under said sections.

PART 4 MEASUREMENT AND PAYMENT

4.01 CLEARING AND GRUBBING

A. Clearing and grubbing shall be measured by the acre cleared and grubbed. Payment shall be

included in the Contract Unit Price per acre for "Clearing and Grubbing" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to complete the clearing and grubbing as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.02 REFUSE EXCAVATION AND RELOCATION

A. Refuse excavation and relocation shall be measured by the in-place cubic yards to be removed and includes all excavation, loading, transport, placement, compaction, and cover soil. Payment shall be included in the Contract Unit Price per cubic yard for "Refuse Excavation and Relocation" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to complete the refuse excavation and relocation as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.03 INCIDENTAL REFUSE EXCAVATION AND DISPOSAL

A. Measurement and payment for incidental refuse excavation shall be included in the Contract Unit Price paid for the various items of Work for which incidental refuse excavation is required.

B. Disposal of refuse shall be measured by the tonnage of refuse disposed of off-site at a permitted transfer station or solid waste disposal facility. Payment shall be included in the Contract Unit Price per ton for "Refuse Disposal" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to dispose of refuse as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.04 SOIL EXCAVATION

A. Sedimentation basin excavation shall be measured on a lump sum basis for the complete excavation of storm water retention basins to the grades and elevations shown on the Plans. Payment shall be included in the Contract Lump Sum Price for "Sedimentation Basin Excavation" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to excavate the sedimentation basins as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

B. Measurement and payment for soil excavation associated with construction of the foundation layer, drainage and erosion control structures, LFG collection system and condensate drain/discharge components, and the leachate overflow collection and storage system shall be included in the Contract Unit Price paid for these various items of Work for which soil excavation is required.

END OF SECTION

SECTION 02224
ENGINEERED FILL

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall install all engineered fill including all fill needed for construction of sedimentation basin improvements, backfilling of the former leachate pond, fill required for conforms outside engineered turf closure area, as well as incidental engineered fill placement for access road subgrades, buried header crossings, road crossings, and backfilling anchor trenches, and pipe/conduit trenches in the flare station area, in accordance with this Section and at the locations and to the dimensions shown on the Plans. The Contractor shall furnish all labor, supervision, tools, equipment, transportation and incidentals as necessary to prepare the subgrade, excavate, haul, place, moisture condition, compact, and grade the material to install the engineered fill.

1.02 REFERENCES

A. *Caltrans Standard Specifications.* California Department of Transportation, 2010.

B. *Caltrans Standard Plans*. California Department of Transportation, 2010.

C. *American Society for Testing and Materials.* Current Edition.

1.03 APPLICABLE STANDARDS AND SPECIFICATIONS

A. ASTM D 1557 Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Modified Effort (56,000 ft-lbf/ft^3 [2,700 kN-m/m^3]).

1.04 QUALITY ASSURANCE

A. Testing and Observation
   1. Testing and observation of engineered fill shall be conducted in accordance with the CQA Plan.
   2. The Contractor shall cooperate with the CQA Monitor during observation, testing, and collection of samples.
   3. If field and/or laboratory testing by CQA Monitor indicate that any area(s) of engineered fill does not meet compacted moisture content and dry density requirements, the Contractor shall rework the material in that area(s) at his expense until the engineered fill is in conformance with the requirements of this Section. A deduction will be made from the Contractor's compensation (based on standard wage rates) to pay for testing of the recompacted engineered fill material.
   4. Where work is interrupted by rain, operations subject to the moisture and density requirements shall not be resumed until observations and field tests by the CQA Monitor indicate that the moisture content and density of the in-place fill are within the limits specified. This requirement will not preclude the Contractor from disking or aerating the subject materials to achieve acceptable conditions.

B. Surveying

1. The Contractor shall provide all construction staking, grading control, and other staking necessary to construct the engineered fill to the lines, grades, contour lines, and dimensions shown on the Plans. The Design Engineer will provide data on existing control points in the vicinity of the Project for use by the Contractor's Land Surveyor or eligible Engineer.
2. All grades and dimensions of completed areas of the engineered fill may be verified by the Design Engineer or CQA Monitor by field survey.
3. If it is demonstrated by the CQA verification surveying that any portion(s) of the engineered fill does not meet the required lines, grades, or dimensions shown on the Plans, the Contractor, at his expense, shall rework or replace that portion(s) to bring the deficient area(s) to grade or the proper dimension in accordance with all requirements of this Section. A deduction will be made from the Contractor's compensation (based on standard wage rates) to retest the materials and re-verify the grade or the proper dimension by survey.

PART 2 PRODUCTS

2.01 SOURCE

A. On-site material meeting the requirements of this Section and as follows shall be used for engineered fill. The Contractor may need to segregate suitable on-site material for use as engineered fill.

B. Material excavated from within the on-site borrow area, sedimentation basins, and leachate UST excavation meeting the requirements of this Section shall be used for engineered fill.

C. It is expected that sufficient suitable material for engineered fill will be available from the on-site sources described in these Technical Specifications. The Contractor may need to segregate or select material from these sources for use as engineered fill, however the Contractor will not be required to mechanically screen or import material for engineered fill.

2.02 PROPERTIES

A. Engineered fill material shall be soil or soil/rock mixture that is free of organic matter, debris, and/or deleterious or other unsuitable materials.

B. Engineered fill material shall not contain rocks or clods over 6 inches in greatest dimension, and not more than 15 percent by dry weight shall be larger than 2 inches in greatest dimension or as approved by the Design Engineer.

PART 3 EXECUTION

3.01 PLACEMENT

A. Prior to placement of engineered fill on native ground, scarify the exposed soils in-place to a depth of approximately 6 inches, moisture condition to within 1 to 3 percentage points of optimum moisture content, and compact as engineered fill to at least 90 percent of the maximum dry density as determined by ASTM D 1557.

B. General engineered fill shall be placed in 6-inch lifts with a maximum uncompacted thickness of 8 inches. Each layer shall be spread evenly and thoroughly mixed to obtain a near uniform

condition in each layer. Engineered fill material shall then be brought to a uniform moisture content within 1 to 3 percentage points of the optimum moisture content, mixed as required to establish uniform moisture, and compacted to a minimum of 90 percent of the maximum dry density as determined by ASTM D 1557.

PART 4 MEASUREMENT AND PAYMENT

4.01 ENGINEERED FILL

A. Engineered fill for the sedimentation basin improvements, backfilling the former leachate pond, access roads, and areas outside the engineered turf closure area, shall be included in the Contract Unit Price for "Fill (Foundation Layer and Engineered Fill)" addressed in Section 02240 (Foundation Layer) of these Technical Specifications and includes all excavation, transport, placement, moisture conditioning and compaction. The quantity for "Fill (Foundation Layer and Engineered Fill" shall be a final pay quantity as described in Section 9-1.015 of the Standard Specifications and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install engineered fill as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.02 INCIDENTAL ENGINEERED FILL

A. Measurement and payment for incidental engineered fill shall be included in the Contract Unit Price paid for the various items of Work for which incidental engineered fill is required.

END OF SECTION

SECTION 02225
TRENCHING AND BACKFILLING

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall perform all trenching and/or backfilling operations necessary to install corrugated metal pipe (CMP) catch basins, down drains and overflow pipes, sedimentation basin outlet, buried pipes and conduits, anchoring of the LLDPE and engineered turf cover (if necessary), and construction of the GRL condensate trench drains in accordance with this Section and at the locations and to the dimensions shown on the Plans. The Contractor shall furnish all labor, supervision, tools, materials, equipment, transportation and incidentals as necessary to implement the trenching and backfilling operations.

1.02 REFERENCES

A. *Caltrans Standard Specifications.* California Department of Transportation, 2010.

B. *Caltrans Standard Plans*. California Department of Transportation, 2010.

C. *American Society for Testing and Materials.* Current Edition.

1.03 APPLICABLE STANDARDS AND SPECIFICATIONS

A. ASTM D 1557 Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Modified Effort (56,000 ft-lbf/ft^3 [2,700 kN-m/m^3]).

1.04 QUALITY ASSURANCE

A. Testing and Observation
   1. Testing and observation of trenching and backfilling shall be conducted in accordance with the CQA Plan.
   2. The Contractor shall cooperate with the CQA Monitor during observation, testing, and collection of samples.
   3. If field testing by the CQA Monitor indicates that the moisture content or density of any lift, or portion thereof, of trench and former leachate pond backfill fails to meet the specified requirement, the subject layer or portion thereof shall be re-worked, at the Contractor's expense, until the required moisture and density have been attained. No additional backfill shall be placed until the in-place fill has been inspected and accepted by the Design Engineer.
   4. Where work is interrupted by rain, operations subject to the moisture and density requirements shall not be resumed until observations and field tests by the CQA Monitor indicate that the moisture content and density of the in-place fill are within the limits specified. This requirement will not preclude the Contractor from discing or aerating the subject materials to achieve acceptable conditions.

PART 2 PRODUCTS

2.01 PIPE BEDDING

A. Pipe bedding shall conform to the requirements of Section 02207 (Aggregate Materials) of these Technical Specifications.

2.02 TRENCH BACKFILL

A. Backfill material for the condensate drain line trenches as shown on the Plans shall consist of material excavated from the trench unless specified otherwise by the Design Engineer.

2.03 ENGINEERED FILL

A. Backfill material for trenches with pipe bedding and for the GCL/geonet composite anchor trenches shall conform to the requirements of Section 02224 (Engineered Fill) of these Technical Specifications.

PART 3 EXECUTION

3.01 TRENCH PREPARATION

A. Required points of connection, lines, levels, contours, and datum locations shall be identified by the Contractor. Locations for points of connection that are shown on the Plans are approximate. The Contractor shall locate utilities to best serve the intended use and to avoid mechanical and structural interference.

3.02 TRENCH EXCAVATING

A. Trenches shall be excavated to the lines and grades as shown on the Plans. Water or materials that interfere with the work shall be removed.

B. Soft areas of trench subgrade not capable of compaction in place shall be cut out.

C. The trench bottom shall be firm, continuous, relatively smooth and free of rocks and/or unsuitable material prior to the installation of pipe bedding or trench backfill material.

3.03 SHORING, SHEETING, AND BRACING OF TRENCH

A. The trench shall be braced and supported with sheets when necessary to prevent caving during excavation in unstable material, or to protect adjacent structures, property, and workers.

B. The Contractor shall secure a trench permit from the California Division of Industrial Safety prior to the excavation of any trench over 5 feet in depth.

C. Shoring and sheeting shall be removed as the backfill is completed in a manner that will not damage the pipe or permit voids in the backfill.

D. All sheeting, shoring, and bracing of trenches shall conform to the safety requirements of the federal, state, or local public agency having jurisdiction. The most stringent of these requirements shall apply.

3.04 PIPE/CONDUIT TRENCH BACKFILLING

A. Trenches shall be backfilled to the lines and grades as shown on the Plans.

B. Placement methods shall be employed that do not disturb or damage buried drainage pipes and conduits in the trench.

C. Pipe bedding material shall be placed at trench bottom, level fill materials in one continuous layer not exceeding 6 inches compacted depth and compacted to 90 percent of maximum dry density as determined by ASTM D 1557.

D. Pipe bedding shall be placed around the sides and to the top of the pipe/conduit, tamped in place, and compacted to 90 percent of maximum dry density as determined by ASTM D 1557.

E. Optimum moisture content of pipe bedding material shall be maintained to attain required compaction density.

F. Portion of trench above pipe bedding shall be backfilled with engineered fill in accordance with Section 02224 (Engineered Fill) of these Technical Specifications.

G. Jetting of trenches shall not be permitted, unless allowed by the Design Engineer.

H. For buried pipe that does not require pipe bedding or engineered fill (condensate drain pipe), the trench backfill shall be placed in a manner that will not damage the pipe. The trench backfill shall be compacted to a firm consistency consistent with surrounding erosion-resistant layer material.

3.05 ANCHOR TRENCH BACKFILLING (IF NECESSARY)

A. A placement method shall be employed that does not damage the LLDPE geomembrane/engineered turf in the trench.

B. The portion of the trench above the LLDPE geomembrane/engineered turf shall be backfilled with engineered fill in accordance with Section 02224 (Engineered Fill) of these Technical Specifications.

C. Jetting of trenches shall not be permitted, unless allowed by the Design Engineer.

D. Trenches shall be backfilled to the lines and grades as shown on the Plans.

PART 4 MEASUREMENT AND PAYMENT

4.01 TRENCHING

A. Measurement and payment for trenching per this Section shall be considered as included in the Contract Unit Price paid for the various items of Work for which it is required.

4.02 SHORING, SHEETING, AND BRACING

A. Measurement and payment for any shoring, sheeting and trench bracing per this Section shall be considered as included in the Contract Unit Price paid for the various items of Work for which they are required.

4.03 TRENCH BACKFILLING

A. Measurement and payment for backfilling of trenches per this Section shall be considered as included in the Contract Unit Price paid for the various items of Work for which it is required.

END OF SECTION

SECTION 02240
FOUNDATION LAYER

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall prepare all existing interim cover soil to be incorporated into the foundation layer and place all new foundation layer material as necessary in accordance with this Section and at the locations and to the dimensions shown on the Plans. The Contractor shall furnish all labor, supervision, tools, materials, equipment, transportation, and incidentals as necessary to prepare, haul, place and grade soil material to install the foundation layer.

1.02 REFERENCES

A. *Caltrans Standard Specifications.* California Department of Transportation, 2010.

B. *Caltrans Standard Plans*. California Department of Transportation, 2010.

C. *American Society for Testing and Materials.* Current Edition.

1.03 APPLICABLE STANDARDS AND SPECIFICATIONS

A. ASTM D 1557 — Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Modified Effort (56,000 ft-lbf/ft^3 [2,700 kN-m/m^3]).

1.04 QUALITY ASSURANCE

A. Testing and Observation
   1. Testing and observation of the foundation layer, including verification of thickness, shall be conducted in accordance with the CQA Plan.
   2. The Contractor shall cooperate with the CQA Monitor during observation, testing, and collection of samples.
   3. If field and/or laboratory testing by CQA Monitor indicates that any area(s) of the foundation layer does not meet compacted moisture content and dry density requirements, the Contractor shall rework the material in that area(s) at his expense until the foundation layer is in conformance with the requirements of this Section. A deduction will be made from the Contractor's compensation (based on standard wage rates) to pay for testing of the recompacted foundation layer material.
   4. Where work is interrupted by rain, operations subject to the moisture and density requirements shall not be resumed until observations and field tests by the CQA Monitor indicate that the moisture content and density of the in-place fill are within the limits specified. This requirement will not preclude the Contractor from discing or aerating the subject materials to achieve acceptable conditions.

B. Surveying
   1. The Contractor shall provide all construction staking, grading control, and other staking necessary to construct the foundation layer to the lines, grades, and dimensions shown on the Plans. The Design Engineer will provide data on existing control points in the vicinity of the Work site for use by the Contractor's Land

Surveyor or eligible Engineer.

2. All grades and dimensions of completed areas of the foundation layer may be verified by the Design Engineer or CQA Monitor by field survey.
3. If it is demonstrated by the CQA verification surveying that any portion(s) of the foundation layer does not meet the required lines, grades, or dimensions shown on the Plans, the Contractor, at his expense, shall rework or replace that portion(s) to bring the deficient area(s) to grade or the proper dimension in accordance with all requirements of this Section. A deduction will be made from the Contractor's compensation (based on standard wage rates) to retest the materials and re-verify the grade or the proper dimension by survey.

C. Foundation Layer Thickness

1. If field testing by CQA Monitor indicates that any area(s) of the foundation layer does not meet the minimum thickness requirements, the Contractor shall place additional foundation layer material at his expense until the deficient area(s) is in conformance with the requirements of this Section. A deduction will be made from the Contractor's compensation (based on standard wage rates) to pay for testing of the new foundation layer placement area(s).

PART 2 PRODUCTS

2.01 SOURCE

A. On-site material meeting the requirements of this Section and as follows shall be used for the foundation layer.

B. Material excavated from within the on-site borrow area meeting the requirements of this Section shall be used for the foundation layer.

C. It is expected that sufficient suitable material for the foundation layer will be available from the on-site borrow area described in these Technical Specifications. The Contractor may need to segregate or select material from the borrow area for use as foundation layer material, however the Contractor will not be required to mechanically screen or import material for the foundation layer.

2.02 PROPERTIES

A. Foundation layer material shall be soil or soil/rock mixture that is free of organic matter, debris, and/or deleterious or other unsuitable materials.

B. Foundation layer material shall not contain rocks or clods over 6 inches in greatest dimension, and not more than 15 percent by dry weight shall be larger than 2 inches in greatest dimension or as approved by the Design Engineer.

PART 3 EXECUTION

3.01 SUBGRADE PREPARATION

A. All vegetative growth on existing interim cover soil surfaces shall be removed in accordance with the "Clearing and Grubbing" procedures presented in Section 02222 (Excavation) of these Technical Specifications.

B. The existing interim cover soils shall be fine graded to eliminate rough or low areas.

C. The existing interim cover soils shall be scarified within the limits shown on the Plans to a depth of approximately 12 inches, moisture conditioned to within 1 to 3 percentage points of optimum moisture content, and compacted to at least 90 percent of the maximum dry density as determined by ASTM D 1557.

3.02 PLACEMENT OF NEW FOUNDATION LAYER MATERIAL

A. In areas requiring additional foundation layer material as shown on the Plans, new foundation layer material shall be placed in 6-inch lifts with a maximum uncompacted thickness of 8 to 12 inches. Each layer shall be spread evenly and thoroughly mixed to obtain a near uniform condition in each layer. Foundation layer material shall then be brought to a uniform moisture content within 1 to 3 percentage points of the optimum moisture content, mixed as required to establish uniform moisture, and compacted to a minimum of 90 percent of the maximum dry density as determined by ASTM D 1557.

3.03 SURFACE GRADING

A. When completed, the surface of the foundation layer shall conform to the grades shown on the Plans after placement and compaction and at no point on the completed grading plane shall the grade vary above the designated grades by more than 0.10 feet.

B. When completed, the surface of all foundation layer slopes greater than 10 percent shall conform to the grades shown on the Plans. At no point on the completed grading plane shall the grade vary below the designated grades measured perpendicular to the slope, nor by more than 0.20 feet above the designated grades as measured perpendicular to the slope.

PART 4 MEASUREMENT AND PAYMENT

4.01 SUBGRADE PREPARATION

A. Subgrade preparation shall be measured by the square foot and includes all fine grading, scarification, moisture conditioning and recompaction. Payment shall be included in the Contract Unit Price per square foot completed for "Subgrade Preparation" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to prepare the subgrade as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.02 NEW FOUNDATION LAYER MATERIAL

A. New foundation layer material shall be measured by the in-place cubic yard installed and includes all excavation, transport, placement, moisture conditioning and compaction. The quantity for "Fill (Foundation Layer and Engineered Fili)" shall be a final pay quantity as described in Section 9-1.015 of the Standard Specifications and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install new foundation layer material as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

END OF SECTION

SECTION 02310
ACCESS ROADS

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall construct all access roads, including grading and subgrade preparation, in accordance with this Section and at the locations and to the dimensions shown on the Plans. The Contractor shall furnish all labor, supervision, tools, materials, equipment, transportation, and incidentals as necessary to prepare and construct the access roads.

1.02 REFERENCES

A. *Caltrans Standard Specifications.* California Department of Transportation, 2010.

B. *Caltrans Standard Plans*. California Department of Transportation, 2010.

C. *American Society for Testing and Materials.* Current Edition.

1.03 APPLICABLE STANDARDS AND SPECIFICATIONS

A. ASTM D 1557 Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Modified Effort (56,000 ft-lbf/ft^3 [2,700 kN-m/m^3]).

1.04 QUALITY ASSURANCE

A. Testing and Observation
   1. Testing and observation of the access roads shall be conducted in accordance with the CQA Plan.
   2. The Contractor shall cooperate with the CQA Monitor during observation, testing, and collection of samples.
   3. If any portion(s) of the access road construction is determined by the Design Engineer to not meet the requirements of this Section, based on either testing or observations, the Contractor, at his expense, shall rework or remove and replace that portion(s) to meet the requirements of this Section as directed by the Design Engineer.
   4. Where work is interrupted by rain, operations subject to the moisture and density requirements shall not be resumed until observations and field tests by the CQA Monitor indicate that the moisture content and density of the in-place fill are within the limits specified. This requirement will not preclude the Contractor from discing or aerating the subject materials to achieve acceptable conditions.

PART 2 PRODUCTS

2.01 REINFORCEMENT GEOTEXTILE

A. Reinforcement geotextile for the access road construction shall conform to the requirements of Section 02771 (Reinforcement Geotextile) of these Technical Specifications.

2.02 AGGREGATE BASE

A. Aggregate base for the access road construction shall conform to the requirements of Section 02207 (Aggregate Materials) of these Technical Specifications.

PART 3 EXECUTION

3.01 GENERAL

A. The Contractor shall provide all construction, grading control, and other staking necessary to construct the access roads to the lines, grades, and dimensions shown on the Plans.

3.02 SUBGRADE

A. Where access roads are not constructed on engineered fill, the subgrade for the access roads shall be scarified a minimum of 6 inches, uniformly moisture conditioned to within 1 to 3 percentage point of optimum moisture content and compacted to at least 90 percent of the maximum dry density as determined by ASTM D1557.

B. Where access roads are constructed on engineered fill, the engineered fill shall be placed and compacted in accordance with the requirements of Section 02224 (Engineered Fill) of these Technical Specifications.

3.03 REINFORCEMENT GEOTEXTILE

A. Prior to placing geotextile on the subgrade for access roads, the stability of the subgrade shall be checked in the presence of the CQA Officer by proof rolling with a roller or loaded water truck. Areas which are not suitable shall be allowed to air dry until stable or shall be over-excavated and backfilled with aggregate base, at the Contractor's expense.

B. Reinforcement geotextile shall be installed over the access road subgrade and seamed as specified in Section 02771 (Reinforcement Geotextile) of these Technical Specifications, as shown on the Plans, and in accordance with the manufacturer's instructions.

C. Reinforcement geotextile panels shall be installed (unrolled) in the direction of traffic (longitudinally).

D. Reinforcement geotextile panels shall be overlapped a minimum of 2 feet on sides and ends.

E. Trucks and other construction equipment shall not drive on reinforcement geotextile prior to covering with the full thickness of aggregate base.

3.04 AGGREGATE BASE

A. Prior to placing aggregate base on subgrade for access roads, the stability of the subgrade shall be checked in the presence of the CQA Officer by proof rolling with a roller or loaded water truck. Areas which are not suitable shall be allowed to air dry until stable or shall be over-excavated and backfilled with aggregate base, at the Contractor's expense.

B. Trucks shall back-dump aggregate base onto the reinforcement geotextile, driving on

previously dumped aggregate base to progress.

C. The aggregate base shall be spread in uniform loose lifts not exceeding 8 inches in thickness.

D. The aggregate base shall be moisture conditioned to within 1 to 3 percentages points of optimum moisture content, and compacted to a minimum of 95 percent of maximum dry density per ASTM D 1557.

E. Access roads shall be "proof rolled" in the presence of the Design Engineer or their representative with a heavy wheel-load vehicle, such as a loaded water truck, to identify weak areas. Weak areas shall be reworked to the Design Engineer's satisfaction without additional compensation.

PART 4 MEASUREMENT AND PAYMENT

4.01 ACCESS ROADS

A. Access roads shall be measured by the square foot in place as determined by the actual length constructed by the actual width constructed and includes all grading, subgrade preparation, reinforcement geotextile and aggregate base. Payment shall be included in the Contract Unit Price per square foot installed for "Access Roads" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the access roads as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

END OF SECTION

SECTION 02722
DRAINAGE AND EROSION CONTROLS

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall furnish and install (including necessary excavations) all drain inlets, drain pipes, sedimentation basin drainage risers, earthen and lined swales, rock riprap swales, rock riprap outfalls and inlets, and erosion control materials in accordance with this Section and at the locations and to the dimensions and grades shown on the Plans. The Contractor shall furnish all labor, supervision, tools, materials, equipment, transportation, and incidentals as necessary to prepare and construct the various drainage and erosion control features.

1.02 REFERENCES

A. *Caltrans Standard Specifications.* California Department of Transportation, 2010.

B. *Caltrans Standard Plan.* California Department of Transportation, 2010.

C. *American Society for Testing and Materials.* Current Edition.

1.03 APPLICABLE STANDARDS AND SPECIFICATIONS

A. ASTM D 1557 Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Modified Effort (56,000 ft-lbf/ft^3 [2,700 kN-m/m^3]).

1.04 SUBMITTALS

A. At least 14 calendar days prior to beginning any drainage or erosion control construction in accordance with the requirements of this Section, the Contractor shall provide three (3) copies to the Design Engineer of the name and location of material sources, laboratory test results and/or material data sheets conforming with relevant details shown on the Plans.

B. The Contractor shall provide the name and location of source, laboratory test results, and product data sheets (mix design) for the concrete to be used showing that the material meets or exceeds the product requirements. If more than one (1) concrete mix is to be used, mix designs for each area shall be submitted and clearly marked as to the area of Work that the mix is intended for.

C. At least 14 calendar days prior to delivery of materials to the Work site, the Contractor shall submit the following to the Design Engineer for approval:
   1. Samples, manufacturer's product data sheets, and manufacture's installation guidelines for the following materials to verify that the materials meet or exceed the corresponding product requirements:
      a. CMP, fittings and anchor assembly stakes and hardware.
      b. Turf reinforcement mat (TRM) and anchorage stakes.

c. Erosion control netting and anchorage staples.

1.05 QUALITY ASSURANCE

A. Testing and Observation
1. Testing and observation of the drainage and erosion control structures shall be conducted in accordance with the CQA Plan.
2. The Contractor shall cooperate with the CQA Monitor during observation, testing, and collection of samples.
3. If any portion(s) of the drainage and erosion control structures is determined by the CQA Monitor to not meet the requirements of this Section, based on either testing or observations, the Contractor shall, at his expense, rework or remove and replace that portion(s) to meet the requirements of this Section as directed by the Design Engineer.

B. Surveying
1. The Contractor shall provide all construction staking, grading control, and other staking necessary to construct the drainage components to the lines, grades, and dimensions shown on the Plans. The Design Engineer will provide data on existing control points in the vicinity of the Work site for use by the Contractor's Land Surveyor or eligible Engineer.
2. All lines, grades and dimensions of installed drainage components may be verified by the Design Engineer or CQA Monitor by field survey.
3. If it is demonstrated by the CQA verification surveying that any portion(s) of the drainage components does not meet the required lines, grades, or dimensions shown on the Plans, the Contractor, at his expense, shall rework or replace that portion(s) to bring the deficient area(s) to grade or the proper dimension in accordance with all requirements of this Section. A deduction will be made from the Contractor's compensation (based on standard wage rates) to retest the materials and re-verify the grade or the proper dimension by survey.

PART 2 PRODUCTS

2.01 DRAIN INLETS

A. Drain inlets shall be as shown on the Plans. Drain inlets shall be manufactured of cast in place concrete or prefabricated reinforced concrete or approved steel equivalent to the dimensions set forth in the Plans.

B. Concrete for the drain inlets shall conform to the requirements of Section 03300 (Concrete) of these Technical Specifications.

2.02 PIPE AND FITTINGS

A. The CMP for the drain pipe shall be of 16 gauge continuous helical lock corrugated steel pipe conforming to the requirements of Section 66 "Corrugated Metal Pipe" of the Standard Specifications. All CMP and standard assembly fittings required for complete assembly shall be galvanized conforming to the requirements of Section 66-1.02 E(1) of the Standard Specifications for zinc coated steel.

B. High density polyethylene (HDPE) pipe shall be Type S corrugated polyethylene pipe with smooth interior and shall conform to the requirements in AASHTO Designation M294. The pipe shall be manufactured from high-density polyethylene virgin compounds.

C. Pipe (including all couplings and fabricated fittings) shall be supplied from the source approved by the Design Engineer based on the submittal requirements in Part 1.04 of this Section.

D. Anchor assembly stakes and hardware for above ground CMP shall conform to Section 75-1.02 of the Standard Specifications. All hardware shall be galvanized after fabrication. All pipe stakes shall be either galvanized after fabrication, or be fabricated from pre-galvanized pipe. If pre-galvanized pipe is used, weld areas shall be cleaned and painted with zinc-rich primer.

2.03 PIPE BEDDING

A. Pipe bedding shall conform to the requirements of Section 02207 (Aggregate Base) of these Technical Specifications.

2.04 BACKFILL

A. Backfill above the pipe bedding shall consist of material excavated from the trench/excavation unless specified otherwise by the Design Engineer.

2.05 EROSION MATTING

A. Erosion matting as shown on the Plans for erosion mat lined swales shall be lined with TRM and shall be made of thermally-welded PVC monofilaments in a two-dimensional web as manufactured by Greenstreak and distributed as "PEC-MAT," or approved equivalent.

B. Anchorage for the TRM shall be wooden survey stakes, 1 inch by 4 inches in dimension, and approximately 10 to 12 inches in length.

2.06 ROCK RIPRAP

A. Loose and grouted rock riprap for the swales and outfalls shall conform to the requirements of Section 02207 (Aggregate Materials) of these Technical Specifications.

2.07 CONCRETE

A. Concrete for the drain inlets, sedimentation basin's drainage riser foundation, and grouted riprap outfalls shall conform to the requirements of Section 03300 (Concrete) of these Technical Specifications.

2.08 EROSION CONTROL

A. Straw for erosion control shall be certified weed free.

B. Erosion control netting shall be lightweight polypropylene having an approximate 0.50-inch x 0.50-inch mesh.

C. U-staples to anchor the netting shall be 0.50-inch by 10-inch U-staples as recommended by the netting manufacturer or as approved by the Design Engineer.

2.09 WOOD POSTS AND RAILING

A. The wood used for the posts and railing at the drainage inlets shall be construction common or better grade redwood. The wood shall be painted with two coats of premium quality exterior grade flat white latex paint approved by the Engineer. Nails used to fasten the rails to the posts shall be galvanized box gauge.

2.10 STEEL GRATE

A. The steel grate on the drainage inlet shall be made of #6 reinforcing bars at a 12 inch spacing. The bars shall be shop welded to form the grate per Plans. The ends of the bars in the upper mat shall be bent downward ¾ inch so that they will rest flat on the bottom of the notch at the top of the drainage inlet. The steel in the reinforcing bars may be Grade 40 or 60.

PART 3 EXECUTION

3.01 GENERAL

A. The Contractor shall provide all construction, grading control, and other staking necessary to construct drainage and erosion control structures to the lines and grades shown on the Plans.

3.02 STOCKPILING

A. The Contractor shall stockpile drainage and erosion control materials in an area(s) approved by the Design Engineer.

3.03 EXCAVATION

A. Excavation for drainage and erosion control structures shall be in conformance with the requirements specified in Section 02222 (Excavation) of these Technical Specifications.

3.04 DRAIN INLETS AND DRAIN PIPE

A. Trenching for drain inlets and buried drain pipe shall be in conformance with the requirements specified in Section 02225 (Trenching and Backfilling) of these Technical Specifications.

B. Placement of drain inlets/buried drain pipe and associated bedding and backfill material shall be in conformance with Section 66-1 of the Standard Specifications and Section 02225 (Trenching and Backfilling) of these Technical Specifications.

C. Above ground drain pipe shall be placed and anchored in conformance with Section 66 of the Standard Specifications and as shown on the Plans.

3.05 SEDIMENTATION BASIN DRAINAGE RISERS

A. Vertical slots shall be cut in the sedimentation basin drainage risers to the dimensions, orientation and frequency as shown on the Plans.

B. Trenching for the drainage riser foundations shall be in conformance with the requirements specified in Section 02225 (Trenching and Backfilling) of these Technical Specifications.

C. Minor concrete for the drainage riser foundations shall be installed as shown on the Plans and placed in conformance with Section 03300 (Concrete) of these Technical Specifications.

D. Placement of backfill material shall be in conformance with Section 66-1 of the Standard Specifications and Section 02225 (Trenching and Backfilling) of these Technical Specifications.

3.06 EARTHEN SWALES

A. Earthen swales shall be excavated to the lines and grades as shown on the Plans and in accordance with Section 02222 (Excavation) of these Technical Specifications.

3.07 EROSION MAT LINED SWALES

A. The TRM shall be installed as shown on the Plans and per manufacturer's recommendations.

B. Trenches for terminal and check slots (anchorage) shall be excavated into the erosion-resistant layer as shown on the Plans. Backfill of trenches shall be compacted to 90 percent of maximum dry density as determined by ASTM D 1557.

C. TRM placed at the top of swale (finish surface) shall be at or below the final grade so surface drainage can flow freely into the swale.

D. TRM shall first be installed in the upstream terminal end slow and rolled downstream with care taken to assure that the TRM conforms to the flow surface of the channel and is not in tension.

E. All splices shall be shingled downstream.

F. Anchorage stakes shall be installed as shown on the Plans and per manufacturer's recommendations.

3.08 LOOSE ROCK RIPRAP LINED SWALES

A. The earthen portion of the swale shall be excavated to the lines and grades as shown on the Plans and in accordance with Section 02222 (Excavation) of these Technical Specifications.

B. Rock riprap shall be placed on the earthen swales to the dimensions as shown on the Plans. Rock riprap shall be placed to the average thickness shown on the Plans with a maximum thickness deviation of 4 inches at any location.

C. Rock riprap shall not be placed by dumping.

D. The Contractor shall move and place individual riprap stones as necessary to obtain a stable three-point bearing for each stone and a well-graded distribution along the entire length of the swale. The placed rock riprap shall be free of pockets of small stones or clusters of larger stones.

3.09 GROUTED ROCK RIPRAP OUTFALLS

A. The footprint of the outfall shall be excavated to the dimensions as shown on the Plans and in accordance with Section 02222 (Excavation) of these Technical Specifications.

B. Rock riprap shall be placed within the excavated footprint to the average thickness shown on the Plans with a maximum thickness deviation of 4 inches at any location.

C. Rock riprap shall not be placed by dumping.

D. The Contractor shall move and place individual riprap stones as necessary to obtain a stable three-point bearing for each stone and a well-graded distribution over the entire footprint of the outfall. The placed rock riprap shall be free of pockets of small stones or clusters of larger stones.

E. Placement of concrete for the grouted rock riprap shall be in conformance with Section 03300 (Concrete) of these Technical Specifications.

3.10 ROCK RIPRAP INLET PROTECTION

A. The earthen portion of the swale or inlet shall be excavated to the lines and grades as shown on the Plans and in accordance with Section 02222 (Excavation) of these Technical Specifications.

B. Rock riprap shall be placed on the earthen swale at inlets to the dimensions as shown on the Plans. Rock riprap shall be placed to the average thickness shown on the Plans with a maximum thickness deviation of 4 inches at any location.

C. Rock riprap shall not be placed by dumping.

D. The Contractor shall move and place individual riprap stones as necessary to obtain a stable three-point bearing for each stone and a well-graded distribution along the entire area of protection. The placed rock riprap shall be free of pockets of small stones or clusters of larger stones.

3.11 EROSION CONTROL

A. Following the application of seed and fertilizer, straw shall be blown onto landfill and borrow area surface slopes that are steeper than 10 percent. Blown straw shall be applied to achieve a minimum thickness of 1.5 inches in place.

B. Following application of the straw, cover the straw with erosion control netting. Space netting anchors at a frequency of 1 foot on center along the edges, and one (1) every 35 square feet for interior areas. Space the butt joints 1 foot apart.

PART 4 MEASUREMENT AND PAYMENT

4.01 DRAIN INLETS AND DRAIN PIPE

A. Drain inlets shall be measured by each drain inlet installed and include all trenching, CMP, backfill, concrete, metal cover, and bars at the opening. Payment shall be included in the Contract Unit Price per each unit installed for "Drain Inlets" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the drain inlets as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

B. Above ground drain pipe shall be measured by the linear foot in place and include all pipe, couplings, and anchor assemblies. Payment shall be included in the Contract Unit Price per linear foot installed for the various sizes and types of "Above Ground Drain Pipe" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the above ground drain pipe as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

C. Buried drain pipe shall be measured by the linear foot in place and include all trenching, pipe bedding, pipe and couplings, backfill, and compaction. Payment shall be included in the Contract Unit Price per linear foot installed for the various sizes and types of "Buried Drain Pipe" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the buried drain pipe as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.02 SEDIMENTATION BASIN DRAINAGE RISERS

A. Sedimentation basin drainage risers shall be measured on a lump sum basis for the complete installation of the drainage risers. Payment shall be included in the Contract Lump Sum Price for "Sedimentation Basin Outlet" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the sedimentation basin drainage risers as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.03 SWALES

A. Earthen swales (Type I) shall be measured by the linear foot in place and include all excavation and grading. Payment shall be included in the Contract Unit Price per linear foot installed for "Type I Swales" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the Type I swales as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

B. Earthen swales with TRM (Types II and IV) shall be measured by the linear foot in place and include all excavation, grading and TRM materials. Payment shall be included in the Contract Unit Prices per linear foot installed for "Type II Swales" and "Type IV Swales" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the Type II and Type IV swales as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

C. Earthen swales with loose rock riprap (Type III) shall be measured by the linear foot in place and include all excavation, grading and riprap. Payment shall be included in the Contract Unit Price per linear foot installed for "Type III Swales" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the Type III swales as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.04 GROUTED ROCK RIPRAP OUTFALLS

A. Grouted rock riprap outfalls shall be measured by each grouted rock riprap outfall installed and include all excavation, rock riprap and concrete. Payment shall be included in the Contract Unit Price per each unit installed for "Grouted Rock Riprap Outfalls" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the grouted rock riprap outfalls as shown on the Plans, as specified herein, and as directed by the Design Engineer. The Contractor shall make provisions for additional material needed to account for excessive voids between rocks, as no additional compensation will be allowed therefore.

4.05 ROCK RIPRAP INLET PROTECTION

A. Rock riprap inlet protection shall be measured by each rock riprap inlet installed and include all excavation and rock riprap. Payment shall be included in the Contract Unit Price per each unit installed for "Rock Riprap Inlet Protection" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the rock riprap protection as shown on the Plans, as specified herein, and as directed by the Design Engineer. The Contractor shall make provisions for additional material needed to account for excessive voids between rocks, as no additional compensation will be allowed therefore.

4.06 EROSION CONTROL

A. Erosion control straw/netting shall be measured by the square foot in place and includes all straw, netting and anchorage. Payment shall be included in the Contract Unit Price per square foot installed for "Erosion Control" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the erosion control materials as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

END OF SECTION

SECTION 02771
REINFORCEMENT GEOTEXTILE

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall furnish, transport to the Work site, and install all reinforcement geotextile in accordance with this Section and at the locations and to the dimensions shown on the Plans. The Contractor shall furnish all labor, supervision, tools, materials (including sewing thread), equipment, transportation, and incidentals as necessary to install the reinforcement geotextile, including that needed for testing and joining materials in field (sewing, heat bonding, etc.).

1.02 REFERENCES

A. *Caltrans Standard Specifications.* California Department of Transportation, 2010.

B. *Caltrans Standard Plans*. California Department of Transportation, 2010.

C. *American Society for Testing and Materials.* Current Edition.

1.03 APPLICABLE STANDARDS AND SPECIFICATIONS

A.	ASTM D 4533	Test Method for Trapezoid Tearing Strength of Geotextiles.
B.	ASTM D 4632	Test Method for Breaking Load and Elongation of Geotextiles (Grab Method).
C.	ASTM D 4833	Test Method for Index Puncture Resistance of Geotextiles, Geomembranes, and Related Products.

1.04 SUBMITTALS

A. At least 14 calendar days prior to delivery of reinforcement geotextile rolls to the Work site, the Contractor shall submit three (3) copies of the following to the Design Engineer for approval:

1. Samples, product data sheets, and complete description of reinforcement geotextiles that meet or exceed the product requirements of this Section.
2. Manufacturer's Quality Control (MQC) testing reports for reinforcement geotextiles to be delivered to the Work site. At a minimum, results of those tests specified in Part 2 of this Section must be included in the MQC testing reports.
3. Manufacturer's recommended procedures for transporting, unloading, storage, handling, installation, repair, and seaming (sewing, heat bonding, and lapping) of reinforcement geotextiles.
4. Samples, product data sheets, and complete description of sewing thread recommended by the Manufacturer to sew the reinforcement geotextile.

1.05 TRANSPORT AND STORAGE

A. The reinforcement geotextile rolls shall be transported to the Work site by the Contractor with opaque protective coverings in a closed trailer.

B. At least seven (7) calendar days prior to any Work site delivery, the Contractor shall notify the Design Engineer of the date, time, material type, material quantity, and number of trucks for delivery. A copy of the packing list showing lot and roll numbers for each shipment shall also be provided to the Design Engineer prior to site delivery.

C. Unloading and storage (stacking) of the reinforcement geotextile rolls at the Work site shall be the responsibility of the Contractor; who shall observe and certify, in writing, that the unloading and storage of reinforcement geotextile rolls was performed in accordance with the submitted Manufacturer's recommended procedures.

D. The Contractor shall transport reinforcement geotextile rolls from the storage area in a manner that does not damage the reinforcement geotextiles, and in accordance with the Manufacturer's recommended procedures.

1.06 QUALITY ASSURANCE

A. Testing and Observation
   1. Testing and observation of the reinforcement geotextile shall be conducted in accordance with the CQA Plan.
   2. The Contractor shall cooperate with the CQA Monitor during observation, testing, and collection of samples.
   3. If any portion(s) of the reinforcement geotextile installation is determined by the Design Engineer to not meet the requirements of this Section, based on either testing or observations, the Contractor, at his expense, shall remove and replace that portion(s) to meet the requirements of this Section as directed by the Design Engineer.

PART 2 PRODUCTS

2.01 REINFORCEMENT GEOTEXTILE

A. Reinforcement geotextile shall be constructed of polypropylene materials and shall be resistant to damage under normal construction activities, and to biological and chemical degradation.

B. Reinforcement geotextile shall be a woven geotextile manufactured for the purposes of separation, confinement, and roadway subgrade reinforcement.

C. Physical properties of the reinforcement geotextile shall be tested at a minimum testing frequency of once per every 100,000 square feet of reinforcement geotextile manufactured and the physical properties shall be as follows:

Test Method	Property	Required Value/MARV
ASTM D 4632	Grab Tensile	
	-Machine Direction	315 lb.
	-Cross Direction	315 lb.
ASTM D 4632	Grab Elongation	
	-Machine Direction	12%
	-Cross Direction	12%
ASTM D 4833	Puncture	120 lb.
ASTM D 4533	Trapezoid Tear Strength	
	-Machine Direction	113 lb.
	-Cross Direction	113 lb.

D. Geotextile products which can be used and meet these specifications are TC Mirafi 600X, Synthetic Industries Geotex 315ST, or equivalent.

2.02 SEWING THREAD

A. The thread used for sewing of reinforcement geotextiles shall be polymeric and have strength properties equal to or greater than the reinforcement geotextile.

B. The thread used for sewing of reinforcement geotextiles shall be chemical resistant.

C. The thread used for sewing the reinforcement geotextiles shall be equivalent to that recommended by the reinforcement geotextile Manufacturer submitted in accordance with Part 1.04A of this Section.

PART 3 EXECUTION

3.01 PREPARATION AND EXAMINATION

A. The Contractor shall verify that the material and surface upon which the reinforcement geotextile is to be placed is complete and in accordance with the Technical Specifications for that material or surface prior to reinforcement geotextile installation.

3.02 INSTALLATION

A. Reinforcement geotextile shall be installed in accordance with Manufacturer's instructions.

B. Reinforcement geotextile shall be installed with sufficient tension to prevent excessive overlapping, insufficient overlapping, wrinkles, and folds.

C. Reinforcement geotextile panels shall be overlapped with sufficient material to create a prayer fold for sewing operations.

D. Reinforcement geotextile shall be ballasted during installation and until the reinforcement geotextile is covered with the overlying material.

E. Temporary anchorage for the reinforcement geotextile during placement shall be the responsibility of the Contractor.

F. Reinforcement geotextile shall be anchored as shown on the Plans when installation is complete.

G. Reinforcement geotextile damaged during installation shall be removed and/or repaired with a sewn patch.

H. Terminal ends of reinforcement geotextile, where the type and purpose of the reinforcement geotextile changes as shown on the Plans, shall be overlapped a minimum of 4 feet.

I. Portions of the reinforcement geotextile wasted by the Installer, and rendered unusable, as determined by the CQA Monitor, shall be transported by the Contractor off-site to a permitted transfer station or solid waste disposal facility for disposal at the Contractor's expense.

3.03 SEAMING

A. All seams for reinforcement geotextile filter shall be made by sewing; alternate seaming methods may be allowed if it is demonstrated by the Contractor that the method will create a seam that is acceptable for the intended purpose and will not reduce the properties of the reinforcement geotextile below those specified in Part 2 of this Section or cause damage to any underlying geosynthetic materials.

B. Soil materials which could adversely affect sewing operations shall be cleaned from the reinforcement geotextile prior to sewing.

C. A prayer fold shall be created within the overlap prior to sewing.

D. The prayer fold shall be sewn with a 401 two-thread chain stitch.

PART 4 MEASUREMENT AND PAYMENT

4.01 REINFORCEMENT GEOTEXTILE

A. Measurement and payment for reinforcement geotextile shall be included in the Contract Unit Price for "Access Roads" addressed in Section 02310 (Access Roads) of these Technical Specifications.

END OF SECTION

SECTION 02772
GEOMEMBRANE

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall furnish and transport to the site all geomembrane as shown on the Plans and a sufficient amount of extrudate rod to complete the extrusion welding necessary for testing and repairing the geomembrane.

B. The Contractor shall furnish all labor, tools, supervision, transportation, and equipment necessary for the installation of the geomembrane, including that needed for testing and welding materials in the field.

1.02 REFERENCES

A. ASTM D 638 Standard Test Method for Tensile Properties of Plastics.

B. ASTM D 746 Standard Test Method for Brittleness Temperature of Plastics and Elastomers by Impact.

J. ASTM D 5321 Standard Test Method for Determining the Coefficient of Soil and Geosynthetic or Geosynthetic Friction by the Direct Shear Method.

K. ASTM D 5397 Standard Test Method for Notched Constant Tensile Load Test of Geomembrane.

L. ASTM D 5596 Standard Test Method for Microscopic Evaluation of the Dispersion of Carbon Black in Polyolefin Geosynthetics.

M. ASTM D 5617 Standard Test Method for Multi-Axial Tension Test for Geosynthetics.

N. FTMS 101C Puncture Resistance.

O. ASTM D 5994 Sheet Thickness for Textured Geomembrane.

1.03 QUALIFICATIONS (Not Used - See Section 01010-1.03B)

1.04 SUBMITTALS

A. At least 14 days prior to delivery of geomembrane rolls to the site, the Contractor shall submit the following, in triplicate, to the Engineer for approval:
   1. A Certificate of Compliance stating that all resin used for the product to be supplied is from a single source in the United States or Canada, of the same general type, and meets the requirements of Part 2.01 of this Section.
   2. Manufacturer's Quality Control (MQC) test results for the geomembrane base resin.
   3. Samples, product data sheets, and a complete description of the geomembrane to be supplied that meets or exceeds the product requirements of Part 2.02 of this Section.
   4. A 2-foot by 2-foot (minimum size) sample from the same geomembrane specimen tested in accordance with Part 2.02G of this Section and possessing a degree of texturization representative of the material that will be shipped to the site.
   5. MQC test results for the geomembrane rolls to be delivered to the site. At a minimum, the results of the tests specified in Part 2.02 of this Section must be included in the MQC testing reports.
   6. Manufacturer's recommended procedures for transporting, unloading, storage, handling, installation, repair, seaming (extrusion and fusion welding), and seam testing of geomembrane.
   7. A Certificate of Compliance stating that the extrudate rod material meets the product requirements of Part 2.03 of this Section.

B. At least 14 days prior to beginning installation of geomembrane, the Contractor shall submit the following, in triplicate, to the Engineer for approval:
   1. Installer's Geomembrane Installation Quality Control Plan, which includes testing procedures and frequencies.
   2. Shop Drawings showing the proposed geomembrane panel layout and details of field fabrications including skirt and sleeve pipe boots.
   3. Installer's Qualifications including the following:
      a. Resume of Installer's foreman.
      b. Resume of Installer's master welder.
      c. Resumes of Installer's welding and quality control personnel.

C. Upon completion of the geomembrane installation, the Contractor shall submit the following, in triplicate, to the Engineer.
   1. Installer's warranty in compliance with Part 1.07B of this Section.
   2. As-built geomembrane panel layout drawings showing all panels, testing, sampling, and repair locations.

1.05 TRANSPORT AND STORAGE

A. At least seven days prior to any site delivery, the Contractor shall notify the Engineer of the date, time, material type, material quantity, and number of trucks for delivery. A copy of the packing list showing lot and roll numbers for each shipment shall also be provided to the Engineer prior to site delivery.

B. Unloading and storage (stacking) of the geomembrane rolls at the site is the responsibility of the Contractor; however, unloading and storage of geomembrane rolls shall be performed in accordance with the submitted Manufacturer's recommended procedures.

C. The Contractor shall transport geomembrane rolls from the storage area in a manner that does not damage the geomembrane, and in accordance with the Manufacturer's recommended procedures.

D. The storage area for the geomembrane rolls will be located by the Contractor and must be approved by the Engineer.

1.06 QUALITY ASSURANCE TESTING

A. The CQA Monitor will take at least one sample for every 100,000 square feet of geomembrane delivered to the site and perform the following quality CQA conformance testing to verify that the product meets the requirements of Part 2.02 of this Section.
   1. Tensile Properties (ASTM D638).
   2. Density (ASTM D1505).
   3. Carbon Black Content (ASTM D1603).
   4. Carbon Black Dispersion (ASTM D5596).
   5. Sheet Thickness (ASTM D5994)

B. The CQA Monitor will take at least one sample per lot of geomembrane delivered to the site for CQA conformance testing to verify compliance with the interface shear strength requirements of Part 2.02F of this Section.

C. Geomembrane shipped to the site that does not contain a degree of texturization comparable to the approved texture sample submitted in accordance with Part 1.04A of this Section will be rejected by the Engineer.

D. Sampling for CQA conformance testing may be performed by the CQA Monitor at the manufacturing plant prior to shipping.

E. The CQA Monitor will collect samples and send them to the Geosynthetics Testing Laboratory for seam testing in accordance with Part 3.05E of this Section. Within 48 hours of sampling, the Engineer will accept or reject the seams based on the results of laboratory testing.

F. The Contractor shall assist with seam sampling by cutting samples and repairing sample locations at the direction of the CQA Monitor.

1.07 WARRANTIES

A. The Contractor shall provide a five-year prorata warranty for the geomembrane against deterioration due to exposure to the elements, either exposed or buried.

B. The Contractor shall provide a two-year non-prorata warranty for the geomembrane against installation defects.

PART 2 PRODUCTS

2.01 RESIN

A. The resin used for manufacturing the geomembrane shall be new virgin material, first quality, compounded Linear Low-density Polyethylene (LLDPE), and manufactured specifically for producing geomembrane.

B. Preferred, but not required to have a 4- to 6-inch wide smooth edge to promote welding.

D. No mixing of different resin types shall occur during geomembrane manufacturing.

E. No second run or recycled materials shall be used during geomembrane manufacturing.

F. The resin used for manufacturing the geomembrane shall have a Specific Gravity (ASTM D 792) of minimum 0.940 g/cm^3 after addition of carbon black and other additives.

G. The resin used for manufacturing the geomembrane shall not contain more than 1 percent (by weight) additives other than carbon black.

H. The resin used for manufacturing the geomembrane shall not contain more than 3.5 percent (by weight) total additives.

2.02 GEOMEMBRANE

A. All geomembrane shall be manufactured by the same Manufacturer in the United States or Canada.

B. Geomembrane shall have a structured studded drainage surface on the top side and a spiked friction surface on the bottom side using a method which fully integrates the texture asperities with the sheet, such as Super Gripnet®, or equivalent; no spray-on texturing shall be allowed.

C. Additives for UV protection, thermal stability, or processing agents must not "bloom" to the surface of the geomembrane over time or inhibit welding.

D. Finished geomembrane rolls shall be free from blemishes, holes, pin holes, bubbles, blisters, excessive gels, undispersed resins, undispersed carbon black, contamination by foreign materials, nicks, and cuts.

E. Geomembrane shall meet the following minimum average roll values for the following properties.

TEST	MINIMUM AVERAGE ROLL VALUE[1]	MQC[3] TEST FREQUENCY
Sheet Thickness (ASTM D 5994)	50-mil ±10 % [2]	10 per roll
Density (ASTM D 792, Method B)	0.993 g/cm^3	1 per rail car
Tensile Strength @ Break (ASTM D 6693)	105 ppi	1 per 100,000 ft^2
Elongation @ Break (ASTM D 638)	300 %	1 per 100,000 ft^2
Tear Resistance (ASTM D 1004)	30 lb	1 per 100,000 ft^2
Puncture Resistance (ASTM D 4833)	55 lb	1 per 100,000 ft^2
Carbon Black Content (ASTM D 4218)	2.0 to 3.0 %	1 per 100,000 ft^2
Carbon Black Dispersion (ASTM D 5596)	All Category 1 or 2	1 per 100,000 ft^2
Oxidation Induction Time (ASTM D 3895)	140 minutes minimum @ 200°C	1 per 100,000 ft^2
Low Temperature Brittleness (ASTM D 746)	< -40°F	Certification
Dimensional Stability (ASTM D 1204)	2 % maximum change	Certification
Drainage Stud Height (ASTM D 7466)	130-mil	1 per 100,000 ft2
Friction Spike Height (ASTM D 7466)	175-mil	1 per 100,000 ft2

[1] The average of all measurements on any roll shall not be less than the MARV value.
[2] The minimum allowable thickness for any measurement shall not be less than 10% of the nominal specified thickness. The average of all measurements on any roll shall not be less than 48 mils.
[3] Manufacturing Quality Control.

I. The geomembrane shall have the following minimum seam strength and test failure criteria when welded in accordance with the submitted Manufacturer's recommended procedures:
   1. For peel test specimens:
      a. The failure mode shall be a film tear bond (FTB).
      b. There shall be no more than 10 percent peel penetration into the weld.
      c. The quantitative value for the peel strength shall be a minimum of 75 ppi.
   2. For shear test specimens:
      a. The failure mode shall be film tear bond (FTB).
      b. The specimen shall achieve a 2-inch elongation with the grips initially set one inch back from the edge of the weld.
      c. The quantitative value for bonded seam strength shall be a minimum of 120 ppi.

2.03 EXTRUDATE ROD

A. All extrudate rod shall be made from same resin as the geomembrane.

B. All additives shall be thoroughly dispersed throughout the rod.

C. Extrudate rod shall be free of contamination by moisture or foreign materials.

2.04 FIELD FABRICATIONS

A. All geomembrane used for field fabrications shall be obtained from the approved geomembrane rolls to be used for the panel installation which meet the material property requirements of Part 2.02 of this Section.

B. The Installer shall fabricate and weld all skirt and sleeve pipe boots in the locations shown on the Plans, and as shown on the approved Shop Drawings.

2.05 FIELD TESTING EQUIPMENT

A. A field tensiometer shall be used by the Installer for seam strength testing and be calibrated and accurate to within 2 pounds.

B. A one-inch (width) by six-inch (length) cutting die shall be used for cutting seam strength test specimens from bulk seam samples.

PART 3 EXECUTION

3.01 PREPARATION AND EXAMINATION

A. The Installer shall verify that the subgrade surface upon which the geomembrane is to be placed is smooth, uniform, firm and unyielding, and free from rocks or other debris. No protrusions, ruts, or ridges greater in depth or height than 1.0 inch shall be allowed prior to geomembrane installation.

B. The Contractor and Installer shall complete and sign the Subgrade Acceptance Form provided by the CQA Monitor, verifying that the surface which the GCL will be installed upon is acceptable. The CQA Monitor and the Design Engineer will also verify that the surface which the GCL will be installed upon is acceptable. Once the Contractor has signed the Subgrade Acceptance Form, it is the Contractor's responsibility to maintain the surface in the condition required by Part 3.01A of this Section.

C. The Contractor is responsible for temporary anchorage during installation and until permanent ballast is fully installed.

D. Prior to and at the middle of each geomembrane welding work shift and whenever adjustments are made to the welding machines, the Installer shall prepare and test trial welds for each welding machine that are being used or will be used during that work shift. Trial welds shall be prepared for both fusion and extrusion welding machines. Trial weld samples for fusion welding machines shall be a minimum of 6-feet in length; trial weld samples for extrusion welding machines will be a minimum of 3-feet in length with the trial weld centered on and running the length of the sample. Trial welds shall be tested as follows.
   1. Trial welds shall be allowed to cool to ambient conditions, prior to testing. After cooling, excessive material shall be cut from the beginning and the end of the trial weld sample (approximately 4-inches from each end). Using the cutting die, four 1-inch specimens shall be cut at an even spacing along the length of the trial weld.
   2. Using the field tenisometer, two non-adjacent specimens shall be tested for peel adhesion (peel) and two for bonded seam strength (shear). Both sides of fusion

welds shall be tested for peel. The rate of separation for both the peel and the shear tests shall be 2 inches per minute. The CQA Monitor will be present for, and observe, all trial weld tests.

3. All peel test specimens shall meet all of the following criteria:
   a. The failure mode shall be a film tear bond (FTB).
   b. There shall be no more than 10 percent peel penetration into the weld.
   c. The quantitative value for the peel strength shall be a minimum of 75 ppi.
4. All shear test specimens shall meet all of the following criteria:
   a. The failure mode shall be film tear bond (FTB).
   b. The specimen shall achieve a 2-inch elongation with the grips initially set one inch back from the edge of the weld.
   c. The quantitative value for bonded seam strength shall be a minimum of 120 ppi.
5. If any of the four test specimens do not meet the peel or shear criteria, the entire trial weld will be rejected and that machine shall not be used for installation of the geomembrane until passing a retest. Retesting shall consist of repeating the entire trial weld sampling and testing procedure on a new weld performed with the failing machine. If the retested trial weld fails, that welding machine shall not be used for installation of the geomembrane until proper adjustments or repairs and a passing trial weld test results. If the welding machine continually fails field testing, the machine shall be tagged and completely removed from work area.

3.02 INSTALLATION

A. Geomembrane panels shall be deployed parallel to the slope by unrolling down the entire length of the slope. Corrections or adjustments shall be made to panels which become askew to the parallel line of the slope. End-to-end panel butt seams shall occur on benches.

B. The textured geomembrane shall be placed in direct and uniform contact with underlying protective cover subgrade soil, with the spikes down and the stud side up. The geomembrane surface shall not be dragged over the underlying subgrade; a plastic slip sheet or other means shall be used to position the geomembrane without dragging it over the subgrade.

C. Adjacent geomembrane panel edges shall be overlapped a minimum of 4-inches for fusion welding. The alignment of the overlap shall be kept consistent by marking overlap indicator points.

D. Geomembrane damaged during handling, transport, or deployment shall be removed or repaired as directed by the Engineer.

E. Geomembrane installation and seaming methods shall not damage underlying subgrade or soil materials; any damage to underlying soil materials shall be repaired at the expense of the Contractor.

F. The Installer shall only deploy the quantity of geomembrane which can be completely welded and anchored by the end of the work shift or day.

G. The Contractor shall prepare an adequate number of sandbags to ballast the geomembrane during deployment. Geomembrane rolls may also be used for ballast provided that no damage to the deployed geomembrane occurs. Only plastic ties shall be used to close sandbags; no

metal or wire ties shall be used. Sandbags shall be removed prior to deploying overlying materials and after completion of permanent closure turf ballast installation. Sandbags shall be disposed of as directed by the Engineer. Sandbag fill shall not be disposed of within the limits of work unless the fill consists of material which meets the Specification for the material it is disposed upon. Adequate sandbags and timely covering are required to prevent wind shifting of geomembrane. If shifting of geomembrane occurs, inspection of underlying subgrade will be required to ensure the subgrade has not been compromised. Repairs or replacement will be required if displacement or damage has occurred .

H. The Installer shall deploy and seam the geomembrane in a manner which minimizes wrinkles; however, the Installer shall be responsible for, and coordinate with the Manufacturer in, providing the proper amount of slack in the installed geomembrane to compensate for contraction due to local temperature extremes prior to covering. Stress-bridging and "fishmouths" shall not be allowed.

I. Immediately after geomembrane panels running through ditch flow lines or at toes of slopes are welded, sandbags shall be placed end-to-end along the entire length of the flow or toe line to prevent geomembrane stress-bridging at those locations.

J. Portions of the geomembrane wasted by the Installer, and rendered unusable, as determined by the CQA Monitor, shall be transported and disposed of by the Contractor.

K. No equipment will be allowed on slopes exceeding 15% on the partially constructed turf cap system until after the completed installation of the sand infill ballast. On slopes less than 15%, ATV type vehicles will be allowed prior to infill placement if the tire /track pressure is less than 5 psi.

L. Following full specified sand infill ballast thickness installation, shall be limited to light duty vehicles with drivability tire/track pressures of less than 35 psi.

3.03 FUSION WELDING

A. Fusion welding shall only take place when the ambient temperature is between 40°F and 110°F. The Installer shall measure ambient temperature 6-inches above the deployed geomembrane. Special weather seaming plans shall be submitted by the Installer and approved by Engineer to perform fusion welds outside this ambient temperature range.

B. All geomembrane seams shall be fusion welded by the double-track method leaving an air gap for leak testing. Extrusion welding shall only be used for repairs, patches, and fabrications.

C. Fusion welding machines shall complete trial weld procedures and pass field testing as specified in Part 3.01 of this Section prior to welding the geomembrane seams.

D. A power source capable of producing sufficient and constant voltage under the combined line load of other welders and equipment shall be used.

E. The surface of the geomembrane to be welded shall be thoroughly cleaned.

F. Geomembrane panels shall be welded at the same speed, temperature, roller pressure, and gauge settings used to prepare the trial weld; the Installer shall adjust the above settings as

temperature conditions indicate and record welding machine number, operator, machine settings, time, and date for each seam welded.

3.04 EXTRUSION WELDING

A. Extrusion welding guns shall complete trial weld procedures and pass field testing as specified in Part 3.01 of this Section prior to welding patches or fabrications.

B. Geomembrane patches to be extrusion welded shall overlap the underlying geomembrane panel a minimum of 4 inches.

C. The Installer shall cut square repair patches with rounded corners large enough to extend a minimum of 4 inches beyond the repair area in all directions.

D. The geomembrane patch shall be tack-welded to the underlying geomembrane panel to prevent movement during grinding and extrusion welding operations.

E. A disc grinder shall be used to remove surface debris and oxidation from the outer edge of overlapped geomembrane patches and the underlying geomembrane. Grinding parallel to seam shall not be allowed.

F. The nozzle of the extrusion gun shall be purged to remove solidified extrudate before each use.

G. The extrusion weld shall completely cover the entire width of the grind area and extend 4 inches up any intersecting fusion weld.

H. A cap strip patch shall be extrusion welded at all fusion welded seam intersections of three or more geomembrane panels.

3.05 QUALITY CONTROL

A. General
   1. The Installer shall perform all quality control procedures and testing in accordance with the approved Geomembrane Installation Quality Control Plan.
   2. The Installer shall maintain an accurate geomembrane panel layout drawing during installation. The drawing shall include: 1) roll and panel numbers; 2) seam numbers; 3) geomembrane limits; 4) anchor trench locations; and 5) seam test sample dates and locations.

B. Deployment
   1. The Installer shall coordinate with the CQA Monitor in assigning geomembrane panel and corresponding seam numbers.
   2. The Installer shall maintain, and submit to the CQA Monitor, daily deployment logs and panel layout drawings as the deployment progresses and record panel and seam numbers, panel dimensions, and deployment quantities.

C. Fusion Welding
   1. The Installer shall maintain, and submit to the CQA Monitor, daily welding logs on which are recorded welding machine number, operator, machine settings, time, and

date for each seam welded.

2. The entire length of each fusion welded seam shall be air-pressure tested by the Installer. The Installer shall provide an air pump capable of generating and maintaining 40 psi of pressure and equipped with a regulator and pressure gauge. The Installer shall provide pressure feed needles with pressure gauges accurate to 1 psi and perform the following air pressure test procedure:
   a. Seal both ends of the fusion welded seam with vise-grip plate clamps or an extrusion weld. Heat may be applied to the seam ends to aid in sealing the seam in conjunction with the clamps. Due to the potential hazard of igniting landfill gas, propane torches or any other flame producing device shall not be used.
   b. At one end of the seam, insert air pressure needle into the fusion weld channel.
   c. Pressurize the channel to 40 psi and maintain pressure for 5 minutes.
   d. Release air from the opposite end of the seam to verify that the entire length of the fusion weld channel was pressurized. If channel pressure is not maintained with a maximum allowable pressure loss of 2 psi over the 5-minute test period or does not stabilize at all; the Installer shall locate the defective area, isolate it, and repeat air pressure test procedures in each direction from the defective area.
   e. The Installer shall maintain air pressure test logs on which are recorded seam numbers, beginning and ending air pressures, beginning and ending test times, lengths of tested seam, defective areas found, and confirmation of repair.

D. Extrusion Welding
   1. The Installer shall maintain, and submit to the CQA Monitor, daily welding logs on which are recorded welding machine number, operator, machine settings, time, and date.
   2. The Installer shall vacuum test each extrusion welded along its entire length. The Installer shall provide a vacuum pump capable of generating and maintaining a pressure of 30 inches of mercury, and equipped with a regulator and vacuum gauge. The Installer shall also provide a vacuum box with a gasket-type seal and a clean view window, and vacuum gauge accurate to 1 psi and perform the following vacuum test procedure:
      a. Saturate the extrusion weld with a soap and water solution.
      b. Place view box over the saturated weld, create an air tight seal, and apply vacuum in the box.
      c. Maintain the vacuum for 10 seconds and examine weld for forming bubbles which indicate leaks. Mark detected leaks for follow up extrusion weld repair. Retest detected leaks after repair to verify that the leaks were successfully repaired.
      d. The Installer shall maintain vacuum test logs on which are recorded repair numbers, vacuum test dates, and vacuum test results.

E. Seam Test Sampling Procedures
   1. The CQA Monitor will determine seam test sample locations at minimum intervals of 500 lineal feet of welded seam. The CQA Monitor may decrease or increase this frequency based on previous seam test results. The Installer shall cut the seam test sample where indicated by the CQA Monitor.

2. The Installer shall repair sample holes with an extrusion welded patch in accordance with Part 3.04 of this Section and perform a vacuum test in accordance with Part 3.05D of this Section.
3. Seam test samples shall be 12-inches wide by 36-inches long with the weld centered along the length of the sample. Sample sizes may be modified at the request of the CQA Monitor. The Installer shall cut one 1-inch specimen from each end of the sample and field test the specimens for peel adhesion in accordance with Part 3.01 of this Section. If these specimens pass the field peel test, the CQA Monitor will divide the remaining sample and submit one specimen to the Geosynthetics Testing Laboratory for further testing and retain one for archive. If either of the specimens fail the field peel test, the Installer shall perform Failed Seam Analysis Procedures in accordance with Part 3.07 of this Section.
4. The Installer may take and test any sample at its option; however, all sampling and testing shall be done under the observation of the CQA Monitor and all tests and repairs shall be in accordance with the procedural requirements of this Part.

3.06 LABORATORY TESTING

A. The Geosynthetics Testing Laboratory will perform the following test procedure at the direction of the Engineer:
1. Test five specimens from each sample submitted for peel adhesion and five specimens from each sample for bonded seam strength (ASTM D 6392).
2. All specimens must meet the criteria specified in Part 3.01C of this Section for each type of test.
3. Both sides of fusion welded seams shall be tested for peel adhesion.

B. The Engineer's acceptance of the welded geomembrane seams will be based on the results of laboratory seam analysis.

C. The Engineer will notify the Installer of acceptance or rejection of the seam within 24 hours of submission of the samples to the Geosynthetics Testing Laboratory.

3.07 FAILED SEAM ANALYSIS PROCEDURES

A. The Installer shall perform the following procedures in the event of a seam failure determined by field or laboratory testing:
1. The Installer shall mark the failed seam at a distance of 10 feet in each direction from the failed test sample location. The Installer shall cut a 12-inch by 12-inch sample from each location, then cut one 1-inch wide specimen from each end of the sample, and field test the specimens for peel adhesion in accordance with Part 3.01 of this Section. If all specimens pass the field peel test, the Installer shall cut, and submit to the CQA Monitor, a 12-inch wide by 18-inch long sample from each location for laboratory seam testing. If any of the specimens fail the field peel test at either location, the Installer shall continue sampling the failed seam at 10-foot intervals until specimens successfully pass the field peel tests and a sample can be submitted for laboratory testing. If specimens continually fail field peel tests at the 10-foot intervals, the entire seam or portion of the welded seam shall be repaired by the Installer as directed by the Engineer.
2. The Installer shall repair the failed length of seam determined by field peel testing with an 18-inch wide extrusion welded cap strip in accordance with Part 3.04 of this

Section. The installer shall vacuum test the cap strip in accordance with Part 3.05D of this Section.

3. If the retest sample fails laboratory testing in accordance with Part 3.06 of this Section, the Installer shall repeat the interval sampling and testing procedure.

B. At the discretion of the CQA Monitor, seam test samples will be taken from extrusion welded cap strips exceeding 100 feet in length.

PART 4 MEASUREMENT AND PAYMENT

4.01 GEOMEMBRANE

A. Geomembrane material shall be measured on a horizontal plane in plan view by the square foot of the in-place material installed. The quantity for "Geomembrane" shall be a final pay quantity as described in Section 9-1.02C, "Final Pay Quantities," of the Standard Specifications and as shown on the Plans. The price paid per square foot for geomembrane shall include full compensation for providing all labor, equipment, tools, and incidentals required for installation of the geomembrane as shown on the Plans, as specified herein, and as directed by the Engineer and no additional compensation will be allowed therefor. The Contractor shall make provisions for additional material needed to account for overlaps, anchorage, and waste, as no additional compensation will be allowed therefor.

4.02 GEOMEMBRANE SURFICIAL STRIPS

A. Geomobrane material for the surficial strips shall be measured by the lineal foot for the 3.5 foot wide strips. The price per lineal foot for geomembrane surficial strips shall be included in the Contract Unit Price per lineal foot installed for "Geomembrane Surficial Strips" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the geomembrane surficial strips as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefor.

END OF SECTION

SECTION 02773
ENGINEERED TURF

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall furnish, transport to the Work site, and install all engineered turf in accordance with this Section and at the locations and to the dimensions shown on the Plans. The Contractor shall furnish all labor, supervision, tools, materials, equipment, transportation, and incidentals necessary to install the engineered turf, sand ballast infill, and HydroBinder® Infill, including that needed for testing and connecting materials in field.

1.04 SUBMITTALS

A. At least 14 calendar days prior to delivery of engineered turf rolls to the Work site, the Contractor shall submit three (3) copies of the following to the Design Engineer for approval:
   1. Samples, product data sheets, and complete description of engineered turf that meets or exceed the product requirements of this Section.
   2. MQC testing reports for engineered turf to be delivered to the Work site. At a minimum, results of those tests specified in Part 2 of this Section must be included in the MQC testing reports.
   3. For the geonet base resin:
      a. A Certificate of Compliance stating that all resin used for the product to be supplied is from a single source in the United States or Canada, of the same general type, and meets the requirements of Part 2 of this Section.
      b. MQC test results.
   4. Manufacturer's recommended procedures for transporting, unloading, storage, handling, installation, repair, and seaming (sewing, heat bonding, lapping, and plastic ties) of the geonet composite.
   5. Samples, product data sheets, and complete description of plastic fasteners (ties) recommended by the Manufacturer to join the geonet and sewing thread recommended by the Manufacturer to sew the geotextile.
   6. Panel layout showing machine direction of rolls.

1.05 TRANSPORT AND STORAGE

A. The engineered turf rolls shall be shipped by the Supplier with protective coverings in a closed trailer or a covered open trailer.

B. At least seven (7) calendar days prior to any Work site delivery, the Contractor shall notify the Design Engineer of the date, time, material type, material quantity, and number of trucks for delivery. A copy of the packing list showing lot and roll numbers for each shipment shall also be provided to the Design Engineer prior to Work site delivery.

C. Unloading and storage (stacking) of the engineered turf rolls at the Work site shall be the responsibility of the Contractor; however, unloading and storage of engineered turf rolls shall be performed in accordance with the submitted Manufacturer's recommended procedures. engineered turf rolls shall be stacked no more than three (3) high.

D. The Contractor shall transport engineered turf rolls from the storage area in a manner that does not damage the geonet composite, and in accordance with the Manufacturer's recommended procedures.

1.06 QUALITY ASSURANCE

A. Testing and Observation

1. Testing and observation of the engineered turf shall be conducted in accordance with the CQA Plan.
2. The Contractor shall cooperate with the CQA Monitor during observation, testing, and collection of samples.
3. If any portion(s) of the engineered turf installation is determined by the Design Engineer to not meet the requirements of this Section, based on either testing or observations, the Contractor, at his expense, shall remove and replace that portion(s) to meet the requirements of this Section as directed by the Design Engineer.

PART 2 PRODUCTS

2.01 ENGINEERED TURF

A. The engineered turf is a synthetic structured material consisting of one or more geotextiles tufted with polyethylene yarns that resemble grass blades such as DuraTurf manufactured by Shaw, or equivalent. Engineered turf shall be manufactured of UV-stabilized yarn oriented into a stable network that maintains its structure during handling, placement and long-term service.

B. The engineered turf shall be chemical resistant and cannot be heat burnished or contain recycled materials.

C. The engineered turf shall have the following minimum average roll values:

ENGINEERED TURF COMPONENT

Product Data	Test Method	Values
CBR Puncture	ASTM D6241	800 lb. (MARV)
Tensile Product (MD/XD)	ASTM D4595	1,000 lb/ft min (MARV)
Rainfall Induced Erosion	ASTM D96459	< 0.45% infill Loss 6 in/hr
Aerodynamic Evaluation	GTRI Wind Tunnel	120 mph with maximum uplift of 0.12 lb/sf
Engineered Turf Fiber UV Stability	ASTM G147	> 60% retained tensile strength at 100 years (projected)
Backing System UV Stability (Exposed)	ASTM G1545 Modified Cycle 1.UVA340	110 lbs/ft retained tensile strength at 6500 hours (projected)
Steady State Hydraulic Overtopping (ClosureTurf® with HydroBinder™)	ASTM D7277/D7276	5 ft overtopping resulting in 29 ft/s velocity and 8.8 psf shear stress for Manning N Value of 0.02
Full Scale Wave Overtopping Test Cumulative Volume (ClosureTurf® with HydroBinder™)	Colorado State University Wave Simulator	165,000 ft^3/ft
Full Scale Wave Overtopping Test Wave Overtopping Discharge(ClosureTurf® with HydroBinder™)	Colorado State University Wave Simulator	4.0 $ft^3/s/ft$
Transmissivity w/ underlying structured geomembrane Normal stress 50 psf and 0.33 gradient (m2/sec)	ASTM D4716	2.5E -03m^2/sec., min.
Internal Friction of combined components	ASTM D5321	35°, min.
Sand Infill Gradation and Ballast	ASTM D6913	ASTM C-33 Fine Aggregates
Yarn Weight (Total Product Weight)	ASTM D5261	19 oz. / sq. yd. (25 oz. / sq. yd. +-1 oz.)
Tensile Strength of Yarn	ASTM D2256	15 lbs. min.

2.02 SEWING THREAD

A. The thread used for sewing of engineered turf shall be polymeric and have strength properties equal to or greater than the engineered turf.

B. The thread used for sewing of engineered turf shall be chemical resistant.

C. The thread used for sewing the engineered turf shall be equivalent to that recommended by the engineered turf Manufacturer submitted in accordance with Part 1.04A of this Section.

2.03 SAND BALLAST INFILL

A. Sand Ballast Infill will meet Particle Size Parameters of ASTM C 33-03 for fine aggregates as shown in the following Table 1:

Table 1: Sand Ballast Infill

Sieve	Percent Passing
9.5 mm (3/8")	100
4.75 mm (No. 4)	95 to 100
2.36 mm (No. 8)	80 to 100
1.18 mm (No. 16)	50 to 85
600 µm (No. 30)	25 to 60
300 µm (No. 50)	5 to 30
150 µm (No. 100)	0 t0 10

2.04 HYDROBINDER™ INFILL

A. HydroBinder™ is a cementious product used as the infill component for surface drainage conveyance areas.

B. HydroBinder™ infill Shall be HydroBinder™ Cementitious Infill. The HydroBinder™ infill material may be delivered in either pallet form of 80 lb. bags or 3000 lb. bulk super sacks.

C. Cement, except as otherwise specified herein, will be a brand of Portland Cement, meeting ASTM C 150 and will be Type I or Type II. Only one brand of cement will be used throughout the duration of this Contract.

D. The cementitious infill mix design will conform to the requirements of ASTM C 387 for high strength mortars.

E. The cementious infill will have a minimum 28 day compressive strength of 5000 psi.

PART 3 EXECUTION

3.01 PREPARATION AND EXAMINATION

A. The Installer shall verify that the material and surface upon which the engineered turf is to be placed is complete and in accordance with these Technical Specifications for that material prior to beginning geonet installation.

B. The Contractor is responsible for temporary anchorage during installation and until permanent anchorage is constructed and completed.

3.02 INSTALLATION

A. Engineered turf shall be installed in accordance with the Manufacturer's instructions.

B. Engineered turf shall be installed with the machine (lengthwise) direction of the roll oriented down the slope in accordance with the Panel Layout.

C. Engineered turf panels shall be deployed from the top of the slope in a way that the engineered turf is laid substantially smooth and filaments are pointing upslope after deployment is complete.

D. The first engineered turf panel deployed shall have the turf filaments facing upward. Subsequent panels shall be deployed turf side down, and on top of the previously installed panel. After seaming each panel, the panel shall be flipped onto the geomembrane component with care to avoid pulling of tufts in the drainage studs.

E. End-to-end panel overlaps shall only occur on benches, unless the length of a slope between benches exceeds the total length of a full engineered turf roll.

F. Engineered turf shall be installed with sufficient tension to prevent excessive overlapping, insufficient overlapping, wrinkles, and folds.

G. A single stitch prayer type seam shall be constructed using a Nulong sewing machine or equivalent. Sewing thread shall be 207 Polyester or equivalent. Sewing will occur between the 1st and 2nd row of Engineered Turf stitches.

H. Engineered turf shall be ballasted during installation and until the engineered turf is covered with the sand ballast infill material.

I. On slopes exceeding 15%, no equipment will be allowed on the partially constructed turf cap system until after the completed installation of the sand ballast infill. On slopes less than 15%, ATV type vehicles will be allowed prior to infill placement if the tire /track pressure is less than 5 psi.

J. Following full specified sand ballast infill thickness installation, shall be limited to light duty vehicles with drivability tire/track pressures of less than 35 psi.

K. Engineered turf damaged during installation shall be removed and/or repaired with a sewn or fastened patch at the direction of the Design Engineer.

L. Portions of the engineered turf wasted by the Installer, and rendered unusable, as determined by the Design Engineer, shall be transported by the Contractor and disposed of off-site at a permitted transfer station or solid waste disposal facility.

3.03 SAND BALLAST INFILL PLACEMENT

A. Sand ballast infill shall be placed between the tufts of the engineered turf and:
   1. Shall be per plan either 5/8 inch thick or 2 1/8 inch thick, with a thickness tolerance of +/-1/8 inch. Measuring the sand ballast infill thickness will be performed utilizing a digital caliper, or approved alternate measuring device approved by the CQA Officer.
   2. Shall consist wholly of sand meeting ASTM C-33-03 for fine aggregates. See Section2.03 - SAND BALAST INFILL - Table 1 for sand infill ballast grain size parameters.
   3. Engineered turf areas that are to receive sand ballast infill must be accepted by the CQA Officer before placement of sand ballast infill takes place

B. Sand ballast infill shall be worked into the Engineered Turf between the synthetic yarn blades.

C. Conveyor systems and/or Express Blowers shall be used to spread and place the sand ballast infill.

C. The Contractor shall explained with detail in the Preparatory Meeting the method of sand infill deployment to be used.

D. Previously installed components shall not be displaced or damaged as a result of the sand ballast infill component installation.

E. A standard washer will be utilized as a plate for the point of entry into the sand ballast infill for consistent depth control.

3.04 INFILL – HYDROBINDER® PLACEMENT

A. See also Section 2.04 - HydroBinder® INFILL.

B. The HydroBinder® infill layer may be placed using any appropriate equipment capable of completing the work. Manual hand spreading is acceptable when equipment isn't practical.

C. The Contractor shall explain in detail during the Preparatory Meeting the method of HydroBinder® infill deployment.

D. Installation of HydroBinder® infill will only be performed by a Manufacture's approved installer using techniques and equipment approved by the Manufacture.

E. The HydroBinder® shall be installed into the turf while it is in a dry state. The HydroBinder® will be worked into the tufts so the tufts are in an upright position.

F. The HydroBinder® infill shall be placed dry to a thickness of 7/8 inch with a tolerance of +/- 1/8 inch.

G. The hydration process must occur on the same day as the HydroBinder® infill placement. The required HydroBinder® infill thickness will be achieved prior to the hydration process.

H. The cemented infill shall be hydrated thoroughly, however care must be taken to avoid

displacement of the non-hydrated infill. The objective is to soak the area to start the hydration process but not to inundate with water beyond saturation.

I. Once hydration is completed as described, backfill and compaction of the vertical anchor trenches (if applicable) shall take place.

K. The HydroBinder® shall be at minimum performance levels within 24 hours. HydroBinder® that does not meet minimum performance levels within 24 hours will be removed and replaced.

3.05 REPAIR

A. All damaged areas or holes shall be repaired with a patch by the Installer as directed by the Design Engineer.

B. Repairs to engineered turf are completed by using a heat-bonded seam. All tie-in seams along flatter slopes less than 15% with length greater than 25 feet will use an approved leistering machine so consistent pressure is achieved throughout the seam. A hand held heat gun with a pressure wheel shall be used for repair of smaller areas. The patch shall extend 2 feet beyond the edge of the damaged area or hole.

C. Contractor may also demonstrate techniques and practices for approval. Field demonstration and approval by the CQA Officer and the Manufacturer is required before incorporating any alternative repair technique.

PART 4 MEASUREMENT AND PAYMENT

4.01 ENGINEERED TURF WITH 5/8" SAND BALLAST INFILL

A. Engineered Turf with 5/8" Sand Ballast Infill shall be measured by the square foot of engineered turf in place covering the entire limits of waste, installed to the toes of all slopes on the landfill or five feet beyond the limits of waste, whichever is greater, as shown on the Plans. The quantity measured for engineered turf shall be as measured on a horizontal plane in plan view and shall include an allowance for overlaps, anchorage and waste. Payment shall be included in the Contract Unit Price per square foot installed for "Engineered Turf with 5/8" Sand Ballast Infill" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the engineered turf and sand ballast infill, including that needed for testing and connecting materials in field as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.02 ENGINEERED TURF WITH 2" SAND BALLAST INFILL

A. Engineered Turf with 2" Sand Ballast Infill shall be measured by the square foot of engineered turf in place covering the entire limits of waste, installed to the toes of all slopes on the landfill or five feet beyond the limits of waste, whichever is greater, as shown on the Plans. The quantity measured for engineered turf shall be as measured on a horizontal plane in plan view and shall include an allowance for overlaps, anchorage and waste. Payment shall be included in the Contract Unit Price per square foot installed for "Engineered Turf with 2" Sand Ballast Infill" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the engineered turf and sand ballast infill, including that needed for testing and connecting materials in field as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore

4.03 ENGINEERED TURF WITH HYDROBINDER INFILL

B. Engineered Turf with HydroBinder® Infill shall be measured by the square foot of engineered turf in place covering the entire limits of waste, installed to the toes of all slopes on the landfill or five feet beyond the limits of waste, whichever is greater, as shown on the Plans. The quantity measured for engineered turf shall be as measured on a horizontal plane in plan view and shall include an allowance for overlaps, anchorage and waste. Payment shall be included in the Contract Unit Price per square foot installed for "Engineered Turf with HydroBinder® Infill" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the engineered turf and HydroBinder® infill, including that needed for testing and connecting materials in field as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore .

4.04 ENGINEERED TURF/GEOMEMBRANE ANCHOR TRENCH

A. Engineered turf/geomembrane anchor trench shall be measured by the lineal foot of anchor trench installed, as shown on the Plans. The quantity measured for the anchor trench shall be measured on the horizontal plan and shall include trenching, placement of material in trench, and backfilling. Payment shall be included in the Contract Unit Price per lineal foot installed for "Engineered Turf/Geomembrane Anchor Trench" and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the engineered tur/geomembrane anchor trench, as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore

END OF SECTION

SECTION 02900
SEEDING AND FERTILIZING

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall seed and fertilize the erosion-resistant layer and on-site borrow area surfaces, earthen drainage swales, and all construction-related disturbed surfaces in accordance with this Section and at the locations and to the dimensions shown on the Plans. The Contractor shall furnish all labor, supervision, tools, materials, equipment, transportation, and incidentals as necessary to seed and fertilize the various areas identified herein.

1.02 REFERENCES

A. *Caltrans Standard Specifications.* California Department of Transportation, 2010.

B. *Caltrans Standard Plans*. California Department of Transportation, 2010.

1.03 SUBMITTALS

A. Prior to seeding, the Contractor shall submit to the CQA Monitor, in triplicate, the name and location of material sources, laboratory test results, and/or material data sheets conforming to the relevant details shown on the Plans as outlined herein.

B. After seeding, the Contractor shall submit to the CQA Monitor the certified tags from the seed bags.

1.04 QUALITY ASSURANCE

A. Testing and Observation
   1. Testing and observation of the seeding, fertilizing and mulching shall be conducted in accordance with the CQA Plan.
   2. If any portion(s) of the seeding and fertilizing is determined by the CQA Monitor to not meet the requirements of this Section, the Contractor, at his expense, shall rework that portion(s) to meet the requirements of this Section as directed by the Design Engineer.

PART 2 PRODUCTS

2.01 SEED

A. Seeding shall conform to the provisions of Section 20-2.10 (Seed) and Section 20-3.04 (Seeding and Fertilizing) of the Standard Specifications.

B. The seed shall consist of the following mix of species and corresponding application rates:
   1. Trilfolium Incarnaium (Crimson Clover): 25 lbs/AC
   2. Hordeum Vulgare (Common Barley): 50 lbs/AC

3.	Festuca Rubra (Creeping Red Fescue):	50 lbs/AC
4.	Lolium Perenne (Perennial Ryegrass):	25 lbs/AC

2.02 FERTILIZER

A. Fertilizer shall consist of the following components and percentages:

Ammonia Phosphate Sulfate	16 percent
Phosphoric Acid	20 percent
Water Soluble Potash	0 percent

PART 3 EXECUTION

3.01 GENERAL

A. The method and equipment used to spread the seed and fertilizer shall be subject to the approval of the Design Engineer.

B. Seed and fertilizer shall be applied after the after the access roads, drainage structures , and erosion-resistant layer have been placed to grade.

C. Seed and fertilizer shall not be applied to the access roads, rock riprap swales, and sedimentation basins.

3.02 APPLICATION

A. The application of seed and fertilizer shall be performed by hydroseeding methods using the following steps:
1. *Step 1:* Seed and fiber shall be hydroseeded onto the designated surfaces at a rate of 150 lbs/AC and 500 lbs/AC, respectively.
2. *Step 2:* Hydromulch with tackifier and fertilizer shall then be applied at rates of 500 lbs/AC (fiber), 150 lbs/AC (tackifier [M-binder, organic bean base glue]), and 200 lbs/AC (fertilizer).

B. All products shall be spread uniformly over all areas subject to revegetation.

PART 4 MEASUREMENT AND PAYMENT

4.01 SEEDING AND FERTILIZING

A. Seeding and fertilizing shall be measured by the acre installed and includes all seed, fertilizer, tackifier and fiber. No adjustments in compensation will be made in the Contract Unit Price paid for "Seeding and Fertilizing" as a result of an increase or decrease in the quantity of revegetation products used, regardless of the reason for the increase or decrease, even if the increase or decrease exceeds 25 percent of the Design Engineer's Estimate. The provisions in Section 4-1.03B (Increased or Decreased Quantities) of the Standard Specifications shall not apply.

B. Payment shall be included in the Contract Unit Price per acre installed for "Seeding and Fertilizing" addressed in this Section and shall include full compensation for providing all

materials, labor, equipment, tools, and incidentals required for seeding and fertilizing as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

END OF SECTION

SECTION 02960
TEMPORARY EROSION AND SEDIMENT CONTROLS

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall implement all erosion control provisions consisting of, but not limited to, the construction of permanent and temporary facilities and taking measures as are necessary to prevent, control and abate water, mud, and erosion damage to public and private property as a result of the construction of this Project. Erosion control shall apply year round to all areas where earthen material is exposed on the Work site and shall not be limited to those areas outlined in these Technical Specifications or as shown on the Plans. The Contractor shall furnish all labor, supervision, tools, materials, equipment, transportation, and incidentals as necessary to implement the erosion control provisions.

1.02 REFERENCES

A. *Caltrans Standard Specifications (Section 20).* California Department of Transportation, May 2006.

B. *California's General Permit for Storm Water Discharges Associated with Construction and Land Disturbance Activities (General Permit) Order No. 2009-0009-DWQ as amended by Order No. 2010-0014-DWQ (NPDES No. CAS000002).* State Water Resources Control Board, 2010.

1.03 SUBMITTALS

A. The Contractor shall prepare and implement a SWPPP for construction activities in accordance with Section 01550 (Storm Water Pollution Prevention) of these Technical Specifications.

PART 2 PRODUCTS

2.01 STRAW BALES

A. Straw for bales shall be noxious weed free and shall be derived from wheat, rice or barley.

2.02 STRAW WATTLES

A. Straw wattles shall be fiber rolls composed of bio-degradable fibers stuffed in a photo-degradable open weave netting.

2.03 ROCK FOR CONSTRUCTION ENTRANCE

A. Rock for the construction entrance shall conform to the requirements of Section 02207 (Aggregate Materials) of these Technical Specifications.

2.04 SILT FENCING

A. Silt Fencing: Filter fabric shall be a pervious sheet of synthetic polymer composed of at least 85% by weight ethylene, propylene, amide, ester, or vinylidene yarn, woven or non-woven. It shall contain stabilizers and/or inhibitors to resist deterioration by heat, water, and ultra-violet light. The fabric shall conform to the following:
   1. The Equivalent Opening Size (U.S. Standard Sieve) shall be within the range 70-100.
   2. The tensile strength (per ASTM D4632) shall be at least 120 pounds.

B. Silt Fencing Posts: Posts for silt fences shall be either 4-inch diameter wood or 1.33 pounds per linear foot steel with a minimum length of 3 feet. Steel posts shall have projections for fastening wire to them.

PART 3 EXECUTION

3.01 SCHEDULE

A. Construction or implementation of erosion control measures shall be performed year round. Between October 15 and May 15 of each year, such temporary erosion control features as are necessary to prevent damage during the forthcoming winter season shall be constructed and remain functional.

B. The Contractor shall comply with the pollution control measures referenced in these Technical Specifications as part of the overall program to control erosion and de-silt runoff.

C. All temporary erosion control facilities shall be maintained during temporary suspension of Work periods.

3.02 PROTECTION

A. All areas of exposed earth created by the Contractor beyond what is shown on the Plans and referred to in these Technical Specifications and areas cleared and grubbed prior to excavation or embankment operations which are subject to wind erosion and runoff shall also be subject to these Technical Specifications, except that the Contractor shall be fully responsible for all costs and liabilities associated with water pollution and temporary erosion control work in these areas.

3.03 TEMPORARY EROSION CONTROL FACILITIES

A. The Contractor shall conduct his operations in such a manner that storm water runoff will be contained within the Work site or channeled into the storm drain system which serves the runoff area. Storm water runoff from one area shall not be allowed to divert to another runoff area.

B. Temporary down drains, drainage structures, and other devices shall be provided to channel storm water runoff water into the respective permanent storm drain systems during construction. Permanent drainage structures, not fully completed, shall be modified as required to accept de-silted runoff.

C. Fill areas, while being brought to grade, and during periods of completion prior to final

construction, shall be protected by various measures to eliminate erosion and the siltation of downstream facilities and adjacent areas. These measures may include, but shall not be limited to:

1. Temporary down drains, either in the form of pipes or paved ditches with protected outfall areas;
2. Graded berms around areas to eliminate erosion of embankment slopes by surface runoff;
3. Embankment slopes, not included as part of the construction contract and constructed by the Contractor for temporary access roads, shall be compacted by track walking the face of the slope in a direction perpendicular to the slope contours. Several passes may be required to adequately compact the slope face.

D. Contour graded areas shall be protected against erosion and the resulting siltation of downstream facilities and adjacent areas during grading operations. Various measures may include, but shall not be limited to:

1. Use of graded contour berms to control sheet flow.
2. Supplemental grading of large areas around temporary or unfinished inlet structures, such as inside ramp loops.

E. Culvert pipe used in conjunction with temporary erosion control measures which was new when delivered to the Work site and, in the opinion of the Design Engineer, is not damaged and whose dimensions and other properties conform to the requirements for new material may be used in the new Work.

PART 4 MEASUREMENT AND PAYMENT

4.01 TEMPORARY EROSION AND SEDIMENT CONTROL

A. Measurement and payment for temporary erosion and sediment control provisions including preparation and implementation of a SWPPP shall be considered as included in the Contract Lump Sum Price paid for "Temporary Erosion and Sediment Controls" as addressed in this Section and Section 01550 (Storm Water Pollution Prevention) of these Technical Specifications and includes all compensation for providing all materials, labor, equipment, tools, and incidentals required to complete the Work specified herein and as directed by the Design Engineer. No additional compensation will be allowed therefore.

END OF SECTION

SECTION 03300
CONCRETE

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall supply, transport to the Work site, and install all concrete for construction of drain inlets and the pads at the flare station, post footings for the metal frame pipe supports and security fencing, foundation for the sedimentation basin's drainage riser, and grouted rock riprap outfalls in accordance with this Section and at the locations and to the dimensions shown on the Plans. The Contractor shall furnish all labor, supervision, tools, materials, equipment, transportation, and incidentals as necessary to prepare and construct the various concrete structures.

1.02 REFERENCES

A. *Caltrans Standard Specifications.* California Department of Transportation, 2010.

B. *Caltrans Standard Plans*. California Department of Transportation, 2010.

C. *American Society for Testing and Materials.* Current Edition.

D. *Manual of Standard Practice*, Concrete Reinforcing Steel Institute (CRSI), 2009.

1.03 APPLICABLE STANDARDS AND SPECIFICATIONS

A.	ASTM A 615	Standard Specification for Deformed and Plain Billet-Steel Bars for Concrete Reinforcement.
B.	ASTM C 31	Standard Specification for Making and Curing Concrete Test Specimens in the Field.
C.	ASTM C 39	Standard Test Method for Compressive Strength of Cylindrical Concrete Specimens.
D.	ASTM C 143	Standard Test Method for Slump of Portland Cement Concrete.
E.	ASTM D 1557	Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Modified Effort (56,000 ft-lbf/ft^3 [2,700 kN-m/m^3]).

1.04 SUBMITTALS

A. At least 14 calendar days prior to delivery of materials to the Work site, the Contractor shall provide three (3) copies of the following information to the Design Engineer for approval:
   1. Name and location of the source for the concrete and reinforcing bars.
   2. Laboratory test results for the concrete and reinforcing bars.

3. Manufacturer's product data sheets for the concrete and reinforcing bars to verify that the materials meet or exceed the corresponding product requirements.

1.05 QUALITY ASSURANCE

A. Testing and Observation
1. Testing and observation of the concrete components shall be conducted in accordance with the CQA Plan.
2. The Contractor shall cooperate with the CQA Monitor during observation and testing.
3. If any portion(s) of the concrete is determined by the Design Engineer to not meet the requirements of this Section, based on either testing or observations, the Contractor, at his expense, shall remove and replace that portion(s) to meet the requirements of this Section as directed by the Design Engineer.

PART 2 PRODUCTS

2.01 CONCRETE

A. Concrete shall be supplied from the same approved source during construction of each structure.

B. Concrete for the drain inlets and flare station concrete pads shall be Type II Portland cement concrete meeting all material requirements of Sections 90-1 and 90-2 of the Standard Specifications and shall exhibit a maximum 4-inch slump when tested in accordance with ASTM C 143 and have a designated 28-day compressive strength of 2,500 psi (drain inlets) and 3,000 psi (flare station concrete pads) when tested in accordance with ASTM C 31 and ASTM C 39.

C. Concrete for post footings and the sedimentation basin's drainage riser foundation shall be minor concrete conforming to the requirements of Section 90-10 of the Standard Specifications.

D. Concrete for the grouted rock riprap outfalls shall be minor concrete conforming to the requirements of Sections 72-5.02 and 90-10 of the Standard Specifications.

2.02 REINFORCEMENT

A. Reinforcing bars shall be billet-steel bars for concrete reinforcement conforming to ASTM A 615, Grade 40, #4 bars.

2.03 FORMS

A. Forms used in concrete installations shall be APA "Plyform" or equivalent as designed by then Contractor and exhibiting sufficient strength to hold the concrete.

2.04 EPOXY

A. Epoxy used for securing dowels or anchors in concrete shall be Simpson "SET – Epoxy" or Covert "CIA-Gel 7000 Epoxy".

2.05 AGGREGATE BASE

A. Aggregate base for the flare station concrete pads shall conform to the requirements of Section 02207 (Aggregate Base) of these Technical Specifications.

2.06 ENGINEERED FILL

A. Engineered fill for the flare station concrete pads shall conform to the requirements of Section 02224 (Engineered Fill) of these Technical Specifications.

PART 3 EXECUTION

3.01 GENERAL

A. The locations, dimensions, and final elevations of the concrete slabs shall be as shown on the Plans or as staked by the Design Engineer.

B. The footprint areas for the flare station concrete pads as shown on the Plans shall be cleared and grubbed in accordance with the requirements of Section 02222 (Excavation) of these Technical Specifications.

C. Following clearing and grubbing, the flare station concrete pad areas shall be overexcavated to a depth of 18 inches and recompacted as engineered fill in accordance with the requirements of Section 02224 (Engineered Fill) of these Technical Specifications. Overexcavation is not required if compaction data beneath the concrete slab footprints are available from the former leachate pond backfilling operations that demonstrate that the upper 18 inches meet the engineered fill compaction requirements.

D. Aggregate base for the flare station concrete pads shall be spread in a uniform loose lift not exceeding 8 inches in thickness, moisture conditioned to within 1 to 3 percentage points of the optimum moisture content, and compacted to a minimum of 95 percent of maximum dry density per ASTM D 1557.

3.02 REINFORCEMENT

A. All reinforcement shall be installed in conformance with CRSI's "Manual of Standard Practice".

B. All reinforcement shall be free from rust, oil, dirt, or any other coating.

C. Continuous reinforcing bars shall be lapped at splices at a minimum of 32 diameters.

D. Unless otherwise noted, reinforcement shall have a minimum concrete cover of 3 inches.

E. Reinforcement shall not be damaged and shall be securely supported and anchored to avoid movement during placement of concrete.

3.03 FORMWORK

A. Design and erection of concrete formwork shall be the responsibility of the Contractor. Strength of concrete formwork shall be sufficient to hold the concrete with minimal or no leakage. Shoring and bracing shall be provided to ensure stability of formwork. Three-quarter-inch chamfer strips shall be used at exposed corners.

3.04 CONCRETE SLAB PLACEMENT

A. Subgrade and forms shall be moistened prior to placing concrete.

B. Care shall be taken to not damage or displace the reinforcing steel components.

C. Concrete shall be placed in a continuous operation and thoroughly vibrated to ensure consolidation around reinforcement.

D. The final surface of the concrete slabs shall have a non-slip broom finish.

E. The Contractor shall repair or patch all significant cracks, spalls and irregularities in formed or finished surfaces or other defects, as required to attain the workmanship standards herein.

3.05 MINOR CONCRETE PLACEMENT

A. Minor concrete for post footings and the sedimentation basin's drainage riser foundation shall be installed as shown on the Plans and in conformance with Sections 51 and 90-10 of the Standard Specifications, as applicable.

B. Minor concrete for the grouted rock riprap shall be placed in conformance with Section 72-5.04 of the Standard Specifications.

3.06 EPOXY SECURED DOWELS OR ANCHORS

A. The diameter and depth of the drill hole shall be as indicated. If not included, the hole shall be drilled 1/8-inch larger and ten (10) times deeper than the diameter of the dowel or anchor.

B. The hole shall be thoroughly cleaned by blowing it out with compressed air and by using a wire brush.

C. Placement of epoxy in the hole shall be performed using a dispensing tool provided by, or recommended by the manufacturer. The hole shall be completely filled with epoxy.

D. The dowel or anchor shall be placed in the hole and the epoxy allowed sufficient time to completely cure before disturbing the dowel or anchor.

PART 4 MEASUREMENT AND PAYMENT

4.01 CONCRETE SLABS

A. The concrete slabs for the flare station shall be measured by the cubic yard of concrete installed and includes all subgrade and pad preparation work, aggregate base, reinforcement steel, formwork, and epoxy secured dowels and anchors. Payment shall be included in the Contract Unit Price per cubic foot installed for "Flare Station Concrete Slabs" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the flare station concrete slabs as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.02 DRAIN INLETS

A. Measurement and payment for concrete associated with the drain inlets shall be included in the Contract Unit Price for "Drain Inlets" addressed in Section 02722 (Drainage and Erosion Controls) of these Technical Specifications.

4.03 CONCRETE POST FOOTINGS

A. Measurement and payment for concrete post footings associated with the metal frame pipe supports and security fencing for the flare station shall be included in the Contract Unit Prices for "Metal Frame Pipe Supports" addressed in Section 15200 (LFG Collection System Components) and "Security Fencing" addressed in Section 15300 (Flare Station), respectively, of these Technical Specifications.

4.04 DRAINAGE RISER FOUNDATION

A. Measurement and payment for concrete associated with the sedimentation basin's drainage riser foundation shall be included in the Contract Unit Price for "Sedimentation Basin Outlet" addressed in Section 02722 (Drainage and Erosion Controls) of these Technical Specifications.

4.05 GROUTED ROCK RIPRAP OUTFALLS

A. Measurement and payment for concrete associated with the grouted rock riprap outfalls shall be included in the Contract Unit Price for "Grouted Rock Riprap Outfalls" addressed in Section 02722 (Drainage and Erosion Controls) of these Technical Specifications.

END OF SECTION

SECTION 15100
LANDFILL GAS (LFG) EXTRACTION WELLS

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall install all LFG extraction wells as shown on the Plans and in accordance with these Technical Specifications. The Contractor shall furnish all labor, supervision, tools, materials, equipment, transportation, and incidentals as necessary to install the LFG extraction wells.

1.02 REFERENCES

A. *Caltrans Standard Specifications*. California Department of Transportation, 2010.

1.03 SUBMITTALS

A. At least 14 calendar days prior to commencement of drilling operations, the Contractor shall submit the following to the Design Engineer for approval:
   1. Drilling subcontractor information, including name of subcontractor, proof of State of California drilling contractor license (Class C-57), type and make of drill rig, names and experience of drill rig operator and helpers, and proposed operating procedures.
   2. The name and location of source, laboratory test results, and/or product data sheets for the following materials to verify that the materials meet or exceed the requirements in Section 7-1.2:
      a. PVC well casing and fittings.
      b. Gravel pack material.
      c. Bentonite.
      d. PVC well bore seal.
      e. Prefabricated Well Head Assemblies.
   3. Manufacturer's recommended installation procedures and operation instructions for prefabricated well head assemblies.
   4. Copies of approved drilling permits (if required) issued by the local governing agency.

B. At the completion of each working day, the Contractor shall prepare a work order summarizing the total footage drilled and amount of materials used for well construction, and submit it to the Design Engineer for approval.

C. The Contractor shall submit to the Design Engineer performance test results for the prefabricated well head assemblies within 14 calendar days of completion of the testing.

1.04 QUALITY ASSURANCE

A. Testing and Observation
   1. Testing and/or observation of the casing, annular materials, PVC well bore seal and prefabricated well head assembly installations shall be conducted in

accordance with the CQA Plan.

2. The Contractor shall cooperate with the CQA Monitor during observation and testing.
3. If any portion(s) of the LFG extraction well installations is determined by the Design Engineer to not meet the requirements of this Section based on observations, the Contractor, at his expense, shall mitigate that portion(s) to meet the requirements of this Section as directed by the Design Engineer.

PART 2 PRODUCTS

2.01 LFG EXTRACTION WELLS

A. PVC WELL CASING AND FITTINGS: PVC well casing and fittings for the LFG extraction wells shall conform to the requirements of Section 15200 (LFG Collection System Components) of these Technical Specifications.

B. GRAVEL PACK: Gravel pack material shall conform to the requirements of Section 02207 (Aggregate Materials) of these Technical Specifications.

C. BENTONITE SEAL: Bentonite seal material shall be 100 percent premium grade bentonite clay.

D. PVC WELL BORE SEAL: PVC well bore seals shall consist of a prefabricated pipe boot and a 10-foot by 10-foot skirt manufactured from 30 mil PVC and designed specifically for the intended purpose. The boot portion shall have a minimum length of 4 feet and shall be sized to accommodate a 4-inch diameter well casing.

E. SOIL BACKFILL: Soil backfill material shall be erosion-resistant layer material in accordance with Section 02250 (Erosion-Resistant Layer) of these Technical Specifications.

2.02 PREFABRICATED WELL HEAD ASSEMBLIES

A. Prefabricated well head assemblies for LFG extraction wells shall be Series 3100 PVC well heads manufactured by Real Environmental Products [(209) 296-7900], or approved equivalent. The overall assembly shall include: Series 3100 PVC well head equipped with a 1.5-inch diameter PVC gate valve and dedicated thermometer; orifice assembly with four (4) interchangeable orifice plates with bore diameters of ½ inch, ¾inch, 1 inch and 1-1/2 inch; elastomeric adaptor for connection between the well casing and well head; and a 2-inch diameter PVC flexible hose for connection between the well head and the LFG collection system piping.

2.03 CLOSURE TURF RELIEF VALVE AND COLLECTION FOOT

A. The closure turf LFG relief valves are a component of the closure turf to provide necessary release of pressure in the event the LFG system malfunctions. These relief valves are to be provided by the turf manufacturer of the closure turf.

B. The closure turf LFG collection foot is a component of the closure turf to provide the interface between the surficial collection strips, the geomembrane, and the LFG collection well head. The collection foot and surficial collection strips are to be provided

by the turf manufacturer of the closure turf.

PART 3 EXECUTION

3.01 GENERAL

A. The Contractor's attention is directed to the details contained in the Plans for information regarding individual well construction characteristics.

B. The locations of LFG extraction wells will be staked by the Design Engineer prior to the commencement of drilling operations.

C. All required drilling permit(s), fees, and inspections shall be arranged, and paid for, by the Contractor.

3.02 DRILLING

A. Drilling and installation of LFG extraction wells shall be by a drilling contractor licensed (Class C-57) in the State of California.

B. Individual LFG extraction wells shall be drilled and installed in a single day so as to minimize the potential for LFG emissions from the borehole. Installation shall include placement of casing, gravel pack, and surface seal (including lower and upper hydrated bentonite seals). The top of the casing shall be capped until installation of the prefabricated well head assembly. In the event of equipment breakdown or other unforeseen circumstance prohibits complete installation of the LFG extraction well within the same working day, provisions shall be made to cover and seal the exposed borehole at the surface to prevent LFG emissions.

C. The boreholes for the LFG extraction wells shall be drilled using a bucket auger drill rig capable of drilling 24-inch diameter boreholes. The Design Engineer will prepare boring logs and associated records.

D. The borehole depths listed in the Plans are estimated and may be adjusted in the field by the Design Engineer.

E. Spoils generated as part of drilling operations may be temporarily stockpiled in proximity of the borehole, or discharged directly into a roll-off bin or dump truck. If temporarily stockpiled, the spoils must be removed by the end of each working day and transferred into a roll-off bin or dump truck for subsequent transport and disposal by the Contractor in accordance with Section 02222 (Excavation) of these Technical Specifications. Spoils remaining on-site overnight in a roll-off bin or dump truck shall be covered at the end of each working day. Spoils shall not remain on-site for more than a 48-hour period.

F. As soon as drilling is completed, a safety screen shall be placed over the top of the borehole. This screen shall stay in place until backfilling is within 4 feet of the surface. The safety screen size should be large enough to accommodate all backfill materials and activities yet not large enough for any human to accidentally fall through.

G. The borehole shall be straight and the well casing shall be installed in the center of the borehole. The Contractor shall take all tension off of the pipe by mechanical means and

center the well casing in the middle of the borehole before starting to backfill.

H. PVC well casing joints shall be solvent cemented and secured with 3/8-inch long Type 316 stainless steel lag screws.

I. The completion height of the well casing above ground surface shall be such that the final height of the installed prefabricated well head assembly is 5 feet above final grade.

J. Obstructions and saturated conditions may be encountered during drilling; the Contractor is expected to make reasonable effort to drill through obstructions and saturated conditions and may only abandon the borehole if written approval is obtained from the Design Engineer.

3.03 BACKFILLING

A. Backfilling operations shall commence immediately after well drilling is completed and the well casing has been installed in the borehole. Backfill materials shall be installed as shown on the Plans and as directed by the Design Engineer.
   1. If water is encountered during drilling, the Design Engineer may elect to have the borehole remain open overnight to allow the water level to stabilize. Under this scenario, the Contractor shall make provisions to cover and secure the borehole as a safety precaution and to prevent LFG emissions.

B. The gravel pack shall be poured or scooped through the safety screen at a rate that will not endanger the integrity of the well casing.

C. The upper and lower bentonite seals shall be formed by evenly distributing the bentonite material around the annulus of the well casing and then adding fresh water in a manner that will allow for a thorough saturation of the bentonite. The proportion of water added versus bentonite material shall be in accordance with the bentonite manufacturer's recommendations. This process shall be continued until the minimum bentonite seal thickness as specified on the Plans has been achieved.

D. Soil backfill shall be placed from the top of the lower bentonite seal to the bottom of the upper bentonite seal in a manner that will promote self compaction and avoid bridging of the soil backfill material.

E. The PVC well bore seal shall be installed in accordance with the manufacturer's recommendations around the well casing and placed at the location shown on the Plans. At a minimum, the following provisions shall be implemented during PVC well bore seal installation:
   1. The boot portion of the well bore seal shall be secured around the well casing with stainless steel straps to provide an air-tight connection. Following placement of erosion-resistant layer material, the boot shall be installed in a collapsed position above the final grade to accommodate potential settlement.
   2. Following installation, the PVC well bore seal shall be covered with the overlying GCL material or soil (temporary) if the PVC well bore seal is going to be exposed for more than three (3) working days.

F. For each completed LFG extraction well, the Design Engineer will make a record of borehole and well completion details to include the following information:

1. Boring log summarizing materials and conditions encountered.
2. Well construction log outlining completion depths and intervals for well casing and construction materials.
3. Map showing the well location by grid coordinates and ground surface elevation.
4. Numbering system to correlate each well with its corresponding well log.

3.04 INSTALLATION OF PREFABRICATED WELL HEAD ASSEMBLIES

A. The prefabricated well head assemblies shall be handled and installed in accordance with the manufacturer's recommendations and as shown on the Plans.

B. Provisions shall be made to ensure that the well head is installed such that the interior extension tube assembly is concentric within the well casing.

C. The completion height of the well head assembly shall be 5 feet above final grade as shown on the Plans.

D. The PVC flexible hose connection between the well head and LFG collection system piping shall be installed with sufficient slack (6 to 8 inches) to accommodate expansion and contraction. "IPS Weld-On 795" plastic pipe cement, or approved equivalent, shall be used for flexible hose connections to the well head and LFG collection system piping.

3.05 ABANDONMENT OF LFG EXTRACTION WELL BOREHOLE (IF REQUIRED)

A. Boreholes approved by the Design Engineer for abandonment shall be backfilled with refuse and/or soil to the final grade and compacted. If refuse is used, the refuse should be mechanically compacted within the borehole using the bucket auger to eliminate potential voids.

B. Upon completion of borehole abandonment activities, the area around the borehole shall be restored to meet the surrounding grades as shown on the Plans.

3.06 PERFORMANCE TESTING

A. During testing of the entire LFG collection system as described in Section 15300 (Flare Station) of these Technical Specifications, the Contractor shall test the prefabricated well head assemblies to verify proper operation. The scope of testing shall include the following:
1. Testing of static and differential pressure ports with valve completely open and completely closed.
2. Operation of temperature gauge.
3. Operation of gas sample port.
4. General inspection of well head assembly, PVC flexible hose, and fittings for leaks.

B. Testing of the static and differential pressure ports and gas sample port shall be conducted using a LANDTEC GEM-2000 Analyzer. The Contractor shall measure and record the following information for subsequent submittal to the Design Engineer:
1. Static and differential pressure (valve open and closed).
2. Temperature (valve open and closed).
3. Gas composition: methane, carbon dioxide, oxygen and balance (valve open and

closed).

PART 4 MEASUREMENT AND PAYMENT

4.01 LFG EXTRACTION WELLS

A. LFG extraction wells shall be measured by the vertical linear foot installed and includes all drilling, backfilling, and materials. Payment shall be included in the Contract Unit Price per vertical linear foot installed for "LFG Extraction Wells" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the LFG extraction wells as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.02 PREFABRICATED WELL HEAD ASSEMBLIES

A. Prefabricated well head assemblies shall be measured by each assembly installed and include supply of four (4) interchangeable orifice plates for each assembly. Payment shall be included in the Contract Unit Price per each unit installed for "Prefabricated Well Head Assemblies" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the prefabricated well head assemblies as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.03 ADDITIONAL BOREHOLE SET-UP

A. Additional borehole set-up (resetting on boreholes allowed to sit overnight for water level stabilization) shall be measured by each set-up required. Payment shall be included in the Contract Unit Price per each occurrence for "Additional Borehole Set-up" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to implement an additional borehole set-up as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.04 BOREHOLE ABANDONMENT

A. Borehole abandonment shall be measured by the vertical liner foot of borehole abandoned and includes all drilling, backfilling, and materials. Payment shall be included in the Contract Unit Price per vertical linear foot of borehole drilled/backfilled for "Borehole Abandonment" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to implement each borehole abandonment as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.05 REFUSE DISPOSAL

A. Measurement and payment for disposal of refuse generated by the LFG extraction well drilling operation shall be included in the Contract Unit Price for "Refuse Disposal" addressed in Section 02222 (Excavation) of these Technical Specifications.

4.06 PERFORMANCE TESTING

A. Measurement and payment for performance testing of the prefabricated well head assemblies described in this Section shall be included in the Contract Unit Price paid for "Prefabricated Well Head Assemblies". No additional compensation will be allowed therefore.

4.07 CLOSURE TURF RELIEF VALVES AND LFG COLLECTION FOOT ASSEMBLY

A. Measurement and payment for the closure turf relief valves described in this Section shall be included in the Contract Unit Price paid for the "Geomembrane" addressed in Section 02772 (Geomembrane) of these Technical Specifications. The relief valves are to provided by the manufacturer of the geomembrane material. No additional compensation will be allowed therefore.

B. Measurement and payment for the LFG closure turf collection foot assembly described in this Section shall be included in the Contact Unit Price per each assembly installed for "LFG Collection Foot Assembly" and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the LFG collection foot including the piping, well head assembly, flexible connector, and connection to the LFG collection header as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

END OF SECTION

SECTION 15200
LFG COLLECTION SYSTEM COMPONENTS

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall furnish, transport to the Work site, and install all required LFG collection system components, including PVC and HDPE pipe, fittings, and valves, flexible couplings, pipe supports and anchors, condensate drop-outs, and condensate discharge points, as shown on the Plans and in accordance with these Technical Specifications. The Contractor shall furnish all labor, supervision, tools, materials, equipment, transportation, and incidentals, including excavation and backfilling services, necessary to install the respective LFC collection system components outlined above.

1.04 SUBMITTALS

A. At least 14 calendar days prior to delivery of materials to the Work site, the Contractor shall provide three (3) copies of the following to the Design Engineer for approval:
   1. Manufacturer's product data sheets for the following materials to verify that the materials meet or exceed the corresponding product requirements:
      a. PVC pipe, fittings, and valves (including gasket, seal, bearing and gear materials).
      b. HDPE pipe and fittings.
      c. Vacuum test port fittings.
      d. PVC-HPDE transition coupling.
      e. Flexible couplings and band clamps.
      f. Staked pipe supports and anchors (including stakes, pipe clamps and miscellaneous fittings).
      g. Metal frame pipe supports (including metal frames, pipe clamps and miscellaneous fittings).
      h. Primer and paint.
   2. Manufacturer's recommended procedures for handling (transporting, unloading, storage, etc.), installation, and welding of PVC and HDPE pipe, fittings, and valves, as applicable.

B. At least 14 calendar days prior to conducting performance testing, the Contractor shall submit proposed procedures for the following to the Design Engineer for approval:
   1. Vacuum pressure test of HDPE condensate drain pipe.
   2. Gravity flow discharge test of condensate discharge points.

C. Within 14 calendar days of completion of performance testing for the respective components, the Contractor shall submit to the Design Engineer test results for the following system components:
   1. PVC LFG collection system pipe.
   2. HDPE condensate drain pipe.
   3. Condensate discharge points.

1.05 QUALITY ASSURANCE

A. Testing and Observation
   1. Testing and observation of the LFG collection system component installations shall be conducted in accordance with the CQA Plan.
   2. The Contractor shall cooperate with the CQA Monitor during observation and testing.
   3. If any portion(s) of the LFG collection system component installations is determined by the Design Engineer to not meet the requirements of this Section, based on either testing or observations, the Contractor, at his expense, shall remove and replace that portion(s) to meet the requirements of this Section as directed by the Design Engineer.

PART 2 PRODUCTS

2.01 PVC PIPE AND FITTINGS

A. PVC pipe shall meet the requirements of ASTM D 1784 and ASTM D 1785 for Schedule 40 and Schedule 80 PVC pipe. The pipe shall be manufactured from a PVC compound which meets the requirements of Cell Classification 12454-B PVC as outlined in ASTM D 1784.

B. PVC fittings shall meet the requirements of ASTM D 2464, ASTM D 2466, and ASTM D 2467 for Schedule 40 and Schedule 80 PVC pipe fittings. Fittings unavailable in Schedule 40 may be replaced with Schedule 80. The fittings shall be manufactured from a PVC compound which meets the requirements of Cell Classification 12454-B PVC as outlined in ASTM D 1784.
   1. Fittings shall be industrial, heavy duty, hub style.
   2. Socket fittings shall be pressure rated as for the corresponding pipe size prescribed by ASTM D 1785. Threaded fittings shall be pressure rated at 50 percent of the rating for socket fittings.
   3. *Flanges:* Flanges shall meet the following specifications:
      a. Flanges shall be one-piece solid design or two-part van stone type which use the tapered, serrated face and full-face gasket technique for joining and are comparable with ANSI B16.5 Class 150 metal flanges.
      b. Flanges shall be non-shock and pressure rated at 150 psi for water service at 73°F, and have a minimum burst requirement of 3.3 times the rate pressure.
      c. Bolts shall be Type 316 stainless steel ASTM A 193, Grade B8M hex head and nuts shall be ASTM A 194, Grade 8m hex head.
      d. Gaskets shall be full-face neoprene.

4. *Branch Saddles:* Branch saddles shall either be socket style affixed using PVC cement or clamp-on style secured using stainless steel screws.

2.02 PVC BUTTERFLY VALVES (ISOLATION VALVES)

A. Butterfly valves used for isolating LFG collection system piping segments shall be wafer-type design with a body and disc manufactured from a PVC compound which meets the requirements of Cell Class 12454-B PVC as outlined in ASTM D 1784 and shall be compatible with associated PVC pipe fittings. The PVC butterfly valves shall also meet the following material and performance specifications:

1. Shaft shall be cadmium-plated steel alloy or 300 series stainless steel, positively attached to the disc, and totally sealed from exposure to the process gas or environment. The shaft shall also have a directional indicator on top to indicate disc position with handle removed.
2. Valve body shall be of the wafer design for ease of installation and maintenance and shall be compatible with ANSI B16.5 Class 150 metal flanges.
3. Seat material shall be Viton.
4. Bearings shall be corrosion resistant TFE or polypropylene 20 percent glass filled.
5. Secondary seal material shall be Viton and correspond to the seat material for maximum chemical resistance.
6. Handles and worm gear operators shall be corrosion resistant.
7. Valves shall be non-shock, rated at 150 psi for water service at 73°F, and have a minimum burst requirement of 3.3 times the rate pressure.

2.03 PVC BALL VALVES

A. PVC valves shall be ball-type design with the major components manufactured from a PVC compound which meets the requirements of Cell Class 12454-B PVC as outlined in ASTM D 1784 and shall be compatible with associated PVC pipe fittings. The PVC ball valves shall also meet the following material and performance specifications:

1. Ball seats shall be virgin TFE and the stem/body seals and seat energizers shall be Viton.
2. PVC socket type connectors shall conform to the requirements of ASTM D 2466 and ASTM D 2467.
3. Threaded type connectors shall conform to the requirements of ASTM D 2466 and ASTM D 2464 and ANSI B1.20.1 for tapered pipe threads.
4. The valve assembly shall be of construction such that a two-piece body is screwed together to contain seats which are maintained under compressive load against the ball.
5. Valves shall be non-shock, rated at 150 psi for water service at 73°F, and have a minimum burst requirement of 3.3 times the rated working pressure.

2.04 PVC CEMENT

A. PVC cements shall meet the requirements of ASTM D 2564 for solvent cemented PVC joints.

2.05 VACUUM TEST PORTS

A. Vacuum test ports for the LFG collection system piping shall be 1/8-inch flow, ¼-inch threaded polypropylene quick disconnect couplings.

2.06 HDPE PIPE AND FITTINGS

A. HDPE pipe and fittings for the condensate drain piping shall be SDR 9 and rated PE 3408 by the Plastics Pipe Institute. The HDPE pipe shall have a cell classification per ASTM D 3350 of 345444C

B. HDPE pipe and fittings shall meet the following criteria:
   1. The nominal inside diameter of the HDPE pipe shall be true to the pipe size shown on the Plans in accordance with ASTM D 2513.
   2. HDPE fittings for use in laying pipe shall have standard dimensions that conform to ASTM D 3261.
   3. Where possible, HDPE pipe and fittings should be produced by the same manufacturer from identical materials meeting the requirements of this specification. Special or custom fittings may be exempted from this requirement.

2.07 PVC-HDPE TRANSITION COUPLING

A. The PVC-HDPE transition coupling used in the condensate discharge point assemblies to the existing leachate drain shall be Series 735 transition couplings manufactured by Poly-Cam, Inc. [(763) 786-6682], or approved equivalent.

2.08 FLEXIBLE COUPLINGS

A. Flexible couplings shall be 18-inch long LANDTEC Models FLXH-060-180T (6-inch pipe diameter) and FLXH-080-180T (8-inch pipe diameter), or approved equivalent.

B. Band clamps used to secure the flexible couplings shall be stainless steel LANDTEC Models HC-060 (6-inch pipe diameter) and HC-080 (8-inch pipe diameter), or approved equivalent.

2.09 STAKED PIPE SUPPORTS AND ANCHORS

A. Stakes for pipe supports and anchors shall be galvanized carbon steel and shall be a minimum of 3 feet in length. The upper portion of the stakes shall contain appropriately-sized holes to allow for the connection and adjustment of angle braces and bolts. The hole spacing shall be at a minimum of 2 inches on-center.

B. Pipe clamps shall be galvanized carbon steel and as shown on the Plans.

C. Miscellaneous fittings (i.e., angle braces, bolts, nuts and washers) shall be zinc-coated carbon steel and conform to ASTM A 325.

2.10 METAL FRAME PIPE SUPPORTS

A. Metal frames for pipe supports shall be 1-5/8-inch hot-dipped galvanized carbon steel as manufactured by UNISTRUT® (Part No. P1000HS[HG]), or approved equivalent.

B. Pipe clamps shall be galvanized carbon steel and as shown on the Plans.

C. Miscellaneous fittings (i.e., angle braces, bolts, nuts and washers) shall be zinc-coated carbon steel and conform to ASTM A 325.

2.11 BLOCK PIPE SUPPORTS

A. Blocks for pipe supports shall be 8" x 8" x16" masonry blocks with a 2 x 8 redwood cap and #4 rebar stakes covered with rubber hose.

2.12 CORRUGATED METAL PIPE (CMP)

A. CMP for pipe supports or sleeves shall be of 16 gauge CMP continuous helical lock steel conforming to the requirements of Section 66-3 of the Standard Specifications. All CMP shall be galvanization compatible and conform to the requirements of Section 66-3.02 of the Standard Specifications for zinc coated steel.

2.13 CONCRETE

A. Concrete for metal frame pipe supports and block pipe supports shall conform to the requirements of Section 03300 (Concrete) of these Technical Specifications.

2.14 PIPE BEDDING

A. Pipe bedding for buried header crossings shall conform to the requirements of Section 02207 (Aggregate Materials) of these Technical Specifications.

2.15 ENGINEERED FILL

A. Engineered fill for buried header crossings and road crossings shall conform to the requirements of Section 02224 (Engineered Fill) of these Technical Specifications.

PART 3 EXECUTION

3.01 GENERAL

A. The alignment and locations of the LFG collection system components will be staked by the Design Engineer prior to installation.

B. PVC and HDPE pipe, fittings, and valves shall be installed by skilled laborers experienced in installation of such materials.

C. All exposed PVC pipe and fittings shall be painted.

3.02 LFG COLLECTION SYSTEM PIPING

A. LFG collection system piping, including flexible couplings, isolation valves and condensate drop-out points, shall be installed as shown on the Plans.

B. All PVC pipe, fittings and valves shall be handled carefully in loading and unloading, and in such a manner as to avoid shock during placement. PVC pipe, fittings and valves shall not be dropped or dumped.

C. Prior to painting and installation, all PVC pipe, fittings and valves shall be inspected for cuts, scratches, or other damages. Pipe, fittings and valves with imperfections shall not be used.

D. Prior to installation, all PVC pipe and fittings to be left exposed shall be steam cleaned and allowed to dry, then painted with an undercoat coat of high-quality, water-based exterior latex primer, followed by a topcoat of high-quality, ultra-violet resistant, water-based exterior latex paint. The pipe shall be painted to within 6 inches of each end of the pipe section length. Light sanding may be necessary to achieve an acceptable bond. The paint shall be medium gray or white in color, or as specified by the City. Within 24 hours of cleaning, the first coat shall be applied followed by the second coat no more than 48 hours after the first coat has dried. The pipe joints shall be painted in this manner after installation.

E. PVC pipe, fittings and valves shall be joined with socket and solvent cement welding in accordance with ASTM D 2855. Joining of PVC pipe, fittings and valves shall be in accordance with these specifications and the pipe manufacturer's recommendations.

F. All PVC pipe cuts shall be square and perpendicular to the centerline of the pipe. In addition, PVC pipe ends shall be beveled prior to applying primer and solvent cement so that the primer or cement are not wiped off during insertion into the fitting socket.

G. All burrs, chips, etc. generated as a result of cutting operations shall be removed from the pipe interior and exterior. In addition, the inside of the piping shall be kept clean of dirt and debris. Piping left overnight shall be capped.

H. A coating of CPS primer as recommended by the PVC pipe supplier shall be applied to the entire interior surface of the fitting socket, and to an equivalent area on the exterior of the pipe prior to applying solvent cement.

I. The solvent cement shall comply with the requirements of ASTM D 2564 and shall be applied in strict accordance with manufacturer's specifications.

J. PVC pipe, fittings and valves shall not be primed or solvent welded when it is raining or when ambient temperature is below 40°F or above 100°F.

K. After solvent welding, the PVC pipe, fittings and valves shall remain undisturbed until cement has thoroughly set. As a guideline for joint setting time, use 1 hour for ambient temperatures 60°F to 100°F, or 2 hours when ambient temperature is 40°F to 60°F.

L. Flexible couplings shall be installed at the locations shown on the Plans. The flexible

couplings shall be installed per the pipe separation criteria specified in the Plans based on the ambient temperature at the time of installation. The stainless steel band clamps shall be secured around the ends of the flexible coupling in such a manner as to provide an air-tight joint.

M. Vacuum test ports shall be installed at the locations and orientations shown on the Plans. The ports shall be installed by drilling and tapping an appropriate sized hole in the LFG collection pipe to allow insertion of the threaded quick disconnect coupling. The ports shall be installed currently with the LFG collection pipe installation and near the end of pipe sections (but not within coupled joints) to facilitate the removal of PVC shavings introduced into the pipe by the drilling/tapping process.

N. Staked pipe supports shall be installed under the selected pipe segments as specified on the Plans. The staked pipe supports shall be spaced at 10 feet on-center along the full length of the pipe segments. The height of the pipe supports shall be adjusted as appropriate to ensure positive slope of LFG collection system piping. Stakes shall be driven no less than 12 inches and no more than 18 inches below final surface grades.

O. Staked pipe anchors shall be installed every 50 linear feet (minimum) of LFG collection system piping, as well as at the locations of all tee, elbow and wye fittings (both ends, but not on the fittings themselves) and at flexible couplings located on slopes as shown on the Plans. Pipe clamps shall be secured around the LFG header system pipe to ensure that the pipe does not move. Securing of the pipe clamps shall be done in such a manner as to not damage the pipe. No portion of the fittings and flexible couplings shall rest on the stake pipe anchors. Stakes shall be driven no less than 12 inches and no more than 18 inches below final surface grades.

P. Metal frame pipe supports shall be installed at selected road crossings and near the flare station at the locations shown on the Plans. Concrete for the pipe supports shall be batched and placed in accordance with the requirements of Section 03300 (Concrete) of these Technical Specifications. The height of cross-bar pipe supports shall be adjusted as appropriate to ensure positive slope of LFG collection system piping.

3.03 BURIED HEADER CROSSINGS

A. Trenching across bench sections shall be to the depth and dimensions shown on the Plans. *Do not excavate deeper than necessary to maintain adequate buffer above the underlying GCL.*

B. Pipe bedding material and LFG collection system piping shall be placed to the dimensions shown on the Plans. LFG collection system piping shall be sloped at a minimum of 3 percent to maintain proper condensate drainage capabilities.

C. The remainder of trench shall be backfilled with engineered fill in accordance with the requirements of Section 02224 (Engineered Fill) of these Technical Specifications and as shown on the Plans.

3.04 ROAD CROSSINGS

A. CMP used for pipe support or protective sleeve shall be installed in the orientations shown on the Plans. When used as a pipe support, the CMP shall be aligned with the center line of the drainage swale.

B. A small section of reinforcement geotextile used in the access road construction shall be wrapped around the CMP protective sleeve where it will be in direct contact with the underlying CMP pipe support in order to provide a cushion between the two CMPs.

C. LFG collection system piping shall be inserted through the CMP protective sleeves in a manner that will not damage or compromise the LFG collection system piping.

D. Engineered fill shall be placed around and over the CMPs as shown on the Plans and in accordance with the requirements of Section 02224 (Engineered Fill) of these Technical Specifications.

E. The final surface of the road crossing shall be completed in accordance with the requirements of Section 02310 (Access Roads) of these Technical Specifications and as shown on the Plans.

3.05 CONDENSATE DRAIN PIPE AND FITTINGS

A. The HDPE pipe and fitting manufacturer shall package products for shipment in a manner suitable for safe transport and shall be subsequently handled in accordance with the manufacturer's recommendations.

B. Prior to installation, all HDPE pipe and fittings shall be inspected for cuts, scratches, or other damages. Pipe and fittings with imperfections shall not be used.

C. Trench excavation and backfill for buried HDPE pipe and fittings shall be as shown on the Plans.

D. HDPE pipe connection ends and fittings shall be joined by butt fusion procedures in accordance with the HDPE pipe and fitting manufacturer's recommended procedures.

E. The Contractor shall not bend the HDPE pipe to a degree greater than the minimum radius recommended by the manufacturer.

F. The HDPE pipe shall not be subjected to strains that will overstress or buckle piping or impose excessive stress on joints.

G. Open ends of fused HDPE pipe shall be covered or capped at the end of each working day to prevent entry by animals or debris.

H. For segments completed above ground, provide sufficient slack to allow for thermal expansion and contraction so as to not promote excessive stress on the piping following installation.

I. For segments completed below ground, the Contractor shall allow for thermal expansion or contraction of the HDPE pipe within the trench and coordinate pipe backfill operations

to avoid buildup of thermal stresses. Whenever possible, segment tie-ins shall be completed within the trench to prevent overstressed conditions.

J. Following placement of HDPE pipe, sufficient time shall be allowed (per manufacturer's recommendations) for the pipe to adjust to trench temperature prior to testing, segment tie-ins, or backfilling activities.

3.06 CONDENSATE DROP-OUTS

A. Condensate drop-outs, including u-trap assemblies, shall be installed at the locations and to the dimensions shown on the Plans. *Do not excavate deeper than necessary to maintain adequate buffer above the underlying GCL.*

B. The transition from PVC to HDPE shall be at the flange connection as shown on the Plans.

C. PVC and HDPE pipe, fittings and valves shall be installed in accordance with Part 3.01 (LFG Collection System Piping) and Part 3.05 (Condensate Drain Pipe and Fittings) of this Section.

D. Staked pipe anchors shall be installed at various points on the u-trap piping as shown on the Plans to prevent movement associated with thermal expansion. Staked pipe anchors shall be installed per the instructions outlined in Part 3.01 (LFG Collection System Piping) of this Section.

E. Following construction of u-trap assemblies and prior to start of LFG collection system operations, the u-trap assemblies shall be filled with clean water.

3.07 CONDENSATE DISCHARGE POINTS

A. Condensate discharge points shall be installed at the locations and to the dimensions shown on the Plans.

B. Soil and/or refuse shall be excavated to expose the existing condensate drain. If refuse is encountered, the refuse shall be removed and disposed of in accordance with Section 02222 (Excavation) of these Technical Specifications.

C. When entering excavations to install branch saddles, miscellaneous piping and/or backfill materials, the Contractor's Health and Safety Plan shall be followed accordingly, including trench safety, LFG hazards and possible confined space entry (i.e., oxygen-deficient atmosphere).

D. PVC and HDPE pipe and fittings shall be installed in accordance with Part 3.01 (LFG Collection System Piping) and Part 3.04 (Condensate Drain Pipe and Fittings) of this Section.

E. For condensate discharge points located within the limits of the final cover system, the respective final cover system components shall be placed and installed in accordance with Sections 02240 (Foundation Layer), 02245 (Gas Relief Layer [GRL]), 02774 (Geosynthetic Clay Liner [GCL]), 02773 (Geonet Composite), and 02250 (Erosion-

Resistant Layer) of these Technical Specifications. Portions below the final cover system shall be backfilled as engineered fill in accordance with Section 02224 (Engineered Fill) of these Technical Specifications.

F. For condensate discharge points located outside the limits of the final cover system, the excavation shall be backfilled with engineered fill in accordance with Section 02224 (Engineered Fill) of these Technical Specifications.

3.08 PERFORMANCE TESTING

A. *PVC LFG Collection System Pipe:* After all PVC pipe and fittings have been joined, including flexible couplings, all connections shall be visually inspected to verify that the connections are securely intact. Tension on the stainless steel straps for the flexible couplings shall also be checked to ensure that the ends of the flexible couplings are adequately secured to the LFG collection system piping and that the tension within the flexible couplings is appropriate based on the given ambient temperature.

B. *HDPE Condensate Drain Pipe:* Before the HDPE condensate drain pipe is connected to the PVC piping system and existing leachate drain, each HDPE condensate drain pipe segment shall be tested and withstand a minimum of 5 psig vacuum for a period of not less than 10 minutes without any drop in pressure. Vacuum shall be measured by a mercury manometer, slope gauge, or an equivalent device calibrated to read increments of not greater than 0.1 psi. The source of the vacuum shall be isolated before the test is made. Testing shall be performed prior to backfilling segments of the HDPE condensate drain pipe that are to be buried. It shall be the Contractor's responsibility to ensure that proper safety precautions are observed during the testing.

C. *Condensate Discharge Points:* After the HDPE condensate drain pipe is connected to the leachate drain but prior to connecting it to PVC piping system, the functionality of each HDPE condensate drain pipe segment shall be tested to verify each segment's ability to transmit water to the existing leachate drain. Testing shall include introducing water at the uppermost point (i.e., highest elevation) of each segment and verifying the influx of water into the existing leachate drain utilizing the closest downgradient manhole as the point of observation.

PART 4 MEASUREMENT AND PAYMENT

4.01 LFG COLLECTION SYSTEM PIPING

A. PVC pipe and fittings for the LFG collection system piping shall be measured by the linear foot of each for each size of pipe installed and includes all fittings. Payment shall be included in the Contract Unit Price per linear foot installed for "PVC Pipe and Fittings" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the PVC pipe and fittings as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

B. Isolation valves shall be measured by each isolation valve installed. Payment shall be included in the Contract Unit Price per each unit installed for "Isolation Valves" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the isolation valves as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

C. Flexible couplings shall be measured by each flexible coupling installed. Payment shall be included in the Contract Unit Price per each unit installed for "Flexible Couplings" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the flexible couplings as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

D. Vacuum test ports shall be measured by each vacuum test port installed. Payment shall be included in the Contract Unit Price per each unit installed for "Vacuum Test Ports" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the vacuum test ports as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore

E. Staked and block pipe supports shall be measured by each staked or block type pipe support installed. Payment shall be included in the Contract Unit Price per each unit installed for "Staked Pipe Supports" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the stake pipe supports as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

F. Staked pipe anchors shall be measured by each staked pipe anchor installed. Payment shall be included in the Contract Unit Price per each unit installed for "Staked Pipe Anchors" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the stake pipe anchors as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

G. Metal frame pipe supports shall be measured by each metal frame pipe support installed and includes all fittings and concrete post footings. Payment shall be included in the Contract Unit Price per each unit installed for "Metal Frame Pipe Supports" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the metal frame pipe supports as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

H. Buried header crossings shall be measured by each buried header crossing (Type 1 or 2) installed and includes all trenching and backfill materials. *PVC pipe and fittings for the LFG collection system piping are not included in this payment as they are addressed separately.* Payment shall be included in the Contract Unit Prices per each unit installed for "Type 1 Buried Header Crossing" and "Type 2 Buried Header Crossing" addressed in this Section and shall include full compensation for providing all materials, labor,

equipment, tools, and incidentals required to install the buried header crossings as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

I. Road crossings shall be measured by each road crossing (Type 1 or 2) installed and includes all trenching, CMP sleeves and supports, and backfill materials. *PVC pipe and fittings for the LFG collection system piping and reinforcement geotextile/aggregate base associated with the access road construction are not included in this payment as they are addressed separately.* Payment shall be included in the Contract Unit Prices per each unit installed for "Type 1 Road Crossing" and "Type 2 Road Crossing" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the road crossings as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.02 CONDENSATE DRAIN PIPING

A. HDPE pipe and fittings for the condensate drainage system piping shall be measured by the linear foot installed and includes all fittings. *HDPE pipe and fittings for the condensate drop-outs and condensate discharge points are not included in this payment as they are addressed separately* Payment shall be included in the Contract Unit Price per linear foot installed for "HDPE Pipe and Fittings" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the HDPE pipe and fittings as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.03 CONDENSATE DROP-OUTS

A. Condensate drop-outs, including u-trap assemblies, shall be measured by each condensate drop-out installed. Payment shall be included in the Contract Unit Price per each unit installed for "Condensate Drop-outs" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the condensate drop-outs as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.04 CONDENSATE DISCHARAGE POINTS

A. Condensate discharge points shall be measured by each condensate discharge point installed. Payment shall be included in the Contract Unit Price per each unit installed for "Condensate Discharge Points" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the condensate discharge points as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.05 PERFORMANCE TESTING

A. Measurement and payment for performance testing of the various LFG collection system components described in this Section shall be included in the Contract Unit Price paid for the various items of Work for which they are required. No additional compensation will be allowed therefore.

END OF SECTION

SECTION 15300
FLARE STATION

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall assemble all required flare station components and associated appurtenances and implement improvements as shown on the Plans and in accordance with these Technical Specifications, including: installation of a skid-mounted packaged combustion system; installation of condensate drainage line between the skid-mounted packaged combustion system and leachate wet well; completion of all electrical, telephone, and mechanical connections; installation of security fencing; and placement of aggregate base within and around the flare station area as shown on the Plans.

B. The Contractor shall furnish all labor, supervision, tools, materials, equipment, and incidentals necessary to assemble all required flare station components and associated appurtenances, including all required piping, fittings, and connections.

C. The Contractor shall not begin flare station assembly activities requiring hookup to the LFG collection system until performance testing of that system is completed in accordance with Section 15100 (Landfill Gas [LFG] Extraction Wells) and Section 15200 (LFG Collection System Components) of these Technical Specifications.

D. The Owner will be responsible for purchasing and arranging delivery of the skid-mounted packaged combustion system. Since the manufacturer of this unit will not be selected until December 2013 or January 2014, actual plans and specifications for these units are not currently available. The design plans, specifications, and installation instructions for the aforementioned system will be supplied to the Contractor a minimum of six (6) weeks prior to commencement of the scheduled LFG collection system installation activities. The Contractor shall be responsible for reviewing the design plans, specifications, and installation instructions in a timely manner and furnishing all necessary materials required to complete the Work in accordance with the approved Construction Schedule.

E. The Contractor shall be responsible for mechanical and electrical assembly and connections of the skid-mounted packaged combustion system. As noted above, actual plans and specifications for these units are not currently available. Based on these circumstances, an assumed scope of work has been developed based on the Design Engineer's experience on similar projects. Whereas the assumed scope of work presented herein is considered representative of what the assembly will entail, the actual work scope is subject to minor revisions based on requirements specified by the selected flare manufacturer.

F. Assembly of the skid-mounted packaged combustion system will require use of a 5 ton crane. The crane will also be required for unloading the skid-mounted packaged combustion system upon its delivery to the Work site. The Contractor shall be responsible for furnishing and operating the crane to implement these tasks. The Design Engineer or Owner will coordinate the delivery schedule of the skid-mounted packaged

combustion system with the Contractor.

G. A representative of the manufacturer of the skid-mounted packaged combustion system will be present during start-up and troubleshooting of the system. Written approval of the system installation and operation by the manufacturer will be required prior to Owner's acceptance of the flare station components. The Owner will pay for the manufacturer's inspection services under the provisions and requirements of this Section.

1.02 REFERENCES

A. *Caltrans Standard Specifications.* California Department of Transportation, 2010.

B. *Caltrans Standard Plans*. California Department of Transportation, 2010.

1.03 APPLICABLE STANDARDS AND SPECIFICATIONS

A. ASTM D 1557 Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Modified Effort (56,000 ft-lbf/ft^3 [2,700 kN-m/m^3]).

1.04 SUBMITTALS

A. At least 14 calendar days prior to commencement of flare station assembly, the Contractor shall submit to the Design Engineer copies of any building permits (if required) issued by the local governing agency.

B. Within 14 calendar days of completion of flare station assembly, the Contractor shall submit to the Design Engineer copies of any building inspection reports (if required) issued by the local governing agency.

C. At least 14 calendar days prior to conducting performance testing, the Contractor shall submit proposed procedures for the following to the Design Engineer for approval:
   1. Skid-mounted packaged combustion system operation.
   2. Hydrostatic pressure test of PVC condensate discharge pipe.

D. Within 14 calendar days of completion of performance testing for the respective components, the Contractor shall submit to the Design Engineer test results for the following system components:
   1. Skid-mounted packaged combustion system.
   2. PVC condensate discharge pipe.

1.05 QUALITY ASSURANCE

A. Testing and Observation
   1. Testing and observation of the flare station components shall be conducted in accordance with the CQA Plan.

2. The Contractor shall cooperate with the CQA Monitor during observation and testing.
3. If any portion(s) of the flare station components is determined by the Design Engineer to not meet the requirements of this Section, based on either testing or observations, the Contractor, at his expense, shall fix that portion(s) to meet the requirements of this Section as directed by the Design Engineer.
4. Abraded and otherwise damaged portions of shop-applied paint shall be cleaned and repainted per the flare manufacturer's recommendations. Welded seams and and other un-coated surfaces, heads and nuts of field-installed bolts, and surface where paint was damaged during installation shall be given a coat of specified primer, followed by top coat paint once the primer has completely dried.

PART 2 PRODUCTS

2.01 SKID-MOUNTED PACKAGED COMBUSTION SYSTEM

A. The skid-mounted packaged combustion system will be furnished by the Owner. In general, the system will be comprised of the following primary equipment components:
1. *Primary Skid Assembly* (AISC designed) housed on a galvanized structural steel skid. This skid will be installed on the eastern flare station concrete pad as shown on the Plans. Primary equipment components mounted to the skid include:
   a. Gas-liquid separator.
   b. Two (2) centrifugal blowers equipped with TEFC electric motors and variable frequency drive.
   c. 4-inch to 8-inch diameter LFG process piping (stainless steel or HDPE) equipped within an automatic block valve.
   d. Control station assembly that includes a self-supporting steel rack with a weather-proof control panel, main power supply disconnect, power transformer, and pilot gas control system.
2. *Totally-Enclosed Vertical Ground Flare* constructed of A-36 carbon steel. The flare will be installed on the western flare station concrete pad as shown on the Plans. The flare stack diameter will be 4 to 5 feet (estimated) with an overall height of approximately 25 feet (estimated). Primary equipment components mounted to the skid include:
   a. One (1) or two (2) combustion air dampers.
   b. Self-checking ultra-violet flame scanner.
   c. Purge air blower.
   d. Thermocouples.
3. *Miscellaneous Appurtenances* including a flow meter, inlet flame arrestor, continuous chart recorder, and an automatic telephone dialer system.
4. All piping, conduit and manual valves are pre-piped/pre-wired to the greatest extent possible and are mounted within the skid boundaries.

2.02 ELECTRICAL CONDUIT, WIRE AND FITTINGS

A. Electrical conduit, wire, and fittings for the flare station shall conform to the requirements of Section 15400 (Flare Station Electrical and Telephone Feed) of these Technical Specifications.

2.03 PVC PIPE, FITTINGS AND BALL VALVE

A. PVC pipe, fittings and ball valve for the condensate drainage line between the skid-mounted packaged combustion system and leachate wet well shall conform to the requirements of Section 15200 (LFG Collection System Components) of these Technical Specifications.

2.04 PIPE BEDDING

A. Pipe bedding for the buried portion of the condensate drainage line shall conform to the requirements of Section 02207 (Aggregate Materials) of these Technical Specifications.

2.05 ENGINEERED FILL

A. Engineered fill for the buried portion of the condensate drainage line shall conform to the requirements of Section 02224 (Engineered Fill) of these Technical Specifications.

2.06 CHAIN LINK FENCE

A. Chain link fence materials for the security fence shall conform to the requirements of Section 80-4.01 of the Standard Specifications and as shown on the Plans.

2.07 CONCRETE

A. Concrete for the security fence post footings shall conform to the requirements of Section 03300 (Concrete) of these Technical Specifications.

2.08 AGGREGATE BASE

A. Aggregate base placed on the completed ground surface within and around the flare station shall conform to the requirements of Section 02207 (Aggregate Materials) of these Technical Specifications.

PART 3 EXECUTION

3.01 FLARE STATION ASSEMBLY

A. All required building permits, fees, and inspections shall be arranged and paid for by the Contractor.

B. Assembly of the flare components shall be performed by skilled laborers experienced in installation of similar equipment.

C. The skid-mounted packaged combustion system shall be installed in strict accordance with the manufacturer's specifications. Design drawings and installation instructions will be provided to the Contractor upon selection of the flare manufacturer. In general, installation of the skid-mounted packaged combustion system will include the following tasks:

1. *Mechanical Assembly*

a. Mount/anchor the primary skid assembly and totally-enclosed vertical ground flare to the concrete slabs.
b. Connect inlet flame arrestor to the totally-enclosed vertical ground flare.
c. Connect LFG process piping from the primary skid assembly to the flame arrestor.
d. Mount thermocouples (three or four) onto the totally-enclosed vertical ground flare (elevated).
e. Connect the LFG collection system header pipe from the wellfield to the primary skid assembly.

2. *Electrical Assembly*
   a. Connect main power supply, telephone line, and conduit to the control station assembly.
   b. Connect thermocouple wire and conduit between the thermocouples (elevated) and the control station assembly.

D. Abraded and otherwise damaged

3.02 CONDENSATE DRAINAGE LINE

A. Trenching and pipe bedding placement shall conform to the requirements of Section 02225 (Trenching and Backfilling) of these Technical Specifications.

B. Handling and installation of the PVC pipe, fittings and ball valve shall conform to the requirements of Section 15300 (LFG Collection System Components) of these Technical Specifications.

C. The condensate drainage line shall be installed at a minimum slope of 1 percent in the direction of the leachate wet well.

D. The wall of the leachate wet well shall be penetrated at the appropriate depth by coring or other means to allow for insertion of the condensate drainage line. The annular space between the condensate drainage line and the wall of the leachate wet well shall be sealed using non-shrink grout.

E. Following placement of pipe bedding material, the remainder of the trench shall be backfilled with engineered fill in accordance with the requirements of Section 02224 (Engineered Fill) of these Technical Specifications.

3.03 SECURITY FENCE

A. The chain link fence and gates shall be installed as shown on the Plans and in accordance with the requirements of Section 80-4.02 of the Standard Specifications.

B. All line, corner, and gate post assemblies shall be constructed with concrete post footings in accordance with the requirements of Section 03300 (Concrete) of these Technical Specifications.

C. Soil between fence posts shall be leveled to create a 2-inch clearance under the fence fabric.

3.04 FLARE STATION AGGREGATE BASE

A. Aggregate base within and around the flare station shall be placed to the dimensions shown on the Plans.

B. The aggregate base shall be spread in uniform loose lifts not exceeding 8 inches in thickness.

C. The aggregate base shall be moisture conditioned to within 1 to 3 percentage points of optimum moisture content, and compacted to a minimum of 95 percent of maximum dry density per ASTM D 1557. The final compacted thickness shall be a minimum of 6 inches.

3.05 PERFORMANCE TESTING

A. *Skid-Mounted Packaged Combustion System:* The skid-mounted packaged combustion system shall be tested to verify proper operation in accordance with the manufacturer's recommendations. Performance testing shall be supervised by the flare manufacturer's on-site inspector and shall encompass all aspects of system operations, including but not limited to the verification of proper operation of the following components:

1. Gas-liquid separator.
2. Blowers.
3. Automatic ignition and pilot gas control system.
4. Automatic temperature controls, including thermocouples and actuated louver assembly.
5. Automatic block valve operation.
6. Flow meter and continuous chart recorder.
7. Control panel gauges and indicator lighter.
8. Safety shut-down and alarm systems, including automatic telephone dialer system.

Written approval from the flare manufacturer's representative for the system installation and operation will be required prior to the Owner's acceptance of the flare station components. The written approval shall certify that the equipment was properly installed and connected, is in accurate alignment, and is free of undue stress imposed by piping or mounting bolts. The performance testing and acquisition of the manufacturer's approval shall be done within a 3-day work period.

During performance testing of the flare station, the entire LFG collection system well field shall be visually inspected to identify any problems or breaks in the system that may have resulted from system operations.

B. *Condensate Drainage Line:* The PVC condensate drainage line between the flare station and existing leachate wet well shall be hydrostatically pressure tested in accordance with the pipe manufacturer's recommended procedures. It shall be the Contractor's responsibility to ensure that proper safety precautions are observed during the testing.

PART 4 MEASUREMENT AND PAYMENT

4.01 FLARE STATION ASSEMBLY

A. Measurement and payment for flare station assembly shall be included in the Contract Lump Sum Price for "Flare Station Assembly" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, general electrical work, and incidentals required to assemble the flare station as shown on the Plans, as specified herein and within the flare manufacturer's specifications, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.02 CONDENSATE DRAINAGE LINE

A. Measurement and payment for the condensate drain line shall be included in the Contract Lump Sum Price above for "Flare Station Assembly" of this Section. No additional compensation will be allowed therefore.

4.03 SECURITY FENCE

A. Security fencing for the flare station shall be measured by the linear foot installed and includes all posts, chain link fence fabric, gates, slats and fittings. Payment shall be included in the Contract Unit Price per linear foot installed for "Security Fencing" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the security fence as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.04 FLARE STATION AGGREGATE BASE

A. Aggregate base placed within and around the flare station shall be measured by the square foot installed. Payment shall be included in the Contract Unit Price per square foot installed for "Flare Station Aggregate Base" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the aggregate base as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.05 PERFORMANCE TESTING

A. Measurement and payment for performance testing of the skid-mounted packaged combustion system and condensate discharge pipe described in this Section shall be included in the Contract Lump Sum Price paid for "Flare Station Assembly". No additional compensation will be allowed therefore.

END OF SECTION

SECTION 15400
FLARE STATION ELECTRICAL AND TELEPHONE FEED

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall furnish and install the electrical and telephone feed for the flare station as shown on the Plans and in accordance with these Technical Specifications, which includes extending electrical and telephone services from the existing service point locations to the flare station control panel. The Contractor shall furnish all labor, tools, supervision, equipment, and materials necessary to provide the flare station electrical and telephone feed.

B. The Owner will be responsible for upgrading the power supply at the existing electrical service point shown on the Plans to accommodate the following power requirements for the flare station: 480 volts, 3 phase, 60 hertz, 100 amps, and 35 HP. In addition, the Owner will be responsible for extending telephone service to the service point shown on the Plans.

1.02 APPLICABLE STANDARDS AND SPECIFICATIONS

A. California Administrative Code (CAC) - Title 24.

B. County Ordinances.

C. National Electrical Code (NEC).

D. National Electrical Manufacturer's Association (NEMA).

E. National Fire Protection Association (NFPA).

F. Underwriters Laboratory Inc. (UL).

1.03 SUBMITTALS

A. At least 14 calendar days prior to delivery of materials to the Work site, the Contractor shall submit the following to the Design Engineer for approval:

1. Name and location of source, product data sheets, and manufacturer's installation instructions for the following materials to verify that the materials meet or exceed the product requirements specified herein:
   a. Wire.
   b. Conduit and fittings.
   c. Meter socket.
   d. Pull boxes.
   e. Panel.
   f. Junction and outlet boxes.

B. At least 14 calendar days prior to commencement of a specific task, the Contractor shall submit to the Design Engineer copies of electrical permits (if required) issued by the local governing agency.

C. Within 14 calendar days of completion of all electrical work, the Contractor shall submit to the Design Engineer copies of electrical inspection reports (if required) issued by the local governing agency.

1.04 QUALITY ASSURANCE

A. Testing and Observation
1. The Contractor shall notify the Design Engineer of progress of all Work in order that the Design Engineer may make the appropriate site inspections.
2. The Contractor shall cooperate with the Design Engineer during testing and observation.
3. If any portion(s) of the electrical components is determined by the Design Engineer to not meet the requirements of this Section, based on either testing or observations, the Contractor, at his expense, shall repair or replace that portion(s) to meet the requirements of this Section as directed by the Design Engineer.

1.05 HAZARDOUS CLASSIFICATION

A. All underground electrical installed shall be classified as Class 1, Division 2. Above ground electrical work from the ground surface to within 18 inches above the ground surface shall be classified as Class 1, Division 2.

PART 2 PRODUCTS

2.01 GENEAL

A. All electrical materials shall be new, meet UL requirements, and bear appropriate UL labels.

2.02 WIRE

A. Wire shall be NEC standard copper wire and shall bear UL and manufacturer's labels. Wire shall provide proper connection and operation of all equipment. Requirements for connection of the respective electrical components are as follows:
1. *Main Power Supply:* Copper AWG No. 2, THW (four [4] wires total).
2. *Automatic Telephone Dialer System:* Standard telephone line (one [1] wire total).

2.03 CONDUIT AND FITTINGS

A. All exposed conduit and fittings shall be rigid PVC type, Schedule 80. All buried conduit and fittings shall be rigid PVC type, Schedule 40. Conduit size requirements for the respective electrical components are as follows:
1. *Main Power Supply:* 1-1/4 inch conduit.
2. *Automatic Telephone Dialer System:* ½ inch conduit.

2.04 METER SOCKET

A. Meter socket for main power supply shall be NEMA 3R, raintight-outdoor, UL listed, with drip shield top that requires no gasketing. Size of meter socket shall accommodate power service requirements.

2.05 JUNCTION AND OUTLET BOXES

A. Junction and outlet boxes shall be NEMA 4 galvanized metal type, cast iron, or malleable iron with proper cover and/or mounting lugs as required.

2.06 WARNING TAPE

A. Direct burial warning tape reading "CAUTION, ELECTRICAL LINE BURIED BELOW", 4 mil polyethylene with foil laminate shall be installed in all underground electrical installations. Panduit, Motivator 3M, or approved equivalent.

2.07 PIPE BEDDING

A. Pipe bedding for conduit shall conform to the requirements of Section 02207 (Aggregate Materials) of these Technical Specifications.

2.08 ENGINEERED FILL

A. Engineered fill for backfill above the pipe bedding shall conform to the requirements of Section 02224 (Engineered Fill) of these Technical Specifications.

PART 3 EXECUTION

3.01 GENERAL

A. All required electrical permits, fees, and inspections shall be arranged and paid for by the Contractor.

B. The Contractor shall furnish, install, and maintain all temporary power and lighting systems needed for construction. After construction is completed, the Contractor shall remove all temporary power equipment and devices.

C. All electrical work shall be conducted by skilled electricians and laborers experienced in this type of work. All equipment, materials, installation, and workmanship shall be in accordance with the mandatory and advisory provisions of NFPA 70 and the NEC.

D. The Contractor shall verify that the wire and conduit sizes specified herein for the main power supply and automatic telephone dialer system are appropriate for the intended use.

E. The Contractor shall install all electrical components in accordance with the NEC, NFPA and local codes and regulations for installation in a Class 1, Division 1 or Class 1, Division 2 classified locations as defined in Part 1.05 of this Section and shown on the Plans. Nothing on the Plans or in these Technical Specifications is to be construed to permit work not conforming to these governing codes and standards.

F. Installation of electrical and telephone feed shall be performed in accordance with the local electrical and telephone company rules and regulations.

G. The electrical and telephone feed from the existing service points to the flare station control panel shall be completed below grade as shown on the Plans.

H. The Contractor shall verify service and panel locations and all other service requirements prior to starting Work. Except for Work specifically excluded from the Contract, the Contractor shall provide all Work required by the serving utility companies to render utility services to the Project.

3.02 PREPARATION

A. The Contractor shall handle electrical materials carefully during loading and unloading. All means necessary shall be used to protect electrical materials before, during and after installation and to protect the installed work of other trades. In the event of damage, provisions shall be made to immediately make repairs and replacement necessary to the approval of the Design Engineer.

B. The Contractor shall inspect materials for damage and imperfections prior to installation. Damaged materials or materials with imperfections shall not be used.

3.03 TRENCHING AND BACKFILLING

A. Trenching and placement of pipe bedding and engineered fill shall conform to the requirements of Section 02224 (Engineered Fill) and Section 02225 (Trenching and Backfilling) of these Technical Specifications.

3.04 INSTALLATION

A. All equipment, motors, conduit and outlets, as applicable, shall be permanently and effectively grounded in accordance with NEC, CAC - Title 24 and local codes.

B. Conduits shall be sloped towards pull boxes. Conduits shall run in straight lines except where a change in direction is necessary. Couplings shall be staggered for maximum duct line strength.

C. Buried conduit and fittings shall not be dropped or dumped into trenches and the ends of conduit shall be kept closed with approved conduit seals during construction. Immediately prior to pulling wire or cable, a swab shall be drawn through all conduits to force out water and foreign materials.

D. Junction boxes shall be installed in an accessible location as required for splicing, connections and pulling of wire.

E. All above ground conduit shall be properly secured on pipe supports or concrete slabs.

F. The meter socket installed at the existing service pole shall comply with the height and fastening specifications outlined in the local electric company rules and regulations.

3.05 CLEAN-UP

A. All exposed portions of electrical installation shall be thoroughly cleaned, including the removal of all traces of soil, labels, grease, oil, and other foreign matter. Only cleaners recommended by the manufacturer shall be used.

PART 4 MEASUREMENT AND PAYMENT

4.01 ELECTRICAL AND TELEPHONE FEED

A. The electrical and telephone feed shall be measured by the linear foot installed, including trench excavation and backfill. Payment shall be included in the Contract Unit Price per linear foot installed for "Electrical and Telephone Feed" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the electrical and telephone feed as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.02 GENERAL ELECTRICAL WORK

A. Measurement and payment for general electrical work associated with assembly of the flare station shall be included in the Contract Lump Sum Price for "Flare Station Assembly" addressed in Section 15300 (Flare Station) of these Technical Specifications. No additional compensation will be allowed therefore.

END OF SECTION

SECTION 15500
LEACHATE OVERFLOW COLLECTION AND STORAGE SYSTEM

PART 1 GENERAL

1.01 SUMMARY

A. The Contractor shall furnish, transport to the Work site, and install all leachate overflow collection and storage system components, including a 10,000 gallon double wall fiberglass reinforced leachate UST, tank accessories, field testing, collection system piping and accessories, and lining of the existing sediment chamber and leachate wet well in accordance with this Section and at the locations and to the dimensions shown on the Plans. The Contractor shall furnish all labor, supervision, tools, materials, equipment, transportation, and incidentals as necessary to install the leachate overflow collection and storage system.

B. The existing sediment chamber is a concrete manhole structure, approximately nine feet deep (base to top of manhole); four feet in diameter with a 30" high riser cone (48" to 24" in diameter). The existing wet well is approximately 18 feet deep and five feet in diameter and contains two submersible pumps.

C. The Contractor accepts full responsibility for proper handling and installation of the leachate UST and shall insure that good workmanship, practices, and construction procedures are followed during the handling and installation of the leachate UST, regardless of the inclusion or omission of any applicable suggestion in this Section.

E. ASTM F 477 Standard Specification for Elastomeric Seals (Gaskets) for Joining Plastic Pipe.

F. UL Standard for Safety 1316.

1.04 SUBMITTALS

A. At least 14 calendar days prior to delivery of materials to the Work site, the Contractor shall provide three (3) copies of the following information to the Design Engineer for approval:
   1. Manufacturer's product data sheets for the following materials to verify that the materials meet or exceed the corresponding product requirements:
      a. Leachate UST, fittings, and accessories.
      b. Collection piping and fittings.
      c. Concrete junction boxes and accessories.
   2. Manufacturer's recommended procedures for handling (transporting, unloading, storage, etc.) and installation of each of the products identified in Subsection 1.04(A)(1) of this Part.

B. Field Test Reports: Tank tightness test at delivery and after installation.

C. At least 14 calendar days prior to commencement of lining the leachate sediment chamber and wet well, the Contractor shall submit the following to the Design Engineer for approval:
   1. Procedures for removal and re-installation of the existing pumps within the leachate wet well.
   2. Name, location and experience of Subcontractor responsible for installation of lining product. Subcontractor shall have sufficient prior experience in the installation of the lining product.
   3. Manufacturer's recommended application procedures for lining product.
   4. Product data and chemical resistance data.

1.05 TRANSPORT AND STORAGE

A. Unloading and storage of the leachate UST and collection piping at the Work site shall be the responsibility of the Contractor and shall be performed in accordance with the manufacturer's recommended procedures.

1.06 QUALITY ASSURANCE

A. Governing Standards, as applicable:
   1. Manufacturer of the leachate overflow storage tank shall be in the business of manufacturing tanks with materials conforming to the requirements of ANSI/AWWA D120-02 Thermosetting Fiberglass-Reinforced Plastic Tanks.
   2. Tank manufacturer shall be in the business of manufacturing tanks to UL 1316 standards.

PART 2 PRODUCTS

2.01 PIPE MATERIALS

A. Pipe for gravity drain lines shall be PVC per AWWA C-900, with integral wall, bell and spigot joints. Pipe and fitting shall meet wall and strength minimum of SDR 26, and the requirements of ASTM D 3034. Joints shall be equipped with rubber rings. The bell shall consist of an integral wall section with a solid cross section rubber ring factory assembled, securely locked in place to prevent displacement. Rubber rings shall meet the requirements of ASTM F 477. All fittings and accessories shall be manufactured and furnished by the pipe supplier and have bell and/or space configurations identical to that of the pipe.

2.02 PIPE ACCESSORIES

A. All fittings and accessories shall be manufactured and furnished by pipe supplier of same material as pipe molded or formed to suit pipe size and end design, in required tee, bends, elbows, cleanouts, reducers, traps and other configurations required.

2.03 PIPE BEDDING

A. Pipe bedding shall conform to the requirements of Section 02207 (Aggregate Materials) of these Technical Specifications.

2.04 CONCRETE JUNCTION BOXES

A. Concrete junction boxes for the leachate collection piping shall be as shown on the Plans. Concrete boxes shall be manufactured of cast in place concrete or prefabricated reinforced concrete or approved steel equivalent to the dimensions set forth in the Plans.

B. Concrete for the junction boxes shall be a 6 sack Portland cement Type II mix and must meet the requirements of a maximum slump of 4 inches and a minimum 28-day compressive strength of 2,500 psi when tested in accordance with ASTM C 143 and ASTM C 39, respectively.

2.05 LEACHATE SEDIMENT CHAMBER/WET WELL LINING

A. Lining material for the existing sediment chamber and wet well shall be a solids epoxy resin based coating formulated for use in chemically aggressive sewer systems. It is the intent that this material shall provide waterproofing, sealing, st4ructural reinforcement, and corrosion protection of the existing sediment chamber and wet well.

B. The coating material shall be resistant to attack from the following: volatile organic compounds; bleaches; sulfuric, acetic, hydrochloric, phosphoric, nitric, chromic, oleic, and stearic acids; sodium and calcium hydroxides; ammonium, sodium, calcium, magnesium, and ferric chlorides; ferric sulfate, hydrogen sulfides, petroleum oil and greases, vegetable and animal oils, fats, greases, soaps and detergents. The coating shall be impermeable to sewage gases and liquid and shall be non-conducive to bacterial or fungus growth.

2.06 LEACHATE UST

A. Design Criteria
   1. *Internal Load:* Tank shall withstand a 5 psig air pressure test with 5:1 safety factor. Contractor shall individually test tank for leakage prior to installation. Maximum test pressure is 5-psi.
   2. *Vacuum Test:* To verify structural integrity, tank shall be vacuum tested by the manufacturer at the factory to 11.5 inches of mercury.
   3. *Surface Load:* Tank shall withstand surface H-20 axle loads when properly installed according to current manufacturer's installation instructions.
   4. *External Hydrostatic Pressure:* Tank shall be capable of being buried in ground with 7 feet of overburden over the top of the tank, the hole fully flooded, and a safety factor of 5:1 against general buckling.
   5. Tank shall support accessory equipment such as drop tubes when installed according to tank manufacturer's recommendations and limitations.

B. Tank shall be double wall, horizontal glass fiber reinforced tank manufactured with 100 percent resin and glass-fiber reinforcement. No sand fibers. Capacity shall be as indicated on Plans.

C. Product Storage:
   1. Tank shall be capable of storing chemicals or leachate with specific gravity up to 1.1.
   2. Tank shall be vented to atmospheric pressure.
   3. Tanks shall be capable of storing products identified in the manufacturer's current standard limited warranty.

D. Interstitial Space: Double wall tank shall have a space between the walls to allow for the free flow and containment of leaked material from the primary tank. The space also allows the insertion of a monitoring device through a monitoring fitting.

2.07 TANK ACCESSORIES

A. Manway: Flanged 22-inch (minimum) inside diameter manway with UL listed gasket, bolt and cover.

B. NPT Fittings: NPT fittings shall be sized and located as indicated on Plans. Fittings shall be UL listed. All fittings are to be 4 inches in diameter and supplied with plugs. NPT fittings shall withstand a minimum of 150 foot-pounds of torque and 1,000 foot-pounds of bending, both with a 2:1 safety factor. The monitor fitting shall consist of a 4-inch NPT fitting on the tank.

C. Striker plates shall be installed under each service fitting and manway opening.

D. Float Switch and Alarm Panel: One (1) mechanical float switch shall be provided and set at bottom of tank to detect presence of any liquid. The float switch shall be approved for use with intrinsically safe, Class I, Division 1 applications and shall be connected to an alarm panel located at pump station structure, warning lights only. The alarm shall also be connected to an existing auto-dialer.

E. A 2-inch diameter PVC vent pipe shall be installed from tank to the surface with a goose-neck and screen.

F. Anchor Straps: Anchor straps shall be of glass fiber reinforced type and located per manufacturer's recommendations. Each strap shall be capable of withstanding the maximum buoyance force of the tank assuming the tank empty and submerged in groundwater. Number and location of straps shall be per manufacturer's recommendations.

G. Concrete Deadman: Two concrete deadman, 12" x 12" x the tank length, shall be installed at the bottom of the tank excavation as shown on the Plans.

2.08 TANK BEDDING AND BACKFILL

A. Tank bedding and backfill shall conform to the requirements of Section 02207 (Aggregate Materials) of these Technical Specifications.

2.09 ENGINEERED FILL

A. Backfill material above the pipe bedding and tank bedding shall conform to the requirements of Section 02224 (Engineered Fill) of these Technical Specifications.

PART 3 EXECUTION

3.01 BRACING AND SHORING

A. As required by the Trench Construction Safety Orders of the California Construction Safety Orders of the Division of Occupational Safety and Health, bracing and shoring shall be installed in trenches or excavations of 5 feet or greater depth to insure the safety of workers and to protect and facilitate the Work.

B. Bracing and shoring shall comply with Section 5-1.02A and 7-1.01E of the Standard Specifications.

3.02 GENERAL PIPE INSTALLATION

A. Contractor shall verify location of point of connection (POC) at the existing leachate collection piping as shown the Plans by potholing to determine the location and depth (elevation).

B. For the gravity drain pipe, the trench subgrade shall provide uniform support at a uniform slope along full length of pipe.

C. Contractor shall furnish all necessary fittings, fixtures, hardware, plates, fasteners, etc. to provide complete installation.

D. Location of pipes, fixtures, fittings, and drains that are shown on the Plans are approximate. The Contractor shall locate fittings and drains to best serve the intended use and to avoid mechanical and structural interferences. Location of valves, drains, and fittings must be approved by the Design Engineer prior to installation.

E. All installations shall be secure and watertight.

3.03 PIPE INSTALLATION

A. Excavation of pipe trenches shall be in accordance with Section 02225 (Trenching and Backfilling) of these Technical Specifications and as shown on the Plans.

B. The bottom of the trench shall be graded and prepared to provide a firm and uniform bearing throughout the entire length of the pipe barrel.

C. Pipe, fittings, and accessories shall be installed in accordance with manufacturer's instructions. Sealed joints shall be watertight.

D. Pipe shall be placed to the lines and grades as shown on the Plans.

E. The pipe shall be laid without break upgrade from structure to structure, with bell end upgrade for bell and spigot pipe.

F. The horizontal alignment of the pipe shall be laid such that any point shall not vary more than 0.10 feet from the design alignment established and shown on the Plans.

G. Pipe bedding material shall be placed at sides and over top of pipe in accordance with Section 02225 (Trenching and Backfilling) of these Technical Specifications and as shown on the Plans.

H. Trench backfill above the pipe bedding shall be in accordance with Section 02225 (Trenching and Backfilling) of these Technical Specifications and as shown on the Plans. Pipe shall not be displaced or damaged when compacting.

3.04 CONCRETE JUNCTION BOXES

A. Excavation for concrete junction boxes shall be in accordance with Section 02222 (Excavation) of these Technical Specifications and as shown on the Plans.

B. Concrete junction boxes shall be installed in accordance with manufacturer's instructions. Placement of the concrete junction boxes into the excavation shall be performed in a manner that will not induce damage or compromise future stability.

C. Backfill for concrete structures shall conform to the provisions in Section 19-3 of the Standard Specifications.

3.05 LEACHATE SEDIMENT CHAMBER/WET WELL LINING

A. Sequencing of this task shall be after installation of the condensate discharge line from the flare station to the leachate wet well in order to ensure that the new penetration is properly sealed by the lining application.

B. The Contractor's Health and Safety Plan shall be followed accordingly, including LFG

hazards and possible confined space entry (i.e., oxygen-deficient atmosphere), for all phases of Work.

C. Prior to start of Work, provisions shall be made to divert leachate from the existing leachate drain from discharging into the leachate sediment chamber. The leachate may be diverted to the new leachate UST (if already installed) or collected in a temporary holding tank of sufficient size.

D. Once discharge into the leachate sediment chamber has been diverted, all leachate shall be pumped from the leachate sediment chamber and wet well. The pumped leachate may be discharged to the existing leachate AST, new leachate UST (if already installed), or temporary holding tank.

E. If sediment is present at the base of the leachate sediment chamber and/or wet well, provisions shall be made to remove all sediment. Removed sediment may be disposed of with refuse excavated from other site activities, or transported separately and disposed of at a permitted transfer station or solid waste disposal facility.

F. Existing pumps and any other equipment/features that may inhibit application product shall be removed and stored in a dry and secure location.

G. The interior walls and base shall be cleaned to remove all dirt, dust, corrosion products, loose concrete, debris, grease, oils, growths, and foreign matter and residues. Residual generated by the cleaning operations shall be removed and managed in the same manner as described previously for leachate and sediment.

H. Sufficient time shall be provided to allow the surfaces of the interior walls and base to dry. Drying time may be expedited by mechanical means. Coatings shall be applied only to a sound clean surface profile consistent with the manufacturer's published recommendation.

I. Cracks, joints, eroded and damaged areas shall be sealed with a compatible grout/mortar as recommended by the coating manufacturer prior to application of the coating material.

J. Coating material shall be applied in a manner and thickness consistent with the manufacturer's published recommendation. Coatings shall be applied in a manner consistent with all applicable environmental and health and safety regulations. At a minimum, during application, the applicators shall use protective clothing, eye protection, chemical resistant gloves, and air respirators. Coating shall be applied to provide full and sufficient coverage of all interior walls and base and shall be free of blisters, pinholes, holidays, or discontinuities. Application shall be performed in strict accordance with recommended manufacturer's procedures.

K. Pumps and any other equipment/features that were removed shall be re-installed and normal operation of the leachate sediment chamber/wet well restored per pre-existing conditions.

3.06 TANK HANDLING

A. Contractor Acceptance Inspection: The Contractor is responsible for damage in shipment according to the checklist included in the tank shipment. Any discrepancies should be

reported to the Design Engineer.

B. The tank shall not be dropped, rolled or impacted. The tank shall be set on smooth ground, free of rocks and foreign objects, and chock tanks to prevent movement.

3.07 TANK INSTALLATION

A. The tank excavation shall be large enough to provide:
   1. 2 feet of clearance between the tank sides and ends and the excavation walls in stable soil.
   2. 12 inches of bedding under the tank.

B. Excavation for the tank shall be in accordance with Section 02222 (Excavation) of these Technical Specifications and as shown on the Plans. Contractor shall slope or shore sides of tank hole excavation as required to comply with the requirements of "OSHA Construction Standards".

C. The tank and all related piping and accessories shall be installed as per manufacturer's printed instructions.

D. Tank backfill shall be as follows:
   1. Tank bedding material shall be evenly placed over bottom of the excavation to attain a minimum thickness of 12 inches.
   2. A 12-inch lift of tank backfill shall initially be placed evenly around the tank. Care shall be taken to push backfill material completely beneath tank bottom and under end caps to provide necessary tank support, without voids.
   3. A second 12-inch lift of tank backfill shall be placed evenly around the tank using the same procedures described above.
   4. After completion of the second lift, tank backfill can be brought to the top of the tank without additional handwork.
   5. The tank shall never be left on the bed without tank backfill to the top of tank if there is any chance of more than 12 inches of water in the hole.
   6. Once tank backfill material has been placed completely over the tank to the depth shown on the Plans, backfill the remainder of the tank excavation with engineered fill in accordance with Section 02224 (Engineered Fill) of these Technical Specifications.

3.08 PERFORMANCE TESTING

A. UST Air Test:
   1. Prior to setting the tank, the Contractor shall perform an aerostatic leakage test in the presence of the Design Engineer.
   2. Pressurizing the relatively small annular space between two (2) tank shells can occur very quickly. A pressure of over 5 psi may cause damage to the tank structure which may not be immediately apparent. For all such tests, an air gauge with maximum ½ psi increments shall be used.
   3. The Contractor shall provide a valve and manifold arrangement with two (2) air gauges to perform tests.
   4. Testing shall be in accordance with the tank manufacturer's instructions.

5. While tank is under pressure, the entire tank, including fittings, should be wetted with a soapy solution to inspect for minor leaks which otherwise might not be evident.

B. Leachate Sediment Chamber/Wet Well:
   1. Visual inspection to verify a leak-free, uniform appearance.
   2. The applied wet film thickness shall be verified per ASTM D 4414, Standard Practice for Measurement of Wet Film Thickness of Organic Coatings by Notched Gages.
   3. The leachate sediment chamber and wet well shall be operated after the lining application and re-assembly of the pumps and other equipment/features to verify that the system is operating in accordance with pre-existing conditions.

C. If tests indicate Work does not meet specified requirements, all Work shall be removed, replaced and retested at no cost to the City.

PART 4 MEASUREMENT AND PAYMENT

4.01 LEACHATE COLLECTION PIPING

A. Leachate collection system piping shall be measured by the linear foot of collection piping installed and includes all piping, fittings, trenching, and backfilling. Payment shall be included in the Contract Unit Price per linear foot installed for the various sizes and types of "Leachate Collection Piping" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the leachate collection piping as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.02 CONCRETE JUNCTION BOXES

A. Concrete junction boxes for the leachate collection piping shall be measured by each box installed and include all trenching, backfill, concrete, and cover. Payment shall be included in the Contract Unit Price per each unit installed for "Concrete Junction Boxes" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to install the concrete junction boxes as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.03 LEACHATE SEDIMENT CHAMBER/WET WELL LINING

A. Measurement and payment for lining of the leachate sediment chamber/wet well shall be included in the Contract Lump Sum Price for "Leachate Sediment Chamber/Wet Well Lining" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, and incidentals required to line the leachate sediment chamber/wet well as shown on the Plans, as specified herein, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

4.04 LEACHATE UST

A. Measurement and payment for the leachate UST shall be included in the Contract Lump Sum Price for "Leachate UST" addressed in this Section and shall include full compensation for providing all materials, labor, equipment, tools, general electrical work, and incidentals required to install the leachate UST and accessories as shown on the Plans, as specified herein and within the tank manufacturer's specifications, and as directed by the Design Engineer. No additional compensation will be allowed therefore.

GENERAL INFORMATION

CQA SECTION 01000
INTRODUCTION

PART 1 GENERAL

1.01 PROJECT DESCRIPTION

A. The City of Ukiah Landfill is located in Mendocino County, California approximately two miles east of the City of Ukiah. The Work site address is 3100 Vichy Springs Road, Ukiah, California 95482 (Sheet 1). The City of Ukiah Landfill was operated as a Class III solid waste disposal facility and is comprised of a single waste management unit that is approximately 40 acres in size.

B. This Construction Quality Assurance (CQA) Plan applies to the final closure of the City of Ukiah Landfill. The final closure project encompasses approximately 65 acres in area and consists of the following construction features:

Site Preparation:
- Refuse excavation and relocation.
- Interim cover preparation.

Final Cover System (in ascending order):
- 1-foot thick foundation layer.
- Gas relief/venting system.
- LLDPE geomenbrane.
- Engineered synthetic turf with specific grade sand infill balast.

Miscellaneous items:
- Drainage and erosion control measures.
- Sedimentation basin improvements.
- Access roads.
- General earthwork, including various excavations and fills.
- Leachate overflow collection and storage system, including installation of a leachate underground storage tanks (UST).
- Landfill gas (LFG) collection system, including condensate drainage components.
- Borrow area reclamation.
- Seeding and fertilizing.
- Security fencing.

C. A detailed scope of construction for each unit of construction is presented in Section 01010 of this CQA Plan.

1.02 PURPOSE

A. The purpose of this CQA Plan is to provide a detailed guidance document for correct and thorough CQA verification procedures implemented during construction. This CQA Plan is also intended to identify, prevent, and correct problems and deficiencies that may occur during construction. This CQA Plan details general and specific requirements of the CQA program that will be implemented during construction to verify and document that construction is in compliance with the contract documents and the design intent.

Requirements of the CQA program include the following:

1. Product quality assurance verification testing to verify that all materials are in compliance with the Technical Specifications.
2. Construction monitoring and documentation to verify that each unit of construction is in compliance with the Technical Specifications and that construction was executed correctly using industry-standard construction methods and the proper materials.
3. Review and approval of product submittals to verify that construction materials are in compliance with the Technical Specifications.
4. Testing to verify that installed or constructed components are in compliance with the Technical Specifications.
5. CQA documentation consisting of Daily Summary Reports, CQA field logs, testing forms, installation logs, document control binders, material control logs, testing reports, photographic documentation, technical revisions, design modifications, record as-built drawings, and corrective action determination and verification reports.
6. Preparation of the CQA Certification Report that documents the CQA program implemented during construction and that construction was completed in compliance with the contract documents and the design intent. The CQA Certification Report will be submitted to the California Regional Water Quality Control Board, North Coast Region (RWQCB).

B. Although the CQA Plan provides a foundation for the CQA program, this plan may be modified and revised as appropriate prior to and during construction. All modifications and revisions to the CQA program will be documented in the CQA Certification Report.

1.03 PROJECT ORGANIZATION

A. The City of Ukiah, Department of Public Works (City) is the owner and operator of the City of Ukiah Landfill and has ultimate responsibility for the Project, including overall project management and project funding. For purposes of this CQA Plan, the City will be referred to as "Owner". The Owner has contracted with the following organizations to complete construction in accordance with the project documents listed in Part 1.02 of Section 01090 (References) of this CQA Plan.

1. EBA Engineering (EBA) - Design Engineer and CQA Certifying Engineer.
2. To Be Determined – Construction Contractor and Subcontractors.

B. EBA is the Design and CQA Certifying Engineer for the Project. As the Design Engineer, EBA is responsible for the design and site engineering related to the design. Site engineering includes: 1) review and approval of product and construction submittals required by the contract documents; 2) technical issues related to construction; 3) interpretation of the Technical Specifications and the Construction Drawings (herein after referred to as "Plans"); and 4) design modifications and technical revisions. For purposes of this CQA Plan, EBA will be referred to as "Design Engineer" when functioning as the Design Engineer.

As the CQA Certifying Engineer, EBA is responsible for certifying to the Owner and RWQCB that construction is in compliance with the contract documents and the design intent. Specific responsibilities of the CQA Certifying Engineer include: 1) providing a professional engineer or certified engineering geologist registered in the state of California; 2) implementing and managing the CQA program outlined in Part 1.02 of this Section; 3) review of all CQA documentation; and 4) preparation of the CQA Certification Report. EBA will provide an on-site CQA Team to implement and manage the CQA program consisting of a CQA Officer, CQA Monitors, a CQA Surveyor, and Geosynthetics and Soils CQA Testing Laboratories. For purposes of this CQA Plan, EBA will be referred to as "CQA Officer"

when functioning as the CQA Certifying Engineer.

C. The Construction Contractor is responsible for overall performance of the earthwork, including construction of drainage and erosion control measures, in accordance with the contract documents and as shown on the construction drawings. For purposes of this CQA Plan, the Construction Contractor will be referred to as "Contractor".

D. The Project Organization for CQA is shown on Table 01000-1, CQA Organization Chart

1.04 CQA PLAN FORMAT

A. This CQA Plan closely parallels the format of the Technical Specifications in the contract documents. The intent of this parallel format is to avoid discrepancies between the two documents, therefore preventing misinterpretations and misunderstandings between the Owner, Contractor, Design Engineer and CQA Certifying Engineer. This format also organizes all necessary quality assurance verification procedures for each unit of construction into a single section.

B. Division 1 of this plan presents general information about the construction project and the CQA program.

C. Division 2 of this plan provides detailed and specific CQA procedures to be implemented by the CQA Officer for each unit of construction. Division 2 is written instruction and direction for members of the CQA Team.

CQA SECTION 01010
SCOPE OF CONSTRUCTION

PART 1 GENERAL

1.01 SECTION SUMMARY

A. Work to be performed by the Design Engineer

B. Work to be performed by the Owner.

C. Contractor's scope of work.

1.02 WORK TO BE PERFORMED BY THE DESIGN ENGINEER

A. The Design Engineer will provide three (3) reference control points with benchmark elevations in the vicinity of the Work site. All other necessary control or reference points needed to perform construction will be established by the Contractor.

1.03 WORK TO BE PERFORMED BY THE OWNER

A. The Owner will provide the following construction materials and services:
   1. Material for engineered fill.
   2. Material for the foundation layer.
   3. Skid-mounted packaged combustion system, including totally-enclosed vertical ground flare.
   4. Extension of adequate power and telephone service to the location of the skid-mounted packaged combustion system.

1.04 CONTRACTOR'S SCOPE OF WORK

A. The Contractor's scope of work includes the following.
   1. Mobilization of construction equipment and personnel.
   2. Excavation of on-site borrow material for construction of final cover system soil components, as well as sedimentation basin improvements.
   3. Construction of final cover system, including interim cover preparation and placement/installation of foundation layer, geomembrane, engineered turf, hydrbinder, and sand ballast.
   4. Seeding and fertilizing of disturbed areas and on-site borrow area.
   5. Excavation and construction of, and supply of materials for, drainage and erosion control measures.
   6. Construction of, and supply of materials for, access roads.
   7. Construction of, and supply of materials for, leachate overflow collection and storage system, including installation of new leachate UST and lining of existing leachate sediment chamber and wet well.
   8. Construction of, and supply materials for, LFG collection and control system, including installation of LFG extraction wells, LFG collection system piping and condensate drainage components.

9. Installation of Owner-supplied skid-mounted packaged combustion system, including totally-enclosed vertical ground flare.
10. Construction of, and supply of materials for, security fencing.

END OF CQA SECTION 01010
SCOPE OF CONSTRUCTION

CQA SECTION 01039
PROJECT MEETINGS

PART 1 GENERAL

1.01 SECTION SUMMARY

A. Communication and coordination between the Design Engineer, Contractor, and CQA Team are most important to achieve the common goals of quality construction and successful completion of the project.

B. A series of project meetings will be held for the purpose of establishing a successful environment of communications, coordination, and overall teamwork; the meetings will be administered by the CQA Officer to: 1) clearly define responsibility and authority of each organization involved in the project; 2) resolve communication problems, misunderstandings, and misinterpretations; 3) find solutions to unanticipated developments; and 4) identify, prevent, and correct problems and deficiencies that may occur during the construction process.

C. Project meetings include the following.
1. Preconstruction meeting.
2. Progress meetings.
3. Preparatory meetings.

1.02 PRECONSTRUCTION MEETING

A. A preconstruction meeting will be held to discuss topics relating to the commencement of the project.

B. The objectives of this meeting are to: 1) clearly define the roles, responsibility, and authority of each organization and individual involved in the project; 2) review specific requirements of the CQA program; and 3) establish a foundation of cooperation to achieve quality construction. The following agenda, as related to CQA, will be addressed by the Design Engineer:
1. Introduce and discuss roles, authority, and responsibilities of each organization and individual involved in the project.
2. Establish lines of communication.
3. Review Technical Specifications and Plans.
4. Distribution of the CQA Plan.
5. Review of CQA activities to be performed.
6. Discuss Contractor's construction schedule and workplan.
7. Discuss Contractor's Construction Quality Control (CQC) procedures and responsibilities.
8. Discuss submittal review and approval procedures.
9. Discuss non-conformance and corrective action procedures.
10. Discuss construction restrictions due to weather conditions.
11. Discuss and schedule weekly progress meetings.
12. Discuss health and safety issues.
13. Discuss preparatory meetings.

C. A Meeting/Discussion Summary Report (see Part 1.08 of Section 01400 of this CQA Plan) will be completed by the CQA Officer and distributed to all parties in attendance.

D. The following representatives from each organization are required to attend the preconstruction meeting:
   1. City's Project Manager or representative.
   2. Contractor's Project Manager and on-site Superintendent.
   3. Installer's Project Manager and on-site Superintendent.
   4. Design Engineer's Project Manager and CQA Officer.

1.03 PROGRESS MEETINGS

A. The CQA Officer will schedule and administer weekly progress meetings. The objectives of these meetings are to: 1) maintain lines of communication; 2) review work progress and CQA activities performed previously; 3) discuss upcoming construction and related CQA activities; and 4) maintain and improve the established foundation of cooperation to achieve quality construction. The following agenda will be addressed by the CQA Officer.
   1. Review minutes of previous progress meeting.
   2. Review work progress.
   3. Review and update construction schedule and obtain a 2-week look-ahead schedule from the Contractor.
   4. Discuss CQA and CQC related field observations, testing results, problems, decisions, and conflicts.
   5. Review and update Submittal Log.

B. A Meeting/Discussion Summary Report (see Section 01400 of this CQA Plan) will be completed by the CQA Officer and distributed to all parties in attendance.

C. The following representatives from each organization are required to attend the weekly progress meetings.
   1. City's Project Manager or representative.
   2. Contractor's on-site Superintendent.
   3. Installers on-site Superintendent (during geosynthetics installation).
   4. Design Engineer's Project Manager and CQA Officer.

1.04 PREPARATORY MEETINGS

A. The CQA Officer will schedule and administer informal preparatory meetings prior to beginning construction/implementation of the following items.
   1. Refuse excavation and interim cover preparation.
   2. Foundation layer placement.
   3. Geomembrane placement.
   4. Turf installation.
   5. Sand ballast placement.
   6. General earthwork, drainage and erosion control, and access road construction, as needed.
   7. Sedimentation basin improvements.
   8. Leachate overflow collection and storage system installation.
   9. LFG collection system installation.
   10. Borrow area reclamation.
   11. Seeding and fertilizing.

B. The objective of these preparatory meetings is to establish a complete understanding of the upcoming unit of construction and CQA activities that will be implemented during construction. To achieve this objective, the following agenda will be addressed by the CQA Officer.

1. Review "Products" part of the applicable section of the Technical Specifications.
2. Review "Execution" part of the applicable section of the Technical Specifications.
3. Discuss any construction and grade control staking needed to perform and complete the Work.
4. Discuss CQA testing, observation, and surveying to be performed.
5. Verify that all submittals have been, or will be, received by the CQA Officer and approved by the Design Engineer in accordance with the schedule.
6. Discuss Contractor's CQC responsibilities.
7. Discuss Contractor's coordination, scheduling, and sequencing of the work.
8. Discuss Contractor's proposed equipment and manpower.

C. A Meeting/Discussion Summary Report (see Section 01400 of this CQA Plan) will be completed by the CQA Officer and distributed to all parties in attendance.

D. The following representatives from each organization are required to attend the preparatory meetings.

1. Design Engineer's Project Manager or representative.
2. Contractor's on-site Superintendent.
3. On-site Superintendent of any Subcontractor, as applicable to the unit of construction.
4. CQA Officer.
5. CQA Monitor(s), as applicable to the unit of construction.

END OF CQA SECTION 01039
PROJECT MEETINGS

CQA SECTION 01050
GENERAL REQUIREMENTS

PART 1 GENERAL

1.01 SECTION SUMMARY

A. Conformance testing.

B. Construction monitoring.

C. Construction testing.

D. Project meetings.

E. Submittal review and approval.

F. Documentation.

1.02 CONFORMANCE TESTING

A. Prior to using a product or material in construction, sampling and testing will be performed to verify that construction products and materials to be used are in conformance with the Technical Specifications.

B. Conformance testing requirements, methods, and sampling frequencies are given for each unit of construction in Division 2 of this CQA Plan.

C. All product and material conformance test samples will be recorded on the appropriate Master Testing Control Log, assigned a sample number, and processed by the CQA Officer for either on-site or off-site testing. The Master Testing Control Logs document: 1) sample numbers; 2) product or material types; 3) required testing; 4) sampling locations and dates; 5) testing personnel or organization; 6) testing completion dates; and 7) a brief summary of the testing results. The Master Testing Control Log for soils are presented in Appendix C.

D. At the request of the Design Engineer, conformance test samples will be archived at the Work site or an alternate location determined by the Owner for a period of one year. Archived samples will be stored in sealed plastic containers tagged with: 1) the sample number; 2) product or material type; 3) the project name and number; 4) sample date and location; and 5) the date for discarding the sample.

E. The following products or materials require conformance testing.
1. Miscellaneous aggregate materials.
2. Engineered fill.
3. Foundation soil layer.
4. Geomembrane.
5. Engineered turf.
6. Erosion-resistant layer.
7. Concrete.

1.03 CONSTRUCTION MONITORING

A. Each unit of construction will be monitored to verify compliance with the Technical Specifications and that construction was executed correctly using industry-standard construction methods and the proper materials.

B. Monitoring guidelines and procedures are specified for each construction unit in Division 2 of this CQA Plan and include the following:
   1. Field tests.
   2. Observations.
   3. Field surveys.
   4. Physical measurements.

1.04 CONSTRUCTION TESTING

A. Construction testing will be performed during installation and construction to verify compliance with the Technical Specifications.

B. Construction testing may be performed by the Contractor, Design Engineer, or CQA personnel as required for each construction unit in Division 2 of this CQA Plan and includes the following:
   1. Engineered fill.
   2. Foundation layer.
   3. Aggregate base for access roads.
   4. Geomembrane.
   5. Engineered turf.
   6. Sand ballast.

1.05 PROJECT MEETINGS

A. In accordance with Section 01039 of this CQA Plan.

1.06 SUBMITTAL REVIEW AND APPROVAL

A. In accordance with Section 01300 of this CQA Plan.

1.07 DOCUMENTATION

A. In accordance with Section 01400 of this CQA Plan.

END OF CQA SECTION 01050
GENERAL REQUIREMENTS

CQA SECTION 01090

1.02 PROJECT REFERENCE DOCUMENTS

A. The following project reference documents provide support and background information for use in conjunction with this CQA Plan.

1. *Joint Technical Document for City of Ukiah Landfill, Mendocino County, California;* EBA Engineering, January 2008.
2. *Response to RWQCB Comments Dated February 21, 2008, Joint Technical Document, City of Ukiah Landfill, Mendocino County, California;* EBA Engineering, April 21, 2008.
3. *January 2008 Joint Technical Document Addendum, Response to Regulatory Comments, Final Closure and Postclosure Maintenance Plans, City of Ukiah Landfill, Mendocino County, California;* EBA Engineering, June 20, 2013.
4. *Design Plan for Landfill Gas Collection and Control System, City of Ukiah Landfill, Mendocino County, California;* EBA Engineering, October 2013.

1.03 INDUSTRY STANDARDS AND TECHNICAL REFERENCE DOCUMENTS

A. The following industry standards and technical reference documents were used in the preparation of this CQA Plan.

1. *ASTM Standards and Other Specifications and Test Methods on the Quality Assurance of Landfill Liner Systems.* American Society for Testing and Materials, Current Edition.
2. *Technical Guidance Document, Quality Assurance and Quality Control for Waste Containment Facilities [EPA/600/R-93/182].* United States Environmental Protection Agency, September 1993.
3. *Federal Register (Vol. 56, No. 196, pp. 50978 - 51119). Part II, Environmental Protection Agency, 40 CFR Parts 257 and 258 - Solid Waste Disposal Facility*

Criteria; Final Rule [EPA/OSW-FR-91-004 FRL-4011-9]. United States Environmental Protection Agency, October 9, 1991.

4. *California Code of Regulations, Title 27 - Combined SWRCB/CIWMB Regulations, Division 2, Subdivision 1, Chapter 3, Subchapter 2, Article 4, Section 20324.* Effective July 18, 1997.
5. *Caltrans Standard Specifications.* California Department of Transportation, 2010.
6. *Caltrans Standard Plans.* California Department of Transportation, 2010.
7. *California Test Methods. California Department of Transportation, Current Edition.*
8. *California Building Code. Current Edition.*

1.04 SOILS TESTING STANDARDS AND METHODS

A. The following standard soils testing methods and procedures apply as referenced in the Technical Specifications and/or this CQA Plan.

1.	ASTM C 33	Standard Specification for Concrete Aggregates.
2.	ASTM C 136	Sieve Analysis of Fine and Coarse Aggregates.
3.	ASTM D 422	Standard Test Method for Particle-Size Analysis of Soils.
4.	ASTM D 1557	Test Method for Laboratory Compaction Characteristics of Soil Using Modified Effort (56,000 ft-lbf/ft^3 [2,700 kN-m/m^3]).
5.	ASTM D 2434	Standard Test Method for Permeability of Granular Soils (Constant Head).
6.	ASTM D 2487	Standard Classification of Soils for Engineering Purposes (Unified Soil Classification System).
7.	ASTM D 2488	Standard Practice for Description and Identification of Soils (Visual-Manual Procedure).
8.	ASTM D 2922	Standard Test Methods for Density of Soil and Soil-Aggregate in Place by Nuclear Methods (Shallow Depth).
9.	ASTM D 3017	Standard Test Method for Water Content of Soil and Rock in Place by Nuclear Methods (Shallow Depth).
10.	ASTM D 4959	Standard Test Method for Determination of Water (Moisture) Content of Soil by Direct Heating.
11.	CTM 229	Method of Test for Durability Index.
12.	CTM 301	Method for Determining the Resistance "R" Value of Treated and Untreated Bases, Subbases, and Basement Soils by the Stabilometer.

1.05 GEOSNYTHETICS TESTING STANDARDS AND METHODS

A. The following standard geosynthetics testing methods and procedures apply as referenced in the Technical Specifications and/or this CQA Plan.

1.	ASTM D 1505	Test Method for Density of Plastics by the Density-Gradient Technique.
2.	ASTM D 4218	Test Method for Carbon Black Content.
3.	ASTM D 4355	Test Method for Deterioration of Geotextiles from Exposure to Ultraviolet Light and Water.
4.	ASTM D 4491	Test Methods for Water Permeability of Geotextiles by Permittivity.
5.	ASTM D 4533	Test Method for Trapezoid Tearing Strength of Geotextiles.
6.	ASTM D 4632	Test Method for Breaking Load and Elongation of Geotextiles (Grab Method).
7.	ASTM D 4633	Standard Test Method for Energy Measurement for

Dynamic Penetrometers.

8.	ASTM D 4716	Standard Test Method for Constant Head Hydraulic Transmissivity (In-Plane Flow) of Geotextiles and Geotextile Related Products.
9.	ASTM D 4751	Test Method for Determining the Apparent Opening Size of a Geotextile.
10.	ASTM D 4759	Standard Practice for Determining the Specification Conformance of Geosynthetics.
11.	ASTM D 4833	Test Method for Index Puncture Resistance of Geotextiles, Geomembranes, and Related Products.
12.	ASTM D 5035	Standard Test Method for Breaking Force and Elongation of Textile Fabrics (Strip Method).
13.	ASTM D 5199	Standard Test Method for Measuring the Nominal Thickness of Geosynthetics.
14.	ASTM D 5261	Test Methods for Mass Per Unit Area (weight) of Woven Fabrics.
15.	ASTM D 5321	Standard Test Method for Determining the Coefficient of Soil and Geosynthetic or Geosynthetic Friction by the Direct Shear Method.

1.06 LANDFILL GAS EXTRACTION SYSTEM TESTING STANDARDS AND METHODS

A. The following standard geosynthetics testing methods and procedures apply as referenced in the Technical Specifications and/or this CQA Plan.

1.	ASTM A 193	Standard Specification for Alloy Steel and Stainless Steel Bolting Materials for High Temperature Service.
2.	ASTM A 325	Standard Specification for Structural Bolts, Steel, Heat Treated, 120/105 KSI Minimum Tensile Strength.
3.	ASTM D 1784	Standard Specification for Rigid PVC Compounds and Chlorinated PVC Compounds.
4.	ASTM D 1785	Standard Specification for PVC Plastic Pipe, Schedules 40, 80, and 120.
5.	ASTM D 2464	Standard Specification for Threaded PVC Plastic Pipe Fittings, Schedule 80.
6.	ASTM D 2466	Standard Specification for Threaded PVC Plastic Pipe Fittings, Schedule 40.
7.	ASTM D 2467	Standard Specification for Socket-Type PVC Plastic Pipe Fittings, Schedule 80.
8.	ASTM D 2513	Standard Specification for Thermoplastic Gas Pressure Pipe, Tubing, and Fittings.
9.	ASTM D 2564	Standard Specification for Solvent Cements for PVC Plastic Piping Systems.
10.	ASTM D 2855	Standard Specification for Making Solvent-Cemented Joints with PVC Pipe and Fittings.
11.	ASTM D 3034	Standard Specification for Type PSM Poly (Vinyl Chloride) (PVC) Sewer Pipe and Fittings.
12.	ASTM D 3212	Standard Specification for Joints for Drain and Sewer Plastic Pipes Using Flexible Elastomeric Seals.
13.	ASTM D 3261	Standard Specification for Butt Heat Fusion Polyethylene (PE) Plastic Fittings for Polyethylene (PE) Plastic Pipe and Tubing.
14.	ASTM D 3350	Standard Specification for Polyethylene Plastic Pipe and

		Fittings Materials.
15.	ASTM D 3786	Standard Test Method for Methoxyl and Hydroxypropyl Substitution in Cellulose Ether Products by Gas Chromatography.
16.	ASTM D 7001	Standard Specification for Geocomposites for Pavement Edge Drains and Other High-Flow Applications.
17.	ASTM F 477	Standard Specification for Elastomeric Seals (Gaskets) for Joining Plastic Pipe.
18.	ASTM F 2648	Standard Specification for 2 to 60 inch [50 to 1500 mm] Annular Corrugated Pipe Wall Polyethylene (PE) Pipe and Fittings for Land Drainage Applications.

1.07 CONCRETE TESTING STANDARDS AND METHODS

A. The following standard concrete testing methods and procedures apply as referenced in the Technical Specifications and/or this CQA Plan.

1.	ASTM C 39	Standard Test Method for Compressive Strength of Cylindrical Concrete Specimens.
2.	ASTM C 42	Standard Test Method for Obtaining and Testing Drilled Cores and Sawed Beams of Concrete.
3.	ASTM C 143	Standard Test Method for Slump of Portland Cement Concrete.
4.	ASTM C 150	Standard Specification for Portland Cement.
5.	ASTM C 260	Standard Specification for Air-Entraining Admixtures for Concrete.
6.	CBC Section 1701	Structural Tests and Special Inspections.
7.	CBC Section 1905	Concrete Quality, Mixing and Placing.

1.08 STEEL TESTING STANDARDS AND METHODS

A. The following standard steel testing methods and procedures apply as referenced in these Technical Specifications and/or the CQA Plan.

1.	ASTM A 36	Standard Specification for Carbon Structural Steel.
2.	ASTM A 90	Test Method for Weight (Mass) of Coating on Iron and Steel Articles with Zinc or Zinc-Alloy Coating.
3.	ASTM A 185	Standard Specifications for Steel Welded Wire Reinforcement, Plain, for Concrete.
4.	ASTM A 313	Specification for Chromium-Nickel Stainless and Heat-Resisting Steel Spring Wire.
5.	ASTM A 370-97a	Test Methods and Definitions for Mechanical Testing of Steel Products.
6.	ASTM A 615	Standard Specification for Deformed and Plain Carbon-Steel Bars for Concrete Reinforcement.
7.	ASTM A 641	Specification for Zinc Coated (Galvanized) Carbon Steel Wire.
8.	ASTM A 764	Specification for Steel Wire, Carbon, Drawn Galvanized and Galvanized at Size for Mechanical Springs.
9.	ASTM A 975-97	Standard Specification for Double-Twisted Hexagonal Mesh Gabions and Revet Mattresses (Metallic-Coated Steel Wire or Metallic-Coated Steel Wire with Polyvinyl Chloride (PVC) Coating).

1.09 ACRONYMS

A. Whenever the following acronyms for standards, institutes and societies are referenced in the Technical Specifications or this CQA Plan, the following meanings apply:

1.	AASHTO	American Association of State Highway and Transportation Officials
2.	AISC	American Institute of Steel Construction
3.	ANSI	American National Standards Institute
4.	ASTM	American Society for Testing and Materials
5.	AWWA	American Water Works Association
6.	CAC	California Administrative Code
7.	CFR	Code of Federal Regulations
8.	CRSI	Concrete Reinforcing Steel Institute
9.	CTM	California Test Methods
10.	NEMA	National Electrical Manufacturer's Association
11.	NEC	National Electric Code
12.	NFPA	National Fire Protection Association
13.	OSHA	Occupational Health and Safety Administration
14.	RWQCB	Regional Water Quality Control Board
15.	SWANA	Solid Waste Association of North America
16.	SWRCB	State Water Resources Control Board
17.	UL	Underwriters Laboratories Inc.
18.	US	United States

B. Whenever the following acronyms for materials and units are referenced in the Technical Specifications or this CQA Plan, the following meanings apply:

1.	AC	acre
2.	AWG	American Wire Gauge
3.	cm	centimeter
4.	CMP	corrugated metal pipe
5.	EPDM	ethylene propylene diene monomer
6.	°F	degree Fahrenheit
7.	ft	foot
8.	g	gram
9.	HDPE	High Density Polyethylene
10.	HP	horse power
11.	in	inch
12.	”	inch
13.	kN	kilonewtons
14.	lb	pound
15.	MARV	minimum average roll value
16.	m	meter
17.	mm	millimeter
18.	mil	1/1000 of 1 inch
19.	ml	milliliters
20.	min	minute
21.	No.	number
22.	oz	ounce

23.	%	percent
24.	psf	pounds per square foot
25.	psi	pounds per square inch
26.	psig	pounds per square inch gauge
27.	PVC	Polyvinyl Chloride
28.	SDR	Standard Dimension Ratio
29.	sec	second
30.	TFE	tetrafluoroethylene
31.	TRM	turf reinforcement mat
32.	yd	yard

C. Whenever the following miscellaneous acronyms are referenced in the Technical Specifications or this CQA Plan, the following meanings apply:

1.	AST	Above Ground Storage Tank
2.	@	at
3.	BMP	Best Management Practice
4.	CQA	Construction Quality Assurance
5.	CQC	Construction Quality Control
6.	CSMP	Construction Storm Water Management Plan
7.	EBA	EBA Engineering
8.	=	equals
9.	GCL	Geosynthetic Clay Liner
10.	GRL	Gas Relief Layer
11.	LFG	Landfill Gas
12.	max.	maximum
13.	min.	minimum
14.	MQC	Manufacturer's Quality Control
15.	MSDS	Material Data Safety Sheet
16.	NOI	Notice of Intent
17.	NPDES	National Pollutant Discharge Elimination System
18.	PDF	Portable Document Format
19.	POC	Point of Connection
20.	QSD	Qualified SWPPP Developer
21.	QSP	Qualified SWPPP Practitioner
22.	REAP	Rain Event Action Plan
23.	SAP	Storm Water Action Plan
24.	SMARTS	Storm Water Multiple Application and Report Tracking System
25.	SPC	Storm Water Pollution Control
26.	Std.	Standard
27.	SWPPP	Storm Water Pollution Prevention Plan
28.	TEFC	Totally Enclosed Fan Cooled
29.	UST	Underground Storage Tank
30.	UV	Ultra-violet
31.	WDID	Waste Discharge Identification
32.	WPC	Water Pollution Control

1.10 CONTACT ADDRESSES AND TELEPHONE NUMBERS

A. The following are addresses, telephone numbers, and fax numbers for individual contacts at each organization involved in the project.

City of Ukiah
Department of Public Works
300 Seminary Avenue
Ukiah, CA 95482
Telephone: (707) 463-6282
Fax: (707) 463-6204

EBA Engineering
825 Sonoma Avenue
Santa Rosa, CA 95404
Contact Name: Damon F. Brown, P.G., C.E.G., C.Hg.
Telephone: (707) 544-0784
Fax: (707) 544-0866

CQA SECTION 01300
SUBMITTALS

PART 1 GENERAL

1.01 SECTION SUMMARY

A. Submittal Control Log.

B. Submittal review and approval procedures.

1.02 SUBMITTAL CONTROL LOG

A. The Submittal Control Log lists all submittals required by the Technical Specifications. The Submittal Control Log will be maintained by the CQA Officer in coordination with the Contractor during construction. The Submittal Control Log documents: 1) submittal number; 2) referenced specification section; 3) submittal description; 4) submitter; 5) date received; 6) reviewer; 7) action taken determination; and 8) return date.

1.03 SUBMITTAL REVIEW AND APPROVAL PROCEDURES

A. Three (3) copies of each submittal listed in the Submittal Control Log will be submitted to the CQA Officer by the Contractor in accordance with the Technical Specifications. The submittals will be forwarded by the CQA Officer to the Design Engineer for review and approval. The Design Engineer may perform a preliminary review of submittals for compliance with the Technical Specifications and issue a verbal *Approval for Use* to the CQA Officer who, in turn, will notify the Contractor that no corrective action determinations were required prior to issuing a verbal *Approval for Use*. All submittals which are not in compliance with the Technical Specifications must be immediately forwarded to the Design Engineer for review and corrective action determinations.

B. At the completion of the review process, the Design Engineer will return two (2) copies of each submittal to the CQA Officer with *Action Taken* determinations stamped on both copies of the submittal. The *Action Taken* determinations and the return dates will be recorded on the Submittal Control Log. One copy of the reviewed submittal will be returned to the Contractor and the other copy will be archived by the CQA Officer in the submittal documentation control binder.

C. The Submittal Control Log will be reviewed and updated in coordination with the Contractor at the weekly progress meetings.

END OF CQA SECTION 01300
SUBMITTALS

CQA SECTION 01400
DOCUMENTATION

PART 1 GENERAL

1.01 SECTION SUMMARY

A. Daily Summary Report.

B. Daily Field Log (Inspection Data Sheet).

C. Construction monitoring forms.

D. Laboratory testing reports.

E. Non-conformance/Corrective Action Form.

F. Acceptance Report.

G. Meeting/Discussion Summary Report.

H. Photograph Log.

I. Document Control.

J. As-built Record Documents.

K. CQA Certification Report.

L. Documentation archive storage.

1.02 DAILY SUMMARY REPORT

A. A summary report will be prepared daily by the CQA Officer. This report will organize and summarize all construction and CQA activities (monitoring and testing) completed during each day. The Daily Summary Report will contain or reference the following information:

1. Title block containing: 1) project name; 2) project number; 3) project location; 4) name of Owner; 5) name of Contractor; 6) date and day; 7) Document Control Number (see Part 1.10 of this Section); and 8) weather conditions.
2. Summary of construction activities for each unit of construction including equipment, personnel, and subcontractors utilized for each unit of construction and identification of the general area(s) where construction took place.
3. General summary of CQA activities (monitoring and testing) completed for each unit of construction with reference to attached Daily Field Logs (see Part 1.03 of this Section) which describe construction monitoring, construction testing results, and quality control procedures and test results.
4. General description of any non-conformance with the Plans or Technical Specifications and the corrective action measures taken with reference to attached Non-conformance/Corrective Action Forms (see Part 1.06 of this Section) which contain a more detailed description of the non-conformance issue and its corrective

action.

5. List of any materials received and status of submittal(s).
6. List of project meetings or pertinent discussions with reference to attached Meeting/Discussion Summary Report (see Part 1.08 of this Section).
7. Other miscellaneous information.
8. Signature of CQA Officer.

B. A sample Daily Summary Report is included in Appendix A, Project Documentation Forms.

1.03 DAILY FIELD LOG (INSPECTION DATA SHEET)

A. Each CQA Monitor will maintain an individual Daily Field Log (or Inspection Data Sheet) which will be assigned a cross-referencing Document Control Number (see Part 1.10 of this Section) and contain daily entries of the CQA Monitor.

B. On the Daily Field Log, the CQA Monitors will provide a written account of construction activities, construction monitoring, construction testing, and quality control procedures performed during the day for the monitored construction unit(s), as well as any observations (i.e., notes, charts, sketches, or photograph reference).

C. Construction monitoring forms (see Part 1.04 of this Section) and laboratory testing forms (see Part 1.05 of this Section) will be attached to, or referenced in, the Daily Field Log.

1.04 CONSTRUCTION MONITORING FORMS

A. Construction activities, construction monitoring, and construction testing will be recorded on appropriate construction monitoring forms. The following construction monitoring forms, or similar forms, will be issued by the CQA Officer for this project and are presented in the following appendices:

1. Soils Monitoring Forms (Appendix B)
   a. Soils Test Request - Sample Custody Log
   b. Nuclear Density/Moisture Test Data
2. Geosynthetics Monitoring Forms (Appendix C)
   a. Geomembrane Delivery and Control Log
   b. Engineered Turf Delivery and Control Log
   c. Geomembrane Test Request – Sample Custody Log
   d. Engineered Turf Test Request – Sample Custody Log
   e. Geomembrane Deployment/Seaming Log
   f. Geomembrane Repair Log
   g. Engineered Turf Deployment/Seaming Lot
   h. Engneered Turf Repair Log

B. Completed construction monitoring forms will be submitted by the CQA Monitor to the CQA Officer for review with Daily Field Logs, or at the completion of testing, and will be addressed by the CQA Officer in the Daily Summary Reports.

1.05 LABORATORY TESTING REPORTS

A. Laboratory testing reports will be issued by the Soils and Geosynthetics CQA Testing Laboratories for conformance and construction testing. Laboratory testing reports will be issued for the following testing during the project.

1. Moisture content, particle size analysis, Atterberg limits, Unified Soil Classification,

and/or moisture-density relationship testing for miscellaneous aggregate materials, engineered fill, foundation layer, and erosion-resistant layer materials.
2. Particle size analysis for sand ballast.
3. Conformance testing for geomembrane.
4. Conformance testing for engineered turf.
5. Conformance testing for concrete.

B. Laboratory testing reports will be addressed by the CQA Officer in the Daily Summary Report on the date of receipt.

1.06 NON-CONFORMANCE/CORRECTIVE ACTION FORM

A. A Non-conformance/Corrective Action Form will be issued by the Owner to the CQA Officer who will notify the Contractor or Installer of construction or materials not in compliance with the Plans or Technical Specifications, or for defective workmanship or materials even if in compliance with the Plans and Technical Specifications. The Non-conformance/Corrective Action Form will contain or reference the following information:
1. Title block containing: 1) project name; 2) project number; 3) project location; 4) name of Owner; 5) name of Contractor; 6) date and day; and 7) Document Control Number (see Part 1.10 of this Section).
2. Description of the non-conformance issue, construction unit, and location.
3. Reference to the technical specification(s) and/or plan(s) for which materials or construction are not in compliance.
4. Description of corrective action measures necessary to fully correct the area of non-conformance with the Plans and/or Technical Specifications as determined by the Owner.
5. Specification variance or revisions to the As-built Record Drawings (see Part 1.11 of this Section) required.
6. If necessary, any Daily Field Log, construction monitoring forms, laboratory testing report(s), Meeting/Discussion Summary Report, or Photograph Log pertaining to the non-conformance issue will be referenced by Document Control or Photograph Number to fully substantiate the non-conformance issue and corrective action determination.
7. Signature of the CQA Officer verifying that corrective measures determined by the Owner have been taken by the Contractor or Installer.

B. A sample Non-conformance/Corrective Action Form is included in Appendix A, Project Documentation Forms.

1.07 ACCEPTANCE REPORT

A. An Acceptance Report will be prepared for each Construction Unit to verify that all materials and construction are in compliance with the Plans and Technical Specifications. The Acceptance Report will reference all relevant Daily Summary Reports, Daily Field Logs (Inspection Data Sheets), and Non-conformance/Corrective Action Forms by the Document Control Number.

B. A sample Acceptance Report is included in Appendix A, Project Documentation Forms.

1.08 MEETING/DISCUSSION SUMMARY REPORT

A. A Meeting/Discussion Summary Report will be prepared for each scheduled Project Meeting (see Section 01039 of this CQA Plan) and any pertinent discussion between the Contractor and CQA personnel. The Meeting/Discussion Summary Report will contain the following information:

1. Title block containing: 1) project name; 2) project number; 3) project location; 4) name of Owner; 5) name of Contractor; 6) date and time; 7) meeting location; and 8) Document Control Number (see Part 1.10 of this Section).
2. Meeting name or general discussion subject matter.
3. List of meeting attendees or discussion participants.
4. Minutes of scheduled Project Meetings or synopsis of discussion.
5. List of any items needing resolution resulting from the meeting or discussion.
6. Signature of CQA Officer.

B. A sample Meeting/Discussion Summary Report is included in Appendix A, Project Documentation Forms.

1.09 PHOTOGRAPH LOG

A. All construction activities will be continually photographed to clearly show and define construction methods and as-built conditions of completed units of construction. Photographs will include: 1) product or material sources; 2) construction methods in progress for each unit of construction; 3) completed units of construction; 4) damaged, rejected, or substandard materials and construction; 5) corrective action measures to rectify damaged, rejected, or substandard construction; 6) completed units of construction after completion of corrective action measures; and 7) design modifications. Photographs will be identified by number, date, and time of the photograph. The CQA Officer will maintain a cross-referencing photography log documenting the subject matter of each photograph.

B. A sample Photograph Log is included in Appendix A, Project Documentation Forms.

1.10 DOCUMENT CONTROL

A. A unique Document Control Number will be assigned to all CQA documents generated during construction and implementation of this CQA Plan.

B. The Document Control Number will organize and index all CQA documentation for cross-referencing, to allow easy access to all documents, and to enable a reviewer to identify and retrieve original CQA documentation for any completed unit of construction.

C. Complete documentation of all CQA activities will be controlled and secured in a series of 3-ring binders maintained by the CQA Officer with a duplicate copy maintained at the offices of the Owner, at the option of the Owner. This documentation control structure organizes and indexes all CQA documents and is intended to allow easy access to all documents for review and audit by the Owner, Design Engineer, or regulatory agencies. The following is a preliminary list and contents of the *CQA Documentation Binders* to be established and maintained by the CQA Officer.

1. Title: *Daily Summary Reports and Field Logs.*
   Color code (optional): Blue.
   Contents: Daily Summary Reports prepared by the CQA Officer and Daily Field

Logs completed by the CQA Monitors.

2. Title: *Project Administration Documentation.*
   Color code (optional): Red.
   Contents: Non-conformance/Corrective Action Forms, Acceptance Reports, Meeting/Discussion Summary Reports, Owner correspondence, Design Engineer correspondence, Contractor correspondence, and miscellaneous correspondence.
3. Title: *Contractor Daily Field Reports.*
   Color code (optional): Green.
   Contents: Any Daily Field Reports prepared by the Contractor (or Installer).
4. Title: *Submittals.*
   Color code (optional): Purple.
   Contents: Updated Submittal Control Log, submittal transmittal cover sheets, and all reviewed and approved (or other status) submittals.
5. Title: *Soils CQA.*
   Color code (optional): White.
   Contents: Construction monitoring forms and laboratory testing reports for soils.
6. Title: *Geosynthetics CQA.*
   Color code (optional): Orange.
   Contents: Construction monitoring forms and laboratory testing reports for geosynthetics.
7. Title: *CQA Plan.*
   Color code (optional): Teal.
   Contents: CQA Plan.
8. Title: *Photography Log.*
   Color code (optional): Yellow.
   Contents: Construction and CQA photographs and cross-referencing Photograph Logs.

1.11 AS-BUILT RECORD DOCUMENTS

A. As-built Record Documents will be maintained by the CQA Officer and will be reviewed and verified by the Design Engineer.

B. The As-built Record Documents will show actual as-built conditions of construction, including an aerial topographic survey illustrating the final construction grades and configuration, and will adequately reflect that construction is in substantial compliance with the design intent of the Plans and Technical Specifications; irrelevant deviations in actual construction that do not substantially affect the design intent will not be incorporated into the As-built Record Documents, but will be addressed in the CQA Certification Report (see Part 1.12 of this Section).

C. As-built Record Documents will be prepared during the construction process by making modifications as they occur to a single set of construction drawings designated as the *Site As-built Record Documents*; at the completion of construction the CQA Officer will incorporate all as-built conditions into the *Final As-built Record Documents.*

D. The final As-built Record Documents will contain revision numbers, dates, and reviewer initials; and will be signed and stamped by the CQA Certifying Engineer.

1.12 CQA CERTIFICATION REPORT

A. At the completion of the project, the CQA Certifying Engineer will prepare a CQA Certification Report and submit it to the Owner. The CQA Certification Report will consist of information and data generated by the CQA program and will document that the final closure construction is in compliance with the design intent of the Plans and Technical Specifications. At a minimum, the CQA Certification Report will contain the following information.

1. Summary of construction methods for each unit of construction completed.
2. Summary of the CQA program implemented during construction and specific CQA activities (monitoring and testing) performed for each unit of construction completed.
3. Results of conformance testing and construction testing.
4. Revisions made to Plans and variances from Technical Specifications allowed.
5. Final As-built Record Documents.
6. Statement of compliance with the design intent of the Plans and Technical Specifications, signed and stamped by the CQA Certifying Engineer, a professional engineer or certified engineering geologist registered in the State of California.

1.13 DOCUMENTATION ARCHIVE STORAGE

A. At the completion of the project and after submittal of the CQA Certification Report and As-built Record Documents to the Owner, all original documentation generated by construction and the CQA program will be archived at the Owner's administrative office with duplicate copies stored at the offices of the Design Engineer and CQA Certifying Engineer.

END OF CQA SECTION 01400
DOCUMENTATION

DIVISION 2

CONSTRUCTION QUALITY ASSURANCE PROCEDURES

CQA SECTION 02207
AGGREGATE MATERIALS

PART 1 GENERAL

1.01 SUMMARY

A. The CQA Officer shall perform CQA procedures as outlined in this Section and follow guidelines for monitoring and testing to verify and document that the aggregate materials are in compliance with the Plans and Technical Specifications.

1.02 SUBMITTALS

A. Collect three (3) copies of each submittal required in the Technical Specifications.

B. Verify compliance with the submittal schedule and update Submittal Log.

C. Perform submittal review and approval procedures in Part 1.03 of Section 01300 (Submittals) of this CQA Plan.

PART 2 PRODUCTS

2.01 AGGREGATE MATERIALS

A. Verify that the following aggregate materials meet the applicable product requirements of Section 02207 (Aggregate Materials) of the Technical Specifications:
1. Aggregate base.
2. Pipe bedding.
3. Sand ballast.
4. Loose rock riprap.
5. Grouted rock riprap.
6. Gravel pack.
7. Concrete aggregate.
8. Coarse rock for construction entrance.
9. Concrete sand.
10. Tank bedding and backfill.

2.02 CONFORMANCE TESTING

A. Prior to aggregate base, pipe bedding, tank bedding and tank backfill placement operations, sample these respective materials to be used at the Work site and send the samples to the Soils Testing Laboratory to perform following test as specified:
1. Moisture-Density Relationship (ASTM D 1557); one (1) per source.

B. Prior to sand ballast placement operations, sample the actual sand material to be used at the Work site and send the samples to the Soils Testing Laboratory to perform at least one (1) of each of the following tests as specified:
1. Sieve Analysis (ASTM C 136) per every 10,000 cubic yards.
2. Permeability (ASTM D 2434 [modified]) per every 10,000 cubic yards.

C. Verify that the respective aggregate materials are derived from the approved sources throughout the Work.

PART 3 EXECUTION

3.01 STOCKPILING

A. Verify that the Contractor places all aggregate materials in the appropriate stockpile areas designated in the Plans and in accordance with all requirements in the Technical Specifications.

B. Verify that provisions are made to direct surface water away from stockpile site(s) so as to prevent erosion or deterioration of materials.

END OF CQA SECTION 02207
AGGREGATE MATERIALS

CQA SECTION 02222
EXCAVATION

PART 1 GENERAL

1.01 SUMMARY

A. The CQA Officer shall perform CQA procedures as outlined in this Section and follow guidelines for monitoring and testing to verify and document that all excavation work associated with the various construction tasks are in compliance with the Plans and Technical Specifications.

1.02 SUBMITTALS

A. Collect three (3) copies of the Contractor's Storm Water Pollution Prevention Plan (SWPPP) as required in the Technical Specifications.

B. Collect certified weight tags issued by the permitted transfer station or solid waste disposal facility for all loads of refuse transported off-site for disposal.

C. Verify compliance with the submittal schedule and update Submittal Log.

D. Perform submittal review and approval procedures in Part 1.03 of Section 01300 (Submittals) of this CQA Plan.

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION

3.01 PREPARATION

A. Prior to beginning of any portion of general earthwork, hold a preparatory meeting in accordance with Part 1.04 of Section 01039 (Project Meetings) of this CQA Plan.

B. Verify that the Contractor has located all underground utilities prior to performing any excavation for drainage and/or erosion control structures outside the limits of Work shown on the Plans.

3.02 CLEARING AND GRUBBING

A. Verify that all areas delineated for construction as shown on the Plans, including interim cover soil on the landfill surface and natural ground surface within the limits of the on-site borrow area, are cleared of all vegetative growth, such as brush, grass, weeds, or other deleterious material.

B. Verify that clearing and grubbing is performed prior to beginning excavation of any area.

C. Verify that cleared and grubbed debris are stockpiled separately from excavated material in accordance with the requirements set forth in Part 3.05 of this Section.

3.03 REFUSE EXCAVATION AND RELOCATION

A. Verify that refuse beneath the existing power lines is excavated to the lines, grades and dimensions shown on the Plans.

B. Verify that the excavated refuse is relocated to the designated refuse relocation area shown on the Plans.

C. Verify that the relocated refuse placed within the designated refuse relocation area is spread in uniform lifts not exceeding 2 feet in thickness and the each lift is compacted with a minimum of four (4) passes using a dozer.

D. Verify that the relocated refuse lifts is covered with a minimum of 6 inches of soil at the end of each working day to minimize vector hazards and odor nuisance.

E. Verify that within five (5) working days of completing the refuse excavation work beneath the existing power lines, the refuse relocation area is completely covered with a minimum of 12 inches of prepared and compacted foundation layer material in accordance with Section 02240 (Foundation Layer) of these Technical Specifications.

3.04 INCIDENTAL REFUSE EXCAVATION AND DISPOSAL

A. Verify that refuse is excavated at the locations and to the details shown on the Plans to accommodate the installation of drainage, LFG collection system, and condensate drain/discharge components.

B. Verify that excavated refuse is handled and managed in accordance with the procedures outlined in Section 02222 (Excavation) of the Technical Specifications, including placement of refuse in roll-off bins or dump trucks, covering of roll-off bins or dump trucks containing refuse at the end of each working day, and the removal of refuse from the site within 48 hours of being excavated.

C. Verify that the Contractor does not mix excess, surplus, or waste materials from other general construction activities with the refuse derived from the excavation work described in this Section.

3.05 SOIL EXCAVATION

A. Verify that excavation of swales for drainage and erosion control structures conforms to Section 19-4.01 of the Standard Specifications.

3.06 GRADING

A. Verify that the excavations for the on-site borrow area, drainage swales, sedimentation basins and leachate UST are constructed in conformance with the lines, grades, and dimensions shown on the Plans.

B. Verify that unsuitable materials, as determined by the Design Engineer, encountered at the subgrade elevation are removed and stockpiled separately from excavated material or disposed of in accordance with Section 02222 (Excavation) of the Technical Specifications.

C. Verify that where excavation is inadvertently carried below subgrade elevations, suitable provision is made by the Contractor for adjustment of same as determined by the Design Engineer to meet requirements incurred by the deeper excavation; also, verify that inadvertent over-excavation in such locations is rectified by backfilling with engineered fill and compacting to provide a firm and unyielding subgrade in accordance with the requirements of the Technical Specifications.

3.07 HAUL ROAD CONSTRUCTION

A. Verify that haul road locations have been approved by the Design Engineer.

3.08 DUST CONTROL

A. Verify that dust control measures are implemented by the Contractor in accordance with the approved Dust Control Plan and are effective in preventing and controlling the generation of dust in construction zones, along haul roads, in equipment parking areas, and in other locations as may be required due to operations related to performing the Work, and as required by the Design Engineer.

3.09 EROSION CONTROL

A. Verify that erosion and sediment control measures are implemented by the Contractor in accordance with the approved SWPPP, and as directed by the Design Engineer for all excavation work areas including on-site borrow area, sedimentation basins, leachate UST, stockpile areas, adjacent areas which have been disturbed, or any other affected areas.

3.10 DRAINAGE CONTROL

A. Verify that the Contractor provides ample means and devices with which to promptly remove and dispose of all water from any source entering the stockpile area(s) and any other active Work areas, and maintains these at all times until authorization for their removal is issued by the Design Engineer.

3.11 CORRECTIVE ACTIONS

A. If any portion(s) of the excavation work does not meet the requirements of the Plans and Technical Specifications, based on either field test results, observations, field survey, and/or physical measurement, verify that that portion(s) is reworked or removed and replaced to meet the requirements of the Plans and Technical Specifications and that the corrective actions implemented by the Contractor are in conformance with methods approved by the Design Engineer and the applicable Standard Specifications.

END OF CQA SECTION 02222
EXCAVATION

CQA SECTION 02224
ENGINEERED FILL

PART 1 GENERAL

1.01 SUMMARY

A. The CQA Officer shall perform CQA procedures as outlined in this Section and follow guidelines for monitoring and testing to verify and document that engineered fill materials and construction methods are in compliance with the Plans and Technical Specifications.

1.02 SUBMITTALS (Not Used)

PART 2 PRODUCTS

2.01 ENGINEERED FILL

A. Verify that the engineered fill materials meets the applicable product requirements of Section 02224 (Engineered Fill) of the Technical Specifications.

2.02 CONFORMANCE TESTING

A. Verify that engineered fill is obtained from one of the approved on-site borrow sources.

B. If engineered fill placement operations are being performed concurrently and from the same borrow source area as the foundation layer or erosion-resistant layer construction, use results from the foundation/erosion-resistant layer conformance testing to determine moisture-density relationship for compaction. If not, sample the actual engineered fill material to be used and send the samples to the Soils Testing Laboratory to perform the following test per the stated frequency of material to be placed or a minimum of two (2) tests, whichever results in the greater number of tests:

1. Moisture-Density Relationship Curve (ASTM D 1557) per every 5,000 cubic yards.

C. If engineered fill material appearance or properties are different from those identified from borrow source characterization or change within the same location at the on-site borrow source, based on visual observation, perform additional borrow source characterization tests in accordance with the aforementioned conformance testing program.

D. Notify the Design Engineer of a change in materials and receive approval from the Design Engineer for use of the material as engineered fill prior to excavating additional material from that location within the on-site borrow source.

PART 3 EXECUTION

3.01 PREPARATION

A. Prior to engineered fill placement operations, hold a preparatory meeting in accordance with Part 1.04 of Section 01039 (Project Meetings) of this CQA Plan.

B. Convey to the Contractor that the nuclear testing gauge shall be calibrated on a daily basis using the methods and materials recommended by the gauge manufacturer. The nuclear gauge serial number and the name of the soil technician performing the soil density testing shall be noted to demonstrate that both the technician and the nuclear gauge are certified.

3.02 PLACEMENT

A. Verify that prior to placement of engineered fill on native ground, the subgrade is scarified to a depth of approximately 6 inches, moisture conditioned to within 1 to 3 percentage points of optimum moisture content, and compacted to at least 90 percent of the maximum dry density as determined by ASTM D1557.

B. Verify that engineered fill material is spread in uniform loose lifts not exceeding 8 inches in thickness.

C. Verify that each loose lift is moisture conditioned and thoroughly mixed to ensure a uniformly distributed moisture content.

3.03 COMPACTION

A. Verify that the final thickness of compacted lifts does not exceed 6 inches.

B. Perform the following field tests at the frequency shown to verify that the compacted engineered fill has a minimum dry density of 90 percent of the maximum dry density and is at a moisture content within 1 to 3 percentage points of the optimum moisture content as determined from ASTM D 1557:

1. *Dry Density and Moisture Content - Nuclear (ASTM D 2922 and D 3017)*; at least four samples (4) per 1,000 cubic yards of material placed or four samples per day.
   a. For sedimentation basin improvements and former leachate pond backfill, perform at least one (1) test per every 5,000 cubic yards
2. *Moisture Content (ASTM D 4959)*; at least one (1) test per every ten (10) nuclear gauge tests.

C. Record corresponding dry density and moisture content results on the Nuclear Density/Moisture Test Data form.

3.04 CORRECTIVE ACTIONS

A. If any portion(s) of the engineered fill does not meet the requirements of the Plans and Technical Specifications, based on either field test results, observations, field survey, and/or physical measurement, verify that that portion(s) is reworked or removed and replaced to meet the requirements of the Plans and Technical Specifications and that the corrective actions implemented by the Contractor are in conformance with methods approved by the Design Engineer and the applicable Standard Specifications.

END OF CQA SECTION 02224
ENGINEERED FILL

CQA SECTION 02225
TRENCHING AND BACKFILLING

PART 1 GENERAL

1.01 SUMMARY

A. The CQA Officer shall perform CQA procedures as outlined in this Section and follow guidelines for monitoring and testing to verify and document that all trenching and backfilling work associated with the various construction tasks are in compliance with the Plans and Technical Specifications.

1.02 SUBMITTALS (Not Used)

PART 2 PRODUCTS

2.01 PIPE BEDDING

A. Verify pipe bedding conformance under CQA Section 02207 (Aggregate Materials) of this CQA Plan.

2.02 ENGINEERED FILL

A. Verify engineered fill conformance under CQA Section 02224 (Engineered Fill) of this CQA Plan.

2.03 CONFORMANCE TESTING

A. Review moisture-density relationship conformance test results for the pipe bedding and engineered fill as determined under CQA Section 02207 (Aggregate Materials) and CQA Section 02224 (Engineered Fill), respectively, of this CQA Plan.

PART 3 EXECUTION

3.01 TRENCH PREPARATION

A. Verify that the required points of connection, lines, levels, contours, and datum locations have been identified by the Contractor.

B. Verify that the Contractor has located all utilities to avoid mechanical and structural interference.

3.02 TRENCH EXCAVATION

A. Verify that trenches are excavated to the lines and grades as shown on the Plans.

B. Verify that any water or materials that interfere with the work is removed.

C. Verify that soft areas of trench subgrades not capable of compaction in place are cut out.

D. Verify that trench bottoms are firm, continuous, relatively smooth and free of rocks and/or unsuitable material prior to the installation of pipe bedding or trench backfill material.

3.03 SHORING, SHEETING, AND BRACING OF TRENCH

A. Verify that the Contractor has secured a trench permit from the California Division of Industrial Safety prior to excavating any trench over 5 feet in depth.

B. Verify that shoring and sheeting is removed as the backfill is completed in a manner that will not damage the pipe or permit voids in the backfill.

3.04 PIPE/CONDUIT TRENCH BACKFILLING

A. Verify that trenches are backfilled to the lines and grades as shown on the Plans.

B. Verify that the placement methods employed do not disturb or damage buried drainage pipes and conduits in the trench.

C. Verify that pipe bedding material is placed at trench bottom in one continuous level layer not exceeding 6 inches in compacted depth.

D. Verify that pipe bedding is placed around the sides and to the top of the pipe/conduit, tamped in place, and compacted.

E. Verify that optimum moisture content of pipe bedding material is maintained to attain required compaction density.

F. Perform the following field tests at the frequency shown to verify that the compacted pipe bedding and engineered fill have a minimum dry density of 90 percent of the maximum dry density and is at a moisture content within 1 to 3 percentage points of the optimum moisture content as determined from ASTM D 1557:

1. *Dry Density and Moisture Content - Nuclear (ASTM D 2922 and D 3017)*; at least one (1) test per 100 linear feet per lift or at a change in material.
2. *Moisture Content (ASTM D 4959)*; at least one (1) test per every ten (10) nuclear gauge tests.

G. Record corresponding dry density and moisture content results on the Nuclear Density/Moisture Test Data form.

H. Verify that trenches are not jetted, unless allowed by the Design Engineer.

I. For buried pipe that does not require pipe bedding or engineered fill (condensate drain pipe), verify that the trench backfill is placed in a manner that will not damage the pipe and that the backfill is compacted to a firm consistency consistent with surrounding erosion-resistant layer material.

3.05 ANCHOR TRENCH BACKFILLING

A. Verify that the placement method employed does not damage the geomembrane/engineered turf in the trench.

B. Verify that the portion of the trench above the geomembrane/engineered turf is backfilled with engineered fill and field tested consistent with the procedures described in Part 3.04 of this Section.

C. Verify that trenches are not jetted, unless allowed by the Design Engineer.

D. Verify that the trenches are backfilled to the lines and grades as shown on the Plans.

3.06 CORRECTIVE ACTIONS

A. If any portion(s) of the trenching and/or backfilling does not meet the requirements of the Plans and Technical Specifications, based on either field test results, observations, field survey, and/or physical measurement, verify that that portion(s) is reworked or removed and replaced to meet the requirements of the Plans and Technical Specifications and that the corrective actions implemented by the Contractor are in conformance with methods approved by the Design Engineer and the applicable Standard Specifications.

END OF CQA SECTION 02225
TRENCHING AND BACKFILLING

CQA SECTION 02240
FOUNDATION LAYER

PART 1 GENERAL

1.01 SUMMARY

A. The CQA Officer shall perform CQA procedures as outlined in this Section and follow guidelines for monitoring and testing to verify and document that the foundation layer materials and construction methods are in compliance with the Plans and Technical Specifications.

1.02 SUBMITTALS (Not Used)

PART 2 PRODUCTS

2.01 FOUNDATION LAYER MATERIAL

A. Verify that the foundation layer materials meet the applicable product requirements of Section 02240 (Foundation Layer) of the Technical Specifications.

2.02 CONFORMANCE TESTING

A. Following clearing and grubbing of landfill surface but prior to fine grading and scarification operations, sample existing interim cover material to be incorporated into the foundation layer and send the samples to the Soils Testing Laboratory to perform at least one (1) of each of the following tests as specified:
   1. Particle Size Analysis (ASTM D 422) per every 5,000 cubic yards.
   2. Unified Soil Classification (ASTM D 2487) per every 5,000 cubic yards.
   3. Moisture-Density Relationship Curve (ASTM D 1557) per every 5,000 cubic yards.

B. Prior to new foundation layer placement operations, sample the actual foundation layer material to be used at the Work site and send the samples to the Soils Testing Laboratory to perform at least one (1) of each of the following tests as specified:
   1. Particle Size Analysis (ASTM D 422) per every 5,000 cubic yards.
   2. Unified Soil Classification (ASTM D 2487) per every 5,000 cubic yards.
   3. Moisture-Density Relationship Curve (ASTM D 1557) per every 5,000 cubic yards.

C. Verify that foundation layer material is obtained from the approved on-site borrow source as determined from the aforementioned conformance testing.

D. If foundation layer material appearance or properties are different from those identified from borrow source characterization or change within the same location at the on-site borrow source, based on visual observation, perform additional borrow source characterization tests in accordance with the aforementioned conformance testing program.

E. Notify the Design Engineer of a change in materials and receive approval from the Design Engineer for use of the material for foundation layer construction prior to excavating additional material from that location within the on-site borrow source.

PART 3 EXECUTION

3.01 PREPARATION

A. Prior to foundation layer placement operations, hold a preparatory meeting in accordance with Part 1.04 of Section 01039 (Project Meetings) of this CQA Plan.

B. Convey to the Contractor that the nuclear testing gauge shall be calibrated on a daily basis using the methods and materials recommended by the gauge manufacturer. The nuclear gauge serial number and the name of the soil technician performing the soil density testing shall be noted to demonstrate that both the technician and the nuclear gauge are certified.

3.02 PREPARATION OF EXISTING INTERIM COVER SOIL TO BE INCORPORATED INTO THE FOUNDATION LAYER

A. Perform visual soil classification of the interim cover soils per the following test method and frequency:
   1. *Visual Soil Classification (ASTM D 2488)*; at least one (1) test per every acre.

B. Verify that existing interim cover soils are scarified to a minimum depth of 12 inches.

C. Following scarification, verify that existing interim cover soils are moisture conditioned and thoroughly mixed to ensure a uniformly distributed moisture content to within 1 to 3 percentage points of the optimum moisture content.

D. Perform the following field tests at the frequency shown to verify that the compacted interim cover soils have a minimum dry density of 90 percent of the maximum dry density and within 1 to 3 percentage points of the optimum moisture content as determined from ASTM D 1557:
   1. *Dry Density and Moisture Content - Nuclear (ASTM D 2922 and D 3017)*. Soil shall be sampled and tested at a frequency of four samples per 1,000 cubic yards (3/AC/lift) of material placed or four samples per day, whichever frequency results in the greatest number of tests.
   2. *Moisture Content (ASTM D 4959)*; at least one (1) test per every ten (10) nuclear gauge tests.

3.03 PLACEMENT AND COMPACTION OF NEW FOUNDATION LAYER MATERIAL

A. Verify that foundation layer material is moisture conditioned and thoroughly mixed in the on-site borrow area to ensure an uniformly distributed moisture content. At time of placement, perform the following field test at the frequency shown to verify that the foundation layer material meets the soil classification requirements:
   1. *Soil Classification (ASTM D 2488)*; one (1) sample per three (3) acres per lift (2,400 cubic yards) of material placed or change in material, whichever results in the greater number of tests.

B. Record corresponding soil classification results on the Test Data form.

C. Continuously observe all placement operations to verify that the foundation layer material is consistent and has no oversized particles, overly wet or dry areas, or organic, deleterious, or other unsuitable matter.

D. Verify that foundation layer material is spread in uniform loose lifts not exceeding 8 or 12 inches in thickness.

E. Verify that each loose lift is moisture conditioned and thoroughly mixed to ensure a uniformly distributed moisture content.

F. Verify that the final thickness of compacted lifts for new foundation layer material does not exceed 6 inches.

G. Perform the following field tests on each 6-inch lift at the frequency shown to verify that the foundation layer has been compacted to 90 percent of the maximum dry density and is within 1 to 3 percentage points of the optimum moisture content as determined from ASTM D 1557:

1. *Dry Density and Moisture Content - Nuclear (ASTM D 2922 and D 3017)*. Soil shall be sampled and tested at a frequency of four samples per 1,000 cubic yards (3/AC/lift) of material placed or four samples per day, whichever frequency results in the greatest number of tests.
2. *Moisture Content (ASTM D 4959)*; at least one (1) test per every ten (10) nuclear gauge tests.

H. Record corresponding dry density and moisture content results on the Nuclear Density/Moisture Test Data form.

3.04 FINAL SURFACE PREPARATION

A. Verify that the completed foundation layer surface is free of individual particles or protrusions greater than 0.50 inches in diameter.

B. Verify that ruts and ridges on the completed foundation layer surface are limited to a maximum depth or height of 1.0 inch.

3.05 CONFORMANCE VERIFICATION

A. Verify by auger or survey that the completed foundation layer has a minimum thickness of 12 inches. Measurements by either method shall be conducted using a grid pattern with 100-foot centers.

3.06 CORRECTIVE ACTIONS

A. If any portion(s) of the foundation layer does not meet the requirements of the Plans and Technical Specifications, based on either field test results, observations, field survey, and/or physical measurement, verify that that portion(s) is reworked or removed and replaced to meet the requirements of the Plans and Technical Specifications and that the corrective actions implemented by the Contractor are in conformance with methods approved by the Design Engineer and the applicable Standard Specifications.

END OF CQA SECTION 02240
FOUNDATION LAYER

CQA SECTION 02310
ACCESS ROADS

PART 1 GENERAL

1.01 SUMMARY

A. The CQA Officer shall perform CQA procedures as outlined in this Section and follow guidelines for monitoring and testing to verify and document that the access road materials and construction methods are in compliance with the Plans and Technical Specifications.

1.02 SUBMITTALS (Not Used)

PART 2 PRODUCTS

2.01 REINFORCEMENT GEOTEXTILE

A. Verify reinforcement geotextile conformance under CQA Section 02771 (Reinforcement Geotextile) of this CQA Plan.

2.02 AGGREGATE BASE

A. Verify aggregate base conformance under CQA Section 02207 (Aggregate Materials) of this CQA Plan.

2.03 CONFORMANCE TESTING

A. Review moisture-density relationship conformance test results for the aggregate base as determined under CQA Section 02207 (Aggregate Materials) of this CQA Plan.

PART 3 EXECUTION

3.01 SUBGRADE

A. Verify that subgrade is scarified a minimum of 6 inches, uniformly moisture conditioned to within 1 to 3 percentages points of optimum moisture content, and compacted to at least 90 percent of the maximum dry density as determined by ASTM D 1557.

3.02 REINFORCEMENT GEOTEXTILE

A. Verify that reinforcement geotextile is installed, including examination of subgrade surface, in accordance with the requirements for geotextile as set forth in Section 02771 (Geotextile) of this CQA Plan.

3.03 AGGREGATE BASE

A. Verify the stability of the subgrade by proof rolling with a roller or loaded water truck. Verify that any areas determined not to be suitable are allowed to air dry until stable or over-excavated and backfilled with aggregate base.

B. Verify that trucks do not back-dump aggregate base onto the reinforcement geotextile and that they only drive on previously dumped aggregate base to progress.

C. Verify that aggregate base material is spread in uniform loose lifts not exceeding 8 inches in thickness.

D. Perform the following field tests at the frequency shown to verify that the compacted aggregate base material has a minimum dry density of 95 percent of the maximum dry density and is within 1 to 3 percentage points of the optimum moisture content as determined from ASTM D 1557:

1. *Dry Density and Moisture Content - Nuclear (ASTM D 2922 and D 3017)*; at least one (1) test per 100 linear feet per lift.
2. *Moisture Content (ASTM D 4959);* at least one (1) test per every ten (10) nuclear gauge tests.

E. Record corresponding dry density and moisture content results on the Nuclear Density/Moisture Test Data form.

F. Verify that access roads are "proof rolled" with a heavy wheel-load vehicle, such as a loaded water truck, to identify weak areas, and verify that any weak areas are reworked to the Design Engineer's satisfaction.

3.04 CORRECTIVE ACTIONS

A. If any portion(s) of the access roads does not meet the requirements of the Plans and Technical Specifications, based on either field test results, observations, field survey, and/or physical measurement, verify that that portion(s) is reworked or removed and replaced to meet the requirements of the Plans and Technical Specifications and that the corrective actions implemented by the Contractor are in conformance with methods approved by the Design Engineer and the applicable Standard Specifications.

END OF CQA SECTION 02310
ACCESS ROADS

CQA SECTION 02722
DRAINAGE AND EROSION CONTROLS

PART 1 GENERAL

1.01 SUMMARY

A. The CQA Officer shall perform CQA procedures as outlined in this Section and follow guidelines for monitoring and testing to verify and document that the drainage and erosion control materials and construction methods are in compliance with the Plans and Technical Specifications.

1.02 SUBMITTALS

A. Collect three (3) copies of each submittal required in the Technical Specifications.

B. Verify compliance with the submittal schedule and update Submittal Log.

C. Perform submittal review and approval procedures in Part 1.03 of Section 01300 (Submittals) of this CQA Plan.

PART 2 PRODUCTS

2.01 DRAINAGE AND EROSION CONTROL COMPONENTS

A. Verify that the following drainage and erosion control components meet the applicable product requirements of Section 02722 (Drainage and Erosion Controls) of the Technical Specifications:

1. Corrugated metal pipe (CMP), couplings and fabricated fittings.
2. High density polyethylene (HDPE) pipe, couplings and fabricated fittings.
3. CMP anchor assembly stakes and hardware.
4. Turf reinforcement mat (TRM).
5. TRM anchorage stakes.
6. Erosion control netting.
7. Erosion control netting anchors.

2.02 PIPE BEDDING

A. Verify pipe bedding conformance under CQA Section 02207 (Aggregate Materials) of this CQA Plan.

2.03 BACKFILL

A. Verify that backfill placed above pipe bedding consists of material excavated from the trench/excavation unless specified otherwise by the Design Engineer.

B. Review moisture-density relationship conformance test results for the erosion-resistant layer as determined under CQA Section 02250 (Erosion-Resistant Layer) of this CQA Plan.

2.04 ROCK RIPRAP

A. Verify rock riprap conformance under CQA Section 02207 (Aggregate Materials) of this CQA Plan.

2.05 CONCRETE

A. Verify concrete conformance under CQA Section 03300 (Concrete) of this CQA Plan.

PART 3 EXECUTION

3.01 PREPARATION

A. Prior to beginning construction of any drainage and erosion control structure, hold a preparatory meeting in accordance with Part 1.04 of Section 01039 (Project Meetings) of this CQA Plan.

3.02 STOCKPILING

A. Verify that the Contractor places all drainage and erosion control materials in an area(s) approved by the Design Engineer.

3.03 EXCAVATION

A. Verify excavation conformance under CQA Section 02222 (Excavation) of this CQA Plan.

3.04 DRAIN INLETS AND DRAIN PIPE

A. Verify trenching conformance under CQA Section 02225 (Trenching and Backfilling) of this CQA Plan.

B. Verify that drain inlets/buried drain pipe and associated bedding and backfill material are placed in conformance with Section 66-1 of the Standard Specifications and the Technical Specifications.

C. Verify that above ground drain pipes are placed and anchored in conformance with Section 66 of the Standard Specifications and as shown on the Plans.

3.05 SEDIMENTATION BASIN DRAINAGE RISERS

A. Verify that vertical slots are cut in the sedimentation basin drainage risers to the dimensions, orientation and frequency as shown on the Plans.

B. Verify trenching conformance under CQA Section 02225 (Trenching and Backfilling) of this CQA Plan.

C. Verify that minor concrete installed for the drainage riser foundations is as shown on the Plans.

D. Verify concrete placement conformance under CQA Section 03300 (Concrete) of this CQA Plan.

E. Verify that bedding and backfill material are placed in conformance with Section 66-1 of the Standard Specifications and the Technical Specifications.

3.06 EARTHEN SWALES

A. Verify excavation conformance under CQA Section 02222 (Excavation) of this CQA Plan.

3.07 EROSION MAT LINED SWALES

A. Verify that the TRM is installed as shown on the Plans and per manufacturer's recommendations.

B. Verify that trenches for terminal and check slots (anchorage) are excavated into the erosion-resistant layer as shown on the Plans.

C. Verify trench backfill conformance under CQA Section 02225 (Trenching and Backfilling) and perform the following field tests at the frequency shown to verify that the trench backfill has a minimum dry density of 90 percent of the maximum dry density and is within 1 to 3 percentage points of the optimum moisture content as determined from ASTM D 1557:

1. *Dry Density and Moisture Content - Nuclear (ASTM D 2922 and D 3017)*; at least one (1) test per 100 linear feet per lift.
2. *Moisture Content (ASTM D 4959);* at least one (1) test per every ten (10) nuclear gauge tests.

D. Record corresponding dry density and moisture content results on the Nuclear Density/Moisture Test Data form.

E. Verify that TRM placed at the top of swale (finish surface) is at or below the final grade so surface drainage can flow freely into the swale.

F. Verify that all splices are shingled downstream.

G. Verify that anchorage stakes are installed as shown on the Plans and per manufacturer's recommendations.

3.08 LOOSE ROCK RIPRAP LINED SWALES

A. Verify that rock riprap is placed to the average thickness shown on the Plans with a maximum thickness deviation of 4 inches at any location.

B. Verify that rock riprap is not be placed by dumping.

C. Verify that individual riprap stones are moved and placed as necessary to obtain a stable three-point bearing for each stone and a well-graded distribution along the entire length of the swale.

D. Verify that the placed rock riprap is free of pockets of small stones or clusters of larger stones.

3.09 GROUTED ROCK RIPRAP OUTFALLS

A. Verify that the footprint of the outfall is excavated to the dimensions as shown on the Plans.

B. Verify that rock riprap is placed within the excavated footprint to the average thickness shown on the Plans with a maximum thickness deviation of 4 inches at any location.

C. Verify that rock riprap is not be placed by dumping.

D. Verify that individual riprap stones are moved and placed as necessary to obtain a stable three-point bearing for each stone and a well-graded distribution over the entire footprint of the outfall.

E. Verify that the placed rock riprap is free of pockets of small stones or clusters of larger stones.

F. Verify concrete placement conformance under CQA Section 03300 (Concrete) of this CQA Plan.

3.10 EROSION CONTROL

A. Verify that the finish surface has been track walked prior to placement of seeding, fertilizer and straw.

B. Verify that the straw is placed onto landfill surface slopes that are steeper than 10 percent.

C. Verify that the blown straw applied to the landfill surface slopes has a minimum thickness of 1.5 inches in place.

D. Verify that erosion control netting is placed over the applied straw and that the netting is secured with anchors at a frequency of 1 foot on center along the edges, and one (1) every 35 square feet for interior areas. Verify that butt joints are spaced 1 foot apart.

3.11 CONFORMANCE VERIFICATION

A. After construction of any portion of drainage and erosion control measures, verify all grades and dimensions of completed work by either field survey or physical measurement.

3.12 CORRECTIVE ACTIONS

A. If any portion(s) of the drainage and erosion control provisions do not meet the requirements of the Plans and Technical Specifications, based on either field test results, observations, field survey, and/or physical measurement, verify that that portion(s) is reworked or removed and replaced to meet the requirements of the Technical Specifications and that the corrective actions implemented by the Contractor are in conformance with methods approved by the Design Engineer and the applicable Standard Specifications.

END OF CQA SECTION 02722
DRAINAGE AND EROSION CONTROL

CQA SECTION 02771
REINFORCEMENT GEOTEXTILE

PART 1 GENERAL

1.01 SUMMARY

A. The CQA Officer shall perform CQA procedures as outlined in this Section and follow guidelines for monitoring and testing to verify and document that reinforcement geotextile materials and installation are in compliance with the Plans and Technical Specifications.

1.02 SUBMITTALS

A. Collect three (3) copies of each submittal listed in the Technical Specifications.

B. Verify compliance with the submittal schedule and update Submittal Log.

C. Perform submittal review and approval procedures in Part 1.03 of Section 01300 (Submittals) of this CQA Plan.

1.03 TRANSPORT AND STORAGE

A. Upon delivery of the reinforcement geotextile rolls to the Work site, verify that the rolls have been transported with opaque protective coverings and within a closed trailer.

B. During unloading of the reinforcement geotextile rolls at the Work site, perform the following procedure:
   1. Obtain a copy of the packing list.
   2. Complete the Geotextile Delivery and Control Log for each shipment and attach a copy of the packing list. The Geotextile Delivery and Control Log documents the following:
      a. Delivery date.
      b. Roll numbers.
      c. Batch/lot numbers or production dates.
      d. Roll dimensions.
      e. Receipt of MQC test reports.
      f. CQA conformance test sampling.
      g. Receipt of CQA conformance test results.
      h. Manufacturer and Product Name or Designation.
      i. Name of CQA monitor observing delivery and storage.
      j. Total quantity delivered with each shipment and the cumulative total quantity delivered to date.
      k. Additional notes including rejection of materials, condition of delivered materials, and other materials included with the shipments.
   3. Obtain written certification from the Supplier that unloading and storage of the reinforcement geotextile rolls has been done in accordance with the Manufacturer's recommended procedures.
   4. Verify that reinforcement geotextile rolls are transported, unloaded, handled, and stored in a manner that does not damage the reinforcement geotextile rolls or their

protective coverings in accordance with the Manufacturer's recommended procedures and the following requirements:

a. Nylon or other cloth straps were used to unload and handle the reinforcement geotextile rolls to protect the rolls and their protective coverings from damage.

b. The reinforcement geotextile rolls were stacked no more than five rolls high and with a 3-foot wide access path between the stacked rows.

5. Verify that damaged protective coverings are repaired or replaced.

6. Identify and separate damaged or rejected reinforcement geotextile rolls.

PART 2 PRODUCTS

2.01 REINFORCEMENT GEOTEXTILE COMPONENTS

A. Verify that the following reinforcement geotextile components meet the applicable product requirements of Section 02771 (Reinforcement Geotextile) of the Technical Specifications:

1. Reinforcement geotextile.
2. Sewing thread.

PART 3 EXECUTION

3.01 PREPARATION AND EXAMINATION

A. Prior to reinforcement geotextile installation, hold a preparatory meeting in accordance with Part 1.04 of Section 01039 (Project Meetings) of this CQA Plan.

B. Prior to reinforcement geotextile installation, verify that all underlying material installation and construction has been completed in accordance with the Technical Specifications.

3.02 INSTALLATION

A. Verify that the reinforcement geotextile is installed in accordance with Manufacturer's instructions for deployment, seaming, and exposure.

B. Verify that the reinforcement geotextile is installed with sufficient tension to prevent excessive overlapping, insufficient overlapping, wrinkles, and folds.

D. Verify that the reinforcement geotextile panels are overlapped with sufficient material to create a prayer fold for sewing operations.

E. Verify that the reinforcement geotextile is adequately ballasted during installation and until geotextile is covered with the overlying material.

F. Verify that the reinforcement geotextile is permanently anchored as shown on the Plans when installation is complete.

G. Verify that reinforcement geotextile damaged during installation is removed and/or repaired with a sewn patch.

H. Verify that terminal ends of reinforcement geotextile, where the type and purpose of the geotextile changes as shown on the Plans, are overlapped a minimum of 4 feet.

I. Verify that when cutting any reinforcement geotextile above other geosynthetics, the Installer uses a knife with a hooked blade.

J. Verify that the underlying soil subgrade or installed geosynthetics are not damaged by reinforcement geotextile installation equipment or methods and that any damaged soil subgrade or installed geosynthetics are completely repaired in accordance with the requirements of the applicable parts of Section 02771 (Reinforcement Geotextile) of the Technical Specifications.

K. Verify that rocks, excessive dust, excessive moisture or other matter that could cause damage, hamper sewing operations, or clog the reinforcement geotextile are not trapped under the reinforcement geotextile or within the overlap.

3.03 SEAMING AND REPAIR

A. Verify that all seams are sewn unless an alternate seaming method is allowed by the Design Engineer based on the Installer's demonstration of the alternative acceptability.

B. Verify that overlaps are clean and free of soil materials which could adversely affect sewing operations.

C. Verify that a prayer fold is made within the overlap prior to sewing.

D. Verify that a continuous 401 two-thread chain stitch is used to sew the prayer fold.

E. Verify that damaged reinforcement geotextile is removed entirely and replaced or repaired in accordance with the following guidelines:
   1. Repair (patching) material shall be of the same type as the damaged reinforcement geotextile.
   2. Patches shall extend a minimum of 12 inches in all directions beyond the damaged area with the machine direction of the patch aligned with the machine direction of the damaged reinforcement geotextile.
   3. Patches shall be seamed using the same method used for seaming the damaged reinforcement geotextile.

3.04 CORRECTIVE ACTIONS

A. If any portion(s) of the reinforcement geotextile provisions do not meet the requirements of the Plans and Technical Specifications, based on either observations and/or physical measurement, verify that that portion(s) is repaired or removed and replaced to meet the requirements of the Technical Specifications and that the corrective actions implemented by the Contractor are in conformance with methods approved by the Design Engineer and the applicable Standard Specifications.

END OF CQA SECTION 02771
REINFORCEMENT GEOTEXTILE

CQA SECTION 02772
GEOMEMBRANE

PART 1 GENERAL

1.01 SUMMARY

A. The CQA Officer shall perform CQA procedures as outlined in this Section and follow guidelines for monitoring and testing to verify and document that geomembrane liner materials and installation are in compliance with the Plans and Technical Specifications.

1.02 SUBMITTALS

A. Collect three copies of each submittal listed in the Specifications.

B. Verify compliance with the submittal schedule and update Submittal Log.

C. Perform submittal review and approval procedures in Part 1.03 of Section 01300 (Submittals) of this CQA Plan.

1.03 TRANSPORT AND STORAGE

A. During unloading of the gemoembrane rolls at the site, perform the following procedure:
   1. Obtain a copy of the packing list.
   2. Complete the Geomembrane Delivery and Control Log for each shipment and attach a copy of the packing list. The Geomembrane Delivery and Control Log documents the following:
      a. Delivery date;
      b. Roll numbers;
      c. Batch/lot numbers or production dates;
      d. Roll dimensions;
      e. Receipt of MQC test reports;
      f. Manufacturer and Product Name or Designation;
      g. Name of CQA monitor observing delivery and storage;
      h. Total quantity delivered with each shipment and the a cumulative total quantity delivered to date; and
      i. Additional notes including rejection of materials, condition of delivered materials, and other materials included with the shipments.
   3. Obtain written certification from the Supplier that unloading and storage of the geomembrane rolls has been done in accordance with the Manufacturer's recommended procedures.
   4. Verify that geomembrane rolls are transported, unloaded, handled, and stored in a manner that does not damage the geomembrane rolls in accordance with the Manufacturer's recommended procedures and the following requirements:
      a. Stinger or straps (nylon or other cloth) shall be used to unload and handle the geomembrane rolls to protect the rolls from damage.
      b. The geomembrane rolls shall be stacked no more than three rolls high and with a 3-foot wide access path between the stacked rows.
   5. Identify and separate damaged or rejected geomembrane rolls.

PART 2 PRODUCTS

2.01 GEOMEMBRANE

A. Verify that geomembrane material consists of a compounded Linear Low-density polyethylene (LLDPE) meeting the product requirements of the Technical Specifications.

2.02 EXTRUDATE ROD

A. Verify that extrudate rod is made from the same resin as the geomembrane.

2.03 FIELD TESTING EQUIPMENT

A. Verify that the Installer provides and uses a field tensiometer for seam testing that has been calibrated within the last year and is accurate to within 2 pounds.

B. Verify that the Installer provides and uses a 1-inch (width) by 6-inch (length) cutting die for cutting seam test specimens.

2.04 CONFORMANCE TESTING

A. Conduct sampling for CQA conformance testing at the site upon delivery or at the manufacturing plant prior to shipment and delivery to the site.

B. For every 100,000 square feet of material delivered to the site, select at least one geomembrane roll to sample for CQA conformance testing.

C. Sample the selected geomembrane rolls for CQA conformance testing using the following procedure:
   1. Cut and discard the first three feet of geomembrane material from across the entire width of the roll.
   2. Cut the next 12 inches of material from across the entire width of the roll; this section of material is the CQA conformance testing sample.
   3. Assign a CQA test number to the sample and mark the following information directly on the sample with a paint marker:
      a. Machine direction of the sample.
      b. Manufacturer's roll number.
      c. CQA test number.
   4. Complete the geomembrane Test Request and Sample Custody Log and ship samples to the Geosynthetics Testing Laboratory via overnight delivery.

D. The following CQA conformance tests will be performed by the Geosynthetics Testing Laboratory to verify compliance with the product requirements of the Specifications:
   1. Tensile Properties (ASTM D638).
   2. Density (ASTM D 1505).
   3. Carbon Black Content (ASTM D 1603).
   4. Carbon Black Dispersion (ASTM D 5596).
   5. Sheet Thickness (ASTM D 5994).

E. Upon completion of CQA conformance testing and receipt of the results, review all results for compliance with the Specifications and report any test results which are not in compliance

with the Specifications to the Engineer.

F. Additional CQA conformance testing or corrective action to be performed in the event of test results which are not in compliance with the Specifications will be determined by the Engineer.

PART 3 EXECUTION

3.01 PREPARATION AND EXAMINATION

A. Prior to geomembrane installation, hold a preparatory meeting in accordance with Section 01039 (Progress Meetings) of this CQA Plan.

B. Prior to geomembrane installation, verify that all underlying material installation and construction has been completed in accordance with the Technical Specifications.

C. Verify that prior to and at the middle of each geomembrane welding work shift and whenever adjustments are made to the welding machines, the Installer prepares and tests trial welds for each welding machine that is being used or will be used during that work shift.

D. Verify that trial welds are prepared for both fusion and extrusion welding machines and sampled using the following guidelines:
   1. Trial weld samples for fusion welding machines should be a minimum of 6 feet in length.
   2. Trial weld samples for extrusion welding machines should be a minimum of 3 feet in length.
   3. The trial weld should be centered along and run the entire length of the sample.

E. Verify that trial welds are tested as follows:
   1. Trial welds should be allowed to cool to ambient conditions prior to testing.
   2. After cooling, excessive material should be cut from the beginning and the end of the trial weld sample (approximately 4-inches from each end).
   3. Using the cutting die, four 1-inch specimens should be cut at an even spacing along the length of the trial weld.
   4. Using the field tenisometer with a rate of separation of 2 inches per minute, two non-adjacent specimens shall be tested for peel adhesion (peel) and two for bonded seam strength (shear); both sides of fusion welds shall be tested for peel.

F. Record peel and shear test results for trial welds on the Geomembrane Deployment/Welding Log using the following criteria:
   1. Peel test specimens:
      a. The break is either a film tear bond (FTB-passing) or a non-film tear bond (NFTB-failing).
      b. Percent of peel penetration into the weld (maximum of 10%).
      c. Quantitative value for peel strength (minimum of 75 ppi).
   2. Shear test specimens:
      a. The break is either a film tear bond (FTB-passing) or a non-film tear bond (NFTB-failing).
      b. Elongation of shear specimen (minimum of 2 inches).
      c. Quantitative value for bonded seam strength (minimum of 120 ppi).

G. If any of the four test specimens do not meet the peel or shear criteria, reject the entire trial weld and verify that the welding machine is not used for installation of the geomembrane until passing a retest consisting of repeating the entire trial weld sampling and testing procedure on a new weld performed with the failing machine.

H. If the retested trial weld fails, verify that the welding machine is not used for installation of the geomembrane until proper adjustments or repairs are made and passing a retest; if the welding machine continually fails field trial weld testing, verify that the welding machine is tagged and completely removed from work area.

3.02 INSTALLATION

A. Verify that geomembrane panels are deployed parallel to the slope by unrolling down the entire length of the slope and that corrections or adjustments are made to panels which become askew to the parallel line of the slope.

B. Verify that adjacent geomembrane panel edges are overlapped a minimum of 4-inches for fusion welding and alignment of the overlap is kept consistent by marking overlap indicator points.

C. Verify that geomembrane damaged during handling, transport, or deployment is removed or repaired.

D. Verify that the underlying the soil subgrade or installed geosynthetics are not damaged by geomembrane installation equipment or methods and that any damaged soil subgrade or installed geosynthetics are completely repaired in accordance with the requirements of the applicable section of the Specifications.

E. Verify that the Installer only deploys the quantity of geomembrane which can be completely welded and anchored by the end of the work shift or day.

F. Verify that the Installer prepares an adequate number of sandbags to ballast the geomembrane during deployment in accordance with the following guidelines:
   1. Only plastic ties should be used to close sandbags; no metal or wire ties are allowed.
   2. Sandbags should be removed prior to deploying overlying materials and after completion of permanent geomembrane anchorage.
   3. Sandbag fill should not be disposed of within the limits of work unless the fill consists of material which meets the Specification for the material it is disposed upon.
   4. Geomembrane rolls may also be used for ballast provided that no damage to the deployed geomembrane occurs.

G. Verify that the Installer deploys and seams the geomembrane in a manner which minimizes wrinkles and provides the proper amount of slack in the installed geomembrane to compensate for contraction due to local temperature extremes prior to covering; no stress-bridging or "fishmouths" are allowed.

H. Verify that immediately after geomembrane panels running through ditch flow lines or at toes of slopes are welded, sandbags are placed end-to-end along the entire length of the flow or toe line to prevent stress-bridging at those locations; alternatively, to reduce the number of sandbags required and to further prevent stress-bridging, the Installer may anchor the

geomembrane near the toes of slopes within a backfilled anchor trench constructed in accordance with the Specifications.

I. Verify that geomembrane panels are not overlapped or seamed perpendicular to the slope on slopes with a gradient of more than 10 percent, within 20 feet of the top of any slope, and unless the geomembrane is anchored within a backfilled anchor trench constructed in accordance with the Specifications.

J. Verify that when cutting any geomembrane above another geomembrane, the Installer uses a knife with a hooked blade.

K. Record the following information on the Geomembrane Deployment/Welding Log:
Note: The abbreviations in parenthesis following each verification procedure are used on the Geomembrane Deployment/Welding Log.

1. Temperature (T). Ambient and geomembrane surface temperatures with a description of the current weather conditions. Record every two hours and document dramatic changes in temperature and weather conditions.
2. Trial Welds (TW). Time of trial weld, type of welding equipment, welding equipment number, welding operator, and results of field peel and shear testing of trial welds.
3. Panel (P). Assigned panel number, geomembrane roll number, panel dimensions, and area of panel.

L. Using a graph computation sheet, field sketch a panel layout drawing of the geomembrane panels deployed during the day and attach this field sketch to the completed Geomembrane Deployment/Welding Log; the daily field sketches will be transposed to the master panel layout drawing.

3.03 FUSION WELDING

A. Verify that fusion welding operations only take place when the ambient temperature is between 40°F and 110°F unless the special weather welding plans have been submitted by the Installer and approved by Engineer to weld outside this range; measure ambient temperature 6-inches above the in-place geomembrane and record readings every two hours on the Geomembrane Deployment/Welding Log.

B. Verify that all geomembrane seams are fusion welded by the double-track method leaving an air gap for leak testing; extrusion welding can only be used for repairs, patches, fabrications, and inaccessible areas.

C. Prior to welding, verify that all fusion welding machines have performed trial welds and passed field trial weld testing.

D. Verify that the Installer's power source is capable of producing sufficient and constant voltage under the combined line load of multiple welders and other equipment.

E. Verify that surfaces to be welded are thoroughly cleaned.

F. Verify that seams are welded at the same speed, temperature, roller pressure, and gauge settings used to prepare the trial weld and that the welding operators record welding machine numbers, operators, machine settings, times, and dates on each seam welded.

G. Closely observe each fusion welding machine to verify that the machine is not adversely affecting or damaging the parent geomembrane material outside the welding area.

H. Record the following information on the Geomembrane Deployment/Welding Log:
Note: The abbreviations in parenthesis following each verification procedure are used on the Geomembrane Deployment/Welding Log.

1. Seam (S). Assigned seam number, welding equipment number that welded the seam, welding operator, and length of the welded seam.
2. End of Seam Test. (EST). If the Installer's quality control program requires that specimens be taken from the end of each welded seam and tested for peel adhesion, record these results using the same criteria as for trial welds. If the Installer records these results, request a copy of the results and this information can be omitted from the Geomembrane Deployment/Welding Log.
3. Seam Test Sample (STS). Assigned sample number, seam number sample is located on, location of sample within the seam, welding machine number, welding operator, and results of field seam testing.

3.04 EXTRUSION WELDING

A. Verify that extrusion welding is used only for repairs, patches, fabrications, and inaccessible areas.

B. Prior to welding, verify that all extrusion welding machines have performed trial welds and passed field trial weld testing.

C. Verify that geomembrane patches overlap the underlying geomembrane panel a minimum of 4 inches.

D. Verify that geomembrane patches are cut square with rounded corners and are large enough to extend a minimum of 4 inches in all directions over the repair area.

E. Verify that geomembrane patches are tack-welded to the underlying geomembrane panel to prevent movement during grinding and extrusion welding operations.

F. Verify that the outer edge of repair patches and the adjacent underlying geomembrane are disc-ground to remove surface debris and oxidation and that grinding is not parallel to seam.

G. Verify that the nozzles of extrusion guns are purged before each use to remove solidified extrudate.

H. Verify that the extrusion weld completely covers the entire width of the grind area and that extrusion safety welds extend 4 inches up any intersecting fusion weld.

I. Verify that a cap strip patch is extrusion welded at all fusion welded seam intersections of three or more geomembrane panels.

3.05 QUALITY CONTROL

A. Verify that quality control procedures are performed by the Installer in accordance with the Installer's Geomembrane Installation Quality Control Manual except where amended or modified by the Engineer or the Specifications.

B. Verify that the Installer maintains the following quality control documentation during the geomembrane installation in accordance with the Specifications:
   1. An accurate geomembrane panel layout drawing which includes; 1) roll and panel numbers; 2) seam numbers; 3) geomembrane limits; 4) anchor trench locations; and 5) seam test sample locations.
   2. Daily deployment logs and panel layout drawings to be submitted to the CQA Officer daily which include; 1) panel and seam numbers; 2) panel dimensions; and 3) deployment quantities.
   3. Daily welding logs to be submitted to the CQA Officer daily which include; 1) welding machine numbers; 2) operators; 3) machine settings; and 4) times and dates for each seam welded.

C. Verify that the entire length of each fusion welded seam is air-pressure tested by the Installer, with an air pump capable of generating and maintaining 40 psi of pressure and equipped with a regulator and pressure gauge and pressure feed needles having pressure gauges accurate to 1 psi, in accordance with the following procedure:
   1. Seal both ends of the fusion welded seam with vise-grip plate clamps or an extrusion weld; heat may be applied to the seam ends to aid in sealing the seam in conjunction with the clamps but due to the potential hazard of igniting landfill gas, propane torches or any other flame producing device are not allowed.
   2. At one end of the seam, insert air pressure needle into the fusion weld channel.
   3. Pressurize the channel to 30-35 psi and maintain pressure for 5 minutes.
   4. Release air from the opposite end of the seam to verify that the entire length of the fusion weld channel was pressurized.
   5. If channel pressure is not maintained with a maximum allowable pressure loss of 2 psi over the 5-minute test period or does not stabilize at all, locate the defective area, isolate it, and repeat air pressure test procedures in each direction from the defective area.

D. Verify that the Installer maintains air-pressure test logs on which are recorded seam numbers, beginning and ending air pressures, beginning and ending test times, lengths of tested seam, defective areas found, and confirmation of repair.

E. Record the following air-pressure testing information on the Geomembrane Deployment/Welding Log:
   Note: The abbreviations in parenthesis following each verification procedure are used on the Geomembrane Deployment/Welding Log.
   1. Air-Pressure Test (AP). Seam number tested, start time of the air pressure test and initial air pressure (psi), termination time of the air pressure test and ending air pressure (psi), and length of seam or portion of seam successfully tested.

F. Verify that the entire length of each extrusion welded seam and repair is vacuum tested by the Installer in accordance with the following procedures, with a vacuum pump capable of generating and maintaining 30 inches of mercury and equipped with a clean view window, regulator, and vacuum gauge accurate to 1 psi:
   1. Saturate the extrusion weld with a soap and water solution.

2. Place view box over the saturated weld, create an air tight seal, and apply vacuum in the box.
3. Maintain the vacuum for 10 seconds and examine weld for forming bubbles which indicate leaks; mark detected leaks for follow-up extrusion weld repair and retest detected leaks after repair to verify that the leaks were successfully repaired.

G. Verify that the Installer maintains vacuum test logs on which are recorded repair numbers, vacuum test dates, and vacuum test results.

H. Record the following vacuum testing information on the Geomembrane Repair Log.
1. Assigned repair number, location and description of repair, vacuum test dates, and vacuum test results.

3.06 SEAM TEST SAMPLING

A. Determine seam analysis sample locations by the *stratified random sampling method.* The stratified random sampling method allows random selection of a single sewn analysis sample location anywhere within the required 500-lineal feet sampling interval required in the technical specifications. Have the Installer perform the following seam analysis sampling procedures.
1. Seam analysis samples will be 12-inches wide by 36-inches long with the weld centered down the length of the sample. Samples sizes may be modified at the request of the Installer or CQA Officer. Cut one 1-inch specimen from each end of the sample, and field test specimens for peel adhesion in accordance with the Technical specifications. If these specimens pass the field peel test, submit sample for laboratory seam analysis. If either of the specimens fail the field peel test, perform Faded Seam Analysis Procedures in accordance with Section 3.08 of this Section.
2. Divide the sample into equal two sections, submit one Section for seam analysis and archive storage the second section.
3. Installer may obtain and test any seam analysis sample at its option.
4. Repair sample holes and vacuum test repair in accordance with Section 3.04 of this Section.

B. Based on the seam analysis *sampling method of attributes,* the CQA Officer may decrease or increase the 500-foot sampling interval based on the following control chart of passing percentages of seam analysis results.

Percent Of Passing Seam Analysis	Sampling Modifications
100	Decrease sampling interval to 1000 lf.
90 – 100	Decrease sampling interval to 750 lf.
60 – 90	Maintain sampling interval at 500 lf.
30 - 60	Increase sampling interval to 250 lf.

Note: Sampling modifications will be considered only after 20 percent of seam analysis is completed.

3.07 LABORATORY TESTING

A. Laboratory seam analysis will be performed at the Geosynthetics Testing Laboratory, which is independent of the geomembrane Manufacturer and Installer, and will be performed in accordance with the following procedures.
   1. Seam analysis will include peel adhesion and bonded seam strength (ASTM D 6392). Five specimens will be tested for each method.
   2. Both sides of fusion welded seams will be tested for peel adhesion.
   3. All five of the specimens must meet the Fail Criteria specified in the technical specifications.

B. Acceptance of the welded geomembrane seams will be based on the results of laboratory seam analysis.

3.08 FAILED SEAM ANALYSIS PROCEDURES

A. In coordination with the Installer, perform the following quality assurance verification procedures in the event of a seam analysis sample failure determined by either field testing or laboratory seam analysis.
   1. Track the welded seam 10 feet in both directions away from the failed seam analysis sample location. Cut a small 12-inch wide by 12-inch long sample from each location. Cut one 1-inch specimen from each end of the sample, and field test specimens for peel adhesion in accordance with Part 3.01 of this Section. If these specimens pass the field peel test, submit a 12-inch wide by 18-inch long re-test sample from both locations for laboratory seam analysis. If either of the specimens fail the field peel test at either location, continue tracking the welded seam at 10-foot intervals until specimens successfully pass the field peel tests and a sample can be submitted for laboratory seam analysis. If specimens continually fail field peel tests at 10-foot intervals, the entire seam or portion of the welded seam will be repaired at the discretion of the CQA Officer.
   2. Verify that the failed length of seam is repaired with an 18-inch wide extrusion welded cap strip. Tack and extrusion welding the leading flap of the fusion welded seam is not permitted. Verify that the extrusion welded cap strip is vacuum tested in accordance with the technical specifications.
   3. If the re-test sample fails laboratory seam analysis, repeat the above procedures.

B. Sample extrusion welded cap strips exceeding 100 feet in length for seam analysis.

END OF CQA SECTION 02772
GEOMEMBRANE

CQA SECTION 02773
ENGINEERED TURF

PART 1 GENERAL

1.01 SUMMARY

A. The CQA Officer shall perform CQA procedures as outlined in this Section and follow guidelines for monitoring and testing to verify and document that geonet composite material and installation are in compliance with the Plans and Technical Specifications.

1.02 SUBMITTALS

A. Collect three (3) copies of each submittal listed in the Technical Specifications.

B. Verify compliance with the submittal schedule and update Submittal Log.

C. Perform submittal review and approval procedures in Part 1.03 of Section 01300 of this CQA Plan.

1.03 TRANSPORT AND STORAGE

A. Upon delivery of the engineered turf rolls to the Work site, verify that the rolls have been transported with opaque protective coverings and within a closed trailer or covered open trailer.

B. During unloading of the geonet composite rolls at the Work site, perform the following procedure:

1. Obtain a copy of the packing list.
2. Complete the Engineered Turf Delivery and Control Log for each shipment and attach a copy of the packing list. The Engineered Turf Delivery and Control Log documents the following:
    a. Delivery date.
    b. Roll numbers.
    c. Batch/lot numbers or production dates.
    d. Roll dimensions.
    e. Manufacturer and Product Name or Designation.
    f. Name of CQA monitor observing delivery and storage.
    g. Total quantity delivered with each shipment.
    h. Additional notes including rejection of materials, condition of delivered materials, and other materials included with the shipments.
3. Verify unloading and storage of the engineered turf rolls has been done in accordance with the Manufacturer's recommended procedures.
4. Verify that engineered turf rolls are transported, unloaded, handled, and stored in a manner that does not damage the engineered turf rolls or their protective coverings in accordance with the Manufacturer's recommended procedures and the following requirements:
    a. Nylon or other cloth straps are used to unload and handle the geonet composite rolls to protect the rolls and their protective coverings from damage.

b. The engineered turf rolls are stacked no more than five (5) rolls high and with a 3-foot wide access path between the stacked rows.

5. Identify and separate damaged or rejected engineered turf rolls.
6. Verify that damaged protective coverings are repaired or replaced.
7. If CQA conformance test sampling, in accordance with Part 2.03C of this Section, is to be performed during delivery to the Work site, determine which geonet composite rolls will be sampled by either individual roll numbers, batch/lot numbers, or production dates, and position the rolls for convenient sampling.

PART 2 PRODUCTS

2.01 ENGINEERED TURF COMPONENTS

A. Verify that the following engineered turf components meet the applicable product requirements of Section 02773 (Engineered Turf) of the Technical Specifications:
   1. Engineered turf geotextiles.
   2. Engineered turf polyethylene yarns (grass blades).
   3. Sewing thread.
   4. Sand ballast infill.
   5. Hydrobinder.

2.02 CONFORMANCE TESTING

A. Conduct sampling for CQA conformance testing at the Work site upon delivery or at the manufacturing plant prior to shipment and delivery to the Work site.

B. For every 100,000 square feet of material delivered to the Work site, select at least one (1) engineered turf roll to sample for CQA conformance testing.

C. Sample the selected engineered turf rolls for CQA conformance testing using the following procedure:
   1. Cut and discard the first 3 feet of engineered turf material from across the entire width of the roll.
   2. Cut the next 18 inches of material from across the entire width of the roll; this section of material is the CQA conformance testing sample.
   3. Mark the sample with the following information directly on the sample with a paint marker:
      a. Machine direction of the sample.
      b. Manufacturer's roll number.
      c. CQA test number.
   4. Immediately re-wrap the sampled engineered turf roll with its protective covering; use additional opaque plastic sheeting, if needed, to completely cover the roll.
   5. Complete the Engineered Turf Test Request and Sample Custody Log and ship samples to the Geosynthetics Testing Laboratory.

D. The following CQA conformance tests will be performed by the Geosynthetics Testing Laboratory to verify compliance with the product requirements of the Technical Specifications at the following frequencies:

One (1) per every 100,000 square feet of Engineered Turf material components to be installed:

1. CBR Puncture (ASTM D6241).
2. Tensile Properties (ASTM D4595).
3. Rainfall Induced Erosion (ASTM D96459).
4. Fiber UV Stability (ASTM G147).
5. Backing System UV Stability, Exposed (ASTM G1545 Modified Cycle 1.UVA340).
6. Steady State Hydraulic Overtopping, Turf with HydroBinder (ASTM D7277/D7276).
7. Transmissivity with underlying structure geomembrane (ASTM D4716).
8. Internal Friction of combined components (ASTM D5321).
9. Sand Infill Gradation and Ballast (ASTM D6913).
10. Yarn Weight (ASTM D5261).
11. Tensile Strength of Yarn (ASTM D2256).

E. Upon completion of CQA conformance testing and receipt of the results, review all results for compliance with the Technical Specifications and report any test results which are not in compliance with the Technical Specifications to the Design Engineer.

F. Additional CQA conformance testing or corrective action to be performed in the event of test results which are not in compliance with the Technical Specifications will be determined by the Design Engineer.

PART 3 EXECUTION

3.01 PREPARATION AND EXAMINATION

A. Prior to engineered turf installation, hold a preparatory meeting in accordance with Part 1.04 of Section 01039 of this CQA Plan.

B. Prior to engineered turf installation, verify that all underlying material installation and construction has been completed in accordance with the Technical Specifications.

3.02 INSTALLATION

A. Verify that engineered turf is installed in accordance with the Manufacturer's instructions.

B. Verify that engineered turf is installed with the machine (lengthwise) direction of the roll oriented down the slope.

C. Verify that the engineered turf panels are deployed from the top of the slope in a way that the engineered turf is laid substantially smooth and filaments are pointing upslope after deployment is complete.

D. Verify that the first engineered turf panel deployed has the turf filaments facing upward. Verify that subsequent panels are deployed turf side down, and on top of the previously installed panel. Verify that after seaming each panel, the panel is flipped onto the geomembrane component with care to avoid pulling of tufts in the drainage studs.

E. Verify that end-to-end panel overlaps only occur on benches, unless the length of a slope

between benches exceeds the total length of a full engineered turf roll.

F. Verify that the engineered turf is installed with sufficient tension to prevent excessive overlapping, insufficient overlapping, wrinkles, and folds.

G. Verify that a single stitch prayer type seam is constructed using a Nulong sewing machine or equivalent. Verify that sewing thread is 207 Polyester or equivalent and that sewing occurs between the 1st and 2nd row of engineered turf stitches.

H. Verify that the engineered turf is ballasted during installation and until the engineered turf is covered with the sand ballast infill material.

I. Verify that on slopes exceeding 15%, no equipment is allowed on the partially constructed turf cap system until after the completed installation of the sand ballast infill. Verify that on slopes less than 15%, ATV type vehicles are allowed prior to infill placement if the tire /track pressure is less than 5 psi.

J. Verify that following full specified sand ballast infill thickness installation, traffic be limited to light duty vehicles with drivability tire/track pressures of less than 35 psi.

K. Verify that engineered turf damaged during installation is removed and/or repaired with a sewn or fastened patch at the direction of the Design Engineer.

L. Verify that portions of the engineered turf wasted by the Installer, and rendered unusable, as determined by the Design Engineer, are transported by the Contractor and disposed of off-site at a permitted transfer station or solid waste disposal facility.

3.03 SAND BALLAST INFILL PLACEMENT

A. Verify that sand ballast infill is placed between the tufts of the engineered turf and:
   1. Is per plan either 5/8 inch thick or 2 1/8 inch thick, with a thickness tolerance of +/- 1/8 inch.
   2. Consists wholly of sand meeting ASTM C-33-03 for fine aggregates.
   3. Turf areas that are to receive sand ballast infill are accepted by the CQA Officer before placement of sand ballast infill takes place

B. Verify that sand ballast infill is worked into the engineered turf between the synthetic yarn blades.

C. Verify that conveyor systems and/or Express Blowers are used to spread and place the sand ballast infill.

D. Verify that the Contractor has explained with detail in the Preparatory Meeting the method of sand infill deployment to be used.

E. Verify that previously installed components are not displaced or damaged as a result of the sand ballast infill component installation.

F. Verify that a standard washer is utilized as a plate for the point of entry into the sand ballast infill for consistent depth control.

3.04 INFILL – HYDROBINDER® PLACEMENT

A. Verify that the HydroBinder® infill layer is placed using appropriate equipment capable of completing the work.

B. Verify that the Contractor has explained in detail during the Preparatory Meeting the method of HydroBinder® infill deployment.

C. Verify that installation of HydroBinder® infill is only be performed by a Manufacture's approved installer using techniques and equipment approved by the Manufacture.

D. Verify that the HydroBinder® is installed into the turf while it is in a dry state and that the HydroBinder® is worked into the tufts so the tufts are in an upright position.

E. Verify that the HydroBinder® infill is placed dry to a thickness of 7/8 inch with a tolerance of +/- 1/8 inch.

F. Verify that the hydration process occurs on the same day as the HydroBinder® infill placement and that the required HydroBinder® infill thickness is achieved prior to the hydration process.

G. Verify that the cemented infill is hydrated thoroughly and that care is taken to avoid displacement of the non-hydrated infill.

H. Verify that once hydration is completed as described, backfill and compaction of the vertical anchor trenches (if applicable) take place.

I. Verify that the HydroBinder® is at minimum performance levels within 24 hours.

3.05 DOCUMENTATION

A. Document daily observations of the deployment and seaming operations.

3.06 REPAIRS

A. Verify that all damaged areas or holes are repaired with a patch that extends 2 feet beyond the edge of the damaged area or hole.

3.07 CORRECTIVE ACTIONS

A. If any portion(s) of the engineered turf components do not meet the requirements of the Plans and Technical Specifications, based on either observations and/or physical measurement, verify that that portion(s) is repaired or removed and replaced to meet the requirements of the Technical Specifications and that the corrective actions implemented by the Contractor are in conformance with methods approved by the Design Engineer and the applicable Standard Specifications.

END OF CQA SECTION 02773
ENGINEERED TURF

CQA SECTION 02900
SEEDING AND FERTILIZING

PART 1 GENERAL

1.01 SUMMARY

A. The CQA Officer shall perform CQA procedures as outlined in this Section and follow guidelines for monitoring and testing to verify and document that revegetation materials and placement methods are in compliance with the Plans and Technical Specifications.

1.02 SUBMITTALS

A. Collect three (3) copies of each submittal required in the Technical Specifications.

B. Verify compliance with the submittal schedule and update Submittal Log.

C. Perform submittal review and approval procedures in Part 1.03 of Section 01300 (Submittals) of this CQA Plan.

PART 2 PRODUCTS

2.01 REVEGETATION MATERIALS

A. Verify that the following revegetation materials meet the applicable product requirements of Section 02900 (Seeding and Fertilizing) of the Technical Specifications:
1. Seed.
2. Fertilizer.
3. Tackifier.
4. Fiber.

B. Verify that fertilizer conforms to Section 20-2.02 of the Standard Specifications.

C. Verify that seed conforms to Section 20-2.10 of the Standard Specifications.

D. Verify that fiber and/or stabilizing emulsion, if used, conforms to Sections 20-2.07 and 20-2.11, respectively, of the Standard Specifications.

PART 3 EXECUTION

3.01 PREPARATION

A. Prior to beginning of revegetation activities, hold a preparatory meeting in accordance with Part 1.04 of Section 01039 (Project Meetings) of this CQA Plan.

B. Verify that the method and equipment to be used to spread the seed, fertilizer and mulch has been approved by the Design Engineer.

C. Verify that the access roads, drainage structures, and erosion-resistant layer have been placed

to grade before seed, fertilizer and mulch is applied and verify with the Contractor that revegetation shall not occur on the access roads, lined drainage swales, and sedimentation basins.

3.02 APPLICATION

A. Verify that seed and fertilizer (including fiber and/or stabilizing emulsion, if applicable) are applied to the areas designated on the Plans.

B. Verify that all products are spread uniformly over all areas subject to revegetation.

3.03 CONFORMANCE VERIFICATION

A. Verify application rates on a daily basis for the respective materials by comparing the amount used (as determined from weight tags) to the total acreage covered.

3.04 CORRECTIVE ACTIONS

A. If any portion(s) of the seeding and fertilizing provisions do not meet the requirements of the Plans and Technical Specifications, based on either observations and/or physical measurement, verify that that portion(s) is reworked or removed and replaced to meet the requirements of the Technical Specifications and that the corrective actions implemented by the Contractor are in conformance with methods approved by the Design Engineer and the applicable Standard Specifications.

END OF CQA SECTION 02900
SEEDING AND FERTILIZING

CQA SECTION 02960
TEMPORARY EROSION AND SEDIMENT CONTROLS

PART 1 GENERAL

1.01 SUMMARY

A. The CQA Officer shall perform CQA procedures as outlined in this Section and follow guidelines for monitoring and testing to verify and document that the temporary erosion and sediment control materials and installation methods are in compliance with the Plans and Technical Specifications.

1.02 SUBMITTALS (NOT USED)

PART 2 PRODUCTS

2.01 EROSION AND SEDIMENT CONTROL COMPONENTS

A. Verify that the following erosion and sediment control components meet the applicable product requirements of Section 02960 (Temporary Erosion and Sediment Controls) of the Technical Specifications:
   1. Straw bales.
   2. Straw wattles.
   3. Silt fencing.

2.02 ROCK FOR CONSTRUCTION ENTRANCE

A. Verify rock conformance under CQA Section 02207 (Aggregate Materials) of this CQA Plan.

PART 3 EXECUTION

3.01 PREPARATION AND SCHEDULE

A. Prior to beginning installation of any temporary erosion and sediment control components, hold a preparatory meeting in accordance with Part 1.04 of Section 01039 (Project Meetings) of this CQA Plan.

B. Verify that the Storm Water Pollution Prevention Plan (SWPPP) has been prepared by a Qualified SWPPP Developer (QSD), been submitted to the State Water Resources Control Board, and that a WDID number has been received for the project.

C. Verify that temporary erosion and sediment control measures are implemented year round during the course of the Project, and that temporary erosion control features are installed and maintained between October 15 and May 15 of each year.

3.02 PROTECTION

A. Verify that temporary erosion and sediment control measures are implemented in all areas of exposed earth created by the Contractor beyond what is shown on the Plans and referred to in

the Technical Specifications and areas cleared and grubbed prior to excavation or embankment operations which are subject to wind erosion and runoff.

3.03 TEMPORARY EROSION CONTROL FACILITIES

A. Verify that the Contractor conducts his operations in such a manner that storm water runoff is contained within the Work site or channeled into the storm drain system which serves the runoff area.

B. Verify that storm water runoff from one area is not diverted to another runoff area.

C. Verify that temporary down drains, drainage structures, and other devices are provided to channel storm water runoff water into the respective permanent storm drain systems during construction. Also verify that permanent drainage structures, not fully completed, are modified as required to accept de-silted runoff.

D. Verify that fill areas, while being brought to grade and during periods of completion prior to final construction, are protected by various measures to eliminate erosion and the siltation of downstream facilities and adjacent areas.

E. Verify that contour graded areas are protected against erosion and the resulting siltation of downstream facilities and adjacent areas during grading operations.

F. Verify that incorporation of culvert pipe used in conjunction with temporary erosion control measures for final construction improvements has been approved by the Design Engineer.

3.04 CORRECTIVE ACTIONS

A. If any portion(s) of the temporary erosion and sediment controls does not meet the requirements of the Plans and Technical Specifications, based on either field test results, observations, field survey, and/or physical measurement, verify that that portion(s) is reworked or removed and replaced to meet the requirements of the Plans and Technical Specifications and that the corrective actions implemented by the Contractor are in conformance with methods approved by the Design Engineer and the applicable Standard Specifications.

END OF CQA SECTION 02960
TEMPORARY EROSION AND SEDIMENT CONTROLS

CQA SECTION 03300
CONCRETE

PART 1 GENERAL

1.01 SUMMARY

A. The CQA Officer shall perform CQA procedures as outlined in this Section and follow guidelines for monitoring and testing to verify and document that the concrete materials and construction methods are in compliance with the Plans and Technical Specifications.

1.02 SUBMITTALS

A. Collect three (3) copies of each submittal required in the Technical Specifications.

B. Verify compliance with the submittal schedule and update Submittal Log.

C. Perform submittal review and approval procedures in Part 1.03 of Section 01300 (Submittals) of this CQA Plan.

PART 2 PRODUCTS

2.01 CONCRETE COMPONENTS

A. Verify that the following concrete components meet the applicable product requirements of Section 03300 (Concrete) of the Technical Specifications:
1. Concrete.
2. Reinforcement.
3. Forms.
4. Epoxy.

2.02 AGGREGATE BASE

A. Verify aggregate base conformance under CQA Section 02207 (Aggregate Materials) of this CQA Plan.

2.03 ENGINEERED FILL

A. Verify engineered fill conformance under CQA Section 02224 (Engineered Fill) of this CQA Plan.

2.04 CONFORMANCE TESTING

A. Review moisture-density relationship conformance test results for the aggregate base as determined under CQA Section 02207 (Aggregate Materials) of this CQA Plan.

B. Verify that concrete and aggregate base materials are obtained from the approved sources throughout the Work.

PART 3 EXECUTION

3.01 PREPARATION

A. Prior to beginning construction of any drainage and erosion control structure, hold a preparatory meeting in accordance with Part 1.04 of Section 01039 (Project Meetings) of this CQA Plan.

B. Verify that the locations and dimensions of the concrete pads are as shown on the Plans or as staked by the Design Engineer.

C. Verify that the footprint areas for the flare station concrete pads as shown on the Plans are properly cleared and grubbed and that the underlying subgrade conforms to the engineered fill requirements per CQA Section 02224 (Engineered Fill) of this CQA Plan.

D. Verify that aggregate base for the flare station concrete pad is spread in a uniform loose lift not exceeding 8 inches in thickness.

E. Perform the following field tests at the frequency shown to verify that the compacted aggregate base material has a minimum dry density of 95 percent of the maximum dry density and is within 1 to 3 percentage points of the optimum moisture content as determined from ASTM D 1557:

1. *Dry Density and Moisture Content - Nuclear (ASTM D 2922 and D 3017)*; at least one test beneath each concrete pad.
2. *Moisture Content (ASTM D 4959)*; at least one (1) test per every ten (10) nuclear gauge tests.

F. Record corresponding dry density and moisture content results on the Nuclear Density/Moisture Test Data form.

3.02 REINFORCEMENT

A. Verify that all reinforcement is installed in conformance with Concrete Reinforcing Steel Institute's (CRSI's) "Manual of Standard Practice".

B. Verify that all reinforcement is free from rust, oil, dirt, or any other coating.

C. Verify that continuous reinforcing bars are lapped at splices at a minimum of 32 diameters.

D. Verify that reinforcement has a minimum concrete cover of 3 inches (unless otherwise noted).

E. Verify that reinforcement is not damaged and is securely supported and anchored to avoid movement during placement of concrete.

3.03 FORMWORK

A. Verify that the strength of concrete formwork is sufficient to hold the concrete with minimal or no leakage and that shoring and bracing is provided to ensure stability of formwork.

B. Verify that 3/4-inch chamfer strips are used at exposed corners.

3.04 CONCRETE SLAB AND DRAIN INLET PLACEMENT

A. Verify that the subgrade and forms are moistened prior to placing concrete.

B. Verify that care is taken to not damage or displace the reinforcing steel components.

C. Verify that concrete is placed in a continuous operation and thoroughly vibrated to ensure consolidation around reinforcement.

D. Collect samples of the concrete to be used at the Work site and perform the following tests to verify that the concrete has the slump and compressive strength characteristics specified in the Technical Specifications:
   1. *Slump (ASTM C 143)*; one test per each concrete pour.
   2. *Compressive Strength (ASTM C 31 and ASTM C 39)*; one test per each concrete pour.

E. Verify that the final surfaces of the concrete slabs have a non-slip broom finish.

F. Verify that all significant cracks, spalls and irregularities in formed or finished surfaces or other defects are properly repaired or patched.

3.05 MINOR CONCRETE PLACEMENT

A. Verify that minor concrete for post footings and the sedimentation basin's drainage riser foundation are installed as shown on the Plans and in conformance with Sections 51 and 90-10 of the Standard Specifications, as applicable.

B. Verify that minor concrete for the grouted rock riprap is placed in conformance with Section 72-5.04 of the Standard Specifications.

3.06 EPOXY SECURED DOWELS OR ANCHORS

A. Verify that the diameter and depth of the drill hole is as indicated. If not included, verify that the hole is drilled 1/8-inch larger and ten (10) times deeper than the diameter of the dowel or anchor.

B. Verify that the hole is thoroughly cleaned by blowing it out with compressed air and by using a wire brush.

C. Verify that placement of epoxy in the hole is performed using a dispensing tool provided by, or recommended by the manufacturer and that the hole shall is completely filled with epoxy.

D. Verify that the dowel or anchor is placed in the hole and the epoxy allowed sufficient time to completely cure before disturbing the dowel or anchor.

3.07 CONFORMANCE VERIFICATION

A. After construction, verify by survey that the flare station concrete pads are completed at the elevations shown on the plans.

3.08 CORRECTIVE ACTIONS

A. If any portion(s) of the concrete provisions do not meet the requirements of the Plans and Technical Specifications, based on either field test results, observations, field survey, and/or physical measurement, verify that that portion(s) is reworked or removed and replaced to meet the requirements of the Technical Specifications and that the corrective actions implemented by the Contractor are in conformance with methods approved by the Design Engineer and the applicable Standard Specifications.

END OF CQA SECTION 03300
CONCRETE

CQA SECTION 15100
LANDFILL GAS (LFG) EXTRACTION WELLS

PART 1 GENERAL

1.01 SUMMARY

A. The CQA Officer shall perform CQA procedures as outlined in this Section and follow guidelines for monitoring and testing to verify and document that the LFG extraction well materials and construction methods are in compliance with the Plans and Technical Specifications.

1.02 SUBMITTALS

A. Collect three (3) copies of each submittal required in the Technical Specifications.

B. Verify compliance with the submittal schedule and update Submittal Log.

C. Perform submittal review and approval procedures in Part 1.03 of Section 01300 (Submittals) of this CQA Plan.

PART 2 PRODUCTS

2.01 LFG EXTRACTION WELL COMPONENTS

A. Verify that the following LFG extraction well components meet the applicable product requirements of Section 15100 (Landfill Gas [LFG] Extraction Wells) of the Technical Specifications:
1. PVC well casing and fittings.
2. Bentonite Seal.
3. PVC well bore seal.
4. Prefabricated well head assemblies.

2.02 GRAVEL PACK

A. Verify gravel pack conformance under CQA Section 02207 (Aggregate Materials) of this CQA Plan.

2.03 SOIL BACKFILL

A. Verify soil backfill conformance under CQA Section 02250 (Erosion-Resistant Layer) of this CQA Plan.

PART 3 EXECUTION

3.01 PREPARATION

A. Prior to LFG extraction well drilling and installation, hold a preparatory meeting in accordance with Part 1.04 of Section 01039 (Project Meetings) of this CQA Plan.

B. Verify that the LFG extraction well locations conform to the locations staked by the Design Engineer.

C. Verify that a drilling permit(s), if required, has been obtained by the Contractor.

D. Verify that drilling contractor is licensed (Class C-57) in the State of California.

E. Verify that the Contractor understands that individual LFG extraction wells must be drilled and installed in a single day so as to minimize the potential for LFG emissions from the borehole. In the event of equipment breakdown or other unforeseen circumstance that prohibits complete installation of the LFG extraction well within the same working day, verify that provisions are made to cover and seal the exposed borehole at the surface to prevent LFG emissions.

3.02 DRILLING

A. Verify that the boreholes for the LFG extraction wells are drilled using a bucket auger drill rig capable of drilling 24-inch diameter boreholes.

B. Verify that a safety screen is placed over the top of the borehole as soon as drilling is completed and that the screen is kept in place until backfilling is within 4 feet of the surface. Verify that the safety screen size is large enough to accommodate all backfill materials and activities yet not large enough for any human to accidentally fall through.

C. Verify that the borehole is straight and the well casing is installed in the center of the borehole. Verify that the Contractor takes all tension off of the pipe by mechanical means and centers the well casing in the middle of the borehole before starting to backfill.

D. Verify that PVC well casing joints are solvent cemented and secured with 3/8-inch long Type 316 stainless steel lag screws.

E. Verify that the completion height of the well casing above ground surface is such that the final height of the installed prefabricated well head assembly is 5 feet above final grade.

F. Verify that the top of the casing is capped until installation of the prefabricated well head assembly.

G. Verify that spoils generated as part of the drilling process are handle and managed in conformance with CQA Section 02222 (Excavation) of this CQA Plan.

H. In the event obstructions and/or saturated conditions are encountered during drilling, verify that the Contractor makes a reasonable effort to drill through obstructions and saturated conditions and that abandonment of the borehole is not performed without written approval obtained from the Design Engineer.

3.03 BACKFILLING

A. Verify that the strength of concrete formwork is sufficient to hold the concrete with minimal or no leakage and that shoring and bracing is provided to ensure stability of formwork.

B. Verify that 3/4-inch chamfer strips are used at exposed corners.

3.04 CONCRETE SLAB AND DRAIN INLET PLACEMENT

A. Verify that backfilling operations commence immediately after well drilling is completed and the well casing has been installed in the borehole. Verify that backfill materials are installed as shown on the Plans and as directed by the Design Engineer.

B. Verify that the gravel pack is poured or scooped through the safety screen at a rate that will not endanger the integrity of the well casing.

C. Verify that the upper and lower bentonite seals are formed by evenly distributing the bentonite material around the annulus of the well casing and that fresh water is added in a manner that will allow for a thorough saturation of the bentonite. Verify that the proportion of water added versus bentonite material is in accordance with the bentonite manufacturer's recommendations.

D. Verify that soil backfill is placed from the top of the lower bentonite seal to the bottom of the upper bentonite seal in a manner that will promote self compaction and avoid bridging of the soil backfill material.

E. Verify that the PVC well bore seal is installed in accordance with the manufacturer's recommendations around the well casing and placed at the location shown on the Plans.

F. Verify that the boot portion of the well bore seal is secured around the well casing with stainless steel straps to provide an air-tight connection. Following placement of erosion-resistant layer material, verify that the boot is installed in a collapsed position above the final grade to accommodate potential settlement.

G. Verify that the PVC well bore seal is covered with the overlying GCL material or soil (temporary) if the PVC well bore seal is going to be exposed for more than three (3) working days.

3.05 INSTALLATION OF PREFABRICATED WELL HEAD ASSEMBLY

A. Verify that the prefabricated well head assemblies are handled and installed in accordance with the manufacturer's recommendations and as shown on the Plans.

B. Verify that the well head is installed such that the interior extension tube assembly is concentric within the well casing.

C. Verify that the final completion height of the well head assembly is 5 feet above final grade as shown on the Plans.

D. Verify that the PVC flexible hose connection between the well head and LFG collection system piping is installed with sufficient slack (6 to 8 inches) to accommodate expansion and contraction. Verify that "IPS Weld-On 795" plastic pipe cement, or approved equivalent, is used for flexible hose connections to the well head and LFG collection system piping.

3.06 ABANDONMENT OF LFG EXTRACTION WELL BOREHOLE (IF REQUIRED)

A. Verify that boreholes approved by the Design Engineer for abandonment are backfilled with refuse and/or soil to the final grade and compacted. If refuse is used, verify that the refuse is

mechanically compacted within the borehole using the bucket auger to eliminate potential voids.

B. Upon completion of borehole abandonment activities, verify that the area around the borehole is restored to meet the surrounding grades as shown on the Plans.

3.07 PERFORMANCE TESTING

A. Verify that performance testing of the prefabricated well head assemblies is performed in conformance with Section 15100 (Landfill Gas [LFG] Extraction Wells) of the Technical Specifications.

3.08 CORRECTIVE ACTIONS

A. If any portion(s) of the LFG extraction well provisions do not meet the requirements of the Plans and Technical Specifications, based on either field test results, observations, field survey, and/or physical measurement, verify that that portion(s) is reworked or removed and replaced to meet the requirements of the Technical Specifications and that the corrective actions implemented by the Contractor are in conformance with methods approved by the Design Engineer and the applicable Standard Specifications.

END OF CQA SECTION 15100
LANDFILL GAS (LFG) EXTRACTION WELLS

CQA SECTION 15200
LFG COLLECTION SYSTEM COMPONENTS

PART 1 GENERAL

1.01 SUMMARY

A. The CQA Officer shall perform CQA procedures as outlined in this Section and follow guidelines for monitoring and testing to verify and document that the LFG collection system component materials and construction methods are in compliance with the Plans and Technical Specifications.

1.02 SUBMITTALS

A. Collect three (3) copies of each submittal required in the Technical Specifications.

B. Verify compliance with the submittal schedule and update Submittal Log.

C. Perform submittal review and approval procedures in Part 1.03 of Section 01300 (Submittals) of this CQA Plan.

PART 2 PRODUCTS

2.01 LFG COLLECTION SYSTEM COMPONENTS

A. Verify that the following LFG collection system components meet the applicable product requirements of Section 15200 (LFG Collection System Components) of the Technical Specifications:

1. PVC pipe and fittings.
2. PVC butterfly valves (isolation valves).
3. PVC ball valves.
4. PVC cement.
5. Vacuum test ports.
6. HDPE pipe and fittings.
7. PVC-HDPE transition coupling.
8. Flexible couplings.
9. Staked pipe supports and anchors.
10. Metal frame pipe supports.
11. Block type pipe supports.
12. CMP.

2.02 CONCRETE

A. Verify concrete conformance under CQA Section 03300 (Concrete) of this CQA Plan.

2.03 PIPE BEDDING

A. Verify pipe bedding conformance under CQA Section 02207 (Aggregate Materials) of this CQA Plan.

2.04 ENGINEERED FILL

A. Verify engineered fill conformance under CQA Section 02224 (Engineered Fill) of this CQA Plan.

2.05 CONFORMANCE TESTING

A. Review moisture-density relationship conformance test results for the pipe bedding and engineered fill as determined under CQA Section 02207 (Aggregate Materials) and CQA Section 02224 (Engineered Fill), respectively, of this CQA Plan.

PART 3 EXECUTION

3.01 PREPARATION

A. Prior to LFG collection system construction, hold a preparatory meeting in accordance with Part 1.04 of Section 01039 (Project Meetings) of this CQA Plan.

3.02 LFG COLLECTION SYSTEM PIPING

A. Verify that the LFG collection system piping, including flexible couplings, isolation valves and condensate drop-out points are installed as shown on the Plans.

B. Verify that all PVC pipe, fittings and valves are inspected for cuts, scratches, or other damages prior to painting and installation.

C. Verify that prior to installation, all PVC pipe and fittings to be left exposed are steam cleaned and allowed to dry, then painted in conformance with Section 15200 (LFG Collection System Components) of the Technical Specifications.

D. Verify that PVC pipe, fittings and valves are joined with socket and solvent cement welding in accordance with ASTM D 2855 and that the joining of PVC pipe, fittings and valves are in accordance with the pipe manufacturer's recommendations and the Technical Specifications.

E. Verify that PVC pipe cuts are square and perpendicular to the centerline of the pipe and that PVC pipe ends are beveled prior to applying primer and solvent cement so that the primer or cement are not wiped off during insertion into the fitting socket.

F. Verify that all burrs, chips, etc. generated as a result of cutting operations are removed from the pipe interior and exterior and that the inside of the piping is kept clean of dirt and debris. Also verify that any piping left overnight is capped.

G. Verify that a coating of CPS primer as recommended by the PVC pipe supplier is applied to the entire interior surface of the fitting socket, and to an equivalent area on the exterior of the pipe prior to applying solvent cement.

H. Verify that the solvent cement used complies with the requirements of ASTM D 2564 and is applied in strict accordance with manufacturer's specifications.

I. Verify that PVC pipe, fittings and valves are not primed or solvent welded when it is raining or when ambient temperature is below 40°F or above 100°F.

J. Verify that after solvent welding, the PVC pipe, fittings and valves are allowed to remain undisturbed until cement has thoroughly set.

K. Verify that flexible couplings are installed at the locations shown on the Plans and that the flexible couplings are installed per the pipe separation criteria specified in the Plans based on the ambient temperature at the time of installation. Also verify that stainless steel band clamps are secured around the ends of the flexible coupling in such a manner as to provide an air-tight joint.

L. Verify that vacuum test ports are installed at the locations and orientations shown on the Plans and in accordance with the procedures described in Section 15200 (LFG Collection System Components) of the Technical Specifications.

M. Verify that staked pipe supports are installed under the selected pipe segments as specified on the Plans and that they are spaced at 10 feet on-center along the full length of the pipe segments. Also verify that the height of the pipe supports are adjusted as appropriate to ensure positive slope of LFG collection system piping and that the stakes are driven no less than 12 inches and no more than 18 inches below final surface grades.

N. Verify that block tyupe pipe anchors are installed at the intervals indicated on the Plans, as well as at the locations of all tee, elbow and wye fittings (both ends, but not on the fittings themselves) and at flexible couplings located on slopes as shown on the Plans and that the pipe clamps are secured around the LFG header system pipe to ensure that the pipe does not move.

O. Verify that metal frame pipe supports are installed at the locations shown on the Plans and that the height of cross-bar pipe supports are adjusted as appropriate to ensure positive slope of LFG collection system piping. Verify concrete placement conformance under CQA Section 03300 (Concrete) of this CQA Plan.

3.03 BURIED HEADER CROSSINGS

A. Verify that trenching across bench sections are to the depth and dimensions shown on the Plans.

B. Verify that LFG collection system piping is sloped at a minimum of 3 percent to maintain proper condensate drainage capabilities.

C. Verify backfill conformance under CQA Section 02225 (Trenching and Backfilling) and perform the following field tests at the frequency shown to verify that the compacted pipe bedding and engineered fill have a minimum dry density of 90 percent of the maximum dry density and is within 1 to 3 percentage points of the optimum moisture content as determined from ASTM D 1557:

1. *Dry Density and Moisture Content - Nuclear (ASTM D 2922 and D 3017)*; at least one (1) test per 100 linear feet per lift.
2. *Moisture Content (ASTM D 4959);* at least one (1) test per every ten (10) nuclear gauge tests.

D. Record corresponding dry density and moisture content results on the Nuclear

Density/Moisture Test Data form.

3.04 ROAD CROSSINGS

A. Verify that CMP pipe supports and protective sleeves are installed in the orientations shown on the Plans and that the CMP pipe supports aligned with the center line of the drainage swale.

B. Verify that reinforcement geotextile is wrapped around the CMP protective sleeve where it will be in direct contact with the underlying CMP pipe support.

C. Verify that LFG collection system piping is inserted through the CMP protective sleeves in a manner that does not damage or compromise the LFG collection system piping.

D. Verify engineered fill placement conformance under CQA Section 02224 (Engineered Fill) and perform the following field tests at the frequency shown to verify that the compacted engineered fill has a minimum dry density of 90 percent of the maximum dry density and is within 1 to 3 percentage points of the optimum moisture content as determined from ASTM D 1557:

1. *Dry Density and Moisture Content - Nuclear (ASTM D 2922 and D 3017)*; at least one (1) test per 100 linear feet per lift.
2. *Moisture Content (ASTM D 4959);* at least one (1) test per every ten (10) nuclear gauge tests.

E. Record corresponding dry density and moisture content results on the Nuclear Density/Moisture Test Data form.

3.05 CONDENSATE DRAIN PIPE AND FITTINGS

A. Prior to installation, verify that all HDPE pipe and fittings are inspected for cuts, scratches, or other damages and that pipe and/or fittings with imperfections are not used.

B. Verify that trench excavation and backfill for buried HDPE pipe and fittings are as shown on the Plans.

C. Verify that HDPE pipe connection ends and fittings are joined by butt fusion procedures in accordance with the HDPE pipe and fitting manufacturer's recommended procedures.

D. Verify during construction that the HDPE pipe is not bent to a degree greater than the minimum radius recommended by the manufacturer and that the HDPE pipe is not subjected to strains that will overstress or buckle piping or impose excessive stress on joints.

E. Verify that open ends of fused HDPE pipe are covered or capped at the end of each working day to prevent entry by animals or debris.

F. Verify that sufficient slack is provided for segments completed above ground to allow for thermal expansion and contraction so as to not promote excessive stress on the piping following installation.

G. Verify that allowance is provided for thermal expansion or contraction of buried HDPE pipe within trenches and is coordinated with the pipe backfill operations to avoid buildup of thermal stresses.

H. Verify that sufficient time (per manufacturer's recommendations) is provided following placement of HDPE pipe to allow the pipe to adjust to trench temperature prior to testing, segment tie-ins, or backfilling activities.

3.06 CONDENSATE DROP-OUTS

A. Verify that the condensate drop-outs, including u-trap assemblies, are installed at the locations and to the dimensions shown on the Plans.

B. Verify that excavations are not deeper than necessary to maintain adequate buffer above the underlying GCL.

C. Verify that the transition from PVC to HDPE is conducted at the flange connection as shown on the Plans.

D. Verify PVC and HDPE pipe, fittings and valves installation conformance under Parts 3.01 and 3.05 of this Section.

E. Verify installation of staked pipe anchors at various points on the u-trap piping as shown on the Plans.

F. Verify that the u-trap assemblies are filled with clean water following construction and prior to start of LFG collection system operations.

3.07 CONDENSATE DISCHARGE POINTS

A. Verify that the Condensate discharge points are installed at the locations and to the dimensions shown on the Plans.

B. Verify soil and/or refuse excavation and handling conformance under CQA Section 02222 (Excavation) of this CQA Plan.

C. Verify PVC and HDPE pipe and fittings installation conformance under Parts 3.01 and 3.05 of this Section.

D. For condensate discharge points located within the limits of the final cover system, verify placement conformance of the engineered fill and respective final cover system components above the condensate discharge points per the applicable sections of this CQA Plan.

E. For condensate discharge points located outside the limits of the final cover system, verify engineered fill placement conformance under CQA Section 02224 (Engineered Fill) and perform the following field tests at the frequency shown to verify that the compacted engineered fill has a minimum dry density of 90 percent of the maximum dry density and is within 1 to 3 percentage points of the optimum moisture content as determined from ASTM D 1557:

1. *Dry Density and Moisture Content - Nuclear (ASTM D 2922 and D 3017)*; at least one (1) test per 100 linear feet per lift.

2. *Moisture Content (ASTM D 4959);* at least one (1) test per every ten (10) nuclear gauge tests.

F. Record corresponding dry density and moisture content results on the Nuclear Density/Moisture Test Data form.

3.08 PERFORMANCE TESTING

A. Verify that performance testing of the PVC LFG collection system pipe, HDPE condensate drain pipe, and condensate discharge points is performed in conformance with Section 15200 (LFG Collection System Components) of the Technical Specifications.

3.09 CORRECTIVE ACTIONS

A. If any portion(s) of the LFG collection system components provisions do not meet the requirements of the Plans and Technical Specifications, based on either field test results, observations, field survey, and/or physical measurement, verify that that portion(s) is reworked or removed and replaced to meet the requirements of the Technical Specifications and that the corrective actions implemented by the Contractor are in conformance with methods approved by the Design Engineer and the applicable Standard Specifications.

END OF CQA SECTION 15200
LFG COLLECTION SYSTEM COMPONENTS

CQA SECTION 15300
FLARE STATION

PART 1 GENERAL

1.01 SUMMARY

A. The CQA Officer shall perform CQA procedures as outlined in this Section and follow guidelines for monitoring and testing to verify and document that the flare station materials and construction methods are in compliance with the Plans and Technical Specifications.

1.02 SUBMITTALS

A. Collect three (3) copies of each submittal required in the Technical Specifications.

B. Verify compliance with the submittal schedule and update Submittal Log.

C. Perform submittal review and approval procedures in Part 1.03 of Section 01300 (Submittals) of this CQA Plan.

PART 2 PRODUCTS

2.01 FLARE STATION COMPONENTS

A. Verify that the following flare station components meet the applicable product requirements of Section 15300 (Flare Station) of the Technical Specifications:
1. Skid-mounted packaged combustion system.
2. Electrical conduit, wire and fittings.
3. Chain link fence.

2.02 PVC PIPE, FITTINGS AND BALL VALVE

A. Verify PVC pipe, fittings and ball valve conformance under CQA Section 15200 (LFG Collection System Components) of this CQA Plan.

2.03 PIPE BEDDING

A. Verify pipe bedding conformance under CQA Section 02207 (Aggregate Materials) of this CQA Plan.

2.04 ENGINEERED FILL

A. Verify engineered fill conformance under CQA Section 02224 (Engineered Fill) of this CQA Plan.

2.05 CONCRETE

A. Verify concrete conformance under CQA Section 03300 (Concrete) of this CQA Plan.

2.06 AGGREGATE BASE

A. Verify aggregate base conformance under CQA Section 02207 (Aggregate Materials) of this CQA Plan.

2.07 CONFORMANCE TESTING

A. Review moisture-density relationship conformance test results for the aggregate base as determined under CQA Section 02207 (Aggregate Materials) of this CQA Plan.

PART 3 EXECUTION

3.01 FLARE STATION ASSEMBLY

A. Prior to flare station assembly activities, hold a preparatory meeting in accordance with Part 1.04 of Section 01039 (Project Meetings) of this CQA Plan.

B. Verify that Contractor has obtained all required building permits.

C. Verify that Contractor's laborers are skilled and experienced in the installation of similar equipment.

D. Verify that the skid-mounted packaged combustion system is installed in strict accordance with the manufacturer's specifications.

3.02 CONDENSATE DRAINAGE LINE

A. Verify that the condensate drain line between the flare station and leachate wet well is installed as shown on the Plans.

B. Verify trenching and pipe bedding conformance under CQA Section 02225 (Trenching and Backfilling) of this CQA Plan.

C. Verify PVC pipe, fittings and ball valve installation conformance under CQA Section 15200 (LFG Collection System Components) of this CQA Plan.

D. Verify that the condensate drainage line is installed at a minimum slope of 1 percent in the direction of the leachate wet well.

E. Verify that the condensate drainage line penetrates the wall of the leachate wet well at the appropriate depth and that the annular space between the condensate drainage line and the wall of the leachate wet well is sealed using non-shrink grout.

F. Verify engineered fill placement conformance under CQA Section 02224 (Engineered Fill) of this CQA Plan.

3.03 SECURITY FENCE

A. Verify that the chain link fence and gates are installed as shown on the Plans and in accordance with the requirements of Section 80-4.02 of the Standard Specifications.

B. Verify that all line, corner, and gate post assemblies are constructed with concrete post footings.

C. Verify that soil between fence posts is leveled to create a 2-inch clearance under the fence fabric.

3.04 FLARE STATION AGGREGATE BASE

A. Verify that the aggregate base within and around the flare station is placed to the dimensions shown on the Plans.

B. Verify that the aggregate base is spread in uniform loose lifts not exceeding 8 inches in thickness.

C. Perform the following field tests at the frequency shown to verify that the compacted aggregate base material has a minimum dry density of 95 percent of the maximum dry density and is within 1 to 3 percentage points of the optimum moisture content as determined from ASTM D 1557:

1. *Dry Density and Moisture Content – Nuclear (ASTM D 2922 and D 3017);* at one test per every 1,200 square feet.
2. *Moisture Content (ASTM D 4959);* at least one (1) test per every ten (10) nuclear gauge tests.

D. Record corresponding dry density and moisture content results on the Nuclear Density/Moisture Test Data form.

E. Verify that the final compacted thickness is a minimum of 6 inches.

3.05 PERFORMANCE TESTING

A. Verify that performance testing of the skid-mounted packaged combustion system and condensate drainage line is performed in conformance with Section 15300 (Flare Station) of the Technical Specifications.

3.06 CORRECTIVE ACTIONS

A. If any portion(s) of the flare station provisions do not meet the requirements of the Plans and Technical Specifications, based on either field test results, observations, field survey, and/or physical measurement, verify that that portion(s) is reworked or removed and replaced to meet the requirements of the Technical Specifications and that the corrective actions implemented by the Contractor are in conformance with methods approved by the Design Engineer and the applicable Standard Specifications.

END OF CQA SECTION 15300
FLARE STATION

CQA SECTION 15400
FLARE STATION ELECTRICAL AND TELEPHONE FEED

PART 1 GENERAL

1.01 SUMMARY

A. The CQA Officer shall perform CQA procedures as outlined in this Section and follow guidelines for monitoring and testing to verify and document that the flare station electrical and telephone feed materials and installation methods are in compliance with the Plans and Technical Specifications.

1.02 SUBMITTALS

A. Collect three (3) copies of each submittal required in the Technical Specifications.

B. Verify compliance with the submittal schedule and update Submittal Log.

C. Perform submittal review and approval procedures in Part 1.03 of Section 01300 (Submittals) of this CQA Plan.

PART 2 PRODUCTS

2.01 ELECTRICAL AND TELEPHONE FEED COMPONENTS

A. Verify that the following electrical and telephone feed components meet the applicable product requirements of Section 15400 (Flare Station Electrical and Telephone Feed) of the Technical Specifications:
1. Wire.
2. Conduit and fittings.
3. Meter socket.
4. Junction and outlet boxes.
5. Warning tape.

2.02 PIPE BEDDING

A. Verify pipe bedding conformance under CQA Section 02207 (Aggregate Materials) of this CQA Plan.

2.03 ENGINEERED FILL

A. Verify engineered fill conformance under CQA Section 02224 (Engineered Fill) of this CQA Plan.

2.04 CONCRETE

A. Verify concrete conformance under CQA Section 03300 (Concrete) of this CQA Plan.

2.05 CONFORMANCE TESTING

A. Review moisture-density relationship conformance test results for pipe bedding and the engineered fill used for backfilling the former leachate pond as determined under CQA Section 02207 (Aggregate Base) and CQA Section 02224 (Engineered Fill), respectively, of this CQA Plan.

PART 3 EXECUTION

3.01 GENERAL

A. Prior to electrical and telephone feed installation, hold a preparatory meeting in accordance with Part 1.04 of Section 01039 (Project Meetings) of this CQA Plan.

B. Verify that Contractor has obtained all required electrical permits.

C. Verify that Contractor has furnished and installed all temporary power and lighting systems needed for construction and their subsequent removal after construction is completed.

D. Verify that Contractor has verified that the wire and conduit sizes for the main power supply and automatic telephone dialer system are appropriate for the intended use.

E. Verify that all electrical components are in accordance with the National Electric Code (NEC), National Fire Protection Association (NFPA) and local codes and regulations for installation in a Class 1, Division 1 or Class 1, Division 2 classified locations.

F. Verify that electrical and telephone feed installations are performed in accordance with the local electrical and telephone company rules and regulations.

G. Verify that the electrical and telephone feed from the existing service points to the flare station control panel is completed below grade as shown on the Plans.

H. Verify that Contractor has confirmed service and panel locations and all other service requirements prior to starting Work.

3.02 PREPARATION

A. Verify that all materials are inspected for damage and imperfections prior to installation and that damaged materials or materials with imperfections are not used.

3.03 TRENCHING AND BACKFILLING

A. Verify trenching and pipe bedding placement conformance under CQA Section 02225 (Trenching and Backfilling) of this CQA Plan.

B. Perform the following field tests at the frequency shown to verify that the compacted pipe bedding and engineered fill have a minimum dry density of 90 percent of the maximum dry density and is at a moisture content within 1 to 3 percentage points of the optimum moisture content as determined from ASTM D 1557:

1. *Dry Density and Moisture Content – Nuclear (ASTM D 2922 and D 3017);* at least one (1) test per 100 linear feet per lift or at a change in material.
2. *Moisture Content (ASTM D 4959);* at least one (1) test per every ten (10) nuclear gauge tests.

C. Record corresponding dry density and moisture content results on the Nuclear Density/Moisture Test Data form.

3.04 INSTALLATION

A. Verify that all equipment, motors, conduit and outlets, as applicable, are permanently and effectively grounded in accordance with NEC, California Administrative Code (CAC) - Title 24 and local codes.

B. Verify that all conduits are sloped towards pull boxes and run in straight lines except where a change in direction is necessary. Also verify that couplings are staggered for maximum duct line strength.

C. Verify that the ends of buried conduit are kept closed with approved conduit seals during construction and that immediately prior to pulling wire or cable, a swab is drawn through all conduits to force out water and foreign materials.

D. Verify that junction boxes are installed in an accessible location as required for splicing, connections and pulling of wire.

E. Verify that all above ground conduit is properly secured on pipe supports or concrete slabs.

F. Verify that the meter socket installed at the existing service pole complies with the height and fastening specifications outlined in the local electric company rules and regulations.

3.05 CLEAN-UP

A. Verify that all exposed portions of electrical installation are thoroughly cleaned, including the removal of all traces of soil, labels, grease, oil, and other foreign matter.

3.06 CORRECTIVE ACTIONS

A. If any portion(s) of the flare station electrical and telephone feed provisions do not meet the requirements of the Plans and Technical Specifications, based on either field test results, observations, field survey, and/or physical measurement, verify that that portion(s) is reworked or removed and replaced to meet the requirements of the Technical Specifications and that the corrective actions implemented by the Contractor are in conformance with methods approved by the Design Engineer and the applicable Standard Specifications.

END OF CQA SECTION 15400
FLARE STATION ELECTRICAL AND TELEPHONE FEED

CQA SECTION 15500
LEACHATE OVERFLOW COLLECTION AND STORAGE SYSTEM

PART 1 GENERAL

1.01 SUMMARY

A. The CQA Officer shall perform CQA procedures as outlined in this Section and follow guidelines for monitoring and testing to verify and document that the leachate overflow collection and storage system materials and construction methods are in compliance with the Plans and Technical Specifications.

1.02 SUBMITTALS

A. Collect three (3) copies of each submittal required in the Technical Specifications.

B. Verify compliance with the submittal schedule and update Submittal Log.

C. Perform submittal review and approval procedures in Part 1.03 of Section 01300 (Submittals) of this CQA Plan.

PART 2 PRODUCTS

2.01 COLLECTION AND STORAGE SYSTEM COMPONENTS

A. Verify that the following leachate overflow collection and storage system components meet the applicable product requirements of Section 15500 (Leachate Overflow Collection and Storage System) of the Technical Specifications:
1. Pipe materials.
2. Pipe accessories.
3. Concrete junction boxes.
4. Lining material for leachate sediment chamber/wet well.
5. Leachate UST and accessories.

2.02 PIPE BEDDING

A. Verify pipe bedding conformance under CQA Section 02207 (Aggregate Materials) of this CQA Plan.

2.03 TANK BEDDING AND BACKFILL

A. Verify tank bedding and backfill conformance under CQA Section 02207 (Aggregate Materials) of this CQA Plan.

2.04 ENGINEERED FILL

A. Verify engineered fill conformance under CQA Section 02224 (Engineered Fill) of this CQA Plan.

2.05 CONFORMANCE TESTING

A. Review moisture-density relationship conformance test results for the pipe bedding and tank bedding and backfill as determined under CQA Section 02207 (Aggregate Materials) of this CQA Plan.

B. Review moisture-density relationship conformance test results for the engineered fill as determined under CQA Section 02224 (Engineered Fill) of this CQA Plan.

PART 3 EXECUTION

3.01 BRACING AND SHORING

A. Verify that Bracing and shoring complies with Section 5-1.02A and 7-1.01E of the Standard Specifications.

3.02 GENERAL PIPE INSTALLATION

A. Verify that Contractor confirms the location of point of connection (POC) at the existing leachate collection piping as shown the Plans by potholing to determine the location and depth (elevation).

B. Verify that the trench subgrade for the gravity drain pipe provides uniform support at a uniform slope along full length of pipe.

3.03 PIPE INSTALLATION

A. Verify trench conformance under CQA Section 02225 (Trenching and Backfilling) of this CQA Plan.

B. Verify that the bottom of the trench is graded and prepared to provide a firm and uniform bearing throughout the entire length of the pipe barrel.

C. Verify that pipe, fittings, and accessories are installed in accordance with manufacturer's instructions and that the sealed joints are watertight.

D. Verify that pipe is placed to the lines and grades as shown on the Plans.

E. Verify that the pipe is laid without break upgrade from structure to structure, with bell end upgrade for bell and spigot pipe.

F. Verify that the horizontal alignment of the pipe is laid such that no points vary more than 0.10 feet from the design alignment established and shown on the Plans.

G. Verify backfill conformance under CQA Section 02225 (Trenching and Backfilling) and perform the following field tests at the frequency shown to verify that the compacted pipe bedding and engineered fill have a minimum dry density of 90 percent of the maximum dry density and is at a moisture content within 1 to 3 percentage points of the optimum moisture content as determined from ASTM D 1557:

1. *Dry Density and Moisture Content – Nuclear (ASTM D 2922 and D 3017);* at least one (1) test per 100 linear feet per lift or at a change in material.
2. *Moisture Content (ASTM D 4959);* at least one (1) test per every ten (10) nuclear gauge tests.

H. Record corresponding dry density and moisture content results on the Nuclear Density/Moisture Test Data form.

3.04 CONCRETE JUNCTION BOXES

A. Verify excavation conformance under CQA Section 02222 (Excavation) of this CQA Plan.

B. Verify that concrete junction boxes are installed in accordance with manufacturer's instructions and that their placement into the excavation is performed in a manner that will not induce damage or compromise future stability.

C. Verify that backfilling operations conform to the provisions in Section 19-3 of the Standard Specifications.

3.05 LEACHATE SEDIMENT CHAMBER/WET WELL LINING

C. Prior to start of Work, verify that provisions have been made to divert leachate from the existing leachate drain from discharging into the leachate sediment chamber and document how the leachate is being diverted and managed.

D. Verify that all leachate is pumped from the leachate sediment chamber and wet well and document where the leachate is pumped and managed.

E. Verify that any sediment present at the base of the leachate sediment chamber and/or wet well is removed and document how the sediment is removed and managed.

F. Verify that existing pumps and any other equipment/features that may inhibit application product are removed and stored in a dry and secure location.

G. Verify that the interior walls and base of the sediment chamber and wet well are steam cleaned to remove residual grime and residues. Also verify that residual rinseate generated by the steam cleaning operations is removed and document how the removed rinseate is managed.

H. Verify that sufficient time is provided to allow the surfaces of the interior walls and base to dry and document the nature of any mechanical means employed to expedite the drying time, as applicable.

I. Verify that the lining product is applied to provide full and sufficient coverage of all interior walls and base and that the application is performed in strict accordance with recommended manufacturer's procedures.

J. Verify that pumps and any other equipment/features that were removed are re-installed and verify that normal operation of the leachate sediment chamber/wet well is restored per pre-existing conditions.

3.06 TANK HOLDING

A. Verify that the tank is not dropped, rolled or impacted during unloaded and that the tank is set on smooth ground, free of rocks and foreign objects, and chock tanks to prevent movement.

3.07 TANK INSTALLATION

A. Verify excavation conformance under CQA Section 02222 (Excavation) of this CQA Plan.

B. Verify that the tank excavation is large enough to provide 2 feet of clearance between the tank sides and ends and the excavation walls in stable soil and 12 inches of bedding under the tank.

C. Verify that the tank and all related piping and accessories are installed as per manufacturer's printed instructions.

D. Verify that the tank bedding and backfill is placed in accordance with the sequence and procedures outlined in Section 15500 (Leachate Overflow Collection and Storage System) of the Technical Specifications.

E. Following placement of the tank bedding and backfill, verify backfill conformance for the remainder of the excavation under CQA Section 02225 (Trenching and Backfilling) and perform the following field tests at the frequency shown to verify that the compacted engineered fill has a minimum dry density of 90 percent of the maximum dry density and is within 1 to 3 percentage points of the optimum moisture content as determined from ASTM D 1557:

1. *Dry Density and Moisture Content – Nuclear (ASTM D 2922 and D 3017);* at one test per every 1,200 square feet.
2. *Moisture Content (ASTM D 4959);* at least one (1) test per every ten (10) nuclear gauge tests.

F. Record corresponding dry density and moisture content results on the Nuclear Density/Moisture Test Data form.

3.08 PERFORMANCE TESTING

A. Verify that performance testing of the leachate sediment chamber/wet well and leachate UST is performed in conformance with Section 15500 (Leachate Overflow Collection and Storage System) of the Technical Specifications.

3.09 CORRECTIVE ACTIONS

A. If any portion(s) of the leachate overflow connection and storage system provisions do not meet the requirements of the Plans and Technical Specifications, based on either field test results, observations, field survey, and/or physical measurement, verify that that portion(s) is reworked or removed and replaced to meet the requirements of the Technical Specifications and that the corrective actions implemented by the Contractor are in conformance with methods approved by the Design Engineer and the applicable Standard Specifications.

GENERAL NOTES

1. ALL CONSTRUCTION MATERIALS AND METHODS SHALL CONFORM TO THE REQUIREMENTS OF THE COUNTY OF MENDOCINO. ALL REFERENCES TO STATE OF CALIFORNIA, DEPARTMENT OF TRANSPORTATION STANDARD SPECIFICATIONS SHALL REFER TO THE MAY, 2006 EDITION OF THE STANDARD SPECIFICATIONS. ATTENTION IS ALSO DIRECTED TO THE STATE OF CALIFORNIA, DEPARTMENT OF TRANSPORTATION STANDARD PLANS (MAY 6, 2006) WHICH, WHEN APPLICABLE, ARE INCLUDED IN THESE DRAWINGS AND REFERENCED BY STANDARD PLAN NUMBER.
2. PUBLIC SAFETY AND TRAFFIC CONTROL SHALL BE PROVIDED IN ACCORDANCE WITH COUNTY REQUIREMENTS AND AS DIRECTED BY THE ENGINEER. SAFE VEHICULAR AND PEDESTRIAN ACCESS SHALL BE PROVIDED AT ALL TIMES DURING CONSTRUCTION.
3. A REGISTERED CIVIL ENGINEER OR LICENSED LAND SURVEYOR SHALL DO ALL FIELD STAKING AT THE EXPENSE OF THE CONTRACTOR.
4. ANY DISCREPANCY DISCOVERED BY THE CONTRACTOR IN THESE PLANS OR ANY FIELD CONDITIONS DISCOVERED BY THE CONTRACTOR THAT MAY DELAY OR OBSTRUCT THE PROPER COMPLETION OF THE WORK PER THESE PLANS SHALL BE BROUGHT TO THE ATTENTION OF THE ENGINEER IMMEDIATELY UPON DISCOVERY. SAID NOTIFICATION SHALL BE IN WRITING.
5. CONSTRUCTION CONTRACTOR AGREES THAT IN ACCORDANCE WITH GENERALLY ACCEPTED CONSTRUCTION PRACTICES, GENERAL CONTRACTOR WILL BE REQUIRED TO ASSUME SOLE AND COMPLETE RESPONSIBILITY FOR JOB SITE CONDITIONS DURING THE COURSE OF CONSTRUCTION OF THE PROJECT INCLUDING SAFETY OF ALL PERSONS AND PROPERTY; THAT THIS REQUIREMENT SHALL BE MADE TO APPLY CONTINUOUSLY AND NOT BE LIMITED TO NORMAL WORKING HOURS.
6. CONTRACTOR IS RESPONSIBLE FOR THE PROTECTION OF ALL EXISTING MONUMENTS AND OTHER SURVEY MARKERS. MONUMENTS, SURVEY MARKERS, GAS, WATER AND MONITORING DEVICES DESTROYED DURING CONSTRUCTION SHALL BE REPLACED AT THE CONTRACTOR'S EXPENSE.
7. CONTRACTOR SHALL MAINTAIN ADEQUATE DUST CONTROL PER SECTION 10, CALTRANS STANDARD SPECIFICATIONS.
8. DURING CONSTRUCTION , THE CONTRACTOR SHALL BE RESPONSIBLE FOR CONTROLLING NOISE, ODORS, DUST, AND DEBRIS TO MINIMIZE IMPACTS ON SURROUNDING PROPERTIES AND ROADWAYS. CONTRACTOR SHALL BE RESPONSIBLE THAT ALL CONSTRUCTION EQUIPMENT IS EQUIPPED WITH MANUFACTURER'S APPROVED MUFFLER BAFFLES. FAILURE TO DO SO MAY RESULT IN THE ISSUANCE OF AN ORDER TO STOP WORK.
9. CONTRACTOR SHALL INDEPENDENTLY REVIEW GROUND, TOPOGRAPHY, AND EXISTING CONDITIONS THROUGHOUT THE LIMITS OF WORK, AND ASSUME WHOLLY AND UNCONDITIONALLY THE RISK OF COMPLETING THE WORK SET OUT ON THESE PLANS, REGARDLESS OF ROCK, WATER TABLE, OR OTHER CONDITIONS WHICH THE CONTRACTOR MAY ENCOUNTER IN THE COURSE OF THE WORK.
10. THE CONTRACTOR SHALL CHECK AND VERIFY ALL DIMENSIONS AND EXISTING CONDITIONS BEFORE LAYING OUT THE WORK AND NOTIFY THE ENGINEER OF ANY DISCREPANCIES BEFORE STARTING WORK. HE SHALL BE RESPONSIBLE FOR ANY ERRORS RESULTING FROM HIS FAILURE TO DO SO.
11. DIMENSION TAKE PRECEDENCE OVER SCALE.
12. ALL WORK TO BE COMPLETED IS ACCORDANCE WITH THE PROJECT SPECIFICATIONS.

EROSION CONTROL NOTES

GENERAL

1. PERFORM EROSION PREVENTION AND SEDIMENT CONTROL IN ACCORDANCE WITH THE COUNTY OF MENDOCINO STANDARDS, CALIFORNIA DEPARTMENT OF TRANSPORTATION STANDARD SPECIFICATIONS, AND THE PROJECT CONSTRUCTION DOCUMENTS.
2. THE CONTRACTOR IS RESPONSIBLE FOR PREVENTING STORM WATER POLLUTION GENERATED FROM THE CONSTRUCTION SITE YEAR ROUND. WORK SITES WITH INADEQUATE EROSION AND SEDIMENT CONTROL MAY BE SUBJECT TO A STOP WORK ORDER.
3. IF DISCREPANCIES OCCUR BETWEEN THESE NOTES, MATERIAL REFERENCED HEREIN OR MANUFACTURER'S RECOMMENDATIONS, THEN THE MOST PROTECTIVE SHALL APPLY.
4. AT ALL TIMES THE CONTRACTOR IS RESPONSIBLE FOR OBTAINING AND COMPLYING WITH THE STATE OF CALIFORNIA NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM (NPDES) GENERAL PERMIT WASTE DISCHARGE REQUIREMENTS FOR DISCHARGES OF STORM WATER RUNOFF ASSOCIATED WITH CONSTRUCTION ACTIVITY. CONSTRUCTION ACTIVITIES INCLUDE BUT ARE NOT LIMITED TO CLEARING, GRADING, EXCAVATION, STOCKPILING, AND RECONSTRUCTION OF EXISTING FACILITIES INVOLVING REMOVAL AND REPLACEMENT.

RAINY SEASON OPERATIONS

1. THE CONTRACTOR MUST IMPLEMENT AN EFFECTIVE COMBINATION OF EROSION PREVENTION AND SEDIMENT CONTROL ON ALL DISTURBED AREAS DURING THE RAINY SEASON (OCTOBER 15 - APRIL 15). CONSTRUCTION GRADING AND DRAINAGE IMPROVEMENT SHALL BE PERMITTED DURING THE RAINY SEASON ONLY WHEN ON-SITE SOIL CONDITIONS PERMIT THE WORK TO BE PERFORMED. STORM WATER BMPS REFERENCED OR DETAILED IN THE PERMIT AUTHORITY'S BEST MANAGEMENT PRACTICES GUIDE SHALL BE IMPLEMENTED AND FUNCTIONAL ON THE SITE AT ALL TIMES.

YEAR ROUND REQUIREMENTS

1. DURING THE NON-RAINY SEASON, ON ANY DAY WHEN THE NATIONAL WEATHER SERVICE FORECAST IS A CHANCE OF RAIN OF 30% OR GREATER WITHIN THE NEXT 24 HOURS, STORM WATER BMPS REFERENCED OR DETAILED IN PRMD'S BEST MANAGEMENT PRACTICES GUIDE SHALL BE IMPLEMENTED, INSTALLED, AND FUNCTIONAL ON THE SITE TO PREVENT SOIL AND OTHER POLLUTANT DISCHARGES. AT ALL OTHER TIMES, BMPS SHOULD BE STORED ON SITE IN PREPARATION FOR INSTALLATION PRIOR TO RAIN EVENTS.
2. EROSION PREVENTION AND SEDIMENT CONTROL MEASURES SHALL BE INSPECTED BY THE CONTRACTOR BEFORE FORECASTED STORM EVENTS AND AFTER STORM EVENTS TO ENSURE MEASURES ARE FUNCTIONING PROPERLY. EROSION PREVENTION AND SEDIMENT CONTROL MEASURES THAT HAVE FAILED OR ARE NO LONGER EFFECTIVE SHALL BE PROMPTLY REPLACED. EROSION PREVENTION AND SEDIMENT CONTROL MEASURES SHALL BE MAINTAINED UNTIL DISTURBED AREAS ARE STABILIZED.
3. THE LIMITS OF GRADING SHALL BE DEFINED AND MARKED ON SITE TO PREVENT DAMAGE TO SURROUNDING VEGETATION. PRESERVATION OF EXISTING VEGETATION SHALL OCCUR TO THE MAXIMUM EXTENT PRACTICABLE. ANY EXISTING VEGETATION WITHIN THE LIMITS OF GRADING THAT IS TO REMAIN UNDISTURBED BY THE WORK SHALL BE IDENTIFIED AND PROTECTED FROM DAMAGE BY MARKING, FENCING, OR OTHER MEASURES.
4. CHANGES TO THE EROSION PREVENTION AND SEDIMENT CONTROL PLAN MAY BE MADE TO RESPOND TO FIELD CONDITIONS AND SHALL BE NOTED ON THE PLAN.
5. DISCHARGES OF POTENTIAL POLLUTANTS FROM CONSTRUCTION SITES SHALL BE PREVENTED USING SOURCE CONTROLS TO THE MAXIMUM EXTENT PRACTICABLE. POTENTIAL POLLUTANTS INCLUDE BUT ARE NOT LIMITED TO: SEDIMENT, TRASH, NUTRIENTS, PATHOGENS, PETROLEUM HYDROCARBONS, METALS, CONCRETE, CEMENT, ASPHALT, LIME, PAINT, STAINS, GLUES, WOOD PRODUCTS, PESTICIDES, HERBICIDES, CHEMICALS, HAZARDOUS WASTE, SANITARY WASTE, VEHICLE OR EQUIPMENT WASH WATER, AND CHLORINATED WATER.
6. ENTRANCE(S) TO THE CONSTRUCTION SITE SHALL BE MAINTAINED IN A CONDITION THAT WILL PREVENT TRACKING OR FLOWING OF POTENTIAL POLLUTANTS OFFSITE. POTENTIAL POLLUTANTS DEPOSITED ON PAVED AREAS WITHIN THE COUNTY RIGHT-OF-WAY, SUCH AS ROADWAYS AND SIDEWALKS, SHALL BE PROPERLY DISPOSED OF AT THE END OF EACH WORKING DAY OR MORE FREQUENTLY AS NECESSARY. THE CONTRACTOR SHALL BE RESPONSIBLE FOR CLEANING CONSTRUCTION VEHICLES LEAVING THE SITE ON A DAILY BASIS TO PREVENT DUST, SILT, AND DIRT FROM BEING RELEASED OR TRACKED OFFSITE. ALL SEDIMENT DEPOSITED ON PAVED ROADWAYS SHALL BE REMOVED AT THE END OF EACH WORKING DAY OR MORE OFTEN AS NECESSARY.
7. ALL DISTURBED AREAS SHALL BE PROTECTED BY USING EROSION PREVENTION MEASURES TO THE MAXIMUM EXTENT PRACTICABLE, SUCH AS ESTABLISHING VEGETATION COVERAGE, HYDROSEEDING, STRAW MULCH, BLANKETS OR MATS. TEMPORARY OR PERMANENT REVEGETATION SHALL BE INSTALLED AS SOON AS PRACTICAL AFTER VEGETATION REMOVAL BUT IN ALL CASES PRIOR TO OCTOBER 15. PRIOR TO FINAL INSPECTION, ALL DISTURBED AREAS SHALL BE REVEGETATED OR LANDSCAPING SHALL BE INSTALLED.
8. WHENEVER IT IS NOT POSSIBLE TO USE EROSION PREVENTION MEASURES ON EXPOSED SLOPES, SEDIMENT CONTROL DEVICES SUCH AS FIBER ROLLS AND SILT FENCES SHALL BE INSTALLED TO PREVENT SEDIMENT MIGRATION. FIBER ROLLS AND SILT FENCES SHALL BE TRENCHED AND KEYED INTO THE SOIL AND INSTALLED ON CONTOUR. SILT FENCES SHALL BE INSTALLED APPROXIMATELY 2 TO 5 FEET FROM TOE OF SLOPE.
9. HYDROSEEDING SHALL BE CONDUCTED IN A THREE STEP PROCESS. FIRST, EVENLY APPLY SEED MIX AND FERTILIZER TO THE EXPOSED SLOPE. SECOND, EVENLY APPLY MULCH OVER THE SEED AND FERTILIZER. THIRD, STABILIZE THE MULCH IN PLACE. AN EQUIVALENT SINGLE STEP PROCESS, WITH SEED, FERTILIZER, WATER, AND BONDED FIBERS IS ACCEPTABLE.

   APPLICATIONS SHALL BE BROADCASTED MECHANICALLY OR MANUALLY AT THE RATES SPECIFIED IN THE PROJECT CONSTRUCTION DOCUMENTS.
10. DUST CONTROL SHALL BE PROVIDED BY CONTRACTOR DURING ALL PHASES OF CONSTRUCTION.
11. STORM DRAIN INLETS SHALL BE PROTECTED FROM POTENTIAL POLLUTANTS UNTIL DRAINAGE CONVEYANCE SYSTEMS ARE FUNCTIONAL AND CONSTRUCTION HAS BEEN COMPLETED.
12. ENERGY DISSIPATERS SHALL BE INSTALLED AT STORM DRAIN OUTLETS WHICH MAY CONVEY EROSIVE STORM WATER FLOW.
13. SOIL AND MATERIAL STOCKPILES SHALL BE PROPERLY PROTECTED TO MINIMIZE SEDIMENT AND POLLUTANT TRANSPORT FROM THE CONSTRUCTION SITE.
14. SOLID WASTE, SUCH AS TRASH, DISCARDED BUILDING MATERIALS AND DEBRIS, SHALL BE PLACED IN DESIGNATED COLLECTION AREAS OR CONTAINERS. THE CONSTRUCTION SITE SHALL BE CLEARED OF SOLID WASTE DAILY OR AS NECESSARY. REGULAR REMOVAL AND PROPER DISPOSAL SHALL BE COORDINATED BY THE CONTRACTOR.
15. A CONCRETE WASHOUT AREA, SUCH AS A TEMPORARY PIT, SHALL BE DESIGNATED TO CLEAN CONCRETE TRUCKS AND TOOLS. AT NO TIME SHALL CONCRETE PRODUCTS AND WASTE BE ALLOWED TO ENTER COUNTY WATERWAYS SUCH AS CREEKS OR STORM DRAINS. NO WASHOUT OF CONCRETE, MORTAR MIXERS, OR TRUCKS SHALL BE ALLOWED ON SOIL.
16. PROPER APPLICATION, CLEANING, AND STORAGE OF POTENTIALLY HAZARDOUS MATERIALS, SUCH AS PAINTS AND CHEMICALS, SHALL BE CONDUCTED TO PREVENT THE DISCHARGE OF POLLUTANTS.
17. TEMPORARY RESTROOMS AND SANITARY FACILITIES SHALL BE LOCATED AND MAINTAINED DURING CONSTRUCTION ACTIVITIES TO PREVENT THE DISCHARGE OF POLLUTANTS.
18. APPROPRIATE VEHICLE STORAGE, FUELING, MAINTENANCE, AND CLEANING AREAS SHALL BE DESIGNATED AND MAINTAINED TO PREVENT DISCHARGE OF POLLUTANTS.

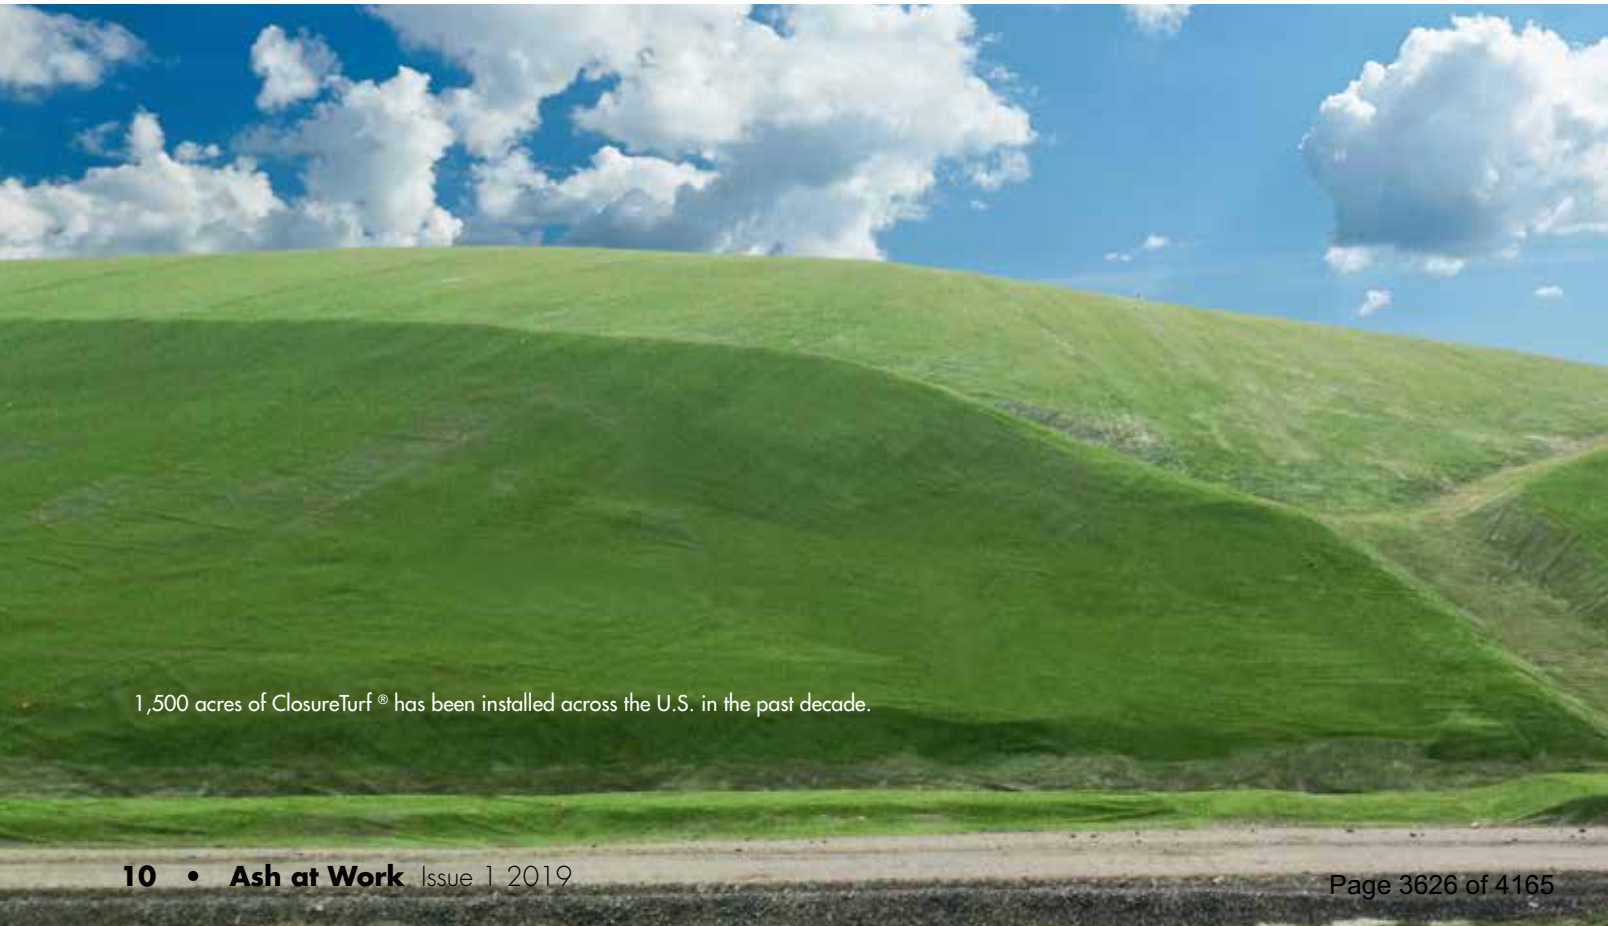
Geosynthetic Solutions for Final Closure: A Decade of Performance



By Mike Ayers

Coal ash is the second-largest industrial waste stream in the United States, with approximately 130 million tons produced annually. Over the last several years, new technologies for final ash storage have been successfully implemented and are outperforming traditional vegetated closures in numerous categories. This year, Watershed Geo celebrates the 10-year anniversary of its first ClosureTurf® landfill installation and reflects on a decade of progress, noting the value of geosynthetics as a viable final closure solution for coal combustion residuals (CCRs).

ClosureTurf® is a final landfill closure system designed to address the environmental and performance failures of traditional soil/vegetated caps. To date, the engineered synthetic turf system spans approximately 1,500 acres of closure, safely and effectively reducing environmental and operational impacts of landfills, including ash impoundments, across the United States. It has also provided an innovative and stable solution for solar generation.

CCR Regulations and Challenges

In 2015, the U.S. Environmental Protection Agency (EPA) published its final rule governing disposal of CCRs produced by electric utilities. The rule requires facilities to meet detailed location, design, operation, closure, and 30-year post-closure care requirements, including the maintenance of and repairs to final covers and other unit components, as well as the semiannual detection and assessment monitoring of groundwater.

1,500 acres of ClosureTurf ® has been installed across the U.S. in the past decade.

The federal CCR rule and individual state efforts to regulate this non-hazardous solid waste are furthering interest in new and emerging technologies. Industrywide, approximately 10% of the coal burned to make electricity makes its way into a CCR waste stream. Beneficial reuse is part of the solution, but the industry needs a long-term answer for CCR that is both cost effective and environmentally responsible. Final landfill closure solutions that include state-of-the-art engineered turf systems require less operation and maintenance expense over the life of the project and are environmentally friendly options that offer utilities more flexibility to meet the growing regulatory framework faced by utilities. Additionally, utilities are facing renewable energy mandates issued by individual states that vary widely, prompting the consideration of geosynthetic turf closures as an ideal surface on which to deploy and maximize the use of solar panels.

Designed to address the stringent requirements of CCR closure regulations, the synthetic turf system is proving to be an effective solution for utilities and industrial sites facing aggressive mandates. Currently being used on multiple large-scale CCR disposal projects, this innovative solution is fully compliant with the requirements of Subtitle D of the Resource Conservation and Recovery Act and offers meaningful advantages specific to CCR disposal challenges.

Traditional Closure Design vs. Geosynthetic Closure

Prescriptive final cover designs for landfills have historically included a compacted soil liner, geomembrane liner, a drainage layer, and a vegetative soil cover. These traditional capping options involve large volumes of soil that many coal-fueled plants may not have available.

Because of challenges associated with prescriptive designs, and specifically the unique requirements for CCR surface impoundments and landfills, an engineered synthetic turf system was created as an alternative Subtitle D capping option and now has a decade of installed performance. In addition to eliminating the need for the intermediate soil cover and vegetative layer, these turf systems have many advantages over their traditional counterparts, including faster installation times, safer construction methods, improved storm water quality, and significantly reduced maintenance and post-closure costs. For surface impoundments, using an alternative capping design can also greatly reduce the amount of disturbance of the existing CCR material within the impoundment.

An engineered synthetic turf system is a three-component system comprising a structured geomembrane, an engineered turf, and a specified infill. The structured geomembrane provides both drainage and high interface friction for stability. It serves as the barrier layer to minimize infiltration through the cover system into the CCR. The engineered turf is made of synthetic grass blades tufted into two layers of geotextile backing. It is the protective layer that covers and protects the underlying geomembrane from ultraviolet (UV) degradation and wind uplift. The specified infill provides additional UV protection and allows the system to withstand traffic loads.

Soil Construction Factors

Eliminating the need for a two-foot soil and vegetative cover layer improves safety while reducing the carbon footprint of the closure, as there is no need to transport soil to the site (see Figure 1). This means the removal of thousands of trucks from local roads, as geosynthetic turf closures eliminate the need for approximately 550 truck trips (275 round trips) per acre that would otherwise be needed to transport soil to and from a borrow site. Less equipment also means reducing the carbon footprint of the closure by approximately 80% compared to traditional soil/vegetative covers. The reduction in size, number, and duration of equipment further contributes to an overall increase in safety on both the project site and local roads, as well as the reduction of dust at the site, mud on the roads, and noise impacts to the surrounding community. Most traditional closures also require destruction of land for project soil sources, resulting in additional environmental impact and loss of future land use.

A geosynthetic turf system installs two to three times faster than a traditional soil cover and uses fewer and lighter pieces of equipment. The increase in project-completion efficiency means that owners, operators, and their design and construction teams can effectively cover more acreage per day. Additionally, the standardization of engineering and construction details associated with engineered turf systems reduces the burden on the regulatory review and approval process. The use of this system also makes it easy to install in smaller, incremental closures. The sooner full cells can be capped, the sooner leachate is reduced, providing significant savings for the owner.

Geosynthetics are lighter and improve the stability of CCR closures by eliminating the weight of the traditional soil and vegetative cover. This reduces the static load surcharge on the impoundment or landfill and the dewatering needed to stabilize

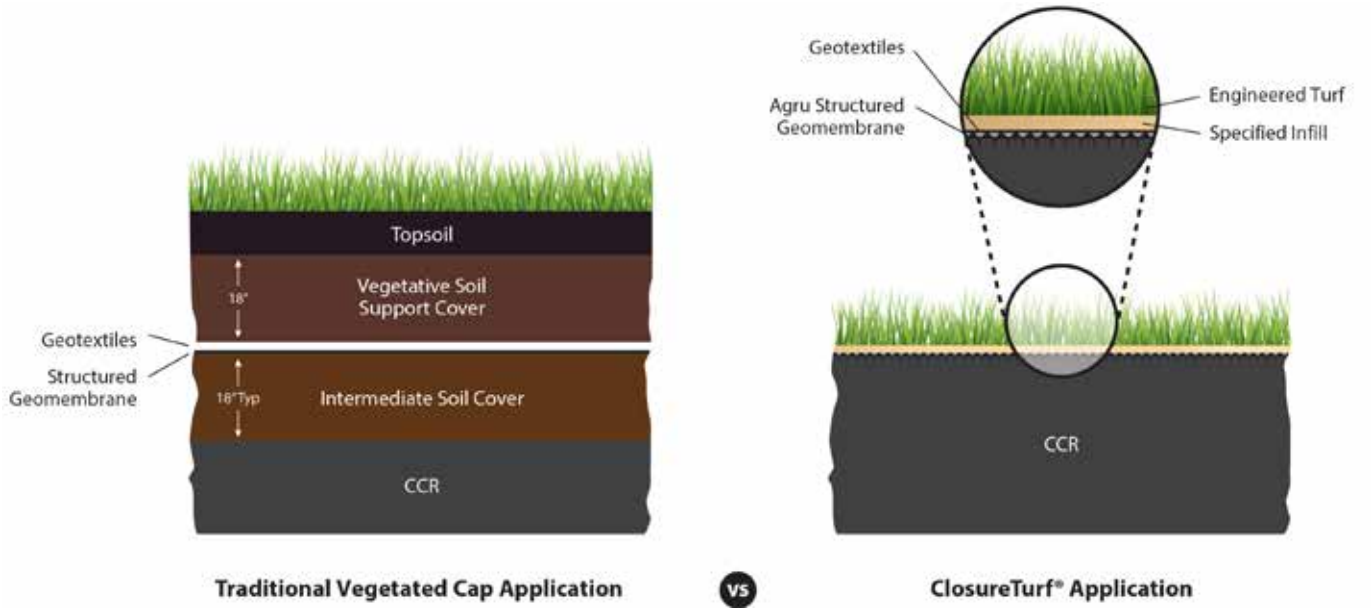


Figure 1. A comparison of a traditional vegetated system and geosynthetic turf system demonstrates the two-foot elimination of soil.

Engineered turf systems install at least 50% faster than traditional soil caps.

a CCR impoundment for final closure, which in turn can shorten the construction schedule. In the event that future access to the ash is needed, the geosynthetic system can be easily cut and resealed back together. A vegetated soil cap, in this instance, would require excavation, management of sediment runoff, and then complete reconstruction.

Shear Strength and Slope Stability

Traditional soil covers are subject to veneer-type slope failure due to insufficient interface shear strength and the possibility of excess hydraulic head in the soil cover. By removing the burden of the heavy soil layers, final cover slope stability is significantly improved due to the highly durable interfaces of engineered turf. In fact, there are two interfaces in ClosureTurf®—the interface between the engineered turf and the structured geomembrane, and the interface between the structured geomembrane and the subgrade soil or waste.

Landfills settle as a result of CCR compression and the consolidation of foundation soils. The dewatering and consolidation of sludge, as well as differential settlement, can create depressions in the final cover, causing traditional soil covers to crack and ponding to occur on the cover surface. Engineered turf systems will tolerate a much larger differential settlement than soil covers due to the elongation of the geomembrane. The flexibility of the system conforms to the surface depressions without damaging the cover.

With the low load-bearing capacity of saturated ash, there are concerns that the additional geotechnical loading of a soil or clay cap and vegetated soil cover could produce excessive surcharge stresses, creating the geotechnical instability (i.e., sloughing) conditions often associated with very low California Bearing Ratio test value subgrades. What we have found through the successful deployment of geosynthetics is that it eliminates the possibility that these settlements will result in reversing the final grades of the cover due to the additional surcharge-type loading after the geomembrane installation.

Design Life

If properly maintained, the engineered synthetic turf layer will have a 100+- year functional longevity. The results of 10 years of independent weathering data for the synthetic turf yarns tell us that the projected half-life of the engineered turf layer far exceeds 176 years. This longevity has been independently evaluated by multiple organizations that are experienced in the longevity performance of geosynthetics. The underlying geomembrane will last much longer because the engineered synthetic turf layer provides protection of the structured geomembrane so that it is not exposed to the environment. In fact, studies by the Geosynthetic Institute show that the geomembrane can last more than 400 years under covered conditions.

Wind tunnel testing was conducted at Georgia Tech Research Institute to evaluate the wind uplift of engineered turf. Wind actually created a downward force on the turf, and it resisted a hurricane-force wind of 120 mph without being lifted. Several project installations have experienced significant, if not historic, weather events, including hurricane-force winds and record-setting rainfall. A closure project in South Carolina endured a 1,000-year rain event when a hurricane swept through the area, and a Florida Panhandle project experienced a historic 500-year storm event in which 5.68 inches fell in a single hour (26 inches total in a 24-hour period). No damage to the system was incurred. Additionally, northern installations with an engineered turf system have provided opportunities to evaluate its performance in areas that encounter cold, high wind, and snowy conditions. Geosynthetics perform exceptionally well in each of these extreme-weather scenarios.

Reduced Environmental Impacts

When considering a final cover system for a landfill or impoundment, it is important not only to keep water out of the waste, but also to ensure that nothing detrimental comes off the surface and lands in the water carried offsite. Considering the average size of CCR impoundments and landfills, opportunity exists for significant sediment pollution through erosion that is often an inherent part of traditional soil covers. Geosynthetic turf systems provide clean runoff with very low turbidity because they do not have a soil layer, except for the thin (0.5-inch thick) layer of sand infill. The sand acts as a natural filter as the water moves down the slope and channeling areas. As a result, sites have experienced a 90% reduction in turbidity, resulting in cleaner water. These systems also significantly reduce sediment loading to surrounding channels and sedimentation detention basins either onsite or offsite. This produces a positive impact on overall storm water quality, allowing effluent levels to meet (or be well below) the regulatory turbidity limits. Most importantly, they consistently provide repeatable water-quality results for every design storm event.

In areas of channelized flow (bench drains, down chutes, and perimeter channels), the geosynthetic turf system can be infilled with a fiber-reinforced, high-strength concrete matrix instead of sand. This specialized pozzolanic infill created specifically for storm water applications will flex and move with typical differential settlements that occur on permanent covers. It provides superior hydraulic performance capable of

Geosynthetics withstand erosive forces from extreme weather conditions.

Geosynthetics allow the direct attachment of new solar technology, maximizing the beneficial use of closed landfills.

handling high shear stress and large flows, resulting in very high velocities.

Geosynthetic systems also require very low post-closure maintenance compared to alternative soil systems. The cost of maintenance is estimated to be as much as 90% less as a result of reduction in maintenance activities, including the vegetation, mowing, fertilization, irrigation, re-vegetation, erosion repairs, and storm water pond cleaning associated with traditional soil covers. Common erosion, storm water, and siltation problems are prevented—even during severe weather events such as intense rainfall, hurricane force winds, and earthquakes. Further, they protect against driving forces and severe weather conditions such as drought and heat.

Post-Closure Beneficial Use: Renewable Energy

With recent federal regulations likely forcing the closure of many power plants' coal ash impoundments, an engineered synthetic system provides an ideal foundation for utilities to deploy solar generation alongside active or retired coal-fueled plants. One of the biggest hurdles to utility-scale solar is finding suitable sites with grid infrastructure for interconnection. By nature, this problem is alleviated when solar is sited at an existing or retired power plant and the impoundments have been capped with engineered synthetic turf systems. Challenges to deploying solar panels on vegetated caps include fugitive dust, grass clippings, and potential damage from mowing equipment. Additionally, panel systems might move or break due to settling caused by erosion impacts to a vegetated cap.

Upright solar panels have been successfully deployed on numerous synthetic cap closure sites across the U.S. Recently, Watershed Geo demonstrated a unique approach to maximizing solar collection at landfills and impoundments. The solar system combines the most advanced, proven panel technology with a rackless, direct surface attachment system that can be used on the top decks and side slopes of a geosynthetic turf foundation. This new slope panel technology system increases the power output by as much as three times per unit area compared to traditional arrays.

Looking Ahead

An engineered synthetic turf system is a proven technology that solves problems that have been plaguing the industry for decades. It addresses landfill stability and erosion problems by providing a long-lasting, geotechnically stable, and environmentally friendly final cover system that significantly reduces construction time and maintenance costs while providing an ideal foundation for solar panel deployment.

The volume of existing CCRs, in both landfills and impoundments, represents a staggering volume that will need to be closed, in some cases on very aggressive schedules. According to the EPA, there are over 310 active CCR landfills, with an average size of approximately 120 acres, and 735 active CCR surface impoundments, with an average size of roughly 50 acres.

The amount of coal ash likely destined for future disposal is expected to remain significant for years to come, leaving an ongoing disposal challenge that can greatly benefit from the use of new and emerging technologies such as geosynthetics.

Mike Ayers is Chief Executive Officer of Watershed Geosynthetics LLC. He has over 25 years of professional experience in the design and development of heavy civil engineering projects, including the execution of all phases of land development, geotechnical evaluation, hydrology assessments, site selection, and management of the permitting process with state and federal agencies. A licensed professional engineer and general contractor in multiple states, Ayers has over 20 years of design experience using a variety of geosynthetics for stability, erosion control, and containment. He is actively involved in the Industrial Fabrics Association, Solid Waste Association of North America, and the International Geosynthetics Association.

ClosureTurf®

Location
Moncks Corner, SC

Owner
Berkeley County

Project Type
Municipal Solid Waste

Year Completed
2013

Size
12 acres

Berkeley County's Landfill showcases the multiple benefits of ClosureTurf® for eliminating soil layers and erosion, reducing post-closure care, withstanding major weather events, and improving storm water quality over a traditional Subtitle D vegetative cap.

The Berkeley County MSW Landfill in Moncks Corner, South Carolina is owned and operated by Berkeley County Water & Sanitation (BCWS), and has been in operation since 1999. It's eight cells encompass approximately 40 acres with an estimated in-place waste volume of 1.1 million cubic yards. When the first four cells totaling 10 acres were at capacity and ready to close, Berkeley officials turned to ClosureTurf, an EPA Subtitle D compliant landfill closure system specifically designed to eliminate soil erosion, reduce post closure maintenance costs, increase slope integrity and enhance landfill gas (LFG) management. With major maintenance savings and the weathering of a major flood event, ClosureTurf has proved to be worth every penny of the county's investment.

Overcoming Capacity Issues

Officials at the landfill had to address significant challenges with the closing of the site explained Mark Schlievert, Director of Solid Waste at BCWS. "The waste had been built too far out to the edge, leaving little room to place a two-foot traditional soil capping system. It would have required us to excavate excess waste and transport it to another location. In addition, the landfill is located in an earthquake zone and an area susceptible to hurricanes and high rainfall events. In the event of seismic activity or significant rainfall, the soil used in a traditional capping system would present a significant slide hazard."

Schlievert and the BCWS had a previous relationship with AGRU America, a manufacturer of geomembranes used as final caps on landfills. After discussing the site's issues, AGRU introduced a new Subtitle D method, called ClosureTurf®. Mike Ayers, CEO/President of Watershed Geo® and inventor of ClosureTurf, describes the system as a patented, three component system comprised of a structured geomembrane, an engineered synthetic turf, and a specialized sand infill. "The foundation of the system is an impermeable, highly transmissive structured geomembrane manufactured by AGRU. It provides for the highest interface friction values available in the market. The engineered turf component gives the system its natural look and feel of grass while protecting the geomembrane from extreme weather conditions for the long term. The specialized sand infill component is placed between the blades of the engineered turf and allows the system to be trafficked while also providing additional protection from weathering. When required, ClosureTurf's patented surficial gas system is included with the system to collect landfill gas emissions."

Addressing Permitting Concerns

To gain approval to implement ClosureTurf, which is considered an alternative long-term cover landfill system, Berkeley County landfill officials worked closely with the South Carolina Department of Health and Environmental Control (SCDHEC). Final cover design for the closure of Berkeley County Landfill went through a three-year approval with the SCDHEC prior to the start of construction.

Since ClosureTurf was a new technology to the state, the SCDHEC had several factors to consider for permitting; some of which included the longevity of the product, the cost benefit over a traditional system, water runoff conditions and accessibility to the areas of the cap. Schlievert, Watershed Geo and SCS Engineering, the consulting engineer, together made several presentations to members of the SCDHEC over the decision period to address the proposed concerns. Ayers addressed the ultimate goal of ClosureTurf, "As a response to numerous failures and poor performance of environmental closures at landfills, engineers and landfill owners have studied new approaches to establish a more physically stable and environmentally sound solution. Traditional landfills require large amounts of soil throughout their lifespan and are often lacking adequate soil to complete closure construction. Many of these landfills experience on-going erosion and sedimentation issues. Traditional covers are highly reliant on trucking soils, heavy civil construction equipment, on-going maintenance and repairs in order to maintain their integrity. ClosureTurf takes the soil out of the equation all together, therefore solving 90% of the issues with that alone."

"In the event of seismic activity or significant rainfall, the soil used in a traditional capping system would present a significant slide hazard."

A 'soiless technology', ClosureTurf® eliminates the risk of slope erosion.

ClosureTurf® applied in a traditional bench design.

ClosureTurf® Benefits Specific to Berkeley

The sliding of a soil cover along the steep slopes was a primary concern with the Berkeley landfill, particularly with the risk of a major weather event. With this concern in mind, Ayers addressed ClosureTurf's stability attributes. "During a rain event, the rainfall will penetrate quickly through the sand infill and drain directly in the geocomposite integrated drainage layer below, avoiding sand erosion and maintaining stability of the sand infill. The infill is also held in place by the unique structure of the synthetic grass that traps the sand to anchor and ballast the synthetic turf layer to the surface it covers. The resulting high interface friction serves to provide a resistance to sliding or veneer failures due to weather, steepness of final slopes and seismic conditions. In fact, the ClosureTurf system has an interface friction of 39 degrees between the engineered turf and geomembrane which equates to a safety factor greater than 2.0 for typical landfill slopes."

Ayers went on to explain, "There are other advantages that ClosureTurf provided to the site both during and after construction; one of which being accessibility for ease of construction and ongoing site inspection. The sand infill used in the ClosureTurf system not only acts as a ballast but also allows for access of a 60 psi tire pressure vehicle on the slopes and higher ground pressure vehicles in flatter areas without being susceptible to damage. This proves to be especially beneficial when gas system monitoring locations or wells in the landfill will have to be accessed by persons on foot or in vehicles. Typical soil closures would likely require all-weather roads for construction access and to get to monitoring locations."

ClosureTurf also provided a natural water filter for Berkeley. The engineered turf and sand aid in filtering runoff that is free of sediment, fertilizer and other contaminants. "This ensured that runoff from the site flowing into local water sources was clean and safe," explained Ayers.

ClosureTurf Receives Approval

Even with all of the obvious advantages, one of the looming questions of state officials focused on is the longevity of the ClosureTurf system. While the oldest real-world application of ClosureTurf was installed at the Lasalle-Grant Landfill in Jena, Louisana in 2009, independent, real-world weathering test performed at Atlas Material Testing Laboratories in New River, AZ, has shown ClosureTurf's engineered turf component to have a design life of 100+ years, certainly exceeding the typical 30-year Subtitle D requirement. With these confirmed results, the SCDHEC granted BCWS approval to use ClosureTurf as an alternative long-term cover system in early 2013.The county was assured that If ClosureTurf could pass inspection for two years and all requirements were met, the SCDHEC would approve the product as a final cover.

Construction on the site began in April and was completed in January 2014. The county saved an initial cost of $50,000 in construction and expects to save at least $720,000 over a 30-year period in future typical maintenance costs while reducing the environmental impact and improving safety and performance. The project marked the first large-scale implementation of this type of cover system in South Carolina.

While ClosureTurf solved several challenges for the county, Schlievert has been most excited about the economic advantages that Berkeley has benefited from in relation to post-closure care since completion. "The reduction in maintenance is our biggest gain. We're saving around $24,000 a year in maintenance. On average,

ClosureTurf® can be used for incremental closures as seen above in Berkeley's first four cells that met capacity.

"The reduction in maintenance is our biggest gain. We're saving around $24,000 a year in maintenance…We have absolutely zero eroded slopes to repair and we have eliminated mowing and grass upkeep."

total overall maintenance costs are typically reduced by approximately 90% with ClosureTurf compared with the traditional soil cover system. A Subtitle D prescribed cap typically requires ongoing vegetation and soil maintenance for the entire system to perform as designed consisting of frequent mowing, water, fertilizer, top soil replacement, erosion control, and sedimentation basin maintenance. We have absolutely zero eroded slopes to repair and we have eliminated mowing and grass upkeep. In addition, we are significantly reducing water contamination, dust and heavy equipment noise and pollution."

Rubber tired vehicles can be driven on ClosureTurf® without risk of damage.

Putting ClosureTurf to the Test

Schlievert and the SCDHEC were particularly impressed with ClosureTurf's performance during a recent flash flooding event in the South Carolina coastal area. "During the epic rain event, we received 26 inches of rain over a couple day period. Many areas in our community experienced severe flooding and many of the county's traditional soil-capped landfills were left with significant and costly erosion. With ClosureTurf, we experienced a small amount of sand migration to the bottom of the slope but there was enough coverage of sand that it did not have to be redistributed or replaced. It did its job and what it was designed to do."

ClosureTurf® was easily implemented into Berkeley's conventional gas system.

Recently, the final inspection of the two-year period that SCDHEC required was completed. Field Operations Manager for Watershed, Bob Buzzell, reported that, "Other than a few small synthetic turf repairs, the site has withstood environmental and weather conditions extremely well." Because ClosureTurf's top layer consists of a synthetic turf material and is not covered with a thick soil profile, it is easily inspected for damage, and if identified, may be easily and inexpensively repaired. Since the infilled turf serves as protection for the liner, there is no risk to the integrity of the overall system and its performance.

"When we designed ClosureTurf, we were very technical and practical in our approach to solving all landfill closure issues," said Ayers. "Today, it has been designed, permitted and installed all around the United States due to its superior performance. I think at this time we have over 33 projects completed with 25 million square feet of ClosureTurf installed. It's been thoroughly vetted and proven in many applications. We look forward to watching ClosureTurf exceed expectations at Berkeley. Our next step is to receive final approval from the state."

CLOSURETURF® is a U.S. registered trademark which designates a product from Watershed Geosynthetics, LLC. This product is the subject of issued U.S. and foreign patents and/or pending U.S. and foreign patent applications.

ClosureTurf®

Location
Portola, CA

Owner
City of Portola

Contractor/Engineer
Cal Valley Construction
D&E Construction

Project Type
Municipal Solid Waste Landfill

Year Completed
2014

Size
10 acres

The Portola Class III landfill is located approximately 1.5 miles northeast of the City of Portola. The landfill was an unlined landfill with highly erosive soils on site causing long-term maintenance issues and ground water contamination problems.

When the city began the closure process, they began looking at options outside of the traditional Subtitle D vegetative cap. When introduced to ClosureTurf®, one of the biggest benefits they considered was the major reduction of maintenance activities and cost.

"Prior to ClosureTurf becoming available we had looked at the traditional Subtitle D vegetative cap. However, one of the biggest advantages of ClosureTurf is the avoidance of long-term maintenance costs," stated the City of Portola's solid waste consultant, Tom Valentino P.E., President of the for TGV Solid Waste Inc. "Another one of the advantages of going with the ClosureTurf system was the ease of installation, as we were under a tight time schedule to get the project completed. Coincidentally enough, there was a storm the night the project was completed, and we got the project done on time. We went with a tan color to blend in with the surroundings. From a short-term stability and a long-term post closure maintenance cost, the ClosureTurf® system was the absolute right decision to make for the Portola Landfill."

MADE WITH agru STRUCTURED MEMBRANES

WG WatershedGeo® Unearthing Solutions
770.777.0386 • www.watershedgeo.com

After a thorough process of approval from the City Council and public, ClosureTurf was submitted to the State of California for permit modification and approved. The scope of work included removing the interim cover, making drainage improvements, and installing the ClosureTurf system.

"From a quality construction assurance perspective, installation of a ClosureTurf cover system required less field personnel during construction than a traditional prescriptive cover system. This resulted in cost savings to the city," stated Jake Russell, P.E., of the City of Portola's CQA consulting firm Geo-Logic Associates. "The installation of the ClosureTurf cover was completed in significantly less time than other similarly sized perspective Subtitle D vegetative cap landfill cover systems with which I have been involved. By removing the soil components of the cover system, construction issues associated with the variability and availability of soil materials were eliminated."

With a residential neighborhood 1,500 feet South West of the landfill, contaminated water was also a concern. Many of the residents receive water through individual domestic supply wells. Because the sand and engineered turf act as a natural filter, ClosureTurf provides clean runoff with very low turbidity. In addition, no chemicals, fertilizers, or pesticides are required to maintain vegetation.

Clean groundwater post ClosureTurf installation.

Sand infill is brushed into the engineered turf.

Located in the Sierra Mountains, the Portola Landfill is often subjected to harsh climates.

ClosureTurf®

Location
Salinas, CA

Owner
Salinas Valley Solid Waste Authority

Engineer
Golder Associates

Project Type
Municipal Solid Waste Landfill

Year Completed
2013

Size
66 acres

The Crazy Horse Landfill (CHLF), owned and maintained by the Salinas Valley Solid Waste Authority (SVSWA), had been in service for 75 years, with final in-place waste volume estimated at 4.3 million cubic yards. In 2013, final cover design for the closure of the CHLF went through three iterations before the SVSWA settled on the ClosureTurf system. The project marks the first large-scale implementation of ClosureTurf in California.

The CHLF began operation in 1934 as a burn dump and continued that operation until 1966 when it was converted to a sanitary landfill operation. In 1990, it became a Superfund site and continued to receive non-hazardous residential, commercial, and industrial solid waste until December 2009, when the SVSWA ceased all fill operations and began the process of closure.

MADE WITH Agru STRUCTURED MEMBRANES

WG WatershedGeo® Unearthing Solutions
770.777.0386 • www.watershedgeo.com

Because of site conditions, the SVSWA's final cover system would have to meet five main criteria:

1. The system would have to withstand the environmental conditions present including wind erosion and uplift, rainfall erosion, concentrated flow erosion, ultraviolet light degradation, and traffic.
2. The system had to provide a static factor of safety of at least 1.5 and resist seismic deformation due to the San Andreas Fault zone located about five miles northeast of the site.
3. The final cover system had to provide excellent groundwater protection to halt continued impact to the local groundwater supply.
4. Due to an old cross-traffic style highway interchange, risk to motorists had to be avoided during construction.
5. The new system could not create additional nuisance conditions for nearby residents, many of whom had been concerned about the landfill site operations and impacts for years.

Installation of engineered turf and geomembrane before sand infill is added.

In addition, surface water that could be affected by the landfill would provide groundwater recharge, contact recreation (i.e. swimming), and wildlife habitat. Adjacent land uses near the site included cattle grazing and residences. Homeowners had often registered complaints with the SVSWA regarding dust, windblown litter, odors, and general site appearance.

The engineered turf and sand infill effectively filters surface water, providing clean runoff with very low turbidity.

The SVSWA evaluated several closure systems including an evapotranspirative cover system, a prescriptive cover utilizing a textured geomembrane, and a prescriptive cover utilizing a structured geomembrane. However, getting vegetative cover soil to the site proved financially prohibitive at an average of $13/cy. The SVSWA was then introduced to the ClosureTurf technology, which was relatively new at the time. The primary regulating agency and design engineer requested some additional testing such as wind erosion and uplift. They found surprising results in that the system became a downward force at higher wind speeds (up to 120 mph or Category 3 hurricane wind speeds. This was important because the design wind speed for the Pacific coast was 85 mph in 2010. With rainfall erosion also being a concern, ASTM testing confirmed that no sand loss occurred at 2.63in and 4.65 in of rainfall per hours. For concentrated flow areas, a cement infill called HydroBinder® was used to increase hydraulic shear resistance up to a measured 15psf) equivalent to a 12-in D50 riprap. In addition, tests were conducted on UV resistance and trafficability, all of which ClosureTurf performed well on.

ClosureTurf® easily integrated into the conventional gas col-lection system.

Ultimately, the SVSWA chose ClosureTurf due to the fact that it met all five criteria, and the cost fell within their budget of available closure funds. The annual post-closure maintenance was estimated at $46,000 per year. ClosureTurf reduced these annual costs by approximately 80%. The total savings over a nominal 30-year post-closure period is projected at $1.4 million.

In addition, ClosureTurf eliminated about 11,000 truck trips to import soil to the site. The project's carbon footprint was reduced by 80% due to the combined project size reductions of soil import elimination and reduced heavy equipment needs.

Most importantly, the closed landfill has had a positive impact on the local neighbors. The site is now barely discernible from the natural hillside, and aesthetic and odor complaints from neighbors have ceased. In fact, many have contacted the SVSWA to compliment the appearance of the site.

Because some of the side slopes measure 2H:1V, Agru's Super Gripnet® membrane was used to provide a high shear strength.

Confluence of drainage channels with HydroBinder® at the Crazy Horse Landfill outlet.

ADVANCES IN GEOSYNTHETIC SOLUTIONS FOR SUSTAINABLE LANDFILL DESIGN

Geosynthetics Really *Do* Last!

By Ming Zhu, PhD, PE, M.ASCE,
Marco Isola, PhD, PE, M.ASCE, and
Jorge Zornberg, PhD, PE, F.ASCE

Even though geosynthetics are now a well-established discipline within geotechnical engineering, ingenuity continues to play a significant role in projects involving their use. This is because it's possible to tailor the mechanical and hydraulic properties of geosynthetics to address design needs in almost all aspects of geotechnical engineering. Although the ability to achieve consistent geosynthetic properties has been a key consideration since their early use, concerns about their lifespan have subjected geosynthetics to careful scrutiny.

Engineered turf cover installed at Baldwin County Landfill, GA.

Figure 1. View of stacked geotextile tubes for containment of dredged sediments showing detail of multiple tube operation stages. (Photo courtesy of TenCate Geosynthetics.)

In recent years, however, there's been increasing confidence within the geotechnical profession regarding geosynthetics' performance and long-term durability. Why? It's because polymer formulations have continued to advance, phenomenal research has been (and continues to be) conducted to quantify the longevity of geosynthetics, and field evidence of good performance has been documented for geosynthetic structures that are more than a half-century old.

This article is not intended to document the important results of recent research on durability or add to an already healthy record of field performance of early geosynthetic structures. Instead, its objective is to illustrate how overcoming early concerns about durability has enabled innovative geosynthetic solutions in landfill design. Geosynthetics have been used in modern landfills in the U.S. for over four decades since the passage of the Resource Conservation and Recovery Act in 1976. Beyond the well-established use of geosynthetics in base liner systems, three relatively new applications are featured in this article that involve the use of geosynthetics as part of the waste disposal, slope stabilization, and final closure of landfills. These applications illustrate recent advances in geosynthetic solutions to overcome enduring challenges previously managed using traditional approaches.

Stacked Geotextile Tubes for Waste Disposal

The use of geotextile tubes combines dewatering and disposal of industrial wastes, such as sludges, dredged sediments, and sluiced coal combustion residuals (CCR), into one operation, significantly reducing the handling of saturated wastes. Geotextile tubes involve high-strength, permeable woven geotextiles sewn into a tube. When used for dewatering, the geotextile acts as a filter that allows water flow while retaining the solids in the tube. The dewatering process includes three main stages: hydraulic filling, free water drainage, and consolidation (Figure 1). Flocculants are usually added to fine-grained slurries to facilitate agglutination of solid particles. After dewatering is complete, geotextile tubes can be either transported for off-site disposal or capped in place for permanent disposal. Unlike traditional dewatering techniques, such as settling basins, geotextile tubes offer high dewatering efficiency and provide effective odor control by limiting exposure of waste to air.

A recent trend in geotextile tube applications involves stacking them in multiple layers to reduce the disposal area footprint in large environmental remediation projects. For example, as part of the Onondaga Lake Cleanup Project near Syracuse, NY, about 1.6 million m^3 of contaminated sediments dredged from the lake were dewatered and contained using approximately 1,000 geotextile tubes that were up to 91 m in length and 24-27 m in circumference. The geotextile tubes were stacked in six layers approximately 11 m high within the 22-hectare landfill footprint and permanently capped in place with a soil-geosynthetic final cover in 2017. Figure 1 shows an aerial photo of the stacked geotextile tubes during construction. The key design considerations when stacking geotextile tubes include internal stability of individual tubes, slope stability of stacked tubes, and settlement and bearing capacity of the foundation that supports stacked tubes.

Another trend is to utilize the waste encapsulated in the geotextile tubes as fill material to reduce the quantity of imported construction materials. A geotextile tube wall was constructed in 2016 during closure of an ash pond at a large Mid-Atlantic utility site. The wall separated the ash pond into a pool section that continued to serve as an operations area to receive sluiced CCR, and a construction section where preparation work for final closure grading was to be started. The geotextile tubes were stacked in two layers and formed an approximately 18- to 24-m-wide, 3.4-m-high, and 730-m-long

wall. Approximately 61,000 m^3 of in-situ fly ash were dredged and pumped into the geotextile tubes and used as the fill material to construct the wall. Figure 2 shows a section of the installed geotextile tube wall.

Durable Geosynthetic Reinforcements for Waste Containment Stabilization

While many design solutions have been adopted to maximize the available waste capacity within the defined footprint of landfills (e.g., dynamic compaction, bioreactor technology, and landfill mining), the use of geosynthetic-reinforced structures, such as mechanically stabilized earth berms, has been incorporated into landfill designs over approximately the last two decades. While the design of reinforced-soil structures generally requires granular backfill material, landfill owners have started using actual landfill waste as backfill material to optimize the site geometry and reduce construction costs.

The use of waste as backfill material introduces several challenges into the design of the reinforced-soil structures. Geotechnical properties of municipal solid waste are inhomogeneous and highly depend on the composition of the waste itself — in particular, the percentage of organic components that decompose over time. Furthermore, waste degradation involves complex fermentation phenomena, chemical alteration, creep, oxidation, and cementation that results in mineralization of the waste. The resulting waste often has an average temperature of 40° C, with peaks over 60° C

Figure 2. View of geotextile tube wall filled with re-used fly ash in an ash pond at a Mid-Atlantic utility site. (Photo courtesy of TenCate Geosynthetics.)

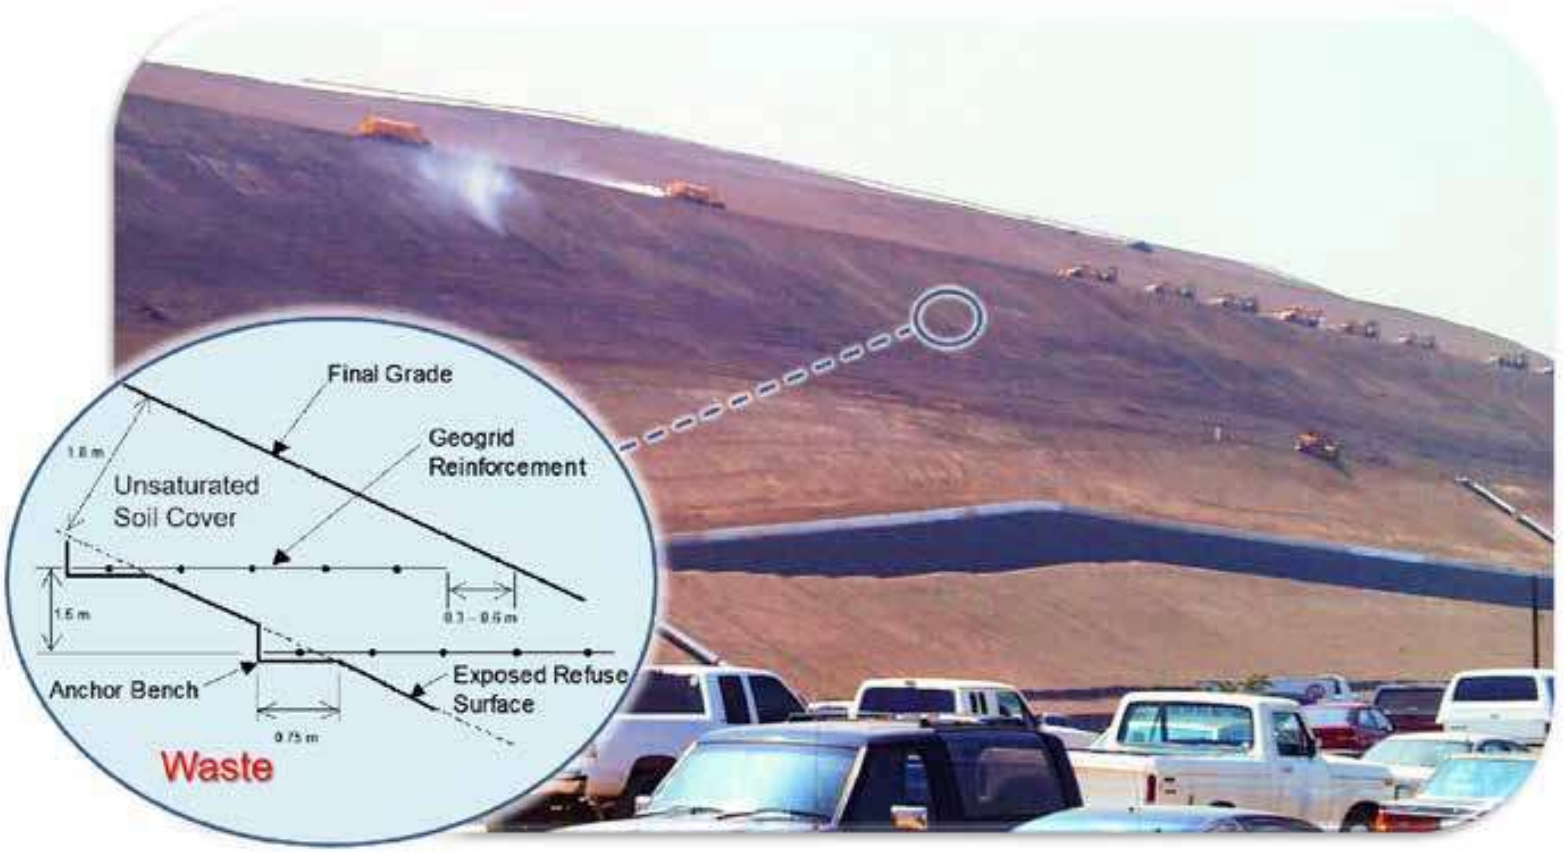

Figure 3. View of a geogrid-reinforced soil cover system on the North Slope of the OII Superfund Landfill. Note the detail of the geogrid reinforcements anchored into solid waste.

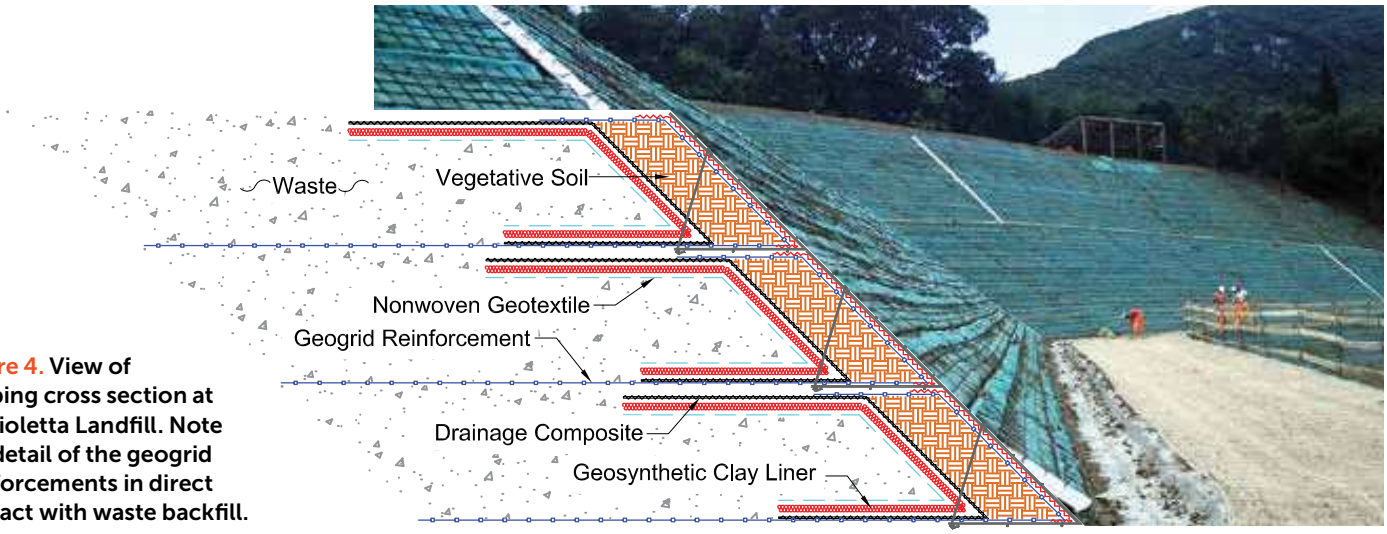

Figure 4. View of capping cross section at Niccioletta Landfill. Note the detail of the geogrid reinforcements in direct contact with waste backfill.

due to anaerobic digestion, and is often chemically aggressive. Key aspects to be considered when selecting geosynthetic reinforcements, such as geogrids, include their resistance to chemical degradation under a wide range of pH, creep performance, performance at high temperatures, and resistance to mechanical damage during waste compaction.

The final closure of the Operating Industries, Inc. (OII) Superfund Landfill located near Los Angeles, CA, is an early design example involving geosynthetic reinforcements in direct contact with solid waste. One of the most challenging design and construction features of that project is related to the stability of the landfill's North Slope. The North Slope is located immediately adjacent to the busy Pomona Freeway. It rises up to 65 m above the freeway and consists of slope segments separated by narrow benches that are as steep as 1.5H:1V and up to 30 m high. As illustrated in Figure 3, horizontally placed uniaxial geogrids anchored in the actual solid waste were selected as the most appropriate and cost-effective method for stabilizing the engineered soil cover constructed over the North Slope. The cover has performed well since its construction over 20 years ago, which demonstrates that the geosynthetic reinforcement solution has been both durable and successful.

In 2011, a landfill cell was constructed in Niccioleta, Tuscany, Italy, using waste as fill material for the reinforced side slope (Figure 4). A geogrid material was used to reinforce each layer of waste material, providing the tensile strength required to achieve internal stability. Additionally, two layers of drainage geocomposites and one layer of geosynthetic clay liner were wrapped around each layer of waste to form the landfill's final capping system. A layer of vegetative soil, retained by a turf-reinforcement mat, was subsequently placed in the slope face to provide a vegetated facia and an extra layer of protection for the capping system. As designed, the system allowed the construction of landfill cells having side slopes at angles much steeper than the typical 3H:1V slope, significantly increasing the overall landfill cell capacity.

Engineered Turf Cover for Final Closure

Closure of a landfill is required after reaching final grades to isolate the underlying waste and manage long-term environmental risks. Traditionally, landfills have been closed using soil covers with geosynthetic components. A traditional landfill cover, for example, consists of (from bottom to top) a geomembrane barrier layer, a geocomposite drainage layer, and a protective/vegetative soil layer that is at least 0.6 m thick. Two persistent, long-standing challenges associated with many traditional soil covers are soil erosion and cover slope failures.

The engineered turf cover is a relatively new landfill closure solution that uses engineered turf and a specified infill to replace the protective/vegetative soil layers used in traditional soil covers. The elimination of these soil layers removes soil erosion as a driving force behind cover slope failures. Because engineering turf is not susceptible to erosion, it's less affected by factors such as changing weather conditions and varying soil properties compared to traditional soil covers. Moreover, engineered turf covers require less post-closure maintenance because soil-erosion repairs, re-vegetation, fertilization, mowing, and stormwater pond cleaning are not needed.

The engineered turf component is made of high-density polyethylene (HDPE) synthetic grass blades tufted into a double-layer polypropylene, woven geotextile backing, which is placed directly on top of a HDPE or linear low-density polyethylene-structured geomembrane (Figure 5). The specified infill, either bonded or unbonded clean sand with a minimum layer thickness of 13 mm, is placed inside the synthetic grass blades. The engineered turf and infill function primarily to protect the geomembrane from ultraviolet (UV) exposure, wind uplift, and puncture by external forces, such as vehicular traffic, hail, and animals.

The first engineered turf cover was installed in 2009 at a four-hectare MSW landfill in Louisiana to solve recurrent soil-erosion problems. In 2013, installation of a 28-hectare engineered turf cover was completed at the Crazy Horse MSW Landfill in California; it was selected to meet the design

requirements of final cover stability for both static and seismic conditions for steep side slopes up to approximately 2H:1V. To date, engineered turf covers have been or are being installed at more than 40 sites in over 20 states in the U.S., covering a total area of more than 600 hectares. These sites include MSW landfills, industrial waste landfills, and CCR landfills and surface impoundments. Figure 5 shows the aerial photo of a 14-hectare engineered turf cover installed in 2014 at the Hartford Landfill in Connecticut.

Sustainability for landfill closures entails long-term performance and minimal environmental and social impacts. The design life of the engineered turf cover is projected to be over 100 years as a result of the enhanced UV stabilization of the synthetic turf fibers. The carbon footprint of engineered turf cover is smaller than that of traditional soil covers due to faster installation, fewer construction materials, fewer construction equipment operations, and less post-closure maintenance. In addition, land disturbance is avoided because borrow soils are not needed, which results in less impact on local communities as a result of less truck traffic on local roads.

Engineered turf covers also facilitate reuse of the large space at the top of landfills after closure, such as converting them into a solar farm because maintenance of grass within the array isn't needed. Figure 5 shows the 1-megawatt solar-electricity-generating facility installed atop the Hartford Landfill, which powers approximately 1,000 homes per day at peak capacity. The solar array is supported by a racking system ballasted with concrete blocks that sits directly on the engineered turf cover. This approach reduces maintenance, because the solar panels are not subject to potential damage from mowing equipment and the runoff from the drip edge of the solar panels does not induce soil erosion that would undermine the panel foundations. Additionally, the engineered turf cover provides a relatively dust-free environment that promotes efficient solar collection.

Looking Ahead

Advances in geosynthetics have made these materials a well-established technology within the portfolio of solutions available to geotechnical engineers. The old question, "How long will they last?" is being addressed through extensive research, sound engineering design, and innovative applications. This contributes to sustainable landfills by incorporating geosynthetics in the design of landfill components related to disposal operations, stabilization approaches, and final closure systems, as illustrated in the three applications presented in this article.

Innovative geosynthetic materials, products, and designs are expected to continue to emerge with the pursuit of sustainable designs. For example, according to data provided by the U.S. Environmental Protection Agency, there are more than 1,000 active CCR landfills and surface impoundments in the U.S. that require closures, creating opportunities for implementing new geosynthetic solutions. Overall, geosynthetics play an important role in geotechnical projects in general and landfill design in particular because of their versatility, cost-effectiveness, ease of installation, and good characterization of their mechanical and hydraulic properties. The creative use of geosynthetics in geotechnical practice will continue to expand as manufacturers continue to develop new and improved materials, and engineers come up with new design approaches and field applications. ClosureTurf®

Location
Port Angeles, WA

Owner
City of Port Angeles

Engineer
Herrera Environmental Consultants

Project Type
Municipal Solid Waste Landfill

Year Completed
2016

Size
19 acres

In 2014, the city of Port Angeles, Washington, underwent a $20+ million project to relocate their landfill from a giant hole on the side of a 135-foot high bluff overlooking the Strait of Juan de Fuca. Small landslides, erosion, and fear of coastal water contamination drove the city to proactively address the possibility of a failure.

As part of their Landfill Cell Stabilization Project, the city had 400,000 cubic yards of trash relocated to an area behind the bluff. A massive hole remains but the remaining refuse is now stabilized with an MSE retaining wall that has special targets installed to measure for movement of the area. Both the remaining slope and relocated landfill have been permanently closed with the ClosureTurf® system. Even with heavy rainfall and major storms, no erosion has occurred to date.

MADE WITH agru STRUCTURED MEMBRANES

WG WatershedGeo® Unearthing Solutions
770.777.0386 • www.watershedgeo.com

The relocated landfill behind the bluff measures approximately 19 acres. It was permanently closed in 2016 with the ClosureTurf® system. Slopes are 2.5:1 with the longest slope length at an impressive 285 feet. The Agru Super Gripnet® geomembrane used as the foundation of the system provides greater stability on steeper grades and reduces the need to rebuild slopes.

Port Angeles receives 29 inches of rain per year on average and the 25-year storm event is 3.9 inches of rainfall in 24-hours. The 25-year flow in the perimeter ditches is over 6 cubic feet per second and the flow velocity is over 5 feet per second. The ditches were quarry spall lined to help increase roughness and attenuate flow velocities. The engineered synthetic turf and sand infill effectively filters surface water, providing clean runoff with very low turbidity. In addition, the system significantly reduces sediment loading to the surrounding channel and sedimentation/detention basins.

The ClosureTurf system also protects against other weather events such as hurricanes, typhoons and earthquakes. The area can experience high wind gusts annually from heavy windstorms and pacific typhoons. In 2016, Super Typhoon Songda hit the Pacific area with wind gusts over 60 mph. The site survived as designed with no erosion or maintenance required. Located in a seismically active area, it is prone to seismic hazards such as amplified seismic response and seismically induced landslide activity. The site lies approximately 4.5 miles north of the recently discovered Little River Fault, a shallow crustal tectonic structure that is considered active and is capable of producing earthquakes of magnitude 6.5 or greater. ClosureTurf protects against erosion that may occur with these events.

The system is designed for and proven to have a design life over 100 years of the infilled geosynthetic protective layer (engineered turf) with the underlying geomembrane lasting many more years beyond the long life of the engineered turf component.

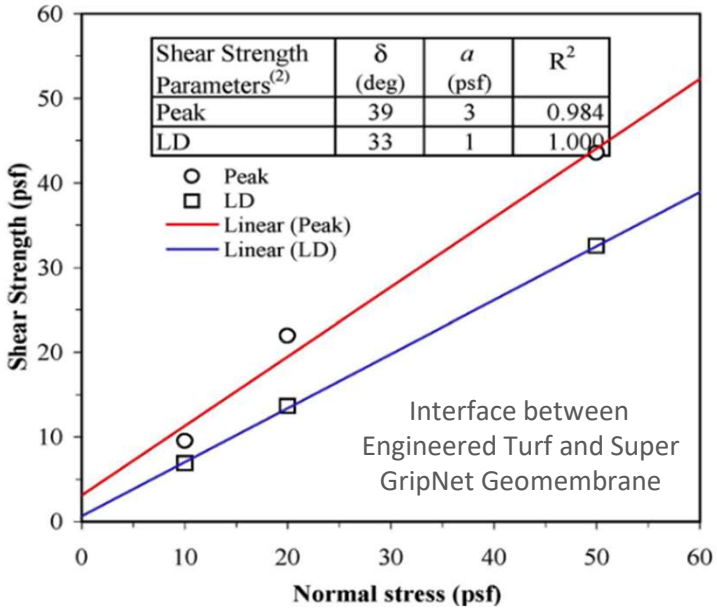
The City's Solid Waste Division now services 7,000 residents and 850 commercial businesses and all refuse is collected at the onsite transfer station and transported to nearby landfills. The closed site serves as a natural habitat and is occupied by many different species of insects and animals, including bees, butterflies, bobcats, otters, elk, and deer.

Slopes are 2.5:1 with the longest slope length at an impressive 285 feet.

Port Angeles was easily able to integrate ClosureTurf® into their conventional gas collection system.

Deer play daily on the top deck and side slopes of the landfill.

Refuse still remains in one of the slide slopes on the bluff but is stabilized by a large MSE wall embedded with survey targets to track any kind of movement.



ClosureTurf® can be driven on without damage to the system.

CLOSURETURF® is a U.S. registered trademark which designates a product from Watershed Geosynthetics, LLC. This product is the subject of issued U.S. and foreign patents and/or pending U.S. and foreign patent applications.

Geotechnical Performance – Slope Stability

- Improved geotechnical stability due to removal of overburden soil layers: no soil cover veneer failure
- Two Interfaces in ClosureTurf:
  - Interface between the Engineered Turf and Structured Geomembrane

Slope Angle	Slope	Calculated Safety Factor
33	1.5H:1V	1.2
26	2.0H:1V	1.6
18	3.0H:1V	2.4
14	4.0H:1V	3.2

  - Interface between Structured Geomembrane and Subgrade Soil/Waste – Site-specific interface shear strength test should be performed.

Geotechnical Performance – Slope Stability

Owner: Salinas Valley Solid Waste Authority

Location: Salinas, CA

Completed: 2013

Closure Area: 68 acres

North side has ~2:1 Slopes

~5 miles from the San Andreas Fault

Benchless Designs

- Eliminates the need for diversion berms and down slope channels
- Allows for storm water to sheet flow for the maximum distance
- Channel flow does not occur until the water reaches the perimeter channels
- Saves in design, construction, and maintenance costs

IN AND FOR THE COUNTY OF MENDOCINO

GILBERT ASHOFF and MARJORIE ASHOFF, dba VICHY SPRINGS and VICHY SPRINGS RESORT, VICHY SPRINGS MINERAL WATER CORPORATION, Plaintiffs, v. CITY OF UKIAH, CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD (NORTH COAST REGION), COUNTY OF MENDOCINO, WEEKS DRILLING & PUMP COMPANY, DOES 1 TO 20, Defendants.	Case No. 70873 DECLARATION OF DAMON F. BROWN IN OPPOSITION TO PLAINTIFFS' APPLICATION FOR PRELIMINARY INJUNCTION DATE: December 19, 1994 TIME: 8:30 a.m. DEPT: 4

I, Damon F. Brown, declare:

1. I am employed as a Senior Geologist by EBA Wastechnologies, engineers and environmental consultants, which has contracted with the City of Ukiah (City) to conduct various geological and engineering studies and prepare various documents in connection with the operation of the City's landfill. I am submitting this declaration in opposition to the plaintiffs' motion for a preliminary injunction and could competently

testify to the contents of this declaration from personal knowledge or based on my professional opinions, if called as a witness herein.

2. I am a Registered Geologist and Certified Engineering Geologist in California and hold a Master of Science degree in Earth Resources from Colorado State University. I have fourteen years' experience in the fields of hydrogeology, engineering geology and environmental geology. A detailed resume, setting forth my professional experience and qualifications, is attached hereto as Exhibit A.

3. EBA Wastechnologies has been contracting with the City to provide engineering services in connection with operation of its landfill since 1986. I have been assigned to supervise this consulting work for EBA since November 1992. We have assisted the City in completing Solid Waste Assessment Tests (SWAT) for the landfill in February 1986 and again in 1988. In connection with preparing that assessment, EBA supervised the drilling of two monitoring wells located at 87-1 and 87-2. (A plat map showing the location of the various wells in relation to the landfill, Vichy Springs Road, and the Vichy Springs Resort is attached hereto as Exhibit B and incorporated herein by reference.) In response to this SWAT, the Regional Water Quality Control Board (RWQCB) ordered the City to drill additional monitoring wells in connection with supplementing its report of waste discharge pursuant to 23 CCR Section 2205. In addition, regulations adopted by the State Integrated Waste Management Board (Board) require the City to continually update a Report of Disposal Site Information (RDSI) which it files with the Local

Enforcement Agency (LEA) and the Board. (See 14 California Code of Regulations [CCR] Section 18222.) In 1989, EBA also contracted with the City to perform various geotechnical and hydrological services to comply with State regulations governing the operation of solid waste sites, like the Ukiah landfill. These services included drilling eight additional monitoring wells and six exploratory borings, geologic mapping, preparation of geologic cross sections, performing aquifer permeability analyses, and analysis of groundwater and surface water quality. EBA has developed several work plans for the City in connection with updating its RDSI and responding to requests from the RWQCB to identify discharges of leachate from the landfill and its effect on groundwater in the area.

4. In the course of supplementing its report of waste discharge, the City drilled a well which has been assigned number 90-8. Water from well 90-8 was tested and contained relatively high concentrations of benzene, which is classified as a hazardous or toxic substance. Benzene, at this level, had not been detected in any of the other monitoring wells that the City had drilled, including wells at the toe of the landfill or in samples of landfill leachate.

5. The RWQCB ordered the City to drill an additional well to determine whether benzene had moved further from the landfill in the direction of the City's property line. As a result of that order, the City drilled monitoring well 92-4, which is depicted on Exhibit B. Benzene, with similar concentrations, was detected in the water extracted from well 92-4.

6. The direction of groundwater flow is along the sloping

plane defined by the surface of the water table. As a result of previous tests conducted by the City, the City had determined the flow direction and gradient of the groundwater aquifer on the northwest side of the landfill, where the landfill toe is located. However, in comparing the waters extracted from the wells drilled at the toe of the landfill with waters extracted from wells 90-8 and 92-4, I determined that the waters came from different underground aquifers. Wells 90-8 and 92-4 are separated from the wells at the toe of the landfill by a ridge. Well 92-4 is approximately 980 feet from Vichy Spring. In order to determine the direction of flow (slope of the surface of the water table) in the aquifer to the southeast of the landfill, where wells 90-8 and 92-4 have been drilled, we require a third well to create a triangular pattern. The third well in the triangle will allow us to identify the plane of the aquifer and its gradient. The proposed monitoring well will be approximately 1,080 feet from Vichy Spring. From this information, we will be able to calculate the direction of flow (whether it is moving from the landfill or toward the landfill) and the groundwater gradient. This information is vital to developing a plan for cleaning up the contamination before it spreads and contaminates water used by the general public. Well 92-4 is close to Sulphur Creek. If the contamination effects groundwater on other property or the water in Sulphur Creek, the damages, although difficult to estimate, could be substantial, possibly in the hundreds of thousands of dollars. Until we drill the benzene well we cannot estimate how immediate this threat may be. Consequently, on November 17, 1993, the RWQCB directed the City

to drill this third monitoring well (the benzene well) to provide information to supplement its report of waste discharge. (A true and correct copy of the letter from Ray O'Connor to Sue Goodrick is attached hereto as Exhibit C and incorporated herein.)

7. In Exhibit C, the RWQCB directed the City to develop a work plan, including well construction specifications, and a site plan showing the proposed location of the benzene well.

8. In January 1994, I prepared the requested work plan and submitted it to the RWQCB on behalf of the City. (A true and correct copy of the work plan is attached hereto as Exhibit D and incorporated herein.) On February 1, 1994, the RWQCB approved the plan and authorized the City to proceed with the drilling. (A true and correct copy of the letter from the RWQCB is attached hereto as Exhibit E and incorporated herein.) On February 10, 1994, the City signed an agreement with EBA Wastechnologies, authorizing it to install the benzene well. (A true and correct copy of the agreement is attached hereto as Exhibit F and incorporated herein.)

9. The City instructed me to delay drilling the well, because the owners of the Vichy Springs Resort had expressed concerns that the well might adversely affect their springs.

10. In response to concerns expressed by Mrs. Marjorie Ashoff about a reduction in the temperature, but not the production of the springs, and the possible effect on a separate spring on their property called the Ardeche Spring, I commissioned additional stable isotope analysis at the University of California at Davis to determine whether the water in the test

wells (90-8 and 92-4) could possibly have come from an aquifer common with the waters produced by the Vichy and Ardeche Springs. This additional analysis took until late May 1994. The results of the additional analyses were consistent with previous tests, the waters from Vichy and Ardeche Springs are similar to each other but different from the water in 90-8 and 92-4. On May 23, 1994, the RWQCB notified the City to proceed with drilling additional wells, other than the benzene well. Because of stated concerns by the representatives of Vichy Springs Resort that the existing and any new monitoring wells might affect their water supply, the RWQCB requested that the City compile a summary of groundwater quality data and hydrological information in advance of a meeting with consultants for Vichy Springs, the Regional Board and the local Health Department. (A true and correct copy of the May 23, 1994, letter from the RWQCB to the City is attached hereto as Exhibit G and incorporated herein.) On August 1, 1994, the Regional Board requested the City to prepare a summary of information supporting my conclusion that the existing or future groundwater monitoring wells at the landfill would not adversely impact Vichy Springs. (A true and correct copy of the August 1, 1994 letter is attached hereto as Exhibit H and incorporated herein.)

11. On August 31, 1994, I prepared a summary report and submitted it to the RWQCB. (A true and correct copy of the summary report dated August 31, 1994, is attached hereto as Exhibit I and incorporated herein.) This report summarizes the data and the basis for my conclusion that the monitoring wells have not and will not impact the Resort springs. I had reached

this conclusion and communicated it to City officials in May 1994.

Based on a review of:

(1) the site geology,

(2) the effects experienced when the monitoring wells were drilled,

(3) an organic and inorganic hydrochemical analysis of the waters extracted from wells 90-8 and 94-2 and waters extracted from Vichy Springs,

(4) stable isotope analysis of those waters, and

(5) my personal experience and the experience of EBA with the geology and hydrogeology of the area, I concluded that monitoring wells 90-8 and 92-4 are not impacting Vichy Springs, because they are installed in a water-bearing zone significantly different from and not connected to, or intermixing with, the water-bearing zone of Vichy Springs.

I also concluded that the monitoring wells are not capable of influencing the hydrology or temperature of Vichy Spring and therefore, are not responsible for the heat loss and flow reduction reported to have occurred at Vichy Springs. Based on the data developed, it was and is my opinion that the likelihood of future landfill site monitoring wells impacting Vichy Springs is extremely improbable.

12. On October 14, 1994, I met with representatives of the City, Vichy Springs, the RWQCB, and Alisto Engineering in Walnut Creek to review all of the data complied to date and to receive any information that Vichy Springs could produce challenging my conclusions. Contrary to Mr. Ashoff's declaration, we had a

vigorous discussion with the engineering firm representing Mr. Ashoff about the hydrogeologic data and its significance. After that meeting, Mr. Ashoff supplied the City and myself with a letter dated October 13, 1994, prepared by Al Sevilla from Alisto engineering. This is the same letter that is attached to Mr. Sevilla's declaration as Exhibit 1.

13. After reviewing the letter and letters from Stanley Singer, I still believe my conclusions are correct. The RWQCB and the California State Water Resources Control Board, Division of Clean Water Programs, also reviewed these materials and have similarly concluded that the drilling of the monitoring wells have not been the cause of any observed changes in the Vichy Springs and are very unlikely to cause any such changes in the future. (See October 28, 1994, letter from Benjamin D. Kor, Executive Officer, Regional Water Quality Control Board, to Charles L. Rough, Ukiah City Manager, and Memorandum to Benjamin Kor from Harry M. Schueller, Chief, Division of Clean Water Programs, State Water Resources Control Board, dated October 31, 1994, attached hereto as Exhibit J and incorporated herein.)

14. In the October 13, 1994, letter from Alisto Engineering, and in the Declaration of Al Sevilla in support of plaintiffs' complaint and application for injunctive relief, Mr. Sevilla contends that the drilling of well 92-4 caused the decreased flow and temperature of Vichy Springs. He further believes that the drilling of the benzene well will cause further degradation of Vichy Springs. He bases this opinion on his view that no other event in the area other than the drilling of well 92-4 could account for the sudden decrease in the flow

and the temperature of the Vichy and Ardeche Springs. He speculates that well 92-4 punctured a "non-hydrostatic geologic zone" which allowed gases to escape that come from the Vichy Springs through faults and fissures in the ground. He and Stanley Singer contend that this reduced pressure caused the flow from the springs to decline and the temperature to drop.

He also criticizes my investigation in several respects. He maintains that the City did not follow standard well installation practices in drilling well 92-4 and that the reasons for locating the well are questionable. He claims drilling of the well did not follow standard practices, because I did not backfill and seal the well, when it did not fill with groundwater within twenty-four (24) hours after drilling. He questions the methodology, because he believes that a well should be drilled at the probable source of the benzene contamination, which, in his opinion, is the landfill, and not in the location I selected.

Finally, he contends that the existing wells should be sealed to see if the temperature and flow of the Vichy Springs increases. He believes this should be done before additional wells are drilled. He also believes that we should first prepare geologic cross-sections and mapping of the area before drilling additional wells.

15. I disagree with the arguments of Mr. Sevilla and Mr. Singer. I will state their contention followed by my response:

a. <u>There is no justification for drilling well 92-4, the two existing wells are not in a water-bearing zone and a third well will not provide valid data regarding gradient and flow direction</u>.

Contrary to Mr. Sevilla's assertion, it is not standard industry

practice to abandon a well if no water exists within a 24 hour period. When drilling monitoring wells in low permeability materials, it is common for wells to remain dry initially for many days or weeks. Regardless, we fully expected well 92-4 to take considerable time to fill with groundwater. This was based on our previous studies of the site geology and the behavior of the previous monitoring wells that we had drilled in this same geologic formation. In the past, we have had to wait several days or weeks after drilling a well before concluding whether it would provide useful data or not.

Wells 90-8 and 92-4 are installed in Continental Basin Deposits. As pointed out in my August 31, 1994, report, this is one of three major geologic units that exists in the vicinity of the landfill. These deposits are estimated to be in excess of 2,000 feet thick in the Ukiah Valley area and consists principally of highly consolidated silty and clayey soils with minor gravel lenses. Water percolates very slowly through these silty and clayey materials. The boring logs for monitoring wells 90-8 and 92-4 indicate that they were both drilled through continuous sections of clayey silt and silty sand of the Continental Basin deposits. No gravel layers, confining layers of clay, or bedrock from the Franciscan formation was encountered. Under these conditions, it is very difficult to obtain water from a monitoring well. Mr. Sevilla's statements about industry standards are simply incorrect.

The suggestion that the wells are not constructed in a water-bearing zone is surprising given that groundwater samples are routinely collected from them.

b. No geologic investigation supports the location of the benzene well.

The purpose of the benzene well is to determine the direction in which the groundwater is flowing in the area southeast of the landfill and the gradient of that flow. Even if we drilled a well directly into the landfill, as Mr. Sevilla suggests, and discovered leachate with similar concentrations of benzene, that would not help us in determining the extent of the benzene contamination in the groundwater, the direction in which the benzene contaminated groundwater is travelling or the gradient of the groundwater. The only way to obtain that information and to further characterize the extent of the benzene contamination in the area is to drill a third well creating a triangle in relation to the existing two wells.

Contrary to Mr. Sevilla's statement that we have made no effort to assess the impact of waste disposal on the underlying groundwater, we have performed an extensive assessment of the impact to groundwater from the landfill. Impacts to groundwater have been detected in a number of wells downgradient of the landfill. While the nature of the groundwater impact at the toe of the landfill is consistent with our experience at other leaking landfills (a wide variety of compounds at relatively low concentrations), it is significantly different from the contamination observed in wells 90-8 and 92-4 which consists primarily of very high concentrations of benzene along with low levels of toluene, xylene and ethylbenzene periodically detected. While these compounds are common constituents of gasoline, the contrast in concentration between benzene and the other three compounds is unusual for gasoline impacted groundwater.

Moreover, we have collected no objective data to date, suggesting that benzene is escaping from the landfill. No sample of leachate has detect benzene and only one well at the toe of the landfill has detected benzene. This well (90-5) consistently has concentrations that are orders of magnitude less than the concentrations identified in the test wells 90-8 and 92-4. While the landfill is the most obvious source, there is as much reason to suspect a source outside the landfill, at this point, as there is to suspect the landfill.

We have determined the direction of groundwater flow in the western area near the toe of the landfill. The groundwater encountered in the landfill toe wells is chemically different and separate from the benzene impacted groundwater found in wells 90-8 and 92-4. Drilling the benzene well will address all of the questions that the Regional Board has requested us to investigate. Drilling a well directly into the landfill would not answer most of the important questions that we need to answer at this point.

c. Wells 90-8 and 92-4 have penetrated either a non-hydrostatic pressure zone, two different geologic units, or a perched aquifer.

Our previous geologic investigation convinced us that the Vichy Springs water comes from the Franciscan formation, which is a separate and distinct geologic unit from the Continental Basin deposits in which wells 90-8 and 92-4 have been drilled. Rocks from the Franciscan formation are much older and deeper than the Continental Basin Deposits. The Franciscan formation consists of a mixture of various types of rock, including sandstone, metavolcanic rock, greenstone, and chert. The stable

isotope analysis of the water from the wells and the Vichy and Ardeche Springs clearly establish that they come from separate, disconnected aquifers. Moreover, the temperature of the water in the wells was significantly lower than the temperature in Vichy Springs. A review of the boring logs documenting the geologic materials encountered during the drilling of the wells demonstrates that two distinct geologic units were not penetrated.

Recognizing that the waters come from separate aquifers, Mr. Sevilla suggests that the test wells have tapped into the gases which drive Vichy Springs. This theory would explain how wells which have not tapped the same groundwater that supplies Vichy Springs could impact the flow or temperature of the springs.

He calls the zone that the wells penetrated a non-hydrostatic pressure zone. This means that the water pressure in this zone is created by active tectonic stresses rather than the pressure created by the water itself. In effect, he contends that the City's wells popped the balloon which contains the pressure which drives Vichy Springs. By releasing the pressure, the wells lowered the temperature and reduced the flow of the springs. He hypothesizes that the gases could have travelled from the Resort's geologic formation to the well sites through faults or cracks aligned between the two zones.

The occurrence of tectonic overpressure zones in the Coastal Ranges, such as the geothermal fields near Geyserville, California is well documented. However, I believe Mr. Sevilla's Hypothesis that the wells are responsible for the release of

gases that have migrated from the springs to the wells through faults and fractures is clearly flawed and not worth serious consideration.

I base this opinion on the following:

(1) A review of published fault maps and geologic maps of the area do not show any faults or fractures sets through the area of Vichy Springs resort and the area of wells 90-8 and 92-4. (California Division of Mines and Geology, 1982, *Alquist-Priolo Fault Map, Ukiah Quadrangle*. Clark, M.M., et al., 1984, *Slip-Rate Table and Map of Late-Quaternary Faults of California*: U.S. Geological Survey, Open-File Report 84-106. Jennings, C.W., 1975, *Fault Map of California with Locations of Volcanoes, Thermal Springs and Thermal Wells*: California Division Mines and Geology, Calif. Geol. Data Map Series, Map No. 1. Jennings and Strand, 1960, *Geologic Map of California, Ukiah Sheet:* California Division of Mines and Geology. Hart, et al., 1983, *Summary Report, Fault Evaluation Program, 1981-1982 Area (Northern Coast Ranges Region, California):* California Division of Mines and Geology, OFR 83-10. Smith, et al., 1982, *Fault Evaluation Report - Maacama Fault (Central and Northern segments):* FER Nos. 123, 124 & 125, California Division of Mines and Geology. Upp. R.R., 1982, *Holocene Activity on the Maacama Fault, Mendocino County, California:* PhD. Thesis, Stanford University.)

(2) On a number of occasions, I have reviewed numerous high altitude and low altitude aerial photographs or the area where the wells were drilled, and I have determined that there are no photo lineaments present in the Continental

Basin deposits which would indicate the presents of faults or fractures which could provide a pathway for the migration of these gases.

(3) Observations made during geologic field mapping of the area noted no evidence of faults, fractures or joint sets within the Continental Basin deposits in the vicinity of wells 90-8 and 92-4.

(4) Observations of the geologic material that we extracted from the well while it was being drilled, demonstrate we never encountered Franciscan formation bedrock or any evidence of a confining layer that would have trapped gas or allowed it to pressurize water.

(5) If we had penetrated such a confining layer, there would have been some evidence of a pressure release. Neither during the drilling nor after the drilling have we encountered evidence of significant changes in pressure within the well.

(6) Our experience with the migration of methane gas from the landfill through the Continental Basin deposits suggests that these geologic materials are not capable of holding gases under pressure.

Mr. Sevilla's suggestion that the water encountered in the wells may be from a perched aquifer does not support his conclusion that the wells have impacted Vichy Springs and while this suggestion may have implications for benzene migration, it is not relevant to the rest of his discussion.

d. Need further geologic investigation before drilling additional wells.

We have already completed all of the non-intrusive geologic investigations that would produce useful information in predicting the effect of drilling the monitoring wells on the Vichy and Ardeche Springs. The City could perform some additional geologic mapping of fractures within the Franciscan formation in the immediate area of Vichy Springs. This data would only supplement the informal observations I have already made during a tour of the resort given to me and RWQCB personnel by Mr. Ashoff. However, this would not provide the City with any additional information that would increase our understanding of the geology between the wells and Vichy Springs. Contrary to Mr. Sevilla's contention, we have developed cross-sections and mapping of the geologic zones. The structure and orientation of the geologic beds (strike and dip of bedding planes) has already been documented and is well known. Without additional subsurface boring data, a cross-section treading toward Vichy Springs would provide little benefit. It would simply show a thick (minimum 265 feet deep) zone of Continental Basin deposits with the Franciscan bedrock lying below at some unknown depth.

e. Wells 90-8 and 92-4 should be backfilled and sealed to see if the springs recover before drilling the benzene well.

There are two reasons why it is not necessary or advisable to backfill and seal wells 90-8 and 92-4.

First, it is not necessary. Both wells can be sealed pressure tight without backfilling. Above the screened bottom of the well casing that allows groundwater to enter, the borehole is sealed with bentonite and grouted to the surface and the top of the well casing is fitted with an airtight cap. The

benzene well will be constructed in the same way. Presently well 90-8 is fitted with water sampling equipment that does not provide an airtight seal, however, this equipment can be modified. Well 92-4 has continuously been equipped with an airtight cap. The well is only allowed to vent to the atmosphere for less than an hour every three months when collecting samples.

Second, the two existing wells may be useful or necessary to future remediation of the benzene contamination once a clean-up plan is developed. Backfilling and sealing the wells now may require re-drilling the wells during the implementation of a clean-up plan.

16. We also do not have reliable data on the degree to which the flow and temperature of Vichy Springs varies over time. In his declaration, Mr. Ashoff states that the flow of water from Vichy Springs was reduced from a normal rate of 65 gallons per minute (gpm) to below 40 gpm. He also states that the temperature when from ninety (90) degrees fahrenheit, which is the springs' normal temperature, to a low of around seventy-six (76) degrees. He attaches as Exhibit 1 to his declaration a list of gallon per minute and temperature figures for the Vichy and Ardeche Springs.

For example, Exhibit 1 shows that in 1979, Vichy Springs had a sixty-nine (69) gpm flow. However, according to a hydrological field test report supplied to the City by Gilbert Ashoff (attached hereto as Exhibit K are the excerpts from the 1979 report furnished by Mr. Ashoff), the Vichy Springs produced a natural flow in December 1979, of 3.4 liters per second. At that same time, the Ardeche Springs discharged one liter per

second. 3.4 liters per second converts to 53.89 gpm and 1 liter per second converts to 15.85 gpm. The combined output of both equals approximately 69 gpm. It appears that Mr. Ashoff may have improperly combined the two rates to report the 69 gpm flow rate that Exhibit 1 shows for Vichy Springs alone.

In addition, if the Ardeche Spring was flowing at 15.85 gpm in 1979, according to Exhibit 1, its flow had already dropped over 3 gpm between 1979 and March 20, 1993, which is just before well 92-4 was drilled. After the drilling of well 92-4, Mr. Ashoff reports that the Ardeche Spring went from 12.5 gpm to 9.5 gpm, which is roughly the same amount of reduction as occurred before the wells were drilled. In addition, if, as Mr. Ashoff's data suggest, the Vichy Spring was producing 53.9 gpm in 1979, it subsequently increased in production to 65.1 gpm in 1980; and then after the drilling of well 92-4, went down to 40.5 gpm.

According to a U.S. Geological Survey paper dated 1915 on file with the RWQCB, and also referred in the October 31 memorandum to the RWQCB from the State Water Resources Control Board, the Ardeche Spring discharged 8 gpm and the Vichy Spring about 16 gpm, as compared to a volume of 9.5 gpm and 39.3 gpm, respectively, reported by Mr. Ashoff for October 13, 1994. (A true and correct copy of the 1915 paper is attached hereto as Exhibit L.) This shows a substantial fluctuation in the output of Vichy Springs both before and after the drilling of the well.

The temperature fluctuations are equally inconclusive. According to his own figures, the Vichy Spring had a temperature of 93 degrees in 1989. By March 20, 1993, that temperature had gone down by 4 degrees. After April 7, 1993, the temperature

went down to 76 degrees and has since recovered to 86.5 degrees. This information suggests that the Vichy and Ardeche Springs have not maintained a consistent temperature or rate of flow over time as Mr. Ashoff asserts.

Further review of the literature show significant historic fluctuations in the flow and temperature of the Springs as shown in Exhibit M. As documented, this table compiles flow and temperature data for Vichy Spring from 1889, 1915, 1965 and 1979.

Based on my review of the literature, I believe that mineral springs frequently change temperature and output. These variations can be due to intermittent mixing of surface water with spring water, temporal variations such as seasonal changes or longer periods such as drought cycles, and seismic activity. Even very minor, otherwise undetectable tectonic shifts can influence both spring discharge and temperature. For example, Exhibit L reports that the Vichy Springs outlet moved 3-4 yards, apparently in response to a small local earthquake. Further, the great 1906 earthquake reportedly did not affect Vichy Springs.

Even if the flow and temperature of the springs changed significantly thirty days after drilling well no. 92-4, as the Ashoffs claim, that fact alone does not, in my professional opinion, establish any cause and effect relationship between the drilling of the well and the observed changes in the spring.

All of the objective hydrogeological evidence indicates that there is no interconnection between the well and the springs.

true and correct.

Executed this 9th day of December 1994, at Ukiah, California.

EXPERIENCE SUMMARY

Mr. Brown is a geologist with over fourteen years of experience in the fields of hydrogeology, engineering geology, and environmental geology. He has experience in: surface and subsurface geologic investigations, hydrogeologic characterization investigations, remedial investigation/feasibility Studies (RI/FS) for landfill and industrial sites, hazardous waste contamination studies, remedial action design and implementation of soil and groundwater corrective action programs, fault and landslide investigations, engineering geologic evaluations, borrow investigations, and environmental impact studies.

At EBA Wastechnologies, he is responsible for applying his experience in the conduct of geologic and hydrogeologic investigations in support of the firm's sanitary landfill and hazardous waste disposal facility projects. He has supervised numerous geologic and hydrogeologic investigations at known and suspected hazardous waste disposal sites.

EXHIBIT A

These investigations have required photogeologic interpretation, regional and site geologic mapping, geophysical exploration, exploratory trenching and drilling, vadose zone monitoring, groundwater monitoring well installation, aquifer testing and analysis, and soil and groundwater sampling and analysis. At waste disposal sites throughout California, he has planned and supervised; development of surface and groundwater monitoring plans, evaluation of regional seismicity and faulting, and evaluation of slope stability. In addition, he has conducted borrow and final cover investigations for waste disposal facilities and investigated suspected soil and groundwater contamination at a number of private industrial sites.

Prior to joining EBA, Mr. Brown conducted a wide range of geologic studies in California. These studies include waste disposal, regulatory compliance, site assessment/remediation, geologic hazards and research of active and potentially active faults including the San Andreas, Hayward, Calaveras, San Gregorio, San Simeon-Hosgri, Sargent-Berrocal, and Shannon faults. He was also responsible for conducting site-specific geologic and geotechnical investigations for residential hillside development, landslide repair and control projects, flood potential and sediment transport studies, and studies of sea cliff erosion and littoral drift.

REPRESENTATIVE PROJECTS:

Project manager and senior geologist for a Class III landfill in Mendocino County, CA. Project includes the expansion of an existing Class III landfill and the design of corrective action alternatives for the remediation of leachate and VOC impacted groundwater at the toe of the landfill. Identification and mixing of multiple hydrogeologic and hydrochemical regimes was critical to the development and evaluation of effective monitoring and corrective action programs. The use of stable isotope geochemistry techniques provided significant cost savings for water quality monitoring. Tasks include:

Preparation of Report of Waste Discharge (ROWD).

Preparation of Report of Disposal Site Information (RDSI).

Development of a Water Quality Monitoring Program in accordance with CCR Title 23, Chapter 15, Article 5.

Preparation of a Remedial Investigation/Feasibility Study for leachate and VOC impacted groundwater.

Preparation of Remedial Action Alternatives

Preliminary Closure/PostClosure Maintenance Plans.

Quarterly water quality monitoring.

NPDES permit and Storm Water Poilution Prevention Plan.

- Served as technical project manager for an extensive multi-phase hydrogeological investigation and characterization for Remedial Investigation/Feasibility Study (RI/FS) for a Class I hazardous landfill facility in Los Angeles County, CA. Tasks included developing a new field office with on-site chemical and geotechnical analytical capabilities, supervising a 15 man field crew and multiple drill rigs using four different drilling methods; supervising installation of piezometers and lysimeters; performed in-situ permeability (packer) testing; downhole geophysical logging; performed aquifer testing and groundwater sampling. Program design under the guidance of the California Department of Health Services (now DTSC).

- Project manager and Construction Quality Control (CQA) officer for closure construction activities at an 80 acre Class III municipal landfill and Class I hazardous waste site in Northern California. Responsible for overall project coordination including borrow source investigation, test pad analysis, placement of engineered fill, low permeability clay cap, and drainage control facilities. Geology Project manager The investigation involved defining groundwater flow conditions and potential pathways for the migration of contaminants released from the Class III landfill and Class I liquid hazardous waste ponds beneath the Landfill. Presently proceeding with the remedial process to satisfy the requirements of both the DTSC and the RWQCB for cleanup of contaminant releases beneath and downgradient of the site.

- Served as geologic project manager for the expansion of an existing Class III landfill in Napa County, California. Tasks included geologic field mapping, installation of groundwater monitoring wells, sampling and analysis of soil and groundwater, slope stability study. Responsible for the preparation of a Master Development Report designed to furnish the site and operations descriptions required in the Report of Waste Discharge (ROWD) for the Regional Water Quality Control Board, and the Report of Disposal Site Information (RDSI) engineering Report for the California Waste Management Board.

- Engineering geologist responsible for engineering geologic evaluation of expansion excavations at a Class III disposal site in Solano County, California. Project included geologic mapping, fracture analysis, and identification and mitigation of high permeability subgrade materials in five expansion modules. Served as project geologist for in-situ field permeability investigation. Study included in-situ field and laboratory permeability testing of native subgrade materials and engineered clay liner material.

- Supervised hydrogeologic investigation to evaluate potential soil and groundwater contamination at three Class III landfills in the Mendocino National Forest, Lake County, California. Project included installation of groundwater monitoring wells, and sampling and analysis of soil and groundwater. Investigation performed in accordance with CCR Title 23, Chapter 15, and Solid Waste Assessment Test (SWAT) requirements.

- Supervised geologic and hydrogeologic investigation for Solid Waste Assessment Test (SWAT) in accordance with the requirements of Calderon Bill (AB 3525) at a Class III landfill in Santa Clara County, California. Managed landfill characterization, and groundwater contamination verification and remediation feasibility study (RI/FS) for an existing Class III landfill. Program designed in accordance with CCR Title 23, Chapter 15. Geology project manager responsible for developing design criteria to mitigate effects of shallow groundwater and Holocene faulting associated with a Class III landfill expansion project. Tasks included extensive exploratory trenching across active traces of the Calaveras fault, conducting a maximum probable earthquake evaluation to develop strong ground motion and ground rupture design parameters, aquifer testing, vadose zone monitoring and expanding existing groundwater monitoring system to evaluate horizontal and vertical groundwater gradients beneath base liner.

- Supervised geologic and hydrogeologic Solid Waste Assessment Test (SWAT) investigation to evaluate potential soil and groundwater contamination at two Class III landfill facilities in Lake County, California. Tasks included installation of piezometers and lysimeters, and soil and groundwater sampling and analysis.

- Project geologist responsible for the preparation of Report of Waste Discharge in accordance with the requirements of Regional Water Quality Control Board; and a Report of Disposal Site Information (RDSI) Report in accordance with the requirements of the Solid Waste Management Board for a proposed major Class III waste disposal site in Napa County, California.

- Prepared Solid Waste Assessment Test (SWAT) Exemption for transfer station facility located on abandoned landfill site in Santa Clara County, California.

- Engineering geologist responsible for conducting Holocene fault investigation for expansion of a Class III Landfill facility in Santa Clara County, California. Tasks included exploratory trenching across traces of the Shannon fault, and Carbon-14 age dating.

- Project Geologist responsible for conducting a geologic and hydrogeologic investigation of suspected hazardous waste contamination at a Class II solid waste disposal site in Santa Clara County, California.

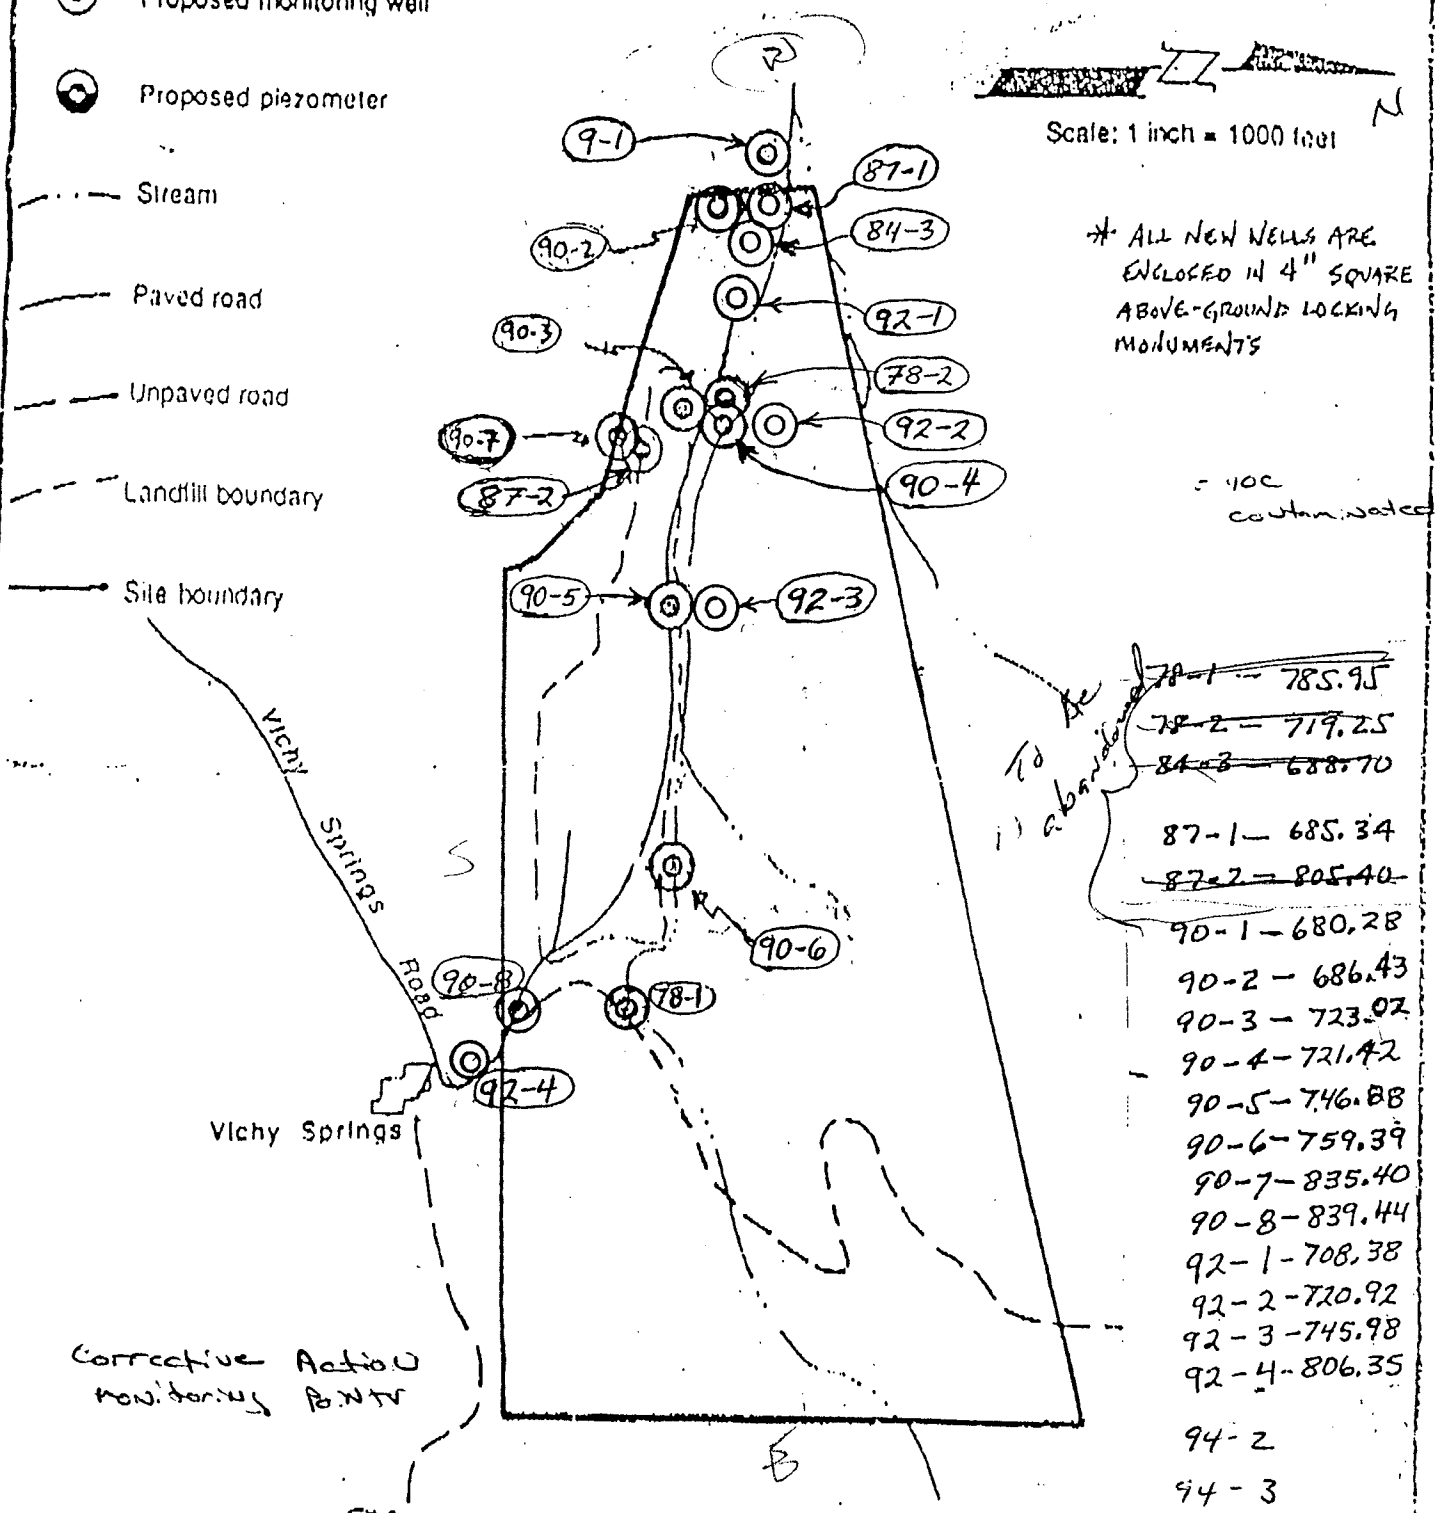
Printed on recycled Paper

- Responsible for conducting Holocene fault investigation and evaluating liquefaction potential and landslide hazards for expansion of a Class III landfill facility in San Luis Obispo County, California. Tasks included exploratory trenching across traces of the Indian Knob-Edna fault.

- Engineering Geologist responsible for the investigation of regional tectonics and seismicity and development of seismic design parameters for over 20 sanitary landfills and Hazardous waste disposal sites throughout California.

- Project Geologist responsible for geologic mapping, fracture analysis, and construction observation of a deep groundwater intercepter trench in highly fractured bedrock as part of a groundwater contamination remediation program at a Class III landfill site in Alameda County, California.

EBA Wastechnologies has been providing engineering and hydrogeologic consulting services for the City of Ukiah Landfill since 1986. EBA has performed following technical investigations:



- 1986 - Geologic and hydrogeologic investigation for Solid Waste Assessment Test (SWAT) in accordance with the requirements of Calderon Bill (AB 3525) at the Ukiah Landfill. Tasks included installation of two new groundwater monitoring wells, sampling and analysis of five groundwater monitoring wells to characterize potential impact to groundwater from landfill activities.

- 1989 - Engineers Report and permitting documents for the Ukiah Landfill. Prepared (1) Engineers Report, (2) Report of Waste Discharge in accordance with requirements of RWQCB, and (3) Report of Disposal Site Information for submittal to California Integrated Waste Management Board. Tasks included installation of nine additional groundwater monitoring wells (maximum 160 feet deep), drilling six exploratory borings (maximum 265 feet deep), geologic mapping and preparation of geologic cross sections, performing aquifer permeability analyses, analysis of groundwater and surface water quality, perpetration of grading and fill plans, analysis of site capacity and borrow site investigation.

- 1992 - Remedial investigation and permitting documents for the Ukiah Landfill. Prepared (1) revised Report of Waste Discharge for submittal to RWQCB, (2) Report of Disposal Site Information for CIWMB, (3) Water Quality Monitoring Program in accordance with CCR Title 23, Chapter 15, Article 5 for RWQCB, (4) NPDES permit and Storm Water Pollution Prevention Plan. Tasks included installation of four additional groundwater monitoring wells (maximum 130.5 feet deep), drilling one exploratory boring (26 feet deep), air photo analysis, seismic refraction analysis of landfill, hydrochemical and statistical analysis of groundwater and surface water quality, stable isotope analysis of groundwater, characterization of VOC impacted groundwater at the toe of the landfill, erosion and sediment control analysis, and analysis of site capacity.

  1993/1994 - Landfill gas migration investigation, prepare Preliminary Closure Plan and Preliminary PostClosure Maintenance Plan, additional hydrogeologic investigation to further characterize the extent of benzene impact and direction of groundwater flow. Tasks included installation of two additional groundwater monitoring wells (performed september 1994, maximum 75 feet deep), development of Landfill Gas Perimeter Monitoring System, installation of five landfill gas monitoring wells (maximum 250 feet deep).

Mr. Brown became actively involved in the management and technical oversight of the project in November 1992. He is responsible for conducting the hydrogeologic and engineering investigations performed at the Ukiah Landfill since November 1992. Mr. Brown directed the installation of groundwater monitoring wells 92-1, 92-2, 92-3, 92-4, 94-1, 94-2; and landfill gas monitoring wells GAS-1 through GAS-5.

Ukiah, CA 95482-5400

Subject: Ukiah Landfill

Dear Ms. Goodrick:

This letter responds to your correspondence dated November 1, 1993, regarding the Ukiah landfill. Specifically, your letter requests direction regarding further investigation of the benzene contamination found in monitoring wells 90-8 and 92-4.

The groundwater quality data for the landfill indicates that the water in 90-8 and 92-4 is different from groundwater samples collected from wells along the toe of the landfill. It is our belief that these are separate aquifers which may or may not flow in the same direction. The groundwater gradient for the toe aquifer is well established as flowing to the northwest. The groundwater gradient for the aquifer to the southeast of the fill has not yet been established. A third well (non-colinear with 90-8 and 92-4) is necessary to determine the gradient. The next step in the investigation is to determine the direction of groundwater flow.

Please submit a workplan for determining the direction of the groundwater gradient for the aquifer southeast of the landfill by December 15, 1993. The workplan should include well construction specifications and a site plan showing the proposed well location.

Please call, if you have questions.

Sincerely,

Ray O'Connor

RE: UKIAH SANITARY LANDFILL, WORK PLAN 93-461(1)

Dear Mr. Kennedy:

EBA Wastechnologies is please to submit this work plan for the installation of two additional groundwater monitoring wells at the Ukiah Landfill. The work Plan has been prepared to address the concerns expressed in conversations with North Coast Regional Water Quality Control Board (RWQCB) personnel and letters from the RWQCB dated November 17, 1993 and December 23, 1993. As you requested, we have submitted this work plan directly to the RWQCB on behalf of the City of Ukiah Public Works department.

We look forward to working with you on this project and will be pleased to discuss any questions you may have.

Sincerely,
EBA WASTECHNOLOGIES

1.0 INTRODUCTION

This Work Plan has been prepared for the Ukiah Landfill, Mendocino County, California, by EBA Wastechnologies (EBA) on behalf of the City of Ukiah. The landfill has accepted waste since 1953 and volatile organic compounds (VOCs) have been found in the uppermost water-bearing zone beneath the site.

This Work Plan has been prepared at the request of the Regional Water Quality Control Board (RWQCB). In a letters dated November 17, 1993 and December 23, 1993, the RWQCB requested that an additional monitoring well be installed southeast of the landfill to aid in determining the groundwater flow direction and gradient in this area. This well will also be used to further characterize the extent of elevated levels of benzene detected in nearby monitoring wells.

During subsequent discussions with RWQCB personnel, a second monitoring well has been requested. This well will be installed northwest of the sediment retention ponds located at the toe of the landfill and be used to further define the extent of VOC impact at the toe of the landfill.

1.2 PURPOSE AND SCOPE

Groundwater contamination in the form of VOCs is evident in the groundwater beneath the landfill. The implementation of this Work Plan will provide additional information concerning the hydrogeologic conditions that influence the movement of contaminates, and aid in additional evaluation of the vertical and lateral extent of VOC contamination in groundwater. The Work Plan described in this document outlines the activities for the Ukiah Landfill, including:

- Proposed drilling and sampling methods
- Rationale for the placement of the two additional monitoring wells
- Monitoring well construction and development details
- Proposed groundwater sampling and analysis

2.0 GROUNDWATER MONITORING WELL INSTALLATION

2.1 MONITORING WELL 94-1

The RWQCB has requested that a groundwater monitoring well be established in the area southeast of the landfill to assess the groundwater flow direction and gradient, and to further characterize the extent of benzene contamination detected in nearby monitoring wells 90-8 and 92-4 (see Figure 1). We propose to install one additional monitoring well (94-1) in this area. We anticipate that the total depth of a monitoring well in this area will be approximately 130 feet. Based on experience drilling wells 90-8 and 92-4, we anticipate that well 94-1 will be drilled with a truck-mounted Schramm T685 air-rotary rig using steam-cleaned rod and a 7-7/8 inch bit. In order to drill this area some grading will be necessary to provide access and a drilling pad. We understand that access an road and drilling pad will be provided by the City of Ukiah.

In addition to the standard logging procedures utilized during past well installations, we are considering the use of down-hole wireline geophysical logging in wells 94-1, 92-4, and 90-8. Borehole logging will aid in the interpretation of lithology, stratification, and occurrence of liquids in the subsurface materials. The geophysical logs will help indicate changes in geology, help evaluate hydrogeology, and aid in setting the screened interval of well 94-1. Geophysical logs that may be run include:

- EM Induction
- Natural Gamma

For the installation of monitoring well 92-4 (see Figure 1), the RWQCB requested the preparation of a Work Plan Addendum which addressed specific concerns raised by the owner of the Vichy Springs Resort that installation of monitoring well 92-4 in the vicinity of the resort property could impact the mineral springs (EBA, 1993, *Work Plan Addendum, Installation and Development of Groundwater Monitoring Well 92-4*). Experience gained during exploratory drilling and well installation at the site in general, and wells 90-8 and 92-4 in particular, suggests that it is unlikely the relatively shallow monitoring wells installed in the area threatens the mineral springs. Therefore, the use of a blowout preventer and other specialized drilling equipment, which was used in the drilling of well 92-4, is not proposed for the installation of monitoring well 94-1.

2.2 MONITORING WELL 94-2

The purpose of installing this well is to further characterize the extent of VOC contaminants discovered in the vicinity of monitoring well 92-1, which is located next to the northeastern

corner of the leachate containment pond, near the western boundary of the fill area (see Figure 1). We propose to install an additional monitoring well (well 94-2) northwest of monitoring well 92-1. Because groundwater in this area has been calculated to flow to the northwest, well 94-2 will aid in identifying groundwater contaminants which may be migrating to the northwest from the leachate pond.

We anticipate that this well will be extended to a total depth of approximately 50 feet, in order to ensure penetration of the saturated zone throughout the year. However, the total depth of the well may vary, depending on the elevation of the drilling site and local hydrogeology. Based on experience drilling the other monitoring wells in this area, we anticipate that the well will be drilled with a truck-mounted Failing FA-100, or Deep Rock drilling rig using steam-cleaned 8 inch O.D. by 4.5 inch I.D. hollow-stem augers.

2.3 MONITORING WELL DESIGN

The monitoring wells will be designed in accordance with specifications outlined in ***Bulletin 74-90, Monitoring Well Standards: State of California***, prepared by the State Department of Water Resources in cooperation with the State Water Resources Control Board. They will be constructed of clean, two inch-diameter, flush-threaded PVC casing, and secured within above-ground locking monuments.

Approximately ten to fifteen feet of perforated well screen will be installed from just above the highest seasonal groundwater level to the bottom of the well, and surrounded by a filter pack of washed Maunder sand. To ensure that the well casing is properly centered in the boreholes, it will be installed within the string of hollow-stem augers, or by using stainless steel centralizers, depending on the drilling method. The annular materials (filter pack, bentonite, etc.) will be placed within the hollow-stem as the augers are withdrawn, or through a tremie pipe. Figure 2 presents a schematic drawing of a typical groundwater monitoring well design for the Ukiah landfill.

2.5 MONITORING WELL DEVELOPMENT

The monitoring wells will be developed by gently surging the wellbore with a stainless steel surge block, followed by continued purging using a bailer, a Brainard-Kilman 1.7 inch hand pump, and/or an air-lift pump driven by an oil-less compressor. At regular intervals (approximately after each well volume of water is removed) the pH, conductivity, temperature and clarity of the water will be tested to verify the effectiveness of the development process.

2.6 SAMPLING AND ANALYSIS PROCEDURES

Specific sampling methodologies, field and laboratory analytical methods, and Quality Assurance/Quality Control (QA/QC) procedures are presented in the Sampling and Analysis Plan

developed for the Ukiah Landfill site. These procedures are summarized below and are consistent with the following guidance documents:

- *Procedures Manual for Groundwater Monitoring at Solid Waste Disposal Facilities*, U.S. Environmental Protection Agency (EPA), EPA-530/SW-611, August 1977
- *Test Methods for Evaluating Solid Waste: Physical/chemical Methods*, EPA, EPA SW-846, Third Edition, November 1986
- *Methods for Organic Chemical Analysis of Municipal and Industrial Wastewater*, EPA, EPA-600/4-82/057, July, 1982
- *RCRA Groundwater Monitoring Technical Enforcement Guidance Document*, OSWER 9950.1, September 1986

Three and five well volumes of water will be purged from the monitoring wells prior to sampling, again testing the pH, conductivity, and temperature for signs of representative formation groundwater. If a well is completed in a zone of low productivity, the well would be purged dry, then sampled after there has been sufficient recharge. Groundwater samples will then be withdrawn from the wells with a bladder pump driven by an oil-less compressor, or a sanitized bailer. All groundwater samples will be stored in the appropriate containers, placed in a refrigerated environment, and immediately transported under chain-of-custody to a certified analytical laboratory for testing. The groundwater samples will be tested for the same parameters proposed in the Article 5 Detection Monitoring Program prepared for the landfill and outlined on Table 1.

  - Dissolved Oxygen
  - Dissolved Silica

* Title 22 metals include: antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, iron, manganese, lead, mercury, molybdenum, nickel, selenium, silver, thallium, vanadium, and zinc.

2.7 SITE SANITATION PROCEDURES

All drill cuttings generated during drilling should be recycled as cover material for the landfill. Groundwater extracted from the wells, as well as rinsate generated from steam cleaning augers and other equipment will be collected in suitable containers (i.e., D.O.T. approved 55 gallon drums) and deposited in the leachate containment pond.

3.0 REPORTING

Upon completion of the field tasks, EBA will prepare a written report summarizing our methods, our observations, monitoring well logs and construction details. The report will also incorporate the recent data into the hydrogeologic framework of the site, include an analysis of laboratory testing results, and a presentation of our conclusions regarding environmental concerns at the site.

Dear Mr. Kennedy:

This letter responds to the Groundwater Monitoring Well Installation Workplan dated January 1994, prepared by EBA Wastechnologies.

The Workplan appears to be in order and it is hereby approved. We concur with the recommendation that borehole logging techniques be employed to develop as much subsurface information as possible. Please contact this office at least a week in advance of scheduled drilling so that we can arrange to have a staff member present.

Please call if you have questions on this matter.

Sincerely,

David S. Evans

CITY OF UKIAH

AMENDMENT TO MASTER AGREEMENT FOR PROFESSIONAL CONSULTING SERVICES DATED NOVEMBER 12, 1992

TERMS AND CONDITIONS

All terms and conditions of Master Agreement for Professional Consulting Services between City of Ukiah and EBA Wastechnologies dated November 12, 1992 shall remain in force and effect except as modified by this and previous executed amendments.

AUTHORIZATION

Upon execution of this amendment, consultant is authorized to perform the work described under "Scope-of-Work" of this amendment, on a time and expense basis not to exceed the total amount of compensation indicated for each work task.

SCOPE-OF-WORK

The following work tasks shall be performed under this amendment.

Task I - Preparation of a Preliminary Closure and Postclosure Maintenance Plan including closure and postclosure cost estimates all in compliance with 14 CCR and 23 CCR. Documents shall be completed for City's review no later than April 1, 1994. Total compensation for this task shall not exceed $29,138.

Task II - Perform gas monitoring well installation and field evaluation related to City's effort in determining the extent of any gas migration along the south boundary line of the landfill in the vicinity of existing gas probe PP4. All work shall conform to applicable sections of 14 CCR and Subtitle D. Perform reporting, monitoring and other required work as outlined in Consultant's proposal dated December 8, 1993. Total compensation for this Task shall not exceed $34,000. Work shall begin promptly after LEA approves Landfill Gas Monitoring Work Plan and shall be completed by the following dates:

Well and/or probe installations	April 15, 1994
Monitoring	May 13, 1994
Report	May 27, 1994

Task III - Perform two (2) groundwater monitoring well installations. One well shall be installed at the toe of the landfill north of Wells 90-2 and 92-1 to further characterize the extent of contamination in that area. The second well shall be installed in the area southeast of the landfill in order to further characterize the extent of groundwater contamination and to aid in the determination of groundwater gradient of the aquifer monitored at Well 90-8 and 92-4. Work includes preparation of report documenting the well installation procedures, boring logs, applicable maps and drawings. Reference is made to consultants proposal dated December 8, 1993. Work shall begin promptly after LEA approves Groundwater Monitoring Work Pan and shall be completed in the most expeditious manner. Total compensation for this work Task shall not exceed $24,960.

Subject: Ukiah Solid Waste Disposal Site

Dear Mr. Kennedy:

This letter is to review the status of landfill regulatory requirements and to outline additional work which needs to be accomplished in the forthcoming fiscal year.

We have begun drafting waste discharge requirements for the Ukiah landfill to reflect compliance with Chapter 15 and Subtitle D solid waste disposal regulations. We have received and conditionally approved the Article 5 Monitoring Proposal and Report of Waste Discharge earlier this year. The approval conditions primarily involved additional monitoring capabilities to completely define the extent of groundwater contamination and submittal of a corrective action plan. These issues are discussed separately below:

Groundwater Investigation

There are two areas of concern regarding groundwater beneath the landfill. The first is the presence of volatile organic compounds (VOC's) in the stream bed alluvium along the landfill toe. The second is the presence of benzene in a deeper aquifer beneath the ridge which separates the landfill from the Vichy Springs Resort. Two additional wells are needed to complete the investigation of the contamination in the alluvial aquifer. One needs to be installed to the northwest of the bottom of the fill and another in the canyon above the fill to serve as a background well. It is our expectation that these two additional wells will complete this part of the groundwater investigation. The wells should be installed, developed and sampled during this summer.

The benzene problem was initially encountered in MW 90-8 at the landfill gate. Additional contamination was detected in MW 92-4 further down the access road toward Vichy Springs. The next step in the investigation is to determine the direction of groundwater flow for the affected aquifer. Once this gradient information is available further thought can be given to isolating the benzene source. Since it is not certain what the results of a third monitoring well in this area would be, contingency funds should be set aside in this year's budget beyond funding a single additional monitoring well.

We are aware of the stated concerns by representatives of Vichy Springs that the existing and any new monitoring wells might affect their water supply. They have

EXHIBIT G

recently requested that MW 90-8 and MW 92-4 be removed. We have had numerous communications with Vichy Springs representatives regarding these monitoring wells. We do not believe that evidence has been submitted which warrants the removal of MW 90-8 and 92-4.

It is our understanding that the City of Ukiah is currently compiling a summary of groundwater quality data and hydrogeological information in advance of a meeting with consultants for Vichy Springs, the Regional Board and the local Health Department. We look forward to participating in this discussion at the earliest possible opportunity because we want to see the groundwater investigation completed in a timely matter.

Corrective Action Plan

Corrective action will likely be performed in two separate phases. The first will involve removal of VOC's from the alluvial aquifer. The second will be to abate the benzene problem in the area between the landfill and Vichy Springs. It is difficult and perhaps premature at this time to budget for the cost of remedial work regarding the benzene problem. Decisions on that matter will need to be made after the site investigation has been completed.

However, most of the information is already developed to design a corrective action plan for the alluvial aquifer VOC problem. The City of Ukiah should plan for completion of the remaining two monitoring wells and design of an extraction, treatment, and disposal system for contaminated groundwater. The actual construction of physical facilities as well as start up and operation and maintenance can be deferred until the 1995/96 fiscal year.

I hope this clarifies our expectations regarding progress to correct groundwater problems related to the Ukiah landfill in the upcoming fiscal year. Please give me a call if you have further questions.

Sincerely,

David S. Evans

Ukiah, CA 95482

Dear Mr. Kennedy:

Subject: Ukiah Solid Waste Disposal Site

This letter regards the groundwater investigation at the Ukiah landfill and, in particular, the investigation of the presence of benzene and toluene in MW 90-8 and 92-4.

In previous discussions and correspondence we have indicated that additional monitoring wells are necessary to understand the presence of benzene and toluene in the groundwater as well as to design measures to correct the problem. This work has been delayed by concerns put forth by Gilbert Ashoff at Vichy Springs Resort that monitoring wells in this area will damage his geothermal springs at the resort. We would like to see those concerns resolved so the groundwater investigation can continue. In this regard, we request that a technical report be prepared which summarizes the information which the City has developed to date in support of the position that additional monitoring facilities will not adversely impact geothermal water sources located on the Vichy Springs property. A similar request is being made to Mr. Ashoff to support his contention that his springs are in real jeopardy. This request is made pursuant to Section 13267 of the California State Water Code. Please submit your report by September 1, 1994.

Your attention to this matter is appreciated.

Sincerely,

David S. Evans

RE: UKIAH LANDFILL SITE MONITORING WELLS AND VICHY SPRINGS RESORT

Dear Mr. Kennedy:

This letter report summarizes the data we have developed to date regarding the potential for groundwater impact to Vichy Springs by groundwater monitoring wells at the Ukiah landfill. This report was prepared in accordance with a letter dated August 1, 1994, from the California Regional Water Quality Control Board, North Coast Region (RWQCB), requesting a summary of information supporting our conclusion that the existing or future groundwater monitoring wells at the landfill will not adversely impact Vichy Springs. It is our understanding that the RWQCB has made a similar request for data and a technical report from Mr. Ashoff, the owner of the Vichy Springs Resort.

BACKGROUND

As you are aware we have examined the available hydrogeologic and geochemical data, and found no evidence supporting Mr. Ashoff's claim that Ukiah Landfill site monitoring wells have adversely affected geothermal spring activity at Vichy Springs Resort. The RWQCB has requested a summary of relevant facts so that concerns can be resolved and the hydrogeologic groundwater investigation at the landfill can continue. This letter presents the data supporting our conclusion that the monitoring wells at the landfill do not influence geothermal spring activity at the Vichy Springs Resort.

Through a letter, dated May 6, 1994, from attorney James R. Mazzoni, Jr., Mr. Ashoff contends that immediately following the installation of the well 92-4, (installed March 15, 1993 through March 18, 1993) the temperature at Vichy Springs declined 12 degrees (a six degree increase was later observed, for a net decrease of six degrees from its "*historic temperature*"). Mr. Ashoff further alleges an accompanying decrease in discharge of thirty percent from a

EXHIBIT 1

825 Sonoma Ave., Suite C P.O. Box 4600 Santa Rosa, California 95402 (707) 544-0784 FAX (707) 544-0866
11344 Coloma Rd., Suite 245 Gold River California 95670 (916) 852-6800 FAX (916) 852-0866

reported flow of 65 gallons per minute (gpm). This decrease in flow of 19.5 gpm (30% of 65 gpm) is also attributed to the presence of monitoring well 92-4. We believe it is highly improbable that either monitoring well 90-8 or 92-4 (see sheet 1) can adversely impact Vichy Springs. The two principal arguments for this position are 1) there are a number independent lines of evidence (geologic, hydrogeologic, and hydrochemical) supporting the conclusion that the monitoring wells are completed in a water-bearing zone that is different, distinct and physically separate from that of Vichy Springs, and 2) the monitoring wells can not physically account for the quantity of heat loss claimed, and volume of groundwater extracted from the monitoring wells is far too low to account for the reduction in spring flow attributed to them. Mr. Ashoff, to date, has not presented records of groundwater temperature or flow rate data for Vichy Springs to document the deviation from historic temperature or discharge referred to in Mr. Mazzoni's letter.

SITE GEOLOGY

The geology and hydrogeology of the area have been studied by a number of researchers (Blake and Jones, 1981; Cardwell, 1965; Farrar,1986; Treasher, 1958; and Upp, 1982) and is discussed in the Environmental Monitoring Program (EBA, 1993a) and the Report of Waste Discharge (ROWD) prepared for the landfill (EBA, 1993b). Based on a review of available geologic maps (Cardwell, 1965; Farrar, 1986) and site field reconnaissance mapping of the area, there appear to be three major geologic units represented in the vicinity of the landfill site. These include rocks from the coastal belt of the Franciscan Assemblage, Pliocene-Pleistocene Continental Basin Deposits, and contemporary (Holocene) alluvial deposits.

The central belt of the Cretaceous-Jurassic age Franciscan Assemblage, underlies the majority of the Mayacamas range east of the Maacama fault (Blake and Jones, 1981). The Franciscan Assemblage outcrops in the Sulphur Creek drainage to the south of the landfill site, near Vichy Springs Resort. The central belt of the Franciscan Assemblage predominantly consists of what is known as a tectonic melange. The melange consists of an admixture of disrupted sandstone and assorted metavolcanic, greenstone and chert inclusions, within a highly sheared and deformed, dark-gray shale matrix. Bedding deformation within blocks of interbedded sandstone and shale turbidites indicates that there has been a complex and varied strain history within the Central belt of the Franciscan Assemblage. As a result of the intense deformation history, the primary porosity of the Central belt of the Franciscan Assemblage has been greatly reduced. Accordingly, the ability of the Franciscan Assemblage melange to absorb, store and transmit water is almost entirely dependent on the degree of faulting, fracturing and weathering. Water often percolates into large upland areas underlain by Franciscan basement, and later discharges from springs and/or provides base flow for tributaries to the Russian River. Discharge of thermal water, such as Vichy Springs, is also quite common throughout the area. Historical records, however, indicate that groundwater yield to wells within Franciscan bedrock is

generally unpredictable and in most cases volumetrically insignificant (Cardwell, 1965; Farrar 1986). Vichy Springs flows from fractured Franciscan bedrock exposed in a hillside along the southern edge of the Sulphur Creek drainage basin (see Figure 1).

The entire landfill site is underlain by Pliocene-Pleistocene Continental Basin Deposits, which are referred to locally as the Ukiah Beds (Treasher, 1958). These relatively undeformed deposits consist of poorly sorted, highly consolidated, partially indurated, silt-dominated conglomerates, clayey sands, and silty clays which unconformably overlie an irregular surface of Franciscan bedrock. The maximum thickness of the Continental Basin Deposits is estimated to be in excess of 2,000 feet (Cardwell, 1965). The basal contact of the continental deposits, where it overlies the Franciscan bedrock has not been encountered in any of the test borings or monitoring wells drilled at the site to date, including a deep test boring (TB-90-4, see Sheet 1) which was abandoned at a depth of 265 feet below the surface, approximately 545 feet MSL (EBA, 1993b).

The hydraulic properties of the Continental Basin Deposits in the saturated zone at selected groundwater monitoring wells at the site were determined by in-situ testing. Hydraulic conductivity values were obtained from rising- and falling-head slug tests and are reported by EBA (1993b). Hydraulic conductivities reported from slug tests for the Plio-Pleistocene Continental Basin Deposits ranged from 7.5×10^{-6} cm/sec to 2.8×10^{-5} cm/sec, and Holocene alluvium tested from 1.6×10^{-5} cm/sec to 1.6×10^{-4} cm/sec.

Lithologic boring logs of monitoring wells 90-8 and 92-4 (EBA, 1993b) indicate they are drilled through a continuous section of Continental Basin Deposits consisting of low permeability silty clays and clayey silts. No perched groundwater, aquitards or Franciscan bedrock were encountered during drilling. This demonstrates that the monitoring wells are completed in a distinctive and separate geologic formation, consisting of significantly different hydrogeologic properties, from the Franciscan bedrock in which Vichy Springs occurs. .

HEAT LOSS

The alleged energy loss associated with a 12 degree (assumed fahrenheit) decrease in temperature of Vichy Springs, immediately following the installation of well 92-4, was calculated assuming an aquifer with a conservatively small area of influence consisting of 1,000 feet by 2,000 feet by 50 feet deep with 30% porosity. The energy loss was calculated as 22.3×10^{9} British thermal units (Btu) or 6,533,841 kWh. On a practical level it is extremely improbable that an energy transference of this magnitude could solely occur via a monitoring well with a 2-inch PVC casing without destroying or resulting in significant damage to the well.

Mr. Singer, in a letter to Mr. Ashoff, dated March 19, 1994, presents examples of adiabatic

cooling related to the rapid release of pressure in rocket motors and explosions designed to extinguish oil well fires. It is well established that rapid decompressive cooling may be achieved in gasses, however, Mr. Singer states "*it is clear that cooling of the spring water resulted from a reduction in formation pressure and release of the natural carbon dioxide gases in the formation by the drilling of this single well*". Mr. Singer fails to present any site specific hydrogeologic data to support this conclusion or his recommendation that no further drilling be allowed in the vicinity of the springs. No significant changes in pressure (other than barometric variations) were observed during drilling or following installation of monitoring well 92-4. In addition, monitoring well 92-4 is located in relatively low permeability material, making it unlikely that gasses would migrate at the rate comparable to Mr. Singer's cited past experience.

Based on the discussion presented above, and in the absence of historic temperature data for Vichy Springs, it is reasonable to assume that the temperature oscillations observed in Vichy Springs water are likely within the range of normal fluctuation. Evaluation of a detailed temperature database should allow the identification of historical temperature ranges and possibly temporal variations in temperature.

Recent observations by the Mendocino County Environmental Health Department indicate that the temperature of Vichy Springs has evidently returned to a "normal level" (personal communication, Mendocino Environmental Health Department personnel, 7/28/94). This further suggests the landfill monitoring wells are not influencing Vichy Springs.

FLOW REDUCTION

A flow reduction of thirty percent from a "*historic level*" of 65 gpm has apparently been observed at Vichy Springs. This equates to a 19.5 gpm reduction in flow or an annual reduction of 10,249,200 gallons. This loss has been attributed, by Mr. Ashoff, to monitoring wells 90-8 and 92-4. To date sampling records show that the volume of water extracted from the two wells due to development and sample purging is approximately 172 gallons from 90-8 since April 1991 (an annual total of 57 gallons) and approximately 36 gallons from well 92-4 since May 15, 1993. Additionally, during the drilling of both monitoring wells no zones of high permeability were encountered. Further, no free water was encountered in well 92-4 during drilling. Well 92-4 was completed on March 18, 1993 and groundwater was not observed until April 27, 1993, 40 days later. Both well 90-8 and 92-4 have slow recharge rates following sample purging consistent with the low permeability subsurface materials in which they are installed. Clearly, the monitoring wells are not physically capable of extracting groundwater at flow rates sufficient to account for the reduction in discharge from Vichy Springs.

Further, the thickness of the Continental Basin Deposits and the depth to the Franciscan bedrock (the geologic formation associated with Vichy Springs) beneath the site is not known, however

exploratory borings from the site, as previously discussed, illustrate that the thickness of the low permeability Continental Basin Deposits is significant. Therefore the likelihood of groundwater flow from the water-bearing zone encountered in wells 90-8 and 92-4 to Franciscan bedrock is very low.

ORGANIC AND INORGANIC HYDROCHEMICAL ANALYTICAL RESULTS

Wells at the Ukiah Landfill have been analyzed for a number of water-quality parameters since 1987. As part of this analysis available chemical data for Vichy Springs was evaluated to examine the similarities and differences in groundwater hydrochemistry between groundwater encountered beneath the landfill and mineral water from the Vichy Springs Resort. These analytical results are presented and discussed in detail by EBA (EBA, 1993a; 1993b).

Sampling of landfill wells has identified three areas of groundwater impact (well 87-1; wells 90-4 and 90-5; and well 90-8) based on the consistent detection of volatile organic compounds (VOC's). Samples analyzed from Vichy Springs in 1987, 1990 and 1991 did not detect VOC's. Analysis of groundwater samples from Vichy Springs for total (unfiltered) metals has also been performed in 1987, 1990, 1991 and 1993 of which a number of metals (antimony, arsenic, beryllium, cadmium, chromium, cobalt, lead, mercury, molybdenum, selenium, silver, thallium, tim, titanium, vanadium and zinc) have not been detected above their respective MDL's.

To date, no pesticides or PCB's have been detected in any landfill groundwater samples or samples collected from Vichy Springs.

Analysis of major anions and cations suggests, in general, that the landfill monitoring wells exhibit significant variations in the concentration of all parameters evaluated but do not appear to exhibit a consistent pattern. No monitoring well is significantly different from all other wells for all parameters evaluated. Well 90-8 and Vichy Springs generally exhibit higher parameter concentrations than most other monitoring wells. Compositionally, however, the analysis indicates that well 90-8 and Vichy Springs exhibit significant differences from each other in cation and anion content.

As noted in the Hydrochemical and Statistical Evaluation of the City of Ukiah Landfill (EBA, 1993a; 1993b) the general hydrochemical signature of Vichy Springs is similar to some landfill wells and different from others. Vichy Springs is readily distinguishable from all landfill wells. VOC's have been identified in specific monitoring wells and have not been detected in samples from Vichy Springs.

Boron is believed to be associated with recent volcanic activity in the northern coast ranges, and is commonly reported in groundwater on the east side of the Ukiah Valley (Cardwell, 1965;

Farrar, 1986). Boron was detected at Vichy Springs in 1990, 1991, and 1993 in concentrations ranging from 100 mg/l to 126 mg/l, significantly higher than any of the landfill monitoring wells. Based on data from the July 12, 1994 sampling event, boron concentration in landfill wells ranged from <0.5 to 54 mg/l. Boron concentrations in well 90-8 and 92-4 were 23 mg/l and 54 mg/l, respectively. Boron concentrations for southeastern landfill well locations (90-6, 90-8, and 92-4) are not significantly different from one another but appear to be significantly higher than all other monitoring wells, suggesting a possible relationship between location and concentration.

Temperature data provided by Mr. Ashoff collected on December 6, 1979 indicates that the temperature of Vichy Springs was 30.5°C, significantly higher than the temperature of groundwater water in monitoring wells 90-8 and 92-4, which ranges from 20° to 21°C and 15° to 25°C, respectively. However, as discussed previously, evaluation of a detailed temperature database from Vichy Springs is needed to identify historic temperature ranges.

STABLE ISOTOPE ANALYSIS

To further characterize the hydrochemistry and hydrogeologic relationship between the shallow groundwater beneath the Ukiah Landfill and Vichy Springs mineral water, stable isotope studies were performed (EBA, 1993b, 1994a, and 1994b). Important trace isotopes of hydrogen and oxygen atoms in water ($H_2{}^{16}O$) are deuterium (D) and oxygen-18 (^{18}O) which can provide a "Fingerprinting" of a source water by its stable isotopic signature. This fingerprinting can provide a very effective method for water characterization, with particular application in tracing the source, migration, recharge, and history of a particular groundwater. Rather than relying solely on the concentrations of constituents that are susceptible to chemical, physical, and biological transformations, stable isotopic identification of a water type allows tracking of its subsequent flow and mixing, independent of its chemical concentrations.

The results of the stable isotope analyses exhibits very distinct isotopic variations in groundwaters in the Ukiah Landfill area, and that the different waters can be easily distinguished. In a plot of δD vs $\delta^{18}O$ the majority of the samples lie along the Meteoric Water Line (MWL) at values appropriate for coastal California (Craig, 1961). The plot clearly shows that Ardeche Spring and Vichy Springs water have isotope characteristics distinct from all other groundwaters at the landfill (see Figure 2). Furthermore, no mixing trend between Vichy Springs/Ardeche Springs water and any other water is apparent. Non-mixing further indicates there is no interconnectivity between groundwater at the Vichy Springs Resort and any of the groundwaters collected from the landfill wells.

As discussed previously, Ardeche Springs and Vichy Springs both flow from fractures and joints in the Franciscan bedrock exposed in the Sulphur Creek drainage. Both of the springs plot close

together, well to the right of the MWL, appropriate for connate or mineralized formation waters. Samples with δD and $\delta^{18}O$ values that plot to the right of the MWL have usually undergone isotopic enrichment by evaporation or water-rock interaction associated with older waters that have also undergone mineralization through long residence time in contact with bedrock. Water-rock isotopic exchange is not significant in cool, meteoric groundwaters, including most young shallow groundwater (Dr. Bob Criss, personal communication, 1993).

Samples from wells 90-8 and 92-4 also plot to the right of the MWL, but are significantly separated from those of Ardeche Springs and Vichy Springs. As described in the ROWD (EBA, 1993b) these low yielding wells have been installed in silts and clays of the Continental Basin Deposits along the northern divide between the Sulphur Creek drainage basin, where the Vichy Springs Resort is located, and the landfill drainage basin. The City Range Spring is located on the north side of the ridge which divides the two drainage basins. The City Range Spring flows from the Continental Basin Deposits, and plots closely with samples from wells 90-8 and 92-4. It appears likely that groundwater in wells 90-8 and 92-4, and the City Range Spring are related, and represent another formation water in the area.

In a letter dated July 26, 1994 to Mr. Ashoff, Mr. Davisson concurs with the results and interpretation of the stable isotope evaluation. He further presents a hypothetical example in which two formation waters may belong to the same general hydrologic system and recommends that a hydrogeologic investigation be performed in the region. Unfortunately, Mr. Davisson may be unaware of the results of the ongoing hydrogeologic investigation and the geologic and hydrogeologic information developed which supports a different scenario. Mr. Davisson also does not present an opinion regarding the probability of site monitoring wells impacting Vichy Springs.

CONCLUSIONS

Local and regional geology, hydrochemical analytic results and stable isotope analysis provide data supporting the conclusion that monitoring wells 90-8 and 92-4 are not impacting Vichy Springs because they are installed in a water-bearing zone significantly different from and not connected to, or intermixing with, the water-bearing zone of Vichy Springs. Further, calculations examining heat loss and flow reduction reported to have occurred at Vichy Springs, clearly demonstrate that the monitoring wells are not physically capable of influencing the hydrology or temperature of Vichy Springs. Based on the data developed, it is our opinion that the likelihood of future landfill site monitoring wells adversely impacting vichy Springs is extremely improbable.

It should be noted that Mr. Ashoff has demanded that an in-depth surface and subsurface hydrogeologic investigation be performed in the area. The City of Ukiah has been attempting

to perform hydrogeologic investigations at the landfill site to identify and characterize the vertical and lateral extent of impacted groundwater, which could pose a threat to the waters of the State. Any responsible and detailed hydrogeologic study must include the installation of monitoring wells in order to further evaluate groundwater conditions. These investigations have been delayed by Mr. Ashoff and are as yet incomplete. In order to further characterize benzene contamination detected in groundwater samples collected from 90-8 and 92-4 and aid in the determination of the direction of groundwater flow in the area, the installation of additional groundwater monitoring wells at the site is required.

As you requested, we have submitted this letter report directly to the RWQCB on behalf of the City of Ukiah. We trust this provides the information you require. Please call me if you have any questions.

Sincerely,
EBA WASTECHNOLOGIES

Subject: REVIEW OF UKIAH LANDFILL MONITORING WELL INFORMATION

As you know, you contacted us recently to request that we review information relating to the drilling of a monitoring well near the Ukiah Landfill and its possible effects on the temperature and flow rate of a spring at the Vichy Hot Springs Resort.

We have reviewed the information forwarded to us regarding the possible effects of drilling monitoring well 92-4 in March, 1993. The well was drilled by the City of Ukiah to monitor water quality in the vicinity of the Ukiah Landfill. The information we reviewed consisted of:

- October 24, 1994 letter from Gilbert Ashoff to Benjamin Kor
- October 17, 1994 letter from Gilbert Ashoff to Benjamin Kor
- October 14, 1994 letter from Robert E. Mackensen to Paul Blais
- October 13, 1994 letter from Alisto Engineering Group to Gilbert Ashoff
- August 31, 1994 letter from EBA Wastechnologies to Rick Kennedy
- September 20, 1994 letter from Judy Pruden to Chuck Rough and Rick Kennedy
- July 26, 1994 letter from M. Lee Davisson (Lawrence Livermore Lab) to Gilbert Ashoff

EXHIBIT 1

- o March 19, 1994 letter from Stanley J. Singer to Dani Renan
- o U.S. Geological Survey Water-Supply Paper 338, 1915
- o U.S. Geological Survey Professional Paper 492, 1965

Our review of these materials, indicates that: (1) the monitoring well was drilled into a different geological formation from the formation underlying the hot springs; (2) apparently no pressure effects were noted during drilling; (3) the temperature of the water in the monitoring well apparently ranges between 59°-77°F, in contrast to the 90°F temperature of the hot spring; and (4) data from Lawrence Livermore Lab shows that the water in the monitoring well and the hot spring have different oxygen isotope values and therefore are from separate water sources and have no apparent mixing relationship. One would expect waters which are in the same hydrothermal regime to have similar oxygen isotope values and elevated temperatures. Furthermore, if the monitoring well were in fact responsible for the drop in temperature of the spring, one would not have expected the temperature in the spring to have recovered almost to its pre-drilling temperature without a subsequent change in the condition of the well, e.g., plugging. In summary, we have not seen convincing evidence to support the conclusion that the drilling of this monitoring well could have impacted the temperature and flow rate of the hot spring.

In order to better ascertain any relationship between drilling boreholes and the hot spring, the following information could be collected if subsequent monitoring wells are drilled: the temperature of the borehole during drilling; insofar as possible, the pressure of the borehole during drilling; the temperature of the spring during and after drilling; and flow rates of the spring during and after drilling.

If you have any questions, please contact Liz Haven at (916) 227-4395 or Calnet 498-4395.

VICHY SPRINGS (UKIAH - MENDOCINO Co.)

HYDROGEOLOGICAL FIELD TESTS PERFOMED

BY M. WALGENWITZ (BRGM)

December 5 - 9 1979

APPENDIXES 1.1. to 1.4.

An investigation carried alongside the river called Sulphur Creek has shown the lack of relationship between surface water and carbon dioxide rich springs. Pump tests on the Vichy and Ardeche Beauty springs (appendixes 1.2. and 1.3. photos 1 to 3) did show besides, that those two springs don't have any direct link as far as water-heads are concerned.

Ardeche spring's discharge (1.0 l/s) cannot be increased through pumping, whereas in Vichy spring case the mean discharge pumped during 4 hour (8.8 l/s) is more than double than that measured just after opening the pipe (3.4 l/s), allowing to forecast the possibility of pumping or siphoning 8.0 l for eight hours in succession.

The discharge meassured the next day, after 18 hours recovery, was 2 but on comparison can be made between this value and the not stabilized 3.4 l/s. It was not possible to measure the discharge from the overflow.

The drilled well in the courtyard produced water with a smaller mineral content than that of the springs (3.6 g/l instead of 5.0 g/l); it reacts like a well in an unconfined aquifer (the permeability cannot be computed due to the lack of the well log) and it can be assessed that this aquifer is feld both by meteoric water and by mineral water.

Their action is almost identical, as indeed is their chemical composition, with the noted Ems on the Lahn; Fachingen of Nassau, Germany; and Vichy of Grande Grille, France.

From the following chemical analysis, made in 1888, it will be observed that the waters from the Doolan Vichy are heavily charged with carbonic acid gas and carbonates and that they contain some iron and potassium salts.

For an antacid, tonic, aperient, diuretic and alterative mineral water the Ukiah Vichy ranks among the finest on the Coast. They have proved highly beneficial in Bright's disease, torpidity of the bowels and liver. For dyspepsia and acid conditions of the urine and the blood they are excellent.

The waters are soon to be sold commercially.

Owing to recent developments the flow has increased enormously, flowing now about 20,000 gallons per hour.

On the premises are numerous springs which will soon be developed and analyzed.

issue consists of the crushed sediments that cover a large part of the region.

CARBONATED SPRING NEAR BOONVILLE (MENDOCINO 46).

A small carbonated spring rises on the Hotel ranch, near Boonville, about 25 miles northwest of Cloverdale. It has not been improved, however, and has been used only occasionally for drinking.

SINGLEYS SODA SPRING (MENDOCINO 47).

Singleys Soda Spring is on the main road between Ukiah and Boonville, about 5 miles northeast of the latter place. There has been a roadhouse near the spring for a number of years and the place is well known to travelers through this region. The spring has been improved only for drinking.

VICHY SPRINGS (MENDOCINO 48).

Vichy Springs form a resort that has been established for many years on Sulphur Creek, 3 miles northeast of Ukiah. In 1909 a small hotel and several cottages provided accommodations for 50 guests, and tub baths were supplied by the two principal springs, which rise on the southern side of the creek, about 200 yards southeast of the hotel. One of them, known as Ardecho Spring, rises in a cemented basin about 5 by 15 feet in size and 2 feet deep and supplies half a dozen tubs in a bathhouse beside it. Many bubbles rise with the water, which is slightly clouded as if by a small precipitate of iron, and a slight deposit, probably of calcium carbonate, forms on its surface. The water is noticeably carbonated and slightly alkaline in taste. Its discharge is about 8 gallons a minute, and the temperature is 60°.

About 45 yards southeastward, upstream from Ardecho Spring, Vichy Spring rises in a pool of irregular shape, about 6 by 10 feet in size, in a natural grotto of lime carbonate. It is said to have formerly issued at a point 3 or 4 yards farther west but changed to its present outlet at the time of a small earthquake. The earthquake of April 18, 1906, is said not to have affected it, however. When visited, the water of Vichy Spring was somewhat clearer than that of Ardecho Spring, but a more noticeable deposit of iron was formed. Its recorded temperature was 58°, being slightly lower than that of Ardecho Spring, but its discharge was approximately twice as great. Because of the temperature of the waters of these main springs they are shown on the map (Pl. III, in pocket) as thermal-carbonated, but they are best known for their carbonated character.

The water of Vichy Spring is kept flowing through tubs in a bathhouse beside it, when they are in use. A tingling sensation that is caused by small bubbles of carbon dioxide which collect on the bather

DISTRICT ID:9163227184 OCT 19'94 14:22 No.002 P.04

is locally ascribed to an electric property of the water. Two other carbonated springs rise in the gravel at the creek edge opposite Vichy Spring, but they have not been improved. They yield flows of about one-half gallon and 8 gallons a minute and have the same temperature as Vichy Spring. There is also a small seeping pool known as the Arsenic Spring on the bank 20 yards westward from Ardeche Spring, but it has been only slightly used. A quarter of a mile south of east from the main group, on the hillside 25 or 30 feet above the creek, a third spring of importance issues in a rock-walled basin that is protected by a roof, and yields perhaps a quarter of a gallon a minute. Like the other springs, it deposits iron and its water has a slightly alkaline taste. It is known as Crystal Spring and is a favorite for drinking, for its water is cool (50°) and pleasantly carbonated. Another small pool is formed by a seepage spring on the hillside 30 yards above Crystal Spring, but it has not been improved.

The following analyses of the three principal springs show their waters to be primary alkaline in character:

Analyses of water from Vichy Springs, Mendocino County, Cal.

Water from these springs has not been bottled commercially, chiefly perhaps because the iron and calcium it contains stain the bottles and injure its sale.

OCT 20'94 8:52 No.001 P.03 ID:

DISTRICT ID:9163227184 OCT 19'94 14:25 NO.002 P.05

The rocks of the locality are soft sandstones and clay shales. Along the creek for some distance below the springs there is a conglomerate that has probably been cemented by lime carbonate deposited from the spring water.

GOBBIS SODA SPRING (MENDOCINO 30).

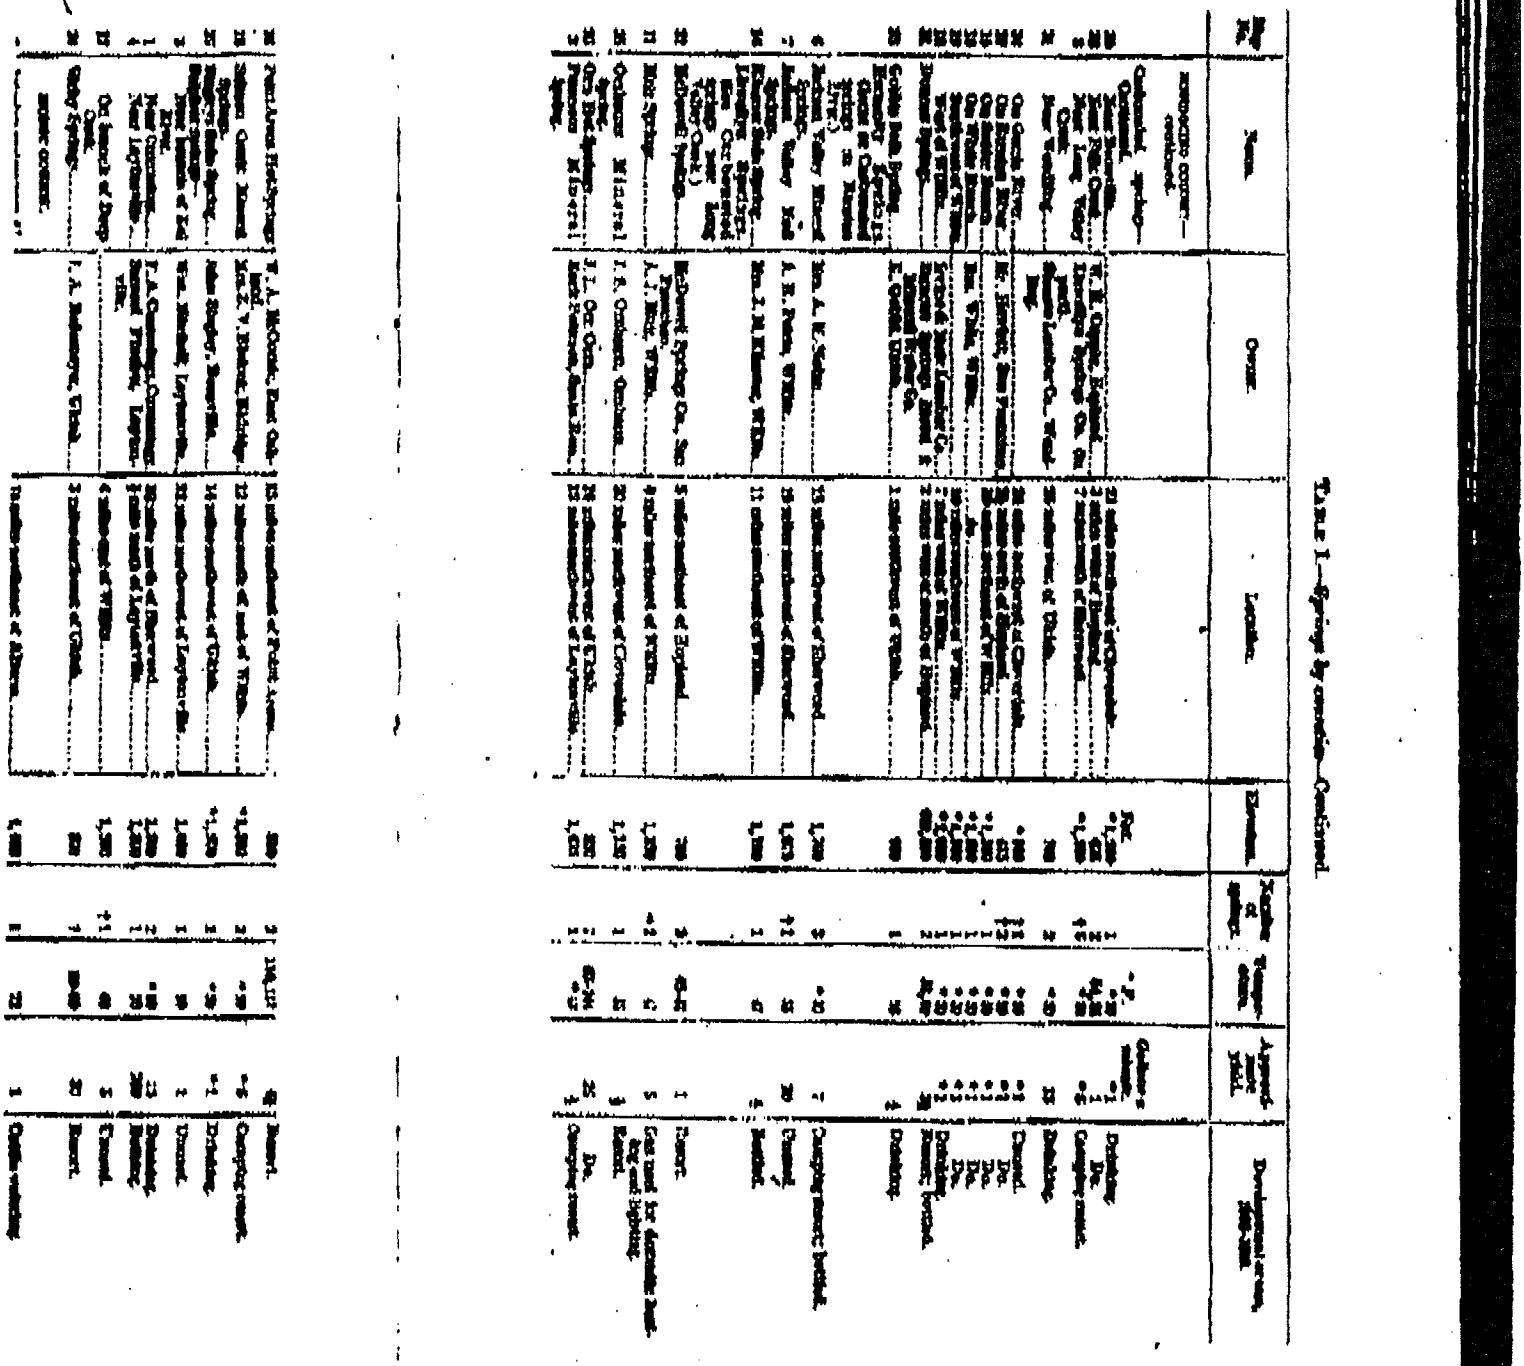
A small carbonated spring, known as Gobbis Soda Spring, rises at the base of the hills a mile southwest of the business portion of Ukiah. A brick-lined, tunnel-like basin has been constructed in the bank, and in summer the spring is visited for drinking water. As is true at most of the other carbonated springs, there is considerable iron stain along its outflow channel, but the water does not seem to be strongly mineralized. The rock at the locality is soft, light-colored shale that yields a clay soil.

CARBONATED SPRINGS AT SHOEMAKER DELL (MENDOCINO 31).

At Shoemaker Dell, a mountain resort in the hills 6 miles northwest of Ukiah, there are a number of carbonated springs that are used for drinking. They are cool and of small flow, like most of the springs of the locality. One or two of the springs are said to be magnesic, and magnesium, derived from serpentinous material associated with the sedimentary series, may be present in unusual amount. Accommodations for about 50 guests were provided at the property in 1910.

CARBONATED SPRINGS AT HAZEL HILL (MENDOCINO 32).

Three small springs that are used for drinking are situated at Hazel Hill, a small mountain resort about 35 miles northwest of Cloverdale. Only one spring has been improved by a cement basin, but they all furnish cool drinking water. The principal spring is moderately carbonated; the other two are respectively sulphureted and ferruginous in character.



CARBONATED SPRINGS NEAR WENDLING (MENDOCINO 33).

Near Wendling, a lumbering settlement about 45 miles northwest of Cloverdale, there are two or three small carbonated springs. One of these was formerly visited by picnic parties, but in recent years it has become neglected and partly filled up. A 200-foot well that furnishes part of the water that supplies a mill pond in the neighborhood also yields water that is carbonated.

BAKER MINERAL SPRINGS (MENDOCINO 37).

Baker Mineral Springs are about 18 miles by road east of Willits, on the banks of a stream that is tributary to Tomki River. The place has been a small camping resort for several years, and there are five small mineral springs on the property. At the lowermost spring

Page 3721 of 4165

determination which the City was required to make in deciding whether the project is categorically exempt.

Even though the plaintiffs' experts disagree with the City's, the City must make a factual determination as to whether there is " . . . a reasonable possibility that the activity will have a significant effect on the environment due to unusual circumstances." (14 CCR §15300.2(c).) It must also determine whether the project will ". . . result in a serious or major disturbance to an environmental resource." (14 CCR §15306.)

In making these determinations the City is entitled to rely upon substantial evidence. (See Dehne v. County of Santa Clara (1981) 115 Cal. App. 3d 827, 844-845 [" . . . courts in similar situations [reviewing categorical exemption determinations] have consistently refused to exceed the scope of their authority, on review of administrative decisions, by undertaking independent evaluation of the evidence. Instead, they have properly limited themselves to application of the substantial evidence test. (Citations omitted.)"].)

If the Court were to adopt the plaintiffs' standard of review, it would order the City to conduct more studies to determine whether the project will adversely affect the Vichy Springs; that is, whether the project is categorically exempt. CEQA clearly contemplates that the City make this threshold factual determination based on substantial evidence.

B. The City's determination that drilling the monitoring well will not harm the Vichy Springs is supported by substantial evidence.

Plaintiffs contend that the flow and temperature of their springs declined significantly one month after the City drilled

monitoring well no. 92-4. They contend that no other change took place that could account for this decline. Based on this fact alone, they contend that drilling any additional monitoring wells in the same area could further damage their springs.

Their experts, then, hypothesize a set of circumstances that could explain how monitoring well no. 92-4 caused these reductions. Recognizing that well 92-4 has tapped a different groundwater aquifer than the one which supplies the springs, the plaintiffs' experts contend that well 92-4 could have tapped the pressure zone that causes the springs to flow. Mr. Singer, the plaintiffs' retired rocket scientist, explains that if gas is allowed to escape, the resulting reduction in pressure could cool the water which that pressure influences. (See, also, Declaration of David Evans, para 13, p. 5, which also explains this fundamental principal of physics.)

The City's hydrogeologist has considered the plaintiffs' theories. His firm has been conducting hydrogeotechnical investigations of the landfill for the last eight years. Mr. Brown personally supervised the drilling of wells 90-8 and 92-4. He has studied the borings from those wells. He has studied aerial photographs of the area where the wells were drilled. The photographs provide information on the cracks and fissures in the geologic zone where the wells were drilled. He has studied and mapped the geology of the area.

Based on his investigations and his specific knowledge of the area, he believes that the plaintiffs' theories are highly improbable. First, it is highly improbable for a well with a two inch diameter located 980 feet from the springs to cause the kind

of pressure reduction that could account for the amount of temperature and flow reduction reported by the plaintiffs.

Second, it is highly improbable that a well drilled in one geologic zone could influence pressures in a separate geologic zone.

Third, the Continental Basin Deposits where the City has and will drill the monitoring wells does not contain the cracks and fissures through which gases could travel from the Franciscan Deposits, where the Vichy Springs are located.

Fourth, if well 92-4 had caused a release of sufficient pressure to cause the changes in the springs which plaintiffs report, the pressure in the well would have changed significantly. Neither during the drilling nor after the drilling has Brown detected that kind of pressure change in the well. (Brown Declaration, p. 15.)

Fifth, if well 92-4 had tapped the pressure zone influencing the springs, it would have penetrated a confining layer capable of maintaining gas under pressure. The soils extracted when the City drilled well 92-4 indicates that the City did not penetrate such a layer. (Brown Declaration, pp. 14-15.)

Mr. Brown states that there is no evidence of a cause and effect relationship between the drilling of well 92-4 and the reported reductions of the springs temperature and flow. (Brown Declaration, p. 19.) If sun spots appeared thirty days before these reductions occurred, it would make just as much sense to blame these reductions on them.

Based on a review of the data developed by EBA, both David Evans of the RWQCB, who is a registered Civil Engineer, and Liz

Haven, a geologist with the State Water Resources Control Board independently determined that the existing monitoring wells have not caused the reported reduction of flow and temperature at the Vichy Springs and the proposed benzene well will not cause further reductions. (Evans Declaration, pp. 10-11; Kennedy Declaration, para. 17, pp. 6-7; Exhibits N and O thereto.)

There is also considerable uncertainty over the consistency of the springs' flow and temperature before the City drilled well 92-4.

Although the Ashoff's claim that both the flow and temperature of the springs declined in April 1993, they did not inform the City or the RWQCB about the decline until January 1994, eight months later. During that time, they made numerous contacts with the defendants and many other agencies and officials. Those communications reported many complaints about the operation of the landfill, the drilling of well 92-4, and their adverse effects on the Ashoff's resort business. However, none of those letters or phone calls referred to a reduction in flow or temperature, even though the plaintiffs' now characterize these effects as "disasterous." (Evans Declaration, pp. 10-11.)

When Gilbert Ashoff contacted David Evans in January 1994 and later Margie Ashoff contacted Rick Kennedy in February 1994, they complained about a temperature reduction, but not a reduction of flow. (Evans Declaration, para. 22, p. 7, Exhibit E thereto; Kennedy Declaration, para. 6, p. 3; Exhibit D thereto.)

The first mention of a flow reduction came in a letter to the City Manager from attorney James Mazzoni who reported a flow reduction of 30%. This is a smaller reduction than the Ashoffs

represented in Exhibit I to the Ashoff Declaration, dated October 24, 1994, which was the first time temperature and flow figures were provided to the City and the RWQCB. (Evans Declaration, para. 28, p. 10. See also note 4, p. 5, ante.)

Moreover, the record of temperatures and flows for the springs at the Vichy Springs resort show a considerable fluctuation in both temperature and flow over the more than 100 years for which there is a record. (Brown Declaration, p. 18; Exhibit M thereto.) The historic record shows fluctuations that are greater than those reported by the Ashoffs for the period after March 1994, when the City drilled well no. 92-4. (Id.)

Fluctuations of this type are common for mineral springs and can be caused by a number of natural events, including very small seismic events. (Brown Declaration, p. 19.)

Given the total absence of evidence showing an interconnection between the monitoring wells and the Vichy Springs, the considerable uncertainty as to the "normal" temperature or flow of the springs and the likelihood that a natural event and not the monitoring wells are responsible for any observed changes in spring flow or temperature, this Court must conclude that substantial evidence supports the City's determination that drilling the monitoring well is categorically exempt from CEQA.

RE: UKIAH LANDFILL SITE MONITORING WELLS AND VICHY SPRINGS RESORT

Dear Mr. Kennedy:

This letter report summarizes the data we have developed to date regarding the potential for groundwater impact to Vichy Springs by groundwater monitoring wells at the Ukiah landfill. This report was prepared in accordance with a letter dated August 1, 1994, from the California Regional Water Quality Control Board, North Coast Region (RWQCB), requesting a summary of information supporting our conclusion that the existing or future groundwater monitoring wells at the landfill will not adversely impact Vichy Springs. It is our understanding that the RWQCB has made a similar request for data and a technical report from Mr. Ashoff, the owner of the Vichy Springs Resort.

BACKGROUND

As you are aware we have examined the available hydrogeologic and geochemical data, and found no evidence supporting Mr. Ashoff's claim that Ukiah Landfill site monitoring wells have adversely affected geothermal spring activity at Vichy Springs Resort. The RWQCB has requested a summary of relevant facts so that concerns can be resolved and the hydrogeologic groundwater investigation at the landfill can continue. This letter presents the data supporting our conclusion that the monitoring wells at the landfill do not influence geothermal spring activity at the Vichy Springs Resort.

Through a letter, dated May 6, 1994, from attorney James R. Mazzoni, Jr., Mr. Ashoff contends that immediately following the installation of the well 92-4, (installed March 15, 1993 through March 18, 1993) the temperature at Vichy Springs declined 12 degrees (a six degree increase was later observed, for a net decrease of six degrees from its "*historic temperature*"). Mr. Ashoff further alleges an accompanying decrease in discharge of thirty percent from a

825 Sonoma Ave., Suite C P.O. Box 4600 Santa Rosa, California 95402 (707) 544-0784 FAX (707) 544-0866

Also Las Vegas, Nevada

reported flow of 65 gallons per minute (gpm). This decrease in flow of 19.5 gpm (30% of 65 gpm) is also attributed to the presence of monitoring well 92-4. We believe it is highly improbable that either monitoring well 90-8 or 92-4 (see sheet 1) can adversely impact Vichy Springs. The two principal arguments for this position are 1) there are a number independent lines of evidence (geologic, hydrogeologic, and hydrochemical) supporting the conclusion that the monitoring wells are completed in a water-bearing zone that is different, distinct and physically separate from that of Vichy Springs, and 2) the monitoring wells can not physically account for the quantity of heat loss claimed, and volume of groundwater extracted from the monitoring wells is far too low to account for the reduction in spring flow attributed to them. Mr. Ashoff, to date, has not presented records of groundwater temperature or flow rate data for Vichy Springs to document the deviation from historic temperature or discharge referred to in Mr. Mazzoni's letter.

SITE GEOLOGY

The geology and hydrogeology of the area have been studied by a number of researchers (Blake and Jones, 1981; Cardwell, 1965; Farrar,1986; Treasher, 1958; and Upp, 1982) and is discussed in the Environmental Monitoring Program (EBA, 1993a) and the Report of Waste Discharge (ROWD) prepared for the landfill (EBA, 1993b). Based on a review of available geologic maps (Cardwell, 1965; Farrar, 1986) and site field reconnaissance mapping of the area, there appear to be three major geologic units represented in the vicinity of the landfill site. These include rocks from the coastal belt of the Franciscan Assemblage, Pliocene-Pleistocene Continental Basin Deposits, and contemporary (Holocene) alluvial deposits.

The central belt of the Cretaceous-Jurassic age Franciscan Assemblage, underlies the majority of the Mayacamas range east of the Maacama fault (Blake and Jones, 1981). The Franciscan Assemblage outcrops in the Sulphur Creek drainage to the south of the landfill site, near Vichy Springs Resort. The central belt of the Franciscan Assemblage predominantly consists of what is known as a tectonic melange. The melange consists of an admixture of disrupted sandstone and assorted metavolcanic, greenstone and chert inclusions, within a highly sheared and deformed, dark-gray shale matrix. Bedding deformation within blocks of interbedded sandstone and shale turbidites indicates that there has been a complex and varied strain history within the Central belt of the Franciscan Assemblage. As a result of the intense deformation history, the primary porosity of the Central belt of the Franciscan Assemblage has been greatly reduced. Accordingly, the ability of the Franciscan Assemblage melange to absorb, store and transmit water is almost entirely dependent on the degree of faulting, fracturing and weathering. Water often percolates into large upland areas underlain by Franciscan basement, and later discharges from springs and/or provides base flow for tributaries to the Russian River. Discharge of thermal water, such as Vichy Springs, is also quite common throughout the area. Historical records, however, indicate that groundwater yield to wells within Franciscan bedrock is

generally unpredictable and in most cases volumetrically insignificant (Cardwell, 1965; Farrar 1986). Vichy Springs flows from fractured Franciscan bedrock exposed in a hillside along the southern edge of the Sulphur Creek drainage basin (see Figure 1).

The entire landfill site is underlain by Pliocene-Pleistocene Continental Basin Deposits, which are referred to locally as the Ukiah Beds (Treasher, 1958). These relatively undeformed deposits consist of poorly sorted, highly consolidated, partially indurated, silt-dominated conglomerates, clayey sands, and silty clays which unconformably overlie an irregular surface of Franciscan bedrock. The maximum thickness of the Continental Basin Deposits is estimated to be in excess of 2,000 feet (Cardwell, 1965). The basal contact of the continental deposits, where it overlies the Franciscan bedrock has not been encountered in any of the test borings or monitoring wells drilled at the site to date, including a deep test boring (TB-90-4, see Sheet 1) which was abandoned at a depth of 265 feet below the surface, approximately 545 feet MSL (EBA, 1993b).

The hydraulic properties of the Continental Basin Deposits in the saturated zone at selected groundwater monitoring wells at the site were determined by in-situ testing. Hydraulic conductivity values were obtained from rising- and falling-head slug tests and are reported by EBA (1993b). Hydraulic conductivities reported from slug tests for the Plio-Pleistocene Continental Basin Deposits ranged from 7.5×10^{-6} cm/sec to 2.8×10^{-5} cm/sec, and Holocene alluvium tested from 1.6×10^{-5} cm/sec to 1.6×10^{-4} cm/sec.

Lithologic boring logs of monitoring wells 90-8 and 92-4 (EBA, 1993b) indicate they are drilled through a continuous section of Continental Basin Deposits consisting of low permeability silty clays and clayey silts. No perched groundwater, aquitards or Franciscan bedrock were encountered during drilling. This demonstrates that the monitoring wells are completed in a distinctive and separate geologic formation, consisting of significantly different hydrogeologic properties, from the Franciscan bedrock in which Vichy Springs occurs..

HEAT LOSS

The alleged energy loss associated with a 12 degree (assumed fahrenheit) decrease in temperature of Vichy Springs, immediately following the installation of well 92-4, was calculated assuming an aquifer with a conservatively small area of influence consisting of 1,000 feet by 2,000 feet by 50 feet deep with 30% porosity. The energy loss was calculated as 22.3×10^{9} British thermal units (Btu) or 6,533,841 kWh. On a practical level it is extremely improbable that an energy transference of this magnitude could solely occur via a monitoring well with a 2-inch PVC casing without destroying or resulting in significant damage to the well.

Mr. Singer, in a letter to Mr. Ashoff, dated March 19, 1994, presents examples of adiabatic

cooling related to the rapid release of pressure in rocket motors and explosions designed to extinguish oil well fires. It is well established that rapid decompressive cooling may be achieved in gasses, however, Mr. Singer states "*it is clear that cooling of the spring water resulted from a reduction in formation pressure and release of the natural carbon dioxide gases in the formation by the drilling of this single well*". Mr. Singer fails to present any site specific hydrogeologic data to support this conclusion or his recommendation that no further drilling be allowed in the vicinity of the springs. No significant changes in pressure (other than barometric variations) were observed during drilling or following installation of monitoring well 92-4. In addition, monitoring well 92-4 is located in relatively low permeability material, making it unlikely that gasses would migrate at the rate comparable to Mr. Singer's cited past experience.

Based on the discussion presented above, and in the absence of historic temperature data for Vichy Springs, it is reasonable to assume that the temperature oscillations observed in Vichy Springs water are likely within the range of normal fluctuation. Evaluation of a detailed temperature database should allow the identification of historical temperature ranges and possibly temporal variations in temperature.

Recent observations by the Mendocino County Environmental Health Department indicate that the temperature of Vichy Springs has evidently returned to a "normal level" (personal communication, Mendocino Environmental Health Department personnel, 7/28/94). This further suggests the landfill monitoring wells are not influencing Vichy Springs.

FLOW REDUCTION

A flow reduction of thirty percent from a "*historic level*" of 65 gpm has apparently been observed at Vichy Springs. This equates to a 19.5 gpm reduction in flow or an annual reduction of 10,249,200 gallons. This loss has been attributed, by Mr. Ashoff, to monitoring wells 90-8 and 92-4. To date sampling records show that the volume of water extracted from the two wells due to development and sample purging is approximately 172 gallons from 90-8 since April 1991 (an annual total of 57 gallons) and approximately 36 gallons from well 92-4 since May 15, 1993. Additionally, during the drilling of both monitoring wells no zones of high permeability were encountered. Further, no free water was encountered in well 92-4 during drilling. Well 92-4 was completed on March 18, 1993 and groundwater was not observed until April 27, 1993, 40 days later. Both well 90-8 and 92-4 have slow recharge rates following sample purging consistent with the low permeability subsurface materials in which they are installed. Clearly, the monitoring wells are not physically capable of extracting groundwater at flow rates sufficient to account for the reduction in discharge from Vichy Springs.

Further, the thickness of the Continental Basin Deposits and the depth to the Franciscan bedrock (the geologic formation associated with Vichy Springs) beneath the site is not known, however

exploratory borings from the site, as previously discussed, illustrate that the thickness of the low permeability Continental Basin Deposits is significant. Therefore the likelihood of groundwater flow from the water-bearing zone encountered in wells 90-8 and 92-4 to Franciscan bedrock is very low.

ORGANIC AND INORGANIC HYDROCHEMICAL ANALYTICAL RESULTS

Wells at the Ukiah Landfill have been analyzed for a number of water-quality parameters since 1987. As part of this analysis available chemical data for Vichy Springs was evaluated to examine the similarities and differences in groundwater hydrochemistry between groundwater encountered beneath the landfill and mineral water from the Vichy Springs Resort. These analytical results are presented and discussed in detail by EBA (EBA, 1993a; 1993b).

Sampling of landfill wells has identified three areas of groundwater impact (well 87-1; wells 90-4 and 90-5; and well 90-8) based on the consistent detection of volatile organic compounds (VOC's). Samples analyzed from Vichy Springs in 1987, 1990 and 1991 did not detect VOC's. Analysis of groundwater samples from Vichy Springs for total (unfiltered) metals has also been performed in 1987, 1990, 1991 and 1993 of which a number of metals (antimony, arsenic, beryllium, cadmium, chromium, cobalt, lead, mercury, molybdenum, selenium, silver, thallium, tim, titanium, vanadium and zinc) have not been detected above their respective MDL's.

To date, no pesticides or PCB's have been detected in any landfill groundwater samples or samples collected from Vichy Springs.

Analysis of major anions and cations suggests, in general, that the landfill monitoring wells exhibit significant variations in the concentration of all parameters evaluated but do not appear to exhibit a consistent pattern. No monitoring well is significantly different from all other wells for all parameters evaluated. Well 90-8 and Vichy Springs generally exhibit higher parameter concentrations than most other monitoring wells. Compositionally, however, the analysis indicates that well 90-8 and Vichy Springs exhibit significant differences from each other in cation and anion content.

As noted in the Hydrochemical and Statistical Evaluation of the City of Ukiah Landfill (EBA, 1993a; 1993b) the general hydrochemical signature of Vichy Springs is similar to some landfill wells and different from others. Vichy Springs is readily distinguishable from all landfill wells. VOC's have been identified in specific monitoring wells and have not been detected in samples from Vichy Springs.

Boron is believed to be associated with recent volcanic activity in the northern coast ranges, and is commonly reported in groundwater on the east side of the Ukiah Valley (Cardwell, 1965;

Farrar, 1986). Boron was detected at Vichy Springs in 1990, 1991, and 1993 in concentrations ranging from 100 mg/l to 126 mg/l, significantly higher than any of the landfill monitoring wells. Based on data from the July 12, 1994 sampling event, boron concentration in landfill wells ranged from <0.5 to 54 mg/l. Boron concentrations in well 90-8 and 92-4 were 23 mg/l and 54 mg/l, respectively. Boron concentrations for southeastern landfill well locations (90-6, 90-8, and 92-4) are not significantly different from one another but appear to be significantly higher than all other monitoring wells, suggesting a possible relationship between location and concentration.

Temperature data provided by Mr. Ashoff collected on December 6, 1979 indicates that the temperature of Vichy Springs was 30.5°C, significantly higher than the temperature of groundwater water in monitoring wells 90-8 and 92-4, which ranges from 20° to 21°C and 15° to 25°C, respectively. However, as discussed previously, evaluation of a detailed temperature database from Vichy Springs is needed to identify historic temperature ranges.

STABLE ISOTOPE ANALYSIS

To further characterize the hydrochemistry and hydrogeologic relationship between the shallow groundwater beneath the Ukiah Landfill and Vichy Springs mineral water, stable isotope studies were performed (EBA, 1993b, 1994a, and 1994b). Important trace isotopes of hydrogen and oxygen atoms in water ($H_2{}^{16}O$) are deuterium (D) and oxygen-18 (^{18}O) which can provide a "Fingerprinting" of a source water by its stable isotopic signature. This fingerprinting can provide a very effective method for water characterization, with particular application in tracing the source, migration, recharge, and history of a particular groundwater. Rather than relying solely on the concentrations of constituents that are susceptible to chemical, physical, and biological transformations, stable isotopic identification of a water type allows tracking of its subsequent flow and mixing, independent of its chemical concentrations.

The results of the stable isotope analyses exhibits very distinct isotopic variations in groundwaters in the Ukiah Landfill area, and that the different waters can be easily distinguished. In a plot of δD vs $\delta^{18}O$ the majority of the samples lie along the Meteoric Water Line (MWL) at values appropriate for coastal California (Craig, 1961). The plot clearly shows that Ardeche Spring and Vichy Springs water have isotope characteristics distinct from all other groundwaters at the landfill (see Figure 2). Furthermore, no mixing trend between Vichy Springs/Ardeche Springs water and any other water is apparent. Non-mixing further indicates there is no interconnectivity between groundwater at the Vichy Springs Resort and any of the groundwaters collected from the landfill wells.

As discussed previously, Ardeche Springs and Vichy Springs both flow from fractures and joints in the Franciscan bedrock exposed in the Sulphur Creek drainage. Both of the springs plot close

together, well to the right of the MWL, appropriate for connate or mineralized formation waters. Samples with δD and $\delta^{18}O$ values that plot to the right of the MWL have usually undergone isotopic enrichment by evaporation or water-rock interaction associated with older waters that have also undergone mineralization through long residence time in contact with bedrock. Water-rock isotopic exchange is not significant in cool, meteoric groundwaters, including most young shallow groundwater (Dr. Bob Criss, personal communication, 1993).

Samples from wells 90-8 and 92-4 also plot to the right of the MWL, but are significantly separated from those of Ardeche Springs and Vichy Springs. As described in the ROWD (EBA, 1993b) these low yielding wells have been installed in silts and clays of the Continental Basin Deposits along the northern divide between the Sulphur Creek drainage basin, where the Vichy Springs Resort is located, and the landfill drainage basin. The City Range Spring is located on the north side of the ridge which divides the two drainage basins. The City Range Spring flows from the Continental Basin Deposits, and plots closely with samples from wells 90-8 and 92-4. It appears likely that groundwater in wells 90-8 and 92-4, and the City Range Spring are related, and represent another formation water in the area.

In a letter dated July 26, 1994 to Mr. Ashoff, Mr. Davisson concurs with the results and interpretation of the stable isotope evaluation. He further presents a hypothetical example in which two formation waters may belong to the same general hydrologic system and recommends that a hydrogeologic investigation be performed in the region. Unfortunately, Mr. Davisson may be unaware of the results of the ongoing hydrogeologic investigation and the geologic and hydrogeologic information developed which supports a different scenario. Mr. Davisson also does not present an opinion regarding the probability of site monitoring wells impacting Vichy Springs.

CONCLUSIONS

Local and regional geology, hydrochemical analytic results and stable isotope analysis provide data supporting the conclusion that monitoring wells 90-8 and 92-4 are not impacting Vichy Springs because they are installed in a water-bearing zone significantly different from and not connected to, or intermixing with, the water-bearing zone of Vichy Springs. Further, calculations examining heat loss and flow reduction reported to have occurred at Vichy Springs, clearly demonstrate that the monitoring wells are not physically capable of influencing the hydrology or temperature of Vichy Springs. Based on the data developed, it is our opinion that the likelihood of future landfill site monitoring wells adversely impacting vichy Springs is extremely improbable.

It should be noted that Mr. Ashoff has demanded that an in-depth surface and subsurface hydrogeologic investigation be performed in the area. The City of Ukiah has been attempting

to perform hydrogeologic investigations at the landfill site to identify and characterize the vertical and lateral extent of impacted groundwater, which could pose a threat to the waters of the State. Any responsible and detailed hydrogeologic study must include the installation of monitoring wells in order to further evaluate groundwater conditions. These investigations have been delayed by Mr. Ashoff and are as yet incomplete. In order to further characterize benzene contamination detected in groundwater samples collected from 90-8 and 92-4 and aid in the determination of the direction of groundwater flow in the area, the installation of additional groundwater monitoring wells at the site is required.

As you requested, we have submitted this letter report directly to the RWQCB on behalf of the City of Ukiah. We trust this provides the information you require. Please call me if you have any questions.

Sincerely,
EBA WASTECHNOLOGIES

Subject: REVIEW OF UKIAH LANDFILL MONITORING WELL INFORMATION

As you know, you contacted us recently to request that we review information relating to the drilling of a monitoring well near the Ukiah Landfill and its possible effects on the temperature and flow rate of a spring at the Vichy Hot Springs Resort.

We have reviewed the information forwarded to us regarding the possible effects of drilling monitoring well 92-4 in March, 1993. The well was drilled by the City of Ukiah to monitor water quality in the vicinity of the Ukiah Landfill. The information we reviewed consisted of:

- October 24, 1994 letter from Gilbert Ashoff to Benjamin Kor
- October 17, 1994 letter from Gilbert Ashoff to Benjamin Kor
- October 14, 1994 letter from Robert E. Mackensen to Paul Blais
- October 13, 1994 letter from Alisto Engineering Group to Gilbert Ashoff
- August 31, 1994 letter from EBA Wastechnologies to Rick Kennedy
- September 20, 1994 letter from Judy Pruden to Chuck Rough and Rick Kennedy
- July 26, 1994 letter from M. Lee Davisson (Lawrence Livermore Lab) to Gilbert Ashoff

EXHIBIT 1

- March 19, 1994 letter from Stanley J. Singer to Dani Renan
- U.S. Geological Survey Water-Supply Paper 338, 1915
- U.S. Geological Survey Professional Paper 492, 1965

Our review of these materials, indicates that: (1) the monitoring well was drilled into a different geological formation from the formation underlying the hot springs; (2) apparently no pressure effects were noted during drilling; (3) the temperature of the water in the monitoring well apparently ranges between 59°-77°F, in contrast to the 90°F temperature of the hot spring; and (4) data from Lawrence Livermore Lab shows that the water in the monitoring well and the hot spring have different oxygen isotope values and therefore are from separate water sources and have no apparent mixing relationship. One would expect waters which are in the same hydrothermal regime to have similar oxygen isotope values and elevated temperatures. Furthermore, if the monitoring well were in fact responsible for the drop in temperature of the spring, one would not have expected the temperature in the spring to have recovered almost to its pre-drilling temperature without a subsequent change in the condition of the well, e.g., plugging. In summary, we have not seen convincing evidence to support the conclusion that the drilling of this monitoring well could have impacted the temperature and flow rate of the hot spring.

In order to better ascertain any relationship between drilling boreholes and the hot spring, the following information could be collected if subsequent monitoring wells are drilled: the temperature of the borehole during drilling; insofar as possible, the pressure of the borehole during drilling; the temperature of the spring during and after drilling; and flow rates of the spring during and after drilling.

If you have any questions, please contact Liz Haven at (916) 227-4395 or Calnet 498-4395.

Attorneys for VICHY SPRINGS RESORT

CITY OF UKIAH CITY COUNCIL

VICHY SPRINGS RESORT, RUSSIAN RIVERKEEPER and MATEEL ENVIRONMENTAL JUSTICE FOUNDATION Petitioner v. **CITY OF UKIAH PUBLIC WORKS DEPARTMENT and CITY OF UKIAH CITY COUNCIL** Respondent	Case No. **CEQA NON-COMPLIANCE FOR CITY OF UKIAH'S FINAL ENVIRONMENTAL IMPACT REPORT (FEIR) FOR LANDFILL CLOSURE PLAN**

I. OVERVIEW: THE FEIR FAILS TO DISCLOSE, EVALUATE AND MITIGATE FIRE HAZARDS, WATER QUALITY IMPACTS AND SCENCIC EFFECTS THAT WILL ADVERSELY IMPACT THE BROADER COMMUNITY

1. VICHY SPRINGS RESORT is a business and land-owner located immediately adjacent to the location of the City of Ukiah ("CITY") landfill on Vichy Springs Road in Mendocino County, California, and immediately adjacent to the location of the CITY's proposed Landfill Closure Plan. VICHY SPRINGS RESORT was established more than 160 years ago in 1854 and is a California

Registered Landmark. People come to VICHY SPRINGS RESORT for the outdoor naturally effervescent "champagne" mineral baths and to explore the extensive hillside hiking trails. As the current brochure for VICHY SPRINGS RESORT states: "Guests are invited to explore and hike the 700-acre private reserve where wildlife abounds in woods, meadows, streams and hills." The natural scenic beauty and quietude of the grounds and trails of the VICHY SPRINGS RESORT are a main reason people come and return.

2. RUSSIAN RIVERKEEPER is a nonprofit organization focused on the protection and restoration of the Russian River and its tributary waters. There are streams and creeks below and in the vicinity of the former Ukiah landfill that are part of the Russian River watershed. RUSSIAN RIVERKEEPER co-submits these comments along with VICHY SPRINGS RESORT and MATEEL ENVIRONMENTAL to ensure that the CITY's Landfill Closure Plan does not pose a threat of harmful releases of landfill contents and toxic materials into such tributary waters.

3. MATEEL ENVIRONMENTAL JUSTICE FOUNDATION ("MATEEL ENVIRONMENTAL") is a California nonprofit organization focused on the prevention of pollutants and toxic releases into air and water and the protection of ecosystems. MATEEL ENVIRONMENTAL co-submits these comments along with VICHY SPRINGS RESORT and RUSSIAN RIVERKEEPER to ensure that the CITY's Landfill Closure Plan does not pose a threat of harmful releases of pollutants into the air and into streams and creeks near the landfill site.

4. In December 2019, the owner and legal counsel for VICHY SPRINGS RESORT attended and participated in a public hearing in Ukiah on the draft environmental impact report ("DEIR") prepared by the CITY for the Landfill Closure Plan. On January 9, 2020, VICHY SPRINGS RESORT submitted written comments to the CITY on the DEIR prepared for the Landfill Closure Plan. In both its December 2019 public hearing testimony and its January 9, 2020 written submission, VICHY SPRINGS RESORT explained the numerous tangible ways that the currently proposed Landfill Closure Plan would adversely impact the local community and natural environment and why the DEIR for the Landfill Closure Plan failed to comply with the requirements of the California Environmental Quality Act ("CEQA").

5. As set forth in VICHY SPRINGS RESORT's January 9, 2020 written submission, and as set forth herein, the CEQA non-compliance concerns raised by VICHYS SPRINGS RESORT, RUSSIAN RIVERKEEPER and MATEEL ENVIRONMENTAL are not trivial or procedural in nature, but focus on critical substantive environmental concerns that will have a lasting impact on the surrounding community and broader natural environment for decades to come, such as: the enhanced fire risks and public safety hazards associated the toxic highly flammable cover proposed for the landfill; the pollution of nearby streams, creeks and the Russian River due to microplastic and PFAS releases from the synthetic cover proposed for the landfill; the long-term scenic degradation of the beautiful natural hillsides where the former landfill is located; the noise impacts that may ruin the outdoor recreational experience for people living, hiking and walking near the landfill; the operation of groundwater monitoring wells that have previously depressurized the carbonated subsurface mineral springs that are the namesake of the Vichy Springs. Beyond these environmental impacts, in terms of the true costs of the current Landfill Closure plan to Ukiah taxpayers, there is the fact that project budget provided to the Ukiah City Council and the public in the CEQA documents do not include the costs of the additional financial assurances and fire insurance that will be necessitated by the proposed synthetic plastic landfill cover and do not include the likely costs of removing, disposing and replacement the interim synthetic landfill cover. The failure to disclose the financial assurance, fire insurance and likely removal/disposal/replacement costs associated with the proposed synthetic landfill cover indicates that – in direct contradiction to claims in the CEQA documents for the project – the selection of the synthetic landfill cover will cost the CITY and Ukiah taxpayers *more* than the selection of a clay/earthen landfill cover.

6. In late April 2020, the CITY released its proposed final environmental impact report ("FEIR"), and indicated its intention to certify the FEIR and move forward with the proposed Landfill Closure Plan which included the proposed synthetic landfill cover. Unfortunately, as explained and detailed herein, the FEIR released in late April 2020 does nothing to address or remedy the fundamental CEQA shortcomings and omissions of the earlier DEIR, and as such the CITY's certification of the FEIR would constitute a material violation of CEQA. If need be, VICHY SPRINGS RESORT, RUSSIAN

RIVERKEEPER and MATEEL ENVIRONMENTAL will file a Petition for Writ of Mandamus in Mendocino County Superior Court to have the CITY's certification of the FEIR and the CITY's approval of the Landfill Closure Plan set aside. However, the preference of VICHY SPRINGS RESORT, RUSSIAN RIVERKEEPER and MATEEL ENVIRONMENTAL would be for the CITY to instead prepare and recirculate an EIR that complies with CEQA by properly addressing and mitigating impacts thereby obviating the need for litigation.

II. CERTIFICATION OF THE APRIL 2020 FEIR WILL EXPOSE UKIAH TAXPAYERS TO EXTENSIVE LIABILITY FOR ATTORNEYS' FEES FOR THE FAILURE TO COMPLY WITH CEQA

7. In the unfortunate event that VICHY SPRINGS RESORT, RUSSIAN RIVERKEEPER or MATEEL ENVIRONMENTAL is forced to pursue litigation to ensure that the CITY prepares and certifies an EIR for the Landfill Closure Plan that complies with CEQA's requirements, such litigation may come at a significant cost to Ukiah taxpayers. In addition to the legal fees Ukiah taxpayers will need to directly pay its own outside private legal counsel to litigate the case, under CEQA, the CITY may also be liable for the reimbursement of VICHY SPRINGS RESORT's, RUSSIAN RIVERKEEPER's and MATEEL ENVIRONMENTAL's attorneys' fees in the event that VICHY SPRINGS RESORT, RUSSIAN RIVERKEEPER or MATEEL ENVIRONMENTAL prevails in the lawsuit.

8. To provide Ukiah taxpayers and the Ukiah City Council with a sense of potential magnitude of the CITY's exposure for attorneys' fees in this instance, it is useful to recount the outcome of a CEQA lawsuit brought against the County of Madera (and brought by the legal counsel now representing VICHY SPRINGS RESORT) for its unlawful certification of an FEIR for a project. In that previous litigation, the County of Madera lost the case at trial, the FEIR certification (and project approvals) were all set aside by the court, and the County of Madera ended up paying the petitioner more than $600,000 in reimbursement for the attorneys' fees expended in bringing the litigation. Again, for the CITY and Ukiah taxpayers, any attorneys' fees awarded to VICHY SPRINGS RESORT, RUSSIAN RIVERKEEPER and MATEEL ENVIRONMENTAL would be in addition to the monies the CITY

directly paid its own outside legal counsel to represent the City.

9. As discussed in more detail in the January 9, 2020 written submission by VICHY SPRINGS RESORT, it should be noted that, according to documentation provided by the CITY in its DEIR and FEIR, the additional upfront costs of using the clay/earthen landfill cover advocated for by VICHY SPRINGS RESORT, RUSSIAN RIVERKEEPER and MATEEL ENVIRONMENTAL (as well as by the North Coast Regional Water Quality Control Board) would be about $460,000. As set forth herein, VICHY SPRINGS RESORT, RUSSIAN RIVERKEEPER and MATEEL ENVIRONMENTAL believe this $460,000 figure to be illusory because it fails to account for the additional financial assurances and fire insurance that will be required if the CITY selects the synthetic landfill cover. However, even if for argument's sake one were to assume that the $460,000 figure was in fact somehow accurate, this $460,000 figure is considerably less than the amount of legal fees (and liability for reimbursement of attorneys' fees) that the CITY can reasonably be expected to pay if this matter proceeds to litigation. As explained further herein, it should also be noted that this $460,000 figure is significantly less that the likely removal, disposal and replacement costs for the proposed interim synthetic plastic cover (costs which can be avoided altogether if the CITY opts for the permanent clay/earthen landfill cover rather than the interim synthetic cover). From a fiscal standpoint, it is therefore hard to understand why Ukiah taxpayers would support a decision by the Ukiah City Council to certify the FEIR prepared for the current Landfill Closure Plan and proceed with the proposed interim synthetic landfill cover.

III. CEQA VIOLATIONS PERTAINING TO THE CITY'S FEIR FOR THE LANDFILL CLOSURE PLAN

10. As set forth herein and in VICHY SPRINGS RESORT's written comments dated January 9, 2020, which are part of the administrative record in this case, the underlying concerns with the shortcomings of the CITY's FEIR for the Landfill Closure Plan are not of a trivial or merely procedural nature. To the contrary, these concerns address fundamental and important issues, such as: whether the proposed synthetic cover for the landfill presents fire and public safety hazards to the local community; whether microplastic releases from the synthetic landfill cover will pollute nearby creeks, streams and the Russian River; whether the landfill closure will mar and degrade the landscape for decades to come;

whether the landfill closure construction activities will generate noise impacts that will ruin the outdoor recreational experience for the surrounding community. The CEQA violations noted below go well beyond the interests of VICHY SPRINGS RESORT and relate to impacts that will affect the broader public, the broader community in Ukiah, and the entire Russian River watershed. The CITY's compliance with the CEQA requirements noted below is the only means to ensure that the CITY has properly studied, disclosed and incorporated feasible alternatives and mitigation measures to avoid enhanced fire hazards/fire risks, water quality and biological resource impacts, long-term scenic impacts, and construction-related noise impacts on outdoor recreation. This CEQA compliance may, in turn, help avoid the unnecessary and avoidable waste of Ukiah taxpayer money on removal, disposal and replacement costs associated with the interim synthetic landfill cover, and on the additional financial assurances and fire insurance associated with the interim synthetic landfill cover.

First CEQA Claim – Failure to Evaluate Fire Hazards and Fire Risks of Proposed Project

11. As those who live in the County of Mendocino know all to well from the recent experience with the deadly Paradise wildfire, and with many other wildfires that have broken out in the hillsides around Ukiah in recent years, the public safety threats posed by wildfire in this regional are tremendous. This is why Appendix G of CEQA now expressly requires that EIRs address the fire hazards and risks associated with proposed projects, as a means to ensure that lead agencies consider feasible alternatives and adopt feasible mitigation measures to reduce such fire hazards and risks. The California Department of Fire (Cal Fire) has specifically identified Ukiah as a high wildfire hazard area. More specifically, Cal Fire's Fire Hazard Risk Map for Mendocino County (attached as **Exhibit 1** to these written comments) identifies the area around and immediately to the east of Ukiah as a high fire hazard zone.

12. The synthetic landfill cover that is currently proposed as part of the Landfill Closure Plan is particularly flammable, and given the synthetic toxic materials that are part of this synthetic cover may release dangerous toxic materials if it catches fire. More specifically, the opinion letter from Pangea Environmental Services (attached as **Exhibit 2** to these written comments) documents that the synthetic landfill cover is composed of polyethylene fibers that emit numerous airborne toxins (including

hydrogen cyanide) when ignited and that present acute health and safety risks to both firefighters and nearby residents that would not occur with a clay/earthen landfill cover. This is in contrast a clay/earthen landfill cover, in which the clay is not particularly flammable and in which the natural grasses on the surface do not present the prospect of toxic releases if they burn in the event of a wildfire. The fire hazard/fire risks associated with the proposed synthetic landfill cover were noted in the January 9, 2020 letter submitted to the CITY by the North Coast Regional Water Quality Control on the DEIR prepared for the Landfill Closure Plan. In its January 9, 2020 comment letter to the CITY, the North Coast Regional Water Quality Control Board stated: "Lastly, regarding the Proposed Project- turf-based design, Regional Water Board staff has reviewed and expressed concerns unique to a turf-based system with the City of Ukiah representatives. **Given the State of California's recent experience with catastrophic wildland fires which resulted in significant infrastructure loss and damage, the Proposed Project's synthetic turf design has an inherent surface-based vulnerability in this regard**." (bold added.)

13. The DEIR and the FEIR prepared by the CITY for the Landfill Closure Plan did not disclose or identify the additional fire hazards and fire risks (and associated public safety risks to firefighters and nearby residents) associated with the selection of the proposed synthetic landfill cover, did not compare these fire hazards and fires risks with those associated with selection of a clay/earthen cover, and did not identify or evaluate alternatives or mitigation measures to reduce such fire hazards and fire risks. The DEIR and FEIR did not disclose and discuss that firefighters would need to wear full hazardous material gear and use breathing apparatuses if the synthetic cover ignites in a wildfire, and the DEIR and FEIR did not identify or discuss the financial liability the CITY and Ukiah taxpayers may face in the event of personal injury claims by nearby residents should the synthetic cover ignite in a wildfire. Instead, in the FEIR (in the final paragraph of its Response to Comment B-1), the CITY conceded the fire hazards and fire risks associated with its proposed synthetic landfill cover and stated as follows: "The City also shares concerns about catastrophic wildfires and its potential to adversely impact the landfill cover. As such and as standard City practice, the City has addressed the maintenance and replacement values in the Final Closure and Post-Closure Maintenance Plan ("FCPMP") and will take out an adequate

insurance policy(s) to cover the costs of replacement in the event of a catastrophic such as a fire." The procurement of an insurance policy to cover the costs of "replacing" the synthetic cover in the event of a wildfire is not a substitute for CEQA's obligation to evaluate and avoid such additional fire hazards and fire risks. More specifically and more importantly, the CITY's promise to procure such an insurance policy does not provide the Ukiah City Council and the public with a *comparison* of the respective fire hazards/fires risks associated with the proposed synthetic landfill cover vis-à-vis a clay/earthen landfill cover, and does not provide the Ukiah City Council and the public with an evaluation of feasible alternatives and feasible mitigation measures to avoid or reduce the fire hazards and fire risks associated the proposed synthetic landfill material. The omission of such information and analysis constitutes a material violation of CEQA.

Second CEQA Claim – Failure to Analyze Microplastic Releases into Waterways

14. The synthetic landfill cover that the CITY proposes to use in its Landfill Closure Plan is manufactured by ClosureTurf. The statutory duration of the postclosure maintenance period is a minimum of 30 years. (*See* 27 CCR §§ 21180, 21190.) In the ClosureTurf product information included in the FEIR, on the page titled "Weathering", ClosureTurf explains after a 30-year period "[t]he tensile strength of the engineered turf fibers is projected to have 75% retention." This claim also means that, according to ClosureTurf, by the end of a 30-year period the tensile strength of the engineered turf fibers is anticipated to lose 25% of their retention. This substantial and increasing loss of structural integrity means that the synthetic fibers on the surface of the ClosureTurf cover (the strands of plastic designed to resemble strands of natural grass) will disintegrate and detach over time. The decrease in tensile strength will likely increase beyond this amount as the synthetic cover ages and is exposed to ultra violet light, rainfall, and wind. (See, e.g., The effects of natural and artificial UV exposure on the physical properties of synthetic turf used for various sports fields, available at: https://core.ac.uk/download/pdf/54185067.pdf.) The disintegration and detachment of these plastic strands on the ClosureTurf synthetic landfill cover will result in such plastic strands (or the disintegrated

microplastic materials in such strands) being washed downhill by rains into nearby streams and creeks, where they will then make their way into the Russian River and eventually the ocean.

15. Attached as **Exhibit 3** to these written comments is a May 2019 paper published by Stockholm University's Department of Physical Geography titled *Tracking Microplastics from Artificial Football Fields to Stormwater Systems* (2019 Stockholm University Paper). The 2019 Stockholm University Paper reports that a recent study found that artificial turfs are the second largest sources of microplastics released into waterways and oceans and that "Microplastics from artificial turfs are discharged to stormwater during precipitation events which can be then recognized as a pathway of transporting microplastics to the marine environment." The 2019 Stockholm University Report further found that: "Microplastics in the marine environment can be ingested passively or actively by a wide range of organisms from small invertebrates to large mammals. …Ingestion of microplastics affects life activities such as feeding, digestion and reproduction, and even leads to mortality directly by entanglement and choking, especially in fish in larval stage." In terms of artificial turf coverings, such as the synthetic landfill cover proposed by the CITY as part of the Landfill Closure Plan, the 2019 Stockholm University Report explained: "At the selected field sites, runoff due to rainfall is a main pathway transporting microplastics to stormwater wells during the summer and autumn, while in the spring microplastic accumulated in cleared snow can be transported by meltwater." The 2019 Stockholm University Report therefore documents data and research showing that, as they degrade and breakdown, artificial synthetic turf coverings such as the one proposed in the Landfill Closure Plan tend to release microplastics when subject to rainfall. Presumably, on a sloped environment such as where the former Ukiah landfill is located this would cause the microplastics to wash into the streams and creeks downhill from the landfill site.

16. The DEIR and the FEIR prepared by the CITY did not contain analysis of what happens to the synthetic plastic strands in the ClosureTurf landfill cover when they begin to degrade and lose structural integrity (a 25% loss of retention after 30 years according to ClosureTurf's own analysis). The DEIR and FEIR prepared by the CITY did not contain analysis of how, as a result of this anticipated degradation, microplastics are likely to be released and (propelled by rains and runoff) washed into the

streams and creeks located downhill of the landfill site, and from these creeks and streams into the Russian River and the ocean. The DEIR and the FEIR did not contain analysis of the financial liability of the CITY and Ukiah taxpayers for polluting waterways with microplastics, such as civil penalties, remediation costs and natural resource damages under environmental laws such as the federal Clean Water Act and California's Porter-Cologne Water Quality Act. The failure of the DEIR and FEIR to identify and analyze the environmental risks presented by the release of such microplastics into nearby waterways constitutes a material failure under CEQA to assess hydrologic resource/water quality impacts and well as a material failure to assess impacts on biological resources (fisheries).

Third CEQA Claim – Failure of Evaluate Reasonable Range of Alternatives

17. As set forth in detail in VICHY SPRINGS RESORT's written submission dated January 9, 2020, CEQA requires that an EIR consider a reasonable range of alternatives to avoid or reduce the environmental impacts of a proposed project. This decision of whether to provide full evaluation of the environmental impacts for alternatives to a proposed action is not a discretionary decision left to the lead agency preparing the EIR, it is a black letter law requirement of CEQA. The failure to provide full evaluation of alternatives to the proposed action is unlawful under CEQA.

18. In the case of the current FEIR for the Landfill Closure Plan, the CITY only provided full evaluation of *one* alternative – the proposed action (which included the use of a synthetic landfill cover, and which omitted any mitigation measures to reduce construction-related noise impacts). The CITY's FEIR mentioned the "no project" alternative of simply not doing a Landfill Closure Plan at all, but then acknowledged that the "no project" alternative was not in fact an alternative at all because the California Health and Safety Code requires the adoption and implementation of a closure plan for all landfills.

19. In the DEIR for the Landfill Closure Plan that was prepared before the current FEIR, the CITY had made a finding that the use of the more permanent clay/earthen landfill cover alternative was not "feasible" and based on this "infeasibility" finding eliminated the clay/earthen cover option from more detailed evaluation. Only after receiving written comments on the DEIR highlighting the use of clay/earthen landfill covers is standard practice throughout the State of California, and highlighting that

the additional incremental costs of using the clay/earthen landfill cover (as provided by the CITY and accepted as correct) would be minimal in the overall budget of the project, the subsequent FEIR prepared by the CITY removed the earlier "infeasibility" finding in the DEIR regarding the clay/earthen cover. Sidestepping the question of whether the clay/earthen cover was a "feasible" alternative, Chapter 4 of the FEIR then went on to include a cursory new analysis discussing why there might be certain advantages (such as reduced upfront installation costs and possible reduced slippage) with the synthetic cover option versus the clay/earthen cover option, and based on these few additional sentences in Chapter 4 then, again and just as with the DEIR, eliminated the clay/earthen cover from further evaluation. That is, the clay/earthen cover alternative was not then independently analyzed in subsequent sections of the FEIR – for reduced fire hazards/risks associated as compared with the proposed synthetic landfill cover, for avoiding the risk of the release of microplastics into waterways with the proposed synthetic landfill cover, for reduced adverse visual/aesthetic impacts as compared with the mono-color synthetic landfill cover, for reduced risks of damage by wild boar populations as compared with the proposed synthetic landfill cover. The FEIR did not therefore provide further substantive analysis of these important environmental advantages of the use of clay-earthen cover, it just provided a few additional sentences in Chapter 4 to explain why it was not going to provide any further analysis of this alternative, of why this alternative was being eliminated from further analysis.

20. The FEIR's added discussion of an earthen/clay final cover alternative does not cure the DEIR's complete failure to include a discussion of this alternative in the alternatives analysis (Chapter 4 of the DEIR). By omitting the required discussion and information concerning this feasible alternative the City deprived the public and responsible agencies of the ability to meaningfully comment on the comparative environmental impacts such an alternative would cause in relation to the proposed project design.

21. In particular, in terms of whether the clay/earthen landfill cover is a feasible alternative to the proposed synthetic landfill cover, it should be noted that the CITY had previously proposed using a clay/earthen landfill cover as part of its Landfill Closure Plan for the Ukiah landfill and that the use of such a clay/earthen landfill cover had previously been approved by both the North Bay Regional Water

Quality Control Board (Regional Board) and CalRecycle – two state agencies with extensive experience with landfill sites and closures. (*see* WDR Order R1-2002-0061, incorporated herein by this reference) It is only more recently that the CITY has indicated its changed preference to select a synthetic landfill cover instead of the previously approved clay/earthen landfill cover. The fact that the Regional Board and CalRecycle had previously approved the use of a clay/earthen landfill cover for the Ukiah landfill is inconsistent with the CITY's current claims (in the DEIR and the FEIR) that the use of a clay/earthen landfill cover would somehow present a dangerous and unacceptable risk of slippage due to the slope of the site. If such slippage concerns had been present, the Regional Board and Cal Recycle would not have previously approved the use of such a clay/earthen landfill cover as a permanent closure remedy for the Ukiah landfill. Additionally, since the Ukiah landfill stopped receiving waste 20 years ago and placed a preliminary clay/earthen cover over the landfill, it should be noted that there have not been problems with slippage of this cover. This 20 years of actual experience on the site of the former Ukiah landfill, with a clay/earthen cover that in fact did not experience slippage problems, contradicts the current claims by the CITY that the option of clay/earthen cover should be limited from further consideration as an alternative in the DEIR and FEIR because this option presents an unacceptably high risk of slippage. The 20 years of actual experience at this site, with a clay/earthen cover that did not suffer slippage, is something that the DEIR and the FEIR fail to disclose.

22. In terms of construction-related noise impacts on nearby outdoor recreation areas, the DEIR did not give full consideration to any alternatives to the proposed action – which involves weekday construction activities from 7:00 am to 7:00 pm (essentially during all the weekday daylight hours when outdoor recreation would take place), includes no seasonal restrictions to restrict construction activities at times of the year when outdoor recreational usage is at its highest, and includes no measures to reduce vehicular and equipment noises. Such construction-related noises include the relentless pounding thud of the soil compaction machines (which pursuant to the Landfill Closure Plan will need to compress material under the synthetic cover across the entire 40-square acres of the site) and the continuous piercing sound of the backup beepers used on all trucks and motor vehicles on site. In regard to alternatives to the use of backup beepers on motor vehicles, Regulation 1926.601(b)(4) issued by the

federal Occupational Health and Safety Administration (OSHA) provides: "No employer shall use a motor vehicle having an obstructed view to the rear unless: (i) The vehicle has a reverse signal alarm audible above the surrounding noise level **or** (ii) **The vehicle is backed up only when an observer signals that it is safe to do so**." (bold added.) OSHA guidelines therefore explicitly provide that the use of an observer is a feasible alternative to backup beepers for motor vehicles used at construction sites. Instead of considering any alternatives to avoid or reduce construction-related noise impacts on outdoor recreation, the CITY's FEIR simply declares (without any data or support or analysis) that construction-related noise associated with the proposed action will not affect the "quiet and enjoyment" of hikers on the trails at VICHY SPRINGS RESORT or other outdoor recreation users in the vicinity of the project. No information was provided in the FEIR to suggest that the alternatives available to reduce construction-related noise were infeasible. The FEIR (and the DEIR) just omitted evaluation of any alternatives to reduce construction-related noise impacts.

23. In terms of compliance with CEQA, VICHY SPRINGS RESORT, RUSSIAN RIVERKEEPER and MATEEL ENVIRONMENTAL recognize that CEQA vests some discretion with lead agencies to develop a reasonable range of alternatives in an EIR that would reduce some of the anticipated adverse environmental impacts of a proposed project. In the case of the proposed Landfill Closure Plan, the administrative record is clear that the action proposed by the CITY will have fire hazard and fire risks, adverse water quality impacts associated with microplastic releases, adverse scenic impacts (by converting a hillside of natural grasses to one of a mono-color synthetic cover), and adverse noise impacts on outdoor recreation resources. While CEQA provides the CITY with some discretion to develop a reasonable range of alternatives to address these environmental concerns, CEQA does not provide the CITY with discretion to simply forgo the comprehensive analysis of alternatives altogether and only provide full evaluation of the proposed action. Simply put, full evaluation of only *one* alternative does not satisfy CEQA's requirement that a reasonable range of alternatives be evaluated, and the CITY's failure to comply with this requirement undercuts the very heart of the CEQA process – to provide decision-makers (the members of the Ukiah City Council) and the public with a meaningful comparison of feasible alternatives to be able to meaningfully weigh the competing environmental

impacts associated with different feasible alternatives. The CITY's consideration of only *one* alternative in the FEIR for the Landfill Closure Plan is therefore not an exercise of lawful discretion. CEQA simply does not allow it.

Fourth CEQA Claim – Failure to Provide an Accurate and Complete Project Description

24. CEQA requires that an EIR provide an accurate and complete description of all the component of the proposed project being evaluated. CEQA similarly prohibits the "piecemealing" and "segmentation" of a larger comprehensive project into smaller discrete "projects" (in terms of the project description) to avoid having to acknowledge and evaluate the larger comprehensive project and thereby fail to disclose the true costs and true environmental impacts associated with the larger project.

25. In the EIR, the CITY proposes the use of an interim synthetic plastic landfill cover for the 30-year period of the Landfill Closure Plan. (*See*, *e.g.*, DEIR, Appendix A, Final Closure and Postclosure Maintenance Plan, p. 1-1, 4-1.) Neither the DEIR nor the FEIR address what will become of the synthetic turf cover beyond 30 years. Because the plastic cover will inevitably disintegrate over time due to multiple weathering forces (including UV light, rain, and wind), at some undetermined point following this 30-year period, according to discussions with staff at the Regional Board, the interim synthetic cover would then likely need to be removed and replaced with another more permanent landfill cover. Although it is likely that the interim synthetic landfill cover will need to be removed, disposed above and replaced with a permanent cover, the DEIR and the FEIR do not include such landfill cover removal, disposal and replacement components as part of the project description. By omitting such landfill cover removal, disposal and replacement components as part of the project description in the DEIR and FEIR, the DEIR and FEIR as a result did not contain an estimate of the costs associated with such removal, disposal and replacement components nor did they contain any analysis of the environmental impacts associated with such removal, disposal and replacement components. This is a classic example of what is referred to as "piecemealing" under CEQA, of unlawfully using an improperly narrow project description to avoid having to acknowledge and evaluate the full environmental impacts of a broader-integrated project. In the case of the Ukiah landfill, the strong

likelihood of eventual removal and disposal of the interim synthetic cover (and the replacement of the interim synthetic cover with a permanent cover) are not some remote speculative possibility – they are a foreseeable and likely component of the overall closure process. The CITY's failure to include these components in the project description is therefore a violation of CEQA's piecemealing prohibition. Every aspect of the environmental impact analysis is compromised by this failure to consider the long-term removal, disposal and replacement of the interim synthetic cover.

26. As explained further below, as part of the Landfill Closure Plan, the CITY will be required by the Regional Board to provide additional "financial assurances" if the CITY selects the synthetic landfill cover option, due to concerns by the Regional Board regarding fire-related risks associated with the synthetic landfill cover as well as concerns the Regional Board has about the interim synthetic landfill cover being subject to degradation and breakdown from ultra-violet exposure, heat and other weather elements. As the Regional Board stated in its January 9, 2020 comment letter on the DEIR: "Given the State of California's recent catastrophic experiences with wildland fires which resulted in significant infrastructure loss and damage, the Proposed Project's synthetic turf design has an inherent surface-based vulnerability in this regard. Also, the surface-based turf system and underlying **synthetic geomembrane liner have a greater exposure to ultraviolet light, weather/temperature impacts and potential degradation and cracking** over the buried type of liner systems…For these reasons **we have requested the financial assurance mechanism to address the possible replacement scenario in the event the surface-based liner system fails. The Proposed Project description should adequately reflect this**." (bold added.) As also further explained below, the CITY has conceded that (due to the enhanced fire hazards and fire-risks associated with the proposed synthetic landfill cover) it will be necessary to maintain fire-related insurance throughout the minimum 30-year duration that the interim synthetic cover will be in place. The DEIR and FEIR failed to include any information about the additional financial assurances and fire-related insurance policies as part of the project components and project description, and as such failed to provide any information about the what these financial assurances and fire-related insurance policies will cover. For instance, in terms of fire risks and fire hazards associated with the synthetic plastic landfill cover, are the amounts included in such additional

financial assurances available to cover these fire-related risks? For instance, in terms of the enhanced risks of degradation and liner failure with the proposed synthetic landfill cover, are the amounts in such additional financial assurance adequate to cover the costs of the anticipated damages that would result if the synthetic cover failed? For instance, will the fire-related insurance policy provide coverage for personal injuries to firefighters or nearby residents if the 40-acre synthetic landfill cover catches fire, or will such insurance policies only apply to the costs of "replacing" the synthetic cover after such a fire? In terms of public safety concerns and impacts, the answers to these questions are critical. Yet, because these items were excluded from the project description for the DEIR and FEIR prepared for the Landfill Closure Plan, these items were not analyzed in the DEIR and FEIR, in terms of either costs or environmental impacts.

27. Pursuant to CEQA Guideline 15124(d)(1), the project description in an EIR must include a list of all other agencies and agency approvals that it is anticipated will reply on CEQA compliance by the lead agency. In the case of the Landfill Closure Plan for the Ukiah landfill, the CITY is the lead CEQA agency Although the CITY is aware that there will be other agency approvals required for the Landfill Closure Plan to proceed, including but not limited to approval by the Mendocino County Environmental Health Department (the lead enforcement agency/LEA under the California Health and Safety Code), CalRecycle and the North Coast Regional Water Quality Control Board, and that these other agencies will need to rely on the CITY's preparation of a legally-adequate CEQA EIR, the DEIR and the FEIR failed to disclose that the Mendocino County Environmental Health Department, CalRecycle and North Coast Regional Water Quality Control Board would be relying on the EIR prepared by the CITY to satisfy their own CEQA compliance obligations. The failure of the CITY to include the information required pursuant to CEQA Guideline 15124(d)(1) in the DEIR and FEIR constitutes a material failure to provide an adequate and accurate project description.

28. Without an accurate and complete project description, an EIR cannot provide decision-makers and the public with a true accounting of the anticipated costs associated with a proposed action, and will be unable to provide decision-makers (Ukiah City Council) and the public with a proper analysis of the environmental impacts and concerns associated with a proposed action. The DEIR and

FEIR prepared for the Landfill Closure Plan fail to include the likely removal, disposal and replacement of the interim landfill cover as part of the project description, fail to include additional financial assurances (to be required by the Regional Board) and the procurements of fire-related insurance policies, and fail (as expressly required by CEQA Guideline 15124(d)(1)) to identify the other agency approvals that would rely upon the EIR as part of the project description. In this regard, the DEIR and FEIR prepared by the CITY for the Landfill Closure Plan fail to satisfy this core and basic requirement of CEQA.

Fifth CEQA Claim – Failure to Provide Accurate Description of Baseline Conditions

29. As set forth in detail in VICHY SPRINGS RESORT's written submission dated January 9, 2020, for each environmental impact evaluated in an EIR, CEQA requires that an accurate and complete description of "baseline conditions" (sometime also referred to as the "existing environmental setting") is provided. The presentation of an accurate and complete description of baseline conditions is required because of the components and basic sequencing involved in environmental impact assessment, which are as follows: (1) presentation of accurate and complete project description; (2) description of baseline conditions/existing environmental setting for each of the resources/impacts evaluated in the EIR; (3) quantification and analysis of anticipated impacts of the proposed project for each of the resources evaluated in the EIR and comparison of these impacts against the baseline conditions/existing environmental setting for these resources; (4) for each of the resources evaluated in the EIR, a determination as to whether the anticipated effects of the project can be considered "insignificant" based on reference to well-articulated significance criteria/thresholds; and (5) consideration and evaluation of a reasonable range of alternatives and feasible mitigation measures to avoid or reduce the adverse environmental impacts of the proposed project. Without an accurate description of baseline conditions (step 2 in CEQA's environmental impact analysis) as a starting point, it is impossible to properly complete steps 3, 4 and 5 in CEQA's environmental impact assessment process.

30. In terms of fire risks and fire hazards, the "baseline conditions/existing environmental setting" are the wildfire threat conditions on and in the vicinity of the landfill property at the time the

EIR is being prepared (current wildfire threat conditions *now*). Appendix G of CEQA now contains special provisions expressly requiring the analysis of wildfire related conditions and risks. These baseline wildfire threat conditions are pertinent to an evaluation of the Landfill Closure Plan because (as explained above) the synthetic landfill cover that the CITY has proposed is particularly flammable, and because the materials that comprise this synthetic landfill cover will result in the release of toxic air fumes and the release of toxic liquified material in the event they catch fire, which presents public health risks to firefighters and nearby residents. As noted above, numerous wildfires have occurred in recent years in the vicinity of the former Ukiah landfill and the area around Ukiah has been designated a high fire hazard zone by the California Department of Fire (see **Exhibit 1** to these comments). As also noted above, in the opinion letter by Pangea Environmental Services attached as **Exhibit 2** to these written comments, the materials used in the proposed landfill cover are highly flammable and are likely to produce dangerous toxic releases if ignited. By failing to describe baseline wildfire threat conditions on and in the vicinity of the landfill site, the EIR then failed to conduct any analysis of the public health risks and environmental risks that would result if the proposed synthetic landfill cover caught fire.

31. In terms of scenic/aesthetic/visual impacts and resources related to the Landfill Closure Project, the "baseline conditions/existing environmental setting" is the scenic condition of the landfill property at the time the EIR is being prepared (current scenic conditions *now*). As set forth in detail in VICHY SPRINGS RESORT's written submission dated January 10, 2020, the Ukiah landfill stopped accepting waste deliveries in 2002, nearly 20 years ago, and at that time a layer of clay and earthen fill was placed over the open landfill until such time as a formal Landfill Closure Plan was developed and implemented. In the nearly 20 years since the Ukiah landfill has been inactive, and the layers of clay earthen fill were placed over the landfill, natural grasses and vegetation have returned and grown on the site such that (currently) there is no clear visual indication that there was ever an open landfill at the site. The natural grasses that have grown over the Ukiah landfill are the same as the grasses on the surrounding hillsides, and these natural grasses change with the seasons (dry/brown in late spring, summer and early fall; lush/green in the late fall, winter and early spring; and all the subtle transitions in between).

32. In the DEIR, and then again in the FEIR, the CITY did not provide photographs or clear accurate narrative information that clearly represented and indicated that that baseline scenic conditions of the Ukiah landfill site are of natural grasses that blend in seamlessly with the surrounding grass-covered hillside and that change color and texture throughout the seasons of the years. Instead, in the DEIR, and the FEIR, the CITY omitted providing an accurate description of baseline scenic conditions, and instead tried to bypass this critical environmental impact assessment step (Step 2) and go directly to the reasons why the CITY thought that the 40-square acre mono-color plastic synthetic landfill cover would not look that bad. But that is not how CEQA requires that environmental impact assessment be done. Putting aside for the moment the credibility of its claims about how visually attractive the "contrast" between the mono-color synthetic cover and natural grass hillsides will be (discussed more below), under CEQA, an EIR does not just look at the conditions that will exist *after* the project is done and ask whether these conditions are "that bad." Rather, CEQA requires that an EIR *compare* the conditions that will exist *after* the project is completed to the baseline conditions that exist *prior* to undertaking the project. It is this *comparison,* of baseline conditions with post-project conditions, that is critical to how CEQA works. And when it comes to scenic/aesthetic impacts, this *comparison* is absent from the both the DEIR and the FEIR because the DEIR and the FEIR failed to provide an accurate description of current baseline scenic conditions – of the natural grasses that now currently cover the Ukiah landfill site.

33. In fact, there is information in the April 2020 FEIR (and the response to comments included in the FEIR) that is fundamentally misleading to decision-makers (Ukiah City Council) and the public in terms of current baseline scenic conditions. In the FEIR, in its Response to Comment 5d, the CITY states: "The existing landfill already is distinct from the existing natural landscape as it is a landfill with waste underneath the existing vegetation and there are no trees on top of the landfill. As a result, the 40-acre area of the closed landfill will always be in contrast to the surrounding natural environment (with sparse or dense stands of trees) even with a clay/natural cover." As the photographs submitted by VICHY SPRINGS RESORT make plain to any viewer, however, there are many hillsides nearby and that surround the 40-square acre patch where the landfill is located that contain either no trees at all or

few trees, and are therefore fairly barren As the photographs submitted by VICHY SPRINGS RESORT also make plain to any viewer, because there are many relatively barren hills nearby with few trees in the vicinity, the area of natural grasses where the Ukiah landfill was located is virtually indistinguishable from many of the surrounding hillsides. In fact, the only way for VICHY SPRINGS RESORT to clearly identify the former Ukiah landfill site in these photographs was to circle the site with blue marker – because without the blue marker the location of the former Ukiah landfill simply looks like many of the natural grass hillsides that surround it. The narrative response provided by the CITY in the FEIR in its Response to Comment 5g – suggesting the former landfill site was somehow situated in a forest or an area where all the surrounding hills were dense with trees – is profoundly inaccurate and misleading. This misrepresentation of current baseline scenic conditions is evident to any person that looks at the photographs submitted by VICHY SPRINGS RESORT.

34. In the FEIR, the CITY baldly claims "The Ukiah landfill is, has been, and will always be a landfill site and is not, nor will ever be considered to be a scenic resource." VICHY SPRINGS RESORT, RUSSIAN RIVERKEEPER and MATEEL ENVIRONMENTAL fundamentally disagree with this claim, as any highly visibly part of the landscape and hills around Ukiah is in fact a scenic resource, is in fact an important viewshed – regardless of whether portions of this vista were at one point in time in the past may have been used as a landfill site. The falsity of the CITY's claim here is revealed through the color photographs included as part of VICHY SPRINGS RESORT's January 9, 2020 written submission, which clearly show that (whether the CITY likes it or not) the landfill site is in fact an undeniable part of the scenery and landscape of the hillsides in the vicinity, and that (in its present/current condition covered with natural grass) the former Ukiah landfill site is in fact now an integral scenic component of this beautiful natural landscape. What is particularly telling about the CITY's claim (quoted above from the FEIR) is that it reveals the FEIR's strangely narrow view of the former Ukiah landfill site – that it should somehow *not* be considered a scenic resource at all and that therefore there cannot conceivably be any possible adverse scenic impacts resulting from what cover is selected for the former landfill. This narrow view, contradicted by any person that views photographs of the landfill site or that visits the actual site and surrounding areas, perhaps explains why the DEIR and

the FEIR are so unwilling to acknowledge that there could possibly be any scenic/visual resources involved or that there could possibly be any adverse scenic impacts associated with the cover selected for landfill closure.

35. In terms of the functionality and viability of the proposed synthetic plastic landfill cover, the FEIR and DEIR failed to provide accurate information about the prevalence of wild boars in the area where the landfill is located. Such wild boars are likely to trample on and burrow and dig (root) into the synthetic landfill cover thereby compromising its integrity. This concern was specifically raised in the comment letter submitted by Gilbert Ashoff, owner of VICHY SPRINGS RESORT, on the DEIR prepared for the Landfill Closure Plan. More specifically, in 2018, the CITY hired a trapper name Kyle Seever to install a series of "pig traps" on the landfill property over a 3-month period to catch wild boars as well as video-cameras to monitor wildlife on the site. During this 3-month period, approximately 20 wild boars were caught in "pig traps" on the landfill property and the video-cameras filmed wild boars regularly roaming the landfill property. Kyle Seever's work in 2018 trapping wild boars was overseen by Dan Hunt, who worked for the CITY at the landfill. All of the information regarding Kyle Seever's activities is in the CITY's files and therefore are part of the administrative record in this case. Additionally, there are professional hunting outfits in the area that routinely organize hunts for wild boars. For example, Lockwood Hunting Services in Ukiah has a wild boar as its official company logo (see **Exhibit 4** to these written comments) and its website states "We specialize in guided hunts for **wild pigs** on thousands of acres on private land in California's Mendocino County near Hopland, CA." (bold added.) Moreover, it is well-known that many landowners in the area (including VICHY SPRINGS RESORT) often maintain their own "pig traps" to capture the wild boars that roam throughout the surrounding hills. For years, VICHY SPRINGS RESORT has had to deal with the problem of wild boars on its property.

36. There is also well documented scientific literature indicating that wild boars routinely engage in "rooting" behavior – that is they dig up and overturn ground covering (whatever that ground covering might be). The "rooting" behavior of wild boars, which is separate and distinct from their tendency to forage for food, is discussed in the 2015 *Wild Pigs Report* by the United States Department

of Agriculture and the *Feral Swine Damages* report prepared by the University of California (attached respectively as **Exhibit 5** and **Exhibit 6** to these written comments). In the opinion letter from Pangea Environmental Services attached as Exhibit 2 to these written comments, information is provided about how "abrasion" activities (such as rooting by wild boars) result in the release of PFAS (perfluoroalkyl and polyfluoroalkyl substances) that are part of synthetic artificial turf coverings like the ClosureTurf landfill cover proposed by the CITY. Pangea Environmental Services' opinion letter notes how the abrasion of the landfill cover by wild boar rooting is likely to cause the release of PFAS into nearby streams and creeks, and notes that the presence of PFAS in waterways is now regulated under several environmental laws and by many environmental agencies. As part of its description of baseline conditions in the DEIR and FEIR for the Landfill Closure Plan, the CITY failed to present an accurate description and evaluation of wild boar populations that have been found on and in the vicinity of the Ukiah landfill and their well-documented "rooting" behavior, and based on this omission failed to properly analyze the potential risks such wild boar populations present to the integrity of the proposed synthetic landfill cover and the likelihood that wild boar rooting will result in the release of PFAS into nearby streams and creeks and from there into the Russian River. In its response to comments on the FEIR, the CITY stated that there had not been any "reported sightings" of wild boars on the former landfill but this statement is in direct contraction to what is common knowledge throughout the area (that wild boars roam the hills where the landfill is located) and is in direct contraction to the fact that the CITY itself hired a trapper that caught many wild boars on the landfill property and that took video-footage of wild boars on the landfill property. In light of the wild boars that Kyle Seever's caught on the landfill property in 2018 (both in pig traps and on video-footage), work that was done on behalf of the CITY and reported to the CITY two years ago, the FEIR's claims of no "reported sightings" of wild boars is misleading in the extreme. The failure of the DEIR and FEIR to disclose and describe and evaluate the presence of wild boars on the landfill site and in the landfill project area, and the risks such wild boars present to the integrity of the propose synthetic landfill cover, is inconsistent with the baseline condition requirements of CEQA.

37. In terms of historic resources, the CITY is aware that VICHY SPRINGS RESORT has been

designated a California Historic Landmark. Information about this landmark designation has been previously provided to the CITY, and is attached to these comments as **Exhibit 7**. The landmark designation applies not only the buildings and mineral springs at VICHY SPRINGS RESORT but also applies to outdoor grounds and, importantly, the "uses" as a resort for more than 150 years. More specifically, the landmark designation for VICHY SPRINGS RESORT specifically identifies "outdoor recreation" as a recognized "historic function" of the property, meaning that adverse impacts on such "outdoor recreation" (such as adverse scenic and noise impacts associated with the Landfill Closure Plan) can impair this "historic function." In Section 3.4 of the DEIR and FEIR on cultural resource the CITY claims that it conducted a search of California State Historic State Landmarks and determined that there were no such sites within a ¼ mile of Landfill Closure Plan project boundaries. This determination is factually incorrect. The property boundary for VICHY SPRINGS RESORT is across the road from the entrance to the landfill (a few hundred feet away), and the outdoor recreation grounds on the VICHY SPRINGS RESORT property covered by the landmark designation are also well within ¼ mile of the entrance to the landfill. The entrance to the landfill is within the Landfill Closure Plan project boundary. As a result of this incorrect determination of baseline conditions in regard to historic and cultural resources, the DEIR and FEIR failed to conduct any analysis of the impacts – including but not limited to noise and scenic impacts – of the Landfill Closure Plan on the uses and features covered by the landmark designation for VICHY SPRINGS RESORT. In failing to conduct a historical resource impacts analysis related to the effects of the project on uses and functions protected by VICHY SPRINGS RESORT's landmark designation, the CITY also violated provisions of the CITY's General Plan concerning the protection of Historic and Archaeological ("HA") Resources. More specifically, in failing conduct a historical resource impacts analysis in the DEIR and FEIR related to the effects of the Landfill Closure Plan on uses and functions protected by VICHY SPRINGS RESORT's landmark designation, the CITY violated Policies HA-2.2., HA-4.1 and HA-7.1 of the CITY's General Plan which require that CITY land-use decisions avoid adverse environmental impacts on historic resources such as those designated and protected by VICHY SPRINGS RESORT's landmark designation.

38. In terms of outdoor recreational resources (hiking trails) located on the VICHY SPRINGS

RESORT property and the construction-related noise impacts of the Landfill Closure Project on such outdoor recreational resources, the "baseline conditions/existing environmental setting" are the current background ambient noise levels for these outdoor recreational resources/hiking trails at the time the EIR is being prepared (current noise conditions now). There are no county noise ordinances that pertain specially to impacts on outdoor recreation areas and hiking trails. Under basic CEQA environmental impact assessment methodology, the EIR for the Landfill Closure Plan would then need to *compare* these baseline/existing noise levels to the expected construction-related noise levels to determine whether such increases in noise will have a significant adverse impact on the experience of "quiet and enjoyment" now available to hikers/outdoor recreation users on these trails. For instance, under current baseline conditions, people using nearby outdoor recreation trails are not subjected to the continuous thud of compression equipment or the regular piercing sound of motor vehicle backup beepers. In the DEIR and then again in the FEIR, however, the CITY never provided information on current/baseline ambient noise levels on the hiking trails on the VICHY SPRINGS PROPERTY. VICHY SPRINGS RESORT most certainly would have, and again here offers, to provide access to the CITY and/or the CITY's consultants to undertake such baseline ambient noise level testing. In its Response to Comments in the FEIR, the CITY states conclusively that the construction-related noise generated by the Landfill Closure Plan would not represent an significant increase over ambient/baseline noise levels on such outdoor recreational area/trails, but since there is no indication that the CITY ever determined such ambient/baseline noise levels this statement lacks any evidentiary support. Without such testing and baseline information, there is no basis to quantify the *increase* in noise levels on such outdoor hiking trails that will result from construction-related noise associated with the Landfill Closure Plan, and therefore no basis for the CITY's FEIR to find that the construction-related noise impacts on such outdoor recreational resources are less-than-significant. Once again, as explained above, without an accurate description of baseline conditions (step 2 in CEQA's environmental impact analysis) as a starting point, it is impossible to complete steps 3, 4 and 5 in CEQA's environmental impact analysis. The CITY's failure to acknowledge and properly analyze the construction-related noise impacts on outdoor recreation areas, in turn, led to a cascade of further and subsequent CEQA violations – including

the failure to consider a reasonable range of alternatives and feasible mitigation measures to reduce such noise impacts on outdoor recreation areas.

39. In its FEIR and Response to Comments, the CITY attempts to gloss over these CEQA omissions by focusing (as it did in the DEIR) exclusively on the sleeping cabins located on the portion of the VICHY SPRING PROPERTY that is the farthest away from where the construction-related activities will occur, and the effects of construction noise on these more remote sleeping cabins. But any analysis of noise impacts on persons staying in these more remote sleeping cabins (which are located on the other side of a hill that would dampen noise impacts) is unrelated to the question of the adequacy of analysis of construction-related noise impacts on outdoor recreation areas/hiking trails in areas considerably closer to where the construction noise would be generated (and on the side of hills facing the former landfill site).

40. As set forth in its previous written comments submitted on the DEIR for the Landfill Closure Plan on January 9, 2020, in 1994 the CITY installed a series of groundwater wells on land located just off the VICHY SPRINGS RESORT property. The purpose of installing these groundwater wells was to monitor potential releases and contamination coming from the Ukiah landfill. At the time such groundwater well installation was taking place, the owner of VICHY SPRINGS RESORT raised concerns with CITY about whether such wells might impact the nearby subsurface mineral springs but such concerns were disregarded. Immediately following the installation of said groundwater wells, VICHY SPRINGS RESORT experienced a 50% drop in the pressure and flow of its mineral springs water and a 20-degree Fahrenheit drop in mineral spring temperature. This drop in pressure and temperature lasted for several months. Such a precipitous drop in pressure and temperature had never been documented before and has never happened since, and this precipitous drop in pressure and temperature occurred immediately after the CITY's groundwater wells were installed and operationalized. Therefore, all indications are that there is a direct hydrological connection between the CITY's groundwater wells and the subsurface source of the Vichy Springs, and that this previous drop in pressure and temperature was caused by the CITY's installation and operation of the groundwater wells. This hydrological connection is documented in the letter submitted to the CITY by Al Sevilla of

Alisto Engineering (included as part of VICHY SPRINGS RESORT's January 9, 2020 written comments on the DEIR and part of the administrative record). In the DEIR, FEIR and Response to Comments, the CITY has alleged that the contemporaneous drop in spring pressure/flow and temperature with the installation of the groundwater wells was merely a "temporal coincidence" that can be attributed to natural fluctuations in the springs' pressure/flow and temperature. The CITY's failure to acknowledge and describe the documented hydrologic connection between the CITY's groundwater wells (which will be used for monitoring as part of the Landfill Closure Plan) and the nearby subsurface Vichy Springs in the DEIR and FEIR for the Landfill Closure Plan constitutes a failure under CEQA to adequately describe baseline conditions.

Sixth CEQA Claim – Failure to Recirculate DEIR After Disclosing Significant New Information Regarding Scenic and Noise Impacts in FEIR

41. CEQA requires the recirculation of an EIR for public comment by other agencies and the public whenever "significant new information" is disclosed in the FEIR that was not disclosed originally in the DEIR. CEQA defines "significant new information" to include information that identifies additional potential significant environmental impacts (such as scenic/visual impacts or noise impacts) or that reveals potential increased severity of environmental impacts (such as scenic/visual impacts or noise impacts).

42. As set forth above, in its January 9, 2020 comment letter to the CITY on the DEIR prepared for the Landfill Closure Plan, the North Coast Regional Water Quality Control Board stated: "Lastly, regarding the Proposed Project- turf-based design, Regional Water Board staff has reviewed and expressed concerns unique to a turf-based system with the City of Ukiah representatives. **Given the State of California's recent experience with catastrophic wildland fires which resulted in significant infrastructure loss and damage, the Proposed Project's synthetic turf design has an inherent surface-based vulnerability in this regard**." (bold added.) The comment letter from the North Coast Regional Water Quality Control Board (included in the FEIR) disclosed to the public and Ukiah City Council the issue of enhanced fire hazards and fire risks associated with the proposed synthetic landfill cover, an issue that was not disclosed or analyzed in the previous DEIR for the Landfill

Closure Plan. This information regarding fire hazards and fire risks associated with the proposed synthetic landfill cover constitutes "significant new information" under CEQA that requires recirculation of the EIR.

43. The DEIR prepared and circulated for comment by the CITY stated that the Ukiah landfill site was not directly visible from VICHY SPRINGS RESORT or from any residences or public roads in the area. In its January 9, 2020 written submission of comments on the DEIR, VICHY SPRINGS RESORT included numerous photographs from the VICHY SPRINGS RESORT property and from several nearby residences and public roads that clearly indicated that the location of the Ukiah landfill (and therefore of the proposed mono-color synthetic plastic cover for the landfill) was directly and prominently visible from these vantage points. The FEIR prepared by the CITY included these photographs which made plain that the statements in the DEIR regarding the lack of visibility of the Ukiah landfill site from VICHY SPRINGS RESORT and nearby residences and public roads were fundamentally incorrect, and that the DEIR's analysis of scenic impacts in the DEIR based on these incorrect statements was therefore also significantly flawed, inaccurate and incomplete. The FEIR acknowledged this previous error in the FEIR when it conceded for the first time (in the last paragraph on Page 3.2-10) that "there are some partial views of the Ukiah Landfill from some vantage points on the Vichy Springs Resort's 700-ares, which include hiking trails for its guests." This new acknowledgement in the FEIR is in direct contradiction to the information provided by the CITY in the DEIR, in which it incorrectly claimed that the Ukiah landfill was not visible at all from the VICHY SPRINGS RESORT property or other residences and public roads. As to whether these current views of the landfill site from VICHY SPRINGS RESORT and nearby residences will be adversely impacted by the 40-acre mono-color synthetic cover that is now proposed to replace the natural grass vistas on the landfill site, this is "significant new information" which goes directly to the question of the severity of the project's impact on scenic/visual resources. None of this information was previously disclosed in the DEIR, and the DEIR in fact expressly (and incorrectly) denied such views of the project site even existed. Moreover, in its response to comments in the FEIR, the CITY claimed (without any support again) that the photographs provided showing numerous prominent views of the landfill site from the

VICHY SPRINGS REORT were taken from locations on the resort property where resort guest don't walk or hike. This claim by the CITY is incorrect, as all of the photographs submitted with views of the landfill are taken from locations on VICHY SPRINGS PROPERTY that are frequented by guests. This unsupported claim by the CITY was merely an effort to try to somehow explain away the incorrect and misleading information the CITY had previously provided in the DEIR, that no such views of the landfill existed. And even after the CITY was provided by VICHY SPRINGS RESORT with photographs depicting prominent views of the landfill from public roads, in the FEIR (in Response to Comment C-5g) the CITY nonetheless incorrectly and misleadingly continues to state that it "not did find any *public* vantage points where the landfill could be readily seen." (emphasis added.)

44. In terms of the construction-related noise impacts on outdoor recreation areas and hiking trails located on the VICHY SPRINGS RESORT property, the DEIR had failed to acknowledge that such outdoor recreation areas and hiking trails existed. Because the DEIR failed to acknowledge that such outdoor recreation areas and hiking trails existed, the DEIR similarly failed to provide any analysis whatsoever regarding the impacts of construction-related noise on these outdoor recreation areas and hiking trails. In the FEIR, for the first time, the CITY acknowledged the existence of outdoor recreation areas and hiking trails on the VICHY SPRINGS RESORT property, but then (again without any supporting data or analysis) made an unsupported finding that the construction-related noise would not affect the quiet and enjoyment of persons using these outdoor recreation areas and hiking trails. In its Response to Comments (included in the FEIR), the CITY justified this less-than-significant finding on the basis that the construction-related noise would not prevent people from being able to "walk and talk" in these outdoor recreation areas. For places that people value primarily for the quietude and tranquility of their surroundings and the restorative effect of silent interaction with nature (like the hiking trails on the VICHY SPRINGS RESORT property), the fact people might still be able to "walk and talk" amidst the persistent roar of diesel trucks, the continuous pounding thud of compression equipment and the jarring sounds of backup beepers tells us nothing about the ways that such noise would compromise and degrade the quality of the recreational experience in such places. Then, based on this bald unsupported finding that the construction-related noise would not affect the experience of persons using these

outdoor recreation areas and hiking trails, and relying on its finding that construction-related noise would constitute a less-than-significant impact on such recreational resources, the FEIR went on to determine that this new disclosure did not amount to "significant new information" and therefore that recirculation of the EIR with this new information was not required. The CITY's logic here is circular, without any evidence to support it, and inconsistent with what CEQA requires.

45. CEQA does not permit the CITY to avoid its obligation to recirculate the EIR for public comment by simply including an unsupported bald finding in the FEIR that the construction-related noise impacts on such just-acknowledged outdoor recreation areas and hiking trails are less-than-significant. To avoid circulation in this instance, the FEIR would need to provide data, evidence and substantive analysis (substantial evidence) to support this finding of less-than-significant impacts. Because the FEIR failed to provide any evidence (let alone substantial evidence) to support this finding, recirculation is required.

Seventh CEQA Claim – Failure to Identify and Consider Feasible Mitigation Measures to Reduce Adverse Environmental Impacts

46. CEQA requires that an EIR identify and evaluate feasible mitigation measures to avoid or reduce the severity of adverse environmental impacts for a proposed action.

47. As noted above, the FEIR prepared by the CITY disclosed (for the first time) that the proposed synthetic landfill cover would create enhanced fire hazard and fire risks. Although the FEIR conceded the enhanced fires hazard and fire risks associated with the proposed synthetic plastic landfill cover, the DEIR and the FEIR did not contain analysis of feasible mitigation measures to avoid or reduce such fire hazards and fire risks. More specifically, in terms of such fire hazards and fire risks, the DEIR and FEIR prepared by the CITY did not evaluate the advantages of using a clay/earthen landfill cover instead of the proposed synthetic landfill cover. This failure to provide such a *comparative* evaluation constitutes a failure to comply with CEQA's obligation to consider feasible mitigation measures to reduce adverse environmental impacts of a proposed project

48. As noted herein, there are large numbers of large wild boars (weighing as much as 200 pounds) that roam on and in the immediate vicinity of the landfill site, and such wild boars have a

natural tendency to "root" – to force their hoofs and snouts into the ground and tear up any ground covering. The presence of wild boar populations and their tendency to "root" poses a significant risk to the integrity of the propose synthetic plastic offer, a risk that it is not posed by the use of a clay/earthen landfill cover. The DEIR and FEIR prepared by the CITY did not evaluate the environmental and performance advantages of using a clay/earthen landfill cover as a feasible means to avoid or mitigate the threats posed by wild boar populations in the vicinity of the landfill site.

49. As noted herein, as a natural consequence of the anticipated degradation during the 30-year period of the Landfill Closure Plan, the synthetic landfill cover proposed by the CITY is likely to release microplastic into nearby streams and creeks, and into the Russian River and the ocean. As also noted herein, as a result of abrasion caused by wild boar rooting, the synthetic landfill cover proposed by the City is likely to release PFAS into nearby stream and creeks, and into the Russian River. The DEIR and FEIR prepared by the CITY did not evaluate the use of a clay/earthen landfill cover as a feasible means to avoid and mitigate the anticipated release of microplastics and PFAS into waterways and thereby reduce adverse impacts on hydrological resources/water quality and biological resources.

50. As noted above and further detailed in VICHY SPRINGS RESORT's January 9, 2020 written submission, construction-related noise generated by the Landfill Closure Plan will have adverse impacts on outdoor recreation resources and hikers both on VICHY SPRINGS RESORT and other nearby properties. As detailed above, although the FEIR prepared by the CITY acknowledged (for the first time) that such nearby outdoor recreation resources and hiking trails exist, the DEIR and the FEIR in fact contained no data, evidence or substantive analysis to evaluate the severity of how construction-related noise (e.g. compression equipment, backup beepers) will increase noise levels above existing/baseline noise levels on such outdoor recreation areas and hiking trails. Without such information and comparative analysis, there is no basis (no substantial evidence) to support the FEIR's finding that the construction-related noise impacts on such outdoor recreation areas and outdoor recreation users will be less-than-significant. This is because, as explained above, for these impacted outdoor areas closer to the landfill site the DEIR and FEIR do not contain a *comparison* of ambient noise levels *prior* to the project (which reflect the peaceful quietude that is an essential part of the

hiking/outdoor experience for such areas) with noise levels while the construction-related activities are taking place. Because the CITY lacks any basis to find that the construction-related noise impacts on such outdoor recreation areas/hiking trails are less-than-significant, CEQA's requirements regarding feasible mitigation measures apply.

51. In the written comments VICHY SPRINGS RESORT submitted to the City on January 9, 2020, several mitigation measures were presented to help reduce or otherwise minimize the construction-related noise impacts of the Landfill Closure Plan on nearby outdoor recreation areas and hiking trails. More specifically, in its January 9, 2020 written submission, VICHY SPRINGS RESORT proposed that the construction work could forgo the use of loud jarring backup beepers on motor vehicles used on the project site, and instead deploy additional construction personnel to help guide such trucks/equipment so the use of such backup beepers would not be needed to ensure the safety of workers (and alternative that, as noted above, is expressly allowed pursuant to OSHA Regulation 1926.601(b)(4)). More specifically, in its January 9, 2020 written submission, VICHY SPRINGS RESORT proposed that instead of scheduling construction work weekdays from 7:00 am to 7:00 pm (essentially all daylight hours when people would be hiking or otherwise using nearby outdoor recreation areas), such construction work could be scheduled for either designated morning shifts or designated after shifts. VICHY SPRING RESORT is open every weekday, and its weekday guests make frequent use of the hiking trails over the hills from the resort buildings. For instance, if weekday construction work was scheduled from 7:00 am to 2:00 pm on weekdays, then people enjoy the nearby outdoor recreation areas/hiking trails from 2:00 pm until 7:00 pm without being subjected to adjacent construction-related noise. Similarly, if weekday construction work was scheduled from 12:00 am to 7:00 pm, then people could enjoy the nearby outdoor recreation areas/hiking trails from 7:00 am to 12:00 am without being subjected to adjacent construction-related noise. As another potential mitigation measure, weekday construction activities could be limited to 9:30 am to 4:30 pm, which would at least provide limited hours in the early morning and late afternoon for nearby hiking and outdoor recreation activities that would be undisturbed by construction-related noise impacts. VICHY SPRINGS RESORT recognizes that, regardless of which landfill cover is selected, there will necessarily be some adverse

noise impacts associated the construction-related aspects of the Landfill Closure Plan. What VICHY SPRINGS RESORT requested was that the CITY, as part of its CEQA environmental impact assessment process, identify and evaluate feasible mitigation measures (such as those noted above) to reduce and minimize such construction-related noise impacts as they related particularly to persons using outdoor recreation areas/hiking trails.

52. Aside from its purely conclusory statement (in its Response to Comments) that forgoing the use of backup beepers would present unacceptable risks to workers on the site (a statement not supported by any analysis of the OSHA-approved option of having additional construction staff on site to address safety concerns related to vehicles backing up), the DIER and FEIR did not consider or evaluate any further measures to reduce or minimize construction-related noise impacts on outdoor recreations areas/hiking trails and on the people that use those recreational resources. As such, the DEIR and the FEIR did not determine that the noise impact mitigation measures proposed by VICHY SPRINGS RESORT were not feasible, but rather simply refused to consider or evaluate them at all. The CITY attempted to justify this refusal on the basis that it did not need to consider and evaluate such mitigation measures because the FEIR had made a finding that the construction-related noise impacts on nearby outdoor recreation areas/hiking trails were less-than-significant.

53. However, as explained above, the CITY's reasoning here is completely circular because the FEIR did not provide any data, evidence or substantive analysis (substantial evidence) to support its finding that the construction-related noise impacts on nearby outdoor recreation areas/hiking trails would be less-than-significant. As such, this finding in the FEIR will simply be disregarded by any reviewing court on the basis that there is no substantial evidence to support it. Because this finding will be disregarded, there is no justification under CEQA for the CITY's refusal to consider and evaluate feasible mitigation measures to reduce and minimize construction-related noise impacts on nearby outdoor recreation areas/hiking trails.

Eighth CEQA Claim – Absence of Substantial Evidence to Support FEIR Findings Regarding Environmental Impacts and True Project Costs

54. CEQA requires that all findings in an EIR be supported by substantial evidence. Under

CEQA, findings in an EIR that are not supported by substantial evidence will be disregarded by a reviewing court.

55. It its Response to Comments (included as part of the FEIR), the CITY claimed that the North Coast Regional Water Quality Control Board, CalRecycle and Mendocino County Health Department (the "LEA" under the California Health and Safety Code) had already "approved" the synthetic landfill cover design in 2018. This is incorrect. Under CEQA, the North Coast Regional Water Quality Control Board, CalRecycle and Mendocino County Environmental Health Department are legally prohibited from making a final approval of the proposed synthetic landfill cover until such time as the CITY (as the CEQA lead agency) first completes its environmental impact assessment for the Landfill Closure Plan. In the case of the Landfill Closure Plan, this means that the North Coast Regional Water Quality Control, CalRecycle and Mendocino County Environmental Health Department may not make a final approval of the proposed synthetic landfill cover until the CITY first certifies a legally-adequate EIR (which has not yet happened). The reason for this sequencing under CEQA is because, before the making a final approval of the proposed synthetic landfill cover, the Regional Board, CalRecycle and Mendocino need to review and consider all of the information and analysis contained in the certified EIR regarding the environmental performance and risks associated with the proposed synthetic cover, including but not limited to fire safety/fire hazard risks, risks to waterways and biological resources associated with the release of microplastics and PFAS, risks to water quality associated with the rooting behavior of wild boar populations that roam on and in the vicinity of the landfill site, and impacts associated with removing, disposing of, and replacing the interim final cover (discussed herein). To the extent the EIR prepared by the CITY for the Landfill Closure Plan is legally inadequate under CEQA, this would preclude the North Coast Regional Water Quality Control Board, CalRecycle and Mendocino County Environmental Health Department from issuing any permits or approvals for the Landfill Closure Plan. Should the North Coast Regional Water Quality Control Board, CalRecycle and Mendocino County Environmental Health Department issue approvals or permits for the Landfill Closure Plan without first determining that a legally-adequate EIR has been prepared, VICHY SPRINGS RESORT, RUSSIAN RIVERKEEPER and MATEEL ENVIRONMENTAL reserve the right

to file administrative appeals and/or litigation to have such agency approvals/permits set aside.

56. The FEIR including the following finding regarding the proposed ClosureTurf synthetic landfill cover on page 4-30: "The durable, high-strength system components ensure a long-life (**100-year design life**) of protection against operational and natural forces." (bold added.) Yet, as noted above, the ClosureTurf company product materials included in the DEIR and FEIR acknowledge (on the page titled "Weathering") that by the end of a 30-year period customers should anticipate a 25% loss in the tensile strength of the engineered turf fibers. If the engineered turf fibers that comprise the synthetic landfill cover are expected (by the manufacturer ClosureTurf) to lose 25% of their strength/integrity in the first 30 years than presumably it can be expected that there would be additional and increasing losses in strength/integrity of the engineered turf fibers during a 100-year period. In light of this acknowledgement of anticipated turf fiber degradation by the manufacturer, there is not substantial evidence to support the CITY's finding the FEIR that the proposed synthetic landfill cover has a "l00-year design life."

57. The DEIR and the FEIR for the Landfill Closure Plan found that there was a less-than-significant impact on hydrologic resources/water quality and a less-than-significant impact on biological resources. In making these findings, the DEIR and FEIR failed to acknowledge (as discussed herein) the likelihood that the anticipated degradation of the engineered turf fibers in the proposed synthetic cover during the minimum 30-year life of the Landfill Closure Plan would result in the release of microplastics into nearby streams and creeks and into the Russian River and the ocean, and failed to acknowledge the adverse impact of such microplastic releases on fisheries. As set forth above, the DEIR and FEIR also failed to disclose and discuss how wild boar rooting is likely to cause to the release of PFAS from the synthetic landfill cover into nearby streams and creek (see Exhibit 2 to these comments). The DEIR and FEIR's disregard of the likelihood of microplastic releases and PFAS releases into waterways and the resulting impacts of such microplastic and PFAS releases on fisheries indicates a lack of substantial evidence to support the finding that the Landfill Closure Plan will have a less-than-significant impact on hydrologic resources/water quality and biological resources.

58. The DEIR and FEIR for the Landfill Closure Plan contained a finding that the proposed

synthetic cover was an "environmentally superior alternative" to the option of using a clay/earthen landfill cover (the cover preferred by the Regional Board). In making its finding in the DEIR and the FEIR that the synthetic landfill cover was an "environmentally superior alternative" the DEIR and FEIR failed to acknowledge and evaluate that the proposed synthetic landfill cover presented enhanced fire hazards and fire risks as compared with the option of a clay/earthen landfill cover (an enhanced fire hazard and fire risks that would be avoided if the clay/earthen landfill cover were selected). In making its finding in the DEIR and FEIR that the synthetic landfill cover was an "environmentally superior alternative" the DEIR and FEIR also failed to:

- acknowledge and address the threats to waterways and biological resources from the release of microplastics and PFAS associated with the use of the proposed synthetic landfill cover;
- acknowledge and address the presence of large numbers of wild boars on and in the vicinity of the landfill site, and failed to recognize the threat such wild boars (and their "rooting" behavior) presented to the integrity of the proposed synthetic landfill cover and the resulting risks of PFAS releases into nearby streams and creeks;
- acknowledge and discuss that the use of a clay/earthen/natural grass landfill cover versus the proposed mono-color synthetic plastic landfill cover would avoid adverse scenic impacts; and
- Acknowledge and address the fact that the interim final cover would ultimately need to be removed, disposed of, and replaced, causing additional environmental impacts.

By failing to acknowledge and address these fire-related, water quality-related, wild boar-related risks and increased adverse scenic and other impacts associated with the selection of the synthetic landfill cover, the DEIR and the FEIR lacked substantial evidence to support the finding that the proposed synthetic landfill cover was the 'environmentally superior alternative."

59. As set forth above, although the DEIR and FEIR contained information that the CITY would be required by the Regional Board to provide additional financial assurances if it selected the synthetic landfill cover option, the DEIR and FEIR did not attempt to estimate the cost of such additional financial assurances nor did it include the costs of a such additional financial assurances in its project budget for the Landfill Closure Plan. As set forth above, due to the fire hazards and fire risks associated with the

selection of the synthetic landfill cover option, the CITY will need to maintain fire-related insurance throughout the entire 30-years of the Landfill Closure Plan (and beyond, until released from postclosure maintenance responsibilities) to provide coverage for these fire-related hazards and risks. The DEIR and the FEIR, however, did not attempt to monetarily quantify the costs of maintaining such fire-related insurance nor did the DEIR or FEIR includes the costs of maintaining such fire-related insurance in its project budget for the Landfill Closure Plan. As explained above, the proposed synthetic plastic landfill cover is an "interim" measure. After these 30 years, the synthetic landfill cover will likely need to be removed and disposed of, and replaced with a "permanent" clay/earthen landfill cover. The DEIR and FEIR, however, did not provide an estimate of the costs of removing and disposing of the interim synthetic landfill cover, or of replacing the interim synthetic landfill cover with a permanent clay/earthen landfill cover. The failure to include and quantify the costs associated with these additional financial guarantees, fire-related insurance premiums, and the failure to include the likely costs of removing, disposing and replacing the interim synthetic landfill cover evidences that there is not substantial evidence to support the findings in the DEIR or FEIR regarding the budget/anticipated costs associated with selecting the synthetic landfill cover, nor is there substantial evidence in the DEIR or FEIR to support the findings that the true budget/anticipated costs of the synthetic cover option will be *less* expensive than the clay/earthen landfill cover option (which the CITY will need to install anyway after 30 years).

60. As set forth above, the DEIR and FEIR for the Landfill Closure Plan do not contain substantial evidence (or any evidence) to support the finding that the construction-related noise impacts of the Landfill Closure Plan will have a less-than-significant on nearby outdoor recreation areas/hiking trails, including impacts on those outdoor recreation areas/hiking trails located on the VICHY SPRINGS RESORT property. As set forth above, the DEIR and FEIR for the Landfill Closure Plan do not contain substantial evidence (or any evidence) to support the claim that foregoing the use of backup beepers for trucks/equipment would present an unacceptable risk to workers (due to the failure to consider the option, approved by the federal Occupational Safety and Health Administration, of having additional construction staff on site to address the worker safety concerns that backup beepers are intended to

address).

61. As set forth above, the FEIR found that forgoing the use of backup beepers for construction vehicles operating at the landfill site would create an unacceptable safety risk. In making this finding the FEIR failed to consider that OSHA Regulation 1926.601(b)(4) expressly provides that, in lieu of the use of backup beepers, motor vehicles at construction sites may rely on an "observer that signals" it is safe to back up. The availability of this OSHA-approved "observer" option makes clear that there is not substantial evidence to support the FEIR's finding that forgoing the use of backup beepers creates an unacceptable safety risk.

62. As set forth above, the CITY's DEIR, FEIR and Response to Comments determined that there was no hydrological connection between the groundwater wells that will be operated as part of the Landfill Closure Plan and the subsurface source of the Vichy Springs, and that the installation and activation of the such groundwater wells in 1994 was unrelated to the precipitous drop in mineral spring pressure and temperature that occurred immediately after the installation and operation of the wells. The CITY determined that these contemporaneous events were just a temporal "coincidence." In support of this finding, the CITY referred to a 1994 study showing that the chemical constituency of the water found in the groundwater wells was different from the chemical constituency of the water in the subsurface springs. This 1994 study, however, is completely off-point from a scientific standpoint because the cause of the depressurization of the springs was not the ongoing co-mingling of waters, it was that the groundwater wells provided a short-term conduit for CO2 to vacate the subsurface springs thereby temporarily reducing pressure that maintained the springs' flow and temperature. A comparison of chemical constituency samples, taken months after this CO2 depressurization had occurred and the CO2 levels had later re-established, does not provide any evidence as to effect of the groundwater wells on the pressure and temperature of the springs (which occurs because of the hydrologic connection between the wells and the springs). For these reasons, there is no evidence (let alone substantial evidence) to support the DEIR's and FEIR's finding that under current baseline conditions the operation of the groundwater wells as part of the Landfill Closure Plan cannot impact the pressure and temperature of subsurface mineral springs upon which VICHY SPRINGS RESORT relies.

63. Beyond the above-noted examples of the lack of substantial evidence to support key findings in the DEIR and FEIR, it is particularly important to note the lack of substantial evidence to support the finding in the DEIR and FEIR that the selection of the synthetic plastic landfill cover will have a less-than-significant impact on scenic/visual resources. It is with this particular finding that the lack of substantial evidence is perhaps the most glaring. In the DEIR, the CITY claimed that the synthetic landfill cover would have a less-than-significant scenic impact because the mono-color synthetic landfill cover would somehow blend naturally into the surrounding natural grass hillsides. Perhaps recognizing the absurdity of this claim, in the FEIR the CITY took a different tack. For the FEIR, instead of sticking with it previous claim that the mono-color synthetic landfill cover would somehow blend naturally into the surrounding natural grass hillsides, the FEIR instead argued that the "contrast" between the surrounding natural grass hillsides and the 40-acre mono-color swath of synthetic plastic might be considered by some people to be visually "pleasing" because it might remind them of an irrigated field. The FEIR then noted that there many irrigated fields throughout Mendocino County and that some people find such irrigated fields picturesque. In support of this new "pleasing contrast" argument, the FEIR then showed a picture of a baseball field with astroturf, and claimed that when seen from a distance it was difficult for most viewers to be able to recognize that the baseball field was artificial astroturf rather than natural grass. The FEIR also claimed that the concerns raised by VICHY SPRINGS RESORT about the adverse scenic/visual impact of the proposed mono-color synthetic plastic cover should be disregarded because they were not made by an appropriate "expert." While a comprehensive refutation of all of the CITY's illogical and strained claims here is beyond the scope of what can be covered herein, a few critical common-sense points can be highlighted.

64. In terms of the CITY's observation that there are many irrigated fields in Mendocino County and that some people find these irrigated fields visually pleasing, this observation is completely irrelevant from a CEQA standpoint. Pursuant to the environmental impact analysis required by CEQA, the pertinent inquiry is not whether some people sometimes find irrigated fields pleasant to look at. The pertinent question is whether, at the former landfill site, the change from the current natural grass hillside to a mono-color synthetic plastic 40-acre swath would be considered an adverse scenic impact. It

is this *comparison* of *existing* scenic conditions to *post-project* scenic conditions at this particular location that is relevant, not whether (in some general sense) some people find irrigated fields pretty. Moreover, in the context the natural grass hillsides surrounding the landfill site (where there are no other irrigated fields), it would be apparent to any viewer that the 40-acre mono-color swath is not an irrigated field as it would make no sense to plant and maintain such an irrigated field in this setting.

65. In terms of the CITY's analogy to a baseball field covered in astroturf, for anyone that has ever attended a professional or college baseball game and sat in the stands to watch the game (several hundred feet away from the playing field), it is immediately visually apparent whether the field is composed of natural grass or of astroturf. The uniformity of color and the texture of astroturf are visually different from natural grass. The claim in the FEIR (in Response to Comment C-3a), in regard to the suggested analogous situation with an astroturf baseball field, that "from over 500-feet away it would be difficult if not impossible to tell the difference between artificial synthetic turf and real/natural grass" is absurd and defies common experience. If one were attending a baseball game with an astroturf field (instead of a real grass field) and asked 100 spectators sitting in the stands 500 feet away from the field, "is that astroturf or natural grass?" it is likely that 100 out of 100 spectators would look at the field and respond "That's astroturf." It is doubtful any spectator attending the baseball game would be mistaken or confused about what it is they are looking at, that they are looking at synthetic artificial turf rather than natural grass. Moreover, the photograph of the baseball field provided by the CITY in its Response to Comments (as part of the FEIR), of a baseball field that has astroturf on the infield and natural grass in the outfield (that both just coincidentally happen to be almost the exact same color), is completely distinguishable from the scenic situation presented with the former Ukiah landfill. As explained herein and as conceded by the CITY, during the drier/hotter portions of the year, the hillsides surrounding the 40-acre mono-color synthetic plastic green cover will be *brown* (not the same color as the synthetic plastic cover). In terms of the baseball field, if the CITY wanted to provide a photograph that was visually analogous to the situation with the former Ukiah landfill, it should have provided a photograph of a mono-color synthetic green infield set against an unirrigated *brown* dry outfield. Had the CITY provided such a photograph, any viewer of the photograph (and any person actually looking at

the real baseball field) would immediately recognize that the strangely uniform *green* infield is artificial astroturf rather than natural grass (because the natural grass in the outfield would be dry and *brown*).

66. Finally, the CITY claims that VICHY SPRINGS RESORT's concerns regarding the scenic impacts of the proposed mono-color plastic synthetic cover should be disregarded because such concerns were not raised by an appropriately trained "expert." When it comes to assessing adverse visual/scenic impacts, unlike with many other environmental impacts, there is no such thing as a technically-trained "expert." There is no professional or academic degree of certification that qualifies someone as an expert to determine whether a scenic change from a natural grass hillside to a mono-color synthetic cover is considered adverse when set in the context of surrounding natural grass hillsides. To determine such scenic impacts, in terms of whether they are adverse and to gauge the severity of any such adverse impact, we are simply left with the preferences and reactions of a reasonable common person. The CITY, and the environmental consultant hired by the CITY to prepare the FEIR and the DEIR, do not have any particular "expertise" in determining or quantifying such adverse scenic impacts. If the question is presented to a judge as to whether the proposed synthetic mono-color plastic landfill cover constitutes a negative scenic impact as compared with the current natural grass condition of the landfill site and in comparison with the surrounding natural grass hillsides, the judge will look to the preferences and reactions of a reasonable common person. VICHY SPRINGS RESORT, RUSSIAN RIVERKEEPER and MATEEL ENVIRONMENTAL are confident that under such an approach the CITY's position and claims – that for some people the synthetic plastic mono-color landfill cover may present a "pleasing contrast" with the natural grass hillsides, or that some people may somehow mistake the synthetic plastic landfill cover for an irrigated field – will be given little if any credence. Those types of claims may be offered up in the marketing materials by the company that manufactures the proposed synthetic landfill clover (ClosureTurf) the CITY proposes to use, but such self-serving marketing claims are inconsistent with the actual preferences and actual experiences of a reasonable common person.

IV. RELIEF SOUGHT

67. For the reasons set forth herein, and in the previous written submissions to the CITY by

VICHY SPRINGS RESORT and other parties, VICHY SPRINGS RESORT, RUSSIAN RIVERKEEPER and MATEEL ENVIRONMENTAL respectfully request that the CITY prepare a revised EIR for recirculation that addresses the shortcomings and instances of CEQA-noncompliance identified herein and in other previous submissions. The preparation and recirculation of such an EIR will not only help ensure that the Landfill Closure Plan reduces adverse fire hazards, scenic impacts, noise impacts, historic resource impacts, public safety impacts, hydrologic resource/water quality impacts and biological resource impacts, but will also help to reduce the true project costs to Ukiah taxpayers and as well as costs and liabilities that are likely to be incurred by the CITY and Ukiah taxpayers if litigation is unfortunately required to ensure compliance with CEQA.

Respectfully submitted,

Paul Stanton Kibel

Re: **Opinions**
Vichy Springs Resort v. City of Ukiah Public Works and City of Ukiah City Council

I, Bob Clark-Riddell, a registered Professional Engineer in California (C49629) and President/Principal Engineer of Pangea Environmental Services, Inc.. prepared the enclosed opinions regarding potential impacts to human health, animals, and water quality for the subject matter. If you have any questions, please contact me at briddell@pangeaenv.com or (510) 435-8664.

Sincerely,
Pangea Environmental Services, Inc.

Bob Clark-Riddell, P.E.
President/Principal Engineer

Enclosure: Opinions

Vichy Springs Resort v. City of Ukiah Public Works and City of Ukiah City Council

Opinion #1: In the event of a wildfire, the proposed synthetic landfill cover would likely represent a significant health risk to nearby residences via airborne emissions.

This opinion is based on the following information:

1. A number of residences are located within 2,000 of the proposed synthetic landfill cover.

2. According to the limited product information readily available from Watershed Geo, ClosureTurf (the apparent proposed synthetic landfill cover material) is comprised of a) an artificial grass on top (polyethylene fibers), b) an infill material (likely a ¾" thick coated sand layer supporting the artificial grass), and c) a MicroSpike plastic bottom layer (composed of high-density polyethylene [HDPE] and linear low-density polyethylene [LLDPE])(Exhibit A).

3. For the polyethylene fibers, according to a material safety data sheet (MSDS) as Exhibit B, the product polymer may decompose under fire conditions to give off hazardous products. The MSDS lists hazardous decomposition products of carbon monoxide, carbon dioxide, nitrogen oxides, and traces of hydrogen cyanide.

4. For HDPE, according to a material safety data sheet (MSDS) as Exhibit C, polyethylene is a combustible substance which in contact with flame ignites and burns until exhausting. The MSDS lists toxic combustion products of carbon monoxide, carbon dioxide, and other oxidizing organic compounds. Molten polymer presents thermal burns hazard in case of skin contact.

Opinion #2: In the event of a wildfire, the proposed synthetic landfill cover would likely represent a significant health risk to fire fighters via airborne emissions.

This opinion is based on This opinion is based on the following information:

1. Information presented in Opinion #1 regarding ClosureTurf components and hazardous decomposition and toxic combustion products (Exhibits A, B and C).

2. For HDPE, according to a material safety data sheet (MSDS) as Exhibit C, fire fighting equipment should include self-contained breathing apparatus and complete fire fighting clothing. Molten polymer presents thermal burns hazard in case of skin contact.

<u>Opinion #3:</u> The proposed synthetic landfill likely represents a threat to water quality near the proposed synthetic cover location.

This opinion is based on the following information:

1. Creeks and surface water are present in the area of the proposed synthetic landfill cover.

2. PFAS chemicals have been found in artificial turf (Exhibit D). 'PFAS' is short for perfluoroalky and polyfluoroalkyl substances and includes chemicals known as PFOS, PFOA and GenX**,** sometimes called 'forever chemicals'. These chemicals all share signature elemental bonds of fluorine and carbon, which are extremely strong and difficult to break down in the environment or in our bodies. PFAS chemicals have been used widely to help with the production of plastic polymers that are molded into the shape of grass blades when in molten form. Exhibit D references water in a wetlands near discarded turf contained PFAS when tested. Exhibit D references research that PFAS is released from turf when exposed to abrasion (maintenance equipment or feral pigs rooting could contribute to turf degradation and PFAS releases). Exhibit D suggests that limited information is available about the presence of PFAS in artificial turf and the potential for releasing and affecting air, soil, and water where these products are used.

3. According to U.S. EPA, there is evidence that exposure to PFAS chemicals can lead to adverse human health outcomes for humans (including cancer) and for animals (Exhibit E). PFAS has been evaluated at numerous sites for potential releases into air, soil and water, and including sources of drinking water. In May 2016, U.S. EPA issued a lifetime health advisory PFOS and PFOA for drinking water. Exhibit E documents that PFAS can affect people via contaminated air and that drinking water has been impacted by PFAS.

4. Persuant to U.S. EPA recommendations, the California State Water Resources Control Board (SWRCB) has issued notifications to sensitive receptors, is investigating PFAS, and has established guidelines for PFAS testing to assess the scope of the problem (Exhibit F). Exhibit F cites that people are exposed to PFAS through dust and drinking water, and that PFASs tend to accumulate in groundwater.

5. A SWRCB map tracking PFAS testing of drinking water. Exhibit G shows a portion of the PFAS map for northern California, where PFAS has been found in drinking water in the main well for the Stonegate Mobile Home Park of Santa Rosa, California.

6. The California Office of Environmental Health Hazard Assessment (OEHHA) has issued a notice that the agency intends to list PFOA and PFOS as known to cause reproductive toxicity under the Safe Drinking Water and Toxic Enforcement Act of 1986 (Exhibit H).

<u>Opinion #4:</u> Due to PFAS, the proposed synthetic landfill cover likely represents a threat to human health via airborne emissions of wildfires or long-term deterioration of the cover.

This opinion is based on the following information:

1. Information presented in Opinion #3 regarding likely PFAS presence and the associated exhibits.

2. The U.S. EPA and CSWRB exhibits reference human health concerns from PFAS via air contamination, which could be exacerbated by wildfires, deterioration over time, and abrasion from mechanical equipment or wildlife (e.g., pig rooting).

Exhibit A for Bob Clark-Riddell Opinion

ClosureTurf

ClosureTurf® w 40 mil MicroSpike® Liner

Product Data	Test Method	LLDPE Values	HDPE Values
Thickness (nominal), mil (mm)	ASTM D5994	40 (1.0)	40 (1.0)
Thickness (min. avg.), mil (mm)	ASTM D5994	38 (0.95)	38 (0.95)

v. 20058

Exhibit B for Bob Clark-Riddell Opinion

ForeverLawn INC.

Grass without limits.

MATERIAL SAFETY DATA SHEET

FOREVERLAWN PRODUCTS CONTAINING POLYETHYLENE AND NYLON FIBERS

A. IDENTITY

Chemical name:	Polyethylene fibers/Nylon fibers with polyurethane backing
Distributor:	ForeverLawn, Inc., 4500 Bogan Ave. NE, Albuquerque, NM 87109
Emergency Telephone Number:	505.217.0177

B. HAZARDOUS INGREDIENTS

This product is considered to be a non-hazardous chemical under the Federal Occupational Safety and Health Administration Hazard Communication Standard 29CFR1910.1200

C. PHYSICAL DATA

Melting Point:	Polyethylene yarn 221° – 249°F/105° – 115°, Nylon yarn 428° – 436°F/220° – 230°C
Specific Gravity:	(H20=1) 0.94 turf
Appearances:	Solid
Odor:	None

D. FIRE HAZARD DATA

Unusual fire and explosion hazards:	None
Flashpoint:	>600°F
Extinguishing Method:	Water, Foam, Carbon Dioxide
Fire Fighting Equipment:	Wear protective pressure, self-contained, breathing apparatus. This product is resistant to damage and spreading of ignition in typical exposures such as lighted cigarette dropped on the surface.

E. REACTIVITY DATA

Stability:	(Conditions to avoid) Polymer may decompose under fire conditions to give off hazardous products
Dissolution:	Softening or discoloration may occur with yarn, phenol, formic acid, other acidic exposures below PH5
Hazardous Decomposition Products:	Carbon Dioxide, Carbon Monoxide, Nitrogen Oxides, Traces of Hydrogen Cyanide
Hazardous Polymerization:	Will not occur

F. HEALTH HAZARD INFORMATION

No health hazards are evident from MSDS documentation of constituents of this product, in the form presented when installed and used for its intended application as a synthetic turf product.

G. ENVIRONMENTAL & DISPOSAL INFORMATION

Environmental Impact:	This product is in compliance with the EPA RCRA backing standard TCLP in US Federal register to CRF261 for all heavy metals on that list.
Disposal Procedures:	Safe for landfills; Can be processed and used as a combustible fuel where proper recycling facilities are available.

H. LEGAL DISCLAIMER

While the information set forth herein is believed to be accurate and complete as of the date hereof. ForeverLawn Inc. makes no warranty with respect thereto and disclaims all liability and release thereon.

I. DATE OF ISSUE

April 2, 2007

Exhibit C for Bob Clark-Riddell Opinion

MSDS -04: HDPE -MATERIAL SAFETY DATA SHEET

1. Product and company identification

Product identification HDPE
Manufacturer Rompetrol Petrochemicals S.R.L., company of Rompetrol Group
DJ226, KM23, COD 905700, CONSTANTA, ROMANIA
Tel: +(40) 241 506 868 Fax: +(40) 241 506 909

2. Composition/information on ingredients

Chemical name: high-density polyethylene
Synonyms: HDPE

Composition:	**CAS #**	**% m/m**
Polyethylene	9002-88-4	> 99
Additives	-	<1

Physical appearance: Translucent white pellets ,cake and powder. Contains slight traces of titanium,chlorine,aluminium. Various organic and inorganic additives may be incorporated.
Potential hazard: Spilled material may present a slipping hazard. Following handling and packing various procedures, polyethylene dust may occur. Molten polymer may cause thermal burns. When burning without sufficient oxygen, it starts to release fumes that can contain carbon mono and dioxide, other oxidizing organic compounds. To minimize exposures, adequate room and ventilation should be provided.

3. Hazard identification

Polyethylene is not classified as toxic, harmful, irritant or corrosive product.

Eye contact: The product may content small particles that may cause eyes irritation, due to the mechanical action. Gaseous emissions released while burning may cause eyes irritation/redness.
Skin contact: The product may content small particles that may cause irritation. The contact with molten polymer cause thermal burns.
Ingestion: The product presents minimal toxicity. No hazard anticipated from swallowing incidental small amounts.
Inhalation: In normal concentrations, polymer dust induces no health effects. The product is not volatile at room temperature. Gaseous emissions released while burning may cause nose and breathing tract irritation.

4. First aid measures

Eye contact: Flush with plenty of water for 15 minutes. Remove large particles. In case the irritation persists, get medical attention.
Skin contact: Flush with water and soap for several minutes. In case the irritation persists, get medical attention. Molten polymer – if molten material comes in contact with the skin, cool under ice water or a running stream of cold water. Cover the affected area with clean cotton sheeting or gauze. Do not attempt to remove the product from skin; it could result severe tissue damage. Get medical attention.
Ingestion: not applicable
Inhalation: In case typical symptoms occur, remove the victim to fresh air. Get medical attention if symptoms persist.

© **ROMPETROL PETROCHEMICALS S.R.L**. Unauthorized reproduction by any means, partial or total, is prohibited

5. Fire fighting measures

Flashpoint: > 340°C
Ignition conditions: Polyethylene is a combustible substance but under normal housekeeping conditions there is no risk of ignition. It not easily ignites but in contact with a flame it becomes soft, flows, ignites and burns until exhausting (if it isn't stabilized with a flame retardant agent). In foil form ignites easily. Static electricity may accumulate during handling/storage, and in certain conditions may constitute an ignition source source in case a high dust concentration exists.
Toxic combustion products: Carbon mono and dioxide, other oxidizing organic compounds. In case of burning without sufficient oxygen, a black, dense smoke is released
Extinguishing media: Small fire: dry chemicals, and carbon dioxide extinguishers. Large fires: large quantities of water spray.
Fire fighting procedures: Keep people away. Isolate fire area and deny unnecessary access. Cool the area with water to localize the fire. Soak with water to cool and to avoid re-ignition.
Protective equipment for fire fighters: Complete fire fighting clothing, self-contained breathing apparatus. In case these are not available, fire extinguishing has to be done from a safe distance or a protected location.
Explosion hazard: The product as delivered has no explosive character. In case of accumulation, polymer dust may form explosive mixtures with the air.

---

6. Accidental release measures

Personnel protection*:* Remove unnecessary personnel from area. Limit access to the area. Spilled pellets may induce slipping hazard. Molten polymer presents thermal burns hazard in case of skin contact.
Environment protection*:* The released material will not be discharged to the sewerage.
Clean up: The contaminated area shall be swept and cleaned, and the residual material collected in dried and labeled containers. For disposal, see section 13.

---

7. Handling and storage

Store polyethylene in dark, dry and well-ventilated area, away from all heat and ignition sources (sparks, open flames or hot surfaces, welding operations), combustible materials or incompatible substances (strong oxidizing agents). Temperature in the storage area shall not exceed 40^0C. Avoid dust accumulation by frequent cleaning and suitable warehouses structure. Local exhaust ventilation is recommended for control of airborne dust, fumes and vapors, in enclosed areas.
During handling and processing, polymer may charge electrostatic. Use only machines fitted with earth.

---

8. Exposure control /personal protection

Eyes and hands protection: Safety glasses for handling at ambient temperature. Thermal resistant gloves, arm protection and goggles/face shield in case of possible contact with molten product.
Skin and body protection: In case of polymer handling or processing at elevated temperatures or in a molten state, adequate protective equipment will be used over the skin, to prevent contact.
Respiratory protection: For most conditions, no special respiratory protection is necessary. When polymer is heated, general and local ventilation systems will be provided.
Hygienic measures: Inside work areas, eating is not allowed. Normal clothing will be kept separately from work and protective equipment.

---

9. Physical and chemical properties

Physical state: Pellets, powder
Color: White translucent

© **ROMPETROL PETROCHEMICALS S.R.L**. Unauthorized reproduction by any means, partial or total, is prohibited

Odor: No odor
Melting temperature: 190- 210 °C
Flash point: > 340 °C
Density: 0.94 - 0.97 g/cm^3
Water solubility: Negligible

---

10. Stability and reactivity

Chemical stability: Polyethylene pellets and cakes are normally stable. The product is not corrosive.
Hazardous polymerization: No
Conditions to avoid: Excessive temperatures (over 250 °C) or open flames.
Materials to avoid: Strong oxidizing agents (chlorates, nitrates, peroxides, free halogens), organic solvents.
Hazardous decomposition products: carbon mono and dioxide, other oxidizing organic products.

---

11. Toxicological information

Acute toxicity: Polyethylene is considered non-toxic for animals, in case of powder inhalation or solid swallowing.
Local effects: Unknown
Sensibility: Unknown
Chronic toxicity: Unknown
Cancer hazard: Not established
Maximum concentration accepted: Not regulated.
According to Governmental Regulations HG 1218/6.09.2006 related to establishment of minimal health and safety work conditions for personnel protection against chemical agents, for polyethylene there are not regulations regarding the exposal limits of personnel .
If toxic impurities or decomposition products appear, it has to take into consideration the smallest limits stipulated in local or national legislation.

---

12. Ecological information

Movement: Soil- the product will not migrate.
Degradation: The product is inert and it is not biodegradable. Surface photo degradation is expected with exposure to sunlight. Due to the negligible water solubility, it produces no effects on aquatic environment.
Bioaccumulation: Not expected
Ecotoxicity: Minimal, due to the negligible water solubility. Pellets may be harmful for birds and fish if swallowed.

---

13. Disposal considerations

Spilled material removal: Sweep and clean contaminated area, collect residual material into dried, labeled containers. Wash the area with water.
Wastes disposal: Polyethylene wastes are recyclable materials. It is preferably that production rejects and conversion wastes be recycled instead of being disposed.
Disposal of any wastes should observe all national and local valid regulations. In this case should be provided the information regarding the delivered polyethylene : the additives content ,the fillers or other components which can affect the disposal process.
Polyethylene can be disposed by burial (after the elimination of risk of soil contaminations) or controlled incineration, respecting valid regulations regarding gaseous or solid particles discharges. Due to the high heat value, incineration has to be done only in units designed to handle high heats of combustion. In case it is landfilled: polyethylene is inert, does not degrade quickly and does not release gases or other compounds known to pollute water resources.

© **ROMPETROL PETROCHEMICALS S.R.L**. Unauthorized reproduction by any means, partial or total, is prohibited

14. Transport information

International settlements: not regulated by RID, ADR, DOT, IATA, ICAO, IMDG rules.

Polyethylene pellets transport: CP4 euro pallets (1375 kg HDPE/pallet, distributed in polyethylene bags, containing each one 25 kg of product), big-bags- in truck or rail silo, maritime transport containers

Polyethylene powder transport: polyethylene bags, containing each one 25 kg of product, big-bags- in truck or rail silo.

Polyethylene cake transport : Bulk and big-bags- in truck or rail silo.

---

15. Regulatory information

According valid Romanian legislation:

Label:	**Hazard symbol:**	Not regulated
	R - phrases:	Not regulated
	S - phrases:	Not regulated

According international legislation: To the best of Rompetrol Petrochemicals knowledge, the product contains no chemical subject to SARA /Title III, OSHA or CERCLA requirements.

---

16. Other information

Rompetrol Petrochemicals does not recommend any company product for applications that involve human tissues or internal fluids contacts (regardless of the contact length of time), for cardiac devices, for medical device components that support human life, as well as for applications that have connections with human reproduction.

The information relates only to the specific product described above and not to use of the product in combination with other materials. The information contained in this material has been compiled from sources that Rompetrol Petrochemicals considers reliable and accurate. However, the information is provided without any warranty, expressed or implied, regarding its correctness and completeness. Because use conditions and valid regulations may differ from one location to another and may change in time, the customer is responsible for deciding whether the product and the information in this document are suitable for his use and for ensuring that his workplace or disposal practices are in compliance with valid legal regulations. To determine applicability or effects of any law or regulation with respect to the product, user should consult his legal advisor or the appropriate government agency. Rompetrol Petrochemicals does not undertake to furnish advice on such matters. Rompetrol Petrochemicals does not assume nor authorize anyone to assume on Rompetrol Petrochemicals behalf any liability with the use of the information in this MSDS.
The conditions or methods of handling, storage, use and disposal of the product are beyond our control and may be beyond our knowledge. For this, we do not assume responsibility for loss, damage, or expense arising out or connected with handling, storage, use or disposal of this product.

Exhibit D for Bob Clark-Riddell Opinion

Illustration: Sc

TOXIC PFAS CHEMICALS FOUND IN ARTIFICIAL TURF

Sharon Lerner

October 8 2019, 6:00 a.m.

PFAS CHEMICALS HAVE been identified in synthetic turf, according to lab tests performed on several samples of the artificial grass that were shared with The Intercept. The presence of the chemicals, members of a class that has been associated with multiple health problems, including cancer, adds to growing concerns about the grass replacement that covers many thousands of acres in parks, schools, professional sports stadiums, and practice fields around the U.S.

In one set of tests, the PFAS chemicals were detected in the plastic backing of two samples of the turf. In another, in which the "blades" of the artificial grass were analyzed, scientists measured significant levels of fluorine, which is seen as an indication of the presence of the chemicals.

"We're seeing unexplained levels of fluorine-based compounds in all of the eight samples of turf grass blades we've looked at," says Jeff Gearhart of the Ecology Center, a nonprofit environmental research group based in Michigan that tested the turf blades. The samples of the blades that tested positive for fluorine were made by two different companies, Shaw Industries and Turf Factory Direct.

Neither Turf Factory Direct nor Shaw Industries responded to requests for comment for this story.

Read Our Complete Coverage

Bad Chemistry

PFAS chemicals are used widely to help with the molding and extrusions of plastic, according to a 2005 paper from the Journal of Vinyl and Additive Technology. The latest version of the synthetic turf, which is prized for its durability, is made with plastic polymers that are molded into the shape of grass blades when in molten form.

"When you extrude plastic, it's like a cookie cutter," explained Graham Peaslee, a professor of nuclear physics at the University of Notre Dame who has spent the last five years studying PFAS compounds. Without the PFAS, the rigid plastic used to make the turf durable clogged up the extruding machines that make the turf. "So they added fluorochemicals and now it runs through the extruders just fine." While other chemicals can also ease the turf-making process, "the fluorinated ones work the best," said Peaslee, who likened the PFAS in turf to "chemical hitchhikers" that are left over from the processing rather than used as ingredients.

The Synthetic Turf Council did not respond to specific questions about the presence of PFAS in turf. In an emailed response to questions from The Intercept, Dan Bond, president and chief executive officer of the Synthetic Turf Council, wrote that "STC members are at the forefront of technology that continuously improves the durability, performance and end of life uses of synthetic turf systems."

Blades and Backing

Bennett was also extremely disappointed that the EPA investigated only the crumb rubber from the fields and not the plastic grass blades and the backing to which they're attached. So she decided to test them herself. This summer, Bennett and a friend went to a sports field near her home in Massachusetts while new turf was being installed. She secured two samples and sent one of the turf pieces to a lab to be analyzed for the presence of specific PFAS chemicals.

The tests on the turf came back positive for a short-chain PFAS chemical (known as 27619-97-2) that was the subject of risk reports sent to the EPA between 2007 and 2011. While there is little published about the health effects on this chemical, one of those reports, submitted by DuPont in 2009, noted that some rats died after being exposed to the compound. Another noted that the chemical induced chromosomal aberrations in hamsters' ovary cells. Nevertheless, the chemical was approved for use and is produced in large quantities, according to EPA records.

Bennett sent the other turf piece to the Ecology Center, which found that PFAS were also in the blades of the turf. The center used a new method known as a "total fluorine" analysis. Using this technique, researchers can get a total signal for all of the PFAS that are present in products as opposed to just the 30 or so that they are now able to identify and test for individually.

The Ecology Center's Gearhart used the total fluorine test to determine that about half of the hundreds of commercial and residential carpeting samples it tested at the beginning of this year contained PFAS. And Peaslee of Notre Dame, who pioneered the total fluorine method, has used it to identify PFAS in food packaging, cosmetics, and in the protective gear worn by firefighters, at "thousands of times over the drinking water limit."

Discarded Turf

Meanwhile Bennett found another source of turf she could test: 11 rolls of the used field covering that were sitting alongside some bags of crumb rubber a short walk from a field in Franklin, Massachusetts. New turf had been installed on the Franklin field in 2017, and the old turf had been sitting there ever since. So Bennett cut off a piece of the fraying, discarded turf and sent that for testing too. That sample came back positive for PFOS, a chemical that is no longer in use but has been recognized as both a health threat and widespread water contaminant.

Bennett also collected water from a wetland just feet from the rolls of old turf and found that PFOS was in the water as well, suggesting another possible way that this and other PFAS chemicals may been getting into water.

Asked about the discarded turf and the presence of PFOS in both the turf and nearby water, Franklin town administrator Jamie Hellen said that he wasn't aware that turf contained any dangerous chemicals. Hellen also said that he hadn't known that the rolls of old turf had been left near the water. Days later, he sent a photo of the spot where the discarded turf had been, showing that the turf was no longer there. Bennett noticed the turf rolls stashed near some trees about a mile away from where it had last been dumped, though the bags of infill were no longer nearby.

In an email, Hellen also wrote, "The Town of Franklin has excellent fields that the community is very proud of and are very safe. The Town invests millions in taxpayer dollars into making our fields the best in the state, always trying to stay on the cutting edge of what technology offers and to have the safest fields for the public."

Franklin, Massachusetts, is hardly the only place struggling with the problem of how to discard turf once it's no longer in use. Turf eventually wears out — typically within about a decade of installation — and when it does, it needs to be replaced. Between 1,200 and 1,500 new turf fields are being installed across the country each year, according to estimates from the Synthetic Turf Council.

The infill and turf for a single field can weigh 495,000 pounds, according to an estimate in recycling guidelines found on the Synthetic Turf Council's website. That document explains that "as with any recycle, reuse and recovery effort, the diversity of component materials may represent economic or technical challenges." It also notes that "the industry continues to research and identify the most economical and responsible way to process all turf components such as turf plastics, infill(s) and underlayment pads that need to be removed, recycled and reused."

Failures to dispose of used turf have recently grabbed public attention in Europe. The Dutch public television documentary program Zembla ran an investigative report showing that several companies falsely claimed to recycle turf and have instead stacked it in towering piles. And in Norway, after turf was found discarded in the woods near waterways in June, the minister of the environment said he was considering new rules to control and clean up the dumping of turf.

Although asked repeatedly, the Synthetic Turf Council did not provide the name of any facility currently able to recycle turf in the U.S. But at least one company listed on the trade group's website does claim to do so. Target Technologies International, Inc., which is based in British Columbia, offers "a one-of-a-kind solution to recycle 100% of your used artificial turf and turn it into useful post-consumer products keeping it from ending up in our landfills, vacant properties and warehouses," according the copy found in the online buyers' guide and membership directory of the Synthetic Turf Council.

Asked about the company's ability to repurpose turf, Target Technologies International did not provide convincing evidence. Although a 2018 report from international soccer governing body FIFA on the environmental impact of turf fields noted that "a full 'closed-loop' process is yet to be developed," Nadia Minato, who answered the phone at the Target Technologies International, said that the company has recycled every bit of "maybe 75 fields" in the past five years by sending the turf to Malaysia, where it is made into "fence posts and different kinds of lumber."

When asked for details about where exactly in Malaysia the company sends the turf and what happens to it when it gets there, Minato replied that that information was "proprietary." She then supplied the email address and phone number of Thomas Lam, who she said handles the "leg work" for Target Technologies International's recycling in Malaysia. In an email sent by a third party, Lam responded to a question about how exactly the company is able to recycle 100 percent of turf with the statement, "This is one of our Trade Secrets." Asked for the location of the company's facility and any evidence that it actually recycles turf there, Lam responded that the plant is not open to the public and that "our recycled, marketable and environmentally safe, end product is a plastic fence post and they are available in the USA."

I'm in →

Whether on a field, dumped in the woods, or sitting in a facility awaiting the advent of effective recycling methods, turf almost certainly ultimately releases its PFAS chemicals, according to Peaslee.

"The question is: Does it come off? And I'm pretty convinced from my previous research on textiles that it does," he said. "When you expose the fibers to mechanical abrasion, some of these chemicals ooze from the fibers." For Peaslee, the discovery of PFAS in turf is a troubling indication that the chemicals are likely present in other products for which they were used as a processing aid. "Turf is only the tip of the iceberg. It's going to happen wherever they're using PFAS as an extrusion agent," said Peaslee, who expressed concern that widespread dumping of the turf in landfills and other places may result in water contamination.

For athletes and their parents, the presence of PFAS in turf may raise more immediate concerns about exposure to yet another group of troubling chemicals while playing on the fields. "We just don't know yet how this might affect people," said PEER's Bennett. For her, the unanswered questions about PFAS in turf and in the water near where it is dumped should be met with caution. "Synthetic turf is now causing a risk to everyone who drinks water," said Bennett, who thinks anyone planning to install turf fields should reconsider. "If there's a potential for risk," she said, "just don't do it."

Basic Information on PFAS

What are PFAS?

Per- and polyfluoroalkyl substances (PFAS) are a group of man-made chemicals that includes PFOA, PFOS, GenX, and many other chemicals. PFAS have been manufactured and used in a variety of industries around the globe, including in the United States since the 1940s. PFOA and PFOS have been the most extensively produced and studied of these chemicals. Both chemicals are very persistent in the environment and in the human body – meaning they don't break down and they can accumulate over time. There is evidence that exposure to PFAS can lead to adverse human health effects.

PFAS can be found in:

- **Food** packaged in PFAS-containing materials, processed with equipment that used PFAS, or grown in PFAS-contaminated soil or water.
- **Commercial household products**, including stain- and water-repellent fabrics, nonstick products (e.g., Teflon), polishes, waxes, paints, cleaning products, and fire-fighting foams (a major source of groundwater contamination at airports and military bases where firefighting training occurs).
- **Workplace**, including production facilities or industries (e.g., chrome plating, electronics manufacturing or oil recovery) that use PFAS.

- **Drinking water**, typically localized and associated with a specific facility (e.g., manufacturer, landfill, wastewater treatment plant, firefighter training facility).
- **Living organisms**, including fish, animals and humans, where PFAS have the ability to build up and persist over time.

Certain PFAS chemicals are no longer manufactured in the United States as a result of phase outs including the PFOA Stewardship Program in which eight major chemical manufacturers agreed to eliminate the use of PFOA and PFOA-related chemicals in their products and as emissions from their facilities. Although PFOA and PFOS are no longer manufactured in the United States, they are still produced internationally and can be imported into the United States in consumer goods such as carpet, leather and apparel, textiles, paper and packaging, coatings, rubber and plastics.

Top of Page

Why are PFAS important?

PFAS are found in a wide range of consumer products that people use daily such as cookware, pizza boxes and stain repellants. Most people have been exposed to PFAS. Certain PFAS can accumulate and stay in the human body for long periods of time. There is evidence that exposure to PFAS can lead to adverse health outcomes in humans. The most-studied PFAS chemicals are PFOA and PFOS. Studies indicate that PFOA and PFOS can cause reproductive and developmental, liver and kidney, and immunological effects in laboratory animals. Both chemicals have caused tumors in animals. The most consistent findings are increased cholesterol levels among exposed populations, with more limited findings related to:

- low infant birth weights,
- effects on the immune system,
- cancer (for PFOA), and
- thyroid hormone disruption (for PFOS).

What is the difference between

PFOA, PFOS and GenX and other replacement PFAS?

Per- and polyfluoroalkyl substances (PFAS) are a group of man-made chemicals that have been in use since the 1940s, and are (or have been) found in many consumer products like cookware, food packaging, and stain repellants. PFAS manufacturing and processing facilities, airports, and military installations that use firefighting foams are some of the main sources of PFAS. PFAS may be released into the air, soil, and water, including sources of drinking water. PFOA and PFOS are the most studied PFAS chemicals and have been voluntarily phased out by industry, though they are still persistent in the environment. There are many other PFAS, including GenX chemicals and PFBS in use throughout our economy.

GenX is a trade name for a technology that is used to make high performance fluoropolymers (e.g., some nonstick coatings) without the use of perfluorooctanoic acid (PFOA). HFPO dimer acid and its ammonium salt are the major chemicals associated with the GenX technology. GenX chemicals have been found in surface water, groundwater, finished drinking water, rainwater, and air emissions in some areas.

As part of EPA's draft toxicity assessment, the agency has developed draft oral reference doses (RfDs) for GenX chemicals and PFBS. Learn more about EPA's draft toxicity assessment on GenX.

Top of Page

How are people exposed to PFAS?

There are a variety of ways that people can be exposed to these chemicals and at different levels of exposure. For example, people can be exposed to low levels of PFAS through *food*, which can become contaminated through:

- Contaminated soil and water used to grow the food,
- Food packaging containing PFAS, and
- Equipment that used PFAS during food processing.

People can also be exposed to PFAS chemicals if they are released during normal *use, biodegradation, or disposal of consumer products* that contain PFAS. People may be exposed to PFAS used in commercially-treated products to make them stain- and water-repellent or nonstick. These goods include carpets, leather and apparel, textiles, paper and packaging materials, and non-stick cookware.

People who *work* at PFAS production facilities, or facilities that manufacture goods made with PFAS, may be exposed in certain occupational settings or through contaminated air.

Drinking water can be a source of exposure in communities where these chemicals have contaminated water supplies. Such contamination is typically localized and associated with a specific facility, for example,

- an industrial facility where PFAS were produced or used to manufacture other products, or
- an oil refinery, airfield or other location at which PFAS were used for firefighting.

PFOA, PFOS, and GenX have been found in a number of drinking water systems due to localized contamination. You can view more information about exposures to PFAS through drinking water on our Drinking Water Health Advisories for PFOA and PFOS page.

Top of Page

Are there health effects from PFAS?

There is evidence that exposure to PFAS can lead to adverse health outcomes in humans. If humans, or animals, ingest PFAS (by eating or drinking food or water than contain PFAS), the PFAS are absorbed, and can accumulate in the body. PFAS stay in the human body for long periods of time. As a result, as people get exposed to PFAS from different sources over time, the level of PFAS in their bodies may increase to the point where they suffer from adverse health effects.

Studies indicate that PFOA and PFOS can cause reproductive and developmental, liver and kidney, and immunological effects in laboratory animals. Both chemicals have caused tumors in animal studies. The most consistent findings from human epidemiology studies are increased

cholesterol levels among exposed populations, with more limited findings related to:

- infant birth weights,
- effects on the immune system,
- cancer (for PFOA), and
- thyroid hormone disruption (for PFOS).

[redacted] COVID-19 and Water Boards Meetings

- As a result of the COVID-19 emergency and the Governor's Executive Order N-33-20, non-essential file reviews are postponed and essential file reviews are by appointment only.
- The COVID-19 emergency has resulted in the cancellation or postponement of some recent meetings of the Water Boards. The Water Boards are continuing day-to-day work protecting public health, safety, and the environment. The Water Boards are conducting Board Meetings solely via remote presence by video and teleconference. Members of the public will be able to listen to and watch the meeting and comment if desired. Please follow our website or subscribe to an applicable Lyris list for your area of interest for further updates.

Perfluorooctanoic acid (PFOA) and Perfluorooctanesulfonic acid (PFOS)

PFOA and PFOS are fluorinated organic chemicals that are part of a larger group of chemicals referred to as per- and poly-fluoroalkyl substances (PFASs). PFOS and PFOA have been extensively produced and studied in the United States. These manmade substances have been synthesized for water and lipid resistance. They have

been used extensively in consumer products such as carpets, clothing, fabrics for furniture, paper packaging for food, and other materials (e.g., cookware) designed to be waterproof, stain-resistant or non-stick. In addition, they have been used in fire-retarding foam and various industrial processes.

People are exposed to PFOS and PFOA through food, food packaging, consumer products, house dust, and drinking water. Exposure through drinking water has become an increasing concern due to the tendency of PFASs to accumulate in groundwater. Such contamination is typically localized and associated with a specific facility, for example, an industrial facility where these chemicals were manufacture or used in other products, or airfield which used the chemicals for firefighting. Between 2000 and 2002, PFOS was voluntarily phased out of production in the U.S. by its primary manufacturer. Beginning in 2006 other manufacturers began to voluntarily limit the number of ongoing uses.

Since these chemicals have been used in an array of consumer products, scientists have found PFOA and PFOS in the blood of nearly all people tested. According to the Center for Disease Control (CDC), blood levels of both PFOS and PFOA have steadily decreased in U.S. residents since 1999-2000.

In May 2016, the United States Environmental Protection Agency (U.S. EPA) issued a lifetime health advisory for PFOS and PFOA for drinking water, advising municipalities that they should notify their customers of the presence of levels over 70 parts per trillion (PPT) in community water supplies. U. S. EPA recommended that the notification of customers include information on the increased risk to health, especially for susceptible populations. Based on the current available peer-reviewed studies on laboratory animals and epidemiological evidence in human populations, the U.S. EPA released the following statement:

"These studies indicate that exposure to PFOA and PFOS over certain levels may result in adverse health effects, including developmental effects to fetuses during pregnancy or to breastfed infants (e.g., low birth weight, accelerated puberty, skeletal variations), cancer (e.g., testicular, kidney), liver effects (e.g., tissue damage), immune effects (e.g., antibody production and immunity), thyroid effects and other effects (e.g., cholesterol changes)."

Notification Level

Notification levels are nonregulatory, health-based advisory levels established for contaminants in drinking water for which maximum contaminant levels have not been established. Notification levels are established as precautionary measures for contaminants that may be considered candidates for establishment of maximum contaminant levels but have not yet undergone or completed the regulatory standard setting process prescribed for the development of maximum contaminant levels and are not drinking water standards.

Health and Safety Code section 116271 delegates to the Division of Drinking Water's (DDW) Deputy Director the authority "to take action pursuant to Article 5," including the power to issue a notification level (NL) pursuant to Health and Safety Code section 116455. Assembly Bill 756 (codified as Health and Safety Code section 116378) provides for new reporting and notification requirements for detections of perfluoroalkyl substances and polyfluoroalkyl substances (collectively, PFAS).

In August 2019, after further review, **the Office of Environmental Health Hazard Assessment**

(OEHHA) recommended NLs for PFOA and for PFOS be set at the lowest levels at which they can be reliably detected in drinking water using currently available and appropriate technologies. This recommendation is based on OEHHA's development of reference levels intended to protect against cancer and noncancer effects, including effects on the liver and immune system. These recommendations supersede the recommended interim NLs that OEHHA provided to SWRCB in July 2018. After independent review of the available information on the risks, DDW established NLs at **6.5 PPT for PFOS** and **5.1 PPT for PFOA.** These levels are consistent with OEHHA's recommendations.

A response level (RL) is set higher than a notification level and represents a recommended chemical concentration level at which water systems consider taking a water source out of service or provide treatment if that option is available to them. Starting in January 2020, water systems that receive an order and detect levels of PFAS substances that exceed their response level, shall take a water source out of use, treat the water delivered, or provide public notification.

Certain requirements and recommendations apply to a water system if it serves customers drinking water containing a contaminant greater than its notification level. In addition to notification levels and pursuant to Health and Safety Code section 116455, DDW has lowered the response levels for PFOA and PFOS from 70 PPT combined to **10 PPT for PFOA** and **40 PPT for PFOS** based on a running four quarter average.

At the request of the Division of Drinking Water, OEHHA is initiating the development of Public Health Goals (PHGs) for perfluorooctanoic acid (PFOA) and perfluorooctane sulfonate (PFOS) in drinking water. PHGs are concentrations of contaminants in drinking water that pose no significant acute or chronic health risks. OEHHA establishes PHGs, which are used as the health basis for the development of California's primary drinking water standards (Maximum Contaminant Levels or MCLs).

Through the State Water Board's investigation, seven additional PFAS chemicals have been detected in multiple wells in California. The State Water Board has requested OEHHA's recommendation in developing notification levels for the following chemicals:

- perfluorohexane sulfonic acid (PFHxS)
- perfluorobutane sulfonic acid (PFBS)
- perfluorohexanoic acid (PFHxA)
- perfluoroheptanoic acid (PFHpA)
- perfluorononanoic acid (PFNA)
- perfluorodecanoic acid (PFDA)
- 4,8-dioxia-3H-perflourononanoic acid (ADONA)

As additional PFAS data become available, DDW may request from OEHHA to include additional PFAS chemicals. The State Water Board also requested that OEHHA include an evaluation of whether some of the PFAS chemicals should be grouped together when being considered in a regulatory manor and if it is possible to consider them in subclasses based on specific characteristics or features of the chemicals.

For more information regarding the impact of Assembly Bill 756 (as codified as Health and Safety Code section 116378) on public water systems, please refer to the Frequently Asked Questions: AB 756 Perfluoroalkyl and Polyfluoroalkyl Substances (PFAS).

Analytical Methods and Reporting

During the third Unregulated Contaminant Monitoring Rule (UCMR3), USEPA required laboratories to use EPA Method 537 to analyze for six perfluorinated compounds. At that time, the minimum reporting levels established by USEPA for PFOS and PFOA were 0.04 µg/L and 0.02 µg/L, respectively.

The minimum reporting level is similar to the detection limit for purposes of reporting, (DLR), which is established in regulation for chemicals with maximum contaminant levels. The DLR is the level at which the DDW is confident about quantification being reported.

DDW has identified EPA Method 537.1 as a validated analytical method for detecting perfluorinated compounds in drinking water. This method is capable of detecting the following 18 perfluorinated compounds:

STORET Code	CHEMICAL	Abbreviation
C2801	PERFLUOROBUTANE SULFONIC ACID	PFBS
C2802	PERFLUOROHEPTANOIC ACID	PFHpA
C2803	PERFLUOROHEXANE SULFONIC ACID	PFHxS
C2804	PERFLUORONONANOIC ACID	PFNA
C2805	**PERFLUOROOCTYL SULFONIC ACID**	**PFOS**
C2806	**PERFLUOROOCTANOIC ACID**	**PFOA**
C2807	N-ETHYL PERFLUOROOCTANESULFONAMIDOACETIC ACID	NEtFOSAA
C2808	N-METHYL PERFLUOROOCTANESULFONAMIDOACETIC ACID	NMeFOSAA
C2809	PERFLUORODECANOIC ACID	PFDA
C2810	PERFLUORODODECANOIC ACID	PFDoA
C2811	PERFLUOROHEXANOIC ACID	PFHxA
C2812	PERFLUOROTETRADECANOIC ACID	PFTA
C2813	PERFLUOROTRIDECANOIC ACID	PFTrDA
C2814	PERFLUOROUNDECANOIC ACID	PFUnA
C2815	HEXAFLUOROPROPYLENE OXIDE DIMER ACID	HFPO-DA
C2816	9-CHLOROHEXADECAFLUORO-3-OXANONE-1 SULFONIC ACID	9Cl-PF3ONS

C2817	11-CHLOROEICOSAFLUORO-3-OXAUNDECANE-1-SULFONIC ACID	11Cl-PF3OUdS
C2818	4,8-DIOXA-3H-PERFLUORONONANOIC ACID	ADONA

Findings in California Drinking Water

From 2013 to 2015,UCMR3 required all large water systems (i.e., water systems serving over 10,000 people) to collect and analyze more than12,000 drinking water samples for PFOS and PFOA. In addition, some water systems serving less than 10,000 people reported approximately 400 drinking water results for PFOS and PFOA. This occurrence data identified 36 sources with PFOS detections and 32 sources with PFOA detections.

Drinking water systems are not currently required by state regulations to monitor for PFOA and/or PFOS. Nevertheless, because of concerns about possible contamination, some water systems have voluntarily chosen to sample their supplies for PFOA and PFOS.

The occurrence data for UCMR3 can be accessed at: https://www.epa.gov/dwucmr/occurrence-data-unregulated-contaminant-monitoring-rule. **A summary of the findings for California is available here**.

Notice of Intent to List Perfluorooctanoic Acid (PFOA) and Perfluorooctane Sulfonate (PFOS)

Sep 16, 2016

The California Environmental Protection Agency's Office of Environmental Health Hazard Assessment (OEHHA) intends to list *perfluorooctanoic acid (PFOA)* and *perfluorooctane sulfonate (PFOS)* as known to the state to cause reproductive toxicity under the Safe Drinking Water and Toxic Enforcement Act of 1986[1]. This action is being proposed under the authoritative bodies listing mechanism[2].

Chemical [CAS No.]	References	Chemical Use	Endpoints
Perfluorooctanoic acid [335-67-1]	US EPA (2016a,b)	PFOA and PFOS are surfactants that have been used in a variety of consumer products, including carpets, textiles, leather, non-stick cookware, and paper coatings used in food packaging, to confer stain, grease and water resistance. PFOA is used in the production of fluoropolymers. PFOA and PFOS are generated as degradation products of other	Developmental toxicity
Perfluorooctane sulfonate [1763-23-1]	US EPA (2016c,d)		

		perfluorinated compounds.	

Background on listing via the authoritative bodies mechanism: A chemical must be listed under the Proposition 65 regulations when two conditions are met:

1. An authoritative body formally identifies the chemical as causing reproductive toxicity pursuant to Title 27, Cal. Code of Regs., section 25306(d)[3].
2. The evidence considered by the authoritative body meets the sufficiency criteria contained in section 25306(g).

However, the chemical is not listed if scientifically valid data which were not considered by the authoritative body clearly establish that the sufficiency of evidence criteria were not met (Section 25306(h)).

The US Environmental Protection Agency (US EPA) is one of several institutions designated as authoritative for the identification of chemicals as causing reproductive toxicity (Section 25306(l)). OEHHA is the lead agency for Proposition 65 implementation. After an authoritative body has made a determination about a chemical, OEHHA evaluates whether listing under Proposition 65 is required using the criteria contained in the regulations.

OEHHA's determination: *Perfluorooctanoic acid (PFOA)* and *perfluorooctane sulfonate (PFOS)* each meet the criteria for listing as known to the state to cause reproductive toxicity under Proposition 65, based on findings of the US EPA (2016a,b,c,d), as outlined below.

Formal identification and sufficiency of evidence for *PFOA*: In 2016, US EPA released the documents: *Drinking Water Health Advisory (HA) for Perfluorooctanoic Acid (PFOA)*(US EPA, 2016a) and *Health Effects Support Document for Perfluorooctanoic Acid* (US EPA, 2016b). In the former document, US EPA developed a lifetime drinking water HA for PFOA (US EPA, 2016a) based on a reference dose (RfD) derived from a developmental toxicity study in mice in which developmental toxicity was manifested as reduced ossification in proximal phalanges and accelerated puberty in males (US EPA, 2016b). Both documents contain conclusions about the developmental toxicity of PFOA, referencing studies in which developmental toxicity results entirely or predominantly from prenatal exposure to the chemical.

Section 25306(d)(1) provides three separate criteria, of which at least one must be met in order for the chemical to be formally identified. These reports and documents meet two of the formal identification criteria in Section 25306(d)(1) because PFOA "is the subject of a report which is published by the authoritative body and which concludes that the chemical causes…reproductive toxicity", *and* because PFOA "has otherwise been identified as causing … reproductive toxicity by the authoritative body in a document that indicates that such identification is a final action". The latter criterion is met by the development by US EPA of a lifetime drinking water HA for PFOA based on a reference dose (RfD) derived from developmental toxicity in mice. Further, Section 25306(d)(2) provides six additional criteria, of which at least one must be met in order for the chemical to be formally identified. In this case three criteria are met because the report or document has been "published by the authoritative body in a

publication, such as, but not limited to, the federal register…" (US EPA, 2016a,b); *and* "reviewed by an advisory committee in a public meeting, if a public meeting is required" (US EPA, 2016a); *and* "made subject to public review and comment prior to its issuance" (US EPA, 2016a).

These reports and documents also meet the sufficiency of evidence criteria in Section 25306(g). Pertinent statements in the US EPA reports documenting the Agency's conclusions about developmental toxicity include the following:

In *Drinking Water Health Advisory for Perfluorooctanoic Acid* (US EPA, 2016a):

- "The US Environmental Protection Agency (EPA) is issuing a lifetime drinking water Health Advisory (HA) for PFOA of 0.07 micrograms per liter (µg/L) based on a reference dose (RfD) derived from a developmental toxicity study in mice; the critical effects included reduced ossification in proximal phalanges and accelerated puberty in male pups following exposure during gestation and lactation." (p. 9)
- "For PFOA, ...studies report developmental effects (survival, body weight changes, reduced ossification, delays in eye opening, altered puberty, and retarded mammary gland development) … Overall, the toxicity studies available for PFOA demonstrate that the developing fetus is particularly sensitive to PFOA-induced toxicity." (p. 9)
- "The effects that serve as the basis for the RfDs for both PFOA and PFOS are developmental endpoints (reduced ossification and accelerated puberty in males for PFOA and decreased pup weight for PFOS)." (p. 55)
- "The animal toxicology studies were used in the dose-response assessment for PFOA. These studies demonstrated dose-related effects on systemic and developmental endpoints in multiple species (monkeys, rats, mice) …" (p. 33)
- "There are extensive human data from epidemiological data from the general population as well as worker cohorts. The epidemiology data provide strong support for the identification of hazards observed following exposure to PFOA in the laboratory animal studies and human relevance." (p. 51)
- "Based on the consistency of the responses across the chronic studies and those for reproductive and developmental endpoints, and with recognition of the use of developmental toxicity as the most sensitive endpoint, 0.00002 mg/kg/day was selected as the RfD for PFOA. This value is based on the HED *[Human Equivalent Dose]* for developmental effects (reduced ossification in male and female pups and accelerated puberty in male pups) from the Lau et al. (2006) study." (p. 54)
- "The lifetime HA for PFOA is based on effects (reduced ossification in male and female pups and accelerated puberty in male pups) on the developing fetus resulting from exposures that occur during gestation and lactation. These developmental endpoints are the most protective for the population at large and are effects that can carry lifetime consequences for a less than lifetime exposure." (p. 55)
- "EPA's risk assessment guidelines reflect that, as a general matter, a single exposure to a developmental toxin at a critical time in development can produce an adverse effect (US EPA 1991). In addition, short-term exposure to PFASs *[perfluoroalkyl substances]* can result in a body burden that persists for years and can increase with additional exposures. Thus, EPA recommends that the lifetime HA for PFOA of 0.07 µg/L apply to both short-term (i.e., weeks to months) scenarios during pregnancy and lactation, as well as to lifetime-exposure scenarios." (p. 10)

In *Health Effects Support Document for Perfluorooctanoic Acid* (US EPA, 2016b):

- "Developmental effects observed in animals include decreased survival, delayed eye opening and reduced ossification, skeletal defects, …" (p. ES-2)
- "Overall, the developmental and reproductive toxicity studies available for PFOA demonstrate that the developing fetus is particularly sensitive to PFOA-induced toxicity." (p. ES-3)

OEHHA has reviewed the studies or study descriptions cited by US EPA (2016a,b) in support of its formal identification of PFOA as causing reproductive toxicity (developmental endpoint) relative to the criteria in Section 25306(g). Based on the PFOA HA (US EPA, 2016a) and the supporting document (US EPA, 2016b), and the studies cited in those documents, OEHHA finds the criteria for listing PFOA through the authoritative bodies mechanism as causing reproductive toxicity (developmental endpoint) have been met.

Formal identification and sufficiency of evidence for *PFOS*: In 2016, US EPA released the documents: *Drinking Water Heath Advisory for Perfluorooctane Sulfonate (PFOS)* (US EPA, 2016c) and *Health Effects Support Document for Perfluorooctane Sulfonate* (US EPA, 2016d). In the former document US EPA developed a lifetime drinking water HA for PFOS (US EPA, 2016c) based on a reference dose (RfD) derived from a developmental toxicity study in rats in which developmental toxicity was manifested as reduced body weight of pups on lactation day 1 (US EPA, 2016d). Both documents make conclusions about the developmental toxicity of PFOS, referencing studies in which prenatal exposure to the chemical results in developmental toxicity.

Section 25306(d)(1) provides three separate criteria, of which at least one must be met in order for the chemical to be formally identified. These reports and documents meet two of the formal identification criteria in Section 25306(d)(1) because PFOS, "is the subject of a report which is published by the authoritative body and which concludes that the chemical causes…reproductive toxicity", *and* because PFOS "has otherwise been identified as causing … reproductive toxicity by the authoritative body in a document that indicates that such identification is a final action". The latter criterion is met by the development by US EPA of a lifetime drinking water HA for PFOS based on a reference dose (RfD) derived from developmental toxicity in rats. Further, Section 25306(d)(2) provides six additional criteria, of which at least one must be met in order for the chemical to be formally identified. In this case three criteria are met because the report or document has been "published by the authoritative body in a publication, such as, but not limited to, the federal register…" (US EPA, 2016c,d); *and* "reviewed by an advisory committee in a public meeting, if a public meeting is required" (US EPA, 2016c); *and* "made subject to public review and comment prior to its issuance" (US EPA, 2016c).

These reports and documents also meet the sufficiency of evidence criteria in Section 25306(g). Pertinent statements in the US EPA reports documenting the Agency's conclusions about developmental toxicity include the following:

In *Drinking Water Health Advisory for Perfluorooctane Sulfonate (PFOS)* (US EPA, 2016c):

- "The US Environmental Protection Agency (EPA) is issuing a lifetime drinking water health advisory (HA) for PFOS of 0.07 micrograms per liter (µg/L) based on a reference dose (RfD) derived from a developmental toxicity study in rats; the critical effect was decreased pup body weight

following exposure during gestation and lactation." (p. 10)

- "For PFOS, … studies report developmental effects (decreased body weight, survival, and increased serum glucose levels and insulin resistance in adult offspring) … Overall, the toxicity studies available for PFOS demonstrate that the developing fetus is particularly sensitive to PFOS induced toxicity." (p. 10)
- "Adverse effects observed following exposures to PFOA and PFOS are the same or similar, and include effects on lipids, birth weight, and antibodies in humans…The effects serving as the basis for the RfDs for both PFOA and PFOS are developmental endpoints (e.g., reduced ossification and accelerated puberty in males for PFOA and decreased birth weight for PFOS…)" (p.51)
- "EPA believes the uncertainty in the chosen POD *[point of departure]* and the reliance on studies with serum data is minimized because of the large and extensive database examining hazard, and the selection of pup body weight as the critical effect with lifetime implications at a NOAEL (0.1 mg/kg/day) from the low end of the range of values evaluated." (p. 51)
- "The RfD is based on the HED derived from serum levels at the NOAEL from a developmental study in rats (Luebker et al. 2005b). …The selected RfD is based on the most sensitive endpoint, developmental effects (e.g., decreased pup body weight), to provide protection to the general population and sensitive life stages." (p. 52)
- "EPA's risk assessment guidelines reflect that, as a general matter, a single exposure to a developmental toxin, at a critical time in development can produce an adverse effect (US EPA 1991). In addition, short-term exposure to PFASs *[perfluoroalkyl substances]* can result in a body burden that persists for years and can increase with additional exposures. Thus, EPA recommends that the lifetime HA for PFOS of 0.07 µg/L apply to both short-term (i.e., weeks to months) scenarios during pregnancy and lactation, as well as to lifetime-exposure scenarios." (p. 11)

In *Health Effects Support Document for Perfluorooctane Sulfonate (PFOS)* (US EPA, 2016d):

- "EPA derived a reference dose (RfD) for PFOS…based on decreased neonatal rat body weight from the two-generation study by Luebker et al. (2005b). …The HED for effects on pup body weight in the two generation study is supported by comparable values derived from the lowest observed adverse effect level for the same effect in the one-generation study and the NOAEL for effects seen in a developmental neurotoxicity study." (p. ES-2)
- "At 3.2 mg/kg/day *[PFOS, oral dose in rats]*, there were significant decreases in gestation length and number of implantation sites, and reductions in litter size." (p. 3-63)
- "For pups only exposed prenatally, mortality was 9% compared to 1.1% for those exposed during lactation only. Reductions in pup body weights on LD 1 were observed in groups exposed both gestationally and lactationally and in those with gestational exposure only." (p. 3-64)
- "Based on the consistency of the response and of the use of the most sensitive endpoint, developmental toxicity, as the critical effect, the RfD of 0.00002 mg/kg/day from Luebker et al. (2005a) is selected as the RfD for PFOS. This RfD is derived from reduced pup body weight in the two-generation study in rats." (p. 4-16)

OEHHA has reviewed the studies or study descriptions cited by the US EPA (2016c,d) in support of its formal identification of PFOS as causing reproductive toxicity (developmental endpoint) relative to the

criteria in Section 25306(g). Based on the PFOS HA (US EPA, 2016c) and the supporting document (US EPA, 2016d), and the studies cited in those documents, OEHHA finds the criteria for listing PFOS through the authoritative bodies mechanism as causing reproductive toxicity (developmental endpoint) have been met.

Request for comments: OEHHA is requesting comments as to whether PFOA and PFOS meet the criteria set forth in the Proposition 65 regulations for authoritative bodies listings. In order to be considered, **OEHHA must receive comments by 5:00 p.m. on October 17, 2016.** We encourage you to submit comments via e-mail, rather than in paper form. Comments transmitted by e-mail should be addressed to P65Public.Comments@oehha.ca.gov with "NOIL – PFOA and PFOS" in the subject line. Comments submitted in paper form may be mailed, faxed, or delivered in person to the addresses below:

Mailing Address: Michelle Ramirez

Tracking Microplastics from Artificial Football Fields to Stormwater Systems

Ran Li

Master's thesis
Environmental Management and Physical Planning,
30 Credits

MA 67
2019

Preface

This Master's thesis is Ran Li's degree project in Environmental Management and Physical Planning at the Department of Physical Geography, Stockholm University. The Master's thesis comprises 30 credits (one term of full-time studies).

Cooperation with WSP Sverige AB.

Supervisors have been Stefano Manzoni at the Department of Physical Geography, Stockholm University, Lea Levi and Hjördis Steen at WSP Sverige AB. Examiner has been Salim Belyazid at the Department of Physical Geography, Stockholm University.

The author is responsible for the contents of this thesis.

Stockholm, 17 June 2019

Björn Gunnarson
Vice Director of studies

Abstract

Microplastic pollution as a global environment problem in marine systems has substantially raised public concern in recent years. In 2016, the Swedish Environmental Protection Agency performed a study about potential sources and pathways of microplastics spreading to the marine environment. Microplastics from artificial turfs have been recognized as the second most important source of microplastic emission in Sweden. Between 1640 to 2460 tons per year of microplastics are estimated to be lost from artificial turfs. The lost microplastics are potentially transported to stormwater wells by runoff during rainfall events, eventually reaching marine environments. This study aims to track microplastics from artificial turfs to stormwater wells.

Since the research of microplastic in stormwater has so far shown to be limited, field work and laboratory analysis have been developed in this study. Four artificial football fields located in Stockholm municipality were taken as sampling sites. First, pathways for microplastics from artificial turfs to stormwater were investigated. Second, the characteristics of microplastic granulates infill used in the football fields have been analyzed. Finally, stereo microscopy was used to visually identify microplastics in stormwater.

The results showed that rainfall as a driving force of runoff process contributes to microplastics transport from artificial turfs to stormwater. During this transport process, a fraction of microplastics is captured by the soil. The size of microplastic granulates identified not only in stormwater but also in stormwater sediments is typically between 1 mm to 3 mm. Due to its limitations, stereo microscopy is quite a subjective method for identifying microplastics and thus not suitable for quantitative analysis, since microplastic particles are comparable in size to and visually difficult to differentiate from organic particles co-occurring in stormwater.

In order to accurately quantify the amounts of microplastics transported to stormwater systems from artificial turfs, it is necessary to develop new methods for microplastics identification. This study presented an attempt in this direction, highlights its limitations, and discusses more suitable alternatives.

Key words: microplastics, artificial turfs, stormwater, runoff, rainfall, Sweden.

Acknowledgements

First and foremost, I would like to thank my internal supervisor Stefano Manzoni at the Department of Physical Geography for his professional guidance and creative suggestions. Thank you for encouraging me to overcome difficulties with your patience and efficient support. I would also like to give big thanks to my external supervisors Lea Levi and Hjördis Steen at WSP Sverige AB, for providing me with this interesting project and putting so much efforts in this research procedure. A special thank you to Veronika Köhler from Extrakta Strauss GmbH for analyzing samples and providing photos under microscopy in Germany. Deeply warm thank you to Lennart Nylund, it was a great pleasure to do field works with you no matter weekends or rainy days. Thank you Martina Hättestrand, for the possibility to use the laboratory and equipment support at the Department of Physical Geography.

This master thesis would not be completed without support from companies and municipalities. I would like to thank WSP Sverige AB as a company for providing me with this master thesis possibility as well as financial and professional support, place and tools for executing the field work and my thesis. Thank you Stockholm Vatten och Avfall, Stockholm Stad, Stockholms Stad fastighetskontor, and Stockholms stad idrottsföryaltning, for giving me permission to take stormwater samples. Thank you ALS Scandinavia AB, for providing me 20 dark glass bottles for free and inviting me to laboratory visit.

Last but not least, I would like to thank my family and dear friends. Thank you for supporting me to study abroad and always being there to listen my stress and calm me down. Without your support, I would not be so brave to do my master at Stockholm University. Thank you!

1 Introduction

Over the past half century, the production and application of plastics has exponentially increased, which has resulted in large amounts of plastic litter directly discharged in water bodies, particularly into sea (IVL, 2017). Plastic production in the world increased from 1.5 million tons in the 1950s to 335 million tons in 2016. Approximately 10% of the plastic produced annually ends discharged into the marine environment (Alimba & Faggio, 2019). Large pieces of plastic litter can further be degraded into very small pieces (less than 5 mm) of plastic, which are abundant in aquatic ecosystems.

Small plastic particles in aquatic environments were first taken into consideration in the 1970s after quantities of small particles were discovered on the surface of the Sargasso Sea (Carpenter & Smith, 1972). The term microplastic was first introduced by Thompson et al. (2004) to describe small plastic particles collected from sediments around Plymouth, UK. Microplastics are now becoming recognized worldwide, with occurrence on the surface of open oceans, lakes, shorelines and sediments, often at exceptionally high concentrations. For instance, microplastics concentration in the main stream of the Yangtze River in China was reported to be up to 1.36×10^7 items per square kilometer and that so far is the highest value noted in the available literature (Zhang et al., 2015). In 2014, the accumulation of microplastics in world's ocean was estimated to 15 to 51 trillion particles, with a weight between 93 to 236 thousand metric tons (Sebille et al., 2015).

Microplastic in the aquatic environment has attracted attention in recent years as a major global environmental concern. In an attempt to raise awareness, National Geographic magazine has published a series of articles on the microplastics crisis, including an eye-catching photo of a green-glowing plastic fragment ingested by a water flea (Royte, 2018). Land-based debris and human activities on the sea and ocean are considered as the main sources of plastic debris. In 2015, the Swedish Environmental Protection Agency has been assigned to identify Swedish sources of microplastics in the sea and propose measures for their reduction and handling. According to the study done by Swedish Environmental Institute IVL (2017), the largest emissions of microplastics in Sweden are released from road wear and abrasion of tires. The same study has reported artificial turfs as the second largest source of microplastics, and drew attention to further investigations of spreading of microplastics from artificial turfs.

The use of artificial turfs as substitutes for nature-grass playgrounds has become more and more popular in the recent years. Loss of microplastics from artificial turfs was estimated to be around 1640-2460 tons per year, however the data about loads reaching the marine environment are scarce (IVL, 2017). Microplastics from artificial turfs are discharged to stormwater during precipitation events which can be then recognized as a pathway of transporting microplastics to marine environment, but the

volumes are still estimated with high uncertainty (IVL, 2017). Stormwater as a pathway transfers microplastics further to aquatic environments having an influence on its organisms, ecosystems as well as human health. In order to better understand environmental impacts of microplastics from artificial turfs it is necessary to improve knowledge about pathways of their spreading and loss that occurs on their way to stormwater. This master thesis aims to investigate possible methods for tracking microplastics from artificial turfs to stormwater networks.

1.1 Microplastics

1.1.1 Definition of microplastic

In general, microplastic is defined as any piece of plastic smaller than 5 mm to 1 µm in size along its longest dimension (Crawford & Quinn, 2017). The majority of materials in microplastics include polyethylene (PE), polypropylene (PP), Polyvinylchloride (PVC), polyethylene terephthalate (PET), polystyrene (PS), and polyamide (PA) (Bannick et al., 2019).

Microplastics can be divided into two categories according to their origins. Primary microplastics are intentionally produced as raw materials which are used as abrasives in applications such as cosmetics, personal caring and cleaning products (Crawford & Quinn, 2017). Many primary microplastics are released directly into the aquatic environment. Secondary microplastics are unintentionally produced by deriving from large pieces of plastic debris (Crawford & Quinn, 2017). An important group of secondary microplastics can be formed through fragmentation of plastic items as a result of solar ultraviolet light and mechanical means such as tidal waves. They may also be produced during washing of synthetic clothes, construction works or maintenance of plastic items.

Several studies on microplastic sources from Sweden and Norway have defined microplastics as a broad and general term without reference to a specific term (Sundt, et al., 2014 & IVL, 2017). Sundt et al. (2014) use term microplastic when referring to a wide range of particles including solid polymer particles and synthetic organic particles. In this study, ‘microplastic’ is used as the broad definition including ‘microplastic products’ that follows the same practice as in Sundt et al. (2014) and Magnusson et al. (2017). ‘Microplastics’ in this study includes petroleum by-products, man-made polymers, as well as synthetic rubbers e.g. EPDM (Ethylene Propylene Diene Monomer), silicone and polyurethane (Sundt, et al., 2014).

1.1.2 Sources of microplastics in Sweden

In order to reduce microplastics in the marine environment, in 2015 the Swedish Environmental Protection Agency was assigned to identify the sources and pathways of microplastics release in Swedish marine environments (IVL, 2017). Microplastics present in the sea come from various land and sea sources, and reach the sea through

different pathways such as transport in natural water bodies, stormwater effluents, or as fragments from plastic litter.

Microplastic derives from land-based sources contributes about 80% of the total microplastic emission, which is higher than that from sea-based sources (Andrady, 2011). According to the research from IVL Swedish Environmental Research Institute, the primary source of microplastics in Sweden derives from roads and tires, and the second from artificial turfs (IVL, 2017). Other sources of emission include industrial production and handling of plastic pellets, synthetics washing, boat hulls and littering. However, the contribution of the microplastic load in the sea is not only depending on the sources of emission but also on their pathways towards the sea. Microplastics can be retained in the pathways, for example microplastics produced by laundry will be retained by water treatment plants.

Pathways of microplastics reaching Swedish coastal waters are via wind transport, stormwater, and water treatment plants as well as those that are directly discharged from ships (IVL, 2017). However, it is difficult to identify the percentage of microplastics transported to marine environment from different sources due to scarcity of quantitative data. Hence, currently the total microplastic discharged by Sweden to the sea cannot be estimated.

1.1.3 Environmental impacts of microplastics

Considering the small size of microplastics, the risk of it being ingested by wild-life is high. Microplastics in the marine environment can be ingested passively or actively by a wide range of organisms from small invertebrates to large mammals. Schmid et al. (2018) found that 13.7% of 14 fish species from Amazon River estuary carries microplastics. Ingestion of microplastics affects life activities such as feeding, digestion and reproduction, and even leads to mortality directly by entanglement and choking, especially in fish in larval stage (*ibid*). Microplastics ingested by primary consumers can be accumulated through marine food webs and thus ingested by secondary consumers (do Sul & Costa, 2014) including humans. In addition, microplastics have the ability to concentrate a considerable amount of waterborne toxic pollutants, which exacerbates toxicological hazards to marine organisms along ingestions (Wang & Wang, 2018).

Microplastics not only have an impact on organisms individually, but also effect ecosystems negatively at various levels. Microplastics accumulate in the sediments, where small organisms such as lugworm have non-selective feeding. Sediments with microplastics ingested by these small organisms could reduce the primary productivity and energetic reserves and thus have influence on benthic habitat structure (Guzzetti et al., 2018). Moreover, microplastics in marine environment have potential impact on nutrient cycling and ecosystem functioning. Zooplankton as a pivotal role in nutrient cycling is vulnerable to microplastics ingestion. Microplastics ingested by zooplanktons could decrease the density and velocity of their faecal pellets (Cole et al., 2016). The vertical movement of these faecal pellets is important

for transportation of carbon, nutrients and organic matter, which are an important part of food production chain and carbon storage in oceans (Turner, 2015).

It is now well-known that microplastics can be accumulated in different ecosystems and transferred within food webs (Carbery et al., 2018). With everything mentioned above it is indicative that high concentrations of microplastics pose risks for human food security. Animals of commercial interest such as fish and shrimp containing microplastics could be consumed by human as seafood, which is a potential route for human exposure to these particles (Barboza et al., 2018). Even though microplastics have been observed in several seafood products, the adverse effects of microplastics on human following ingestions are still not well understood (Wright & Kelly, 2017). Thus, subsequent long-term effects of microplastic on human health should be researched further.

1.2 Microplastics from artificial turfs

1.2.1 Characteristics and use of artificial turfs

Artificial turfs are surfaces made of synthetic fibers with the characteristic of natural grass fields, and the technology has developed in four generations (***Figure 1***). In the late 1960's the first-generation artificial turfs with polyamide (nylon) began to be used as playing surfaces. The second-generation brought polypropylene straw and sand as a replacement applied from 1977 to 1995. With the development of artificial turfs, the third-generation artificial turfs with polyethylene and different fillings used today are more similar to natural grass (Twomey et al., 2018). The fourth-generation was introduced in 2006, which are made by polyethylene complex, sand and pad. Artificial turfs have the advantages of stability, safety and weather resistance. Hence artificial turfs are more and more popular to be used in football arenas, playgrounds and sports fields in recent years.

Figure 1 The development of artificial turfs. (source: NTNU, 2018)

During the last ten years, the construction of artificial turf fields has increased in Sweden. According to IVL Swedish Environmental Research Institute there are approximately 1336 artificial turf fields in Sweden in 2016, in which 50% are artificial football fields with 7140 m^2 for 11 players (IVL, 2017). The total area of artificial turf fields in Sweden is estimated to around 6,056,580 m^2 (*ibid*). However, the number of new large artificial football fields in Sweden has recently been declining after the rapid development in last decades, while construction of small sports fields made of artificial turfs, with size of around 800 m^2, is increasing rapidly in recent years (*ibid*).

The life span of artificial turf is within a range of 8 to 15 years depending on the using frequency and maintenance (IVL, 2017). Components of artificial turfs could be degraded due to sunlight, water and wind, so artificial turfs reaching their life span should be disposed of. Landfilling as the default disposition for scrap rubbers has been banned in EU countries since 2006 (Cheng et al, 2014). At present, in some cases the spent rubber is used as fuel supplement for heating, although toxic emissions would be released during burning. However, a potential solution is to move life spanned artificial turfs to smaller football areas or recycle them for new artificial turfs.

1.2.2 Characteristics of microplastic granulates

Artificial turfs generally consist of different layers of straws, rubber granulates and crushed stones as shown in ***Figure 2*** (Fleming et al., 2015). The top layer of an artificial turf is made of straws with a mixture material of polypropylene (PP), polyamide 6, polyolefiner, and polyurethane (PUR) (Wredh, 2014). Straws with the length of 3-6 cm are typically filled with sands and rubber granulates, in order to make the straws stand up (IVL, 2017). Materials of rubber granulates vary depending on the design of the surface, and the size of granulates varies from 0.8 mm to 3 mm (Bujak, 2018). There is a rubber pad layer below the straws, which promotes shock absorption and reduces the risk of injuries. The bottom layer is made of crushed stones which are underlain by soil.

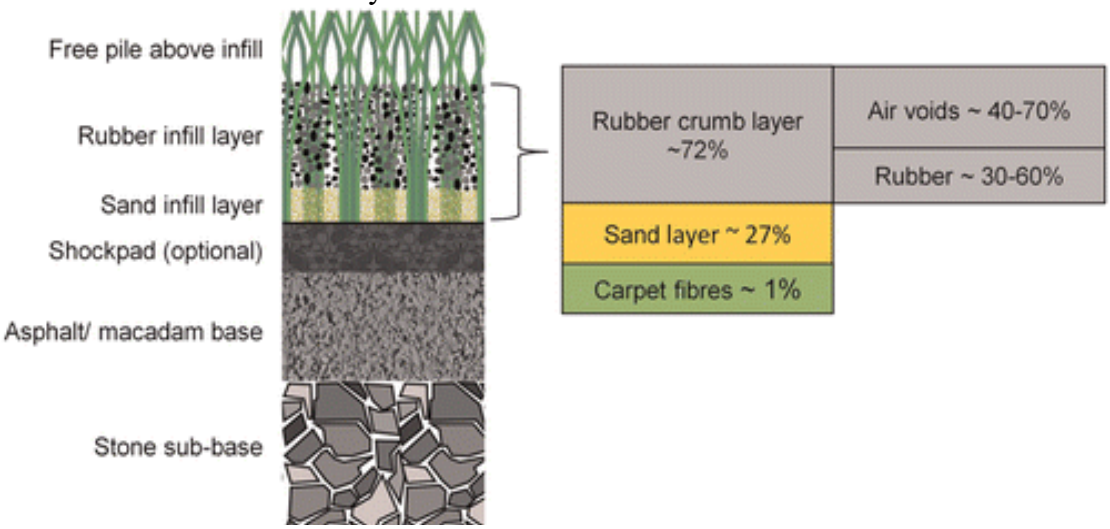

Figure 2 Structure of the third-generation artificial football field. (Fleming et al., 2015)

Rubber is an important filling material for artificial turfs, and its main function is to provide shock absorption and desirable playing characteristics. The amount of rubber infill for an artificial turf depends on the size and function of the field, as well as the type of rubber. An 11-player artificial football field of 7881 m^2 can contain 51 to 87 tons of rubber granulates (Magnusson, 2015).

Traditional rubber fillers consist of three types of granulates, which are styrene butadiene rubber (SBR), thermoplastic elastomer (TPE) and ethylene propylene diene (EPDM). In recent years some other organic fillers such as cork and coconut have been used as alternatives (Fjordefalk, 2018). However, the applicability of these organic fillers is still in the investigating stage.

SBR granulates are rubber from recycled tires, and they in the past they were the most popular filling material previously due to the low price and good properties (Bujak, 2018). SBR granulates with the size of 0.5 to 2 mm are resistant to acid, alkali and alcohol. However, SBR has been found containing black carbon and zinc oxide which can cause environmental hazards as well as negative influences on human's health (Magnusson, 2015). Hence, other granulate materials such as EPDM and TPE are becoming more popular in recent years. EPDM is a kind of new manufactured industrial rubber with high resistance to sunlight and heat, which is particularly suitable for outdoor environments (Wredh, 2014). TPE is made of a mixture of plastic and rubber with the size of 0.5 to 4 mm. TPE is an environmentally friendly alternative as it can be recycled with melting and reforming (Gustafsson, 2017).

1.2.3 Loss of microplastics from artificial turfs

Environmental risks associated with artificial turfs have been recognized in recent years. Wear and tear of the artificial turfs result in the loss of rubber infill. IVL estimated that artificial turfs in Sweden lose between 0.28 and 0.42 kg of rubber per m^2 per year on average, amounting to a total of 1640-2460 tons of infilled granulates lost per year, which has therefore become the second source of microplastics after tire wear (IVL, 2017). Loss of infilled granulates can be removed via people's shoes and clothes, melting of snow cleared from the field, drainage, as well as through runoff. Microplastics taken away by shoes and clothes may end up in the water treatment plants after washing the clothes. During snow melting, microplastics can spread outside the artificial turfs. In addition, microplastics lost from artificial turfs through the mentioned pathways are reaching stormwater, which is further reaching marine environments. However, it is uncertain how much of the lost microplastics are transported eventually by stormwater since data on microplastic content in stormwater are scarce.

Filtration methods are now being applied, in order to capture microplastics lost from the artificial turfs and reaching the stormwater. Setting filter bags into stormwater wells is an effective way to capture granulates from artificial turfs. Filter bags are fixed with granulate traps, and held in the well by means of clamping rings and guide plates (***Figure 3***). Filter bags with 0.4 mm pores can capture particles larger than 0.4

mm and at the same time water can flow through the filter bag to the well. Granulates captured by filter bags can be collected and returned to artificial turfs as reused infill, which could therefore reduce spread of most microplastics. Microplastics that are smaller than 0.4 mm cannot be captured by filter bags, and can still flow through pores into stormwater.

Figure 3 Granulate Trap with Filter Bag. (source: Unisport, 2018)

1.3 Microplastics in stormwater

Due to the different ways of microplastics loss including the loss from artificial turf fields, stormwater may accumulate numerous microplastic particles. The amount of microplastics present in stormwater depends on the design of artificial turfs and the availability of filtration appliances (Fjordefalk, 2018). Although some filtration systems have been introduced in several municipalities of Sweden, their effectiveness is still uncertain as the information of microplastics in stormwater is lacking. Therefore, increasing research on microplastic fate in stormwater is necessary to assess the spread of microplastics from artificial turfs as well as designing reasonable mitigation measures.

In order to better understand environmental impacts of microplastics, a number of studies have focused on monitoring quantity and quality of microplastics in freshwater systems and aquatic environments during the last few years (Wang & Wang, 2018). However, studies on microplastics in stormwater are fewer than those in freshwater systems and aquatic environments. Recently, a few theoretical studies have assessed methods for microplastic identification in stormwater from artificial turfs. Methods of quantitative analysis of microplastics from artificial turfs are at the beginning stage of development, and applied projects are quite limited. IVL Swedish Environmental Agency has researched microplastics in stormwater sediments from artificial turfs in 2019. Stereo microscopy has been used as technique to quantify microplastics. Research Institutes of Sweden (RISE) started sampling stormwater with

pumps to identify microplastics from artificial turfs in 2019. ICP-MS, FT-IR and electron microscopy were used as techniques in their quantitative analysis. Practical research is less and quantitative estimation is still scarce.

Hence, in this study, some practical measurements have been used to assess the occurrence of microplastics from artificial turfs reaching stormwater, in order to attain a better understanding of the spread of microplastics from artificial turfs and be able to adapt the filtration methods accordingly.

1.4 Aim of the study

The aim of this study is to investigate the spread of microplastics generated by artificial football fields through stormwater systems. Lacking established protocols for microplastic identification and quantification, a research method to identify microplastics from artificial football fields to stormwater has been designed. Properties of microplastic granulates have been assessed and quantities of microplastic contents in different stormwater wells have been estimated. The research questions guiding this work were:

1) What are the characteristics of microplastic particles from artificial turfs?
2) How are microplastics transported from artificial turfs to stormwater?
3) Is it possible to identify microplastics in stormwater with inexpensive methods?

2 Materials and methods

In order to quantify microplastics that are spread from artificial football fields through stormwater systems, four 11-people artificial football fields in Stockholm municipality (Stockholm kommun, Sweden) were taken as sampling fields. Sampling wells were selected according to topology and distribution of stormwater pipes. Microplastics analysis method was developed with information obtained through literature review. Samples were first filtrated in laboratory at the department of Physical Geography at Stockholm University. Subsequently, the samples were sent to Retch Technology in Germany to identify microplastics under stereo microscopy and Camsizer P4.

2.1 Literature review

In this study, the first step was to research reports published by different environmental organizations and institutions in order to evaluate the current level of understanding of microplastic pollutions caused by artificial turfs. The second step was to read through literature that focuses on analytical methods to identify microplastics. Literature review was performed using databases such as Science Direct, Google Scholar and Web of Science. The search keywords used were: ‘microplastics’, ‘water’, ‘marine environment’, ‘artificial turfs’, ‘environmental impact’, ‘stormwater’.

2.2 Sites description

In this study, four artificial football fields in Stockholm municipality were taken as site fields for taking the samples and in order to study the loss of microplastics that reach stormwater network. All four measurement sites are 11-people football fields with an area of 7881 m^2 and located in west of the capital Stockholm. Their names are: Åkeshovs IP, Bromstens IP, Spånaga IP and Grimsta IP (***Figure 4***). Water samples were taken from downstream stormwater main holes.

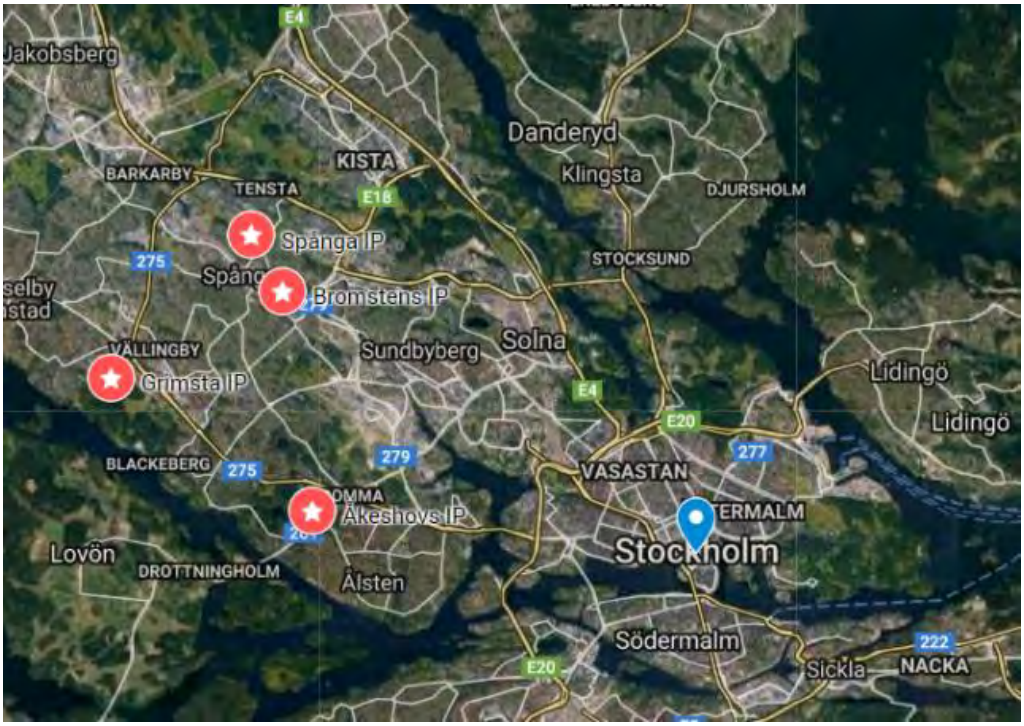

Figure 4 Location of four football fields equipped with artificial turf. (source: Google map)

2.2.1 Åkeshovs IP

Åkeshovs artificial football field is located in the west of Stockholm, 9.3km far from Stockholm centre. Water samples were taken from stormwater wells which are located in the south-east of artificial football field with the lowest elevation 8.14 m (***Figure 5***). The two stormwater wells shown in (***Figure 5***, blue points) are connected to each other. Elevation and flooded areas of Åkeshovs IP is shown in ***Figure 6***. Runoff flows along with the terrain from north (8.62 m) to south (8.14 m). Microplastics from artificial football turf can be transported into stormwater wells by rainfall with the longest route extending over 193 m and the shortest route over 153 m (***Figure 6***).

Figure 5 Satellite map of Åkeshovs IP and location of stormwater wells. (source: Google map)

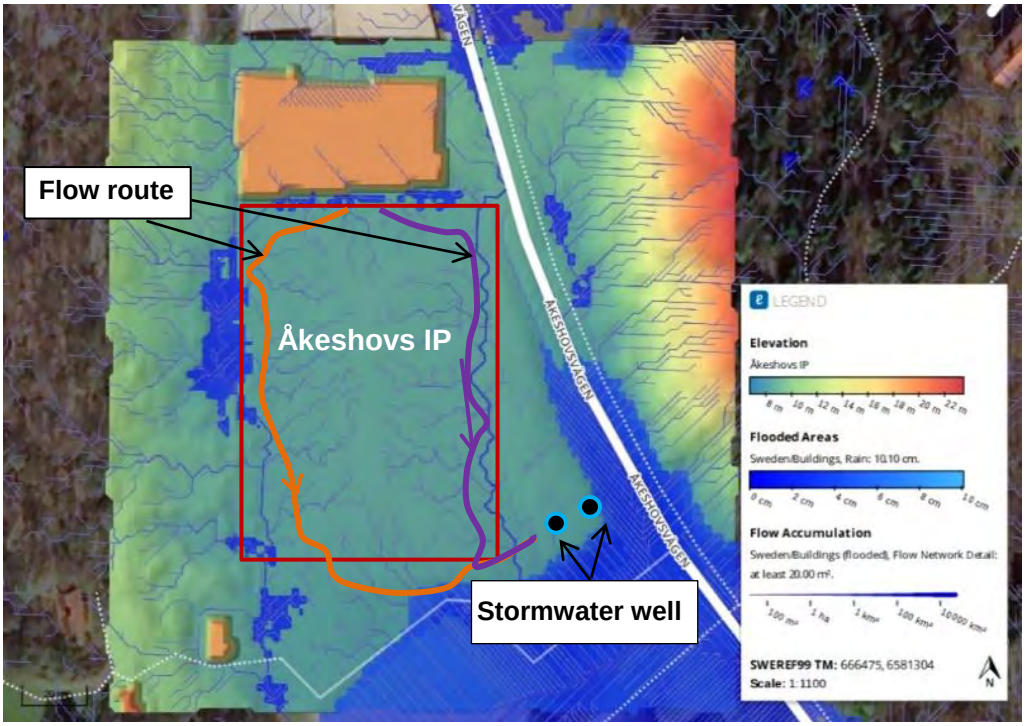

Figure 6 Elevation and flooded areas of Åkeshovs IP. (source: Scalgo Live)

2.2.2 Bromstens IP

Bromstens artificial football field was constructed in 2014, and is located in the north of Sundbyberg, south of Spånga IP. Next to the artificial football field is an 11-people natural grass field (***Figure 7***). The terrain descends from northeast (4.81 m) to southwest (3.65 m). Water samples were taken from two stormwater wells located in the southwest of the area. Microplastics from Bromstens IP could be transported to the stormwater wells downstream by runoff, over a grass-covered football field (***Figure 7***). The longest flow distance is 180 m and the shortest flow distance is 111 m. Elevation of the area and rainfall flow directions are shown in ***Figure 8***. The presence of the grass field might lower microplastic impact at this site by capturing particles in runoff water.

Figure 7 Satellite map of Bromsten IP and location of stormwater wells. (source: Google map)

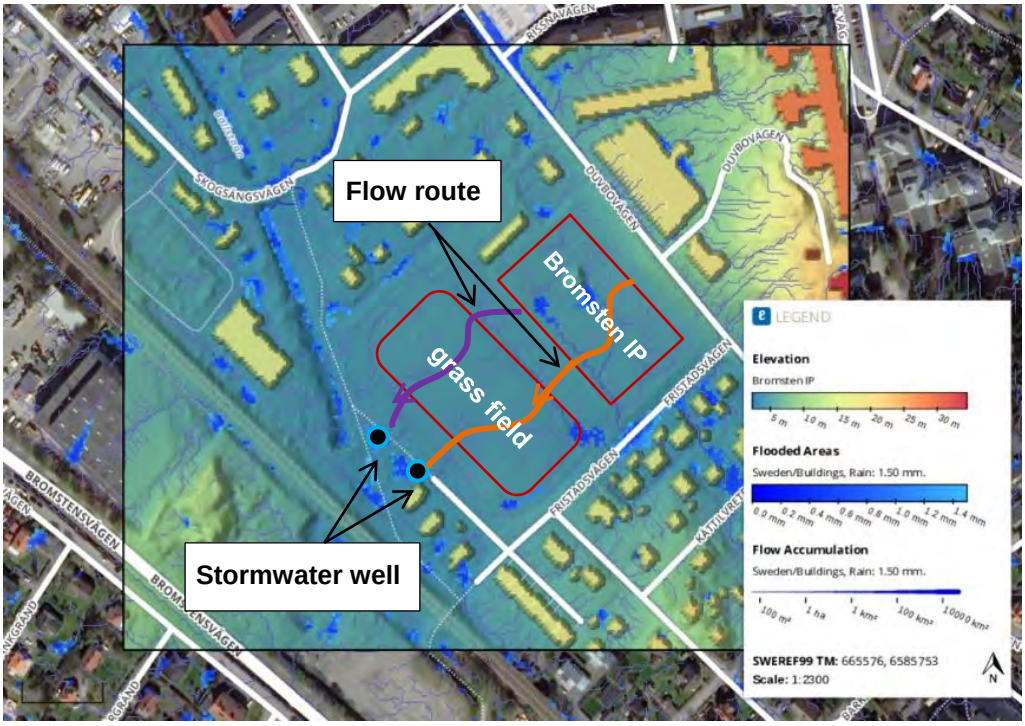

Figure 8 Elevation and flooded areas of Bromsten IP.
(source: Scalgo Live)

2.2.3 Spånga IP

Spånga artificial football turf was inaugurated in 1977 with TPE infilled ranging from 0.5 mm to 2.7 mm. It is located in the north of Sundbyberg, and is a regional facility for football, bandy and athletics. The terrain of Spånga area descends from southwest to northeast. Water samples were taken from two stormwater wells located in the northeast of the area (***Figure 9***). One stormwater well is located in the northeast corner of artificial football field, and microplastic granulates could be observed flowing into this stormwater well directly (personal observation from the site visit). The other stormwater well is 60 m away from the well located in the northeast corner, which is the main well for the whole area. Microplastics from Spånga artificial football field is assumed to be accumulated into the stormwater well located in the corner, and then spread to the main stormwater well. Elevation map and the flow routes of microplastics from Spånga IP are shown in ***Figure 10***.

Figure 9 Satellite map of Spånga IP and location of stormwater wells. (source: Google map)

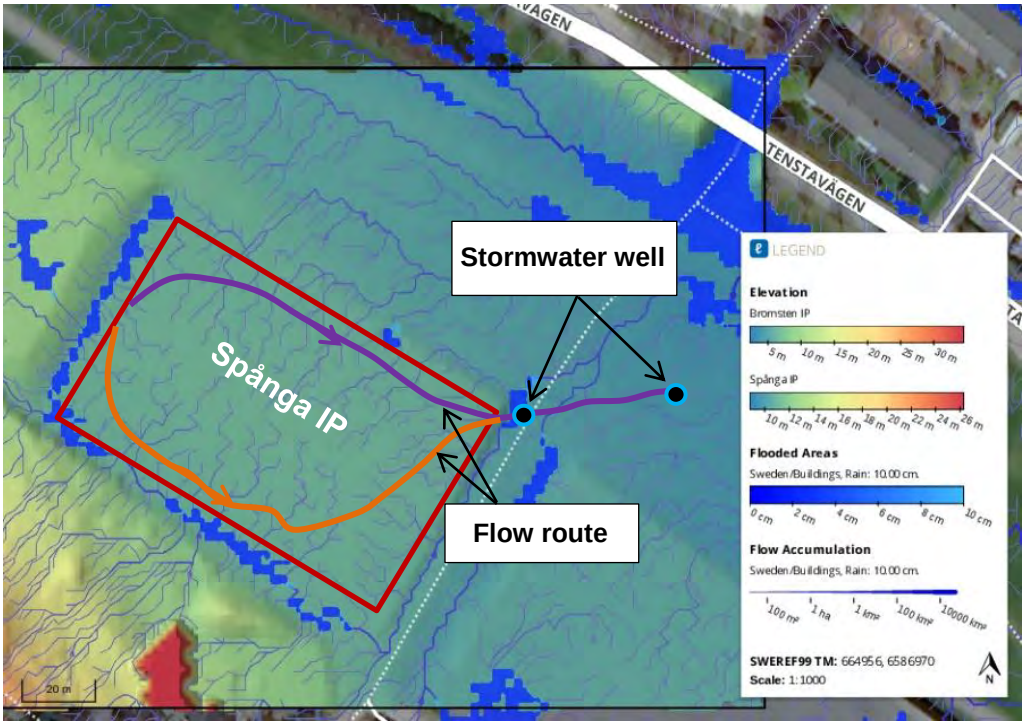

Figure 10 Elevation and flooded areas of Spånga IP. (source: Scalgo live)

2.2.4 Grimsta IP

Grimsta artificial football field is the home stadium of IF Brommapojkarna located in Vällingby. The latest expansion took place between 2015 and 2017 with a total capacity of 5,000 people. The terrain of the area is high in the south and low in the north, with elevation of 19.89 m and 18.02 m respectively. Water samples were taken from one drainage water well located in the northeast corner of the football field, and two stormwater wells located further north with lower elevation 18.02 m (***Figure 11***). The northeast stormwater well is the well that collects water from the basin area. Microplastics from Grimsta artificial football field transport partially to the drainage well through underground pipes. Another part of microplastics transport is carried to stormwater wells by surface runoff. Elevation map and the flow routes of microplastics of Grimsta IP are shown in ***Figure 12***.

Figure 11 Satellite map of Grimsta IP and location of stormwater wells. (source: Google map)

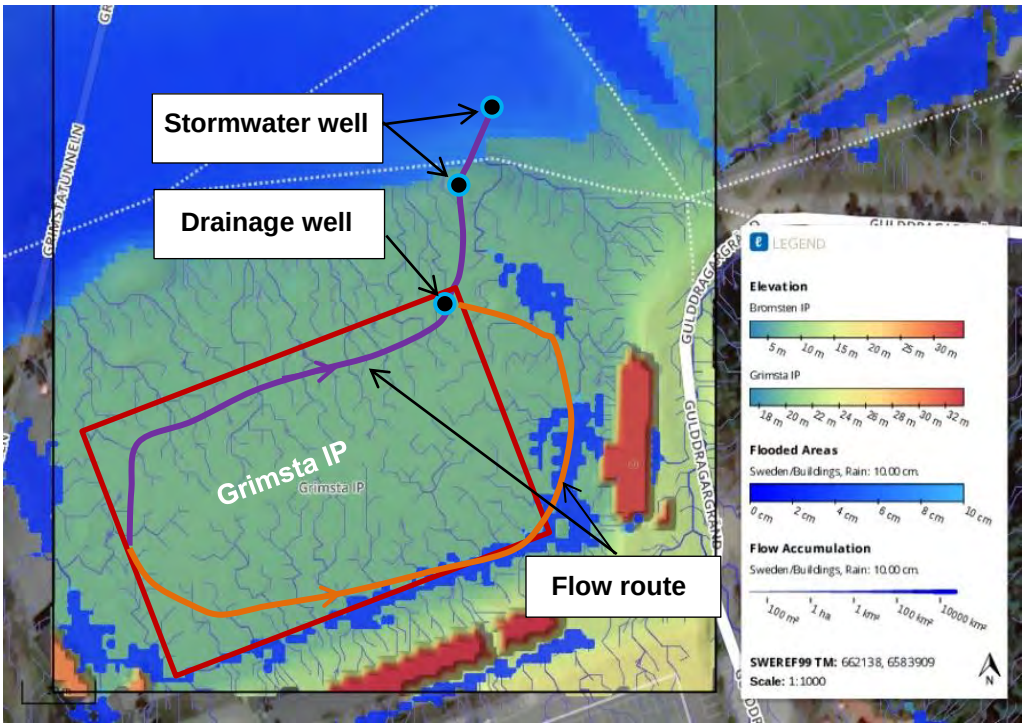

Figure 12 Elevation and flooded areas of Grimsta IP. (source: Scalgo live)

2.3 Sample collection

2.3.1 Granulate sampling

To understand the physical properties of microplastic granulate in artificial turf fields, granulates were randomly collected from the four artificial turf fields. It is important to have in mind that granulates can be damaged by wear and tear of long-term use before entering a stormwater system, or can be degraded into smaller pieces in stormwater itself due to transport. Granulate samples from four sites were artificially fragmented by mortar for five minutes respectively in the laboratory to simulate the wear and tear process, in order to have a better understand of the properties between raw granulates and old granulates. In this study, eight granulate samples are analyzed in total (two for each field; one of raw material and one fragmented).

2.3.2 Water sampling

Distribution of microplastics in water depends on their properties such as shape, size and densities, and environmental conditions such as water density and wind (Prata et al., 2019). The density of microplastic granulates varies between 0.9-1.53 g/cm^3 (Bujak, 2018). Microplastics tend to float on the water surface even though particles have higher density, which happens because air bubbles attached to the particle surfaces can lift the particles to water surface (*ibid*). In this study, samples were taken from surface water with water dispenser, using 500 ml dark glass bottles as containers.

Water samples were taken on the March 13th, March 25th and March 31st respectively from all four sites and under different weather conditions between measuring dates. Each main hole was opened by removing the metal cover lid and expected for the pipe connections within it in order to detect the direction of the flow. Then the water sample was taken from the upstream flow directly from the pipe opening. For collecting water samples, a plastic bottle installed on a telescope stick (***Figure 13***) was used. Samples were stored in 500 ml dark glass bottles and transported to the laboratory.

Figure 13 Lea Levi collecting stormwater. (photo by: Ran Li)

Meteorological data was obtained from Swedish Meteorological and Hydrological Institute (SMHI). Weather conditions are reported in

Table 1 (temperature data from Stockholm-Bromma station and precipitation data from Stockholm station). Precipitation data on March 31st was collected from WSP station located in Gullmarsplan, Stockholm due to data bias from SMHI.

Table 1 Sampling date and time, and meteorological conditions

Sample Time	Temperature (℃)	Precipitation (mm)	Number of bottles
2019-03-13 17:00	2.7	5.3	9
2019-03-25 7:00	1.8	0	12
2019-03-31 9:00	3.9	0.2	17

Water samples were taken from stormwater wells that are connected with the artificial turf fields. Two stormwater wells were selected in each of the artificial turf field. One sample per stormwater well were taken on March 13th, and two samples per well were

taken on March 25th and 31st to avoid contingency. In addition, 100 ml drainage sample was taken in Grimsta on March 13th, and one sediment in the well was taken in Åkeshov on March 31st. No sample was taken from Åkeshov on March 25th because the stormwater wells were dry.

2.4 Sample preparation

2.4.1 Filtration

Filtration is an effective approach applied to separate microplastic particles from water samples by use of a filter medium through which only liquid can pass. The medium utilized for filtration includes a funnel, a filter paper and a vacuum system (***Figure 14***), where microplastic particles can be retained in the filter paper (Crawford & Quinn, 2017). The pore size of the filter paper used in this study is 10 µm, which means in this research microplastic particles with a range from 10 µm to 5 mm could detected. Any particles smaller than the lower limit of the mentioned range could not be detected and thus taken into consideration for analysis. Complications can happen during the filtration process since stormwater samples are contaminated with debris and soils that can clog the filter paper. However, because the volume of water sample is small in this study, risks of blockage is assumed to be avoided.

After the filtration, curved mouth washing bottle was used to wash out particles from filter papers into 50 ml glass bottles. The samples were then dried in a dry-cabinet at 50℃ to evaporate water. Here it is important to note that the main decomposition temperature of microplastic polymers is between 375 and 500℃ (Dümichen et al., 2017). Under condition of 30 to 100℃, water can be evaporated while the polymers would not be degraded (*ibid*).

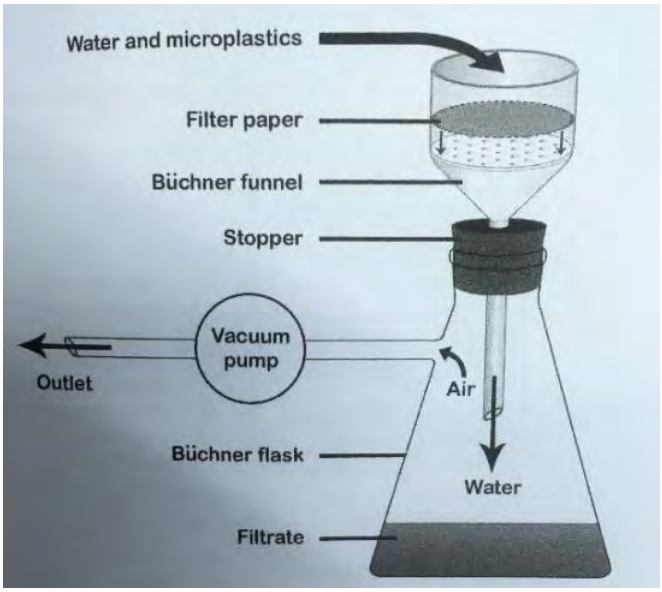

Figure 14 A vacuum filtration system.
(source: Crawford & Quinn, 2017)

2.4.2 Centrifugation

Sediments have been suggested as a long-term sink for microplastics (Van Cauwenberghe et al., 2015). Density separation is a common method to isolate microplastics from sediment samples. Centrifugation was applied in this study to separate microplastics from the sediment sample and in order to research distribution of microplastics in stormwater.

Stormwater samples were filled into centrifuge tubes to do centrifugation with 4000 r/min rotating speed for 4 minutes. In addition, clean water with plastic granulates was centrifuged as blank control. After the centrifugation was done, the supernatant was extracted and dried in the dry-cabinet to obtain microplastic particles.

2.5 Microplastic identification

2.5.1 Visual analysis with stereo microscopy

Stereo microscopy is a variant of optical microscopy designed for sample observation with low magnification. Stereo microscopy can provide three-dimensional erect and laterally-correct image, typically light reflect from the surface of object rather than transmit through it. A stereo microscopy produced by WILD Company with an enlargement up to 40x was used in study to evaluate type and appearance of microplastic particles from water samples (***Figure 15***).

Veronika Köhler from Extrakta Strauss GmbH analyzed and took photos dried water samples with stereo microscopy at laboratory Extrakta Strauss GmbH in Germany. Samples were observed with 6.4x, 16x, and 40x magnification respectively. According to the scale ruler, particles with a size range between 1mm to 5 mm were considered as microplastics. Symbols '○', '+', '++', '+++', '++++' were used to record the quantity estimation of microplastics in different samples. '○' represented zero microplastic were found. '+' represented that several scattered particles of microplastics can be identified in a photo. '++' represented that an amount of microplastics was concentrated in only one part of the photo. '+++' represented an amount of microplastics that was spread in several concentrated areas of the photo. '++++' represented a larger amount of microplastics that almost covered the whole photo. The same indexing was used to analyze the impurity contents of the samples. '○' represented the sample was clean. '+' represented that a few sand and soil were found, and the filter paper was grey (after filtration). '++' represented that an amount of black particles were mixing with microplastics, and the filter paper was black (after filtration). '+++' represented an amount of black particles and some fibers were found, and filter paper was black (after filtration). '++++' represented an amount of black particles and fibers were found, and filter paper was black (after filtration).

Figure 15 Wild M3C Microscopy at Extrakta Strauss GmbH.
(photo by: Veronika Köhler)

2.5.2 Particle size analysis with Camsizer

In this study, Camsizer P4 was used to analyze the characteristic of microplastic granulates from different artificial turf fields. Camsizer P4 as one shown in the ***Figure 16*** produced by Retsch GmbH is a particle sizer for analysis of particle size and particle size distribution in a defined sample. The principles of measurement are laser diffraction and dynamic image analysis. Camsizer P4 works with two cameras and makes 3D pictures for each particle while the sample falls through the case funnel. Eight granulate samples were analyzed with Camsizer P4 by Veronika Köhler at the laboratory Extrakta Strauss GmbH in Germany. Each sample was tested by three times in order to avoid bias and the data used for analysis was the median data.

Figure 16 The Camsizer P4 dynamic image analyzer.
(source: Retsch GmbH)

3 Results

3.1 Pathways for microplastics from artificial turfs to stormwater

At the selected field sites, runoff due to rainfall is a main pathway transporting microplastics to stormwater wells during the summer and autumn, while in the spring microplastic accumulated in cleared snow can be transported by meltwater. Microplastics from artificial football fields spread following the terrain slope to stormwater wells during rainfall. ***Figure 17*** shows the observation of microplastics spread from Åkeshovs IP after rainfall. It can be seen that large amount of microplastics are spread on the road and soils surrounding Åkeshovs IP due to rainfall-runoff process. These microplastics could be transported further downstream by runoff and stormwater system to stormwater wells.

Figure 17 Microplastics spreading route from Åkeshovs IP. In the photographs, microplastic is easily identified as the bright green fragments (photo by: Ran Li).

Microplastics granulates were observed in close surroundings of stormwater wells, which also indicates that stormwater wells are one of the destinations to which microplastics are transported by runoff and where lost part of microplastics from artificial football fields can be found. The stormwater well located in the northeast of the Spånga artificial football field has the shortest straight distance to artificial football field among the four investigated sites, with a straight distance of 7 m (***Figure 9***). ***Figure 18*** shows microplastics from Spånga IP transported to the nearest stormwater well. More microplastic granulates and plastic straws had been collected

in this stormwater well compared to the farther one located 50 m away. Stormwater wells located close to the artificial football fields have higher likelihood of trapping and concentrate microplastics if the topography allows for the runoff to flow through that path.

Figure 18 Stormwater well located in Spånga IP collecting microplastics. (photo by: Ran Li)

Snow clearance removes a large amount of microplastic granulates, which can be an indirect pathway of transporting microplastics to the stormwater system. The cleared snow is gathered around the artificial football field as shown in ***Figure 19***. Microplastic granulates are left as snow melts. This 'microplastic-rich snow' has been observed in Bromsten IP and Spånga IP during field work. Some of these microplastic granulates can spread to stormwater via snow melting and wind transport, but the quantity is uncertain. The remaining microplastic granulates are either recycled as waste or refilled into the artificial football field.

Wind spreading is also one of pathway through which microplastics are transported to stormwater. The amount and exact paths of microplastics transported this way are challenging to observe and quantify. The movement distance and direction of microplastics depend on wind speed and direction. Wind can not only spread microplastics from artificial football fields to stormwater, but also move microplastics from surrounding soils to stormwater. In contrast, grass-covered surfaces trap microplastics as shown in ***Figure 17***.

Figure 19 The 'microplastic-rich snow' located in Bromsten IP.

3.2 Properties of microplastics from artificial football fields

3.2.1 Size distribution of the granulates

Table 2 shows the median size of granulates from four artificial sites. Median size of fragmented granulates is larger than raw granulates. Åkeshov IP has the largest median size of granulates infill, and Spånga IP has the smallest granulates infill. The size of raw granulates is similar comparing between Bromsten IP and Grimsta IP. However, median size difference between raw granulates and fragmented granulates are largest in Grimsta IP. The size difference is 792.3μm.

Table 2 Median size of granulates of the each sample.

Site	Median size of raw granulates (μm)	Median size of fragmented granulates (μm)
Åkeshov	2155.38	2684.82
Bromsten	1702.92	1896.25
Spånga	1638.71	1659.86
Grimsta	1722.92	2515.22

Figure 20 shows the size distribution of the granulates (G) from the four artificial football fields. Value P3 represents the percentage of granulates in different size intervals (blue bars), and value Q3 represents the cumulative sum in percentage (orange lines). All the detected granulates have diameters smaller than 5000 μm (5 mm), and can thus be defined as microplastics. Approximately 90% of the detected granulates are between 1 mm to 3 mm in size, and 1.3% are larger than 3 mm. Granulates with a size of 1 mm to 2 mm account for the highest proportion, especially in Spånga IP and Grimsta IP, where more than 60% of granulates are within that range. The size of granulates from Åkeshovs IP is different compared to the other sites, with 32.4% granulates between 1 mm to 2 mm and 39.5% between 2.3 mm to 3 mm. All granulates from Spånga IP and Grimsta IP are less than 3 mm.

Figure 21 shows the size distribution of the fragmented granulates (FG) that simulate wear under field conditions. The proportion of large granulates in the fragmented samples is higher than that of raw granulates, although all the granulates are less than 5 mm as well. Approximately 81% of the destroyed granulates are concentrated between 1 mm to 3 mm, and 14 % are between 3 mm to 5 mm. In Åkeshovs IP, size of granulates between intervals of 1 mm to 2 mm, 2.5 mm to 3 mm, and 3.1 mm to 5 mm are account for more than 20% respectively. In the other three artificial turfs, granulates between 1 mm to 2 mm in size are dominant; however, the proportion of this size class is smaller compared to raw granulates. It should be noted that fragmented granulates between 3.1 mm to 5 mm are 28% more frequent than raw granulates from Grimsta IP.

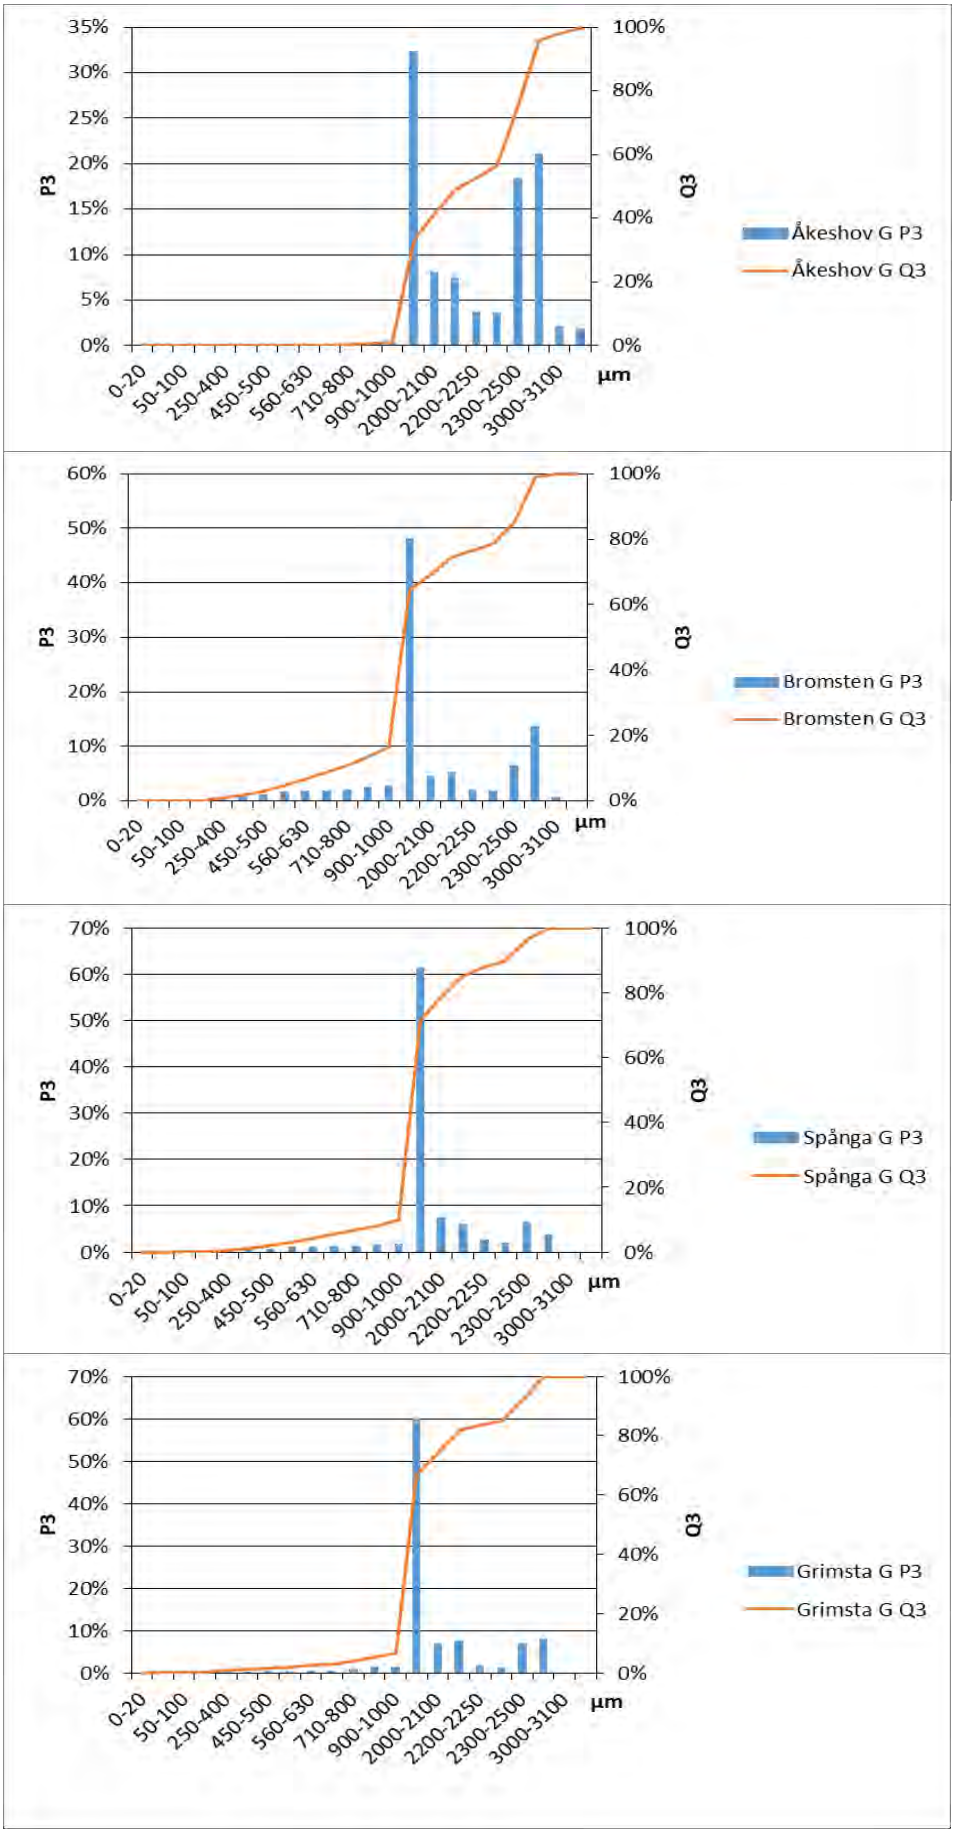

Figure 20 Size distribution of granulates from four artificial turf sites.

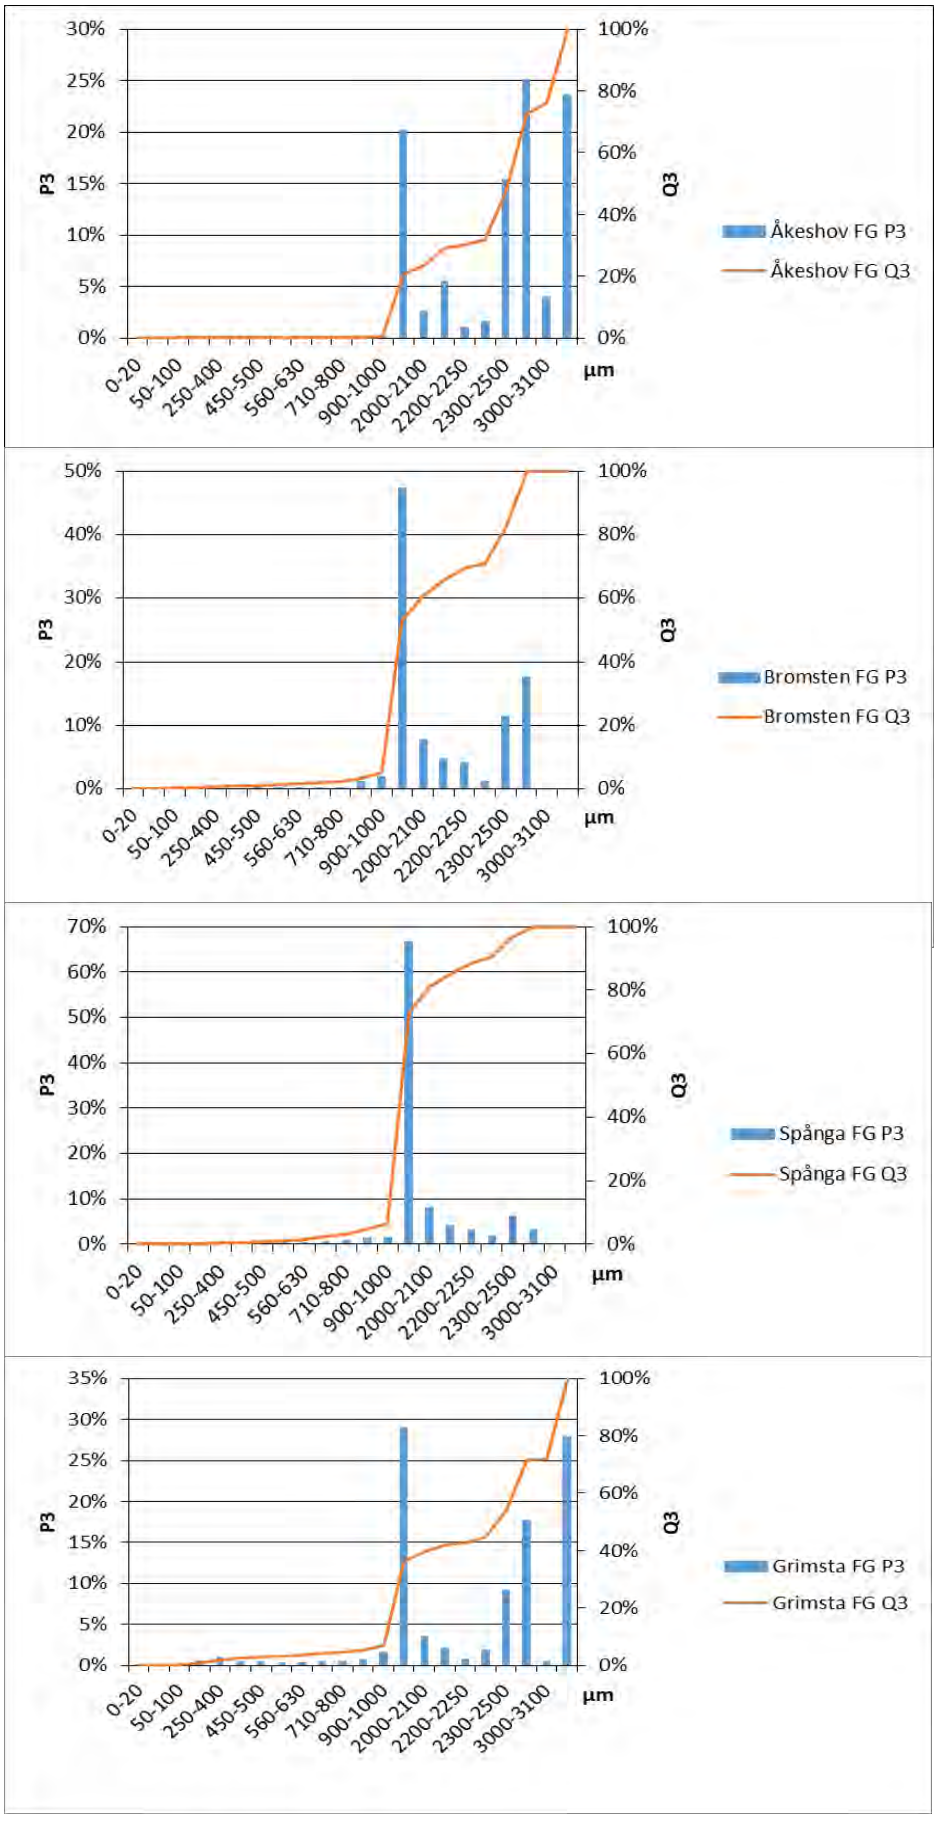

Figure 21 Size distribution of fragmented granulates from four artificial turf sites.

3.2.2 Shape properties of the granulates

Shape of the granulates from artificial football fields is between rectangular and spherical. ***Figure 22*** shows the average spherical index of the granulates, and b/l3 is the shape parameter of the granulates. If b/l3 equals to one it means that the granulates in one size range are perfectly spherical. On the other hand, if b/l3 equals zero it means that the granulates look different from different angles, for example cubic or triangle shape

The median spherical index of granulates from four artificial football fields is between 0.586 to 0.655, which means the shape of granulates is comparable to a sphere, but it also shows some edges. Granulates from Spånga IP are more spherical than those from the other sites. The spherical index of fragmented granulates is higher than that of raw granulates, except from Åkeshov IP. Granulates from Åkeshov IP became more angular after wear, unlike granulates from the other three artificial turfs that became more spherical.

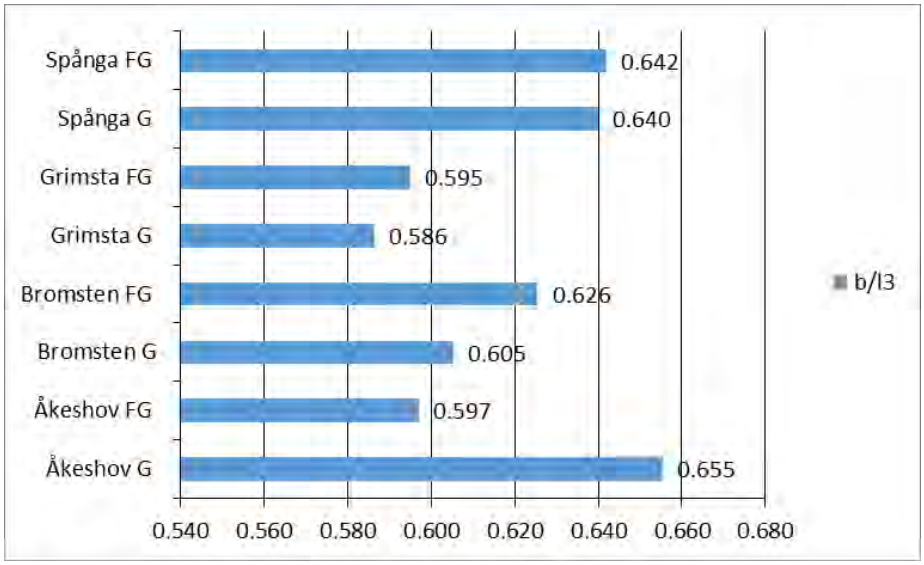

Figure 22 Median spherical index of granulates from different sites and subjected to either no treatment (F) or simulated tear and wear (FG).

3.2.3 Distribution of microplastic granulates in stormwater

In this study, although water samples were taken directly from the flow from a pipe opening into the body of a main hole, there could still be some sediment mixed with stormwater caught within a sample. In order to investigate distribution of microplastics in stormwater, experiments were simulated in the lab.

Distribution of microplastic granulates in stormwater under different conditions shows in ***Figure 23***. Microplastic granulates are floating on the surface of water when they flow into the water as the ***Figure 23a*** shows. In ***Figure 23b*** illustrates how using centrifugation to simulate the shaking process, microplastic granulates accumulated on the bottom. However, if microplastic granulates were added into the stormwater

with sediment, mixed sediments and microplastic granulates can be distributed both on the surface as well as in the bottom, as the ***Figure 23c*** shows.

The simulation experiments illustrate that these microplastic granulates can exist both on the surface of stormwater and in the sediment of stormwater wells. These microplastics could be transported into surface of stormwater by rainfall, and during the heavy rain and wind these microplastics would be mixed into sediments. Hence, once microplastic granulates reach the stormwater wells, they are distributed between the stormwater surface and in the sediments. Since the density of microplastics is similar to organic materials as well as water, separation of microplastics from stormwater is difficult.

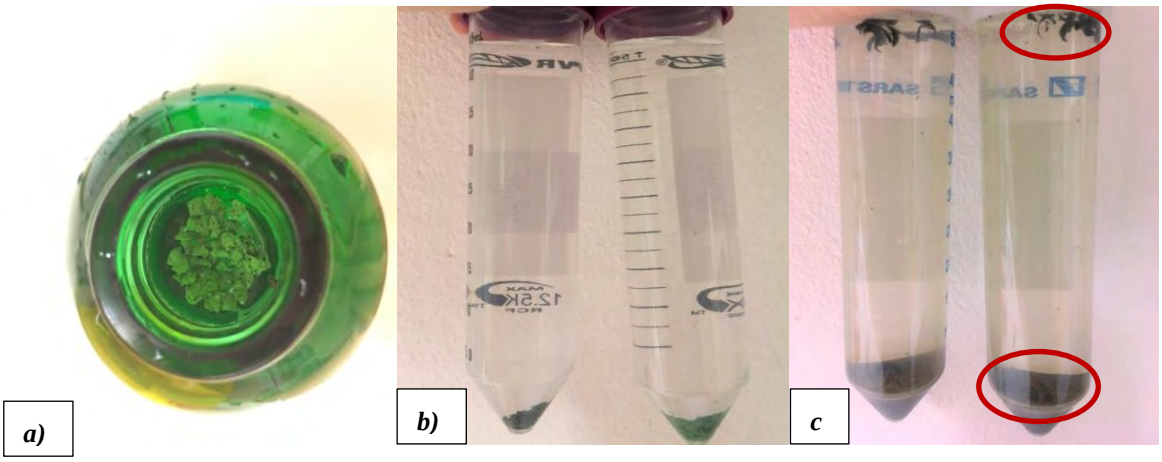

Figure 23 Distribution of granulates in stormwater under different conditions.

a) Microplastics granulates concentrated on the top of stormwater (without centrifugation).

b) Microplastics granulates concentrated at the bottom of stormwater (after centrifugation).

c) Micriplastics granulates present both on the top and at the bottom in stormwater sediments (after centrifugation).

3.3 Identification of microplastics in stormwater samples

3.3.1 Water samples under stereo microscopy

Figure 24 shows dried stormwater samples under naked eyes. After filtration, particles with size larger than 10 µm remain in samples including microplastics, sands, soils, plastic straws and other unknown organic materials. However, the amount of microplastic, sediments and other materials in samples from different sites is different. For instance, microplastic granulates and artificial grass straws can be seen by naked eyes in Spånga samples, but Grimsta samples are clean and nothing can be seen.

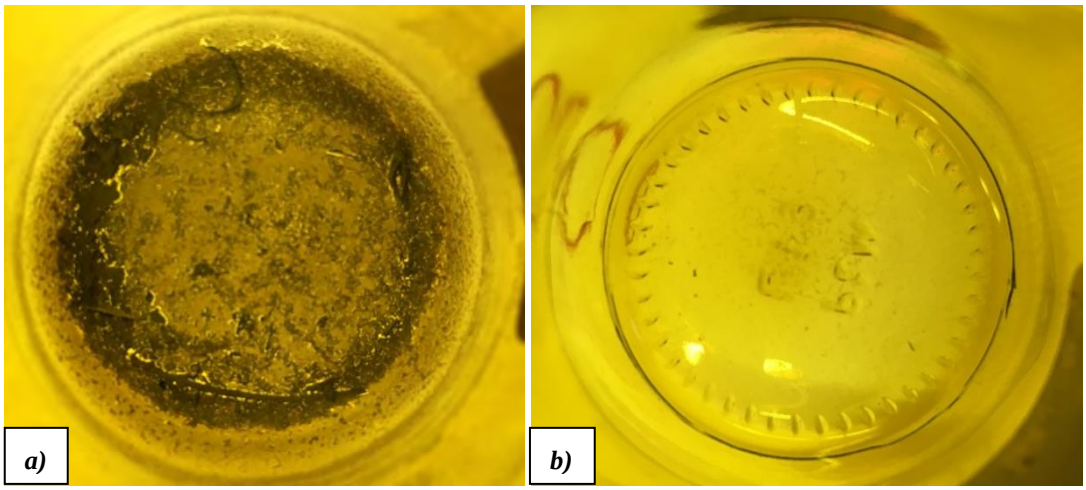

Figure 24 Dried stormwater samples under naked eyes. (photo by: Veronika Köhler)
a) *Spånga sample (3-31); b) Grimsta sample (3-31)*

Figure 25 shows the pictures of a water sample under stereo microscopy with different magnification. Greenish particles are found under microscopy, which could be identified as microplastics subjectively. However, stereo microscopy cannot identify microplastics quantitatively since large amount of fibrous material (possibly roots) and soil are mixed and intertwined with microplastics. Soil and sand with microplastic dimensions could be easily be mistaken as microplastics. Fibrous materials are found in all analysed water samples, though their origin is unknown. The presence of these fibres has influenced the identification of microplastics.

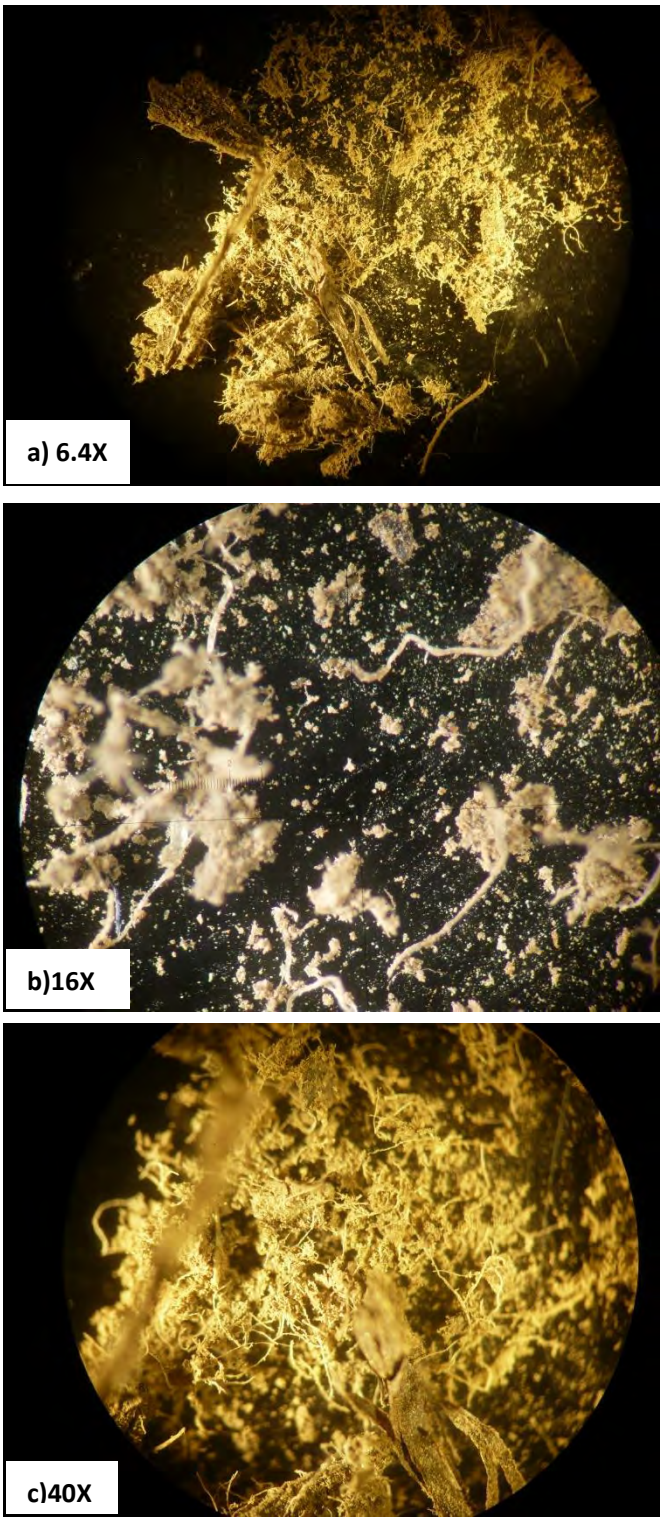

Figure 25 Spånga sample (3-31) under stereo microscopy with different magnification (6.4x, 16x and 40x). (photo by: Veronika Köhler)

3.3.2 Occurrence of microplastics in stormwater samples

According to the pictures of water samples under microscopy, ***Table 3*** and ***Table 4*** indicate microplastic content and impurity in different stormwater samples respectively. 'SW1' is the stormwater well closer to the artificial turf and 'SW2' is the stormwater well further away. '+' is used to indicate the microplastic and impurity content in samples (additional '+' allow a qualitative ranking of the samples); '○' means zero microplastic or zero impurity in samples.

Microplastic content is similar to impurity content. Stormwater wells with high impurity content have also higher likelihood to have more microplastics. In the study of eight stormwater wells, stormwater well 1 from Spånga IP (located in the northeast) has the highest microplastic content, as well as stormwater with highest impurity based on my visual identification approach. Stormwater wells located close to the artificial football fields are more likely to contain high microplastic content, as found in samples from Spånga IP and Grimsta IP (***Table 3***). Microplastic contents are similar for the two stormwater wells in Åkeshovs IP and Bromsten IP, possibly because the two stormwater wells are located close to each other (distances are 5 m and 30 m respectively).

In addition, microplastic content and impurity content could be influenced by precipitation. It has rained on March the 13th with 5.2 mm (***Table 1***) and stormwater wells in Bromsten IP contained more microplastics on that day compared with the other days (***Table 3***). On March 25th there was no water in stormwater wells from Åkeshovs IP. On March the 31st there was a small rain event (0.2 mm); hence, the results are almost the same as on March 25th.

Compared to stormwater wells, the content of microplastics is higher in drainage wells. Drainage wells located in Grimsta IP shows greenish particles mixed with sediments, which are more frequent than in the stormwater wells. Furthermore, in the case of the same stormwater well sediments contain more microplastics than surface water.

Table 3 Microplastic Content Index in Stormwater Samples

Date	Åkeshovs IP			Bromsten IP		Spånga IP		Grimsta IP		
	SW 1	SW 2	sediment	SW 1	SW 2	SW 1	SW 2	SW 1	SW 2	Drainage

3-31	+++	+++	++++	++	++	+++	++	+	○	

4 Discussion

4.1 Uncertainties, knowledge gaps, and outlook for future work

In this study, the evaluation of microplastics in stormwater was quite limited and was done under several assumptions due to difficulties in extracting microplastics from stormwater and separation from suspended materials (mineral or organic). The size of microplastic granulates from artificial football fields are mainly between 1 mm to 3 mm. However, there are soil particles in the same size range as microplastics (e.g., sand grains), which could be visually identified as microplastics by mistake. During filtration, filter paper with 10 µm mesh could extract all the particles larger than 10 µm, including organic and mineral fragments of various origin, which makes identification of microplastics with microscopy even more challenging and demanding. Nowadays, filtration and density separation are commonly used as separation method, but it is challenging to operate them in practice due to the fact that the density of microplastics is similar to the density of stormwater and that there are organic particles similar to microplastics that can be found in the samples. Moreover, microplastics can be easily stuck within sediments in stormwater. Therefore, new techniques of separating microplastics from stormwater based on the unique characteristics of microplastics need to be developed.

The source of microplastics in stormwater added uncertainty in this study. Although stormwater wells were selected based on the location, topography and data about water system around artificial football fields, these fields are not the only potential source of microplastics. Microplastics could also originate from other sources such as road wear and abrasion of tires. Microplastics found in stormwater samples have possibility to be transported by runoff also from nearby roads. Therefore, unless microplastics in the artificial turfs are marked or unambiguously identified, microplastics collected in stormwater could have originated from other sources.

Transportation of the samples from the field to a laboratory can also increase the uncertainties of the results. A part of microplastics might be lost during the filtration process, because microplastics could be absorbed by filter paper. Apart from filtration, long-distance transportation to a laboratory in another country (in this case Germany) is another risk for microplastics loss. Small microplastic fragments can be easily attached to sample bottles or other surfaces and for this reason the identification of microplastics should avoid long distance transportation.

Due to time and weather limitations, stormwater samples were only taken on three different weather conditions in this study. Even though the small number of samples might not be sufficient enough to draw conclusions about the relationship between microplastic content and weather conditions, they could still be indicative and represent an important step towards assessing microplastics content and behavior in stormwater. In future studies, stormwater samples are suggested to be taken

continuously during the whole year, always following the same protocol to ensure homogenous sample quality.

Since there are interference factors in field measurements, lab simulation experiments could support future studies. For example, it would be interesting to test how turf responds to various types of artificial conditions. Preparing a square surface of artificial football turf and simulating runoff with clean water would help identifying how many microplastic fragments would be lost from artificial football turf. In this way, not only precipitation amounts and intensity could be controlled, but also interference from other particles would be effectively avoided.

4.2 Methods for microplastics identification

In recent years, with the increasing attention on microplastics, the discussion on the identification of microplastics has also increased. Based on experience gained in this work (Section 3.2.3) combined with a literature review (Section 2.1), in this section advantages and disadvantages of available methods for microplastics identification are discussed.

In this study, stereo microscopy was used to identify microplastics, which is an economic and simple method to assess morphological characteristics of microplastics. However, the stereo microscopy has shown to be neither suitable for quantitative analysis nor identification of microplastics from stormwater samples, and the assessment was conducted using an approach that is quite subjective. The challenging and difficult part of this study was to visually distinguish microplastics from other particles of similar size and shape, especially for the samples that contain organic particles (root fragments, plant detritus) as in this study. Hence, spectroscopic approaches are required for microplastic quantitative analysis.

Spectroscopic methods for microplastic identification include scanning electron microscopy (SEM), Fourier-transform infrared (FT-IR) spectroscopy and Raman spectroscopy. SEM is a technique that characterizes surface morphology of microplastics by the interaction of an electrons beam with the sample in order to measure the secondary ions (Rocha-Santos & Duarte, 2015). X-ray radiation can also be detected by scanning electron microscopy. This radiation can be analyzed with a specially designed spectrometer, so-called scanning electron microscopy-energy dispersive X-ray spectrometer (SEM-EDS), which measures the x-ray radiation emitted from the sample. Plastic particles can be separated from organic particles because of the specific, high carbon concentration contained in plastics (Bujak, 2018). SEM-EDS can be used to analyze SBR, EPDM, TPE and plastic straws, providing granulates with light color (*ibid*).

FT-IR microscopy is often used to identify the polymeric composition of the microplastics. FT-IR has the low requirement for sample preparation, and clean-up sample is enough. Microplastic analyses with FT-IR are well established and the results are reliable. However, the equipment and sample processing are expensive and

professional persons are required with data processing. As for microplastic granulates in artificial turfs, FT-IR can only be used for analyzing TPE granulates as well as plastic straws, which is not suitable for SBR and EPDM granulates due to their black and rubber materials (Bujak, 2018).

The technique of Raman spectroscopy (RS) resembles the FT-IR and involves a sample being irradiated with a monochromatic laser that creates vibrations in a molecule. Raman spectra provide information about bonding within the material and about networking structures (Rocha-Santos & Duarte, 2015). Small particles, including even dark particles between 1 to 20 μm can be analyzed by RS with high spatial resolution. Furthermore, RS can fast perform chemical mapping with automatic data collection (Li et al., 2018). However, the analysis by RS is time consuming and although RS can detect type of particles theoretically, the method has not been applied in microplastic identifications yet.

According to the literature review, in recent years FT-IR and SEM are common quantitative methods of microplastic identification in oceans. Since microplastics has been one of the most discussed environmental problems in recent years, and more and more applied studies have been conducted, quantitative identification of microplastics is improving in terms of accuracy, simplicity and economy. However, relatively fewer studies present methods and results on microplastics in stormwater, motivating further research in this area.

4.3 Mitigation measures of microplastics in stormwater

As artificial turfs have been studied as an important source of microplastics, municipalities and research institutes in Sweden have become aware of the environmental impacts of artificial turfs and some mitigation measures have been proposed to decrease the emission or transport of microplastics. On one hand, loss of microplastics can be reduced from the source by regular maintenance of artificial turfs. On the other hand, they can also be captured during their transport along different pathways.

Nowadays the most commonly used artificial turfs are the third-generation turfs with rubber infill granulates, which results in a large amount of loss of microplastics. Loss of microplastics has been observed spreading to the environment through mechanical snow removal, stormwater, and when mixed or trapped in sand. Reducing the snow removal in winter is a simple and effective measure to avoid spreading of microplastics. Matches and trainings can be coordinated between several artificial football fields in winter with an overall booking arrangement in order to reduce snow removal in total. Regular maintenance of artificial football fields can not only increase their life span, but also can be used as a measure to prevent spreading of microplastic granulates. During maintenance, deep-cleaning can help to remove unwanted particles from the artificial turfs and increase available store depth for microplastic granulates. Besides maintenance, reducing the quantities of microplastic granulates used for infill

is a direct way to mitigate loss of microplastics. Lidingö municipality has positive experience of using granulates made of natural materials such as coconut and cork. Some manufacturers have proposed the fourth-generation artificial turf without granulates, which prevents the spread of microplastics from the source. However, the application effect of the fourth-generation products is still under test. In Germany and the Netherlands, eight fourth-generation artificial turfs were replaced after several years due to fiber release (Krång et al., 2019). Recently, a fourth-generation artificial turf has been built in Stockholm with only sand infill, and it has met the expectations of environmentally-friendly requirements (*ibid*). Choice of infill granulates of artificial turfs should be considered based on site conditions, function requirements, price, as well as environment and sustainability.

Technical installations are effective ways to reduce the spread of microplastics through several different pathways. Installation of underlying sealing layers can be proposed to reduce spreading of microplastics. Most artificial football fields are well drained and are opened at the bottom, allowing part of the water to be transported through the drainage pipes while the rest flows directly to the groundwater and from tehre eventually to surface recipient (Krång et al., 2019). Underlying sealing layers should ensure water purification before it flows to drainage pipes.

Filtration installations surrounding stormwater wells are also effective measures to capture microplastics. Some municipalities have installed filter bags in stormwater wells to avoid microplastics reaching stormwater. In general, the pore size of a filter bag is 0.4 mm which can capture ca 99% microplastics from artificial turfs according to the properties of granulates. The filter bags need to be emptied regularly to avoid clogging the trap. Since filter bags are effective and inexpensive installations, they can be widely used in stormwater wells and drainage wells surrounding artificial turfs. However, the capacity of the filter bags and the installed locations should be considered in practice. Besides filtration bags, a filtration well installation is proposed in order to capture smaller microplastics. All the stormwater and drainage water are led to the filtration well (***Figure 26***) with filter materials such as sand, and during filtration not only microplastics but also metals or other particles can be settled before flowing out of the well. In order to avoid clogging, the filtration well should be installed in a bigger well with a balancing function that allows bigger particles to be deposited. However, the filtration well is difficult and expensive to be installed especially for the existing pipe system.

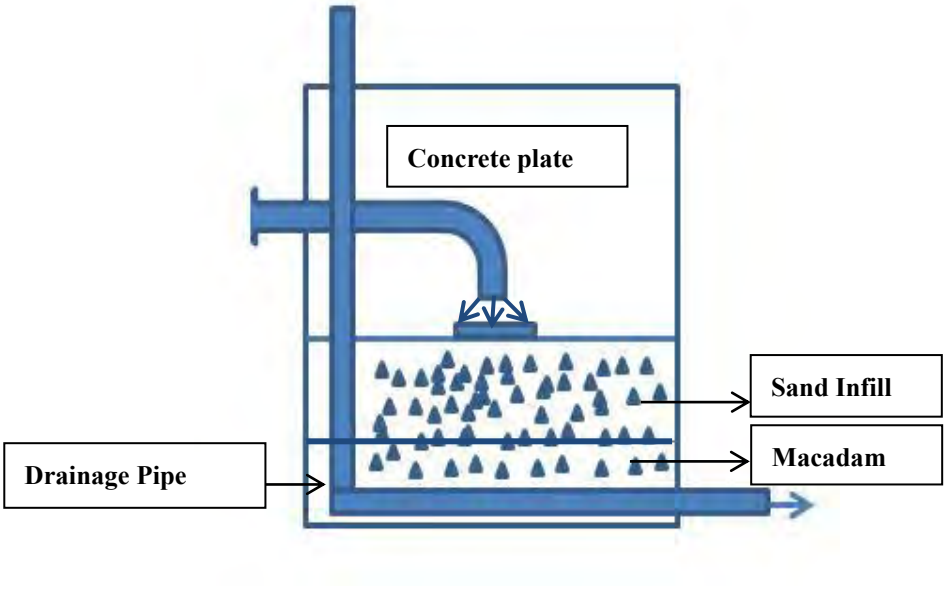

Figure 26 Filtration well installation.
(Reference: Skiss inspired by drawing by Skellefteå kommun)

Microplastics from artificial turfs are generally small and low-density particles, and they are difficult to be separated from sediments once mixed. Hence it is better to capture microplastics before they get transported from artificial turfs. When compared with other existing techniques for preventing microplastics loss, filter bags are the most economical and effective method at present. Based on the available literature data, filter bags are worth promoting as measures to mitigate microplastics entering stormwater. At the same time, the development of alternative material for microplastic granulates is essential as well, since microplastics from artificial turfs could be settled in surrounding soils, which are difficult to be degraded and have persistent negative impact on environment.

5 Conclusions

Microplastics from artificial turfs, as the second source of microplastics in Sweden, have attracted much attention in recent years. Stormwater is considered as one of the most important pathways transporting microplastics to environment and in particular ecologically-sensitive surface water bodies. However, because of challenges in the quantitative analysis of microplastics in stormwater, how much microplastic from artificial turfs reaches the stormwater is still unknown.

Approximately 90% of microplastic granulates from artificial turfs analyzed in this study from the four sites in Stockholm is between 1 mm to 3 mm. The density of microplastics is similar to stormwater and organic materials, and they can exist both on surface and in sediments of stormwater. Thus, microplastics are difficult to be separated from stormwater samples. Further development of method for separation of microplastics is necessary for quantitative studies in the future, because the approach developed here includes subjective evaluations that should be avoided.

Microplastics from artificial turfs flow with runoff along with the terrain slope to stormwater wells by. Stormwater wells located closer to an artificial turf capture more microplastics compared with stormwater wells further away. It has been detected that a certain amount of microplastics get stuck in soils during their spreading through rainfall-runoff process.

Stereo microscopy has shown as limited and rather subjective method for microplastic identification in stormwater samples as quantifying microplastics by naked eyes due to presence of other particles with characteristics similar to microplastics is very challenging process. Thus, the obtained results are more indicative than they could be used for conclusive purposes. In order to quantify microplastics transported from artificial turfs to stormwater, marking microplastic granulates and analyzing stormwater samples with electron microscopy are suggested. At present, although spread of microplastics from artificial turfs has been on the agenda in various municipalities and institutes, research perspectives and practical quantitative investigations of microplastics in stormwater are still scarce or in their initial phases. Hence, it is important to encourage, share and discuss obtained results as well as to cooperate in tracking and quantitatively analyzing microplastics spreading and loss. In this way one can adapt and develop future solutions with the best available technology.

FERAL SWINE DAMAGES

Manage the Damage
Stop Feral Swine

What are Feral Swine?

Feral swine, also known as wild pigs, Eurasian boar, or feral hogs, are not native to North America. They were first brought into the United States in the 1500s by early explorers and settlers as a source of food. Repeated introductions occurred thereafter, as well as breeding with escaped domestic pigs. They are a harmful and destructive invasive species whose geographic range is rapidly expanding and their populations are increasing across the nation. Over 6 million feral swine can now be found across more than 35 states.

Why are they a Problem?

The rapid expansion of feral swine across the country, along with the varied types of damage they cause, are creating problems. Feral swine can multiply faster than any other large mammal. Females begin breeding at about eight months and can produce two litters of four to 12 piglets every 12-15 months. Reasons for their expanding range involve illegal movements by people and accidental escapes from fenced facilities. Feral swine cause significant damage to property, agriculture (crops and livestock), native species and ecosystems, and historical and cultural resources. They also pose a threat to the health of wildlife, pets and other domestic animals, and humans. Damages and risks to animal and human health are expected to rise as feral swine populations continue to expand across the country.

Damage to Agriculture

Feral swine damage crops by consuming them or by their rooting, trampling, and wallowing behaviors, which can destroy fields or reduce yield. Field crops commonly damaged by feral swine include sugar cane, corn, grain sorghum, wheat, oats, peanuts, and rice, among others. Vegetable and fruit crops, such as lettuce, spinach, melons, and pumpkins are also attractive to these animals. Feral swine can also impact the regeneration of forests and stunt the growth of trees. Basically, feral swine could turn almost any crop into a meal.

Feral swine can transmit diseases to domestic livestock, resulting in economic losses through decreased production, decreased feed efficiency, lower reproductive success, mortality, and the costs associated with veterinary diagnostics and treatment. Feral swine are omnivorous, meaning they eat just about anything. They have killed calves and lambs, and adult animals are vulnerable to predation while giving birth.

Feral swine damage pasture grasses and consume, contaminate, and destroy livestock feed. Feral swine can also damage farm property, such as fences, water systems, irrigation ditches, troughs, and levees.

Risks to People

Feral swine can carry at least 30 diseases and nearly 40 parasites that may affect humans, pets, livestock, and other wildlife. Feral swine can also pass on bacteria associated with foodborne illness, such as E. coli, toxoplasmosis, and trichinosis. Feral swine collisions with vehicles and aircraft pose major risks to the safety of drivers, pilots and passengers. Feral swine in urban and suburban areas become less afraid of people over time and have been aggressive to golfers, picnickers, and others. This behavior is even more of a problem when they associate people with food because of handouts and improper waste disposal.

Feral swine also may pose risks to pets, either directly through aggressive behaviors or by spreading diseases. Some diseases, such as pseudorabies, are fatal to dogs that are exposed through hunting activities or from eating raw feral swine meat.

FERAL SWINE DAMAGES

Manage the Damage
Stop Feral Swine

Damage to Natural Resources

Feral swine consume large amounts of vegetation. Behaviors such as rooting, soil compaction, and wallowing all pose problems for plants. Consumption of seeds, nuts, and seedlings also reduces the potential for forest growth. Sites disturbed by rooting and wallowing are often vulnerable to erosion and establishment of non-native, invasive plants. In some habitats, feral swine may eat or uproot protected, sensitive, unique, or rare plants.

Feral swine diets overlap with those of native wildlife, which results in competition for important and limited natural food supplies. Mast crops, such as acorns, are a preferred food of feral swine and are also a critical food source for native wildlife. Consumption of seeds, seedlings, and other vegetation reduces the amount of food available for native animals. Feral swine will also eat invertebrates and other small animals, including insects, earthworms, voles, shrews, turtles, amphibians, and ground-nesting birds. Feral swine will destroy nests and consume eggs of reptiles and ground-nesting birds, such as alligators, quail, turkey, and shorebirds. In some areas, feral swine can have negative impacts on threatened and endangered species and their habitats. The preference of feral swine for wet environments also creates competition for limited water resources with native wildlife during dry seasons.

Soil disturbance and vegetation loss associated with trampling, wallowing, and rooting by feral swine increases erosion and associated problems with water quality. Siltation and water contamination in streams and coastal areas with swine activity have contributed to declines in aquatic organisms, including freshwater mussels and insects. In some areas, feral swine have been identified as the cause of elevated waterborne bacteria levels in streams, which can risk human health. The use of contaminated water in irrigating foods marketed for human consumption could lead to outbreaks of foodborne illness.

Feral swine can transmit diseases to wildlife, some of which can be fatal. Feral swine may also cause an increase in mosquito habitat which contributes to the prevalence of avian malaria and avian pox which impacts native birds.

Damage to Property

Estimates do not exist for costs associated with feral swine damage to landscaping or recreational areas. However, homeowners' efforts to improve their properties are often ruined quickly if feral swine are in the area. Destroyed vegetation and wallows reduce the aesthetic value of private properties, public parks, and recreational areas. Feral swine foraging, rooting, and wallowing can damage landscaping, golf courses, recreational fields, cemeteries, parks, lawns, and other natural areas.

On average, adult feral swine weigh from 75–250 pounds with some individual animals weighing considerably more. Consequently, collisions with vehicles such as motorcycles, automobiles, and aircraft can cause substantial damage.

Damage to Cultural and Historical Resources

Cultural sites can be impacted by feral swine and have included national historic sites, tribal sacred sites and burial grounds, cemeteries, and archaeological sites and digs. Feral swine damage can affect the significance and integrity of historic properties through physical disturbance to structures, vegetation, and soils. Foraging and habitat damage by feral swine can negatively impact the distribution and abundance of plants and animals which may be used for traditional purposes.

WILD PIGS

Integrated Pest Management for Home Gardeners and Landscape Professionals

Wild pigs are not native to North America and were first introduced in California in 1769 by the Spanish missionaries at Mission San Juan Bautista. The missionaries released domestic pigs near the missions in order to take advantage of the rich natural forage resources available. Released domestic pigs that were not harvested or recaptured became feral. Feral is a term that refers to an animal or group of animals that was once domesticated but has since lost its domestic nature and become wild. In the 1920's, Russian wild boars were introduced in Monterey County for sport hunting. Russian wild boar and domestic swine belong to the same species, *Sus scrofa*, (Figure 1) and are able to interbreed without restriction. Wild pigs in California today are descendants of both the released domestic pigs and the Russian wild boar.

Wild pigs are susceptible to at least 30 transmittable livestock diseases and are hosts to over 35 types of parasites. Of the 30 diseases that wild pigs carry, 20 can be transferred to humans. Wild pigs are known to cause extensive damage to crops and rangelands. Additionally, they are known carriers of five major waterborne pathogens that can contaminate drinking water: *Escherichia coli* (*E. coli*), *Campylobacter*, *Salmonella*, *Cryptosporidium*, and *Giardia*.

IDENTIFICATION

Since wild pigs in California today are descendants of both domestic swine and the Russian wild boar, their appearance can vary based on their heritage. Table 1 summarizes some of the physical differences that may be observed between wild pigs and domestic pigs.

LIFE CYCLE, BIOLOGY, AND BEHAVIOR

Wild pigs usually live to be 4 to 8 years old, with high mortality rates among the young and the very old. Full-grown males are usually 200 pounds at adult weight, while full-grown females weigh slightly less and average about 175 pounds. While they can grow larger than this, it is not considered common; and it would most likely occur under artificial supplementation of feed. Once juveniles reach 10 to 15 pounds, predation risk is minimal. Females are sexually mature and can be reproductive at 6 to 9 months of age, although most females are over a year before they have their first litter. Females can have up to 2 litters per year, and litter size can vary from as little as 3 to as many as 18 per litter, with an average litter size of 5 or 6. The size of the litter and the success rate of the young depend on available resources. In areas where food resources and cover are plentiful, litter sizes will be larger and a larger number of pigs will survive. When food resources are scarcer, litter sizes will be smaller; and there will be increased competition between the young for resources. Competition among littermates can be strong, leaving weaker pigs more susceptible

Figure 1. Wild pig, *Sus scrofa*.

Table 1: Physical Characteristics of Wild and Domestic Pigs.

Physical Characteristic	Wild Pigs	Domestic Pigs
Hair	Amply covered with coarse, long hair	Sparse, short hair
Ears	Relatively small and erect	Relatively large and floppy
Tail	Straight, covered in hair	Curly, little hair present
Body	Razor-backed, shoulders higher and wider than hindquarters	Wide body, flat back
Tusks	Long and sharp	Relatively short
Head	Longer snout with flat profile	Shorter snout, concave profile
Color	Mostly black, some pied or russet	Usually white, sometimes russet or pink
Young	Dark with horizontal stripes	Same uniform color as parents

PEST NOTES Publication 74170

July 2015

to disease and predation. Up to 48% of pigs may die within the first year of life.

Wild pigs are very smart and able to adapt and respond to an array of environmental conditions in order to sustain their population. Their fecundity and litter success rates are highly correlated with precipitation amounts. Like many other species during dry years, wild pigs have smaller litters with lower survival rates. During dry years, wild pigs also expand their home range in search of food and water. During years with above average precipitation, wild pigs have larger litters with higher survival rates among the young.

Known for their voracious appetite, wild pigs have a wide and varied diet made up of plant and animal matter. Wild pigs frequently scavenge and will prey upon reptiles, amphibians, and small mammals. Such feeding is indiscriminate; wild pigs will kill and eat whatever is most available or easiest to catch. Wild pigs will even prey upon lambs, full grown sheep, kids (baby goats), and calves. Wild pigs root through the soil to find roots, bulbs, and grubs, and show a strong preference for hard mast crops (e.g., acorns). The monogastric (one stomach) digestive system of the pig is similar to humans; pigs will digest food in as little as 4 to 6 hours. A full grown wild pig will consume about 3% of its body weight per day. However, they are capable of consuming considerably more in a short period of time. For example, one study reported 49 spade foot toads (*Scaphiopus holbrooki*) in the stomach of a harvested wild pig. Another wild pig stomach contained seven voles, two pocket gophers, one woodrat, and three mice. The rapid rate of digestion in the pig indicates that the harvested pigs had consumed the contents of their stomach in the last 4 to 6 hours and also demonstrates the substantial amount one pig is able to consume when binge feeding.

Wild pigs live in matrilineal groups called sounders that are led by a dominant female. While males are nomadic and are known to move about within their home range, females tend to stay in their familial groups with 80% of females remaining with the sounder in which they were reared. Although wild pigs are considered habitat generalists, a few common themes are often observed. Wild pigs like to rest and nest in areas with low growing dense vegetation. Like most other vertebrates, wild pigs need water. Additionally, since wild pigs do not have sweat glands, in hot weather they wallow in seeps and springs to cool themselves. Wild pigs show a dietary preference for a number of plants that grow in riparian areas, so their home range will be dictated by not only the availability of water resources but also proximity to riparian ecosystems, especially in the summer or during dry periods.

IMPACT

Wild pigs impact ecosystems through their rooting, wallowing, foraging, and hunting, with a conservative annual estimate of $1.5 billion in economic damage nationally to agriculture and the environment. They are highly competitive for food resources and have been known to drive cattle away from supplement. Deer are also known to vacate an area, such as a water source, upon the arrival of wild pigs.

Their rooting behavior overturns and tills the soil, uprooting plants, exposing bare soil, and creating opportunities for weeds to invade (Figures 2 and 3). They disturb native and naturalized vegetation and reduce available forage for livestock and other wildlife. Their wallowing disturbs springs and seeps, and they are known to cause damage to stock water troughs by rooting around their bases and undermining the troughs (Figure 4). Their rooting and wallowing behavior also disturbs riparian areas and reduces habitat suitability for native and endangered wildlife species. In urban areas, the rooting behavior of wild pigs can cause extensive damage to lawns and gardens.

The foraging behavior and dietary preferences of wild pigs makes them highly competitive with other wildlife species. Many native wildlife species (e.g., black bear (*Ursus americanus*) and mule deer (*Odocoileus hemionus*)) are highly dependent on hard mast crops, which are known to be a favorite of wild pigs. In years where hard mast crops are small, wild pigs may invade and rob the underground caches of small mammal species. Wild pigs have been implicated in the reduced regeneration of oak trees in California due to their

Figure 2. Wild pig rooting in an almond orchard. The drip irrigation system was most likely damaged as a result of this wallow.

Figure 3. A man sits in a deep hole created by wild pig rooting. Extensive rooting can lead to erosion, loss of forage, and invasion by weedy species.

Figure 4. Wild pigs drinking and swimming in a cattle water trough. The pigs can damage water control valves causing a waste of water resources and may spread disease by contaminating the water supply for livestock and other wildlife species. Direct interaction of wild pigs and livestock can also result in disease transmittance.

rooting behavior and their affinity for acorns. However, it has been proposed that wild pigs may instead facilitate oak regeneration because they do not generally consume all available acorns and may actually "plant" some through their rooting behavior; but there is no scientific evidence to support this theory. In fact, one study found that high density populations of wild pigs led to lower acorn survival.

Wild pigs can be a major nuisance for farmers and ranchers, as they will invade farm fields and eat crops, disturb plantings by rooting through the soil, defecate in fields leaving behind fecal coliforms that may be infectious to humans, and pose a serious risk to human and livestock health by serving as vectors for numerous diseases and parasites. In California, damage from wild pigs can be quite high. One study noted a 6 – 10% loss in revenue in various agricultural commodities when wild pigs are present, while a study in Texas estimated $57 million worth of damage caused by wild pigs to crops annually.

Wild pigs carry five major waterborne pathogens that can be infectious to humans. These five pathogens are: *E.coli*, *Campylobacter*, *Salmonella*, *Cryptosporidium*, and *Giardia*. For example, after the *E. coli* outbreak in spinach from California fields in 2006, *E. coli* was isolated from both cattle and wild pigs. Although the exact source could not be verified, wild pigs were considered the prime suspect. In another study in Texas, six of seven wild pigs tested positive for *E. coli*. Additionally, wild pigs increase turbidity in water sources by stirring up sediment. Turbidity, or the relative cloudiness of water, is a critical factor affecting the survival of waterborne pathogens. As turbidity increases, the survival rate of waterborne pathogens, including *E. coli*, also increases. Further, high levels of turbidity can protect waterborne pathogens during the chemical disinfection process used in water treatment facilities.

Wild pigs pose a significant potential disease threat to humans, domestic livestock, and native wildlife and are hosts to at least 37 parasites that can affect multiple species. Wild pigs can carry potentially devastating diseases to domestic livestock and wildlife including pseudorabies, foot and mouth disease, swine brucellosis, bovine tuberculosis, and classical swine fever. Given the diverse hazards posed by wild pigs, combined with the extreme negative economic impact they often impose, an effective management program is warranted.

LEGAL STATUS

Wild pigs are classified as a game animal by the California Department of Fish and Wildlife, and a license and tag is required to hunt them. If wild pigs are causing damage to property, depredation permits are available for removing nuisance individuals. Unmarked, free-roaming domestic pigs are legally equivalent to wild pigs.

MANAGEMENT

Wild pigs can be managed through small-scale exclusion, trapping, and/or shooting. While recreational hunting is often a preferred method, it is not effective at controlling wild pig population growth. Trapping, however, is highly effective at controlling and reducing wild pig population growth. All methods of control are only effective long-term if adjacent property owners work together cooperatively to reduce population size; otherwise, even the most efficient wild pig removal programs will suffer from frequent reinvasion from neighboring pig populations.

Exclusion

Excluding wild pigs using fencing is an effective option, although it can be expensive. However, if implemented on a small scale, it can be practical. Wild pigs are strong enough to upturn many types of fences and simply go under them by utilizing their natural rooting instinct. If wild pigs are excluded using a fence, it should be monitored closely to watch for signs that the perimeter has been breached. For more information on how to properly construct wild pig exclusionary fences, see the References section.

Trapping

Trapping is a common and effective method of removing wild pigs. There are two types of traps that are most commonly used with wild pigs, box traps and corral traps. Box traps are usually relatively small, about 4′ x 4′ x 8′, and constructed using heavy duty welded framing as well as wire paneling. A door system with a trip wire is used to allow entry but prevent escape from the trap. Some box traps are equipped with what is known as a rooting door, which allows multiple pigs to enter by utilizing their natural rooting tendencies but prevents escape.

Corral traps are generally larger than box traps and designed to capture larger numbers of wild pigs (Figure 5). Corral traps are either round or square, although round traps are recommended over square traps because pigs tend to pile up in the corners of square traps and will climb on top of each other to escape the trap. If a square corral trap is used, it is recommended that the corners be adequately covered to prevent pigs from climbing out. The two basic door types used in corral traps are the same as those used in box traps. Either a drop gate, triggered by a trip wire, is used or a rooting door on springs is used. In the case of the drop gate, the trip wire is generally attached to something of interest to the pigs at the furthest end of the trap from the door. This allows more than one pig to enter in search of food before the trip wire is triggered and the door drops closed. Corral traps are preferred by many because entire sounders can be

Figure 5. Wild pigs in a corral trap.

captured at once, which helps prevent trap education of other wild pigs.

Traps are baited with a number of food substances intended to draw wild pigs in as they search for food (Figure 6). Recommendations include corn, barley, oats, carrion, fruit, and fermented corn or soybeans, although any food that the wild pigs are currently feeding on is a good option. Trapping is considered more of an art than a science, and it may take some time to determine which bait works best. Some have developed mechanical feeding devices, like a 55-gallon drum with small holes that lets bait out. This allows wild pigs to access the bait but prevents smaller, non-target species from consuming bait. Pre-baiting traps can significantly improve the success rate of a trapping program. It is important to ensure a steady bait supply, check traps daily, and check traps from a distance. If trapped pigs are approached, they may become agitated and attempt to escape the trap. Wild pigs are large, strong animals; and traps must be constructed using materials that can withstand the force of agitated individuals. For more information on trapping and how to build and bait traps, see the References section.

OTHER CONTROL METHODS

Shooting is a popular method of controlling wild pig populations; however, recreational hunting alone is not an effective control method. Pressure from hunting will drive wild pigs to move away from where they are hunted or, at a minimum, will restrict their movements. The California Department of Fish and Wildlife maintains a "Guide to Hunting Wild Pigs in California" on their website. It is legal to use dogs when hunting wild pigs under some circumstances. However, it has been found that using dogs is most effective for locating individuals or smaller groups of wild pigs. In some cases, a female pig is trapped, spayed, fitted with a radio collar, and then released. Since female pigs live in groups, the spayed female pig will lead wildlife managers to local pig populations, which can assist population control efforts.

Figure 6. An example of a bait station inside a corral trap.

Chemical Control

There are no toxicants currently registered for use on wild pigs in the United States and there are no known effective repellents. Further, there are no oral contraceptives approved for use with wild pigs.

Eradication

Any eradication efforts should be approached with careful planning and forethought. Eradication efforts are expensive and time consuming; however, they can be successful by implementing multiple control methods. There are two examples of wild pig eradication documented in California. One example comes from Santa Cruz Island where wild pigs were eradicated in 2007 at a total cost of about $5 million. Eradication took about 26 months and 5,036 wild pigs were shot on the 62,000 acre island. Wild pigs were also eradicated from Pinnacles National Monument (now Pinnacles National Park) at a total cost of over $600,000 dollars for 200 wild pigs. This number does not include the approximate $2 million that was spent to install an exclusionary fence to prevent wild pigs from recolonizing the monument. The cost of maintaining the fence is over $50,000 annually.

Obviously, eradicating or even lowering a wild pig population to an acceptable level is quite expensive, difficult to achieve, and difficult to maintain. It should be noted that assistance in wild pig removal can often be obtained from USDA/APHIS/Wildlife Services and some County Agricultural Commissioner's offices. Contact your local County Agricultural Commissioner's office for more details.

WARNING ON THE USE OF CHEMICALS

Pesticides are poisonous. Always read and carefully follow all precautions and safety recommendations given on the container label. Store all chemicals in the original, labeled containers in a locked cabinet or shed, away from food or feeds, and out of the reach of children, unauthorized persons, pets, and livestock.

Pesticides applied in your home and landscape can move and contaminate creeks, rivers, and oceans. Confine chemicals to the property being treated. Avoid drift onto neighboring properties, especially gardens containing fruits or vegetables ready to be picked.

Do not place containers containing pesticide in the trash or pour pesticides down the sink or toilet. Either use the pesticide according to the label, or take unwanted pesticides to a Household Hazardous Waste Collection site. Contact your county agricultural commissioner for additional information on safe container disposal and for the location of the Household Hazardous Waste Collection site nearest you. Dispose of empty containers by following label directions. Never reuse or burn the containers or dispose of them in such a manner that they may contaminate water supplies or natural waterways.

ANR NONDISCRIMINATION AND AFFIRMATIVE ACTION POLICY STATEMENT

It is the policy of the University of California (UC) and the UC Division of Agriculture & Natural Resources not to engage in discrimination against or harassment of any person in any of its programs or activities (Complete nondiscrimination policy statement can be found at http://ucanr.edu/sites/anrstaff/files/183099.pdf).

Inquiries regarding ANR's nondiscrimination policies may be directed to Linda Marie Manton, Affirmative Action Contact, University of California, Agriculture and Natural Resources, 2801 Second Street, Davis, CA 95618, (530) 750-1318.

Describe present and historic physical appearance.

Ukiah Vichy Sprigns Mineral Resort is located on an 82.64 acre parcel which is part of the 790.85 acre remainder of a Resort and Ranch which once encompassed 1400 acres. Located three miles east of Ukiah, the current ranch is divided into four assessment parcels (there are nine legalparcels), all under the ownership of the Vichy Springs Group. The resort parcel contains six historic buildings, the deteriorated remains of three guest cabins, eleven mineral springs, four historic structures, one dam, and a corrogated-metal building constructed in 1978 for the Vichy Springs Mineral Water bottling plant. A dam and natural waterfall are located on an eastern parcel, as is a cinnabar shaft mine at the northeastern corner of the ranch; the westernmost parcel has a stable complex which continues to provide boarding and riding facilities for guests of the resort. (See aerial overview (Photo 1), 1892 lithograph (Photo 2), and 1895 overview (Photo 3)).

The complex of structures and buildings which remain represent each of the major periods of development and almost every facet of life at Vichy Springs Resort. From the earliest period, that of Day's Soda Springs, 1854 to 1867, the Rock Cabin (the earliest building on the property), the Red Cabin, Myrtle Cabin, and both the Vichy and Ardeche bath houses are intact. All but one was originally sided with redwood board and batten and built in the vernacular Homestead style using square nails.

From the Doolan period, 1867 to 1897, only the 1875 Hotel has been lost. (This was more accurately a tavern, since it did not contain rooms for guests' lodging.) Long Row and Short Row, circa 1875, provide excellent examples of the architecture of the resort during this period. The vernacular Greek Revival or Homestead style, the redwood shiplap siding, and the appearance of square nails date and typify these buildings.

From 1897 until 1948, the resort was owned by the Redemeyer family. The structures built by these owners - the Plunge, Water Tank, and falls dam - were constructed in 1905. In 1914, leaseholder Bob Jones made major additions - the New Cabins, the Tent Houses, the Bowling Alley, Club House, and Garage. The bowling alley has survived; remodelled by lease-holder Bob Salsburger in 1936, it was restored to its original appearance by the current owner in 1987. Most cabins were demolished during the Erickson period, 1948 - 1979, when three of the earlier buildings were resided in stucco. The current owners have restored or rehabilitated most

August 26, 1988

Mr. and Mrs. Gilbert Ashoff
2605 Vichy Springs Road
Ukiah, CA 95482

Dear Mr. and Mrs. Ashoff:

The State Historical Resources Commission sitting in regular session in Santa Ana on August 5, 1988 considered the application for the registration of the Ukiah Vichy Springs Resort, Mendocino County. You will be pleased to know that the Commission recommended registration of this landmark. Landmark No. 980 has been assigned to this site.

The Commission also recommended allocation of an official bronze plaque for the Resort. Upon receipt of your suggested text, sponsoring organizations, dedication date, and shipping instructions, I will be pleased to order the plaque. Please allow eight weeks for casting of the plaque in addition to the length of time for corresponding about the wording.

Thank you very much for your continued interest in our State Landmark Program.

Sincerely,

Sandra J. Elder
Assistant Executive Secretary

March 16, 1989

Mr. David Koppel
Division of Environmental Health
County of Mendocino
Courthouse
Ukiah, California 95482

Dear Mr. Koppel:

I am writing to express my concern that the City of Ukiah's Draft Application for Solid Waste Disposal Site Permit appears to ignore the cultural resource protection requirements of the National Historic Preservation Act, the National Environmental Protection Act, and the California Environmental Quality Act.

The application, County Solid Waste Management Plan, supporting permits and communications fails even to mention the existence of a recognized historic landmark which will be impacted by the proposed site. To date no environmental assessment meeting either CEQA or NEPA requirements for EIS and EIR has considered the direct and immediate or indirect and long-term impact of the project on the surface or subsurface cultural resources directly South of the project boundaries.

Ukiah Vichy Springs is both a Mendocino County and a California State Historic Landmark. When proposed for landmark status, the existing landfill operation was identified as a threat to the historic resource. The proposed expansion of that operation would, I believe, be an even more serious threat - both to the resort and to the unique spring waters of Ukiah Vichy. This threat is not identified, project alternatives which would mitigate the threat to this cultural resource are neither identified nor discussed, and the preferred project alternative would cause irreparable damage both to the buildings at the resort and to the subsurface springs upon which the resort's 135 year history of continuous operation is based.

Sincerely,

Dennis E. Harris

Dr. Dennis E. Harris
Professor of History

Mr. Chuck Rough
City Manager
City of Ukiah
300 Seminary Way
Ukiah, CA 95482

Dear Mr. Rough:

VICHY SPRINGS
CALIFORNIA LANDMARK NUMBER 980

Governor Wilson's Executive Order W-26-92, of last April once again confirms the importance the people of California place on the protection of their historic resources. This importance was earlier manifested in mandates of the California Environmental Quality Act (CEQA), to fully and fairly evaluate the consequences of actions which have the potential for adverse effect on our natural or cultural heritage.

There is well-founded concern for the potential contamination and irretrievable loss of the mineral waters of Vichy Springs, by the continuing - and expanded - use of the dumpsite infringing upon it. Additionally, it is reported that methane emissions from the dumpsite are already contaminating neighboring properties.

This letter serves as a formal request that the City of Ukiah, in consultation with all the control and regulatory agencies related to this dumpsite, provide a comprehensive environmental assessment of both existing and proposed dump operations vis-a-vis the full spectrum of potential effects, with particular emphasis on air quality, ground water quality, noise, odor, fire hazard and the continued viability of an important California Landmark whose existence predates humanity itself.

Sincerely,

Robert E. Mackensen
Executive Director

March 3, 1993

Mr. Chuck Rough
City Manager
City of Ukiah
300 Seminary Way
Ukiah, CA 95482

Dear Mr. Rough:

VICHY SPRINGS - CALIFORNIA LANDMARK NUMBER 980

This is a follow-up to the letter (enclosed) sent to you on August 5th, from the State Historical Building Safety Board (SHBSB), and copied to the Office of Historic Preservation. That office shares the Board's concern over not only the potential loss of the historic resort which has been in existence since 1854, but also the irretrievable ruin, by contamination, of the prehistoric springs themselves - naturally carbonated, thermal mineral springs unique in North America.

California Landmark status is granted only to cultural resources of the very highest significance, and as such, their protection is of paramount importance to both present and future generations of Californians. These resources are protected, as you know, by the California Environmental Quality Act (CEQA), which requires serious, good-faith efforts to find alternatives to actions which will adversely affect cultural resources.

In recognition of the foregoing, any proposal or permit for either the continued or expanded use of the encroaching dumpsite, must include a comprehensive assessment of the very real threat such action poses to this major natural and cultural resource. Such assessment must address the effect of continued or expanded dumpsite use on the viability of Vichy Springs, as to water quality, the spring's natural setting, and its capacity to operate as a tourist destination, continuing a century-and-a-half historic legacy which is rich with the names of world-renowned individuals.

It must be understood that the threat of contamination of the water is but one of a number of very legitimate concerns. The already existing and continually worsening negative impact of the sight, the smell and the sounds of the dumpsite operation on this landmark resort must be addressed. It is painfully evident that, if the dump were owned and operated by the private sector, and the resort operated by the public sector, the kind of tolerance of damage to neighbors being exhibited by officialdom would not exist. It is a betrayal of the public trust for Government to ignore the rules it imposes on its citizens.

Please provide this office with documentation appropriate to the above noted CEQA mandates. If you have any questions or require further information, please contact the undersigned.

Finally, please be certain that all parties involved recognize the magnitude of the liability associated with the loss of this irreplaceable natural and cultural resource.

Sincerely,

Robert E. Mackensen, AIA
Executive Director

May 28, 1993

Mr. Chuck Rough
City Manager
City of Ukiah
300 Seminary Way
Ukiah, CA 95482

Dear Mr. Rough:

VICHY SPRINGS
CALIFORNIA LANDMARK NUMBER 980

Thank you for your letter of March 15, 1993. Your assurances of compliance with both the letter and the spirit of the California Environmental Quality Act are most welcome.

The State Historical Building Safety Board's concern for Vichy Springs grows from both Governor Wilson's Executive Order W-26-92, of last April, and the mandates of the California Environmental Quality Act, both of which were referenced in my first letter (8-5-92). While they both confirm the importance the people of California place on the protection of their historic resources, The Executive Order cites the State Historic Building Code and its Board as resources through which each state agency "is directed...

> "3) to ensure that the protection of significant heritage resources are given full consideration in all of its land use and capital outlay decisions; and
>
> "4) in consultation with the California State Office of Historic Preservation, to institute procedures to ensure that state plans and programs contribute to the preservation and enhancement of significant non-state owned heritage resources."

The State Historical Building Safety Board (SHBSB) was consulted by the Office of Historic Preservation, in an effort to enlist the Board's significant expertise in achieving reasonable solutions that insure the viability of historic resources. The SHBSB, recognizing that local agencies have lead authority, but that State agencies control the permitting process, is alerting all parties to the severity of the damage being inflicted on this California Landmark, and of their obligation to take action which will protect rather than destroy it.

Finally, the Board recognizes that pursuing the "letter of the law" is frequently a time-consuming process. However the spirit of the heritage

protection mandates of CEQA are manifestly clear; yet since the date of your letter, continued operations, which exacerbate the negative impacts highlighted on the enclosed CEQA Appendix, are contradicting your letter's stated intent "to fully comply with the letter and spirit of CEQA. Both the Board and the Office of Historic Preservation are concerned over the mounting evidence that the existing, ongoing operations are doing irreparable harm to this Landmark; and thus, like arson or "demolition by neglect", will render moot any deliberations over its preservation. It is urgent that we have your guarantees to the contrary.

If you have any questions or require more information, please do not hesitate to contact either the Office of Historic Preservation, 916-653-6624, or the Board.

Sincerely,

Robert E. Mackensen, AIA
Executive Director

EXECUTIVE DEPARTMENT
STATE OF CALIFORNIA

EXECUTIVE ORDER W-26-92

WHEREAS, the preservation and wise use of California's cultural and historic resources are of importance to the people of this state; and

WHEREAS, these cultural and historic resources, hereinafter referred to as "heritage resources," include artifacts, sites, building, structures, districts, and objects with historical, architectural, archaeological, and cultural significance; and

WHEREAS, these heritage resources provide not only continuity with our past, but foster community pride, stimulate economic activity, improve housing, enhance the quality of life and, along with California's unique natural resources, draw hundreds of thousands of visitors to California every year; and

WHEREAS, due to their location, age, and the construction materials used, many of our important historic buildings and historic sites may be at risk from deterioration, destruction, and natural disasters; and

WHEREAS, an assessment of the extent of our heritage resources is needed in order to ensure their recognition and adequate protection in the future; and

WHEREAS, the preservation and wise use of historic resources must include consideration of cost-effectiveness and fostering private sector incentives, and state agencies must consider these and other public interests in their decision-making processes;

NOW, THEREFORE, I, PETE WILSON, Governor of the State of California, by virtue of the power and authority vested in me by the Constitution and the statutes of the State of California, do hereby issue this order to become effective immediately, and do hereby direct all agencies of the Executive Branch of state government as follows:

Section 1. In furtherance of the purposes and policies of the State's environmental protection laws, including but not limited to the California Environmental quality Act, Public Resources Code Section 21000 et seq., the State Historic Building Code, Health and Safety Code Section 18950 et seq., and the historic resources preservation laws, Public Resources Code Section 5020 et seq., all state agencies shall recognize and, to the extent prudent and feasible within existing budget and personnel resources, preserve and maintain the significant heritage resources of the State. In accordance with these statutes, each state agency is directed:

1) to administer the cultural and historic properties under its control in a spirit of stewardship and trusteeship for future generations; and

2) to initiate measures necessary to direct its policies, plans, and programs in such a way that state-owned sites, structures, and objects of historical, architectural, or archaeological significance are preserved, restored, and maintained for the inspiration and benefit of the people; and

3) to ensure that the protection of significant heritage resources are given full consideration in all of its land use and capital outlay decisions; and

4) in consultation with the California State Office of Historic Preservation, to institute procedures to ensure that state plans and programs contribute to the preservation and enhancement of significant non-state owned heritage resources.

Section 2. Each state agency shall designate from among its current staff a key official (Agency Preservation Officer) whose responsibility will be to ensure that the State's policies regarding the protection of cultural and historic resources within the jurisdiction of such state agency are carried out.

Section 3. Under the direction of its Agency Preservation Officer, in consultation with the State Historic Preservation Officer, and in consultation as appropriate with the State Historical Building Safety Board, each agency shall, by January 1994, develop and institute feasible and prudent policies and a management plan to preserve and maintain its significant heritage resources.

(a) Inventories pursuant to Section 5024 are to be completed or updated by January 1995, or as soon thereafter as feasible as specified in a Memorandum of Understanding with the State Historic Preservation Officer. Inventory preparation shall take into account the kind, quantity, location of, and development risk to properties within the ownership and control of the agency.

(b) Heritage resources management plans and policies shall be reviewed periodically and revised as appropriate in consultation with the State Office of Historic Preservation.

(c) For purposes of developing management plans and policies under this order, resources which meet the following criteria shall be considered significant heritage resources:

(1) listed in or potentially eligible for inclusion in the National Register of Historic Places; or

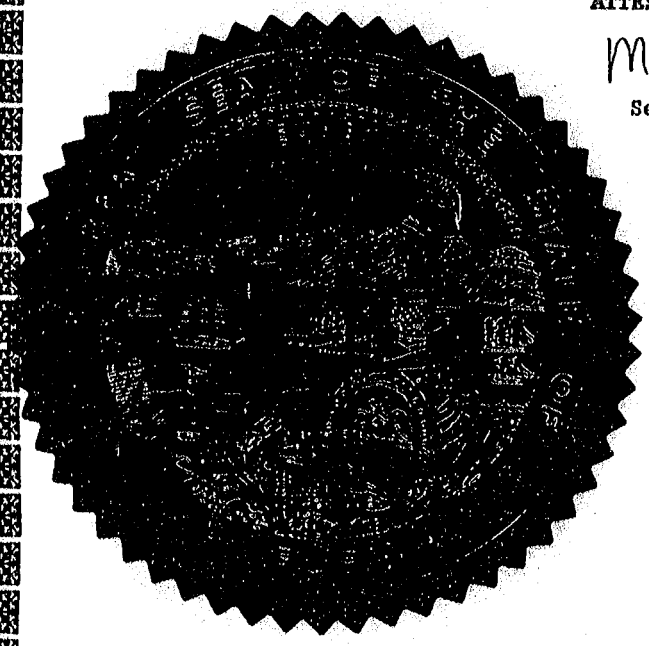
(2) registered or eligible for registration as a state historical landmark or point of historical interest; or

(3) registered or eligible for listing in a California Register of Historical Resources in accordance with procedures and criteria developed by the State Historical Resources Commission.

Section 4. The State Historic Preservation Officer and the State Office of Historic Preservation shall provide leadership to and shall coordinate the efforts of State agencies in implementing their stewardship obligations with regard to historic resources, including, but not limited to, the requirements of Public Resources Code Sections 5020, et seq.

Section 5. Each state agency shall report to the State Office of Historic Preservation annually its progress in completing inventories, management plans, and policies pursuant to this order.

Section 6. The Resources Agency and the Office of Planning and Research shall provide guidance concerning the application of the California Environmental Quality Act (CEQA) and the state's CEQA regulations in order to provide for the consistent protection and preservation of the heritage resources of California.



The provisions of Section 21080(b)(3) and (4) of the Public Resources Code shall not be construed or applied to exempt from review projects to alter significant historic resources except to the extent that the condition of the historic structures or resources poses an emergency as defined by Section 21060.3 of the Public Resources Code. The historic value of structures is to be preserved and enhanced, unless the state or local agency finds the structure presents an imminent threat of harm to the public or of damage to adjacent property.

IN WITNESS WHEREOF I have hereunto set my hand and caused the Great Seal of the State of California to be affixed this 8th day of April 1992.

Governor of California

ATTEST:

Secretary of State

Appendix G

SIGNIFICANT EFFECTS

A project will normally have a significant effect on the environment if it will:

(a) Conflict with adopted environmental plans and goals of the community where it is located;

(b) Have a substantial, demonstrable negative aesthetic effect;

(c) Substantially affect a rare or endangered species of animal or plant or the habitat of the species;

(d) Interfere substantially with the movement of any resident or migratory fish or wildlife species;

(e) Breach published national, state, or local standards relating to solid waste or litter control;

(f) Substantially degrade water quality;

(g) Contaminate a public water supply;

(h) Substantially degrade or deplete ground water resources;

(i) Interfere substantially with ground water recharge;

(j) Disrupt or adversely affect a prehistoric or historic archaeological site or a property of historic or cultural significance to a community or ethnic or social group; or a paleontological site except as a part of a scientific study;

(k) Induce substantial growth or concentration of population;

(l) Cause an increase in traffic which is substantial in relation to the existing traffic load and capacity of the street system;

(m) Displace a large number of people;

(n) Encourage activities which result in the use of large amounts of fuel, water, or energy;

(o) Use fuel, water, or energy in a wasteful manner;

(p) Increase substantially the ambient noise levels for adjoining areas;

(q) Cause substantial flooding, erosion or siltation;

(r) Expose people or structures to major geologic hazards;

(s) Extend a sewer trunk line with capacity to serve new development;

(t) Substantially diminish habitat for fish, wildlife or plants;

(u) Disrupt or divide the physical arrangement of an established community;

(v) Create a potential public health hazard or involve the use, production or disposal of materials which pose a hazard to people or animal or plant populations in the area affected;

(w) Conflict with established recreational, educational, religious or scientific uses of the area;

(x) Violate any ambient air quality standard, contribute substantially to an existing or projected air quality violation, or expose sensitive receptors to substantial pollutant concentrations;

(y) Convert prime agricultural land to non-agricultural use or impair the agricultural productivity of prime agricultural land;

(z) Interfere with emergency response plans or emergency evacuation plans.

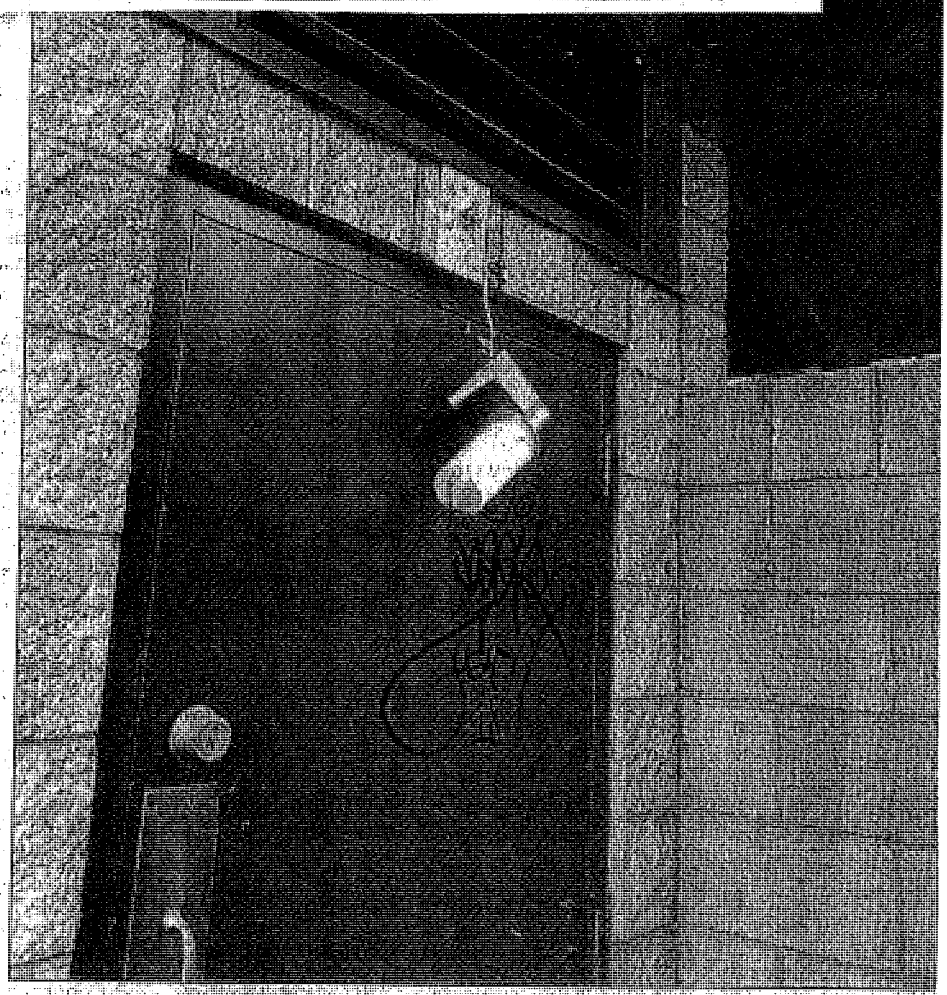
CRIME

Vandalism continues at Lake Mendocino



By Curtis Driscoll
cdriscoll@willitsnews.com

Vandalism at Lake Mendocino's recreational facilities continues to be a problem, and multiple recreational facilities at the park are in danger of being closed for an extended period if the problem can't be solved. Supervisory Park Ranger at Lake Mendocino Poppy Lozoff says that the vandalism ranges from raw sewage being dumped on Inlet Road to light fixtures being broken and removed at the locked North Boat Ramp restrooms.

Lozoff said that they closed Bushay Campground for the season because of excessive garbage dumped in sites and vandalism to the storage compound, cutting of locks, and off-roading through recreation areas. The Overlook restrooms on the south end of the lake are also in danger of being closed due to repeated graffiti, and janitorial contractors and ranger staff have repeatedly covered up graffiti only to have it return the next day.

The Kaweyo Horse Staging Area is available on the south end of the

VANDALISM » PAGE 2

CONTRIBUTED

A photo of one of the vandalized bathrooms at Lake Mendocino recreational facilities.

Vandalism

FROM PAGE 1

lake for access to the trails on the east side of the lake.

Because most of the vandalism seems to be happening in the early morning, staff said it's hard to say who is doing it. During the winter months they often shut down parts of the area, but they are considering closing down areas for an extended period if the vandalism continues.

"We would think about longer-term closures for areas, especially the ones with high vandalism like the overlook including the bathroom facilities and possibly even the gates, so people have to walk a little way to get in there," Lozoff said.

To deter vandalism, they have rangers working different hours checking on the grounds, and they also are working with the Sheriff's Office. They also remove the graffiti as soon as possible to deter future efforts.

Lozoff says they have received angry complaints from people online and in person that the campground and facilities around the campground are closed for recreation and were opened up to fire survivors. Lozoff said that if vandalism to the recreation facilities on the north end of the lake is because of the closures around Kyen Campground, it will not result in the opening of facilities. Part of the Army Corps' mission is to help with emergency response, and opening the campground to the fire survivors is a part of that.

She says they thought about having a community meeting at some point for people interested in finding a solution. However, a lot of the feedback they get is negative, and they worry the meeting would be counterproductive. Despite the problems, they hope that they can figure out a way to solve the problem so that they can keep it open to the public.

"It's definitely a cherished resource by the local community and by the people who work here, and we really want to maintain it and have access for everybody," Lozoff said.

The rangers ask that anyone who sees vandalism contact park headquarters at (707) 467-4200. They do not have designated front office staff, so there may be a small delay in returning phone calls, but they do appreciate reports on suspicious activity.

M E M O R A N D U M

TO: Honorable Mayor and City Council Members
FROM: David J. Rapport, City Attorney
DATE: May 19, 2020
SUBJECT: Agenda item 11.a - Hearing on Consideration and Possible Adoption of Resolution Certifying EIR for Landfill Closure and Post-Closure Maintenance Plan and Approval of Plan.

On Friday afternoon (May 15) Vichy Springs Resort, Russian Riverkeeper and Matee Environmental Justice Foundation filed a 41 page document, not counting attachments, entitled: CEQA Non-Compliance For City Of Ukiah's Final Environmental Impact Report (FEIR) For Landfill Closure Plan ("Vichy Opposition"), which attaches an opinion letter from a Licensed Engineer and an article from the Department of Physical Geography at Stockholm University and other materials.

The Vichy Opposition raises for the first time its claims that the use of the ClosureTurf geomembrane system in the closure of the landfill pose risks in a wildfire, including the potential release of toxic chemicals and adverse water quality impacts that were not addressed in the draft EIR.

The CEQA procedures allow them to raise these issues at the upcoming hearing, even though Russian Riverkeepers and Matee Environmental Justice Foundation did not submit comments on the draft EIR or otherwise participate during the preparation of the EIR and these issues were not raised during the public comment period on the draft EIR.[1]Without commenting on the merits of these claims, the City staff recommends delaying further action on certification of the EIR until the City can assess these claimed impacts and determine what, if any, additional environmental review should be done before a final EIR is certified for this project.

[1] In its comments on the draft EIR the North Coast Regional Water Quality Control Board wanted assurance that the City would have insurance or other financial resources to replace the geomembrane, if it were destroyed in a wild fire, but it did not raise the issue of the membrane's potential toxicity or any adverse water quality impacts.

For these reasons, City staff recommends against commencing the public hearing on item 11.a and continuing the matter to a future date to be determined.

subject Memorandum in Response to Comments on the Environmental Impact Report for the City of Ukiah Landfill Closure Plan

ESA has prepared this memorandum in connection with the Environmental Impact Report (EIR) for the proposed closure plan for the inactive City of Ukiah landfill located at 3100 Vichy Springs Road. The landfill operated between 1955 and 2001. Several permanent closure scenarios have been considered over the years, the latest of which is the subject of this EIR.[1] As proposed in the 2019 Final Closure and Postclosure Maintenance Plan,[2] the landfill would be capped with a specialized tufted geotextile. Per applicable regulations, the plan would also incorporate a number of other features, such as a post-closure maintenance plan and a monitoring plan.

This memorandum specifically addresses challenges to the EIR that were raised in a submittal made by attorneys representing the Vichy Springs Resort, Russian Riverkeeper, and the Mateel Environmental Justice Foundation, herein after collectively referred to as the "Petitioner." On May 15, 2020, the Petitioner submitted comments to the City in the form of a preemptory petition outlining a series of alleged deficiencies with the EIR. This memorandum summarizes those comments, where appropriate, and responds to the points identified in the petition.

1 SMB Environmental. 2020. *Final Environmental Impact Report, City of Ukiah's Landfill Closure Project.* March 2020.
2 EBA. 2019. *Final Closure and Postclosure Maintenance Plan for City of Ukiah Landfill, Mendocino County, California.* April 2019.

I. The Petitioner Alleges that the EIR Fails to Evaluate the Fire Hazards and Fire Risks of the Proposed Project

A. The Petitioner alleges that the proposed landfill cover is highly flammable.

The allegation that the proposed landfill cover is "particularly flammable," as stated in the Petitioner's comment, is not supported by evidence.

The synthetic tufted geotextile proposed for use as a cover of the landfill is referred to as the ClosureTurf® Final Cover System, manufactured by Watershed Geosynthetics.[3] ClosureTurf consists of a structured membrane with studs to prevent slippage (referred to as Super Gripnet or SGN), an engineered turf to resemble grass, and sand infill to protect the engineered turf and underlying componenets.[4] From top to bottom, the system consists of the following components:

- Minimum 5/8-inch-thick sand infill layer.
- Specialized tufted geotextile (Engineered Turf)
- 50 mil linear low-density polyethylene (LLDPE) geomembrane liner (Super Gripnet® with Spike Down) (collectively, the structured membrane)
- Minimum 2-foot-thick soil foundation layer

The materials were tested per the standards prescribed under American Society for Testing and Materials (ASTM) Test Method E108, Standard Test Methods for Fire Tests of Roof Coverings, the results of which are attached hereto as **Attachment A**.[5] ASTM E108 is a standardized test for roof coverings that measures the surface spread of flame and the ability of the roof covering material or system to resist fire penetration from the exterior to the underside of a roof deck under the conditions of exposure. This test method also provides criteria to determine if the roof covering material will develop flying burning material, identified as flying brands, when subjected to a 12 mile per hour wind during the simulated fire exposure tests. The materials are subjected to various degrees of fire severity, described as Class A, B, and C fire resistance. Class A tests are applicable to roof coverings that are expected to be effective against severe fire exposure, afford a high degree of fire protection to the roof deck, not slip from position, and not be expected to present a flying brand hazard. Class C tests are applicable to roof coverings that are effective against light fire exposure, afford a light degree of fire protection to the roof deck, do not slip from position, and are not expected to present a flying brand hazard. The test method places a fire source directly on the material, simulating burning materials (such as a burning tree, flying embers, or a burning portion of a house) falling directly onto the materials being tested.

In the test, the Class A and B tests burned away the turf blades under the direct fire; the turf blades under the Class C burn area were melted. The Class A and C tests melted the blades up to 6 inches (Class A) to 4 inches (Class C) from the fire; turf beyond these distances were not affected. The turf adjacent to the fire areas did not ignite, self-propagate, or spread fire. In all

[3] To date, the system has been approved for use and has been installed at four California locations, including landfills in Contra Costa, Monterey, Plumas, and San Bernardino Counties.

[4] Watershed Geosynthetics. 2020. Product Data.

[5] Richgels Environmental Services. 2020. *ClosureTurf Fire Test CT and CT-HD.* June 15, 2020.

cases, the fire did not burn through the structured membrane. The membrane and turf blades did not ignite or self-propagate fire away from the flame source. In other words, when the proposed synthetic landfill cover is exposed to fire, the fire is limited to the immediate location of the fire source; the fire does not spread by burning the synthetic landfill cover materials. The testing concluded that the proposed landfill cover demonstrates performance results that would qualify it as Class C fire resistant. Based on this information, there is no basis to the Petitioner's allegations that the landfill cover would constitute a fire hazard or spread fire to adjoining areas if it were to be exposed to sources of ignition. Natural grass cover, on the other hand, is easily ignited and carries fire readily. In this respect, the proposed landfill cover would result in an improved condition when compared with the existing natural vegetation that currently covers the landfill, or the Compacted Clay/Natural Cover Alternative advocated by the Petitioner. This assertion is supported by expert opinion provided by the City of Ukiah Fire Chief (**Attachment B**), with his opinion based on 36 years of firefighting experience and education, with more than 25 years of that time spent as a Strike Team Leader and Type 4 Incident Commander for wildland fires.

The Petitioner provided an opinion letter prepared by a consultant[6] who reviewed the product data sheets provided by Watershed Geosynthetics.[7] However, the consultant makes the expansive assertion that "polyethylene is a combustible substance which in contact with flame ignites and burns until exhausting." The consultant apparently did not review the above-described ASTM E108 fire test results, which indicated that the polyethylene tufted grass only burns under severe fire conditions and only at the immediate location of the flame source. This limited effect would not have the potential to impact the residences located within 2,000 feet of the landfill cover, as implied by the consultant.

The Petitioner's consultant provided Material Safety Data Sheets (MSDSs) for an unrelated artificial turf product and high-density polyethylene (HDPE) in its raw form. The consultant used these MSDSs, which are not actually representative of the ClosureTurf product, to selectively present information. For example, as previously noted, the consultant quoted "burns until exhausting" without providing the full context, precisely repeated below:

> ***Ignition conditions:*** *Polyethylene is a combustible substance but under normal housekeeping conditions there is no risk of ignition. It [does] not easily ignite but in contact with a flame it becomes soft, flows, ignites and burns until exhausting (if it isn't stabilized with a flame retardant agent). In foil form ignites easily. Static electricity may accumulate during handling/storage, and in certain conditions may constitute an ignition source in case a high dust concentration exists.*

As stated in the MSDS, while polyethylene is combustible, it does not ignite easily and "burns until exhausting" "in contact with a flame." This response to fire was verified by the previously described ASTM E108 tests, which indicate the polyethylene material will not burn beyond the immediate flame source.

---

6 Pangea Environmental Services, 2020, *Opinions, Vichy Springs Resort v. City of Ukiah Public Works and City of Ukiah City Council*, May 13, 2020.

7 Watershed Geosynthetics, 2020, Product Data.

Further countering the Petitioner's claim of extreme flammability of the ClosureTurf product are the actual MSDSs for the product, attached hereto as **Attachment C**. One MSDS notes that the "material is non-combustible and is not expected to pose a fire or explosion hazard," while the other states that 'the material is not flammable or combustible."

Based on each of these considerations, the Petitioner's assertion that the proposed landfill cover would be highly flammable, or that it would propagate fire to surrounding areas, is in no way supported.

B. The Petitioner alleges that, if burned, the proposed landfill cover would emit airborne toxins.

As discussed above in Response I.A., the proposed landfill cover has a low flammability rating. When exposed to fire, fire is limited to the immediate location of the fire source and does not spread. As a result, the likelihood of the proposed landfill cover burning in quantities sufficient to create widespread emissions of airborne toxins is not supported, and the potential for emission of airborne toxins, if any, is insubstantial.

II. The Petitioner Alleges that the Proposed Landfill Cover Would Deteriorate and Release Microplastics and Perfluoroalky and Polyfluoroalkyl Substances (PFAS) into Surface Waters.

The tensile strength of the turf fiber was tested using ASTM G147, *Standard Practice for Conditioning and Handling of Nonmetallic Materials for Natural and Artificial Weathering Tests*. The ASTM G147 test exposes the tested material to an ultraviolet (UV) radiation source at a 45-degree angle pointing south, and then quantifies the percent of degradation that is projected to occur over various time durations. The results indicate that the turf fiber is projected to retain 75 percent of its original tensile strength[8] after 30 years and over 60 percent after 100 years. This indicates a slow rate of degradation, which would also mean that the amount of microplastics generated over the years would be anticipated to be negligible. In addition, and as described above, a sand infill layer would be placed on the tufted blades and then worked in the blades. The sand would serve to reduce the exposure of the lower portions of the blades to UV radiation, thus further reducing the blade degradation and extending the service life of the product. Note that the underlying structural membrane is not exposed to any sunlight and its associated UV radiation.

It should further be noted that the Stockholm University master's thesis paper[9] presented in the Petitioner's comments on this issue evaluated a very different product from the proposed landfill cover. The paper also evaluated very different uses for those products than that proposed for the landfill cover. First, the artificial turfs that were analyzed in the paper were presumably of much lower quality and predicted durability than that of the proposed landfill cover, since their life spans were estimated at 8 to 15 years. In comparison, the lifespan of the proposed landfill covering has been predicted to be 100 years or more, based on laboratory tests. Second, rubber granulates were used as the filler material for the artificial turfs in the study, and those rubber

8 Tensile strength is the resistance of a material to breaking under tension. It is not an indicator of material degradation or production of microplastics.

9 Li, Ran. 2019. *Tracking Microplastics from Artificial Football Fields to Stormwater Systems*. Master's Thesis in Environmental Management and Physical Planning. Department of Physical Geography, Stockholm University.

granulates were the greatest contributing element of microplastics in samples gathered as part of the study. The proposed landfill cover, on the other hand, would use sand as its filler, not rubber granulates. Third, the artificial turfs in the study were in regular use on sports fields in an active application, where they were subjected to regular abrasion during sports activities and other events, and were also subjected to abrasion by snowplows and other mechanical equipment during snow removal. None of these activities would occur as part of the proposed landfill cover's use, since the cover would be installed in a fully passive application, and would not be subject to any sort of abrasive activity. In short, while superficially similar, the products assessed in the Stockholm study and the proposed landfill cover are vastly different, and are not comparable. Based on each of these considerations, the Stockholm study's results are not a reasonable predictor of what could be expected with the proposed landfill cover.

Finally, the following statement is presented in the conclusion of the Stockholm paper:

> *Microplastics are difficult to be separated from stormwater samples. Further development of a method for separation of microplastics is necessary for quantitative studies in the future, because the approach developed here includes subjective evaluations that should be avoided.*

The paper concludes that the evaluation and results of the study were subjective since microplastics could not be reliably and objectively identified and separated from soil and other organic particles in stormwater. Ultimately, the Stockholm study presents no quantifiably defensible measure of microplastics production from the studied sports fields. The paper does not represent objective, quantified, and repeatable scientific evidence of microplastic release from artificial turf, and therefore cannot be relied upon to support any conclusions related to the proposed landfill cover.

The Petitioner has also provided several references throughout the comment letter to perfluoroalky and polyfluoroalkyl substances (PFAS), with implied adverse implications to water quality. This allegation, however, does not apply to the Proposed Project, as the polyethylene used in the proposed landfill cover materials does not contain PFAS (see **Attachment D**).[10,11] The Petitioner's position is not supported.

III. The Petitioner Alleges that the EIR Failed to Evaluate a Reasonable Range of Alternatives

A. The Petitioner alleges that the finding of infeasibility of a permanent clay/earthen landfill cover was not supported by sufficient evidence.

As stated in the revised EIR Alternatives chapter on pages 4-22 through 4-39 of the Final EIR, the Compacted Clay/Natural Cover Alternative has not been rejected on the basis of infeasibility, but rather because it presents a number of operational and environmental disadvantages when compared to the Proposed Project. These disadvantages are articulated on page 4-30 of the Final EIR in Section 4.4.2. The disadvantages to the Compacted Clay/Natural Cover Alternative are

10 Chevron Phillips. 2019. *Letter stating the polyethylene provided for the synthetic bladed turf does not contain PFAs.* January 7, 2019.

11 Shaw. 2020. *Shaw PFAs Statement, ClosureTurf Products.* May 18, 2019.

not trivial in nature, and include constraints and heightened impacts related to slope instability, erosion and resultant water quality impacts, enhanced wildfire risk, and increased air quality and noise emissions from importation of cover materials. The Compacted Clay/Natural Cover Alternative provides no operational or environmental advantages over the Proposed Project.

B. The Petitioner alleges that adequate alternatives were not provided to deal with construction noise impacts to nearby receptors, which the Petitioner asserts are potentially significant.

The EIR determined that there would be no significant impacts from construction noise, thus negating the need for an alternative that would potentially lessen construction noise impacts. The EIR's finding of a less-than-significant construction noise impact was supported by substantial evidence, particularly as relates to the level of noise impacts that could be experienced by the Petitioner. As noted on page 3.8-2 of the Draft EIR, the nearest sensitive receptor to the site is approximately 600 feet from the nearest area of proposed construction activities, and the construction area and the sensitive receptor are separated by an intervening ridge. Most construction activities would occur at an even greater distance from the sensitive receptor, at distances greater than 1,000 feet. As shown in Table 3.8-3 of the Draft EIR, at this distance the noise from construction equipment would be well below the County's noise standards and also below land use noise compatibility standards, even when measured in a straight line, without the intervening ridge providing additional sound abatement. Other public areas on the Vichy Springs Resort property, such as the Resort's hiking trails, would be even further away from the noise sources, and the noise impacts would thus be even less in those areas. The Project would also comply with the City's Noise Ordinance, which allows operation of construction equipment between 7:00 a.m. and 7:00 p.m. Based on each of these considerations, there would be no significant impact from construction noise that would require consideration of an alternative to lessen that impact.

C. The Petitioner alleges that the range of alternatives evaluated in the EIR does not meet the requirements of CEQA.

The principal purpose of an EIR's alternatives analysis is to consider alternatives that would feasibly attain most of the basic objectives of a proposed project while avoiding or substantially lessening the identified significant effects of the project as proposed (CEQA Guidelines Section 15126.6). As conveyed in both the Draft EIR and the Final EIR, the Proposed Project would result in no significant effects that could not be effectively mitigated to a level of less-than-significant. Therefore, since there would be no significant effects remaining after implementation of prescribed mitigation measures, the requirement to identify potential alternatives to the Proposed Project is limited. Nevertheless, in addition to the No Project Alternative, and at the request of the Petitioner, a Compacted Clay/Natural Cover Alternative was evaluated in the Final EIR. Per the requirements of CEQA Guidelines Section 15126.6(d), alternatives are not required to be evaluated to the same level of detail as the Proposed Project. As noted in Table 4-1 of the Final EIR, the Compacted Clay/Natural Cover Alternative would not meet the Project objectives as well as the Proposed Project. In addition, the Compacted Clay/Natural Cover Alternative would result in a greater level of impact for a number of issues, including air quality, biological resources, cultural resources, geology, soils, and seismicity, greenhouse gas emissions, hydrology and water quality, and noise.

In summary, the City has responded to the Petitioner's request that the Compacted Clay/Natural Cover Alternative be analyzed in the EIR. Beyond that, it is unclear what other additional alternatives the Petitioner contends should be evaluated, nor is it clear why additional alternatives should even be considered, based on the Proposed Project's demonstrated lack of significant environmental effects.

IV. The Petitioner Alleges that the EIR did not Provide an Accurate and Complete Project Description

A. The Petitioner alleges that the EIR's Project Description did not provide information or consider the replacement of the proposed landfill cover.

The principal purpose of the Final Closure and Postclosure Maintenance Plan, which is the subject of the EIR, is to devise a plan to maintain the landfill until the buried waste is considered to have become inert and no longer capable of generating leachate with chemicals above regulatory standards. During this time, the landfill would be capped to prevent rainwater from leaching through the buried waste and generating leachate that could then contaminate groundwater and surface waters. Per the proposed plan, the postclosure maintenance period will be 30 years, during which time continued monitoring will occur to determine if any leaching is occurring, and if that leachate exceeds regulatory standards. At the end of that time, if the landfill surface is stable, and if the leachate has become inert, then the landfill responsible party (i.e., the City) would apply to the North Coast Regional Water Quality Control Board to end monitoring and other maintenance activities. Otherwise, the monitoring, leachate control, and surface maintenance requirements would be required to continue under an extended permit.

The proposed landfill cover would remain in place during the entire postclosure maintenance period, and perhaps longer. The cover has a design of life of 100 years or more, as documented in standardized tests (see the Final Closure and Postclosure Maintenance Plan, included as Appendix A of the Draft EIR). If the maintenance period is extended beyond 30 years for the reasons outlined above, the cover would remain in place. Based on the timeframes involved, determining when and if the cover would need to be removed and replaced would require speculation, and would also require speculation as to the different technologies and regulatory environment that could be in place at that time. Based on these considerations, the Petitioner's claim that the cover would require removal and replacement before the end of the postclosure maintenance period or before the designed lifespan of the material has elapsed is also speculative.

B. The Petitioner alleges that the EIR's Project Description did not provide a comprehensive list of Responsible Agencies that would use the EIR for their own CEQA compliance requirements.

The Petitioner claims that the EIR did not identify the Mendocino County Environmental Health Department, CalRecycle, and the North Coast Regional Water Quality Control Board as agencies that would use the Project's EIR to make their own CEQA determinations. This is not accurate. Table 2-2 on page 2-17 of the Draft EIR provides a list of regulatory permits and other agency approvals that would be required to implement the Project. This list includes the three aforementioned agencies. Further, all three agencies received the Notice of Preparation and Draft EIR. In their role as Responsible Agencies, both the North Coast Regional Water Quality Control

Board and CalRecycle provided comments on the Draft EIR. The City is fully aware of the various permits and approvals it will be required to obtain as part of the project's implementation, and has articulated those requirements in the EIR.

V. The Petitioner Alleges that the EIR did not Provide an Accurate Description of Baseline Conditions.

A. The Petitioner alleges that the EIR did not disclose baseline conditions for fire risks and fire hazards.

As stated on page 1-7 of the Draft EIR, issues related to hazards, including fire risk, were scoped out in the Initial Study that was circulated in 2016 (see Draft EIR Appendix B). Page 49 of the Initial Study identified the site as within an area of high fire hazard. However, the Initial Study determined that the Project would not include any development that would subject either structures or occupants of the site to the potential for loss, injury, or death resulting from the potential for wildland fire. This remains the case, and, as stated previously in Responses I.A. and I.B., the proposed landfill cover is not subject to ignition or self-propagation of fire away from direct flame sources. In this respect, the proposed landfill cover would result in a beneficial impact when compared with the existing natural grass cover, which could easily ignite and carry fire.

B. The Petitioner alleges that the EIR did not disclose baseline conditions for aesthetics and scenic resources.

Section 3.1.2 of the Draft EIR, commencing on page 3.1-2, describes the existing visual setting of the Project site and surrounding areas. This description was supplemented in the Final EIR, beginning on page 4-11. The description notes that the landfill has been graded to form a series of flat terraces, which are currently covered with seasonal grasses. This description is very similar to the description of existing conditions which the Petitioner claims is missing from the Draft EIR's baseline description. As a result, it is unclear what additional information the Petitioner contends needs to be added. The information presented in the EIR describes the landfill for what it is – a landscape that has been formed into a series of terraces that are now covered with seasonal grasses.

Both the Draft EIR and the Final EIR also provide detailed descriptions of views of the landfill as observed from potential sensitive receptors, such as the Vichy Springs Resort property. The analysis showed views of the landfill site to be partial and distant. Photographs submitted by the Petitioner purportedly showing views of the landfill site also depict views of the landfill from the Vichy Springs property that are also distant and partial, at best. The submitted photographs showed partial views that were: 1) either a very far distance of over 2,000 feet; or 2) from the edge of the Resort's property lines adjacent to the landfill property, which are not the main areas visited or used by most, if not all, Vichy Springs Resort guests and hiking trail users. It must also be noted that the submitted photographs were clearly zoomed photographs that showed a very narrow field of view, which therefore exaggerated the effect of the views and distorted the much broader field of view that would be experienced by someone actually viewing the landfill from the distances at which the photographs were taken. Most importantly, all of the visual resources-

related comments submitted by the Petitioner overlook the fact that the landfill is located on the far side of an intervening ridge that separates the Resort from the landfill property, which means that the landfill site is impossible to see from most of the Resort's property, and from those few locations where it is visible, those views are partial and/or very distant. This is particularly true for those portions of the Resort with which the Petitioner has expressed the most concern, such as the Resort's guest areas and hiking trails.

With respect to the commenter's assertion that the landfill is a valuable scenic resource, this assertion is not supported. Whether viewed from near or afar, it is clearly a human-manipulated landscape, and its features and covering vegetation are neither unusual nor particularly noteworthy in a region where such features are abundant. The landfill does not enjoy any designated status as a scenic vista or a scenic area; it does not contain any noteworthy trees, rock outcroppings, or historic buildings; and it cannot be seen from any state scenic highway. In short, the Petitioner is attributing unusual or even spectacular visual characteristics to the site that it simply does not possess. While the landfill site is not particularly ugly or unpleasant to look at, it is unlikely that any reasonable observer would consider it a valued scenic resource. The EIR's description of the baseline visual conditions of the landfill site provides readers with an accurate overview of what the site actually looks like. The Petitioner's contrary assertion is not supported.

C. The Petitioner alleges that the EIR did not accurately disclose the presence of feral swine in the Project area and the effect those animals could have on the proposed landfill cover.

As per common practice, the EIR's discussion of biological resources focused on sensitive species and habitats, since those resources are a key concern under CEQA. Common and invasive species are typically not considered, except in situations where they are relevant to the evaluation of impacts. The Project EIR followed that practice. Feral swine are not protected or otherwise sensitive, so their presence was not noted in the EIR. Under existing conditions, feral swine and other animals can burrow or otherwise cause damage to the existing clay soil layer that covers the landfill. This is a common problem at all soil-covered landfills, where the covering soil layer provides habitat and feeding opportunities for burrowing or rooting animals. This can damage the existing clay soil layer, and thereby compromise the integrity of the protective barrier that covers the landfill and subject the underlying waste material to intrusion by rainwater.

The proposed landfill cover would eliminate this current condition by covering the landfill with a durable cover that would be substantially more resistant to wildlife activity than the existing soil cover. The proposed cover consists of two layers of 6 oz/yd^2 woven geotextile that serve as an additional cushion to protect the underlying geomembrane. When subjected to puncture tests conducted under ASTM D-6241, the proposed cover material provides a puncture resistance of 1,500 pounds. **Attachment E** provides the results of the tests performed on the product, as well as general information on the product's resistance to wildlife. Hydrostatic tests have also been conducted on the product and show that no punctures or holes were observed under a loading pressure of 85 pounds per square inch (psi). By comparison, the hooves of an adult bull elk weighing 1,200 pounds exert a ground contact pressure of only 16.7 psi. As such, the product's durability and resistance to breaching is several orders of magnitude greater than that required to prevent puncture by feral swine or other rooting or burrowing animals. Further, since there would be no accessible soil layer, there would also be no accessible habitat or food sources to attract

burrowing or rooting animals. In the unlikely event that damage was to occur to the material through rooting by feral swine or in some other manner, or through some management requirement to open the covering, the material is designed to be patched and repaired.

When combined with the demonstrated durability of the product, the proposed landfill cover would represent an improved condition to landfill integrity over what is present currently, or that which would be present under the Compacted Clay/Natural Cover Alternative that is preferred by the Petitioner. Soil landfill coverings are readily subject to burrowing wildlife, erosion, and other factors that can compromise landfill integrity. That is not the case with the proposed landfill cover. Based on each of these considerations, the Petitioner's allegation that the proposed landfill cover could be breached by feral swine or other wildlife is not supported.

D. The Petitioner alleges that the EIR did not accurately disclose the presence of historic resources in the Project area and the Proposed Project's effects on those resources.

The presence of historic resources in the vicinity of the Project area are disclosed in the Draft EIR, commencing on page 3.4-2. Of particular note, on page 3.4-5 of the Draft EIR, the Vichy Springs Resort is identified as a State Historic Landmark. Therefore, the Petitioner's assertion that the EIR did not identify the Resort as an historic resource is not accurate.

With respect to the Petitioner's claim that the Project would have an adverse effect on the Resort's status as a designated landmark, the EIR found that the Project would cause no physical impact to the Resort property. At most, the Petitioner relies on changes the Project would create in the vicinity of the designated landmark, such as the proposed landfill cover. Environmental impacts on a historic resource are addressed in CEQA Guidelines Section 15064.5. Under those regulations, when evaluating environmental impacts of a project on an historic resource, the key question is whether the project would cause a substantial adverse change in the significance of the resource, which "means physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of the historic resource would be significantly impaired." [CEQA Guidelines Section 15064.5(b)(1).] As stated in the Guidelines, the significance of an historical resource would be materially impaired when a project "demolishes or materially alters in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its inclusion in, or eligibility for, inclusion in the California Register of Historical Resources. [CEQA Guidelines Section 15064.5(b)(2)(A).] Under the proposed Project, no changes would be made directly to the Resort. Placing the landfill cover on the closed landfill would change the appearance of the landfill, but would not alter the physical characteristics of the Resort which convey its historical significance or adversely affect its qualification to be listed as a California Historical Landmark. The Resort was listed in 1988, when the landfill was an active solid waste disposal site with daily use of heavy earth-moving equipment and the transport and disposal of 100 and more tons of refuse per day by garbage trucks driving in and out of the landfill through the landfill entrance directly across Vichy Springs Road from the Resort. If that condition did not prevent the Resort from being listed in 1988, it cannot be reasonably claimed that placing the landfill cover over the closed landfill would adversely affect the Resort's historical significance or eligibility for continued listing. If anything, the proposed Project would result in an improved condition over what was present when the Resort was listed.

Also inaccurate is the Petitioner's claim that the EIR did not evaluate the potential effects of the Project on the Resort. In fact, the bulk of the EIR is devoted to evaluating the effect of the Project on the Resort, particularly with respect to aesthetics/scenic resources; geology, soils, and seismicity; hydrology and water quality; and noise. As conveyed in these responses, and also in the Draft and Final EIR, there would be no significant impact resulting to the Resort from the Proposed Project for any environmental issue. As also conveyed in these responses, the Petitioner has failed to present any evidence to indicate that the findings of the EIR are not adequately supported. Based on each of these considerations, the Petitioner's allegation that the Proposed Project would result in a significant impact to an historic resource is not supported.

E. The Petitioner alleges that the EIR did not disclose baseline conditions for recreation trails in the Project area and the effect of Project-related construction noise on those resources.

As discussed in Section 3.8 of the Draft EIR, ambient noise measurements were taken at selected locations in the Project area that were representative of the existing noise environment. The EIR characterized the Project area as "very quiet," with the lowest measurement being 42 dB along the private road immediately north of the gated landfill entrance, and the loudest measurement (63 dB) in the vicinity of Vichy Springs Road and Medicine Way. As stated previously under Response III.B., the EIR determined that there would be no significant impacts from construction noise to any sensitive receptors in the area, the nearest of which is approximately 600 feet from the nearest area of proposed construction activities when measured as a straight-line distance, but which also includes an intervening ridge between the construction site and the sensitive receptor. The referred-to hiking trails are an even greater distance from the construction area than the nearest sensitive receptor. Noise impacts on the hiking trails would therefore be even less than they would be at the sensitive receptor location. It should further be noted that construction noise would be temporary in duration, and most of the construction activity would occur 1,000 feet or more from the nearest sensitive receptor and would again be separated from that receptor by an intervening ridge. This amount of distance is the principal reason for the EIR's finding of a less-than-significant impact for construction noise. Noise from even the loudest types of heavy construction equipment would not surpass applicable thresholds at such a distance, even without the intervening ridge to provide additional abatement. As such, the Petitioner's allegation that the Project would create a significant impact to recreation trails or other sensitive receptors is not supported.

F. The Petitioner alleges that the EIR did not disclose purported groundwater connections between the Project site and the Vichy Springs Resort.

The Petitioner's contention that a groundwater connection exists between the landfill site and the Vichy Springs Resort was discussed in Section 3.7 of the Draft EIR, *Hydrology and Water Quality*, commencing on page 3.7-11. The impact of this purported connection, or more accurately, the documented lack of connection, was evaluated in the Draft EIR under Impact 3.7-2, commencing on page 3.7-25. The issue was again addressed in the Final EIR on page 3-12, in response to Comment C-7, as presented by the Petitioner. To repeat: the purported connection of groundwater beneath the landfill and the groundwater source to Vichy Springs was previously

addressed in 1994 in the declaration of Damon Brown, Certified Engineering Geologist,[12] and affirmed by the Regional Water Quality Control Board, which directed the City to drill the groundwater monitoring wells based on Brown's investigation and report. In the investigation, the water types of the Vichy Springs water and groundwater from the landfill's monitoring wells were compared using testing for organic and inorganic chemicals, stable isotopes, and knowledge of the local hydrogeology. The evaluation indicated that the landfill monitoring wells could not impact Vichy Springs because they are installed in a water-bearing zone significantly different from, and not connected to or intermixing with, the water-bearing zone of Vichy Springs. Any possible impact to Vichy Springs would have to be caused by wells that are part of the existing environmental baseline, and it has already been established that there is no connection between the landfill and Vichy Springs. Further, the Project does not propose the drilling of any new wells beyond those that would be used to monitor the buried refuse mass itself, which would have no effect on groundwater, even if there were a connection, which there is not.

VI. The Petitioner Alleges that the Draft EIR Should Have Been Recirculated Upon the City's Receipt of Significant New Information Regarding Fire Risk, Scenic Resources, and Noise Impacts

A. The Petitioner alleges that the Draft EIR should have been recirculated based on comments from the North Coast Regional Water Quality Control Board related to fire risk.

The potential fire risk related to the proposed landfill cover is discussed above in Response I.A. In summary, the proposed landfill cover materials are not capable of propagating fire, and in fact, have the beneficial impact of being significantly less flammable than native vegetation. There would therefore be no new significant impact that would warrant recirculation of the EIR.

B. The Petitioner alleges that the Draft EIR should have been recirculated based on comments received by the Vichy Springs Resort related to scenic resources.

As stated previously in Response V.B, and as provided in both the Draft EIR and the Final EIR, the baseline descriptions of the landfill property, particularly as viewed from the Vichy Springs Resort property, negate the possibility of a significant effect occurring to the Resort property as a result of Project implementation. The Petitioner's comments to the contrary are not supported, particularly in light of the fact that the landfill is located on the far side of an intervening ridge that separates the Resort from the landfill property, which means that the landfill site is impossible to see from most of the Resort's property, and from those few locations where it is visible, those views are partial and/or very distant. This is particularly true for those portions of the Resort with which the Petitioner has expressed the most concern, such as the Resort's guest areas and hiking trails. There would therefore be no new significant impact that would warrant recirculation of the EIR.

[12] Declaration of Damon Brown in Opposition to Plaintiffs' Application for Preliminary Injunction, Case No. 70873. December 19, 1994

C. The Petitioner alleges that the Draft EIR should have been recirculated based on comments received from the Vichy Springs Resort related to construction noise impacts on area recreation trails.

As stated previously in Response III.B, evidence provided in both the Draft EIR and Final EIR determined that the Project's implementation would not result in significant construction noise impacts. The Petitioner's comments did not provide any evidence to support a differing conclusion, as the sensitive receptors identified by the Petitioner (recreation trails) are even further from the area of proposed construction than the receptors analyzed in the Draft EIR. There would therefore be no new significant impact that would warrant recirculation of the EIR.

D. The Petitioner alleges that the Draft EIR and Final EIR's finding of a less than significant impact for construction noise was not supported by substantial evidence.

Please see Response III.B above, as well as Response VI.C. Both the Draft EIR and the Final EIR provided extensive documentation, prepared in conformance with accepted professional standards, concerning the Project's less-than-significant impacts resulting from construction noise. The Petitioner's comments did not provide any evidence to support a differing conclusion. There would therefore be no new significant impact that would warrant recirculation of the EIR.

VII. The Petitioner Alleges that the EIR did not Identify or Consider Feasible Mitigation Measures to Reduce Adverse Environmental Impacts

A. The Petitioner alleges that the Draft EIR did not identify or consider feasible mitigation related to fire risk.

The potential fire risk related to the proposed landfill cover is discussed above in Response I.A. In summary, the proposed landfill cover materials are not capable of propagating fire, and in fact, have the beneficial impact of being significantly less flammable than native vegetation. Therefore, no mitigation is necessary and the Petitioner's position is not supported.

B. The Petitioner alleges that the Draft EIR did not identify or consider feasible mitigation related to feral swine.

The potential for animals, including feral swine, to cause damage to the proposed landfill cover, is discussed above in Response V.C. In summary, the landfill cover system is not a food source, does not provide habitat, and would not be punctured by an adult bull elk standing on the materials, as verified in puncture tests. Therefore, no mitigation is necessary and the Petitioner's position is not supported.

C. The Petitioner alleges that the Draft EIR did not identify or consider feasible mitigation related to release of microplastics into surface waters.

The potential for degradation of the proposed landfill cover materials that might generate microplastics is discussed above in Response II. In summary, the structured membrane would not be exposed to sunlight and its associated UV radiation since it would be covered by synthetic tufted geotextile blades and sand infill. The sand infill does not degrade into microplastics. The synthetic tufted geotextile blades were tested for degradation due to UV radiation and were found

to resist degradation for decades, which would result in a negligible generation of microplastics. Therefore, no mitigation is necessary and the Petitioner's position is not supported.

D. The Petitioner alleges that the Draft EIR did not identify or consider feasible mitigation related to construction noise.

The Project's less-than-significant construction noise impacts have already been addressed in Responses III.B, VI.C, and VI.D. As stated previously, both the Draft EIR and the Final EIR provided extensive documentation, prepared in conformance with accepted professional standards, concerning the Project's less-than-significant impacts resulting from construction noise. The Petitioner's comments did not provide any evidence to support a differing conclusion. Therefore, no mitigation is necessary and the Petitioner's position is not supported.

VIII. The Petitioner Alleges that the EIR Failed to Provide Substantial Evidence as to the Project's Environmental Impacts and Costs

A. The Petitioner alleges that the Project may not proceed without concurrence from Responsible Agencies concerning the environmental impact findings as presented in the Final EIR.

The Petitioner's suggestion that the City is under the impression that the Proposed Project has been "approved" by relevant Responsible Agencies is not accurate. In responding to this comment we can only assume that the Petitioner is referring to the analysis conducted on the Proposed Project in compliance with 27 CCR § 20080(b), which requires that the Proposed Project be consistent with the performance goals addressed by the prescriptive standard and afford equivalent protection against water quality impairment, while also demonstrating that the construction of the prescriptive standard is unreasonably and unnecessarily burdensome and will cost substantially more than the proposed alternative. These analyses have been performed and have been found adequate by the regulatory agencies, including the North Coast Regional Water Quality Control Board.

The City is fully aware that without issuance of required permits by these agencies, the Project will not be able to proceed. The City is also aware that these Responsible Agencies will use the City's EIR to meet their own compliance requirements under CEQA. As noted previously in Response IV.B, and as noted in Table 2-2 on page 2-17 of the Draft EIR, these agencies include the Mendocino County Environmental Health Department, CalRecycle, and the North Coast Regional Water Quality Control Board. Each of these agencies has been consulted during the Notice of Preparation, Draft EIR, and Final EIR stages of the CEQA process, as evidenced by the comments that were received by both CalRecycle and the North Coast Regional Water Quality Control Board during the CEQA process.

B. The Petitioner alleges that the proposed landfill cover's advertised service life is not supported by substantial evidence.

As discussed above in Responses II and VII.C, the structured membrane would not be exposed to sunlight and its associated UV radiation since it would be covered by synthetic tufted geotextile blades and sand infill. The sand infill does not degrade. The synthetic tufted geotextile blades were tested for degradation due to UV radiation and were found to resist degradation for decades,

which would result in exceeding the required service life of 30 years and is projected to last to 100 years. Therefore, the advertised service life is supported by substantial evidence and the Petitioner's position is not supported.

C. The Petitioner alleges that the EIR's identification of an "environmentally superior alternative" did not consider an additional alternative that the Petitioner prefers.

At the request of the Petitioner, the Final EIR evaluated the Compacted Clay/Natural Cover Alternative. That alternative was not identified as the environmentally superior alternative because it would present a number of environmental disadvantages when compared to the Proposed Project. These disadvantages are articulated on page 4-30 of the Final EIR in Section 4.4.2. The disadvantages to the Compacted Clay/Natural Cover Alternative are not trivial in nature, and include constraints and heightened impacts related to slope instability, erosion and resultant water quality impacts, enhanced wildfire risk, and increased air quality and noise emissions from importation of cover materials. The Compacted Clay/Natural Cover Alternative provides no environmental advantages over the Proposed Project and was therefore not identified as the environmentally superior alternative.

D. The Petitioner alleges that the proposed landfill cover is an "interim measure" and that the EIR did not disclose the cost of removing and disposing of the landfill cover at the end of its service life, which the Petitioner alleges is only 30 years rather than the 100 years advertised by the manufacturer.

As discussed above in Responses II, VII.C, and VIII.B, the structured membrane would not be exposed to sunlight and its associated UV radiation since it would be covered by synthetic tufted geotextile blades and sand infill. The sand infill does not degrade. The synthetic tufted geotextile blades were tested for degradation due to UV radiation and were found to resist degradation for decades, which would result in exceeding the required service life of 30 years to possibly 100 years. Therefore, the service life is supported by substantial evidence and the Petitioner's position is not supported.

E. The Petitioner alleges that the findings in the EIR related to a less-than-significant impact from construction noise are not supported by substantial evidence.

As discussed previously in Response III.B, and as documented repeatedly in the Draft EIR and Final EIR, implementation of the Proposed Project would result in less-than-significant impacts with respect to construction noise.

F. The Petitioner alleges that the findings in the EIR related to a less-than-significant impact to groundwater resources are not supported by substantial evidence.

As discussed above in Response V.F, the Petitioner's contention that a groundwater connection exists between the landfill site and the Vichy Springs Resort was discussed in Section 3.7 of the Draft EIR, Hydrology and Water Quality, commencing on page 3.7-11. The impact of this purported connection, or more accurately, the documented lack of connection, was evaluated in the Draft EIR under Impact 3.7-2, commencing on page 3.7-25. The issue was again addressed in the Final EIR on page 3-12, in response to Comment C-7, as presented by the Petitioner. To repeat: the purported connection of groundwater beneath the landfill and the groundwater source

to Vichy Springs was previously addressed in 1994 in the declaration of Damon Brown, Certified Engineering Geologist,[13] and affirmed by the Regional Water Quality Control Board, which directed the City to drill the groundwater monitoring wells based on Brown's investigation and report. In the investigation, the water types of the Vichy Springs water and groundwater from the landfill's monitoring wells were compared using testing for organic and inorganic chemicals, stable isotopes, and knowledge of the local hydrogeology. The evaluation indicated that the landfill monitoring wells could not impact Vichy Springs because they are installed in a water-bearing zone significantly different from, and not connected to or intermixing with, the water-bearing zone of Vichy Springs. Any possible impact to Vichy Springs would have to be caused by wells that are part of the existing environmental baseline, and it has already been established that there is no connection between the landfill and Vichy Springs. Further, the Project does not propose the drilling of any new wells beyond those that would be used to monitor the buried refuse mass itself, which would have no effect on groundwater, even if there were a connection, which there is not. Therefore, substantial evidence demonstrates that the source water to Vichy Springs is not from the groundwater monitored under the landfill and the Petitioner's position is not supported.

G. The Petitioner alleges that the findings in the EIR related to a less-than-significant impact to visual resources are not supported by substantial evidence.

As discussed previously in Responses V.B. and VI.B, and as documented repeatedly with substantial evidence in the Draft EIR and Final EIR, implementation of the Proposed Project would result in less-than-significant impacts with respect to visual resources. The evidence supporting that conclusion, as well as the rationale used to determine it, is manifest within those responses and within the Draft and Final EIRs. The Petitioner's position is not supported.

IX. The Petitioner Desires Relief in the Form of a Recirculated Draft EIR That Considers the Alleged Deficiencies

CEQA Guidelines Section 15088.5 lists the conditions that must be present to necessitate recirculation of an EIR. These include the following:

1) A new significant environmental impact would result from the project or from a new mitigation measure proposed to be implemented.
2) A substantial increase in the severity of an environmental impact would result unless mitigation measures are adopted that reduce the impact to a level of insignificance.
3) A feasible project alternative or mitigation measure considerably different from others previously analyzed would clearly lessen the environmental impacts of the project, but the project's proponents decline to adopt it.
4) The draft EIR was so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded.

[13] Declaration of Damon Brown in Opposition to Plaintiffs' Application for Preliminary Injunction, Case No. 70873. December 19, 1994

As demonstrated in these responses, as well as within previous responses presented in the Final EIR, none of these conditions arise here in connection with the EIR for the City of Ukiah's Landfill Closure Plan: no new significant environmental impacts have been identified; no mitigation measures have been identified that would increase the severity of an environmental impact; no alternative has been identified that would clearly lessen the environmental impacts of the Project as proposed; and no evidence has been presented that would render any aspect of the EIR as fundamentally inadequate or conclusory in nature. The Petitioner's request for relief is therefore not warranted.

Conclusion

Based upon substantial evidence in light of the whole record, and as summarized above in the responses provided to the Petitioner's comments, it is evident that the Petitioner has not presented any rationale that would indicate that the Project EIR is fundamentally flawed or otherwise inadequate so as to require recirculation. While the Petitioner has made it clear that they are not in favor of the Project as proposed, the contentions in Petitioner's comments are unsupported by evidence. The City has satisfied the requirements of CEQA, and further environmental analysis or documentation for the Proposed Project is not warranted.

Alpharetta, GA 30022

RE: CLOSURETURF FIRE TEST CT AND CT-HD

Dear Jose:

Richgels Environmental Services (RES) had initially investigated the fire resistance of ClosureTurf CT in June 2015. RES' concern at the time was the State of California had declared wildfire as a "reasonable foreseeable" risk for solid waste landfill surfaces after wildfire events at landfills resulting in destruction of landfill gas collection systems and other supporting infrastructure. The most recent occurrence at Butte County's Neal Road Landfill in 2018 during the Camp Fire (destroyed the town of Paradise, CA). The American Society for Testing and Materials (ASTM) test Method E108 *Standard Test Methods for Fire Tests of Roof Coverings* is designed to test asphalt composite roofs for fire resistance. Section 10 of this test method is similar to field conditions such as large brush or trees adjacent to landfill surfaces from which burning embers could fall thus igniting grasses on the landfill surface.

Thus, this method was chosen to assess fire resistance of both the CT and CT-HD versions of ClosureTurf (data sheets attached). This investigation performed the Burning Brand Test (Section 10 of ASTM E108) conducted with 3 different brand sizes, Class A, B and C. The Class A brand is 12 inches square in length, width and nominally 3 inches in depth. The Class B brand is 6 inches square and nominally 3 inches in depth. The Class C brand is a 2-inch cube. The CT test was performed in California in June 2015. After development of the denser CT-HD version, its fire test was conducted in August 2018 under my supervision at Watershed Geo's Research and Development Laboratory in Louisiana.

Test Preparation

Brands for both the Class A and Class B tests were constructed using nominal 1x1 (¾ " x ¾" finished) pine stock and fastened together with 3d finishing nails. Strips were spaced ¼" apart using a ¼" template to provide consistent strip spacing. The Class A brand was built with 36 each 12" long strips. Class B brand was built with 18 each 6" long strips. The Class C brand was made with a 1-1/2" long piece of 2x2 pine stock with perpendicular saw kerfs on opposite sides per ASTM E108 specifications. The completed brands were oven cured overnight. ASTM E108 specifications recommend curing the brands in an oven for 24 hours at an oven temperature between 105°F and 120°F. Home ovens only go as low as 150°F, so the brands were just cured overnight (Figure 1). All brands were judged as nearly "bone dry," which was confirmed by their ignitability (below).

The test site subgrade was stripped of vegetation and bladed smooth with a straight shovel before placing 50-mil, LLDPE Super Gripnet geomembrane samples. ClosureTurf test pads were prepared using dimensions specified in ASTM E108 – 4'-4" by 3'-4." All test pads received 60 pounds of commercially available sand that met ASTM C33 specifications (Figure 2). Sand was poured evenly over the pads and raked in place per recommended construction practice. This is an equivalent application of 4.2 psf, less than the ClosureTurf manufacturer's recommended sand ballast application (5 psf).

Assuming a sand unit weight of 120 pcf,, sand applied at a rate of 5 psf would spread to approximately 0.5 inches deep. An application rate of 4.2 psf would be 0.42 inches. The thickness difference of 0.08 inches would expose that much more of HDPE grass tufting hence is considered conservative for the purposes of this examination.

Figure 1

Figure 2

Test Execution

The Class A brand was ignited over charcoal and propane outdoor grills for the CT and CT-HD tests respectively. Each large face was exposed to the ignition source for 30 seconds. Each side face was exposed for 45 seconds each. The final exposure of the brand faces per ASTM E108 procedures were not done as the brands were fully aflame and the pine stock was beginning to be consumed. The total ignition time was four minutes.

After the prescribed ignition time, the fully aflame brands were placed on the turf samples (Figure 3). Turf blades melted to the top of the sand ballast in proximity of the burning brand, yet the turf did not ignite nor self-propagate flame away from the brand in either test. A slight wind developed during testing fanning flames to one side.

Figure 3

ClosureTurf CT

ClosureTurf CT-HD

The Class B brands were also ignited over outdoor grills as described above for the Class A brands. Each face was placed on the grill for 30 seconds. Each side face was exposed for 30 seconds each. As with the Class A brands, the Class B brands were fully aflame after the last side face was placed against the grills. Total ignition time was 3 minutes.

The Class C brands were ignited over the grills as described above. Four of the brand faces were placed on the grills for 30 seconds for a total of 2 minutes ignition time.

The Class A brand finished burning with open flame approximately 30 minutes after placement. No fire propagation away from brand in the CT nor CT-HD tests occurred. The same was true for the Class B and C brand tests.

Post Test Inspections

The Class A and B brands were nearly entirely consumed. (Figure 4) Only a few pieces of brand were left after fire test completion. Grass tufts in both the CT and CT-HD samples were melted up to 6 inches away from the Brand A (Figure 5) edge in the melt zone. Ballast sand was discolored under the brand within burn zone.

The Class B brands were also nearly entirely consumed. Only a few pieces of brand were left after fire test completion. Grass tufts were melted up to 4 inches away from the brand edge as shown in Figure 6. Sand discolored under brand but retained natural color within melt zone.

The melt zone around the Class C brand was up to 4 inches in the longest dimension (Figure 7).

Figure 4

Brand A Closure CT

Brand A ClosureTurf CT-HD

Figure 5

Figure 6

Brand B ClosureTurf CT

Brand B ClosureTurf CT-HD

Figure 7

Brand C ClosureTurf CT Brand C ClosureTurf CT-HD

Upon peeling back the turf component of the tested samples, it was found the turf had melted on to the SGN and was essentially consumed by the fire within the burn zone of all the Class A and B tests. The SGN drainage studs were intact up to the boundary of the brand and melted down to the geomembrane sheet within the burn zone. The woven geotextile beyond the burn zone – or under the melt zone - was undamaged as shown in Figure 8.

Figure 8

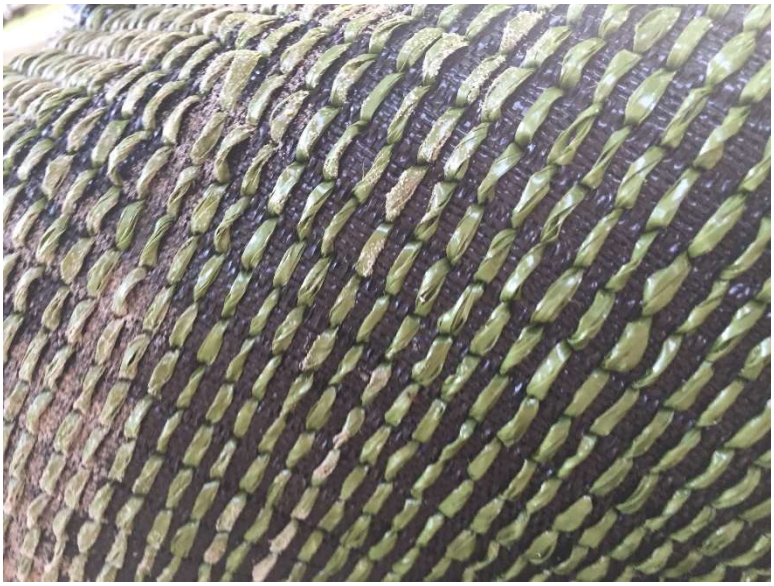
The entire system was pulled back to observe if the fire had burned through the SGN for both tested samples.

The underside of the SGN displayed observable effects from the fire but was not broached. The SGN burn zone boundary for results typical to all Class A and Class B tests is shown in Figure 9. Some of the soil and organic debris beneath the burn zone was dry and adhering to the SGN. Spikes beneath the burn zone were gone, while spikes in areas immediately neighboring the burn zone were intact.

The Class A brand burn zone damage to the SGN was essentially the dimensions of the brand – 12" x 12".

Figure 9

Figure 10



Sand discoloration beneath the burn zone was also observed in the Class B brand test. The underside of the SGN displayed observable melting from the fire but was not broached (Figure 10). Again dry soil and organic debris was found adhering to the SGN underside.

The Class B brand melt zone was slightly larger than the dimensions on the brand – 7-1/2" 7-1/2" for the CT test. For both the Class A and B tests, studs in the immediate vicinity of the burn zone were completely intact. Studs with the burn zone were flattened.

Class C brands were stuck to the underlying grass tufts after the fire had gone out. The CT test brand was not fully consumed by the fire. Note sand discoloration under the brand and minor melting of nearby grass tufts in Figure 7.

For both tests, Class C brands displayed no melting effect on the woven geotextile component in the turf (Figure 11) There were no observable impacts to the SGN either.

Figure 11

Conclusions

1. ClosureTurf exposure to fire is contained to the vicinity of the fire source. It does not spread.
2. None of the ASTM burning brand tests burned through the SGN component of ClosureTurf. This is important when considering active gas control maybe near site perimeter where burning embers may fall.

These results are relevant to concerns in California with respect to wildfire. Wildfire danger is a regulated consideration for closed landfills with surface infrastructure such as landfill gas (LFG) collection wells and piping. California considers wildfire a reasonably foreseeable event for which site owners must provide corrective action cost estimates. Vegetated surfaces provide fuel for fire propagation to other combustible structures such as LFG collection systems. This corrective action requirement could be coming to other states. Use of ClosureTurf as a final cover system should reduce these concerns and related financial burdens for corrective action financial liabilities.

If you have any questions, please call or email the undersigned.

Very Truly Yours

MEMORANDUM

Date: 10 July, 2020

To: David Rappaport, City Attorney

From: Doug Hutchison, Fire Chief

Subject: Proposed Landfill Cover Fire Hazard

This memo is in response to your request to review and assess the fire hazard posed by the proposed artificial covering for the landfill. I base my opinions and assessments generally on my 36 years of firefighting experience and education, and more specifically as a 25+ year Strike Team Leader and Type 4 Incident Commander for wildland fires.

After reviewing the available data and test information regarding the proposed artificial covering for the landfill, it is my opinion that it would not pose an increased fire risk versus cured grasses, but would, in fact, burn slower and with much less intensity than vegetative fuels.

As for the concerns of toxic air contaminants being released, I would agree that it could occur. However, given the relatively low fire intensity, the extent would be very limited.

Please let me know if you have any other questions.

Attachment C
Material Safety Data Sheets

ATTACHMENT C

Safety Data Sheet

Section 1: Identification

Product identifier

Product Name • **DuraTurf**

Chemical Name • Polyolefin tufted turf.

Relevant identified uses of the substance or mixture and uses advised against

Recommended use • Erosion Protection

Details of the supplier of the safety data sheet

Manufacturer • Shaw Industries Group, Inc.
P.O. Drawer 2128
Dalton, GA 30720
United States
www.shawfloors.com

Telephone (General) • 706-278-3812

Emergency telephone number

Manufacturer • 800-255-3924 - Chem-Tel

Section 2: Hazard Identification

United States (US)

According to OSHA 29 CFR 1910.1200 HCS

Classification of the substance or mixture

OSHA HCS 2012 • Not classified

Label elements

OSHA HCS 2012

Hazard statements • No label element(s) required

Other hazards

OSHA HCS 2012 • Under United States Regulations (29 CFR 1910.1200(c) - Hazard Communication Standard), the product(s) listed above are exempt as article(s) under stated normal conditions of use.

Other information

• This material, as an article, does not legally require an SDS

Section 3 - Composition/Information on Ingredients

Substances

- Material does not meet the criteria of a substance.

Mixtures

- Hazardous ingredients are encapsulated and are not airborne or of respirable size therefore will not be released or otherwise result in exposure to hazardous chemicals under normal conditions of use.

Section 4: First-Aid Measures

Description of first aid measures

Inhalation
- First aid is not expected to be necessary if material is used under ordinary conditions and as recommended. If signs/symptoms develop, move person to fresh air. Administer oxygen if breathing is difficult. Give artificial respiration if victim is not breathing. If signs/symptoms continue, get medical attention.

Skin
- First aid is not expected to be necessary if material is used under ordinary conditions and as recommended. Wash skin with soap and water. If signs/symptoms develop, get medical attention.

Eye
- First aid is not expected to be necessary if material is used under ordinary conditions and as recommended. If contact with material occurs flush eyes with water. If signs/symptoms develop, get medical attention.

Ingestion
- First aid is not expected to be necessary if material is used under ordinary conditions and as recommended. If signs/symptoms develop, get medical attention.

Most important symptoms and effects, both acute and delayed

- Under normal conditions of use, no health effects are expected.

Indication of any immediate medical attention and special treatment needed

Notes to Physician
- No specific actions or treatments recommended related to exposure to this material.

Section 5: Fire-Fighting Measures

Extinguishing media

Suitable Extinguishing Media
- Material is non-combustible. In case of fire use media as appropriate for surrounding fire.

Unsuitable Extinguishing Media
- No data available.

Special hazards arising from the substance or mixture

Unusual Fire and Explosion Hazards
- Material is non-combustible and is not expected to pose a fire or explosion hazard.

Hazardous Combustion Products
- No data available

Advice for firefighters

- Wear positive pressure self-contained breathing apparatus (SCBA). Structural firefighters' protective clothing will only provide limited protection.

Section 6 - Accidental Release Measures

Personal precautions, protective equipment and emergency procedures

Personal Precautions
- No special precautions expected to be necessary if material is used under ordinary conditions and as recommended.

Emergency Procedures
- No emergency procedures are expected to be necessary if material is used under ordinary conditions as as recommended. Use normal clean up procedures.

Environmental precautions

- No special precautions necessary.

Methods and material for containment and cleaning up

Containment/Clean-up Measures
- Carefully shovel or sweep up spilled material and place in suitable container.

Section 7 - Handling and Storage

Precautions for safe handling

Handling
- Use good safety and industrial hygiene practices.

Conditions for safe storage, including any incompatibilities

Storage
- Store in a cool, dry place.

Section 8 - Exposure Controls/Personal Protection

Control parameters

Exposure Limits/Guidelines
- No applicable exposure limits available for product or components.

Exposure controls

Engineering Measures/Controls
- Under normal conditions of use, special ventilation is not required.

Personal Protective Equipment

Respiratory
- No respiratory protection is required under normal conditions of use.

Eye/Face
- Under normal conditions of use, eye protection is not required.

Skin/Body
- No skin protection is ordinarily required under normal conditions of use.

Environmental Exposure Controls
- Follow best practice for site management and disposal of waste.

Section 9 - Physical and Chemical Properties

Information on Physical and Chemical Properties

Material Description			
Physical Form	Solid	Appearance/Description	Tuft green or brown artificial turf.
Color	Brown or green.	Odor	No data available
Odor Threshold	No data available		
General Properties			
Boiling Point	No data available	Melting Point	No data available
Decomposition Temperature	No data available	pH	7 to 9
Specific Gravity/Relative Density	No data available	Water Solubility	Negligible < 0.1 %
Viscosity	No data available		
Volatility			
Vapor Pressure	No data available	Vapor Density	No data available
Evaporation Rate	No data available		
Flammability			

Flash Point	No data available	UEL	No data available
LEL	No data available	Autoignition	No data available
Flammability (solid, gas)	No data available		
Environmental			
Octanol/Water Partition coefficient	No data available		

Other Information

- No additional physical and chemical parameters noted.

Section 10: Stability and Reactivity

Reactivity

- No dangerous reaction known under conditions of normal use.

Chemical stability

- Stable under normal temperatures and pressures.

Possibility of hazardous reactions

- Hazardous polymerization will not occur.

Conditions to avoid

- No data available.

Incompatible materials

- No data available.

Hazardous decomposition products

- No data available.

Section 11 - Toxicological Information

Information on toxicological effects

GHS Properties	Classification
Acute toxicity	**OSHA HCS 2012** • Not relevant
Aspiration Hazard	**OSHA HCS 2012** • Not relevant
Carcinogenicity	**OSHA HCS 2012** • Not relevant
Germ Cell Mutagenicity	**OSHA HCS 2012** • Not relevant
Skin corrosion/Irritation	**OSHA HCS 2012** • Not relevant
Skin sensitization	**OSHA HCS 2012** • Not relevant
STOT-RE	**OSHA HCS 2012** • Not relevant
STOT-SE	**OSHA HCS 2012** • Not relevant
Toxicity for Reproduction	**OSHA HCS 2012** • Not relevant
Respiratory sensitization	**OSHA HCS 2012** • Not relevant
Serious eye damage/Irritation	**OSHA HCS 2012** • Not relevant

Potential Health Effects

Inhalation

Acute (Immediate)

- Under normal conditions of use, no health effects are expected.

Chronic (Delayed)
- Under normal conditions of use, no health effects are expected.

Skin

Acute (Immediate)
- Under normal conditions of use, no health effects are expected.

Chronic (Delayed)
- Under normal conditions of use, no health effects are expected.

Eye

Acute (Immediate)
- Under normal conditions of use, no health effects are expected.

Chronic (Delayed)
- Under normal conditions of use, no health effects are expected.

Ingestion

Acute (Immediate)
- Under normal conditions of use, no health effects are expected.

Chronic (Delayed)
- Under normal conditions of use, no health effects are expected.

Section 12 - Ecological Information

Toxicity

- Section is not required therefore ecological information for this material was not evaluated.

Persistence and degradability

- Section is not required therefore ecological information for this material was not evaluated.

Bioaccumulative potential

- Section is not required therefore ecological information for this material was not evaluated.

Mobility in Soil

- Section is not required therefore ecological information for this material was not evaluated.

Other adverse effects

- Section is not required therefore ecological information for this material was not evaluated.

Section 13 - Disposal Considerations

Waste treatment methods

Product waste
- Dispose of content and/or container in accordance with local, regional, national, and/or international regulations.

Packaging waste
- Dispose of content and/or container in accordance with local, regional, national, and/or international regulations.

Section 14 - Transport Information

	UN number	UN proper shipping name	Transport hazard class(es)	Packing group	Environmental hazards
DOT	NDA	Not Regulated	NDA	NDA	NDA

Special precautions for user
- No special precautions.

Transport in bulk according to Annex II of MARPOL 73/78 and the IBC Code
- Not relevant.

Section 15 - Regulatory Information

Safety, health and environmental regulations/legislation specific for the substance or mixture

- Non-Mandatory section.

SARA Hazard Classifications

- None

Section 16 - Other Information

Last Revision Date

- 26/November/2013

Preparation Date

- 26/November/2013

Disclaimer/Statement of Liability

- Reasonable care has been taken in the preparation of this information, but the supplier gives no warranty of merchantability or of fitness for a particular purpose. Any product purchased is sold on the assumption the purchaser will make his own tests to determine the quality and suitability of the product. Supplier expressly disclaims any and all liability for incidental and/or consequential property damage arising out of the use of this product. No information provided shall be deemed to be a recommendation to use any product in conflict with any existing patent rights. Read the Safety Data Sheet before handling product.

1. CHEMICAL PRODUCT AND COMPANY IDENTIFICATION

Synonyms: Plastic
Chemical Name: Ethene, Homopolymer; 1-Butene, Polymer with Ethene; 1-Hexene, Polymer with Ethene; Ethylene Polymers & Copolymers plus Additives
Chemical Family: Olefin Polymers and Copolymers plus Additives
Chemical Formula: Mixture
CAS Reg. No.: Mixture-See Section B for ingredient CAS Reg. No.
Product No.: Marlex ® BHN, BMN, DTR, DTR-F, EHM, HHM, HHN, HMN, HXM, HXB, B, C, D, H, J, K, PE, HiD, mPact, Vytek, Dynex, LX, ER, TD, DS, Marlex ® and Marflex™ Series. As well as YYY and YYY-F (where Y is a number from 1 to 10) Series.

PRODUCT USE:
MEDICAL APPLICATION CAUTION: Do not use this Chevron Phillips Chemical material in medical applications involving permanent implantation in the human body or permanent contact with internal body fluids or tissues.

Do not use this Chevron Phillips Chemical material in medical applications involving brief or temporary implantation in the human body or contact with internal body fluids or tissues unless the material has been provided directly from Chevron Phillips Chemical under a contract which expressly acknowledges the contemplated use.

Chevron Phillips Chemical makes no representation, promise, express warranty or implied warranty concerning the suitability of this material for use in implantation in the human body or in contact with internal body fluid or tissues.

Product and/or Components Entered on EPA's TSCA Inventory: Yes
This product is in U.S. commerce, and is listed in the Toxic Substances Control Act (TSCA) Inventory of Chemicals; hence, it may be subject to applicable TSCA provisions and restrictions.

Canadian Inventory Listing Status: DSL
All ingredients are listed in the Domestic Substances List (DSL).
Impurities are exempt in accordance with Section 3 of the Canadian Environmental Protection Act (CEPA).

---

---

3. HAZARDS IDENTIFICATION

********** **EMERGENCY OVERVIEW** **********

Opaque, translucent, colorless pellets or fluff

- Formaldehyde can be produced at elevated temperature.

****

Recommended Exposure Limits:

Control as Particulate Not Otherwise Classified (PNOC) or Regulated:

	OSHA PEL
Respirable Fraction	5 mg/m3
Total Dust	15 mg/m3

* The value is for inhalable (total) particulate matter containing no asbestos and <1% crystalline silica.

_X_ Based on information presently available, this product does not meet any of the hazard definitions of 29 CFR Section 1910.1200.

Specify: No known applicable information for Canadian "Health Hazard Categories".

Other: Thermal decomposition products formed during thermal processing are expected to be irritating to the eyes.

Formaldehyde, A probable human carcinogen, may be formed at extrusion temperatures.

IMMEDIATE HEALTH EFFECTS

EYE:

Not expected to cause prolonged or significant eye irritation. Dust may cause mechanical irritation. If this material is heated, thermal burns may result from eye contact.

SKIN:

Contact with the skin is not expected to cause prolonged or significant irritation. Not expected to be harmful to internal organs if absorbed through the skin. If this material is heated, thermal burns may result from skin contact.

INGESTION:

Not expected to be harmful if swallowed.

INHALATION:

Not expected to be harmful if inhaled. If this material is heated, fumes may be unpleasant and produce nausea and irritation of the upper respiratory tract. Inhalation: Dust may produce mechanical irritation to the mucous membranes of the nose, throat and upper respiratory tract.Long term exposure to high dust concentrations may cause non-debilitating lung changes.

SIGNS AND SYMPTOMS OF EXPOSURE:

Thermal burns to the eye: may include pain, tearing, reddening, swelling, and impaired vision. Thermal burns to the skin: may include pain or feeling of heat, discoloration, swelling, and blistering. Respiratory irritation: may include coughing and difficulty breathing.

At extrusion temperatures (>350F, >177C), polyethylenes can release vapors and gases which are irritating to the muccus membranes of the eyes, mouth, throat, and lungs. These substances may include acetaldehyde, acetone, acetic acid, formic acid, formaldehyde and acrolein. Generally these irritant effects are all transitory. However, prolonged exposure to irritating off gases can lead to pulmonary edema. Adequate ventilation should prevent sensory discomfort. Based on animal data and limited epidemiological evidence, NTP, IARC(2A), and OSHA have listed Formaldehyde as a probable human carcinogen.

---

4. FIRST AID MEASURES

EYE:

If heated material should splash into eyes, flush eyes immediately with fresh water for 15 minutes while holding the eyelids open. Remove contact lenses, if worn. Get immediate medical attention.

SKIN:

If the hot material gets on skin, quickly cool in water. See a doctor for extensive burns. Do not try to peel the solidified material from the skin or use solvents or thinners to dissolve it. The use of vegetable oil or mineral oil is recommended for removal of this material from the skin.

INGESTION:

No specific first aid measures are required because this material is not expected to be harmful if swallowed.

INHALATION:

Move the exposed person to fresh air. If not breathing, give artificial respiration. If breathing is difficult, give oxygen. Get medical attention if breathing difficulties continue.

---

5. FIRE FIGHTING MEASURES

FIRE CLASSIFICATION:

Classification (29 CFR 1910.1200): Not flammable or combustible.

FLAMMABLE PROPERTIES:

FLASH POINT: 645F (340C) ASTM (D1929)
AUTOIGNITION: 716F (380C)
FLAMMABILITY LIMITS (% by volume in air): Lower: NA Upper: NA
EXTINGUISHING MEDIA:
C02, dry chemical, foam and water fog

NFPA RATINGS: Health 1; Flammability 1; Reactivity 0.

FIRE FIGHTING INSTRUCTIONS:

This material will burn although it is not easily ignited. For fires involving this material, do not enter any enclosed or confined fire space without proper protective equipment, including self-contained breathing apparatus (NIOSH SCBA).

If possible, water should be applied as a spray from a fogging nozzle since this is a surface burning material. The application of high velocity water will spread the burning surface layer.

COMBUSTION PRODUCTS:

Normal combustion forms carbon dioxide, water vapor and may produce carbon monoxide, original monomer, other hydrocarbons and hydrocarbon oxidation products, depending on temperature and air availability.

---

6. ACCIDENTAL RELEASE MEASURES

CHEMTREC EMERGENCY NUMBER (24 hr): (800)424-9300 or (703)527-3887
International Collect Calls Accepted

ACCIDENTAL RELEASE MEASURES:

Sweep up material and place in a disposable container. If liquid material is spilled, allow it to cool and solidify before proceeding with disposal methods. Contain spill and control dusts. Keep out of water sources and sewers. Spilled pellets can create slipping hazard. Sweep or vacuum up spill and place in drums for recovery or disposal.

---

7. HANDLING AND STORAGE

Avoid contact of heated material with eyes, skin, and clothing. Avoid breathing vapor or fumes from heated material.

Bulk storage of polyethylene pellets may result in accumulation of ethylene gas with possible explosion potential. Keep concentrations of ethylene gas below the lower explosive limit (LEL) of 2.7%.

Airborne dust concentrations above 20 mg/l may create a dust explosion hazard. Avoid inhalation of product dust (fines). Avoid eye contact with product dust. Avoid inhalation of, and eye contact with, off gases which may be produced during thermal processing. Do not get molten material in eyes, on skin or on clothing. Process only with adequate ventilation. Wash thoroughly after handling. Launder exposed clothing before reuse.

Thermal decomposition processing off gas condensate may form on surrounding equipment. Impervious gloves and apron should be used when cleaning condensate from equipment.
Store away from heat or flames.

Molten polymer may cause severe thermal burns. The interior of molten masses may remain hot for some time because of low thermal conductivity of the polymer. Use care when disposing of or handling such masses.

Spilled pellets may create a slipping hazard.

Avoid contaminating soil or releasing this material into sewage and drainage systems and bodies of water.

Bond and ground all containers and equipment before transfer operations to prevent electrostatic accumulation hazard.

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

GENERAL CONSIDERATIONS:
Consider the potential hazards of this material (see Section 3), applicable exposure limits, job activities, and other substances in the work place when designing engineering controls and selecting personal protective equipment. If engineering controls or work practices are not adequate to prevent exposure to harmful levels of this material, the personal protective equipment listed below is recommended. The user should read and understand all instructions and limitations supplied with the equipment since protection is usually provided for a limited time or under certain circumstances.

ENGINEERING CONTROLS
Use in a well-ventilated area. If heated material generates vapor, or fumes, use process enclosures, local exhaust ventilation, or other engineering controls to control exposure. Ventilation requirements must be locally determined. If handling results in dust generation, special ventilation may be needed to ensure that dust exposure does not exceed the OSHA PEL for nuisance dust.

PERSONAL PROTECTIVE EQUIPMENT
EYE/FACE PROTECTION:
Wear safety glasses with side shields when working with this material as a good safety practice. If this material is heated, wear chemical goggles or safety glasses and a face shield.
VENTILATION:
Use adequate ventilation to control below recommended exposure levels. Supplemental ventilation may be needed to control off gases which may be produced during thermal processing.
SKIN PROTECTION:
Wear protective clothing to minimize skin contact as a good industrial hygiene practice. Selection of protective clothing will depend on operations conducted. Use heat resistant gloves when handling hot material. Use impervious gloves and apron when cleaning thermal decomposition processing off gas condensate from equipment.Consider physical requirements and other substanceswhen selecting protective clothing.
RESPIRATORY PROTECTION:
No special respiratory protection is normally required. When cutting or abrading these materials use a respirator approved by IOSH for protection against dust, mists and fumes having an exposure limit measured as a time weighted average (TWA) of not less than 0.05 mg/m3.When vapors or fumes from the heated material are not adequately controlled, wear a NIOSH/MSHA approved respirator. Use the following elements for air-purifying respirators: Organic Vapor and Formaldehyde.

NOTE: Personal protection information is based upon general information as to normal uses and conditions. Where special orunusual uses or conditions exist, it is suggested that the expertassistance of an industrial hygienist or other qualified professional be sought.

---

9. PHYSICAL AND CHEMICAL PROPERTIES

PHYSICAL DESCRIPTION:
Opaque, translucent, colorless pellets or fluff

pH:	NA
VAPOR PRESSURE:	NA
VAPOR DENSITY (AIR=1):	NA
BOILING POINT:	NA
MELTING POINT:	100 - 135C
SOLUBILITY:	Insoluble in water
SPECIFIC GRAVITY:	0.91 - 1.02
DENSITY:	0.910 - 0.970 g/cm3
EVAPORATION RATE:	NA
PERCENT VOLATILE (VOL):	0.01%

---

10. STABILITY AND REACTIVITY

HAZARDOUS DECOMPOSITION PRODUCTS:
Low molecular weight hydrocarbons, alcohols, aldehydes, acids, carbon oxides and ketones can be formed during thermal processing.

CHEMICAL STABILITY:
Stable.
CONDITIONS TO AVOID:
Avoid heating above the recommended processing temperature. Do not heat above the autoignition temperature. Do not heat without adequate ventilation.
INCOMPATIBILITY WITH OTHER MATERIALS:
May react with strong oxidizing agents, such as chlorates, nitrates, peroxides, etc. May react with free halogens.
HAZARDOUS POLYMERIZATION:
Polymerization will not occur.

---

11. TOXICOLOGICAL INFORMATION

EYE EFFECTS:
The eye irritation hazard is based on data for a similar material.
SKIN EFFECTS:
The skin irritation hazard is based on data for a similar material. The acute dermal toxicity is based on data for a similar material.
ACUTE ORAL EFFECTS:
The acute oral toxicity is based on data for a similar material.
ACUTE INHALATION EFFECTS:
The acute respiratory toxicity is based on data for a similar material.
ADDITIONAL TOXICOLOGY INFORMATION:
A similar material did not cause skin sensitization in a patch test study with human subjects.

This product contains polymerized ethylene. During thermal processing, this polymer can degrade. The three variables which control its degradation are the temperature, the length of time at that temperature, and the amount of oxygen available. Depending on the local processing conditions, a variety of low molecular weight hydrocarbons, alcohols, aldehydes, acids, and ketones can be formed. These materials are respiratory irritants. Prolonged and repeated breathing of fume components has been shown to cause other adverse health effects. Exposure to processing emissions should be minimized by following all recommendations in this MSDS.

---

12. ECOLOGICAL INFORMATION

ECOTOXICITY:
Fish or birds may eat pellets which may obstruct their digestive tracts.
ENVIRONMENTAL FATE:
This material is not expected to be readily biodegradable.

---

13. DISPOSAL CONSIDERATIONS

Place contaminated materials in disposable containers and dispose of in a manner consistent with applicable regulations. Contact local environmental or health authorities for approved disposal of this material. Recover for reuse,

recycle, incinerate for energy or place in waste management facility. Prior to disposal, consult your environmental contact to determine if the TCLP (Toxicity Characteristic Leaching Procedure, EPA Test Method 1311) is required. Reference 40 CFR Part 261.

---

14. TRANSPORT INFORMATION

The description shown may not apply to all shipping situations. Consult 49CFR, or appropriate Dangerous Goods Regulations, for additional description requirements (e.g., technical name) and mode-specific or quantity-specific shipping requirements.

DOT SHIPPING NAME: NOT DESIGNATED AS A HAZARDOUS MATERIAL BY THE FEDERAL DOT

To Whom It May Concern:

Chevron Phillips Chemical Company can state that Marlex® 7104 Polyethylene, Marlex® K306 Polyethylene, and Marlex® K307 Polyethylene, as shipped, do not contain per- and polyfluoroalkyl substances (PFAS).

These substances are not used in the formulation of these products.

Sincerely,

John Marek

SHAW PFAS STATEMENT –
ClosureTurf® Products

To Whom It May Concern:

Shaw has a longstanding commitment to sustainability and the responsible manufacture of our products. This includes a strong focus on the material chemistry of our products.

Based on information provided to date by suppliers, Shaw does not use any PFAS chemicals currently listed as part of California's Proposition 65 regulations or identified as part of USEPA's Method 537 to manufacture the components of its ClosureTurf® products, including the fibers and backing materials. This information is confirmed through independent, third party laboratory testing of the finished product; thus, a copy of the most recent laboratory test results for the ClosureTurf products is provided for your convenience and reference.

If you should have any questions, please do not hesitate to contact the undersigned at 706-532-2185, or by email at troy.virgo@shawinc.com.

Sincerely,

Troy Virgo

ClosureTurf® and Wildlife Fact Sheet and Hydrostatic Puncture Test Report

ClosureTurf and Wildlife

April 15, 2020

Birds

1. ClosureTurf® has low attraction to birds since it does not provide them with habitat or a food source. Birds are present at most sites where ClosureTurf is installed. There is typically an increase in bird population for sites with an open working face because the active waste disposal provides a source of food.

2. Based on field observations by Watershed Geo and site owners, bird damage is very limited and easily repaired. On a few sites, bird damage has been observed in localized areas. These may include areas where water has ponded, where birds typically perch, and around landfill gas wellheads. Also, it appears that the birds target the black geotextile backing of the engineered turf layer, rather than the green synthetic turf fibers or the underlying geomembrane. For sites that attract birds (i.e., with a working face), potential bird damage may be mitigated by maintaining coverage of the exposed geotextile backing, if any, with sand and/or HydroBinder infill. For example, bird damage around a landfill gas wellhead can be repaired and prevented by infilling the engineered turf in that area with the HydroBinder infill, which has compressive strength of 5,000 psi.

3. Bird damage, if it occurs, does not affect performance of ClosureTurf as follows:
   a) it is limited to localized areas (e.g., most times around landfill gas wellheads, ponded water, or berms where the birds can perch);
   b) it occurs only to the engineered turf, not the underlying geomembrane; and
   c) it can be immediately identified and easily repaired by patching and infilling.

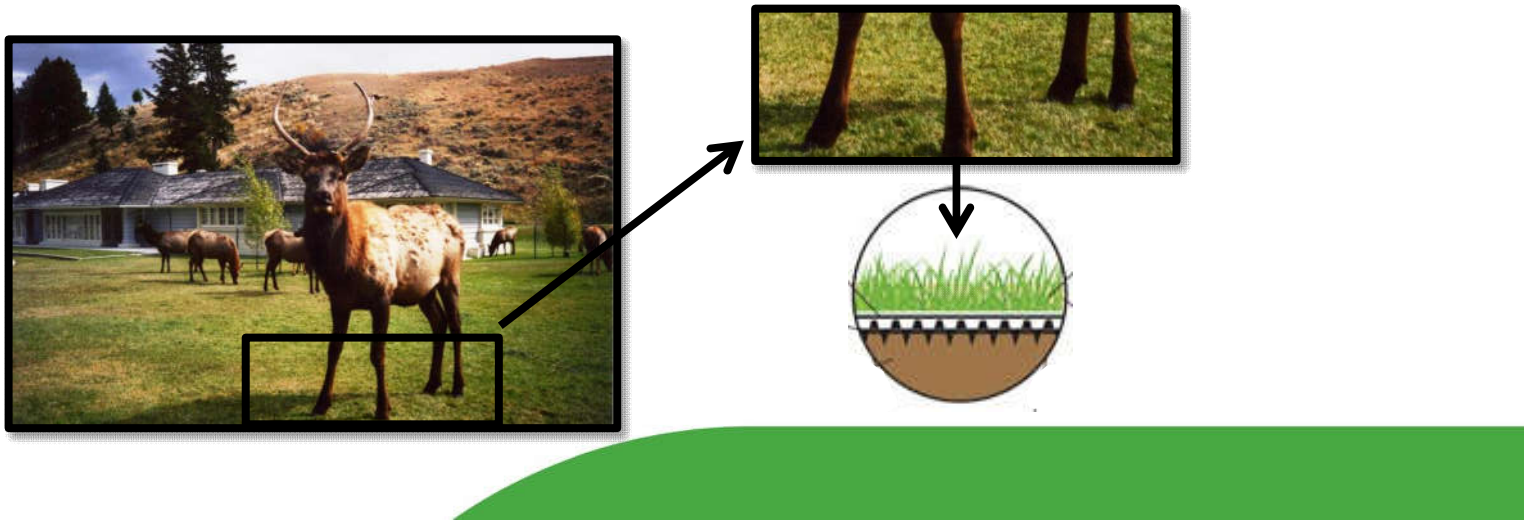
Burrowing Animals

1. There is no soil layer, therefore there is no effective habitat for a burrowing animal. A burrowing animal, e.g., rodents, would be unlikely to spend any significant time on top of ClosureTurf® due to the lack of food sources, effective cover, and/or shielding from predators (i.e., birds of prey).

2. To date, with 2,000+ acres of ClosureTurf installed/being installed across multiple climate zones in the U.S. and Canada, there is no evidence of any burrowing animal activity.

3. If by chance evidence of burrowing was discovered, it is easily repaired due to the lack of soil.

Hoofed Animals



1. Hoofed animals (e.g., deer) have been spotted at ClosureTurf® sites. However, they usually do not spend any significant time on ClosureTurf due to the lack of food sources. To date, no damage has been reported due to activities of hoofed animals.
2. Unlike exposed geomembrane that is subject to damage by animal hoofs, the structured geomembrane of ClosureTurf is protected by the sand infill and engineered turf:
   a) The sand infill and engineered turf act as buffers to prevent direct contact of the hoofs with the underlying geomembrane;
   b) The sand infill dissipates the contact pressure from the hoofs and reduces their impact on both the engineered turf and geomembrane;
   c) The engineered turf consists of two layers of 6 oz/yd^2 woven geotextile that serve as an additional cushion to protect the underlying geomembrane; The CBR puncture resistance of the engineered turf is greater than 1,500 lbs (See **Attachment 1** for the ClosureTurf product data sheet); and
   d) The results of hydrostatic puncture testing show that no punctures or holes on the geomembrane were observed under a loading pressure of 85 psi (see **Attachment 2** for the test report).
3. Damage due to hoofed animals, if it occurs, can be immediately identified and easily repaired.

Hoofed Animals

Estimate of ground contact pressure from animal hoofs:

1. Assumptions:
   a) An adult bull elk weighs approximately 1,200 lbs, which is approximately 300 lbs per hoof; and
   b) A hoof size is about 4 in by 4.5 in and therefore, the contact area is about 18 in^2.
2. The ground contact pressure is estimated to be 16.7 psi (assuming all four hoofs on ground) or 33.4 psi (assuming two hoofs on ground). Note the latter represents a temporary situation.
3. The estimated ground contact pressures are less than the allowable loading limits of ClosureTurf suggested by WatershedGeo, i.e., 35 psi for slopes greater than 15% and 85 psi for slopes less than 15% (see **Attachment 3**).

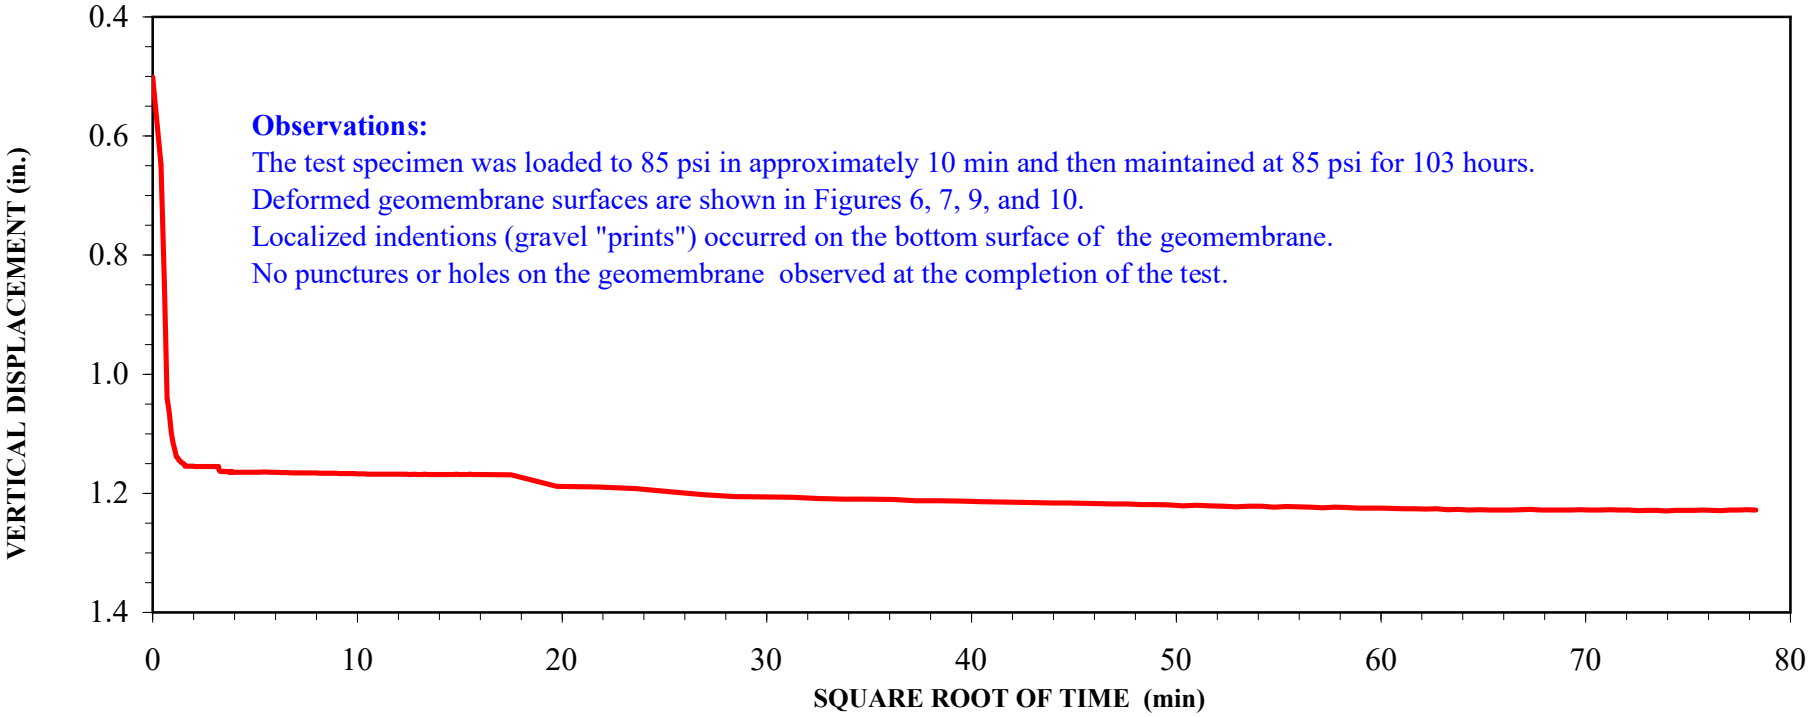
Nothing herein is to be construed as permission or as a recommendation to infringe any patent.

Attachment 2



Hydrostatic Puncture Test Report

Notes:

1. The testing was performed on the HydroTurf sample; however, the test results are applicable to ClosureTurf because they both consist of structured geomembrane and engineered turf.
2. The testing was performed on a 40-mil MicroSpike geomembrane. If a thicker (i.e., 50-mil) MicroDrain or Super Gripnet geomembrane is used in ClosureTurf, the puncture performance is expected to be better.
3. The testing was performed at the maximum loading of 85 psi. Since no punctures or holes were observed, the ultimate static puncture strength of the system was not reached and therefore, should be greater than 85 psi.

Attachment 3

ClosureTurf Loading Limits

(Excerpts from WatershedGeo ClosureTurf Installation Specification)

removal of selvage.

8. Any damage that occurs due to production seaming will be repaired as outlined in WG Installation Guidance Documents.

9. Any defects will be repaired as outlined in Section 3.14.

3.09 EQUIPMENT ON THE TURF:

A. During Construction:

1. On slopes exceeding 15%:

   a. No equipment will be allowed until Sand Infill is in place.

2. On slopes less than 15%:

   a. ATV type vehicles will be allowed prior to infill placement if the tire /track ground contact pressure is less than 5 psi.

B. Post construction (full specified sand infill thickness)

1. On slopes exceeding 15%

   a. Temporary or transient loads, allowable tire/track ground contact pressures will be limited to less than 35 psi
   b. Regularly trafficked areas will be designed and approved by the POR and/or CQA Engineer

2. On slopes less than 15%:

   a. Temporary or transient loads, allowable tire/track ground contact pressures will be limited to less than 85 psi
   b. Regularly trafficked areas will be designed and approved by the POR
   c. Allowable tire/track ground contact pressures may be increased with the written approval of the POR and/or CQA Engineer.

C. Any activity that may be identified during the course of construction by the POR, OWNER'S REPRESENTATIVE, or CQA PERSONNEL as being a possible danger to the integrity of the ClosureTurf® system will prohibited regardless of any prior approval.

Note to Author: The above suggested equipment load limits are based on assumptions that: (1) the subgrade is firm and unyielding and able to support the equipment without creating rutting or bearing capacity issues; and (2) the subgrade is free of sharp rock fragments or stones, large stones and other deleterious matter such as tree roots, construction debris and metallic objects that could cause damage to ClosureTurf. The CQA Engineer should verify the subgrade conditions and approve the suggested equipment load limit.

3.10 SAND BALLAST INFILL PLACEMENT

A. Sand infill that is placed between the tufts of the Engineered Turf Component:

1. The sand infill layer will be placed to a ½ inch minimum thickness not to exceed ¾ inch thick.

2. Will consist wholly of sand meeting Section 31 05 16, ClosureTurf® SAND INFILL COMPONENT.

3. CQA PERSONNEL shall check final thickness of sand infill at a rate of approximately 20 times per acre.

B. ClosureTurf® Sand Infill Grain Size Parameters are shown in Section 31 05 16 – Table 1.

1. CQA PERSONNEL shall observe that the following requirements regarding Sand Infill are met:

   a. Installation of sand infill will only be performed by a Watershed Geosynthetics' licensed and approved installer.
   b. Areas that are to receive sand infill must be accepted by the POR or CQA PERSONNEL before placement of sand infill takes place.

C. CQA PERSONNEL shall observe:

1. The sand infill is worked into the Engineered Turf between the synthetic yarn

1.0 Introduction

The City of Ukiah (City), Department of Public Works - Solid Waste Division, has prepared this Environmental Impact Report (EIR) in accordance with the California Environmental Quality Act (CEQA) to provide the public and responsible agencies with information about the potential environmental effects of the City's proposed Ukiah Landfill Closure Project (Proposed Project/Project). The Findings of Fact (Findings) presented herein address the environmental effects associated with the Proposed Project that are described and analyzed within the Final EIR. These Findings have been made pursuant to California Environmental Quality Act (CEQA; California Public Resources Code Section 21000 et seq.), specifically Public Resources Code Sections 21081 and 21081.6, as well as the CEQA Guidelines (14 CCR 15000 et seq.) Sections 15091 and 15093.

Public Resources Code Section 21081 and CEQA Guidelines Section 15091 require that the City as the Lead Agency for this Project, prepare written findings for any identified significant environmental effects along with a brief explanation of the rationale for each finding. Specific findings under CEQA Guidelines Section 15091(a) are:

1. Changes or alterations have been required in, or incorporated into, the project which avoid or substantially lessen the significant environmental effects as identified in the Final EIR.
2. Such changes or alterations are within the responsibility and jurisdiction of another public agency and not the agency making the finding. Such changes have been adopted by such other agency or can and should be adopted by such other agency.
3. Specific economic, legal, social, technological, or other considerations, including provision of employment opportunities for highly trained workers, make infeasible the mitigation measures or project alternatives identified in the Final EIR.

Further, in accordance with Public Resources Code Section 21081 and CEQA Guidelines Section 15093, whenever significant effects cannot be mitigated to below a level of significance, the City as the decision-making agency is required to balance, as applicable, the benefits of the project against its unavoidable environmental risks when determining whether to approve the project. If the benefits of a project outweigh the unavoidable adverse environmental effects, the adverse effects may be considered "acceptable," in which case the lead agency must adopt a formal statement of overriding considerations.

The Final EIR identified potentially significant environmental effects that could result from construction and implementation of the Proposed Project. Those effects were related to air quality, biological resources, and cultural, paleontological and tribal resources. However, with the implementation of appropriate mitigation measures identified in the Draft EIR and the Mitigation Monitoring and Reporting Program (MMRP) in the final EIR, all of the potential impacts could be avoided and/or reduced to less-than-significant levels. The Draft and Final EIR did not find any significant unmitigable impacts and thus a statement of overriding considerations is not necessary nor required.

2.0 Project Goals and Objectives

The overall purpose of the Proposed Project is to close the Ukiah Landfill in accordance with the applicable regulatory standards. Specifically, the components and systems required for closure of the landfill include the final cover and grading design to control stormwater, potential infiltration and accommodate future settlement, landfill slope stability, construction quality assurance, drainage and erosion control systems, landfill gas control and monitoring systems, groundwater/surface water monitoring systems, and site security.

3.0 Project Description

As described in Chapter 2, Project Description of the Draft EIR, the Ukiah Landfill is located approximately three miles east of the City of Ukiah within the unincorporated area of Mendocino County. The Landfill is an approximately 40-acre part of a 283.5-acre parcel of land and has a physical address of 3100 Vichy Springs Road, Ukiah, California in the southeast ¼ of Section 10, Township 15 north, Range 12 west, Mount Diablo Base and Meridian. The property is further identified by Mendocino County Assessor's Parcel Number 178-130-01.

Closure of the Ukiah Landfill will be performed in accordance with the applicable regulatory standards. The components and systems required for closure of the landfill include the final cover and grading design to control stormwater, potential infiltration and accommodate future settlement, landfill slope stability, construction quality assurance, drainage and erosion control systems, LFG control and monitoring systems, groundwater/surface water/leachate monitoring systems, and site security. As outlined in 27 CCR, §20950, the primary performance goal for final closure is to minimize the infiltration of water into the waste, thereby minimizing the production of leachate and LFG. The proposed final cover design for the Landfill areas will consist of the following layers, from top to bottom:

- Minimum 5/8-inch thick sand infill layer;
- Specialized tufted geotextile;
- 50-millimeter linear low-density polyethylene (LLDPE) geomembrane liner; and
- A minimum two-foot thick foundation layer.

This final cover design for the Landfill areas is an engineered alternative final cover consistent with 27 CCR, §20080.

4.0 Purpose of the EIR

The purpose of this EIR is to provide the public and responsible and trustee agencies with information about the potential environmental effects of the Proposed Project. This Draft EIR was prepared in compliance with the California Environmental Quality Act (CEQA) (Public Resources Code Section 21000et seq.) of 1970 (as amended), and the CEQA Guidelines (California Code of Regulations, Title 14). As described in CEQA guidelines Section 15121(a), an EIR is a public information document that assesses potential environmental effects of the Proposed Project, and identifies mitigation measures and alternatives to the Proposed Project that would reduce or avoid adverse environmental impacts. CEQA requires that state and local government agencies consider the environmental consequences of projects over which they have discretionary authority.

5.0 Findings of Fact

Having received, reviewed, and considered the information in the Draft and Final EIR for this Project, as well as the supporting administrative record, the City hereby makes findings pursuant to, and in accordance with, Sections 21081, 21081.5, and 21081.6 of the Public Resources Code.

5.1 Environmental Effects Found Not to be Significant

Through the preparation of the Draft 2016 Initial Study/Mitigated Negative Declaration (IS/MND) it was determined that an EIR should be prepared for this Proposed Project. Subsequently and through project scoping and the environmental analysis contained within the Draft and Final EIR, it was determined that the Proposed Project would not result in a potential significant effect on the environment with respect to aesthetics/visual resources; agricultural and forestry resources; energy resources; geology, soils, and

seismicity; greenhouse gases; hydrology and water quality; hazards and hazardous materials; toxic air contaminants; land use and planning; mineral resources; noise; population and housing; public services; recreation; traffic and transportation; utilities and service systems; wildfire; growth inducing effects; and cumulative effects. A summary of the reasons for this determination can be found in the Draft and Final EIR. No further findings are required for these subject areas.

5.2 Findings for Significant but Mitigated Effects

The following findings have been made for the significant environmental effects identified in the Draft EIR related to air quality; biological resources; and cultural, paleontological, and tribal resources.

Air Quality

Implementation of the Proposed Project could result in temporary potentially significant impacts to air quality as follows:

> **Impact 3.2-2: Construction of the Proposed Project Could Result in a Cumulatively Considerable Net Increase of any Criteria Pollutant Under an Applicable Federal or State Ambient Air Quality Standard.**
>
> **Impact 3.2-6: Would Construction of the Proposed Project Result in Other Emissions (Such as Naturally Occurring Asbestos) Adversely Affecting a Substantial Number of People.**

Finding:

Changes or alterations have been required in, or incorporated into, the Proposed Project which would avoid or substantially lessen the significant environmental effect as identified in the Draft EIR. (*Section 15091(a)(1)*).

Mitigation Measures:

Pursuant to CEQA Guidelines Section 15091, the following mitigation measures have been included in the Mitigation Monitoring and Reporting Program (MMRP) that is to be adopted concurrently with these findings.

> **Mitigation Measure 3.2-1: Fugitive Dust Control Measures***:* The following airborne dust control measures shall be required during all construction operations, grading of roads, or the clearing of land (MCAQMD Rule 1-430- Fugitive Dust Emissions):
>
> - All visibly dry disturbed soil road surfaces shall be watered to minimize fugitive dust emissions.
> - All unpaved surfaces, unless otherwise treated with suitable chemicals or oils, shall have a posted speed limit of 10 miles per hour.
> - Earth or other material that has been transported by trucking or earth moving equipment, erosion by water, or other means onto paved streets shall be promptly removed.
> - Asphalt, oil, water or suitable chemicals shall be applied on materials stockpiles, and other surfaces that can give rise to airborne dusts.
> - All earthmoving activities shall cease when sustained winds exceed 15 miles per hour.
> - The operator shall take reasonable precautions to prevent the entry of unauthorized vehicles onto the site during non-work hours.
> - The operator shall keep a daily log of activities to control fugitive dust.

Mitigation Measure 3.2-6: Develop and Submit NOA Dust Mitigation Plan. Prior to construction of the Proposed Project (if an exemption is not granted because it is determined that NOA is not found on the project site), the City shall submit a NOA Dust Mitigation Plan to the MCAQMD and comply with NOA requirements of the MCAQMD and Title 17 California Code of Regulations §93105. Specifically, the MCAQMD requires that the following control measures are implemented at the start and maintained throughout the duration of the construction or grading activity (one acre or greater), in accordance with Title 17 California Code of Regulations §93105:

- Submittal of an Asbestos Dust Mitigation Plan in accordance with Section 93105(e)(4)
- All Asbestos Dust Mitigation Plan requirements must be implemented and maintained throughout project.
- Stabilize disturbed areas after construction.
- Report and record all geologic survey and sampling analysis results.
- All fill removed from areas containing NOA must be disposed of in accordance with all applicable laws and regulations.
- Approved dust suppressants are to be used on all unpaved surfaces annually.
- Construction within ¼ mile of a school, hospital, or other sensitive receptors can occur only with a District permit.
- Discovery of NOA after start of a project requires stoppage of work, notification to the District and implementation of NOA requirements for the project size prior to restarting of work.
- All on-site workers must be notified of the presence or possible presence of NOA per OSHA requirements.

Significance after Mitigation:

With the incorporation of the above mitigation measures, significant environmental effects to air quality would be reduced to less-than-significant.

Biological Resources

Implementation of the Proposed Project could result in temporary potentially significant impacts to biological recourses as follows:

Impact 3.3-1: Construction of the Proposed Project could have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service.

Impact 3.3-3: Construction of the Proposed Project could have a substantial adverse effect on federally protected waters of the U.S. as defined by Section 404 of the federal Clean Water Act or protected waters of the state as defined by Section 1600 et seq. of the California Fish and Game Code (including, but not limited to, marshes, vernal pools, and coastal wetlands) through direct removal, filling, hydrological interruption, or other means.

Finding:

Changes or alterations have been required in, or incorporated into, the Proposed Project which would avoid or substantially lessen the significant environmental effect as identified in the Draft EIR. (*Section 15091(a)(1)*).

Mitigation Measures:

Pursuant to CEQA Guidelines Section 15091, the following mitigation measures have been included in the Mitigation Monitoring and Reporting Program (MMRP) that is to be adopted concurrently with these findings.

Mitigation Measure 3.3-1a: Conduct A Preconstruction Survey for Special Status Wildlife Species. A qualified biologist shall conduct a pre-construction survey for state and federal special status wildlife species no more than 10-days prior to construction. A combination of visual and trapping surveys may be performed with authorization from CDFW and/or USFWS. If a wildlife special species such as the western pond turtle, and/or the yellow-legged frog is found near any proposed construction areas, impacts on individuals and their habitat shall be avoided to the extent feasible. If occupied habitat can be avoided, an exclusion zone shall be established around the habitat and temporary suitable/authorized fencing shall be installed around the buffer area with "Sensitive Habitat Area" signs posted and clearly visible on the outside of the fence. If avoidance is not possible and the species is determined to be present in work areas, the biologist with approval and permits from CDFW may capture the wildlife special status species prior to construction activities and relocate them to nearby, suitable habitat a minimum of 300-feet from the work area. Exclusion fencing shall then be installed if feasible to prevent them from reentering the work area. For the duration of work in these areas, the biologist shall conduct regular follow-up visits during and throughout construction activities to monitor effectiveness.

Mitigation Measure 3.3-1b: Conduct Bird Breeding and Nesting Surveys. For construction activities that occur between February 1 and August 31, preconstruction breeding and nesting bird surveys shall be conducted by a qualified biologist prior to and within 3-days of any initial ground-disturbance activities to prevent birds from nesting between the survey and the start of construction. Typically, nesting birds can build a nest in approximately 4 days. Surveys shall be conducted within all suitable nesting habitat within 250-feet of the activity. All active, non-status passerine nests identified at that time shall be protected by a 75-100-foot radius minimum exclusion zone. Active raptor or special-status species nests shall be protected by a buffer with a minimum radius of 200-feet. CDFW and USFWS recommend that a minimum 500-foot exclusion buffer be established around active special-status species nests. The following considerations apply to this mitigation measure:

- Survey results are valid for 7-days from the survey date. Should ground disturbance commence later than 7-days from the survey date, surveys should be repeated. If no breeding birds are encountered, then work may proceed as planned.
- Exclusion zone sizes may vary, depending on habitat characteristics and species, and are generally larger for raptors and colonial nesting birds. Each exclusion zone would remain in place until the nest is abandoned or all young have fledged.
- The non-breeding season is defined as September 1 to January 31. During this period, breeding is not occurring and surveys are not required. However, if nesting birds are encountered during work activities in the non-breeding season, disturbance activities within a minimum of 50-feet of the nest should be postponed until the nest is abandoned or young birds have fledged.

Mitigation Measure 3.3-1c: Conduct a Bat Habitat Assessment of Trees: Removal of trees containing suitable bat roosting habitat comprised of cavities, crevices, and/or exfoliating bark, may cause direct mortality of roosting bats if removed during maternity season (April 15 to August 31) prior to self-sufficient volancy of pups, or in winter during torpor or hibernation (October 16 to February 28). Removal of larger mature trees has the potential of causing direct mortality of solitary tree-roosting species such as western red bat or hoary bat. Minimization Measures identified in Sections 1.3.7, and 1.3.8 will reduce these impacts to less than significant. However,

if the construction timing is changed and construction must occur between April 15 and August 31 or October 15 and February 29, a bat habitat assessment will be conducted.

For those trees with suitable potential habitat, presume presence of roosting bats, then conduct two-step tree removal during seasonal periods of bat activity, so that bats can safely abandon the tree prior to removal. These dates are:

A) between March 1 (or after evening temperatures rise above 45F and 72 hours after rains fall to less than 0.5-inches in 24 hours) and April 15 (maternity season), after which time non-volant pups are present in maternity roosts, and;

B) between September 1, after young are self-sufficiently volant, and October 15 (winter hibernation), or before evening temperatures fall below 45F, and 72 hours prior to onset of rains greater than 0.5-inches in 24 hours.

A qualified bat biologist experienced with two-step removal procedures is required to instruct and provide initial supervision of tree cutting crews on Day 1 so that they do not accidentally remove potential habitat features, which could result in direct mortality of bats. On Day 2, the day following trimming and removal of non-habitat roost features on habitat trees, the tree is removed. Any new tree cutting crew members added to the crew will require instruction and initial supervision by a qualified bat biologist.

Mitigation Measure 3.3-1d: Environmental Awareness Training. All construction personnel shall be given environmental awareness training by the Proposed Project's environmental inspector or biological monitor before the start of construction. The training will familiarize all construction personnel with the federally listed species that may occur in the Action Area, their habitats, general provisions and protections afforded by the Endangered Species Act, measures to be implemented to protect these species, and the project boundaries. This training will be provided to any new worker before they are authorized to perform project work. As part of the environmental awareness training, construction personnel will be notified that no dogs or any other pets under control of construction personnel will be allowed in the Project Area, and that no firearms will be permitted in the Project Area, unless carried by authorized security personnel or law enforcement.

Mitigation Measure 3.3-1e: Biological Monitor. A CDFW -approved Biological Monitor will be present on site for all construction activities that occur within 100-feet of suitable habitats for state and/or federally listed species that may be present during the Proposed Project. The City will submit the Biological Monitor's qualifications to the CDFW for approval 30-days prior to project construction. The Biological Monitor will ensure that all applicable avoidance and minimization measures are implemented during project construction. Specifically, the Biological Monitor will also ensure that:

- All vehicles entering the site are free of debris that may harbor organisms that could be introduced to the site, such as vegetation or mud from other areas.
- Turbidity, sedimentation, and the release of materials such as dust or construction runoff are controlled, and that spill control measures are enacted properly.
- No state or federally listed species and/or their habitats experience unintended effects.

The Biological Monitor will have the authority to stop any work activities that could result in unintended adverse effects to covered species and/or their habitats.

Mitigation Measure 3.3-1f: Staging Areas and Access Routes. Placement of all staging areas, access roads, and other facilities will avoid and limit disturbance-sensitive habitats (e.g., riparian habitat, suitable habitats) as much as possible. All staging and material storage areas, including the locations where equipment and vehicles are parked overnight, will be placed outside of the flood

zone of a watercourse, away from riparian habitat or wetland habitat, and away from any other sensitive habitats. When possible, staging and access areas will be situated in areas that are previously disturbed, such as developed areas, paved areas, parking lots, areas with bare ground or gravel, and areas clear of vegetation.

Mitigation Measure 3.3-3a: Protect Jurisdictional Waters and Sensitive Habitat Areas. The City shall implement the following measures to protect jurisdictional waters and sensitive habitats.

- Request a verification of the pre-construction delineated boundaries from the Corps. Following verification of the delineation boundaries from the Corps, the City shall develop measures to avoid impacts to jurisdictional wetlands.
- After final design, quantify impacts to wetlands and other waters. Submit to the Corps a permit application for discharge of fill material into waters of her United States, pursuant to Section 404 of the Clean Water Act.
- Install and maintain appropriate erosion and sedimentation controls during and following construction.
- Obtain a streambed alteration agreement with the California Department of Fish and Wildlife, pursuant to Section 1601 of the Fish and Game Code, before initiating construction within the 100-year floodplain of any stream crossing.
- Develop and implement mitigation plans for impacts to wetlands. Replace eliminated wetlands at a 1:1 ratio so there is no net loss of wetlands. Temporarily impacted wetlands should be restored onsite. Stockpile topsoil removed from wetlands and store in upland landscape positions. Following construction disturbance, restore the land surface contours and backfill the top 6- to 12-inches with stockpiled topsoil.
- Following Project completion, monitor the site to assess mitigation success. Success criteria should be clearly defined for all measures implemented to mitigate for project impacts to wetlands. Yearly reports should be submitted to the Corps until implementation has been determined to be successful.

Significance after Mitigation:

With the incorporation of the above mitigation measures, significant environmental effects to biological resources would be reduced to less-than-significant.

Cultural, Paleontological, and Tribal Resources

Implementation of the Proposed Project could result in temporary potentially significant impacts to Cultural, Paleontological, and Tribal Resources as follows:

Impact 3-4.2: Construction of the Proposed Project could cause a substantial adverse change in the significance of an archaeological resource pursuant to CEQA Guidelines §15064.5.

Impact 3.4-3: Construction of the Proposed Project could directly or indirectly destroy a unique paleontological resource or site or unique geologic feature.

Impact 3.4-4: Construction of the Proposed Project could disturb any human remains, including those interred outside of formal cemeteries.

Impact 3.4-5: Construction of the Proposed Project could cause a substantial adverse change in the significance of a tribal cultural resource.

Finding:

Changes or alterations have been required in, or incorporated into, the Proposed Project which would avoid or substantially lessen the significant environmental effect as identified in the Draft EIR. (*Section 15091(a)(1)*).

Mitigation Measures:

Pursuant to CEQA Guidelines Section 15091, the following mitigation measures have been included in the Mitigation Monitoring and Reporting Program (MMRP) that is to be adopted concurrently with these findings.

Mitigation Measure 3.4-2: Halt Work if Cultural Resources are Discovered. In the event that any prehistoric or historic subsurface cultural resources are discovered during ground disturbing activities, all work within 100-feet of the resources shall be halted and after notification, the City shall consult with a qualified archaeologist to assess the significance of the find. If any find is determined to be significant (CEQA Guidelines 15064.5[a][3] or as unique archaeological resources per Section 21083.2 of the California Public Resources Code), representatives of the City and a qualified archaeologist shall meet to determine the appropriate course of action. In considering any suggested mitigation proposed by the consulting archaeologist in order to mitigate impacts to historical resources or unique archaeological resources, the lead agency shall determine whether avoidance is necessary and feasible in light of factors such as the nature of the find, project design, costs, and other considerations. If avoidance is infeasible, other appropriate measures (e.g., data recovery) shall be instituted. Work may proceed on other parts of the project site while mitigation for historical resources or unique archaeological resources is carried out.

Mitigation Measure 3.4-3: Stop Work if Paleontological Remains are Discovered. If paleontological resources, such as fossilized bone, teeth, shell, tracks, trails, casts, molds, or impressions are discovered during ground-disturbing activities, work will stop in that area and within 100-feet of the find until a qualified paleontologist can assess the significance of the find and, if necessary, develop appropriate treatment measures in consultation with the City.

Mitigation Measure 3.4-4: Halt Work if Human Remains are Found. If human remains are encountered during excavation activities conducted for the Proposed Project, all work in the adjacent area shall stop immediately and the Mendocino County Coroner's office shall be notified. If the Coroner determines that the remains are Native American in origin, the Native American Heritage Commission shall be notified and will identify the Most Likely Descendent, who will be consulted for recommendations for treatment of the discovered human remains and any associated burial goods.

Mitigation Measure 3.4-5: Halt Work if Tribal Cultural Resources are Discovered. In the event that any tribal cultural resources are discovered during ground disturbing activities, all work within 100-feet of the resources shall be halted and after notification, the City shall consult with a qualified archaeologist and local tribes to assess the significance of the find. If any find is determined to be significant as a unique tribal cultural resource, the City shall treat the resource with culturally appropriate dignity, taking into account the tribal cultural values and meaning of the resource, including to, but not limited to, the following:

- Protecting the cultural character and integrity of the resource;
- Protecting the traditional use of the resource; and
- Protecting the confidentiality of the resource.

In considering any suggested mitigation proposed by the consulting archaeologist and/or the appropriate tribe in order to mitigate impacts to any tribal cultural resources find, the City shall determine whether avoidance is feasible in light of factors such as the nature of the find, project design, costs, and other considerations. If avoidance is infeasible, other appropriate measures (e.g., data recovery) shall be instituted and coordinated with the appropriate tribe(s). Work may proceed on other parts of the project site while mitigation measures for tribal cultural resources or other unique archaeological resources are carried out.

Significance after Mitigation:

With the incorporation of the above mitigation measures, significant environmental effects to Cultural, Paleontological, and Tribal Resources would be reduced to less-than-significant.

5.3 Findings for Significant and Unavoidable Effects

Public Resources Code 21081 and 21081.5, and CEQA Guidelines Section 15093, require that the City balance economic, legal, social, technological, or other benefit(s) of a proposed project against its unavoidable environmental effects when determining to approve a project. If specific economic, legal, social, technological, or other benefit(s) outweigh the unavoidable adverse environmental effect, the adverse effects may be considered "acceptable".

The Proposed Project does not have any significant and unavoidable effects.

5.4 Mitigation Monitoring and Reporting Program and Project Design Features

As referenced above in the findings, a MMRP has been prepared for the project and is to be adopted concurrently with these findings and statement of overriding considerations pursuant to Public Resources Code Section 21081(a)(1). The MMRP is a separate stand-alone document that will be used by the City to track compliance with the project mitigation measures. The MMRP will remain available for public review during the compliance period, which includes pre-construction coordination, construction, and post-construction documentation.

6.0 Project Alternatives

CEQA requires that a reasonable range of feasible alternatives be evaluated in an EIR. The CEQA Guidelines, Section 15126.6, *Consideration and Discussion of Alternatives to the Proposed Project*, specify the following:

> "(a) Alternatives to the Proposed Project. An EIR shall describe a range of reasonable alternatives to the project, or to the location of the project, which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project, and evaluate the comparative merits of the alternatives. An EIR need not consider every conceivable alternative to a project. Rather, it must consider a reasonable range of potentially feasible alternatives that will foster informed decision-making and public participation. An EIR is not required to consider alternatives that are infeasible. The lead agency is responsible for selecting a range of project alternatives for examination and must publicly disclose its reasoning for selecting (and eliminating) those alternatives. There is no ironclad rule governing the nature or scope of the alternatives to be discussed other than the rule of reason. (*Citizens of Goleta Valley v. Board of Supervisors* (1990) 52 Cal.3d 553 and *Laurel Heights Improvement Association v. Regents of the University of California* (1988) 47 Cal.3d 376)."

With respect to the feasibility of alternatives, the CEQA Guidelines state, "among the factors that may be taken into account when addressing the feasibility of alternatives are site suitability, economic viability, availability of infrastructure, general plan consistency, jurisdictional boundaries, and whether an applicant can reasonably acquire, control or otherwise have access to the alternative site." The CEQA Guidelines also state that the alternatives discussion should not be remote or speculative and need not be presented in the same level of detail as the assessment of the Proposed Project.

Section 15126.6(b) of the CEQA Guidelines provides:

> (b) Purpose. Because an EIR must identify ways to mitigate or avoid the significant effects that a project may have on the environment (Public Resources Code Section 21002.1), the discussion of alternatives shall focus on alternatives to the project or its location which are capable of avoiding or substantially lessening any significant effects of the project, even if these alternatives would impede to some degree the attainment of the project objectives, or would be more costly.

The EIR finds that proposed project using the ClosureTurf cover does not have significant adverse environmental impacts, including on viewsheds from public or private property that the Compacted Clay and/or Geo Synthetic Clay Layers with Natural Vegetation could lessen or avoid. Accordingly, the analysis of this alternative properly considers whether the Proposed Project better achieves the project objectives and at less cost than the Proposed Project.

Section 15126.6 (e) of the CEQA Guidelines also requires the analysis of a No Project Alternative. The purpose of describing and analyzing a No Project Alternative is to allow decision-makers the opportunity to compare the impacts of approving the proposed project with the impacts of not approving the proposed project. The CEQA Guidelines state that the No Project Alternative is the circumstance under which the project would not proceed. If the No Project Alternative would not result in the preservation of existing conditions, the consequences of not approving the Proposed Project should also be discussed.

As detailed in Chapter 3 – Environmental Analysis of the Draft EIR and discussed above, the Proposed Project would have several potentially significant impacts to the environment. However, with the implementation of the identified and corresponding mitigation measures, all of the potentially significant impacts can be reduced to less-than-significant levels. CEQA Guidelines §15126.6(c) recommends that an EIR briefly describe the rationale for selecting the alternatives to be discussed. The following factors were considered in identifying and considering a reasonable range of alternatives to the Project:

- Does the alternative accomplish all or most of the primary Project objectives?
- Is the alternative feasible, from an economic, environmental, legal, social and technological standpoint?
- Does the alternative avoid or lessen any significant environmental effects of the Project?

To that end, the Draft EIR identified and considered the following alternatives:

- The CEQA required No Project Alternative
- Compacted Clay and/or Geo Synthetic Clay Layers with Natural Vegetation Closure Alternative
- Relocation of the Ukiah Landfill
- Alternative/Synthetic Specialized Tufted Geotextile Landfill Turf Cover Color

Consistent with CEQA, the City prepared a preliminary evaluation of these alternatives and eliminated all of the alternatives from further consideration, except for the CEQA required No Project Alternative. A summary of this evaluation and the rationale for the elimination of each alternative is disclosed in Chapter 4 of the Draft EIR. The No Action Alternative is not a legally feasible alternative as the Ukiah Landfill would not be properly closed according to state and local regulations and would be susceptible to slope instability, potential water quality impacts to surface water and groundwater resources due to inadequate cover leading to drainage and erosion issues during inclement weather/stormwater, and the potential for inadequate landfill gas control and monitoring leading to air quality issues and impacts. Under the No Action Alternative, the City would be potentially susceptible for a variety of water quality and air quality violations and fines. However, due to CEQA requirements, the No Project Alternative must still be evaluated against the Proposed Project.

Of particular concern to several commenters on the Draft EIR was the elimination of the Compacted Clay and/or Geo Synthetic Clay Layers with Natural Vegetation Closure Alternative. However, the Ukiah Landfill

is located on steep, 2:1 plus, slopes and the potential for a clay and/or geosynthetic clay layer alternative failure is unreasonably quite high. Such a failure could result in significant water quality issues to the unnamed creek alongside the Ukiah Landfill, which drains into Sulfur Creek and then the Russian River. Further, forensic analyses of a number of natural landfill cover slope failures over the last 20-plus years has shown that both Compacted Clay and Geosynthetic Clay Liners fail due to pore water pressure rise in saturated cover soils building up beneath the clay layers; particularly on steep slopes such as the conditions of the Ukiah Landfill. In short, the heavy clay layers assist in the probability of slope failure. Further, CalRecycle has approved numerous alternative landfill covers that are similar to the Proposed Project throughout the State of California and they have proven to be a viable alternative, especially on landfills with steep slopes.

From an environmental perspective, the Compacted Clay and/or Geo Synthetic Clay Layers with Natural Vegetation Closure Alternative would also cause a substantial increase in temporary construction impacts to air quality, noise, and traffic issues over the Proposed Project as it would require the need to excavate and/or import (transport) significant quantities of clay sources and natural vegetation cover soils of to the site and spread them over the 40-acre Ukiah Landfill. Also, from an operational standpoint, this alternative would result in increased maintenance impacts (and costs) from having to maintain the natural grass/vegetation to prevent fires and keep rodents from compromising the clay layer structure, which would then contribute to a substantial increase in traffic, air quality, noise, and other potential environmental impacts.

However, to avoid controversy over whether the Compacted Clay and/or Geo Synthetic Clay Layers with Natural Vegetation Closure is feasible, the City expanded upon its environmental evaluation of that alternative, without determining that it is infeasible. However, as allowed by Section 15126.6(b) of the CEQA Guidelines, the Final EIR takes into consideration whether this alternative would impede to some degree the attainment of the project objectives and would be more costly. Specifically, this alternatives analysis includes a detailed discussion of the Compacted Clay and/or Geo Synthetic Clay Layer Alternative against the Proposed Project and within each of the environmental resource areas/categories. The conclusions are the same. From an environmental perspective, the Compacted Clay and/or Geo Synthetic Clay Layers with Natural Vegetation Closure Alternative would cause an increase in temporary construction impacts to air quality, biological resources, water quality, and noise as compared to the Proposed Project as the alternative would require the need to excavate and/or possibly import (transport) significant quantities of clay sources and natural vegetation cover soils to the site and spread them over the 40-acre Ukiah Landfill. Also, from an operational standpoint, the Compacted Clay and/or Geo Synthetic Clay Layers with Natural Vegetation Closure Alternative would increase maintenance impacts (and costs) from having to maintain and repair slope failures as well as to maintain the natural grass/vegetation to prevent fires and keep rodents from compromising the clay layer structure, which would then contribute to increases in traffic, air quality, noise, and other potential environmental impacts over the Proposed Project.

This further evaluation of the Compacted Clay and/or Geo Synthetic Clay Layers with Natural Vegetation Closure Alternative as well as comments received on the Final EIR and the City's responses to those comments do not constitute "significant new information" which would require recirculation of the Draft EIR. Significant new information is defined:

(1) A new significant environmental impact would result from the project or from a new mitigation measure proposed to be implemented.

(2) A substantial increase in the severity of an environmental impact would result unless mitigation measures are adopted that reduce the impact to a level of insignificance.

(3) A feasible project alternative or mitigation measure considerably different from others previously analyzed would clearly lessen the environmental impacts of the project, but the project's proponents decline to adopt it.

(4) The Draft EIR was so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded.

None of these circumstances has arisen from this expanded evaluation and/or comments on the Draft EIR, the Final EIR or the response to those comments; therefore, recirculation is not required.

As a result, the Proposed Project and artificial cover alternative remains as the City's selected alternative because it has many advantages over the Compacted Clay and/or Geo Synthetic Clay Layer with Natural Vegetation Closure Alternative and the No Project Alternative as the Proposed Project provides: 1) A proven stable cover on steep slopes due to the elimination of low interface strength pore water pressure and gas relief layers, 2) Decreased exposure to construction-related air quality, noise, and traffic impacts and potential significant and unavoidable long-term water quality impacts to surface and groundwater resources which could lead to significant fines, and 3) significant lower capital and on-going/perpetual maintenance costs. As a result, the Compacted Clay and/or Geo Synthetic Clay Layer with Natural Vegetation Closure Alternative has been considered and evaluated pursuant to CEQA requirements, but is not selected as it does not perform as well as the Proposed Project. The No Project Alternative is not a legally implementable alternative. As a result, the Proposed Project remains the City's selected alternative and is also the Environmentally Superior Alternative.

7.0 Statement of Overriding Consideration

The Proposed Project does not have any significant and unavoidable effects. Therefore, the City does not need, nor is required, to prepare any Statements of Overriding Consideration.

8.0 Statement of Location and Custodian of Documents

Public Resources Code Section 21081.6(a)(2) requires that the City, as the Lead Agency, specify the location and custodian of the documents of other materials that constitute the record of proceedings upon which its decision has been based. The following location is where review of the record may be performed:

The City of Ukiah
300 Seminary Avenue
Ukiah, California 95482-5400

The City has relied on all of the documents contained within the record of proceedings in reaching its decision on the project.

RESOLUTION NO 2020-

RESOLUTION OF THE CITY COUNCIL OF THE CITY OF UKIAH ADOPTING AN ENVIRONMENTAL IMPACT REPORT, MITIGATION MONITORING AND REPORTING PROGRAM, AND CEQA FINDINGS OF FACT IN ACCORDANCE WITH THE CALIFORNIA ENVIRONMENTAL QUALITY ACT FOR THE PUBLIC WORK'S UKAH LANDFILL CLOSURE PROJECT

WHEREAS, the City of Ukiah (City) prepared an Environmental Impact Report for the Public Works Ukiah Landfill Closure Project (Proposed Project) in accordance with the requirements of the California Environmental Quality Act of 1970, as amended ("CEQA"), and state and local guidelines implementing CEQA; and

WHEREAS, the City is the CEQA Lead Agency on the Proposed Project, and the City Council is the decision-making body for the Proposed Project; and

WHEREAS, the City of Ukiah Landfill is located approximately three miles east of the City of Ukiah within the unincorporated area of Mendocino County; and

WHEREAS, waste disposal operations at the Ukiah Landfill began in 1955 at the eastern end of the landfill footprint and progressed upslope and westward; and

WHEREAS, the Ukiah Landfill occupies approximately 40-acres of a 283.5-acre parcel having a maximum width of approximately 1,000-feet in the north-south direction and a maximum length of about 3,500-feet in the east-west direction; and

WHEREAS, dwellings around the Ukiah Landfill property include a group of structures owned by the Vichy Springs Resort that are located within 500-feet of the City's south property line, but are well over 1,250 feet from the actual Ukiah Landfill area that is also separated visually by an elevation barrier/ridge; and

WHEREAS, the method of operation during the Landfill's operation was a fill and cover approach in a canyon/gully terrain; and

WHEREAS, the Landfill operated as a nonhazardous Class III solid waste disposal site servicing the City of Ukiah and the surrounding area; and

WHEREAS, the types of waste received included garbage, rubbish, demolition and construction waste, brush, stumps, large appliances diverted as scrap metal and street refuse; and

WHEREAS, the Landfill ceased operations in September 2001; and

WHEREAS, the City's Public Works Department oversees the City's efforts to properly close the landfill according to the applicable regulatory standards to protect the public health and safety and the environment; and

WHEREAS, since the closing of operations in 2001, the City and its engineer (EBA Engineers) have been working with the various regulatory agencies and has evaluated numerous alternatives; and

WHEREAS, the City has selected an engineered alternative using an synthetic tufted geotextile cover system instead of the clay layer and natural cover prescribed by 27 CCR § 21090

("prescriptive clay layer") as the Proposed Project due to a variety of environmental, technical and cost considerations resulting in part from being located on steep 2:1 vertical to horizontal slopes; and

WHEREAS, the City prepared an EIR to evaluate its potential impacts of the Proposed Project and evaluated project alternatives pursuant to CEQA; and

WHEREAS, the City issued a Notice of Preparation (NOP) of the EIR on February 2, 2017 (State Clearing House (SCH) #2017022009); and

WHEREAS, the NOP was circulated to the public, local, state, and federal agencies, and other interested parties to solicit comments on the Proposed Project during the 30-day comment period; and

WHEREAS, during the scoping period, the City held two (2) scoping meetings on February 15, 2017 to discuss the Proposed Project and to solicit public input on the scope and content of the EIR; and

WHEREAS, the NOP and comments received are available for review in the Public Draft EIR; and

WHEREAS, in accordance with Sections 15087 and 15105 of the State CEQA Guidelines, the Public Draft EIR was circulated for public review and comment to lead and responsible agencies, as well as members of the public, for 45- days (November 13 through December 31, 2019 and was then extended through January 9, 2020); and

WHEREAS, the Public Draft EIR disclosed that the construction of the Proposed Project would result in short-term/temporary construction related impacts that can be reduced to less-than-significant impacts with the implementation of mitigation measures and best construction practices as identified in the Public Draft EIR; and

WHEREAS, operations of the Proposed Project would also generally result in less-than-significant impacts and/or any potentially significant impacts that can be reduced to less-than-significant levels with the implementation of mitigation measures and best practices as identified in the Public Draft EIR; and

WHEREAS, in connection with the approval of a project involving the preparation of a Public Draft EIR that identifies one or more significant environmental effects, CEQA requires the decision-making body of the lead agency to incorporate feasible mitigation measures that would reduce those significant environment effects to a less-than-significant level; and

WHEREAS, the Proposed Project will not individually or cumulatively have an adverse effect on wildlife resources, as defined in Section 711.2 of the California Department of Fish and Game Code; and

WHEREAS, whenever a lead agency approves a project requiring the implementation of measures to mitigate or avoid significant effects on the environment, CEQA also requires a lead agency to adopt a Mitigation Monitoring and Reporting Program (MMRP) to ensure compliance with the mitigation measures during project implementation; and

WHEREAS, the Public Draft EIR found that the Proposed Project does not directly create or induce growth in the Ukiah area because it does not provide a significant number of additional permanent jobs nor does it approve land development; and

WHEREAS, the Public Draft EIR found that the Proposed Project would not have any cumulatively considerable effects; and

WHEREAS, the during the 45-day Public Review Period the City received four (4) comment letters – two (2) from public agencies and two (2) from Vichy Springs Resort on the Public Draft EIR; and

WHEREAS, none of the comments, nor the City's responses change any of the outcomes or conclusions in the Public Draft EIR which would require the re-circulation or cancellation of the Public Draft EIR; and

WHEREAS, the City prepared a Final EIR document that responded to all of the comments received during the 45-day public review period, responded where appropriate to late comments and comments on the Final EIR, and also prepared a Mitigation Monitoring and Reporting Program (MMRP) to ensure compliance with the identified mitigation measures identified and proposed in the Public Draft EIR, and

WHEREAS, all of the commenters on the Public Draft EIR have been given a copy of the Final EIR with the City's responses to those comments and have been invited to this City Council Meeting to express any issues and concerns they may have; and

WHEREAS, no public (or other) comments were received from the two public agencies in regard to the City's responses to their comments in the Final EIR;

NOW, THEREFORE, BE IT RESOLVED BY THE CITY COUNCIL OF THE CITY OF UKIAH AS FOLLOWS:

THAT THE CITY COUNCIL does hereby certify the EIR in compliance with CEQA and makeR the following findings: (1) it has independently reviewed, analyzed and based its decision on the whole of the record, which includes those items identified in Public Resources Code Section 21167.6(e), including, but not limited to, the Public Draft and Final EIR, the staff reports and other information in the administrative record. The City Council has considered the information contained therein, prior to acting upon or approving the Project, (2) the Public Draft and Final EIR prepared for the Proposed Project has been completed in compliance with CEQA and consistent with state and local guidelines implementing CEQA, and (3) the Public Draft and Final EIR represents the independent judgment and analysis of the City as lead agency for the Proposed Project. The City Council designates the City's Director of Public Works Department as the custodian of documents and records of proceedings on which this decision is based.

THAT THE CITY COUNCIL does hereby adopt the MMRP prepared for the Proposed Project.(Appendix A to the Final EIR). The Public Draft, Final EIR, and MMRP are: (1) on file with the City at its Public Works Department at 300 Seminary Avenue, Ukiah, California 95482 and (2) available for inspection by any interested person.

THAT THE CITY COUNCIL does hereby adopt the CEQA Findings of Fact that have been prepared for the Proposed Project. The CEQA Findings of Fact are: (1) on file with the City at its Public Works Department at 300 Seminary Avenue, Ukiah, California 95482 and (2) available for inspection by any interested person.

THAT THE CITY COUNCIL does hereby authorize the Director of Public Works to file the Notice of Determination with the California State Clearinghouse and the Mendocino County Recorder-Clerk, along with a check for $3,393 for the required California Fish and Wildlife Filing Fee ($3,343) and the Mendocino County Processing Fee ($50) within five (5) days of this resolution as required by CEQA.

THAT THE CITY COUNCIL does hereby adopt the Ukiah Landfill Closure Project, as currently written. The Public Works Integrated Master Plan is: (1) on file with the City at its Public Works

Department at 300 Seminary Avenue, Ukiah, California 95482 and (2) available for inspection by any interested person.

PASSED AND ADOPTED on May 6, 2020, by the following roll call vote:

AYES:

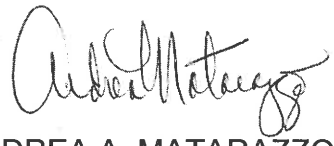
405 West Perkins Street
Ukiah, California 95482

Re: City of Ukiah Landfill Closure Project, 3100 Vichy Springs Road
Our File No. 5364-001

Dear Mr. Rapport:

As you requested, our office reviewed the Environmental Impact Report ("EIR") for the proposed closure plan for the City's landfill located at 3100 Vichy Springs Road, as well as comments received from attorneys representing the Vichy Springs Resort, Russian Riverkeeper, and the Mateel Environmental Justice Foundation, and a memorandum in response to those comments prepared by Environmental Science Associates ("ESA").



The attorneys' comment letter objected to approval of the landfill closure plan as proposed and asserted a variety of reasons for the challenge. ESA's technical memorandum evaluated and responded to each of the allegations made in the attorneys' comment letter. Our review and evaluation of these documents concludes that the EIR satisfies the requirements of the California Environmental Quality Act ("CEQA"), while the attorneys' comments disregard fundamental CEQA principles regarding the existing environmental baseline (CEQA Guidelines, § 15125(a); ; the City's duties under CEQA's standards of reasonableness and feasibility (e.g., CEQA Guidelines, §§ 15151, 15204, *Dry Creek Citizens Coalition v. County of Tulare* (1990) 70 Cal.App.4th 20, 26); the regulatory framework in which the closure plan will be implemented and monitored (see, e.g., CEQA

Guidelines, §§ 15064, 15064.7; 27 CCR, § 20950); and the definition of substantial evidence (CEQA Guidelines, § 15384), among others.

The opinion letter and other material submitted with the attorneys' comments make a variety of inaccurate and unsubstantiated assertions focused primarily on the suitability of the specialized tufted geotextile (ClosureTurf® Final Cover System, manufactured by Watershed Geosynthetics) proposed for the landfill cover.[1] Inaccurate and unsubstantiated comments and assertions do not constitute evidence, much less that which is considered substantial. Even if they did, the mere presence of conflicting opinions from purported experts is not sufficient to invalidate the analysis in an EIR.

ESA's detailed evaluation of the attorneys' comments and the evidence in the City's record as a whole demonstrate that the attorneys' comments identify no fundamental defect or inadequacy in the EIR and present no substantial evidence of a new or substantially more severe environmental impact of the project that would require revision and recirculation of the EIR. (CEQA Guidelines, § 15088, 15088.5.)

Very truly yours,
PIONEER LAW GROUP, LLP

ANDREA A. MATARAZZO

AAM:sr

---

1 / The ClosureTurf® Final Cover System has been approved and is in use in several other California locations, including but not limited to the Salinas Valley Solid Waste Authority's Crazy Horse Sanitary Landfill in Monterey County, the City of Portola's Class III Municipal Solid Waste Landfill in Plumas County, and the George Air Force Base Landfill Closure in San Bernardino County. (https://watershedgeo.com/closureturf-projects/closureturf-projects-in-california/.) The final cover design proposed for the City of Ukiah Landfill Closure Project likewise is an engineered alternative cover consistent with 27 CCR, § 20080.

City of Ukiah

AGENDA SUMMARY REPORT

SUBJECT: Conduct a Public Hearing to Consider Adoption of a Resolution Authorizing Submittal of an Application in Response to the 2020 State Community Development Block Grant Program - Coronavirus Response Round 1 Notice of Funding Availability; and Approve Corresponding Budget Amendments if Awarded the Grant.

DEPARTMENT: Community Development

PREPARED BY: Craig Schlatter, Community Development Director

PRESENTER: Craig Schlatter, Community Development Director

ATTACHMENTS:
1. CDBG-CV1 NOFA
2. CARES-Programs-for-CDBG-Grantees-Enterprise
3. CDBG-CV1 Jurisdiction Allocations
4. Resolution- 2020 CDBG-CV1 application

Summary: Council will conduct a public hearing to consider and possibly adopt a resolution authorizing the submittal of an application in response to the 2020 State Community Development Block Grant Program - Coronavirus Response Round 1 Notice of Funding Availability.

Background: On June 5, 2020, the State Department of Housing and Community Development (HCD) announced the availability of $18.7 million in new federal funds for the Community Development Block Grant Coronavirus Response Round 1 (CDBG-CV1) for local assistance through a Notice of Funding Availability (NOFA) (Attachment 1). HCD began accepting applications beginning June 8, 2020, with applications and required documentation due by August 31, 2020. Funding for the NOFA was made available pursuant to the Coronavirus Aid, Relief, and Economic Security (CARES) Act signed into law March 27, 2020.

State CDBG Citizen Participation regulations require a public hearing to adopt a resolution authorizing submittal of an application, or applications, to HCD. That is the purpose of this public hearing.

CDBG-CV1 Eligible Activities and Threshold Requirements

The CDBG-CV1 NOFA provides funding for the following activities: assistance to businesses and microenterprises impacted by COVID-19 stay-at-home orders and shut-downs; public services related to COVID-19 support; facility improvements related to COVID-19 healthcare and homeless housing needs; and acquisition of real property to be used for the treatment or recovery of infectious diseases in response to COVID-19. Funds must be used to meet the national objective of benefit to low- to moderate-income (LMI) individuals and/or households.

CDBG-CV1 funds cannot be used where a "Duplication of Benefits" occurs- i.e. "when a program beneficiary receives assistance from multiple sources for a cumulative amount that exceeds the total need for a particular funding need." For this reason, jurisdictions must be careful in their deployment of CDBG-CV1 funds. Please

see Attachment 2 for a list of other financial assistance sources that may preclude deployment of CDBG-CV1 funds.

Applicants can apply for up to three activities with the total request not exceeding the allocation limit per jurisdiction. The City's allocation per the NOFA is $108,757 (Attachment 3). Up to 17 percent of this allocation can be utilized for general administration. Because CDBG-CV1 funds are noncompetitive, provided the City's application is complete and meets threshold requirements, the City will receive an award of $108,757.

Discussion: Staff within the City Manager's Office/Emergency Management, Electric Utility Department, and Community Development Department discussed current priorities related to the COVID-19 pandemic. Identified was the need for an emergency sheltering facility within the city limits to assist healthcare providers meet the demand for services and support in the event of a surge in the number of COVID-19 patients. Such an emergency sheltering facility should also have the capacity to sustain services in the event of a Public Safety Power Shutdown (PSPS).

The City's conference center was identified as a possible emergency sheltering facility but would need to be improved with a generator in the event of a PSPS or other disaster causing a power outage. Staff discussed the eligibility of a generator installation for CDBG-CV1 funds with HCD staff, and HCD staff confirmed the project would be eligible provided that it principally benefited LMI residents and could assist existing healthcare providers with increased capacity to respond to COVID-19. By having the City's conference center operational to handle emergency sheltering and support during a PSPS, the hospital is able to more fully focus on responding to the COVID-19 crisis, improving capacity. The conference center is located within a census tract/block group with more than 50% LMI area benefit, so the project is eligible per CDBG National Objective requirements.

Staff Recommendation to Council

The following is requested and included in the attached Resolution (Attachment 4):

City of Ukiah Public Facility Improvement Project = not to exceed $90,269
General Administration = not to exceed $18,488
Total = not to exceed $108,757

To proceed with this recommendation, Staff requests Council 1) conduct a public hearing; and 2) adopt the Resolution in Attachment 4 authorizing an application be submitted to HCD for the above activities; and 3) approve corresponding budget amendments if the application is awarded.

Recommended Action: 1) Conduct a public hearing to consider approval of application submittal to the State Department of Housing and Community Development; and 2) adopt a resolution authorizing the submittal of a 2020 State Community Development Block Grant application and authorizing the City Manager to execute all related documents; and 3) approve corresponding budget amendments if awarded.

BUDGET AMENDMENT REQUIRED: If CDBG-CV1 grant awarded.

CURRENT BUDGET AMOUNT: N/A

PROPOSED BUDGET AMOUNT: $108,757: $18,488- General Administration; $90,269- City of Ukiah Public Facility Improvement Project

FINANCING SOURCE: CDBG-CV1

PREVIOUS CONTRACT/PURCHASE ORDER NO.: N/A

COORDINATED WITH: Mel Grandi, Electric Utility Director, Tami Bartolomei, Office of Emergency

Approved:

June 5, 2020

MEMORANDUM FOR: All Potential Applicants

FROM: Jennifer Seeger, Acting Deputy Director
Division of Financial Assistance

SUBJECT: Community Development Block Grant Program – Coronavirus Response Round 1 (CDBG-CV1) Notice of Funding Availability

The California Department of Housing and Community Development (Department) is pleased to announce the availability of approximately $18.7 million in new federal funds for the Community Development Block Grant Coronavirus Response Round 1 (CDBG-CV1) funding for local assistance. Funding for this Notice of Funding Availability (NOFA) is made available pursuant to the Coronavirus Aid, Relief, and Economic Security (CARES) Act signed into law March 27, 2020.

The Department will be accepting applications through the Grants Network portal beginning June 8, 2020. Applications and required documentation must be received by the Department no later than **Monday, August 31, 2020, 5:00 p.m. Pacific Daylight Time. Any applications received after this time will not be accepted.**

Applications will be reviewed and awarded as received. Applicants must submit their approved governing body resolution prior to the Department's execution of a Standard Agreement. The Department will not execute agreements without an approved governing body resolution that is acceptable to the Department. In the event that the CDBG-CV1 funds are not fully awarded by the application closing date, the Department will either allocate additional funding to active contracts that have met performance and timeliness milestones, or it will roll unawarded funds into subsequent rounds of CARES Act funding as appropriate and available.

Applicants are encouraged to set-up their profiles in the Grants Network portal located at https://portal.ecivis.com/#/login as early as possible. Profile set-up instructions can be found in the Grants Network portal, external user manual on the CDBG webpage at https://www.hcd.ca.gov/grants-funding/active-funding/cdbg.shtml.

Applicants are encouraged to begin the application process early to ensure successful submission before the application deadline. If you have any trouble logging into the portal or have questions on how to complete the online application, please contact the CDBG staff at cdbg@hcd.ca.gov and make sure to include CDBG-CV1 in the subject line of your message.

To receive CDBG-CV1 NOFA FAQs, notice of the NOFA webinar, and other program information and updates, please subscribe to the CDBG listserv at https://www.hcd.ca.gov/HCD_SSI/subscribe-form.html. For questions or assistance, please email cdbgnofa@hcd.ca.gov.

I. Notice of Funding Availability

The California Department of Housing and Community Development (Department) receives funding from the United States Department of Housing and Urban Development (HUD) for the Community Development Block Grant (CDBG) Program and allocates funds to CDBG eligible non-entitlement jurisdictions. Approximately $18.7 million in new CDBG coronavirus response round 1 (CDBG-CV1) federal funds authorized by the Coronavirus Aid, Relief, and Economic Security (CARES) Act, will be allocated to eligible jurisdictions to perform Activities related to COVID-19 response and recovery. The CARES Act provides extra CDBG funds specifically targeted to prevent, prepare for, and respond to coronavirus.

The CDBG-CV1 Notice of Funding Availability (NOFA) provides funding ONLY for the following Activities, which are narrowly tailored as described in Section II.A and Section II.B of this Notice of Funding Availability (NOFA):

- Assistance to businesses and microenterprises impacted by COVID-19 stay-at-home orders and shut-downs
- Public services related to COVID-19 support
- Facility improvements related to COVID-19 healthcare and homeless housing needs
- Acquisition of real property to be used for the treatment or recovery of infectious diseases in response to COVID-19

CDBG-CV1 funds will be distributed through a simplified application via the Grants Network portal online grant management system and will be available to all CDBG-eligible non-entitlement jurisdictions as outlined in the Department's Annual Plan Amendment located at https://www.hcd.ca.gov/policy-research/plans-reports/index.shtml.

This NOFA outlines application requirements, timelines for eligible jurisdictions, and provides documentation requirements.

A. Tentative program timeline

EVENT	DATE
CDBG-CV1 NOFA and application released	**June 5, 2020**
OTC application window opens	**June 8, 2020**
Application deadline	**August 31, 2020**
Department announces awards	**As applications are received**

* Award timeline is dependent on receipt of HUD's grant agreement.

B. Authorizing Legislation

Funding under this NOFA is made available pursuant to the CARES Act (Public Law No: 116-136) and the Housing and Community Development Act of 1974 (HCDA) as amended and codified at Title 42 United States Code (U.S.C.) § 5301 et. seq., and Subpart 1 of the Federal CDBG Regulations, found at Title 24 Code of Federal Regulations (CFR) § 570.480 et seq. The requirements of the state administered CDBG program are in California Health and Safety Code (HSC) §§ 50825-50834. This NOFA should be read in conjunction with the following regulations that establish state and federal CDBG requirements. Relevant legal authority includes, but is not limited to, the following:

- Housing and Community Development Act of 1974 (HCDA) as amended and codified at Title 42 United States Code 5301 et seq., and Subpart 1 of the Federal CDBG Regulations
- HSC §§ 50825-50834
- CFR, Title 24, Part 570, Subpart I
- 24 CFR Part 58
- 2 CFR Part 200
- CDBG Guidelines (Guidelines)
- The State of California 2015-2020 Consolidated Plan as amended
- The State of California 2019-2020 Annual Action Plan as amended
- Governor of California Executive Order N-66.20

If state or federal statutes or regulations, or other laws, relating to the CDBG-CV1 funds are modified by the United States Congress, HUD, the Department, California State Legislature, or the Governor, the changes may become effective immediately and may be applicable to this NOFA and existing Standard Agreements.

If there is a conflict between the state and federal regulations, the federal regulations shall prevail. In addition, the Department reserves the right, at its sole discretion, to suspend or amend the provisions of this NOFA. If such an action occurs, the Department will notify interested parties. Awards made under this NOFA are also contingent upon the Department executing a grant agreement from HUD for the CARES Act funds.

C. Conditions

Applicants and Awardees acknowledge that the funding opportunities referenced in this NOFA, and all obligations of the Department herein, are expressly subject to the following conditions:

1. The ongoing availability of funds

2. The continued authority of the Department to administer the CDBG-CV1 funds

3. The execution of the CARES Act funding grant agreement with HUD

4. Issuance of the Governor's Executive Order providing regulatory relief from state statute

In the event that funds are not available to fund any, or all, Activities offered herein, or if the Department's authority to administer the CDBG-CV1 funds or act under this NOFA is eliminated, or in any way restricted, the Department shall have the option, at its sole discretion, to amend, rescind, suspend, or terminate this NOFA and any associated funding pursuant to the provision set forth immediately above. **This NOFA is not a commitment of funds to any Activity or Applicant**.

D. Applicant responsibility

It is the Applicant's responsibility to ensure that the application submitted is clear, complete, and accurate. It is also the Applicant's responsibility to ensure that the governing body resolution submitted is clear, complete, and accurate. The Department will not execute agreements without a resolution that is also acceptable to the Department. In this NOFA, the Department has gone to great lengths to explain what will be an acceptable resolution to the Department. After the application submittal deadline, Department staff may request clarifying information to make sure the application is complete and accurate and meets federal eligibility requirements. Applicants may be asked to make changes to their Activities to meet eligibility requirements. Applications that do not meet federal minimum eligibility requirements will be returned to draft status for Applicant changes. No Applicant may appeal the Department's evaluation of another Applicant's application.

II. Eligible Activities (24 CFR §§ 570.201-203

Applicants can apply for a total of three (3) Activities with the total request not exceeding the allocation amount in Appendix A. **Activities funded under this NOFA will have a 12-month expenditure period**. See Appendix E for a list of eligible HUD Matrix Codes. Applicants must show a relationship between the need for services and COVID-19 impacts.

For the CDBG-CV1 NOFA, the following Activities are permitted:

A. Community Development

1. Public services to respond to COVID-19 impacts

2. Public facility improvements to increase capacity for healthcare facilities (facility improvements must include a documented connection with healthcare facility needs)

3. Public facility acquisition, provided that the end use increases healthcare facility capacity

4. Acquisition and/or improvement of housing facilities for persons experiencing homelessness

B. Economic Development with a focus on job retention

1. Business assistance

2. Microenterprise assistance (including Micro-financial assistance and Technical assistance)

III. Duplication of benefits

A Duplication of Benefits (DOB) occurs when a program beneficiary receives assistance from multiple sources for a cumulative amount that exceeds the total need for a particular funding need. The amount of the duplication is the amount of assistance provided in excess of the need. It is the Department's responsibility to ensure that each CDBG-CV1 Activity provides assistance only to the extent that the project's funding needs have not been met by another source. See the Robert T. Stafford Disaster Relief and Emergency Assistance Act (Stafford Act) (42 U.S.C. § 5155; HUD Memorandum dated 9 April 2020, subject: 'CARES Act Flexibilities for CDBG funds used to support coronavirus response and plan amendment waiver').

Section 312 of the Stafford Act prohibits federal agencies from providing assistance to any "person, business concern, or other entity" for any loss to which the entity has already received financial assistance from another source (42 USC § 5155(a)). The Federal Register Notice, published November 16, 2011 (Docket No. FR-5582-N), requires adequate policies and procedures in place to prevent a DOB and the recapture of funds, if necessary.

Applicants will be required to complete DOB documentation at application and will be required to continue to report on DOBs throughout the expenditure period for the CDBG-CV1 funds.

IV. National Objectives (24 CFR §§ 570.483-484)

A. Low- to Moderate-Income National Objective

At least 70 percent of the funds awarded shall benefit low- to moderate-income (LMI) individuals or households. No Activity or portion of a program assisted by these funds may exclude from its benefits the lowest-income eligible group.

Persons, households, and/or neighborhoods benefiting from LMI Activities must meet HUD's LMI requirements. Income limits are regularly updated. Applicants will be notified via a news email blast and information will be posted on the Department's website if the HUD Adjusted Median Family Income (HAMFI) limits or low- to moderate-income areas (LMA) are updated during the application period.

The LMI National Objective consists of the following categories:

1. LMI Limited Clientele (LMC), as defined by income limits or presumed benefit.

   LMC refers to persons who earn 80 percent or less of HAMFI for the county of residence, as updated annually by HUD.

   Presumed benefit LMC refers to persons who, as a category, are typically low income. This includes:

   - Seniors
   - Persons with a disability (must meet the Bureau of the Census' Current Population Report's definition of "severely disabled")
   - Homeless persons
   - Abused children and battered spouses
   - Illiterate adults
   - Persons living with acquired immunodeficiency syndrome (AIDS)
   - Migrant farmworkers

2. LMI Area (LMA), as defined by census tracts and block groups.

   - LMA eligibility is based on the American Community Survey using Census Geographies.
   - At least 51 percent of households in the area must be earning at 80 percent or below HAMFI to meet LMA.

- Must be contiguous – the area must be a solid area, without certain streets or buildings being excluded, and the area should be mapped to show eligibility. If a service area is not contiguous it will be determined to be a separate Activity and will need a separate application.

- Activity must be a public benefit for the area, for example, the construction of a facility to be used for testing, diagnosis, or treatment of infectious disease.

  LMA eligibility should be determined from the map application at HUD's Low- and Moderate-Income Summary Data Application page. Instructions for HUD's mapping application can be found at this link: https://hud.maps.arcgis.com/apps/webappviewer/index.html?id=ffd0597e8af24f88b501b7e7f326bedd

3. LMI Housing (LMH), as defined by household income limits

   - Households earning 80 percent or less of HAMFI.

4. LMI Job Creation or Retention (LMJ) Activities

   - LMJ is based on the number of full-time equivalent jobs created or retained.

   - Must create or retain jobs, and 51 percent of those jobs must be for LMI persons.

   - To meet the public benefit requirements for LMJ Activities, for every $35,000 spent (including Activity delivery), one full-time equivalent job must be created or retained.

B. Urgent Need National Objective

Urgent Need is a National Objective that is available for instances where the existing conditions in a community:

- Pose a serious and immediate threat to the health or welfare of the community.

- Are of recent origin or recently became urgent.

- The applicant is unable to finance the Activity.

- Other resources of funding are not available to carry out the Activity.

The availability of Urgent Need as a National Objective depends on the overall LMI performance of the state. The state may only offer Urgent Need in the margin above the statutory 70 percent LMI requirement. As a result, Urgent Need will not be a default National Objective and may only be designated on a case-by-case basis.

Applicants that have no option but to use Urgent Need must contact the Department to discuss how to prepare and submit their application.

Please note that if HUD should provide waivers of the 70 percent LMI requirement or other guidance that will allow for greater utilization of Urgent Need, the Department may make changes to the program allocation process to incorporate Urgent Need as a default National Objective without amending this NOFA. Applicants will be notified of any such changes via email.

V. Eligible applications

Applicants must meet the following requirements when the application is submitted to be eligible to apply for funding under this NOFA:

A. Eligible jurisdictions

Any California city or county is eligible to apply for CDBG-CV1 funding except a city or county that participates in the HUD-administered CDBG Entitlement program either as a direct entitlement, or as part of an Urban County consortium. Incorporated cities located in an Urban County as defined by 42 U.S.C. 5302(a)(6) must formally elect to be excluded from participation in the Urban County entitlement status.

HUD must be notified that the city has elected to be excluded from the Urban County participation as per 24 CFR 570.307(g) for it to be eligible for the state administered CDBG program, including CDBG-CV1 funding. Eligible Applicants may use the following approaches. Only eligible Activities from eligible Applicants will be reviewed.

1. An eligible Applicant may apply on its own behalf.

2. An eligible Applicant may apply on behalf of one or more other eligible Applicants. An application on behalf of one or more other eligible applications will need to include a Memorandum of Understanding (MOU), or similar formal agreement, fully executed by all parties of the application, that clearly identifies the lead Applicant and that details the roles, responsibilities, and requirements for each party. The agreement must be enforceable.

3. Two or more eligible Applicants, which share a program, may submit a joint application. A joint application must include a MOU, or similar formal agreement, fully executed by all parties of the application, that clearly identifies the lead Applicant and that details the roles, responsibilities, and requirements for each party. The agreement must be enforceable. Only one Applicant in a joint application may be designated as the lead agency and will have the lead responsibility for administering the Standard Agreement, financial management, and Activity reporting.

B. Financial Management Compliance (2 CFR Part 200)

The Applicant must demonstrate to the satisfaction of the Department that it is in compliance with the financial management requirements at 2 CFR §200, et seq., including the single audit requirements of 2 CFR §200.501.

C. Good standing

The Applicant, and any co-Applicant, together with the respective affiliates, must be in good standing with the Department (*i.e*., are current on all loan and/or grant obligations, have a satisfactory past performance history in all of their prior dealings with the Department, and are in full compliance with all Department contracts and reporting requirements). Applicants not meeting the foregoing requirements shall include with their application evidence that they are actively working with the Department to resolve any issue.

D. Federal debarment

Pursuant to 24 CFR Part 5, all CDBG-CV1 Applicants are required to verify they and their principals, or any/all persons, contractors, consultants, businesses, sub-recipients, etc., that will be conducting business with the Applicant as part of the Activity are not presently debarred, proposed for debarment, suspended, declared ineligible, or voluntarily excluded from participation in the covered transaction or in any proposal submitted in connection with the covered transaction.

The Department will not award any CDBG-CV1 funds to Applicants that are debarred, suspended, proposed for debarment, and declared ineligible or voluntarily excluded from participation from federally assisted programs, or that are proposing to partner, contract, or otherwise fund Activities through an organization that is debarred, suspended, proposed for debarment, or otherwise ineligible from participation in federally assisted programs. Applicants are responsible for providing proof that all program partners, subrecipients, contractors, and any other program participants, current or future, are not debarred. Applicants must provide proof from the federal System for Award Management that the Applicant, all application partners, and any subrecipients, developers, consultants, and contractors that are or may be participating in the application, the potential administration of the award, or the potential implementation of the Activity, are not debarred. Applicants are not required to run debarment checks against individual employees. If the Applicant has not yet procured the contractor or identified a subrecipient for a specific Activity, the Applicant will be required to check for debarment prior to executing a contract or agreement for that Activity and shall include proof of debarment evaluation in the Activity file.

E. Restrictions on multiple Activities in the same political districts

Applications for eligible Activities outside the Applicant's jurisdiction must include a legally binding agreement, acceptable to the Department, with the city or county in which the eligible Activity is located. Applicants may not apply to both the state administered CDBG program (including CDBG-CV1) and to a CDBG program

administered by an Urban County or other entitlement entity during the same program year.

VI. Funding and Activity limits

IMPORTANT NOTE:

All applications must be submitted through the Department's online Grants Network portal via https://portal.ecivis.com/#/login; no hard copies will be accepted. Jurisdictions will submit **one application per** Activity. Each jurisdiction **can submit up to three (3) applications** during this NOFA cycle. Each Activity must have a unique application with a complete budget, National Objective, scope of work, and milestone timeline. There will be no "combo" Activities or applications accepted in this NOFA cycle. Each Activity, both projects and programs, is stand-alone with a separate budget and scope of work. General Administration should be budgeted for each Activity up to 17 percent of the total Activity budget. HUD allows a total of 20 percent of funding to be used for planning and administration. HUD limits the state to 3 percent, which allows up to 17 percent for local jurisdictions. The Department is not proposing to allocate any funding for planning only Activities, which will allow local jurisdictions to access the full administration balance. Each Activity will have a stand-alone Standard Agreement for that Activity. Applicants are encouraged to review the attached draft Standard Agreement as a sample of the applicable terms and conditions.

- Funds from this NOFA cycle will be available to eligible Applicants via allocation through a simplified application (See Appendix A for final jurisdiction allocations).

- Maximum total grant amount limits are the allocation for your jurisdiction. Program income is not included in the allocation amounts. Total Activity budgets may exceed the award limits if program income is included in the Activity application. Note that program income included in a CDBG-CV1 application will be required to meet the same performance terms, duplication of benefits, and expenditure period for the CDBG-CV1 funds.

- Milestones: All CDBG-CV1 funded Activities must be implemented according to the milestones defined in the Standard Agreement. Applicants must include at least two milestones per Activity application – a milestone for Activity initiation and a milestone for Activity closeout. Additional milestones are optional, though encouraged for best practice Activity implementation.

VII. Program administrative costs

Grantees will be allowed to use a total of 17 percent of their allocation for program administration costs. Costs incurred in COVID-19 response prior to the allocation may be eligible for reimbursement as per the CARES Act. Applicants will be asked to identify pre-agreement costs as part of the simplified application.

VIII. Pre-agreement costs

Costs incurred in COVID-19 response prior to allocation may be eligible for reimbursement as per the CARES Act. Applicants will be required to identify pre-agreement costs. Pre-agreement costs not identified as part of the application budget will not be eligible for reimbursement. See the attached sample Standard Agreement for pre-agreement cost reimbursement terms.

IX. Threshold requirements

- A city or county must be a non-entitlement jurisdiction and must not currently be party to an Urban County Agreement or participate in, or be eligible to participate in, the HUD-administered CDBG Entitlement program.

- The Activity applied for must be an eligible Activity as defined by 24 CFR §§ 570.201-203 and the CARES Act.

- The Activity must meet a CDBG National Objective as defined by 24 CFR §570.483.

- The Applicant must provide the Department with its most recent single audit, if applicable. If the Applicant has open single audit findings and does not have a plan or agreement to remediate those findings, the Applicant will be deemed ineligible for CDBG-CV1 funding through the state administered CDBG program until the findings are resolved or a remediation plan or agreement is established.

- Pursuant to 24 CFR § 570.486, applications must follow CDBG Public Participation regulations as identified in the state's updated Citizen Participation Requirements for Federal Programs, Plans, and Reports. Applicants will be expected to provide opportunities for virtual meetings that include opportunities for the public to pose questions about the program and receive answers. Applicants will also be expected to meet noticing and public information requirements for the program as per federal regulations and the Citizen Participation Requirements.

- As per HSC § 50829, the Applicant must submit a draft and adopted Housing Element to the Department in accordance with the requirements listed in Government Code (GC) § 65580 et seq., most specifically GC § 65585. Applicants must demonstrate compliance with HSC § 50829 with documented proof at the time of application submittal. Documented proof includes, at a minimum, correspondence, resolutions or email verification from the Department. Failure to comply with the procedural requirements (i.e., GC § 65585) of Housing Element Law will invalidate the application for this NOFA and the Applicant will be deemed ineligible for funding through the state administered CDBG program, including CDBG-CV1 funding, until the Applicant has met procedural requirements. Applicants triggering the provision of HSC § 50830 must meet and document all pertinent requirements. See Appendix A for information on Housing Element status. For additional information and assistance, please contact Paul McDougall at paul.mcdougall@hcd.ca.gov.

- The Applicant must be in good standing with the Department as defined in Section V of this NOFA.

- The Applicant must demonstrate compliance with the Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970 relocation requirements, as applicable.

- The Applicant must demonstrate compliance with Article XXXIV, as applicable.

- To reduce delays in the application review, award, and contracting processes, Applicants are required to use the Department's *Sample Resolution of the Governing Body*. For reference, please see Appendix D.

X. Applications

A. Application webinar

The Department will hold a NOFA workshop webinar on June 24, 2020. Please visit the Department's website at https://www.hcd.ca.gov/grants-funding/active-funding/cdbg.shtml to register.

Applicants are also strongly encouraged to review available webinars and training materials on the CDBG program in general, the CDBG Redesign, using the Grants Network portal, and preparing a CDBG program application in the Grants Network portal.

B. Application submission

Applicants **must** follow instructions in both this NOFA and the online application. Failure to follow instructions will result in disqualification, and applications will be returned to draft status for correction and re-submittal.

The CDBG-CV1 application and all required attachments must be submitted to the Department through the Grants Network portal located at https://portal.ecivis.com/#/login. Applications must include all required information to be submitted. Applicants must certify that all information is true and complete to the best of their knowledge, under penalty of perjury.

Applicants that do not have an account with the Grants Network portal should log into the https://portal.ecivis.com/#/login. Use the "Create an account" option to initiate a profile.

Applications must meet all threshold and eligibility requirements upon submission. It is the Applicant's responsibility to ensure that the submitted application is clear, complete, and accurate. Department staff may request clarifying information and may request that applications be revised and resubmitted to help address eligibility and threshold issues prior to approving applications and issuing awards.

C. Disclosure of application

Information provided in the application will become public record available for review by the public pursuant to the California Public Records Act (PRA) (GC § 6250 et seq.). As such, the Department may disclose any materials provided by the Applicant to any person making a request under the PRA. The Department cautions Applicants to use discretion in providing information not specifically requested, including, but not limited to, bank account numbers, personal phone numbers, home addresses, or other personally identifiable information. By providing this information to the Department, the Applicant is waiving any claims of confidentiality, and consents to the Department's disclosure of the Applicant's material upon receipt of a PRA request.

XI. Application review, approval and commitment process

A. Application review

All applications are required to pass threshold requirements. Failure to meet threshold will result in immediate disqualification. Applications that do not meet threshold will not be further reviewed and will be returned to a draft status for Applicant revisions.

All applications will be reviewed for Activity eligibility. Activities that do not meet program eligibility will be disqualified, and the application will be returned to a draft status for Applicant revisions.

B. Recommendations

The Department will review applications and make award recommendations according to the above criteria. Applicants that are recommended for awards will be contacted and provided with an opportunity to update project schedules or other date-dependent data that may have aged during the application review period. Applicants will officially be notified of awards through the Grants Network portal. Applicants should ensure that the appropriate contact information is included in applicant profiles to facilitate notifications of awards and requests for changes. The award notification will include instructions for accepting or declining the award, as well as an executable Standard Agreement. Applicants that are not recommended for awards will be notified through the Grants Network portal that their application has been returned to draft status for Applicant revision, as applicable.

C. Standard Agreements

Successful Applicants (Grantees) will enter into a Standard Agreement with the Department. A draft sample is included as Appendix K of this NOFA. The Standard Agreement contains all the relevant state and federal requirements, Activity performance and management requirements, and disbursement requirements. A condition of award will be that a Standard Agreement must be executed by the Grantee within 30 days (contracting period) of the Grantee's receipt of the Standard Agreement(s). Failure to execute and return the Standard Agreement(s) to the

Department within the contracting period will result in award cancellation. Award cancellations are final.

XII. Awards announcement and grant implementation

The Department anticipates awards will be announced as applications are approved for funding.

XIII. Federal program requirements

A. Cross-cutting requirements

The CDBG-CV1 funding is administered under the general rules and regulations promulgated primarily in 24 CFR § 570.600, et seq. These primary regulations are known as the federal cross-cutting requirements and form the basis of the programmatic requirements. The Department incorporates all federal cross-cutting requirements into the state administered CDBG program, and the regulations in Part 570 are translated into required actions on the part of all Grantees of the state administered CDBG program, including CDBG-CV1 funds.

This following is a summary of the federal cross-cutting requirements:

1. Environmental Standards (based on the National Environmental Policy Act of 1969 [NEPA])
2. Labor Standards (Davis-Bacon and related laws)
3. Achieving a HUD National Objective
4. Public participation requirements
5. Fair Housing and Affirmatively Furthering Fair Housing
6. Equal Opportunity and Non-Discrimination in federal Grant Programs
7. Federal Procurement Guidelines
8. National Flood Insurance Program compliance
9. Relocation and displacement requirements
10. Employment and Contracting Opportunities Section 3 compliance
11. Lead-based paint requirements
12. No use of debarred, ineligible, or suspended contractors or sub-recipients
13. Uniform Administrative Requirements and Cost Principles
14. Conflict of interest prohibitions
15. Compliance with the Architectural Barriers Act and the Americans with Disabilities Act
16. Compliance with Eligibility Restrictions for certain resident aliens
17. Federal reporting requirements
18. Grant and subrecipient monitoring requirements

B. Relocation Plan requirement

Applicants engaging in project-specific Activities that may or will cause the temporary or permanent relocation and displacement of persons, property, or businesses must provide a project-specific relocation plan as part of the application. The plan must meet the standards established in the Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970 (URA). Applicants must successfully demonstrate that they have met URA requirements prior to the start of the project or displacement Activity. Applicants should include relocation costs in project budgets.

Applicants must provide General Information Notices to persons who may be displaced if the Activity in the grant application is funded. This plan must outline how the Grantee will enforce and manage the project's temporary relocation and displacement Activities and estimate what relocation benefits will be required so those costs can be included in the project's development budget.

C. Article XXXIV compliance

Applicants engaging in low-income housing project Activities that are subject to Article XXXIV of the California Constitution must show that the project approval process complies with Article XXXIV requirements as defined in the California Constitution, California state statutes, and applicable case law. The state statutes implementing Article XXXIV can be found at HSC § 37000, et seq.

D. Procurement

Pursuant to 24 CFR §570.489(g), all Grantees must comply with federal procurement requirements. The Department will review the Grantee's procurement documents for services (i.e., administrative sub-contractor, Davis-Bacon Act consultant, etc.) at time of monitoring.

Requirements for federal procurement can be found at 2 CFR §200.317-326. Applicants are responsible for meeting all federal procurement standards for goods and services funded through federal programs. Failure to meet procurement requirements may result in disqualification, recapture of federal funds, and debarment.

E. Certifications and Statement of Assurances

Applicants must sign and submit the Certifications and Statement of Assurances (Appendix J) with their application to meet threshold. Please review the Statement and confirm compliance with each requirement. Failure to comply with the certifications and assurances may result in disqualification, recapture of federal funds, and debarment.

JURISDICATION ALLOCATIONS

Housing Element Eligibility status is as of June 1, 2020. This is a static list. Ineligible jurisdictions are encouraged to resolve Housing Element issues as early to be able to participate in the CDBG-CV1 funding. Eligible jurisdictions that fail to meet Housing Element timelines may be ineligible at application. For additional information and assistance, please contact Paul McDougall at paul.mcdougall@hcd.ca.gov.

Jurisdiction Low-Mod Income percentages are based on HUD's 2020 Area Benefit instructions.

CARES Act Programs through SBA, FEMA, IRS, Treasury, USDA, and HHS for CDBG Grantees' Awareness for Duplication of Benefits

Agency	Program Name	Populations Served	Services Provided	Program Rollout and Duration	Size & Additional Notes on Eligibility	Funding and operating mechanisms
SBA	Payment Protection Program Loans	All small businesses, including non-profits, Veterans organizations, Tribal concerns, sole proprietorships, self-employed individuals, and independent contractors, with 500 or fewer employees, or no greater than the number of employees set by the SBA as the size standard for certain industries.[1]	The new loan program will help small businesses with their payroll and other business operating expenses. It will provide critical capital to businesses without collateral requirements, personal guarantees, or SBA fees – all with a 100% guarantee from SBA. All loan payments will be deferred for six months. Most importantly, the SBA will forgive the portion of the loan proceeds that are used to cover the first eight weeks of payroll costs, rent, utilities, and mortgage interest.	Treasury and the Small Business Administration launched this program on April 3, allowing businesses to go to a participating SBA 7(a) lender, bank, or credit union, to apply for a loan, and be approved on the same day. As of April 7, the program had reached the funding limit set in the CARES Act.	Maximum loan amounts up to $10 million. Small Business owners in all U.S. states and territories	**$349 billion** of loans available. Loan forgiveness if proceeds used for payroll costs and other designated business operating expenses in the 8 weeks following the date of loan origination (due to likely high subscription, it is anticipated that not more than 25% of the forgiven amount may be for non-payroll costs). All loans under this program will have the following identical features: Interest rate of 0.5%, maturity of 2 years, first payment deferred for six months, 100% guarantee by SBA, no collateral, no personal guarantees, no borrower or lender fees payable to SBA
SBA	Economic Injury Disaster Loans	Small Business owners in all U.S. States and territories	In response to the Coronavirus (COVID-19) pandemic, small business owners in all U.S. states, Washington D.C., and territories are eligible to apply for an Economic Injury Disaster Loan advance of up to $10,000.[2]	Funds will be made available within three days of a successful application, and this loan advance will not have to be repaid.	Loans up to $10,000. Small Business owners in all U.S. states and territories	An additional appropriation of **$10 billion**. This advance will provide economic relief to businesses that are currently experiencing a temporary loss of revenue. Funds will be made available within three days of a successful application. This loan advance will not have to be repaid.

Agency	Program Name	Populations Served	Services Provided	Program Rollout and Duration	Size & Additional Notes on Eligibility	Funding and operating mechanisms
SBA	Express Bridge Loans	Small Business owners in all U.S. States and territories	Express Bridge Loan Pilot Program allows small businesses who currently have a business relationship with an SBA Express Lender to access up to $25,000 quickly.	These loans can provide vital economic support to small businesses to help overcome the temporary loss of revenue they are experiencing and can be a term loans or used to bridge the gap while applying for a direct SBA Economic Injury Disaster loan.	Access up to $25,000 quickly.	If a small business has an urgent need for cash while waiting for decision and disbursement on an Economic Injury Disaster Loan, they may qualify for an SBA Express Disaster Bridge Loan.
SBA	Debt Relief Program	Small Business owners in all U.S. States and territories	As part of SBA's debt relief efforts will automatically pay the principal, interest, and fees for: - current 7(a), 504, and microloans for a period of six months, and - new 7(a), 504, and microloans issued prior to September 27, 2020.	For current SBA Serviced Disaster (Home and Business) Loans: If your disaster loan was in "regular servicing" status on March 1, 2020, the SBA is providing automatic deferments through December 31, 2020.		Payment of applicable principal, interest, and fees, or of loan deferment, is automatic.
FEMA	Disaster Relief Fund	State and local governments attempting to mitigate against the spread of COVID-19 and protect public health.	FEMA can direct, coordinate, manage, and fund eligible response and recovery efforts associated with COVID-19 that overwhelm State resources pursuant to the Robert T. Stafford Disaster Relief and Emergency Assistance Act.[3]	Every 30 days the Administrator shall provide the Committees on Appropriations of the Senate and the House both projected and actual costs for funds provided.	$25 billion set aside for major disasters declared pursuant to the Stafford Act. The other $15 billion may be used for all purposes authorized by FEMA under the CARES Act. (*The other $5 billion seems to be unmentioned)*	**$45 billion** to remain available until expended. Through the DRF, FEMA can fund authorized Federal disaster support activities as well as eligible State, territorial, tribal, and local actions, such as: (1) the repair and restoration of qualifying disaster-damaged public infrastructure; (2) hazard mitigation initiatives; (3) financial assistance to eligible disaster survivors.
FEMA	Public Assistance Program	State, territorial, tribal, and local government entities and certain private non-	Under the COVID-19 Emergency Declaration described above, FEMA may	Consistent with the President's national emergency declaration for the coronavirus (COVID-	President Trump declared a national emergency under Section 501(b) of the Stafford Act on March 13 in wake	FEMA assistance will be provided at a 75 percent federal cost share. This assistance will

		profit organizations are eligible to apply for Public Assistance.	provide assistance for emergency protective measures including, but not limited to: *Management, control and reduction of immediate threats to public health and safety, Emergency medical care, Medical sheltering, and Purchase and distribution of food,* provided they are not funded by the HHS/CDC or other federal agency. Final reimbursement determinations will be coordinated by HHS and FEMA.	19) pandemic on March 13, 2020, FEMA urges officials to, without delay, take appropriate actions that are necessary to protect public health and safety pursuant to public health guidance and conditions and capabilities in their jurisdictions. FEMA provides the following guidance on the types of emergency protective measures that may be eligible under FEMA's Public Assistance Program in accordance with the COVID-19 Emergency Declaration in order to ensure that resource constraints do not inhibit efforts to respond to this unprecedented disaster.	of the ongoing COVID-19 pandemic. State, territorial, tribal, and local government entities and certain private non-profit organizations are eligible to apply for Public Assistance. FEMA will not duplicate any assistance provided by HHS/CDC.	require execution of a FEMA-State/Tribal/Territory Agreement, as appropriate, and execution of an applicable emergency plan. Local governments and other eligible PA applicants will apply through their respective state, tribal or territorial jurisdictions.
FEMA	Emergency Food and Shelter Program (EFSP)	American families in sudden economic crisis.	Shelter, food and supportive services to individuals and families in sudden economic crisis.	EFSP was established to supplement and expand the ongoing work of local social service organizations, both nonprofit and governmental. Accordingly, EFSP funding is open to all organizations helping hungry and homeless people, as well as organizations that support those at risk of becoming hungry or homeless due to economic hardships[4]	$200 million allocation to program account. Nonprofit and governmental service organizations in U.S. states and territories	Unlike FEMA's disaster assistance programs authorized under the Stafford Act, EFSP is authorized by the McKinney-Vento Homeless Assistance Act of 1987 (PL 100-77).
Treasury	The Coronavirus Relief Fund	States, Tribal governments, and units of local governments with a population above 500,000	The CARES Act requires that the payments from the Coronavirus Relief Fund only be used to cover expenses that— (1) are necessary expenditures incurred due to the public health emergency	The legislation specifies that within 30 days of passage the funds will be released to states based on their relative populations, with each state receiving at least $1.25 billion.	$150 billion fund. U.S. states and territories. Additional information on eligible uses of Fund disbursements by governments will be posted as it becomes available.	Funds will be released to states based on their relative populations, with each state receiving at least $1.25 billion. A local government must have a population above 500,000 to qualify.

			created by COVID-19. (2) were not accounted for in the budget most recently approved as of March 27, 2020 (the date of enactment of the CARES Act) for the State or government; and (3) were incurred during the period that begins on March 1, 2020, and ends on December 30, 2020.			$3 billion for making payment to the District of Columbia, the Commonwealth of Puerto Rico, the United States Virgin Islands, Guam, the Commonwealth of the Northern Mariana Islands, and American Samoa. $8 billion for making payments to Tribal governments**.**
Treasury	Unemployment Insurance Provisions	Makes sure self-employed and independent contractors, gig workers, can receive unemployment during the public health emergency. The bill also includes support to state and local governments and nonprofits so they can pay unemployment to their employees.	Makes benefits more generous by adding a $600/week across-the-board payment increase through the end of July.	For those who need extra assistance the bill provides an additional 13 weeks of benefits beyond what states typically allow.	$250 billion to expand unemployment benefits. Individuals in U.S. states and territories.	The expansion in unemployment benefits expires at the end of 2020 in recognition of the temporary nature of this challenge.
IRS	Economic Impact Payments	Tax filers with adjusted gross income up to $75,000 for individuals and up to $150,000 for married couples filing joint returns will receive the full payment. For filers with income above those amounts, the payment amount is reduced by $5 for each $100 above the $75,000/$150,000 thresholds. Single filers with income exceeding	Direct payment.	One-time payment for eligible citizens.	Up to $1,200 for single filers. Up to $2,400 for joint filers. Individuals in U.S. states and territories.	The payments will be administered by the Internal Revenue Service (IRS) and function as a federally refundable tax credit.

		$99,000 and $198,000 for joint filers with no children are not eligible. Social Security recipients and railroad retirees who are otherwise not required to file a tax return are also eligible and will not be required to file a return.				
USDA	Commodity Assistance Program	Through CSFP, USDA distributes both food and administrative funds to participating states and Indian Tribal Organizations (ITOs).	The Commodity Supplemental Food Program (CSFP) works to improve the health of low-income elderly persons at least 60 years of age by supplementing their diets with nutritious USDA Foods.	Sec 1101. (g) AVAILABILITY OF COMMODITIES.—During fiscal year 2020, the Secretary of Agriculture may purchase commodities for emergency distribution in any area of the United States during a public health emergency designation. (i) FUNDING.—There are hereby appropriated to the Secretary of Agriculture such amounts as are necessary to carry out this section.	Through CSFP, USDA distributes both food and administrative funds to participating states and Indian Tribal Organizations (ITOs).	$450 million to Commodity Assistance Program, $150 million of which may be used for distribution.
USDA	Child Nutrition Programs	Children from low-income families (at or below 130% of the Federal Poverty Level (FPL), or $31,590 for a family of four in school year 2016 - 2017) are eligible for free meals. Those with incomes up to 185% of the FPL are eligible for reduced price meals.	Child nutrition programs help to ensure that children have access to nutrition meals and snacks in schools, summer programs, childcare centers and homes, and afterschool programs. FNS also issued guidance on meal delivery using existing authorities in summer meal programs.	Waiver authority for existing program.	For Congregate Meal Waivers, FNS has approved waivers from all 50 states, DC, Guam, Puerto Rico, and the Virgin Islands, enabling Summer Food Service Program (SFSP) and National School Lunch Program Seamless Summer Option (SSO) sponsors to serve meals in a non-congregate setting and at school sites during school closures related to the coronavirus.	$8.8 billion. Pandemic EBT – Supplemental EBT allotments in FY2020 for the value of school meals for each eligible child in the household.
USDA	Supplemental Nutrition for Women, Infants and Children (WIC)	The WIC target population are low-income, nutritionally at risk: - Pregnant women (through pregnancy and up	The Special Supplemental Nutrition Program for Women, Infants, and Children (WIC) provides federal grants to states for supplemental foods, health care referrals,	WIC is not an entitlement program as Congress does not set aside funds to allow every eligible individual to participate in the program. WIC is a Federal grant program for which Congress authorizes a specific amount	WIC operates through 1,900 local agencies in 10,000 clinic sites, in 50 State health departments, 34 Indian Tribal Organizations, the District of Columbia, and five territories (Northern Mariana, American	The Families First Coronavirus Response Act provided the WIC Program with $500 million to remain available through Sept. 30, 2021 for increases in program participation. FNS will

		to 6 weeks after birth or after pregnancy ends). - Breastfeeding women (up to infant's 1st birthday) - Non breastfeeding postpartum women (up to 6 months after the birth of an infant or after pregnancy ends) - Infants (up to 1st birthday). - Children up to their 5th birthday.	and nutrition education for low-income pregnant, breastfeeding, and non-breastfeeding postpartum women, and to infants and children up to age five who are found to be at nutritional risk.	of funds each year for the program. WIC is administered at the Federal level by FNS, and by 90 WIC state agencies, through approximately 47,000 authorized retailers.	Samoa, Guam, Puerto Rico, and the Virgin Islands).	work with state to ensure funding is available to state agencies that require additional funds based on enrollment.
USDA	Nutrition Assistance Block Grant to Territories	Low-income individuals and families are eligible for benefits as determined by each Territory.	The NABG Provides food assistance to low-income households in the U.S. Territories of the Commonwealth of Puerto Rico, American Samoa, and the Commonwealth of the Northern Mariana Islands, in lieu of operating a Supplemental Nutrition Assistance Program (SNAP).	With the authority granted them via the block grants, the U.S. territories establish eligibility and benefit levels for their nutrition assistance programs.	$200 million U.S. Territories of the Commonwealth of Puerto Rico, American Samoa, and the Commonwealth of the Northern Mariana Islands	$200 million for PR, CNMI, AS.
USDA	Disaster Household Distribution	USDA has approved targeted DHD programs for the following states and Indian Tribal Organizations (ITOs).	States and Tribes may apply for the DHD program to meet specific needs when traditional channels of food are unavailable and not being replenished on a regular basis.	Please check with the specific state or ITO for details on the DHD operation	USDA has approved targeted DHD programs for the following states and Indian Tribal Organizations (ITOs).	Please check with the specific state or ITO for details on the DHD operation
USDA	Summer Food Service Program	Summer Food Service Program (SFSP) and National School Lunch Program Seamless Summer Option (SSO) to serve	The U.S. Department of Agriculture's (USDA) Summer Food Service Program (SFSP), also known as the Summer Meals Program, provides kids	The SFSP reimburses providers who serve free healthy meals to children and teens in low-income areas during the summer months when school is not in session.	The SFSP serves children and teens age 18 and younger. Serve meals in non-congregate setting and at school sites during COVID-related school closures.	There are three main players involved: State agencies, sponsors, and sites.

Agency	Program Name	Populations Served	Services Provided	Program Rollout and Duration	Size & Additional Notes on Eligibility	Funding and operating mechanisms
		meals in non-congregate setting and at school sites during COVID-related school closures.	and teens in low-income areas free meals when school is out.			- State agencies administer the program and communicate with USDA. - Sponsors enter into agreements with State agencies to run the program. Schools, local government agencies, camps, faith-based and other non-profit community organizations that can manage a food service program may be SFSP sponsors. Sponsors get reimbursed by the Program and may manage multiple sites. - Sites are places in the community where children receive meals in a safe and supervised environment. Sites may be in a variety of settings, including schools, parks, community centers, health clinics, hospitals, apartment complexes, churches, and migrant centers. Sites work directly with sponsors.
USDA	The Emergency Food Assistance Program	The Emergency Food Assistance Program (TEFAP) is a federal program that helps supplement the diets of low-income Americans, including elderly people, by providing them with emergency food assistance at no cost.	Through TEFAP, the U.S. Department of Agriculture (USDA) purchases a variety of nutritious, high-quality USDA Foods, and makes those foods available to State Distributing Agencies.	States provide the food to local agencies that they have selected, usually food banks, which in turn distribute the food to local organizations, such as soup kitchens and food pantries that directly serve the public.	The amount of food each state receives out of the total amount of food provided is based on the number of unemployed persons and the number of people with incomes below the poverty level in the state.	State agencies may adjust The Emergency Food Assistance Program (TEFAP) income eligibility guidelines to expand participation at any time; can consider categorical income eligibility (e.g. all SNAP and WIC participants).
USDA	Pandemic EBT	As a result of the Families First Coronavirus Response	Temporary emergency standards of eligibility and	Waiver of existing requirements is provided upon request.	State agencies may submit plans in any case in which a school is closed	Secretary has authority to approve state agency plans for

Agency	Program Name	Populations Served	Services Provided	Program Rollout and Duration	Size & Additional Notes on Eligibility	Funding and operating mechanisms
		Act of 2020, children who would receive free or reduced-price meals if not for school closures are eligible to receive assistance under this provision. USDA is providing guidance to state agencies on plan requirements in order to receive approval.	levels of benefits for free or reduced-price meals.		for at least 5 consecutive days during a public health emergency designation during which the school would otherwise be in session.	temporary emergency standards of eligibility and levels of benefits under the Food and Nutrition Act of 2008. Children eligible for free or reduced-price meals if not for the school closure are eligible under this provision.
USDA	Supplemental Nutrition Assistance Program Emergency Allotments	USDA has granted waivers to all states, allowing for the issuance of emergency allotments (supplements) based on a public health emergency declaration by the Secretary of Health and Human Services under section 319 of the Public Health Service Act related to an outbreak of COVID-19 when a state has also issued an emergency or disaster declaration.	SNAP provides nutrition benefits to supplement the food budget of needy families so they can purchase healthy food and move towards self-sufficiency.	Waiver of existing program requirements is provided upon request.	Options for plan adjustments include a number of approaches to easing states' workload to facilitate processing the large number of new applications expected. For example, USDA has already allowed states to extend certification periods and take other measures to keep current participants from having their cases closed when they cannot conduct business online or remotely. USDA also has allowed states to modify their application processes to streamline operations, for example by reducing interview requirements and adapting telephone signature procedures.	The Act allows USDA to approve state plans to adjust their SNAP operations and procedures to help states manage their workload under current conditions.

Agency	Program Name	Populations Served	Services Provided	Program Rollout and Duration	Size & Additional Notes on Eligibility	Funding and operating mechanisms
HHS	Community Living Allocation	Older adults in need of meals.	These programs provide meals to more than 2.4 million older adults each year, both through home delivery and in places like community centers. The need for these services, particularly home-delivered and packaged meals, has increased as community measures to slow transmission of COVID-19 have closed meal sites and have left many family caregivers unable to assist their older loved ones.	Funding has been provided to states, territories, and tribes for subsequent allocation to local meal providers. Grant amounts are determined based on the population-based formulas defined in the Older Americans Act.		$250 million in grants from the Administration for Community Living (ACL) to help communities provide meals for older adults.
Labor	Dislocated Worker Grants	Workers laid off because of impact from COVID-19.	Grants for temporary employment and training services, including humanitarian assistance, clean-up and mitigation associated with the virus, and job training for industries still hiring during the health emergency.	Grants will be made in installments to state and local workforce programs, with the first 26 grants totaling $131 million awarded on April 15, 2020.	States and other eligible entities may also apply for Employment Recovery DWGs to provide reemployment services to eligible individuals	$345 million made available through state and local workforce programs.

*Note on Duplication of Benefits

Federal disaster law prohibits the provision of federal assistance in excess of need. Before paying a cost with federal disaster assistance, a Federal agency must check to see that the assistance will not cause a duplication of benefits, meaning that the cost has not or will not be paid by another source. HUD grantees are required to prevent the duplication of benefits when carrying out HUD-funded programs to provide disaster assistance.

Knowing the other sources of assistance that may be available to pay for coronavirus-related needs can help grantees prevent duplication of benefits in two ways. First, it helps grantees design programs that target needs that are unlikely to be addressed by other sources. Second, it helps grantees know which sources of assistance it needs to look for when completing a duplication of benefits check before providing assistance to individuals, households, and entities.

Assistance is not prohibited to meet needs that remain after considering other federal, state, local or philanthropic financial assistance. Private, unsubsidized loans generally are not considered a duplication of benefits. In some cases, subsidized loans do not cause a duplication, if all assistance is used for disaster-related needs. More specific information about how to comply with this requirement is available from HUD.

JURISDICATION ALLOCATIONS

Housing Element Eligibility status is as of June 1, 2020. This is a static list. Ineligible jurisdictions are encouraged to resolve Housing Element issues as early to be able to participate in the CDBG-CV1 funding. Eligible jurisdictions that fail to meet Housing Element timelines may be ineligible at application. For additional information and assistance, please contact Paul McDougall at paul.mcdougall@hcd.ca.gov.

Jurisdiction Low-Mod Income percentages are based on HUD's 2020 Area Benefit instructions.

RESOLUTION NO. 2020-__

A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF UKIAH APPROVING AN APPLICATION FOR FUNDING AND THE EXECUTION OF A GRANT AGREEMENT AND ANY AMENDMENTS THERETO FROM THE 2020 COMMUNITY DEVELOPMENT BLOCK GRANT PROGRAM- CORONAVIRUS RESPONSE ROUND 1 (CDBG-CV1) NOFA DATED JUNE 5, 2020

BE IT RESOLVED by the **City Council** of the **City of Ukiah** as follows:

SECTION 1:

The City Council has reviewed and hereby approves the submission to the State of California of one application, in the aggregate amount of not to exceed $108,757, for the following CDBG-CV1 activities, pursuant to the June 2020 CDBG-CV1 NOFA:

City of Ukiah Public Facility Improvement Project	Not to Exceed $ 90,269
General Administration	Not to Exceed $ 18,488
Total	Not to Exceed $108,757

SECTION 2:

The City hereby approves the use of Program Income in an amount not to exceed $0 for the CDBG-CV1 activities described in Section 1.

SECTION 3:

The City acknowledges compliance with all state and federal public participation requirements in the development of its application.

SECTION 4:

The City hereby authorizes and directs City Manager Sage Sangiacomo to execute and deliver the application and act on the City's behalf in all matters pertaining to the application.

SECTION 5:

If an application is approved, the City Manager is authorized to enter into, execute and deliver the grant agreement (i.e., Standard Agreement) and any and all subsequent amendments thereto with the State of California for the purposes of the grant.

SECTION 6:

If an application is approved, the City Manager is authorized to sign and submit Funds Requests and all required reporting forms and other documentation as may be required by the State of California from time to time in connection with the grant.

PASSED AND ADOPTED at a regular meeting of the City Council of the City of Ukiah held on August 5, 2020 by the following vote:

AYES:

NOES:

ABSTAIN:

ABSENT:

_____

Douglas F. Crane, Mayor
Ukiah City Council

STATE OF CALIFORNIA
City of Ukiah

ATTEST:

I, Kristine Lawler, City Clerk of the City of Ukiah, State of California, hereby certify the above and foregoing to be a full, true and correct copy of a resolution adopted by said City Council on this 5th day of August, 2020.

Kristine Lawler, City Clerk
of the City of Ukiah of the State of California

Agenda Item No: 11.c.
MEETING DATE/TIME: 8/5/2020
ITEM NO: 2020-428

City of Ukiah

AGENDA SUMMARY REPORT

SUBJECT: Public Hearing on Financing Documentation for Facilities Acquisition, Enhancement, and Repair of Recently Acquired Property at 501 South State Street and Other Facilities (Recommended to be continued to a date certain of August 19, 2020).

DEPARTMENT: Finance **PREPARED BY:** Dan Buffalo, Finance Director
PRESENTER: Dan Buffalo, Director of Finance

ATTACHMENTS:
None

Summary: The City Council has expressed its intention to issue municipal tax-exempt bonds to reimburse the City for the cost to purchase the 501 South State Street. Furthermore, there is also the need to consider other renovations and deferred maintenance at other city facilities.

Background: The acquisition of the 501 South State took place on June 1, 2020, and it is now necessary and appropriate for the City to follow through with the financing the acquisition costs. Further, staff anticipates financing needs for renovation and deferred maintenance of other city facilities.

Discussion: This item is recommended to be continued to the August 19, 2020 City Council meeting in order to allow time for the Budget Ad hoc to continue meeting and review the scope, financing plan, and related documents. Note, the item was originally scheduled and noticed for July 1 and subsequently continued to August 5th.

Recommended Action: Continue the agenda item to a time/date certain on August 19, 2020, at 6:15 PM to conduct a public hearing on financing documentation for facility acquisition and improvements.

AGENDA SUMMARY REPORT

SUBJECT: Receive Report and Consider Directing Staff to Gather the Necessary Information and Conduct the Necessary Analyses to Develop an Application for Potential Annexation of Certain Unincorporated Lands, Including and Surrounding those Areas Commonly Known as the Brush Street Triangle, the Masonite Area Properties, and the City's Water Treatment Plant; and Bring that Application and Pertinent Information and Analyses to the City Council for its Consideration.

DEPARTMENT: Community Development

PREPARED BY: Craig Schlatter, Community Development Director

PRESENTER: Craig Schlatter, Community Development Director

ATTACHMENTS:

1. Past Staff Reports- 1-16-20 and 8-27-19 workshops
2. CC Reso 2020-06 - Adopting Annexation Policy
3. Map of Potential Annexation Area

Summary: Council will receive a report and consider directing Staff to gather the necessary information and conduct the necessary analyses to develop an application for potential annexation of certain unincorporated lands, including and surrounding those areas commonly known as the Brush Street Triangle, the Masonite Area properties, and the City's Water Treatment Plan. Council will also consider directing Staff to bring that application and pertinent information and analyses to the City Council for its consideration.

Background: At two workshops on August 27, 2019 and January 16, 2020, City Council and Staff discussed the City of Ukiah's long-term land use planning policy for Ukiah and the Ukiah Valley. The August 27 workshop provided an overview of reorganization requirements under the Cortese-Knox-Hertzberg Act and the role of the Mendocino Local Agency Formation Commission. Staff also outlined proposed Policy Directives for Council's consideration, which Council approved by a 3-1-1 vote. Councilmembers expressed concern with and request for further consideration of Policy Directive #2, particularly as it related to the origin of the 1995 Sphere of Influence (SOI) proposed as part of the 1995 General Plan.

Consequently, at the January 16, 2020 workshop, Staff presented research on long term land use planning conducted in Ukiah and the Ukiah Valley since 1974, including a discussion on the origin of the Ukiah Valley General Plan (City of Ukiah General Plan) and the resulting 1995 SOI. Staff also presented a revised Policy Directive #2, to reflect this history and the input received from Council, as well as a proposed SOI. Council approved the revised Policy Directive #2 and proposed SOI by a 5-0 vote. The staff reports for both items at the August 27, 2019 and January 16, 2020 workshops are attached as Attachment 1.

Also at the January 16, 2020 workshop, a second agenda item requested Council adoption of a resolution adopting an annexation policy. Council adopted Resolution No. 2020-06 (Attachment 2) by a 5-0 vote.

Discussion: Since receiving direction from Council at the January 16 workshop and in accordance with the City's Annexation Policy, which states in part that: "the City will apply for the annexation of unincorporated areas and will support property owners who desire to annex to the City where the City determines it to be in its

residents' interests to do so, to promote orderly development, to implement General Plan goals and objectives, and/or to ensure the efficient provision of municipal services," Staff have been analyzing possible annexation implementation approaches. Possible implementation approaches have been informed and influenced by the City's priority as expressed by City Council in providing efficient municipal services, including effective fire mitigation and suppression, water supply, and electricity services; preventing urban sprawl; preserving open space and protecting prime agricultural lands; maintaining economic opportunities; and having an orderly approach to long-term planning in the Ukiah Valley.

Given Council's recent direction plus historical efforts to annex portions of the area generally known as the Brush Street Triangle, Staff and the Ad Hoc feel annexing the area in and around the Brush Street Triangle, including areas around the Masonite Area properties and the City's Water Treatment Plant (see Attachment 3 for a map of the potentially proposed area), is appropriate and an important first step in achieving the Council's policy objectives outlined above. Additionally, Staff have been approached by owners within this area who have expressed a desire for the City to annex their properties.

There are also compelling economic development reasons for the Ukiah Valley for proceeding with annexation of the Brush Street Triangle, areas around the Masonite Area properties, and areas around the City's Water Treatment Plant. These areas represent the primary region for industrial and manufacturing zoned properties in the Valley, and by extension and implication, all of Mendocino County. Providing the full suite of City municipal services to these areas will provide significant economic opportunities to Ukiah and the Ukiah Valley, as well as keeping businesses and jobs in the Ukiah Valley.

At this time, Staff and the Advanced Planning and Policy Ad Hoc recommend Council receive this report and direct Staff to gather the necessary information and conduct the necessary analyses to develop an application for potential annexation of certain unincorporated lands, including and surrounding those areas commonly known as the Brush Street Triangle, the Masonite Area properties, and the City's Water Treatment Plan; and bring that application and pertinent information and analyses to the City Council for its consideration.

Recommended Action: Receive report and direct staff to gather the necessary information and conduct the necessary analyses to develop an application for potential annexation of certain unincorporated lands, including and surrounding those areas commonly known as the Brush Street Triangle, the Masonite Area Properties, and the City's Water Treatment Plant; and bring that application and pertinent information and analyses to the City Council for its consideration.

City of Ukiah

AGENDA SUMMARY REPORT

SUBJECT: Discussion with Possible Direction to Staff Regarding the City of Ukiah's Long-Term Land Use Planning Policy for Ukiah and the Ukiah Valley.

DEPARTMENT: Community Development

PREPARED BY: Craig Schlatter, Community Development Director

ATTACHMENTS:

1. 8-27-19 CC LT Planning Workshop ASR
2. City of Ukiah 1995-Proposed SOI
3. Building Div # of inspections-permits 2003-present (2019)

Summary: Council will receive a report from Staff regarding the City of Ukiah's long-term land use planning policy for Ukiah and the Ukiah Valley, specifically related to research and additional analysis and information pertaining to Policy Directive No. 2.

Background:

On August 27, 2019, City Council and Staff discussed the City of Ukiah's long-term land use planning policy for Ukiah and the Ukiah Valley during a workshop at the Ukiah Valley Conference Center. The workshop served to provide information regarding reorganization requirements under the Cortese-Knox-Hertzberg Act, the role of the Local Agency Formation Commission, and key terms such as Sphere of Influence and Municipal Service Review, as well as outlining proposed Policy Directives for Council's consideration. The discussion was prompted by priorities and strategies within the City Council's Strategic Plan, which listed actionable items as 1) update the Ukiah General Plan; 2) update the City of Ukiah's sphere of influence; 3) prepare and adopt annexation policies, and; 4) evaluate and amend the city zoning code to improve efficiencies/public service and protect natural resources. See Attachment 1 for the Staff Report for August 27.

During discussion by Council related to the recommended Policy Directive No. 2, Council requested additional information regarding possible reasons for the reduction of the Sphere of Influence (SOI) proposed in the 1995 General Plan. Although never adopted by the Mendocino County Local Agency Formation Commission (Mendocino LAFCo), the 1995-proposed SOI (see Attachment 2) reflected a departure from the long-term planning policy and approach to growth management in Ukiah and the Valley since 1974.

Discussion:

To address Council's questions plus explore information provided by Mendocino LAFCo's Executive Officer at the August 27 City Council workshop related to Areas of Interest, Staff has conducted extensive research into the City's archives and historical files, as well as reviewing past City Planning staff's notes and files. The following constitutes the sources and materials reviewed: 1974 General Plan, 1984 General Plan, *Sphere of Influence Study* prepared by William R. Zion, Fall 1984, Planning Commission agenda packets and minutes for the period 1991 to 1995 (which included updates from the Growth Management Steering Committee formed to provide recommendations for the City's 1995 General Plan), 1991 Ukiah Valley-Wide Task Force Report and Recommendations, minutes and agenda packet materials from 1994 and 1995 meetings of the City Council,

the 1995 Ukiah Valley General Plan, documents/notes from former Community Development Director Stump titled “City of Ukiah Sphere of Influence Update 2014-2015,” 2009 Ukiah Valley Area Plan, Mendocino County General Plan (2009), and the 2012 City of Ukiah Municipal Service Review.

Research was conducted from published reports, studies, and documents and publicly available legislative materials. No interviews were conducted as part of this research, nor were any opinions collected from the former members of the committees, City Councils, Boards of Supervisors, special districts, certain special interest agencies and organizations, or the former or current staffs of these various entities.

Below is a timeline listing key events leading up to and/or related to the development of the 1995 General Plan, as well as pertinent quotes.

1. Establishment of the City of Ukiah Sphere of Influence

Fall 1984: *Sphere of Influence Study*, by William R. Zion

Known as the Zion Study, this was an independent Mendocino County-wide study completed for all special districts and local agencies in Mendocino County. The purpose of the study was to make recommendations to Mendocino LAFCo on appropriate SOIs for Mendocino County. Relevant quotes:

“The adopted city” (of Ukiah) “sphere of influence includes all of both water districts, except for that part of Willow south of Boonville Road. In addition the territory of both districts is part of the Ukiah urban area and needs the full range of city services.”

“*Because of the inclusion of the districts within the Ukiah sphere, a “zero” sphere is indicated, implying no annexations and eventual annexation to Ukiah and dissolution. That part of the Willow district outside the city sphere could have a sphere permitting some expansion, if LAFCo feels this is consistent with the county general plans and with local needs.”*

This study and recommendations within the study served as the basis for establishing Ukiah’s SOI, which Mendocino LAFCo adopted on December 3, 1984, through Resolution No. 84-15.

2. Early Annexation Efforts and Intentions

There has been speculation that the City never intended to annex areas within its 1984 SOI. However, in reviewing actions and legislative proceedings from 1984 to 1989 it appears the City was actively preparing to annex areas within the entire SOI while also focusing on preservation and protection of agricultural areas.

August 1986: *City Council Ordinance 858*, Prezoning Certain Properties Ukiah North

“Whereas, pursuant to Government Code Section 65859, the City has the authority to prezone property within its Sphere of Influence, and

Whereas, the subject prezone includes 1110 parcels extending from the northern city boundaries to Highway 20 and westerly to the foothills from the Russian River.”

November 1988: *City Council Minutes*, Presentation of Maps of the Incorporated Ukiah Valley

“The City Manager presented maps depicting the Ukiah Valley with the City of Ukiah sphere of influence that is overlapped by different water, sanitation, and fire districts. He noted since the City Council has established a

goal of incorporating the Ukiah Valley, this map visibly shows the magnitude of the issues to be resolved. (Mayor Henderson, Councilmembers Shoemaker, Schneiter, Hickey, and Wattenburger)."

February 1989: *Letter from Mayor of Ukiah City Council to Board of Supervisors* and *Policy Resolution*

First paragraph and part of second paragraph from letter written by Mayor Colleen Henderson to Marilyn Butcher, Chairman of Board of Supervisors: *"As you may know, the City of Ukiah is in the process of prezoning all parcels of land within its sphere of influence. We have completed the prezoning of all lands to the north, and down the east side of the valley south to Gobbi Street. This process raised some concern within the farming community that agriculturally zoned lands might not be preserved. The City has always had a strong commitment to the preservation of agriculture in the valley and an individual's right to farm on such agriculturally zoned lands. In light of this commitment and in light of the farming community's concerns, the City Council and Mendocino County Farm Bureau have adopted policy resolutions reflecting our joint position on prezoning and annexation of agricultural lands from Gobbi Street south in Ukiah's sphere of influence…I am enclosing copies of both resolutions for your reference."*

3. Towards a Plan for the Ukiah Valley- Development of the 1995 Ukiah Valley General Plan

1990-91: *Ukiah Valley-Wide Task Force Report and Recommendations*

A Valley-wide task force was formed by the City of Ukiah and County of Mendocino in April 1990. The task force consisted of a combination of citizens-at-large, County and City representatives, representatives from each of the water districts and fire district, and representatives from agencies of other certain interests. The purpose of this task force was *"to initiate a long overdue study of possible consolidation of services, and consolidation of interests in providing services and/or meeting future service needs in the areas of water, sewer, emergency services and development standards."*

After several meetings, the Task Force produced a draft report in August 1991 with findings and recommendations for efficient delivery of public services within the Ukiah Valley. The task force also produced an implementation plan for accomplishing the recommendations.

"8. The County and City shall reactivate their joint planning meetings and utilize these joint meetings to facilitate the standardization of development standards in the Valley."

In relation to the sections focused on the Ukiah Valley, the report reinforced the importance of joint planning between the City and Mendocino County, especially in regards to future development and land use. The report also served as the basis for the future *Community Facilities Element* of the 1995 Ukiah Valley General Plan (1995 Ukiah Valley General Plan, Section 2.02.8).

1990-1994: *Growth Management Steering Committee*

November 21, 1994 Staff Report from City of Ukiah Planning Department to City of Ukiah Planning Commission providing background and a recommendation to adopt the *Draft Ukiah Valley General Plan and Draft Environmental Impact Report*: *"In late 1990, the Ukiah City Council authorized and budgeted for this planning effort" (the 1995 Ukiah Valley General Plan). "Thereafter, the Growth Management Steering Committee (GMSC) was formed to guide the Plan's development, and a planning consultant was awarded the contract to perform necessary research and actually compose the document. The GMSC is a 35-member citizen advisory committee made up of Valley-wide participants representing groups, organizations, agencies, districts, and the general public. The consultant is The Company of Eric Jay Toll AICP, Inc., a small planning firm from Carson City, Nevada. The GMSC, which met regularly over the course of the entire four-year period,*

was basically responsible for crafting the final version of virtually every goal, policy, and implementation measure contained in the Plan, as well as many of the findings contained in each Element."

In addition to the GMSC, individual Citizen Advisory Committees (CACs) were created for each of the 14 General Plan Elements. Similar to the member composition of the GMSC, the CACs represented Valley-wide interests. *"Each volunteer" (*of the GMSC and CACs) "*was drawn from a broad cross-section of the **entire"*** (emphasis included within document) ***"**community- both in the City and in the Valley."* (1995 Ukiah Valley General Plan, Section 1- Preface)

"…it was apparent from the early stages of the planning process that the Ukiah Valley General Plan would have its greatest influence on the long-term development and use of the Valley if both the City of Ukiah and the County of Mendocino would utilize it for decision-making and planning policy. Accordingly, about mid-1991, City staff broached the subject of having the County adopt the eventual document as an Area Plan of the Mendocino County General Plan with County officials and the County Planning Commission and Board of Supervisors."

Although serving as the City of Ukiah's General Plan, the 1995 Ukiah Valley General Plan appears to have been envisioned by its creators to be the area plan for the Ukiah Valley. Through the collaborative efforts of both County and City representatives, the 1995 Plan would eventually be used to develop the 2009 Ukiah Valley Area Plan (UVAP), which is a component of the Mendocino County General Plan.

Utilization of an area plan as a municipal general plan is unusual. Common planning practice is for area or specific plans to be used for systematic implementation of a general plan (as is the case currently with the 2009 UVAP and its relationship to the Mendocino County General Plan). In its 2017 General Plan Guidelines, the California Office of Planning and Research (OPR) notes the followings: *"Area and community plans are part of the general plan. A specific plan is a tool for implementing the general plan but is not part of the general plan..."Area plan" and "community plan" are terms for plans that focus on a particular region or community within the overall general plan area."*

This aspect deserves further study, which Staff has attempted in Section 4 below. Additionally, given the City's current updating of the General Plan, Council will want to consider if continuing with a Valley-wide focused municipal general plan for the 2040 General Plan is appropriate, especially in light of the 2009 County of Mendocino adopted UVAP. Staff has provided some preliminary recommendations, and a future General Plan workshop has been scheduled to discuss the subject further.

1994-1995: *Sphere of Influence* and *Planning Commission and City Council Review and Adoption*

The earliest conceptualizations of the 1995-proposed SOI appear to have been developed by various stakeholder groups, either in conjunction with or independent of the Ukiah Valley General Plan GMSC. For example, in a City planning staff report produced in February 1994 a footnote to the report states *"In addition to the Staff-proposed version, the GMSC already has a color copy of the Board of Realtors' proposed Sphere of Influence, and has seen a presentation of the Farm Bureau's version. In addition, Lief Farr has also proposed a Sphere of Influence based on other issues."*

From the reports, minutes, and documents produced during this period, it appears that the GMSC reviewed multiple proposed SOIs from different Valley-wide stakeholders, then developed a final proposed SOI, which was inserted into the *Draft Ukiah Valley General Plan*.*

The efforts of the GMSC concluded sometime in mid-1994, and the *Draft Ukiah Valley General Plan* was presented to the Planning Commission on December 13, 1994. Through a series of public meetings from

December 1994 to April 1995, the Planning Commission discussed and deliberated on proposed revisions to the General Plan. After conceptually approving the Draft on June 10, 1995, the City Council conducted a series of public meetings and made *"numerous additional revisions,*" resulting in a Final General Plan that was adopted on December 6, 1995.

It seems the final City Council adopted version was relatively unchanged from the GMSC Draft document. Per Section I.1.3, Preface, of the *Ukiah Valley General Plan "The Planning Commission worked hard on the draft Plan, but, in the end, the Plan was left basically and functionally intact from the Growth Management Steering Committee's final version…The document was, and remains, truly representative of the citizens of the Valley…"*

4. Summary of Research

The 1995 Ukiah Valley General Plan, although serving as the City's municipal general plan, is essentially an older version of the (2009) Ukiah Valley Area Plan. It is not a traditional municipal General Plan in that it is not focused primarily on City incorporated areas. This historical context is important. Although aligning with a vision in earlier General Plans that foresaw the City and Valley as one community, the difference between the City's General Plans and related efforts between 1974 and 1989 and the Ukiah Valley General Plan process of 1990-1995 appears to be that the former was Ukiah-centric versus the latter that was area-wide. It is Staff's opinion that although this was a worthwhile planning effort ultimately leading to development of the UVAP, at this point (2020) in the Valley's development it is appropriate for the City to have its own municipal general plan, and although not required by State law, the 2040 General Plan should seek to achieve consistency with the 2009 UVAP.

It is also not clear that City of Ukiah representatives on the Planning Commission or City Council were fully in support of the valley-wide approach to the City's General Plan. "*While the document was not changed in a grand or profound way as a result of the Commission's involvement, it would nevertheless be misleading and inaccurate to deduce that the Commission was in full harmony on various issues, or that individual Commissioners did not have viewpoints that substantially deviated from the Steering Committee's recommendations…Indeed, differences of opinion were expressed in regards to…the Plan's relationship to the community's needs."*

However, although it can be proven with a degree of certainty that the 1995 Ukiah Valley General Plan is akin to an area plan, the specific motivation or reasoning behind the 1995-proposed SOI is more ambiguous. There appear to have been several early versions of the SOI developed by various stakeholder groups but few additional details or reasons are provided as to how these proposals were formulated. Given that the final *Draft Ukiah Valley General Plan* was produced by the GMSC for presentation to the Planning Commission and City Council and this Draft Plan included the 1995-proposed SOI, it is thus reasonable to conclude the 1995 SOI was a product of the GMSC.

In light of this research, plus research into subsequent confirmations of the 1995 SOI by City Councils in 2006 and 2012 (although in 2012 there was an amendment proposed to increase the 1995 SOI slightly to encompass the western hills) it is Staff's conclusion that the reasoning behind the 1995 SOI consisted of the following: 1) the focus of the City's General Plan was on the entire Valley, and the City's representation was reduced due to the composition and focus of the GMSC and CACs; 2) little to no City-related annexation applications had been received, nor approved, during the period from 1974 to 2012, so there were limited realistic development expectations for the City, and 3) a combination of little to no population growth, limited new construction activity, and the Great Recession in 2007-2009 all tempered future growth expectations.

5. Staff Recommendations

Given this research, plus other analysis below, Staff recommends modifying Policy Directive No. 2 as follows (note that strikethroughs are utilized to show deletions to the current Policy language):

Policy Directive No. 2: Maintain the City's current ~~Sphere of Influence~~ **Planning Area as the City's** ~~long-term Sphere of Influence~~ **2040 Planning Area. Reduce the City's Sphere of Influence to be reflective of areas with existing and forecast urbanized development within the next 10 years and designate as Areas of Interest areas outside the SOI but within the City's 2040 Planning Area.**

Reasoning behind 2040 Planning Area Recommendation

The planning area in the 1995 General Plan is coterminous with the current (1984) SOI and planning area of the Ukiah Valley Area Plan (UVAP). Planning areas represent geographical areas, sometimes similar to or the same as SOIs and at other times greater than SOIs, representing any land outside a city's boundaries which in the planning agency's judgment bears relation to its planning (Gov. Code 65300).

In its 2017 General Plan Guidelines, the California Office of Planning and Research (OPR) notes *"When establishing its planning area, each city should consider using its sphere of influence as a starting point, and building off of that area based on factors such as its location in a watershed."* Both the 1995 Ukiah Valley General Plan and 2009 UVAP refer to the Ukiah Valley as one community, and in Staff's opinion this reinforces the importance of establishing the City's planning area as coterminous to the UVAP planning area. However, adoption of a planning area alone would limit the City's ability to "have a seat at the table" when it comes to land use planning and future development in the Ukiah Valley.

Therefore, Staff recommends Council direct that Staff work with Mendocino LAFCo to pursue Areas of Interest for all areas outside the proposed SOI but within the 2040 planning area. Mendocino LAFCo defines Areas of Interest in its Policies & Procedures Manual as the following:

"An Area of Interest is a geographic area beyond the sphere of influence in which land use decisions or other governmental actions of one local agency (the "Acting Agency") impact directly or indirectly upon another local agency (the "Interested Agency"). For example, approval of a housing project developed to urban densities on septic tanks outside the city limits of a city and its sphere of influence may result in the city being forced subsequently to extend sewer services to the area to deal with septic failures and improve city roads that provide access to the development. The city in such a situation would be the Interested Agency with appropriate reason to request special consideration from the Acting Agency in considering projects adjacent to the city."

(Policies & Procedures Manual, Section 10.1.12)

Reasoning behind Sphere of Influence Recommendation

The Office of Planning and Research defines a Sphere of Influence as "a plan for the probable physical boundaries and service area of a local government agency as determined by the" (local agency formation) "commission." Spheres of Influence are designed to map out future development of urban uses or urban-type service expectations within a certain period of time, usually 10-20 years. In deciding on an appropriate SOI for recommendation, it is important to analyze both the historical decision-making leading up to the current SOI and 1995-proposed SOI, plus affirmations of these SOIs, as well as the planning and development landscapes of these eras and the era since the 2012 Municipal Service Review (the date of the most recent Council affirmation of the 1995-proposed SOI). This historical perspective was the key component missing in Staff's

presentation at the August 27, 2019 workshop.

There are five, and possibly more, notable differences between the time period of 1995 to 2012 and the period of 2012 to the present. From a review of data on building permits (see Attachment 3), plus inquiries related to new commercial and residential development, development pressures have potentially been greater within the last seven years than in any time since the “growth years” of the 1920s.** Second and given the demand for development, the City is rapidly approaching full build-out. Third, within the last approximately 5 years Ukiah like most of California has experienced significant demand for housing, and new State laws like SB 743 and the California Housing Package have prioritized that this housing be located within infill areas served by adequate infrastructure and services. Fourth, the City recently completed a study that identified 12 Disadvantaged Unincorporated Communities (DUCs), and per Mendocino LAFCo’s Policies and Procedures, Issues of Interest, Section D. “*To promote environmental justice for underserved inhabited communities, funding sources should be identified for extension of municipal services, including options for annexation of contiguous disadvantaged unincorporated communities.”* And fifth, given these reasons, plus the increasing need for wildfire mitigation planning within the Wildland Urban Interface, it will be vital that the City move forward with a plan for the orderly development of future urbanized areas.

Consequently, it is Staff’s opinion that the SOI should reflect the current and future perspective of Ukiah and its Valley, representing realistic infill development expectations within the short-term planning period- areas that are planned to be annexed by the City within the next 10 years (see proposed SOI in Attachment 4). Staff is also of the opinion that the City’s general plan should be reflective of this updated perspective and that, although not required by State Law, the general plan be consistent with the County’s UVAP.

From a big picture standpoint, this policy recommendation effectively ties together all separate but related components of long-range planning in Ukiah and the Ukiah Valley. It is reflective of historical policy (through consistency with the UVAP), current development conditions, and future infill development expectations. It also represents a policy that is more proactive and driven by the City.

Footnotes: *Because the GMSC provided information to the consultant Eric Jay Toll, Inc., who then prepared the *Preliminary General Plan*, which would serve as the basis for the *Draft Ukiah Valley General Plan* presented to the Planning Commission and City Council, and because it appears the GMSC and CACs were not legislative or quasi-legislative bodies and not subject to the Brown Act, no minutes or reports have been found that were produced by the GMSC and CACs. Instead, Staff has been able to piece together the origin of City planning staff’s Sphere of Influence recommendation through review of informational reports (updates) produced by City staff and agenda packets and minutes of the Planning Commission and City Council.

**This statement is made from a review of the resources cited in this report. Development pressures prior to 1974 have not been studied in detail.

Recommended Action: 1) Receive report and discuss; 2) direct Staff to proceed with Policy Directive No. 2, as revised within this Staff Report.

City of Ukiah

AGENDA SUMMARY REPORT

SUBJECT: Discussion with Possible Direction to Staff Regarding the City of Ukiah's Long-Term Land Use Planning Policy for Ukiah and the Ukiah Valley.

DEPARTMENT: Community Development **PREPARED BY:** Craig Schlatter

ATTACHMENTS:

Attachment 1- Mendocino LAFCo P&P Manual 2018
Attachment 2- Mendocino LAFCo 4-1-19 agenda packet
Attachment 3- UVAP Chap. 3- Land Use and CD
Attachment 4- UVAP Map-Planning Area (Figure 9.1)
Attachment 5- Ukiah Valley Fire District Map

Summary: Council will discuss the status of planning documents relating to long-term land use planning in Ukiah and the Ukiah Valley, with possible direction to Staff. This item specifically addresses the "Actionable Items" identified in the Council's Strategic Plan under "Plan for the Future: Utilize sound principles for valley-wide planning."

Background: The Cortese-Knox-Hertzberg Local Government Reorganization Act of 2000 ("CKH Act"), enacted through the passage of AB 2838, combined existing statutes--such as the act formerly known as the Cortese-Knox Act--into a single law and significantly and comprehensively reformed local government reorganization law. The CKH Act provides the framework for proposed city and special district annexations, incorporations/formations, consolidations, and other changes of organization. This law establishes a Local

RECOMMENDED ACTION: 1) Receive report and discuss; 2) direct Staff to proceed with Policy Directives 1, 2, and 3 as outlined in this Staff Report.

Agency Formation Commission (LAFCo) in each county, empowering it to review, approve, or deny proposals for boundary changes and incorporations/formations for cities, counties, and special districts. LAFCos were first created by the Legislature in 1963. Currently, although exercising both regulatory and planning functions, the major planning task of LAFCOs across the state is the "establishment, periodic review, and update of spheres of influence (SOI) for the various governmental bodies within their jurisdiction" (Office of Planning and Research--LAFCOs, General Plans, and City Annexations, 2012).

The Mendocino County Local Agency Formation Commission ("Mendocino LAFCo") is the LAFCo for Mendocino County. Mendocino LAFCo annually reviews its five-year rolling work plan and associated budget, primarily focusing on municipal service reviews ("MSRs") and SOI Updates. Mendocino LAFCo also reviews and updates its policies and procedures manual as needed. The Mendocino Local Agency Formation Commission Policies & Procedures Manual (Attachment 1), last updated and adopted on November 5, 2018, sets forth policies and procedures for carrying out Mendocino LAFCo's functions.

A Sphere of Influence is "a plan for the probable physical boundaries and service area of a local government agency as determined by the commission," while a municipal service review is a "comprehensive review of all agencies that provide the services LAFCo identifies" (Office of Planning and Research, 2012).

Mendocino LAFCo's 2019 five-year rolling work plan and associated budget was adopted on April 1, 2019 (Attachment 2). Included in the work plan was to update the MSR and SOI for the City of Ukiah, planned as being undertaken in Fiscal Year 2020-21. Mendocino LAFCo also voted to re-prioritize the MSR/SOI update for Ukiah Valley Fire District, originally planned to be completed in FY 2019-20, to FY 2020-21 to correspond with the City of Ukiah MSR/SOI update. The City's MSR was last updated in 2012. An update to the City's SOI has not been completed since 1984. AB 2838 and the CKH Act require the local LAFCo to review and update each local agency's SOI every five years. The law also requires local LAFCos to conduct MSRs before or in conjunction with the establishment or update of SOIs.

Both City Staff and Mendocino LAFCo staff have been in communication regarding a tentative work plan for these MSR/SOI updates since 2017. Of significant relevance has been the timing of the City's General Plan Update which, through extensive community engagement and the establishment of other long-term policies, sets forth the City's future intentions for surrounding unincorporated lands within the City's SOI. As the SOI describes the probable physical boundaries and service area for the City, it is important these two advanced planning projects are coordinated and aligned between the City and Mendocino LAFCo as much as possible.

Of additional importance is the City Council's Strategic Plan, which sets as a priority "Plan for the Future: Utilize sound principles for valley-wide planning." The recommended strategy for this item is to "Review and revise land use planning documents to be reflective of the long-term vision for the community." The "actionable items" associated with that strategy are 1) update the Ukiah General Plan; 2) update the City of Ukiah's sphere of influence; 3) prepare and adopt annexation policies, and; 4) evaluate and amend the city zoning code to improve efficiencies/public service and protect natural resources.

Discussion: Although the City's MSR/SOI updates are not scheduled to be undertaken by Mendocino LAFCo until 2020-21, there are primarily two reasons Staff is seeking Council's input regarding policy at this juncture:

1) Mendocino LAFCo has received, or may receive prior to the City's updating of the MSR/SOI, proposals from single- or multi-purpose districts in the City's SOI to annex portions of lands within the City's SOI. Under existing Mendocino LAFCo policy, "where an area could be assigned to the sphere of influence of more than one agency, the following hierarchy typically applies:

a) Inclusion within a city's sphere
b) Inclusion within a multi-purpose district's sphere
c) Inclusion within a single-purpose district's sphere"

2) Mendocino LAFCo's guidelines state "in all of its decisions and actions, the Commission's desired result is the most efficient and effective delivery of services by local entities…" and "preference shall be given to those local agencies which can provide services in the most effective and efficient manner." Given the efficiency and potential capacity of both existing and future City services, Staff believes it important that the City outline its potential policy for these services for the future. This policy should be shared publicly but especially outlined to Mendocino LAFCo, the County of Mendocino, and special districts within the City's existing and proposed SOI.

Staff has researched historical City and Ukiah Valley policies regarding long-term growth management planning and analyzed the status of current land use and availability in Ukiah and the Ukiah Valley with the capacity of municipal services. Below are policy recommendations for the Council's consideration and discussion:

Policy Directive No. 1: The goals and vision of the Ukiah Valley Area Plan will be utilized as the basis for the City's policy towards future reorganization efforts in the Valley.

Adopted by the Mendocino County Board of Supervisors in 2011, the Ukiah Valley Area Plan ("UVAP") is a "comprehensive and long range inter-jurisdictional planning document" envisioned as one that would "meet the needs of the County, as well as shared needs of the City" [of Ukiah], "by addressing the important issues that affect how the area will grow..." The UVAP also sets forth a vision that "The Ukiah Valley is understood to be one community with collaborative decision-making between County and City agencies." UVAP policies "take precedence over the [Mendocino County] General Plan" for land use and development proposals in the Valley.

Section 3 of the UVAP, Land Use and Community Development (Attachment 3), lists several goals on Page 3-3 in support of this policy. Promoting compatible land uses and managing future growth to ensure essential support infrastructure is in place prior to development recognizes "that the Ukiah Valley is one community[.]" Realizing the vision of a coherent community will not be possible without the coordinated and efficient provision of services to lands in the Ukiah Valley.

Policy Directive No. 2: Maintain the City's current Sphere of Influence as the City's long-term Sphere of Influence.

Although past attempts were made by the City to revise its SOI, no update has been successfully completed, nor approved by LAFCo, since the 1984 SOI. The 1984 SOI, which is coterminous to the UVAP planning area, "extends from Highway 20 in the north to Boonville Road in the south and from ridge to ridge on east and west" (Attachment 4).

At the time of adoption of the 1984 General Plan, Mendocino LAFCo, working with the City, identified the SOI/planning area to consider the areas surrounding Ukiah that would have an impact on the ultimate development of the City." At that time, the General Plan was "based upon a policy that growth will occur, but will be directed toward existing developed areas and those locales unsuitable for viable agricultural production."

In restating the current (1984) SOI as the City's long-term SOI, the City will reaffirm that the level of growth and/or service delivery anticipated by the City remains consistent for 2020-40 and aligned with the Ukiah Valley Area Plan. Ukiah is the county seat and commercial hub of a growing region that extends over 5,000 square miles, including the counties of Sonoma, Mendocino, Lake, and Humboldt. Ukiah will invariably continue to grow in the coming years. Planned well, that growth can result in a vibrant, healthy, and sustainable community. Unmitigated, the piecemeal provision of services leads to piecemeal development, which leads to urban sprawl and/or the lack of supporting infrastructure.

Staff also recommends reaffirming the current SOI as the City's long-term SOI to ensure efficiency and reliability of service delivery within the Ukiah Valley. As an example, the Ukiah Valley Fire District spans an area larger than the City's city limits (see Attachment 5), and as recent wildfire seasons have shown, having a well-funded and operated Fire Authority is important for the continued safety of the region. Additionally, as much-needed housing is developed, it will be important to ensure adequate water and sewer infrastructure is in

place. By utilizing existing tax measures and revenue sources, the City can ensure the effective and efficient provision of services. Reaffirming the current SOI as the long-term SOI will help ensure the City has an active role in directing urbanized growth to appropriate areas in our community and ensuring "the preservation and enhancement of the existing and potential agriculture within the valley," which is one of the primary visions set forth in the 1984 General Plan.

Policy Directive No. 3: Implement an annexation plan, with the first phase designating the area to be annexed within the first 10 years.

In multiple planning documents produced over the past 35 years, including the 1984 Ukiah General Plan, the 1995 Ukiah General Plan, both the 2009-14 and 2014-19 Housing Elements, and the 2011 Ukiah Valley Area Plan, two common and recurring themes emerge: 1) our community values the rural and agricultural identity of Ukiah and its surrounding valley; and 2) our community seeks to preserve that identity through well-designed projects and conservation of open space and agricultural lands.

In developing and adopting a growth management phasing plan, the first 10-year phase would identify the area around existing and forecasted urbanized development north and south of the city limits as the focus of the City's annexation efforts. Encouraging infill development where services are already concentrated will limit unnecessary sprawl and protect agricultural uses.

Development of a growth management phasing plan will ensure adequate services and infrastructure are in place for existing development, as well as ensuring that future development occurs in a sustainable manner. This policy would preserve the agricultural identity of the Valley, including preservation of an existing natural "green belt" around these areas.

Summarizing, Staff recommends Council direct Staff to implement the following three Policy Directives:

1. The goals and vision of the Ukiah Valley Area Plan will be utilized as the basis for the City's policy towards future reorganization efforts in the Valley.

2. The City will maintain the City's current Sphere of Influence as the City's long-term Sphere of Influence.

3. The City will implement an annexation plan, designating the area to be annexed within the first 10 years.

RESOLUTION NO. 2020-06

RESOLUTION OF THE CITY COUNCIL OF THE CITY OF UKIAH ADOPTING ANNEXATION POLICY

WHEREAS, the Cortese-Knox-Hertzberg Local Government Reorganization Act of 2000 provides for the annexation of unincorporated areas within a City's sphere of influence; and

WHEREAS, on August 27, 2019, the Ukiah City Council provided direction to staff to prepare and adopt annexation policies as part of the City's long-term land use planning and City Council Strategic Plan; and

WHEREAS, the City intends, in part through the attached Annexation Policy, to avoid the consequences of continued urban sprawl in the Ukiah Valley, to ensure the efficient provision of municipal services, and to protect open space and prime agricultural land in the Ukiah Valley; and

WHEREAS, the City envisions a future of the Ukiah Valley as a thriving community that is politically, economically, environmentally, and socially sustainable; and

WHEREAS, the City desires to provide annexation policies for the City and property owners within the City's sphere of influence that promote the successful annexation of unincorporated areas.

NOW, THEREFORE, THE CITY COUNCIL OF THE CITY OF UKIAH DOES HEREBY RESOLVE to adopt the Annexation Policy attached as Exhibit A, which shall be endorsed to show adoption by the City Council on January 16, 2019 and made publicly available.

PASSED AND ADOPTED this 16th day of January, 2020, by the following roll call vote:

AYES: Councilmembers Mulheren, Brown, Scalmanini, and Mayor Crane
NOES: None
ABSENT: None
ABSTAIN: None

Douglas F. Crane, Mayor

ATTEST:

Kristine Lawler, City Clerk

EXHIBIT A

City of Ukiah

Annexation Policy

The City will pursue, apply for, and support the annexation of unincorporated areas to the City to avoid the negative consequences of continued urban sprawl and to ensure the efficient provision of municipal services to unincorporated areas without placing an undue financial burden on the City or its residents.

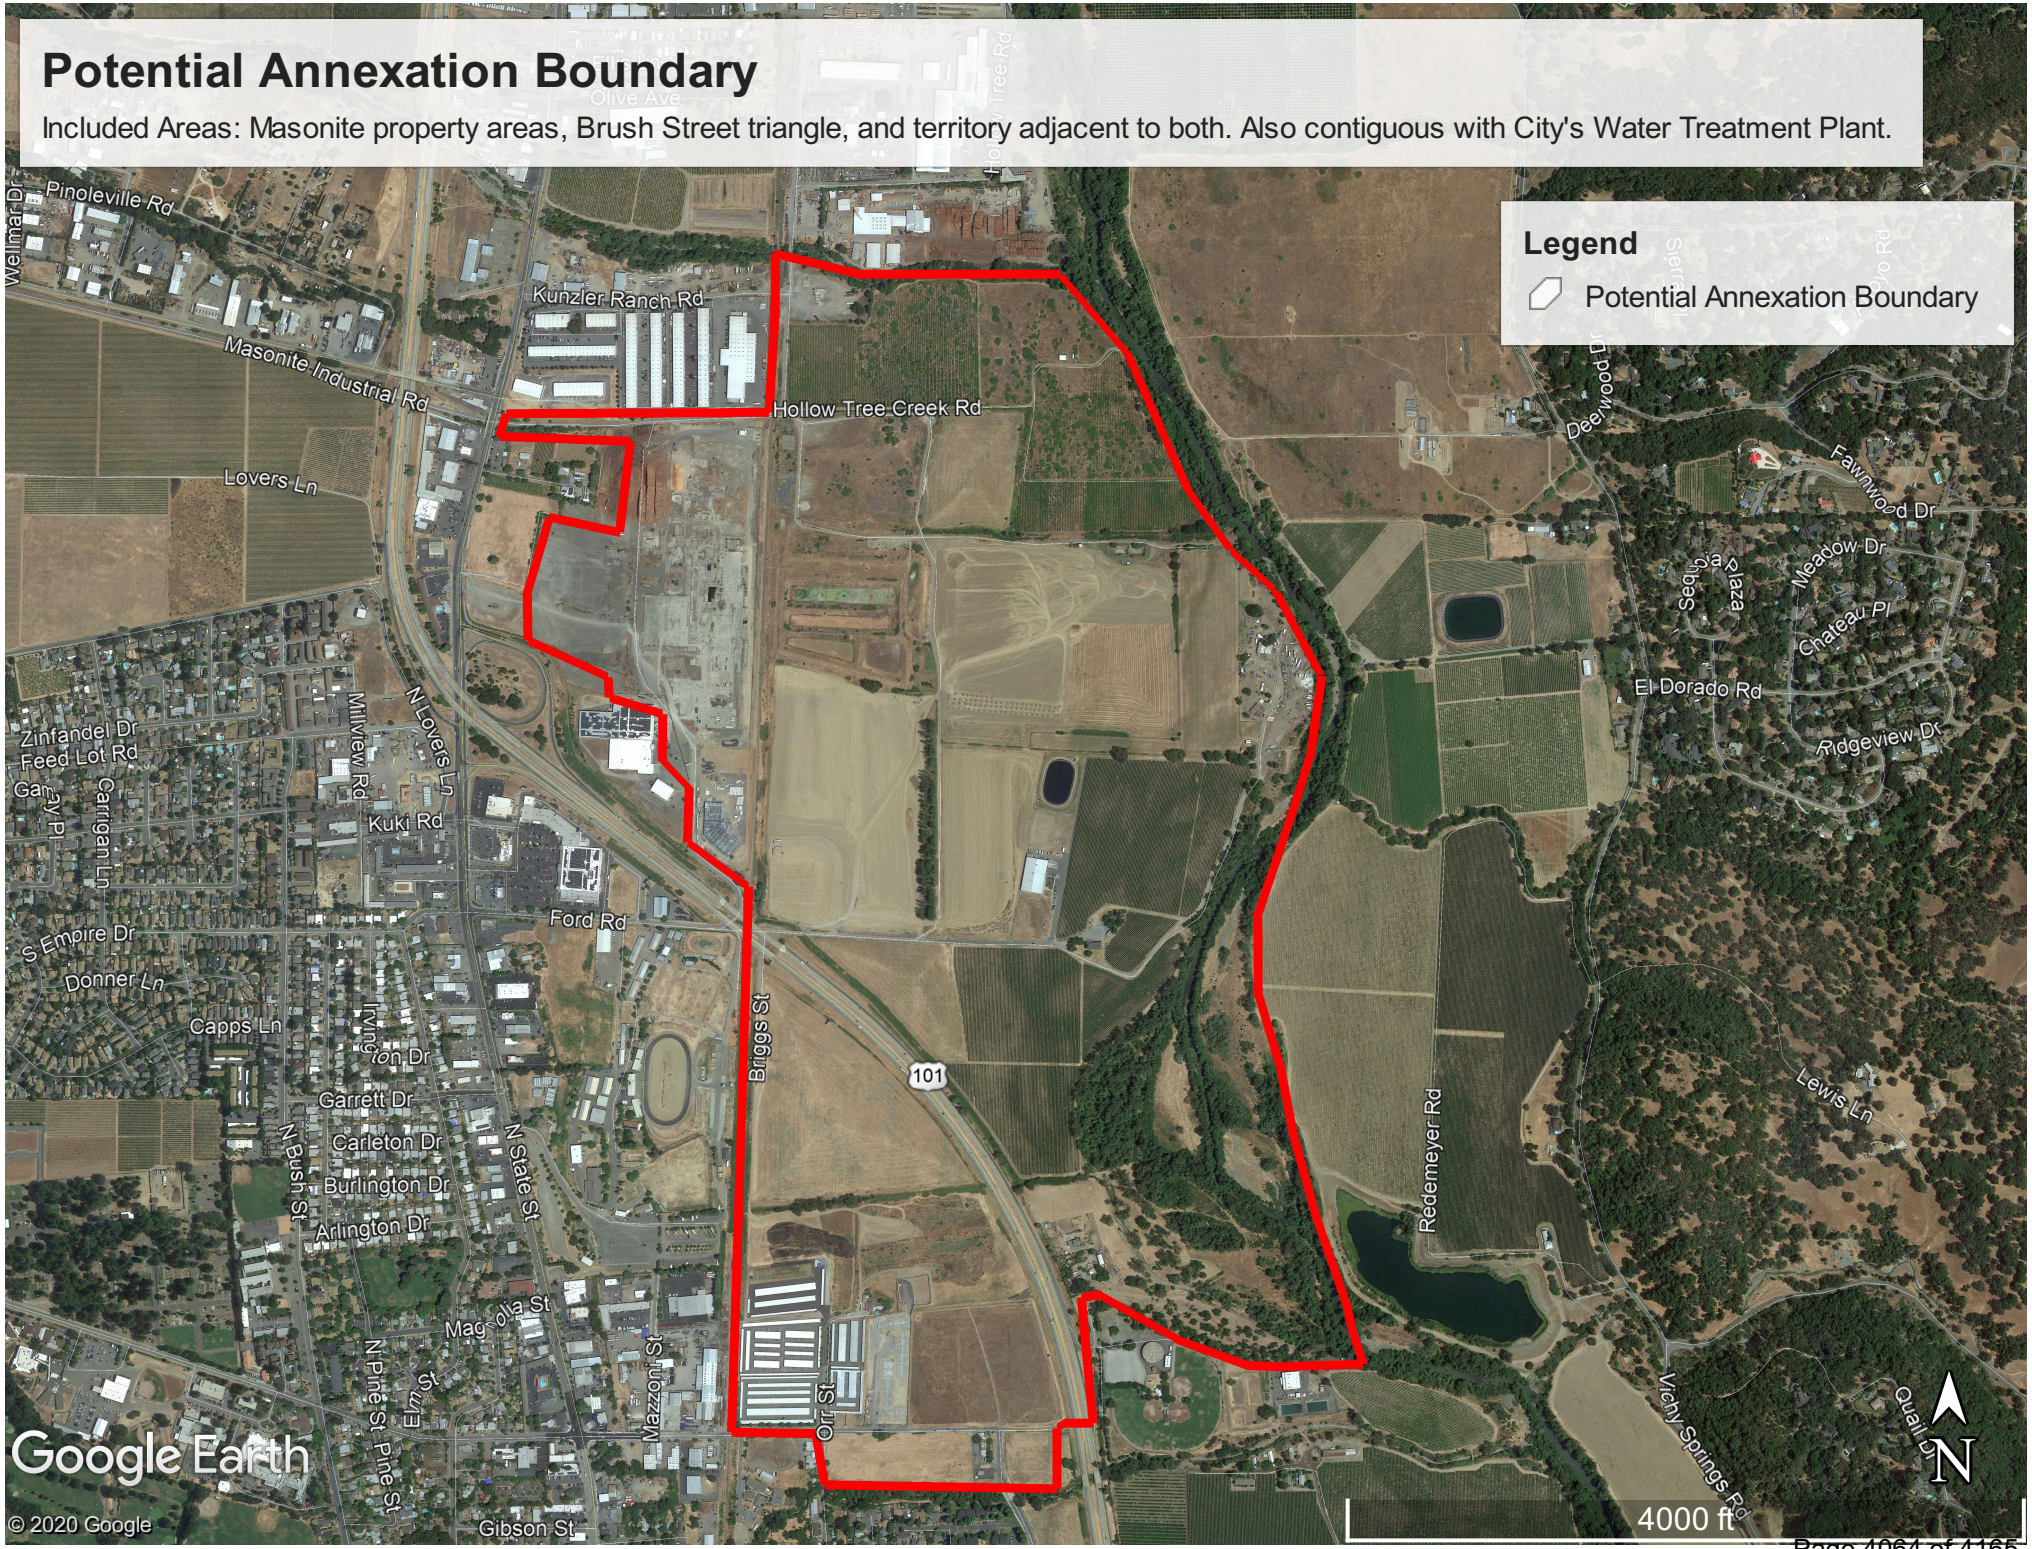
The City's Sphere of Influence reflects the City's intent and ability to apply to annex those territories within that Sphere of Influence. The City's Sphere of Influence should be updated periodically and as necessary to reflect any change in the City's intent or ability to annex unincorporated territory.

The City's Area of Interest reflects that territory outside its Sphere of Influence where the City has an interest in ensuring orderly development and the efficient provision of municipal services, and a financial interest in the implications of any such development and services. The City will consider providing services to unincorporated areas within its Area of Interest when the City and all local agencies with relevant jurisdiction, if any, arrive at an agreement ensuring the City is adequately compensated for the costs it incurs and/or will incur due to development in its Area of Interest.

The City will apply for the annexation of unincorporated areas and will support property owners who desire to annex to the City where the City determines it to be in its residents' interests to do so, to promote orderly development, to implement General Plan goals and objectives, and/or to ensure the efficient provision of municipal services.

In pursuing, applying for, or supporting annexation, the City will demonstrate that existing or planned-for facilities, infrastructure and improvements, and municipal services are or will be available, including but not limited to: vehicular and pedestrian traffic corridors, fire protection, sewer, electricity, and municipal and industrial water, in accordance with City standards and General Plan goals and objectives, to those areas proposed to be annexed.

The City will pursue, apply for, or support annexations that could affect open space and prime or unique agricultural lands, when it is satisfied that they will be adequately protected.



The City will pursue, apply for, or support annexation in those cases where significant environmental impacts have been mitigated or avoided as appropriate.

The City will develop, maintain, and make publicly-available a City of Ukiah Annexation Guide that includes an annexation applicant's responsibilities, the requirements for environmental review, requirements for development plans, and fees associated with applications for annexation.

If appropriate, and as it may be amended, the City will incorporate and include this Annexation Policy in its 2040 General Plan.

Potential Annexation Boundary

Included Areas: Masonite property areas, Brush Street triangle, and territory adjacent to both. Also contiguous with City's Water Treatment Plant.

Summary: The City Council will receive a status report and consider any action or direction related to the Novel Coronavirus (COVID-19) Emergency including operational preparedness and response; continuity of City operations and services; community and business impacts; and any other related matters.

Background: On March 4, 2020, California Governor Gavin Newsom declared a State of Emergency in California in response to the COVID-19 pandemic.

The County of Mendocino declared a State of Emergency related to the COVID-19 on March 4, 2020.

On March 17, 2020, the City Manager acting as the Director of Emergency Services declared the existence of a local emergency.

On March 18, 2020, City Council approved a Resolution ratifying the proclamation declaring the existence of a local emergency.

Since the onset of the emergency, the City of Ukiah has worked to respond to the public health and safety needs of the community in cooperation with the County of Mendocino and other partners. The local response for public health is lead regionally by the County of Mendocino and the County's Public Health Officer. In addition, the City of Ukiah has worked to maintain the continuity of public services including public safety, water, sewer, electric, airport, public works, and other essential activities.

Discussion: As the coronavirus “COVID-19” continues to evolve, the City of Ukiah continues to monitor the situation and respond to emerging needs of the community. The City is in continued contact with local and state agencies, as well as community partners, hospitals, schools, and neighboring cities to ensure we have the most updated information pertaining to COVID-19 and are coordinating efforts.

Reports and/or information from the City of Ukiah's Emergency Operation Center (EOC) will include:

* Emergency Operation Center (EOC) Status
* COVID-19 Case Updates
* Public Information Officer

* Medical Services
* School/Education
* Public Safety (Police/Fire/EMS)
* Shelter in Place Monitoring and Compliance
* Community Service Groups
* Homeless Response
* Business Impacts/Services
* Public Infrastructure/Construction Status
* City Finance
* Recovery Efforts and Planning
* Other Related matters

Staff will provide a status report to City Council and will seek direction or action on operational preparedness and response; continuity of City operations and services; community and business impacts; and any other related matters.

Go to the City's website (www.cityofukiah.com) for direct access to information related to the Novel Coronavirus (COVID-19) emergency including local updates, City Services, Community/Resident Information, and Business Resources.

Recommended Action: Receive status report and consider any action or direction related to the Novel Coronavirus (COVID-19) Emergency including operational preparedness and response; continuity of City operations and services; community and business impacts; and any other related matters.

AGENDA SUMMARY REPORT

SUBJECT: Consideration of Adoption of Amended Resolution Authorizing Applications for Funding and the Execution of Grant Agreements and any Amendments thereto from the 2019-2020 Funding Year of the State Community Development Block Grant Program.

DEPARTMENT: Community Development

PREPARED BY: Craig Schlatter, Community Development Director

PRESENTER: Craig Schlatter, Community Development Director

ATTACHMENTS:

1. CC Reso 2020-20 - Approving Application for Funding from CDBG
2. 2020-CDBG-OTC-Applications-Received-Final
3. Resolution (Amended)- 2020 State CDBG application

Summary: Council will consider adoption of an amended resolution authorizing applications for funding and the execution of grant agreements and any amendments thereto from the 2019-2020 funding year of the State Community Development Block Grant program.

Background: On May 6, 2020, Council adopted Resolution No. 2020-20 (Attachment 1) approving one or more applications for funding and the execution of a grant agreement(s) and any amendments thereto from the 2019-2020 funding year of the State Community Development Block Grant (CDBG) Program. Within the Resolution, Council approved submission of applications in the aggregate amount of not to exceed $3,460,000 for five eligible activities: Microenterprise Technical Assistance Program, Business Assistance Program, Clara Avenue Reconstruction Project, Orr Street Bridge and Transportation Corridor Study and Plan, and a Design and Feasibility Study for ADA Improvements at a City of Ukiah Municipal Services Facility located at 501 S. State Street. Council also approved the use of CDBG Program Income in an amount not to exceed $48,530 for the Clara Avenue Reconstruction Project.

With the exception of the Clara Avenue application, Staff submitted all other applications to the State Department of Housing and Community Development (HCD) prior to HCD's amended application submittal deadline of June 1, 2020. Per the 2019-2020 CDBG Notice of Funding Availability (NOFA), capital improvement project applications, such as for the Clara Avenue project, are submitted in the Over the Counter (OTC) application pool and due September 30, 2020. OTC project applications are awarded on a rolling basis as complete applications are received.

On July 7, 2020, the City received a payoff of a business assistance loan in the amount of $117,412.06. Repayments and payoffs of loans originally funded by open CDBG grants are known as Program Income (PI). PI can be reused by jurisdictions for eligible activities in substantially the same manner as that of open CDBG grants. Additionally, CDBG regulations require all PI be expended or committed to an eligible activity prior to drawing down and/or applying for additional funding. 17% of the $117,412 payoff, or $19,960, is automatically earned by the City as revenue for general administration activities, for the purposes of ongoing administration of CDBG programming. This leaves $97,452 to be committed within the City's 2019-2020 CDBG application.

In addition to the need to commit additional unanticipated PI, on June 19, 2020 HCD released a second amended NOFA reducing the maximum amount for the Business Assistance program from $750,000 to $500,000. The City's Resolution No. 2020-20 had approved an application be submitted for a $504,500 Business Assistance Program.

Staff discussed these two issues with HCD representatives in July. Due to the release of a list of OTC applications received as of June 4, 2020 (Attachment 2), Staff also discussed the likelihood of an award in the 2019-2020 funding cycle for the Clara Avenue Reconstruction project application. At Staff's request and for the City to be in compliance with current HCD guidance and CDBG regulations, HCD changed the status of the City's Business Assistance and Microenterprise Technical Assistance programs from submitted to draft. Both applications are due August 31 (also within NOFA amendment #2).

Discussion: Working closely with its underwriter/program operator, Staff redesigned the CDBG Business Assistance program for the provision of at least eight to nine forgivable loans to businesses impacted by the COVID-19 pandemic. As the impacts from the pandemic continue, additional funds to sustain the Ukiah small business community will likely be needed, and therefore Staff recommends the additional unanticipated Program Income be committed to the City's Business Assistance Program application. The $97,452 plus additional loan repayments expected within the 2020-21 fiscal year, bring the total amount of PI to be committed to approximately $140,000.

HCD representatives expressed doubt that additional OTC projects submitted within the next two months prior to September 30, 2020 would be awarded, as the amount available for OTC projects was already oversubscribed by approximately $37 million as of June 2. HCD suggested the City may have a better chance at an OTC award if submitting an application early in the 2021 CDBG NOFA funding cycle. The 2021 CDBG NOFA is expected to be released in mid-January 2021.

For all these reasons, Staff recommends Council adopt the Resolution in Attachment 3 for the following:

City of Ukiah Microenterprise Technical Assistance Program = $140,000
General Administration- Microenterprise Technical Assistance Program = $10,500
City of Ukiah Business Assistance Program = $431,000
Activity Delivery- Business Assistance Program = $34,000
General Administration- Business Assistance Program = $35,000
Orr Street Bridge and Transportation Corridor Study and Plan = $150,000
Design and Feasibility Study for ADA Improvements at City of Ukiah Municipal Services Facility located at 501 South State Street = $50,000
Total = $850,500

Staff also recommends Council approve the use of Program Income in an amount not to exceed $140,000 for the City of Ukiah Business Assistance Program.

Recommended Action: Adopt amended resolution authorizing applications for funding and the execution of grant agreements and any amendments thereto from the 2019-2020 funding year of the State CDBG program.

RESOLUTION NO. 2020-20

A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF UKIAH APPROVING AN APPLICATION FOR FUNDING AND THE EXECUTION OF A GRANT AGREEMENT AND ANY AMENDMENTS THERETO FROM THE 2019-2020 FUNDING YEAR OF THE STATE CDBG PROGRAM

NOW, THEREFORE, BE IT RESOLVED by the City Council of the City of Ukiah as follows:

SECTION 1:
The City Council has reviewed and hereby approves the submission to the State of California of one or more application(s) in the aggregate amount, of not to exceed $3,460,000, for the following CDBG activities, to be implemented in City of Ukiah incorporated areas, pursuant to the January 2020 CDBG NOFA:

City of Ukiah Microenterprise Technical Assistance Program	$ 140,000
General Administration – Microenterprise Technical Assistance Program	$ 10,500
City of Ukiah Business Assistance Program	$ 434,539
Activity Delivery – Business Assistance Program	$ 34,763
General Administration – Business Assistance Program	$ 35,198
Clara Avenue Reconstruction Project	$2,300,000
Activity Delivery – Clara Avenue Reconstruction Project	$ 230,000
General Administration – Clara Avenue Reconstruction Project	$ 75,000
Orr Street Bridge and Transportation Corridor Study and Plan	$ 150,000
Design and Feasibility Study for ADA Improvements at City of Ukiah Municipal Services Facility Located at 501 South State Street	$ 50,000
Total Grant Amount	$3,460,000

SECTION 2:
The City hereby approves the use of Program Income in an amount not to exceed $48,530 for the Clara Avenue Reconstruction Project Public Improvement Project described in Section 1.

SECTION 3:
The City acknowledges compliance with all state and federal public participation requirements in the development of its applications.

SECTION 4:
The City hereby authorizes and directs City Manager Sage Sangiacomo to execute and deliver all applications and act on the City's behalf in all matters pertaining to all such applications.

SECTION 5:
If an application is approved, the City Manager is authorized to enter into, execute and deliver the grant agreement (i.e., Standard Agreement) and any and all subsequent amendments thereto with the State of California for the purposes of the grant.

SECTION 6:
If an application is approved, City Manager is authorized to sign and submit Funds Requests and all required reporting forms and other documentation as may be required by the State of California from time to time in connection with the grant.

The foregoing Resolution introduced by Councilmember Mulheren, seconded by Councilmember Scalmanini, and passed and adopted at a regular meeting of the City Council of the City of Ukiah this 6th day of May, 2020, by the following roll call vote:

AYES: Councilmembers Mulheren, Brown, Scalmanini, Orozco, and Mayor Crane

RESOLUTION NO. 2020-__

A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF UKIAH APPROVING AN APPLICATION FOR FUNDING AND THE EXECUTION OF A GRANT AGREEMENT AND ANY AMENDMENTS THERETO FROM THE 2019-2020 FUNDING YEAR OF THE STATE CDBG PROGRAM

BE IT RESOLVED by the **City Council** of the **City of Ukiah** as follows:

SECTION 1:

The City Council has reviewed and hereby approves the submission to the State of California of one or more application(s) in the aggregate amount, of not to exceed $850,500, for the following CDBG activities, pursuant to the January 2020 CDBG NOFA:

City of Ukiah Microenterprise Technical Assistance Program	$ 140,000
General Administration – Microenterprise Technical Assistance Program	$ 10,500
City of Ukiah Business Assistance Program	$ 431,000
Activity Delivery – Business Assistance Program	$ 34,000
General Administration – Business Assistance Program	$ 35,000
Orr Street Bridge and Transportation Corridor Study and Plan	$ 150,000
Design and Feasibility Study for ADA Improvements at City of Ukiah Municipal Services Facility Located at 501 South State Street	$ 50,000
Total Grant Amount	$ 850,500

SECTION 2:

The City hereby approves the use of Program Income in an amount not to exceed $140,000 for the City of Ukiah Business Assistance Program described in Section 1.

SECTION 3:

The City acknowledges compliance with all state and federal public participation requirements in the development of its applications.

SECTION 4:

The City hereby authorizes and directs City Manager Sage Sangiacomo to execute and deliver all applications and act on the City's behalf in all matters pertaining to all such applications.

SECTION 5:

If an application is approved, the City Manager is authorized to enter into, execute and deliver the grant agreement (i.e., Standard Agreement) and any and all subsequent amendments thereto with the State of California for the purposes of the grant.

SECTION 6:

If an application is approved, City Manager is authorized to sign and submit Funds Requests and all required reporting forms and other documentation as may be required by the State of California from time to time in connection with the grant.

PASSED AND ADOPTED at a regular meeting of the City Council of the City of Ukiah held on August 5, 2020 by the following vote:

AGENDA SUMMARY REPORT

SUBJECT: Consider Adoption of the Ordinance Amending City Code Provisions Regulating Development of Accessory Dwelling Units.

DEPARTMENT: City Attorney **PREPARED BY:** Darcy Vaughn, Assistant City Attorney
PRESENTER: Darcy Vaughn, Assistant City Attorney

ATTACHMENTS:
1. ADU Ordinance Amendment REDLINE
2. ADU Ordinance Amendment CLEAN

Summary: The City Council will consider adopting the Ordinance Amending City Code Provisions Regulating Development of Accessory Dwelling Units.

Background: In 2018, the California State legislature enacted AB 68, AB 88, SB 13, AB 671, and AB 587 ("ADU Statutes"), which are intended to encourage development of Accessory Dwelling Units ("ADUs") and impose new requirements on local regulation of ADUs. These provisions are codified in California Government Code §§ 65852.2 (for ADUs) and 65852.22 (for Junior Accessory Dwelling Units ("JADUs")). While the City updated the City Code provisions regulating ADUs ("ADU Ordinance") in order to incorporate the then-current State regulations in 2017, the ADU Statutes include even further requirements that should again be incorporated into the City Code. Because the new State laws were effective January 1, 2020, the City ADU Ordinance is currently in conflict with State law and is, as such, void until amended to comply with the ADU Statutes. Because the only minimal State default standards for ADUs apply while the City's ADU Ordinance is void, it is in the City's interest to adopt an amended ADU Ordinance ("Amended ADU Ordinance") so that the City can continue to regulate ADU development in a manner that considers local needs and limitations, to the extent that the Statutes allow.

It is also in the interest of the City to adopt an Amended ADU Ordinance as soon as possible to assist Planning staff in the development of building plans for public use through funding from the City's SB 2 Planning Grant. The changes required by the ADU Statutes undoubtedly affect features of the building plans, and Planning has issued an RFP for design professionals to develop these plans, which include plans for ADUs. As such, an Amended ADU Ordinance that includes updated standards for ADU development would provide essential guidance in the development of ADU building plans during this process.

Prior to introduction of the Amended ADU Ordinance at the July 15, 2020 Council meeting, two Council members had questions about the following issues:

ADU Development and the Airport Land Use Compatibility Plan:

Mayor Crane inquired whether the land use requirements in the Airport Land Use Compatibility Plan ("ALUCP") were superceded by those set forth in the ADU Statutes and Amended ADU Ordinance regarding density calculations. Staff has considered this issue and has determined that provisions in the ALUCP that could prohibit detached ADU development are permissible under the ADU Statutes because these provisions

have an impact on public safety.

The 2020 ALUCP states as follows: “Secondary Dwellings. Detached secondary dwellings on the same parcel should be counted as additional dwellings for the purposes of density calculations. This factor needs to be reflected in local policies either by adjusting the maximum allowable densities or by prohibiting secondary dwellings where their presence would conflict with the compatibility criteria.”

The ALUCP defines a Secondary Dwelling as: “An attached or a detached residential dwelling unit which provides complete independent living facilities for one or more persons. It shall include permanent provisions for living, sleeping, eating, cooking, and sanitation on the same parcel as the single-family dwelling is situated. (California Department of Housing and Community Development).”

As mandated by the ADU Statutes, both the ADU Ordinance and Amended ADU Ordinance state, “ADUs and JADUs shall be deemed not to exceed the allowable density for the residential lot upon which an ADU or JADU is located”

However, many other jurisdictions, including the City, have already designated certain zoning districts where ADU development is not an allowed use due to concerns about the impact of increased density on traffic flow and public safety. Local jurisdictions can do so because of the following provision in the ADU Statutes, codified aton Govt Code § 65852.2(a)(1)(A):

"A local agency may, by ordinance, provide for the creation of accessory dwelling units in areas zoned to allow single-family or multifamily dwelling residential use. The ordinance shall do all of the following:

(A) Designate areas within the jurisdiction of the local agency where accessory dwelling units may be permitted. The designation of areas may be based on the adequacy of water and sewer services and the impact of accessory dwelling units on traffic flow and public safety. . . . "(emphasis added).

The provisions of the 2020 ALUCP that authorizes prohibition of ADUs in areas where their presence would conflict with compatibility criteria address a possible impact on public safety posed by ADU development. Section 21670 of the Public Utilities Code declares that the purpose of airport land use compatibility plans is “. . . to protect public health, safety, and welfare by ensuring the orderly expansion of airports and the adoption of land use measures that minimize the public’s exposure to excessive noise and safety hazards within areas around public airports to the extent that these areas are not already devoted to incompatible uses.” The density and height limits in airport compatibility zones promote public safety and an ADU in this zone that exceeded either limit should be excludable under Govt. Code § 65852.2.

Sewer and Water Connection Fees:

Councilmember Scalmanini expressed concern about the provisions of the ADU Statutes and the Amended ADU Ordinance that prohibit imposing a sewer or water connection fee or capacity charge for an ADU constructed within the space of an existing single-family home or accessory structure (“Existing Space ADU”) but allow such charges to be imposed on an Existing Space ADU that is constructed with and is a part of a new single-family home. Specifically, he observed that this would effectively penalize someone who wanted to build a new home with an Existing Space ADU included and would result in a double standard for differently situated Existing Space ADU developers.

Staff has researched this issue and has concluded that this application of sewer and water connection fees or capacity charges for Existing Space ADUs does not violate State or City law. Proposition 218 does not apply

here, and, while Proposition 26 does apply to sewer and water connection fees and capacity charges, these charges are subject to an exception within Proposition 26.

From a policy perspective, the State rationalizes that, for an ADU converted from existing space, the utilities for that space have already been accounted for in the original utility connection fee assessment when the house was constructed. For an ADU contained within a newly constructed building, the new ADU's impact on utilities has not been accounted for and will be assessed as part of the impact of the new single-family home.

There is an exception under Proposition 26, i.e. California Constitution Article XIII C, that applies to a water and sewer connection fee or capacity charge:

(e) As used in this article, “tax” means any levy, charge, or exaction of any kind imposed by a local government, except the following:

***

(2) A charge imposed for a specific government service or product provided directly to the payor that is not provided to those not charged, and which does not exceed the reasonable costs to the local government of providing the service or product.

Here, water and sewer connection fees or capacity charges are imposed for provision of sewer and water service, and imposed directly to the property owner paying for those services. The ADU Statutes and the current City Code already state that water and sewer connection fees and capacity charges cannot exceed the reasonable costs to the City of providing water and sewer services. As such, Proposition 26 does not bar application of the provisions regarding water and sewer connection fees and capacity charges in the ADU Statutes.

Finally, even if a California city or county determined that the provisions regarding water and sewer connection fees and capacity charges in the ADU Statutes were unconstitutional, there is no legal basis for refusing to comply with State law on these grounds. The city or county’s recourse would be to comply with the State law provisions while challenging their legality in California Superior Court. Alternatively, a reasonable interpretation of the provisions regarding water and sewer connection fees and capacity charges in the ADU Statutes is that while the City is prohibited from imposing these fees on an Existing Space ADU, the City has a choice as to whether to impose these fees on ADUs contained within a new single-family home.

Discussion: The Amended ADU Ordinance, a redlined version of which is attached here as Attachment 1 and a clean version as Attachment 2, amends a number of sections of the City Code to incorporate certain default standards imposed by the ADU Statutes for local agency ordinances regulating ADUs, to incorporate the revised basis for water and sewer connection fees and capacity charges, and to include provisions defining and regulating JADUs.

Note that, while the ADU Statutes do require cities and counties to amend ADU ordinances that are currently more restrictive than allowable under the new State standards, the City may still impose certain standards and restrictions on development of ADUs. For example, the City may still impose floor area and height limitations for ADUs, provided that these limitations are not more restrictive than the development standards set in the ADU Statutes. The City may still restrict development of ADUs in zoning districts if, due to local climatic, geologic and topographic conditions (e.g. inadequate roadways to provide adequate ingress and egress for emergency access and evacuation in the in the event of a fire or other emergency) the City determines that additional dwelling units in these areas would present negatively impact on traffic flow and public safety.

The current version of the Ordinance Amending City Code Provisions Regulating Development of Accessory

Dwelling Units reflects a wide array of community, City staff, and Council input. The Ordinance is now ready for consideration for adoption and, if adopted, will go into effect in thirty (30) days.

The primary changes required by the new State laws, and the recommended changes to the City's Ordinance, are as follows:

State Requirements Inconsistent with City Code	**Changes to City Code Provisions**
Cities must allow ADUs in any residential or mixed-use zone.	The City currently allows ADUs by right in the R-1, R-2, R-3, C-N, C-1, and C-2 zones. The Amended ADU Ordinance includes language clarifying that ADUs and JADUs are allowed in any zoning district that allows residential uses by right or with a use permit.
Cities must allow certain types of ADUs by right: • Within a new or proposed single-family home: one ADU and one JADU per lot if exterior access is available and side and rear setbacks are sufficient for fire and safety. • On a lot with a new or proposed single-family-home: one detached, new construction ADU that does not encroach into four-foot side and rear yard setbacks. A city may impose total floor area of 800 square feet; height limitation of 16 feet. • Within an existing multifamily dwelling: multiple ADUs within portions of existing multifamily dwelling structures that are not used as livable space including storage rooms, boiler rooms, passageways, attics, basements, garages if each unit complies with state building standards. A city must allow at least one and as many ADUs as is equal to 25% of the existing units in a multifamily dwelling. • On a lot with an existing multifamily dwelling: Not more than two ADUs that are detached from the dwelling and subject to a height limit of 16 feet and four-foot rear and side setbacks.	• The existing ADU Ordinance does not apply to ADUs associated with proposed single family homes or existing multifamily dwellings. The Amended ADU Ordinance requires ministerial approval of applications for ADUs associated with proposed single family homes. In addition, the Ordinance requires ministerial approval for up to two detached ADUs on a lot with an existing multifamily dwelling. The Ordinance also allows for ADUs within an existing multifamily dwelling, with the number of units capped at 25% of the existing units in a multifamily dwelling or one ADU, whichever is greater. • The Amended ADU Ordinance allows for ADUs with up to 1200 square feet in floor area and up to 18 feet in height.
If an applicant converts an attached garage, storage area, or other accessory structure to an ADU, and on-site parking is removed to allow for the conversion, a city may not require the applicant to replace the on-site parking. Cities shall require only one off street space for each bedroom or ADU, whichever is less. Cities cannot require off street parking for a JADU.	The City currently requires only one off street space per ADU. This provision was changed to one off street space per ADU or bedroom, whichever is less. A provision has been added indicating that an applicant is not required to replace on-site parking when conversion of an accessory structure involves removal of on-site parking. A provision has been added indicating that no off street parking is required for a JADU.
Cities are bound by the following development standards: • The maximum rear and side yard setback for an ADU that is not converted from an existing structure is 4 feet (reduced from 5 feet in the previous State ADU law). • A city may not impose a minimum lot size. • Maximum size may not be less than 850 square feet or 1,000 square feet for an ADU larger than one bedroom. • Combined, a city's standards governing lot coverage, floor	• The current ADU Ordinance mandates side and rear setbacks of five (5) feet for single story ADUs, and side and rear setbacks of ten (10) feet for a two-story unit. All these setbacks have been changed to four (4) feet. • A minimum lot size requirement in the City Code has been removed. • The percentage of lot size limitation has been

area ratio, open space and other standards may not preclude at least an 800 square foot ADU that is at least 16 feet high.	removed. Maximum floor area standards for ADUs remain up to 1200 square feet. • The current ADU Ordinance limits the floor area of an attached ADU to fifty percent of the existing floor area of the primary residence. Because this would prohibit an 800 square foot attached ADU for any residence smaller than 1600 square feet, this provision has been removed. The City currently imposes a maximum height of 18 feet, which is in compliance with the ADU Statutes.
A city must act on an application for an ADU on a lot with an existing single-family or multi-family structure within 60 days of receiving a completed application.	The current ADU Ordinance requires the City to act on a building permit application for an ADU in 120 days. This has been changed to 60 days.
A city may not require owner occupancy for either the primary dwelling or the ADU (this prohibition expires January 1, 2025). Cities must require owner occupancy for JADUs, in either the primary residence or the JADU.	The owner occupancy requirement in the City Code has been changed to apply only to JADUs.
Cities must include provisions allowing and regulating JADUs in their ADU ordinance. A JADU is a unit that is no more than 500 square feet and contained entirely within an existing or proposed single-family structure, and that is accessible through a separate entrance from the main entrance to the proposed or existing single-family residence. A JADU must have an efficiency kitchen with a cooking facility but a city cannot limit the nature of the electrical, gas, or propane gas connections. A city may not require a sink within the cooking facility. A city must act on an application for a JADU within 60 days of receiving a completed application.	The Amended ADU Ordinance defines a JADU and includes all the requirements and limitations imposed by the ADU Statutes.
Connection fees and capacity charges are based upon the "proportionate burden of the proposed ADU on the water or sewer system, based upon either its square feet (formerly "size") or the number of its drainage fixture unit (DFU) values, as defined by the UPC (formerly "number of plumbing fixtures").	The Amended ADU Ordinance includes this revision to the basis for assessing connection fees and capacity charges for water and sewer.

The current version of the Ordinance Amending City Code Provisions Regulating Development of Accessory Dwelling Units reflects a wide array of community, City staff, and Council input. The Ordinance is now ready for consideration for adoption and will go into effect thirty (30) days after adoption.

Recommended Action: Adopt the Ordinance Amending City Code Provisions Regulating Development of Accessory Dwelling Units.

ORDINANCE NO.

ORDINANCE OF THE CITY COUNCIL OF THE CITY OF UKIAH ADDING AND AMENDING VARIOUS SECTIONS OF THE UKIAH CITY CODE TO COMPLY WITH CALIFORNIA GOVERNMENT CODE SECTION 65852.2 REGULATING ACCESSORY DWELLING UNITS

The City Council of the City of Ukiah hereby ordains as follows.

SECTION 1

Findings and Declarations. The City Council finds and declares as follows:

A. In October 2019, the Governor of California signed Senate Bill 13, Assembly Bill 68, Assembly Bill 881, Assembly Bill 670 and Assembly Bill 587 ("ADU Statutes"), which relate to the creation of new Accessory Dwelling Units ("ADU") and were intended to address California's ongoing housing affordability crisis by reducing local regulatory barriers to constructing new ADUs.

B. The ADU Statutes, as codified in State of California Government Code Sections 65852.2 and 65852.22, established new standards for regulating ADUs to be effective January 1, 2020;

C. Because the City's existing standards for ADUs are inconsistent with the new standards enacted by the ADU Statutes, the current City Code provisions regarding ADUs are voided until amended to be consistent with the ADU Statutes.

D. Because the City's standards for ADUs are currently voided, any application for an ADU consistent with State law will be deemed approved and the default State law standards do not consider the City's particular needs and limitations. As such, it is in the interest of the City to amend the City Code to bring its standards for ADUs into compliance with the State standards and to include any permissible standards that consider local needs and limitations.

SECTION 2

Section 3702.5 of Division 4, Chapter 2, Article 3 of the Ukiah City Code is amended to read as follows:

§3702.5 SEWER REQUIRED

Any structure located within the City in which plumbing is to be installed and to which a public sewer is available shall, at the expense of the owner of the property, connect the plumbing of such structure directly to the proper public sewer in accordance with the provisions of this ordinance. A public sewer shall be deemed to be available if a public sewer is located within two hundred feet (200') of the property line of the property involved.

However, no new connection between an Accessory Dwelling Unit (as defined in Section 9278 of this Code) and the proper public sewer will be required for an Accessory Dwelling Unit contained within the ~~existing~~ space of an existing or proposed primary

residence or accessory structure, unless the Accessory Dwelling Unit was constructed with a new single-family home. ~~and located in the R-1 zone~~.

SECTION 3

Division 4, Chapter 2, Article 12 of the Ukiah City Code is hereby amended to read as follows (unchanged text is omitted and is shown by "* * *"):

§3731A SEWER CONNECTION CHARGES

The following charges are hereby established for the connection of the plumbing of any building or structure which discharges to the sanitary sewer system of the city and said charges are separate from any other charges presently levied or which may be levied in the future:

A. Residential Schedule:

Ten thousand nine hundred eleven dollars ($10,911.00) for equivalent sewer service unit (ESSU) per dwelling unit connected to the wastewater system based on the number of bedrooms according to the following schedule:

		Connection Fee	**ESSU**
1.	One bedroom	$ 9,820.00	0.9
2.	Two bedroom	10,911.00	1.0
3.	Three bedroom	12,002.00	1.1
4.	For each additional bedroom	1,091.00	0.1

* * *

D. Connection Fees for Accessory Dwelling Units

1. Accessory D~~d~~welling U~~u~~nits shall not be considered new residential uses for the purposes of calculating ~~local agency~~City connection fees or capacity charges for utilities, including water and sewer service. The Residential Schedule for calculation of sewer system connection fees set forth in Subdivision A of this Section shall not apply to Accessory Dwelling Units.

2. As provided in Section 3702.5, the City will not require a new connection between an Accessory Dwelling Unit (as defined in Section 9278 of this Code) and the sanitary sewer system for an Accessory Dwelling Unit contained within the ~~existing~~ space of an existing primary residence or accessory structure ~~and located in the R-1 zone~~. Notwithstanding Section 3734A, the City shall not impose a connection fee or capacity charge for this type of Accessory Dwelling Unit, unless the Accessory Dwelling Unit was constructed with a new single-family home~~.~~.

3. For Accessory Dwelling Units that are not contained within the ~~existing~~ space of an existing primary residence or accessory structure ~~or not located in the R-1 zone~~, the City may charge a connection fee or capacity charge that is proportionate to the burden of the proposed Accessory Dwelling Unit, based upon either its square feet or the number of its drainage fixture unit (DFU) values, as defined in the Uniform Plumbing Code adopted and published by the International Association of Plumbing and Mechanical Officials, upon the water or sewer system. ~~size or the number of fixture unit values as set forth in the current edition of the California Plumbing Code ("fixture units"), upon the sewer system.~~ This fee or charge shall not exceed the reasonable cost of providing this service.

4. The connection fee for an Accessory Dwelling Unit shall be calculated based on the number of fixture units in the developed ADU, as determined by the City Engineer.

5. In the event that the property on which a primary dwelling and an Accessory Dwelling Unit are located is subdivided to create a new lot on which the Accessory Dwelling Unit is located, and the Accessory Dwelling Unit was constructed on or after January 1, 2017, the property owner must pay to the City the difference between the sewer connection fee initially calculated for the Accessory Dwelling Unit pursuant to subdivision D4 of this Section and the connection fee that would have been calculated pursuant to subdivision A if the dwelling unit were the primary dwelling unit on a lot.

SECTION 4

Section 3861 of Division 4, Chapter 4 of the Ukiah City Code is hereby amended to read as follows (unchanged text is omitted and is shown by "* * *"):

§3861 WATER CONNECTION FEES

A. Payment of Fees

The storage and transmission and production and treatment facilities' fees are based on the size of the service. Said fees shall be due and payable prior to use and occupancy of the new facility requiring the service. No certificate of occupancy shall be issued and permanent water service shall not be provided until payment is received.

B. Connection Fees for Accessory Dwelling Units

1. Accessory dwelling units shall not be considered new residential uses for the purposes of calculating connection fees or capacity charges.

2. No new water connection shall be required, and no fee charged, for an Accessory Dwelling Unit (as defined in Section 9278 of this Code) contained within the ~~existing~~ space of an existing primary residence or accessory structure, unless the Accessory Dwelling Unit was constructed with a new single-family home. ~~and located in the R-1 zone~~.

3. Accessory Dwelling Units that are not contained within the ~~existing~~ space of an existing primary residence or accessory structure ~~or not located in the R-1 zone~~ are subject to connection fees for water service as provided in Section 3861.

SECTION 5

Article 3 of Division 9, Chapter 2 of the Ukiah City Code is hereby amended to read as follows (unchanged text is omitted and is shown by "* * *"):

§9016 ALLOWED USES

The following uses are allowed in single family residential (R-1) districts:

* * *

Accessory Dwelling Units (ADU) or Junior Accessory Dwelling Units (JADU) on lots developed with a primary single-family or multifamily residence or for which a primary residence is proposed subject to the following standards/criteria:

A. The requirements of this subsection are applicable to all existing ~~Accessory Dwelling Units~~ADUs and JADUs as well as those proposed after the effective date hereof, except for legal nonconforming units, or as is otherwise specifically provided herein. Existing ~~Accessory Dwelling Units~~ ADUs or JADUs as of the date hereof inconsistent with the provisions listed herein, shall be considered legal nonconforming, provided that they were legal at the time of their creation.

B. Pursuant to California Government Code 65852.2(a)(1)(C) and 65852.22(d) and (e), ~~accessory dwelling units~~ADUs and JADUs shall be deemed not to exceed the allowable density for the residential lot upon which an A~~ccessory Dwelling Unit~~DU or JADU is located, and ~~Accessory Dwelling Units~~ADUs and JADUs are deemed a residential use that is consistent with the existing general plan and zoning designation for the residential lot on which an ~~Accessory Dwelling Unit~~ADU or JADU is located.

C. These regulations do not allow the division of property upon which an Accessory Dwelling Unit is located unless all requirements of the applicable zoning district, and any other requirements of this Code are met.

D. The Accessory Dwelling Unit or JADU may be used for rental purposes. The minimum term of a lease for an Accessory Dwelling Unit or JADU shall be thirty (30) days.

E. The ADU or JADU may be rented separate from the primary residence, but may not be sold or otherwise conveyed separate from the primary residence.

F. For development of an ADU or JADU, the applicant shall record a deed restriction, which shall run with the land. A copy showing recordation with the Mendocino County Recorder~~,~~ shall be filed with the City, and shall include both of the following:

(1) A prohibition on the sale of the ADU or JADU separate from the sale of the primary residence, including a statement that the deed restriction may be enforced against future purchasers.

(2) For a JADU only, a restriction on the size and attributes of the JADU that conforms with this Section.

~~E~~G. Accessory Dwelling Units may be attached to existing single-family or multifamily residences or detached as separate structures. Accessory Dwelling Units shall incorporate the same or substantially similar architectural features, height, building materials and colors as the main dwelling unit or compatible dwellings located on adjacent properties. Architecture not similar to the architecture of the principal dwelling or buildings on adjacent properties shall be subject to the use permit process.

H. Junior Accessory Dwelling Units are installed within a legally established bedroom within the existing walls of a fully permitted single-family dwelling or proposed single-family dwelling. In the case of a legal, non-conforming single-family dwelling unit, the applicant must demonstrate adequate septic capacity for the bedroom count, if the dwelling uses a septic system, and utilize an existing, fully permitted bathroom. A separate entrance to the Junior Accessory Dwelling Unit shall be provided. A Junior Accessory Dwelling Unit may include a full bathroom, or the occupant(s) may use a full bathroom inside the remainder of the single-family dwelling. A Junior Accessory Dwelling Unit shall contain an efficiency kitchen, which shall include a cooking facility for preparation and sanitation of food with appliances (e.g., microwave, toaster oven, hot plate) and a food preparation counter and storage cabinets that are of reasonable size in relation to the size of the JADU. The efficiency kitchen must be removed when the JADU use ceases.

~~F. The minimum lot size upon which an Accessory Dwelling Unit may be placed is five thousand (5,000) square feet for an interior lot, and seven thousand (7,000) square feet for a corner lot.~~

~~G~~I. The maximum size of an Accessory Dwelling Unit shall be ~~ten percent (10%) of the lot size with a maximum size of~~ one thousand two hundred (1200) square feet. ~~The increased floor area of an Accessory Dwelling Unit that is attached to the primary residence shall not exceed 50 percent of the existing living area~~. The maximum size of a Junior Accessory Dwelling Unit shall not exceed five hundred (500) square feet in floor area. If the bathroom is shared with the remainder of the single-family dwelling, it shall not be included in the square footage calculation.

~~H~~J. Parking

(1) Parking requirements for the ~~Accessory Dwelling Unit~~ADU shall be one off street space (independently accessible or tandem) for each bedroom or ADU, whichever is less, in addition to the two (2) independently accessible parking spaces required for the existing single-family or multifamily residence. If the primary residence was legally constructed at a time when on-site parking was not required, then only the parking space(s) for the ~~Accessory Dwelling Unit~~ADU shall be required. No off street parking space shall be required for a JADU.

(2) Off-street parking shall be permitted in setback areas in compliance with the definition of “Off-street Parking” found in Section 9278B of this Code or through tandem parking

(3) Parking standards will not be imposed for an ~~Accessory Dwelling Unit~~ADU in any of the following instances:

(~~1~~a) The ~~Accessory Dwelling Unit~~ADU is located within one-half mile of public transit.

(~~2~~b) The ~~Accessory Dwelling Unit~~ADU is located within an architecturally and historically significant historic district.

(~~3~~c) The ~~Accessory Dwelling Unit~~ADU is part of the existing primary residence or an existing accessory structure.

(~~4~~d) When on-street parking permits are required but not offered to the occupant of the ~~Accessory Dwelling Unit~~ADU.

(~~5~~e) When there is a car share vehicle located within one block of the ~~Accessory Dwelling Unit~~ADU.

(4) If a garage, carport, or covered parking structure is demolished in conjunction with the construction of an ADU or converted to an ADU, the City shall not require that those offstreet parking spaces be replaced.

K~~I~~. ~~The~~ An ~~Accessory Dwelling Unit~~ADU must meet all applicable building and fire codes, and shall have electric, water and sewer or septic service ~~provided through the city~~ with the type of meter arrangement at the property owner's option. Water, sewer, and electrical services shall be available prior to the issuance of a building permit for an ~~Accessory Dwelling Unit~~ADU. No new water or sewer connection fees may be required for ~~Accessory Dwelling Unit~~ADUs that are contained within the existing space of a single-family or multifamily residence or accessory structure as provided in Sections 3731A and 3861.B, unless the ADU is constructed with a new single-family home . ~~Accessory Dwelling Unit~~ADUs shall not be required to provide fire sprinklers if they are not required for the primary residence.

L. A Junior Accessory Dwelling Unit shall not be considered a separate or new dwelling unit for purposes of applying building codes, fire codes, collection of impact fees, or the provision of water, sewer, and power, including connection fees that might otherwise be associated with the provision of those services. Junior Accessory Dwelling Units shall not be required to provide fire sprinklers if they are not required for the primary residence.

~~J~~M. The A~~ccessory Dwelling Unit~~ DU or JADU shall comply with all applicable requirements of this ~~code~~Code.

~~K~~N. The maximum height for ~~Accessory Dwelling Unit~~ADUs shall be eighteen feet (18'), except for attached ~~accessory dwelling unit~~ADUs, which shall have a maximum height of thirty feet (30'), pursuant to Section 9018 of this Chapter. Taller units may be approved through the use permit process.

~~L~~O. The following yard setback requirements shall apply to ~~Accessory Dwelling Unit~~ADUs ~~in the R-1 (single-family residential) zoning district~~:

1. Front Yard: The same as the existing ~~single-family~~primary residence, but no closer than five feet (5').

2. Side Yard or Rear Yard, Single-Story or Two-Story: ~~Side yard for single-story unit: Five feet (5').~~Four feet (4')

~~3. Side Yard, Two-Story: Side yard for two-story unit: Ten feet (10').~~

~~4. Rear Yard, Single-Story: Rear yard for single-story unit: Five feet (5').~~

~~5. Rear Yard, Two-Story: Rear yard for two-story unit: Ten feet (10').~~

~~If the subject lot abuts a differently zoned lot, then the side and rear yard setbacks shall be the same as for the adjoining lot.~~

3. No setback shall be required for an existing living area, garage, or accessory structure or a structure constructed in the same location and to the same dimensions as an existing structure that is converted to an ADU or to a portion of an ADU.~~Existing structures proposed for conversion to an Accessory Dwelling Unit must comply with the above yard setback requirements, except that no setback will be required for an existing garage that is converted to an accessory dwelling unit. A setback of no more than five feet from the side and rear lot lines shall be required for an accessory dwelling unit that is constructed above a garage.~~

~~M~~Q. The proposed ~~Accessory Dwelling Unit~~ADUs shall have a separate front door, which, in the event of an attached unit, shall not be located along the front of the existing single-family or multifamily residence unless it is not obviously visible from the street in front of the residence.

~~N~~R. ~~One~~ For a JADU, either the primary single-family residence or the JADU~~of the units on the lot~~ shall be occupied by the property owner. Owner-occupancy shall not be required if the owner is a governmental agency, land trust, or housing organization.

~~O~~S. Any balcony, window or door of an ~~Accessory Dwelling Unit~~ADU shall utilize techniques to lessen the privacy impacts onto adjacent properties. These techniques may include use of obscured glazing, window placement above eye level, or locating balconies, windows and doors toward the existing on site primary residence. In addition, trees shall be planted and maintained in a viable condition by the property owner, where appropriate, to preserve the privacy of neighboring property owners.

This requirement will not apply to an ~~Accessory Dwelling Unit~~ADU that is contained within the existing space of a single-family or multifamily residence or accessory structure.

~~P~~T. Driveways accessing ~~Accessory Dwelling Unit~~ADUs shall be set back a minimum of five feet (5') from any structure on an adjoining lot that has a bedroom adjacent to the proposed driveway.

U~~Q~~. The minimum width of a driveway serving an ~~Accessory Dwelling Unit~~ADU shall be twelve feet (12'), unless the City Fire Marshal determines that adequate fire protection can be provided to the ~~Accessory Dwelling Unit~~ADU even though the driveway has a width less than twelve feet (12').

~~R~~V. Unless otherwise indicated, relief from the above criteria and standards may be pursued through the use permit process pursuant to ~~article~~ Article 20 of this chapter.

~~S~~W. Applications for a building permit for an A~~ccessory Dwelling Unit~~DU or a JADU shall be considered ministerially without discretionary review or a hearing within ~~120~~ 60 days after receiving the application if there is an existing primary dwelling on the lot. If the permit application to create an ADU or a JADU is submitted with a permit application to create a new single-family dwelling on the lot, the City may delay acting on the permit

application for the ADU or JADU until the City acts on the permit application to create the new single-family dwelling, but the application to create the ADU or JADU shall be considered without discretionary review.

~~T~~X. Applications for a building permit within any zoning district where residential uses are allowed by right ~~for an Accessory Dwelling Unit that is contained within the existing space of an existing primary residence or accessory structure and located in the R-1 zone~~ shall be approved ministerially to develop any of the following: ~~if the unit is the sole Accessory Dwelling Unit on the lot, has independent exterior access from the existing residence, and has side and rear setbacks that are sufficient for fire safety. No additional parking or other development standards as set forth in subdivisions (F) through (H), (K) through (M), and (O) through (R) of this Section shall be applied except for building code requirements. This subdivision shall not apply to Accessory Dwelling Units that are not located within the R-1 zone.~~

(1) One ADU or JADU per lot with a proposed or existing single-family dwelling if all of the following apply:

(a) The ADU or JADU is within the proposed space of a single-family dwelling or existing space of a single-family dwelling or accessory structure and may include an expansion of not more than 150 square feet beyond the same physical dimensions as the existing accessory structure. An expansion beyond the physical dimensions of the existing accessory structure shall be limited to accommodating ingress and egress.

(b) The space has exterior access from the proposed or existing single-family dwelling.

(c) The side and rear setbacks are sufficient for fire and safety.

(d) The JADU complies with the requirements of this Section.

(2) One detached, new construction, ADU that does not exceed four-foot side and rear yard setbacks for a lot with a proposed or existing single-family dwelling. The ADU may be combined with a JADU described in subparagraph X.1 above.

(3) Multiple ADUs within the portions of existing multifamily dwelling structures that are not used as livable space, including, but not limited to, storage rooms, boiler rooms, passageways, attics, basements, or garages, if each unit complies with state building standards for dwellings. The number of ADUs permitted within an existing multifamily dwelling structure shall be capped at twenty five percent (25%) of the existing units in the multifamily dwelling, or one ADU, whichever is greater.

(4) Not more than two (2) ADUs that are located on a lot that has an existing multifamily dwelling, but are detached from that multifamily dwelling and are subject to four (4) foot rear yard and side setbacks.

(Y) For the development of ADUs and JADUs described in subdivision (X), no additional parking or other development standards as set forth in subdivisions (I) through (J), (N) through (Q), and (S) through (V) of this Section shall be applied except for Building Code requirements.

(Z) The City shall not require, as a condition for ministerial approval of a permit application for the creation of an ADU or JADU, the correction of nonconforming zoning conditions. For purposes of this Section, "Nonconforming zoning condition" means a physical improvement on a property that does not conform with current zoning standards.

* * *

§9021 REQUIRED PARKING

A. The minimum parking area required in single-family residential (R-1) districts is two (2) on site independently accessible spaces for each dwelling unit. Accessory Dwelling Units (ADU) require one additional onsite independently accessible parking space per ADU or per bedroom, whichever is less, except as provided in Section 9016 of this Chapter. The parking requirements for all other allowed or permitted uses shall be subject to the provisions of section 9198 of this chapter.

SECTION 6

Article 4 of Division 9, Chapter 2 of the Ukiah City Code is hereby amended to read as follows (unchanged text is omitted and is shown by "* * *"):

§9031 ALLOWED USES

The following uses are allowed in medium density residential (R-2) districts:

Accessory buildings and accessory uses.

Accessory Dwelling Units and Junior Accessory Dwelling Units, as defined in Section 9278 of this Code and regulated in Section 9016 of this Code.

* * *

SECTION 11

Section 9278 in Division 9, Chapter 2, Article 21 of the Ukiah City Code (unchanged text is omitted and is shown by "* * *"):

* * *

DWELLING UNIT: A residential building or portion thereof providing complete, independent living facilities for one family including permanent provisions of living, sleeping, eating, cooking, and sanitation.

DWELLING UNIT, ACCESSORY:
An attached or a detached residential dwelling unit, located on a lot in any zoning district where residential uses are allowed by-right or with the securing of a use permit~~the R-1, R-2, and R-3 Zoning Districts~~ that has been developed with an existing or proposed primary single-family or multifamily residence, which provides complete independent living facilities for one or more persons. It can be wholly contained within the footprint of the proposed existing primary~~, single-family residence~~ dwelling, including attached garages, storage areas or similar uses or an ~~existing~~ accessory structure, or detached from the proposed or existing primary dwelling and located on the same lot as the proposed or existing primary dwelling.. It shall include permanent provisions for living, sleeping, eating, cooking, and sanitation on the same lot as the ~~single-family~~primary dwelling is situated. An Accessory Dwelling Unit also includes the following:
(A) An efficiency unit, as defined in Section 17958.1 of Health and Safety Code.
(B) A manufactured home, as defined in Section 18007 of the Health and Safety Code.

DWELLING UNIT, JUNIOR ACCESSORY:
An attached residential dwelling unit, located on a lot in the R-1, R-2, and R-3 Zoning Districts, not exceeding 500 sq. ft. in size and contained within a legally established bedroom within the existing walls of an existing or proposed single-family dwelling. A Junior Accessory Dwelling Unit (JADU) shall include an efficiency kitchen, which shall include a cooking facility with appliances and a food preparation counter and storage cabinets that are of reasonable size in relation to the size of the JADU. The JADU may include separate sanitation facilities or share sanitation facilities with the existing structure. A Junior Accessory Dwelling Unit shall have a separate entrance, and interior access to the remainder of the primary dwelling.

SECTION 12

1. SEVERABILITY.

If any section, subsection, subdivision, paragraph, sentence, clause or phrase of this Ordinance, or its application to any person or circumstance, is for any reason held to be invalid or unenforceable, such invalidity or unenforceability shall not affect the validity or enforceability of the remaining sections, subsections, subdivisions, paragraphs, sentences, clauses or phrases of this Ordinance, or its application to any other person or circumstance. The City Council of the City of Ukiah hereby declares that it would have adopted each section, subsection, subdivision, paragraph, sentence, clause or phrase hereof, irrespective of the fact that any one or more other sections, subsections, subdivisions, paragraphs, sentences, clauses or phrases hereof be declared invalid or unenforceable.

2. EFFECTIVE DATE.

This Ordinance shall be published as required by law in a newspaper of general circulation in the City of Ukiah, and shall become effective thirty (30) days after its adoption.

ORDINANCE NO.

ORDINANCE OF THE CITY COUNCIL OF THE CITY OF UKIAH ADDING AND AMENDING VARIOUS SECTIONS OF THE UKIAH CITY CODE TO COMPLY WITH CALIFORNIA GOVERNMENT CODE SECTION 65852.2 REGULATING ACCESSORY DWELLING UNITS

The City Council of the City of Ukiah hereby ordains as follows.

SECTION 1

Findings and Declarations. The City Council finds and declares as follows:

A. In October 2019, the Governor of California signed Senate Bill 13, Assembly Bill 68, Assembly Bill 881, Assembly Bill 670 and Assembly Bill 587 ("ADU Statutes"), which relate to the creation of new Accessory Dwelling Units ("ADU") and were intended to address California's ongoing housing affordability crisis by reducing local regulatory barriers to constructing new ADUs.

B. The ADU Statutes, as codified in State of California Government Code Sections 65852.2 and 65852.22, established new standards for regulating ADUs to be effective January 1, 2020;

C. Because the City's existing standards for ADUs are inconsistent with the new standards enacted by the ADU Statutes, the current City Code provisions regarding ADUs are voided until amended to be consistent with the ADU Statutes.

D. Because the City's standards for ADUs are currently voided, any application for an ADU consistent with State law will be deemed approved and the default State law standards do not consider the City's particular needs and limitations. As such, it is in the interest of the City to amend the City Code to bring its standards for ADUs into compliance with the State standards and to include any permissible standards that consider local needs and limitations.

SECTION 2

Section 3702.5 of Division 4, Chapter 2, Article 3 of the Ukiah City Code is amended to read as follows:

§3702.5 SEWER REQUIRED

Any structure located within the City in which plumbing is to be installed and to which a public sewer is available shall, at the expense of the owner of the property, connect the plumbing of such structure directly to the proper public sewer in accordance with the provisions of this ordinance. A public sewer shall be deemed to be available if a public sewer is located within two hundred feet (200') of the property line of the property involved.

However, no new connection between an Accessory Dwelling Unit (as defined in Section 9278 of this Code) and the proper public sewer will be required for an Accessory Dwelling Unit contained within the space of an existing or proposed primary residence or

accessory structure, unless the Accessory Dwelling Unit was constructed with a new single-family home. .

SECTION 3

Division 4, Chapter 2, Article 12 of the Ukiah City Code is hereby amended to read as follows (unchanged text is omitted and is shown by "* * *"):

§3731A SEWER CONNECTION CHARGES

The following charges are hereby established for the connection of the plumbing of any building or structure which discharges to the sanitary sewer system of the city and said charges are separate from any other charges presently levied or which may be levied in the future:

A. Residential Schedule:

Ten thousand nine hundred eleven dollars ($10,911.00) for equivalent sewer service unit (ESSU) per dwelling unit connected to the wastewater system based on the number of bedrooms according to the following schedule:

		Connection Fee	**ESSU**
1.	One bedroom	$ 9,820.00	0.9
2.	Two bedroom	10,911.00	1.0
3.	Three bedroom	12,002.00	1.1
4.	For each additional bedroom	1,091.00	0.1

* * *

D. Connection Fees for Accessory Dwelling Units

1. Accessory Dwelling Units shall not be considered new residential uses for the purposes of calculating City connection fees or capacity charges for utilities, including water and sewer service. The Residential Schedule for calculation of sewer system connection fees set forth in Subdivision A of this Section shall not apply to Accessory Dwelling Units.

2. As provided in Section 3702.5, the City will not require a new connection between an Accessory Dwelling Unit (as defined in Section 9278 of this Code) and the sanitary sewer system for an Accessory Dwelling Unit contained within the space of an existing primary residence or accessory structure. Notwithstanding Section 3734A, the City shall not impose a connection fee or capacity charge for this type of Accessory Dwelling Unit, unless the Accessory Dwelling Unit was constructed with a new single-family home.

3. For Accessory Dwelling Units that are not contained within the space of an existing primary residence or accessory structure, the City may charge a connection fee or

capacity charge that is proportionate to the burden of the proposed Accessory Dwelling Unit, based upon either its square feet or the number of its drainage fixture unit (DFU) values, as defined in the Uniform Plumbing Code adopted and published by the International Association of Plumbing and Mechanical Officials, upon the water or sewer system. This fee or charge shall not exceed the reasonable cost of providing this service.

4. The connection fee for an Accessory Dwelling Unit shall be calculated based on the number of fixture units in the developed ADU, as determined by the City Engineer.

5. In the event that the property on which a primary dwelling and an Accessory Dwelling Unit are located is subdivided to create a new lot on which the Accessory Dwelling Unit is located, and the Accessory Dwelling Unit was constructed on or after January 1, 2017, the property owner must pay to the City the difference between the sewer connection fee initially calculated for the Accessory Dwelling Unit pursuant to subdivision D4 of this Section and the connection fee that would have been calculated pursuant to subdivision A if the dwelling unit were the primary dwelling unit on a lot.

SECTION 4

Section 3861 of Division 4, Chapter 4 of the Ukiah City Code is hereby amended to read as follows (unchanged text is omitted and is shown by "* * *"):

§3861 WATER CONNECTION FEES

A. Payment of Fees

The storage and transmission and production and treatment facilities' fees are based on the size of the service. Said fees shall be due and payable prior to use and occupancy of the new facility requiring the service. No certificate of occupancy shall be issued and permanent water service shall not be provided until payment is received.

B. Connection Fees for Accessory Dwelling Units

1. Accessory dwelling units shall not be considered new residential uses for the purposes of calculating connection fees or capacity charges.

2. No new water connection shall be required, and no fee charged, for an Accessory Dwelling Unit (as defined in Section 9278 of this Code) contained within the space of an existing primary residence or accessory structure, unless the Accessory Dwelling Unit was constructed with a new single-family home..

3. Accessory Dwelling Units that are not contained within the space of an existing primary residence or accessory structure are subject to connection fees for water service as provided in Section 3861.

SECTION 5

Article 3 of Division 9, Chapter 2 of the Ukiah City Code is hereby amended to read as follows (unchanged text is omitted and is shown by "* * *"):

§9016 ALLOWED USES

The following uses are allowed in single family residential (R-1) districts:

* * *
Accessory Dwelling Units (ADU) or Junior Accessory Dwelling Units (JADU) on lots developed with a primary single-family or multifamily residence or for which a primary residence is proposed subject to the following standards/criteria:

A. The requirements of this subsection are applicable to all existing ADUs and JADUs as well as those proposed after the effective date hereof, except for legal nonconforming units, or as is otherwise specifically provided herein. Existing ADUs or JADUs as of the date hereof inconsistent with the provisions listed herein, shall be considered legal nonconforming, provided that they were legal at the time of their creation.

B. Pursuant to California Government Code 65852.2(a)(1)(C) and 65852.22(d) and (e), ADUs and JADUs shall be deemed not to exceed the allowable density for the residential lot upon which an ADU or JADU is located, and ADUs and JADUs are deemed a residential use that is consistent with the existing general plan and zoning designation for the residential lot on which an ADU or JADU is located.

C. These regulations do not allow the division of property upon which an Accessory Dwelling Unit is located unless all requirements of the applicable zoning district, and any other requirements of this Code are met.

D. The Accessory Dwelling Unit or JADU may be used for rental purposes. The minimum term of a lease for an Accessory Dwelling Unit or JADU shall be thirty (30) days.

E. The ADU or JADU may be rented separate from the primary residence, but may not be sold or otherwise conveyed separate from the primary residence.

F. For development of an ADU or JADU, the applicant shall record a deed restriction, which shall run with the land. A copy showing recordation with the Mendocino County Recorder shall be filed with the City, and shall include both of the following:

(1) A prohibition on the sale of the ADU or JADU separate from the sale of the primary residence, including a statement that the deed restriction may be enforced against future purchasers.
(2) For a JADU only, a restriction on the size and attributes of the JADU that conforms with this Section.

G. Accessory Dwelling Units may be attached to existing single-family or multifamily residences or detached as separate structures. Accessory Dwelling Units shall incorporate the same or substantially similar architectural features, height, building materials and colors as the main dwelling unit or compatible dwellings located on adjacent properties. Architecture not similar to the architecture of the principal dwelling or buildings on adjacent properties shall be subject to the use permit process.

H. Junior Accessory Dwelling Units are installed within a legally established bedroom within the existing walls of a fully permitted single-family dwelling or proposed single-family dwelling. In the case of a legal, non-conforming single-family dwelling unit, the applicant must demonstrate adequate septic capacity for the bedroom count, if the dwelling uses a septic system, and utilize an existing, fully permitted bathroom. A separate entrance to the Junior Accessory Dwelling Unit shall be provided. A Junior Accessory Dwelling Unit may include a full bathroom, or the occupant(s) may use a full bathroom inside the remainder of the single-family dwelling. A Junior Accessory Dwelling Unit shall contain an efficiency kitchen, which shall include a cooking facility for preparation and sanitation of food with appliances (e.g., microwave, toaster oven, hot plate) and a food preparation counter and storage cabinets that are of reasonable size in relation to the size of the JADU. The efficiency kitchen must be removed when the JADU use ceases.

I. The maximum size of an Accessory Dwelling Unit shall be one thousand two hundred (1200) square feet.. The maximum size of a Junior Accessory Dwelling Unit shall not exceed five hundred (500) square feet in floor area. If the bathroom is shared with the remainder of the single-family dwelling, it shall not be included in the square footage calculation.

J. Parking

(1) Parking requirements for the ADU shall be one off street space (independently accessible or tandem) for each bedroom or ADU, whichever is less, in addition to the two (2) independently accessible parking spaces required for the existing single-family or multifamily residence. If the primary residence was legally constructed at a time when on-site parking was not required, then only the parking space(s) for the ADU shall be required. No off street parking space shall be required for a JADU.

(2) Off-street parking shall be permitted in setback areas in compliance with the definition of “Off-street Parking” found in Section 9278B of this Code or through tandem parking

(3) Parking standards will not be imposed for an ADU in any of the following instances:

(a) The ADU is located within one-half mile of public transit.
(b) The ADU is located within an architecturally and historically significant historic district.
(c) The ADU is part of the existing primary residence or an existing accessory structure.
(d) When on-street parking permits are required but not offered to the occupant of the ADU.
(e) When there is a car share vehicle located within one block of the ADU.

(4) If a garage, carport, or covered parking structure is demolished in conjunction with the construction of an ADU or converted to an ADU, the City shall not require that those offstreet parking spaces be replaced.

K. An ADU must meet all applicable building and fire codes, and shall have electric, water and sewer or septic service with the type of meter arrangement at the property

owner's option. Water, sewer, and electrical services shall be available prior to the issuance of a building permit for an ADU. No new water or sewer connection fees may be required for ADUs that are contained within the existing space of a single-family or multifamily residence or accessory structure as provided in Sections 3731A and 3861.B, unless the ADU is constructed with a new single-family home . ADUs shall not be required to provide fire sprinklers if they are not required for the primary residence.

L. A Junior Accessory Dwelling Unit shall not be considered a separate or new dwelling unit for purposes of applying building codes, fire codes, collection of impact fees, or the provision of water, sewer, and power, including connection fees that might otherwise be associated with the provision of those services. Junior Accessory Dwelling Units shall not be required to provide fire sprinklers if they are not required for the primary residence.

M. The ADU or JADU shall comply with all applicable requirements of this Code.

N. The maximum height for ADUs shall be eighteen feet (18'), except for attached ADUs, which shall have a maximum height of thirty feet (30'), pursuant to Section 9018 of this Chapter. Taller units may be approved through the use permit process.

O. The following yard setback requirements shall apply to ADUs:

1. Front Yard: The same as the existing primary residence, but no closer than five feet (5').

2. Side Yard or Rear Yard, Single-Story or Two-Story: Four feet (4')

3. No setback shall be required for an existing living area, garage, or accessory structure or a structure constructed in the same location and to the same dimensions as an existing structure that is converted to an ADU or to a portion of an ADU.

Q. The proposed ADUs shall have a separate front door, which, in the event of an attached unit, shall not be located along the front of the existing single-family or multifamily residence unless it is not obviously visible from the street in front of the residence.

R. For a JADU, either the primary single-family residence or the JADU shall be occupied by the property owner. Owner-occupancy shall not be required if the owner is a governmental agency, land trust, or housing organization.

S. Any balcony, window or door of an ADU shall utilize techniques to lessen the privacy impacts onto adjacent properties. These techniques may include use of obscured glazing, window placement above eye level, or locating balconies, windows and doors toward the existing on site primary residence. In addition, trees shall be planted and maintained in a viable condition by the property owner, where appropriate, to preserve the privacy of neighboring property owners.

This requirement will not apply to an ADU that is contained within the existing space of a single-family or multifamily residence or accessory structure.

T. Driveways accessing ADUs shall be set back a minimum of five feet (5') from any structure on an adjoining lot that has a bedroom adjacent to the proposed driveway.

U. The minimum width of a driveway serving an ADU shall be twelve feet (12'), unless the City Fire Marshal determines that adequate fire protection can be provided to the ADU even though the driveway has a width less than twelve feet (12').

V. Unless otherwise indicated, relief from the above criteria and standards may be pursued through the use permit process pursuant to Article 20 of this chapter.

W. Applications for a building permit for an ADU or a JADU shall be considered ministerially without discretionary review or a hearing within 60 days after receiving the application if there is an existing primary dwelling on the lot. If the permit application to create an ADU or a JADU is submitted with a permit application to create a new single-family dwelling on the lot, the City may delay acting on the permit application for the ADU or JADU until the City acts on the permit application to create the new single-family dwelling, but the application to create the ADU or JADU shall be considered without discretionary review.

X. Applications for a building permit within any zoning district where residential uses are allowed by right shall be approved ministerially to develop any of the following:

(1) One ADU or JADU per lot with a proposed or existing single-family dwelling if all of the following apply:

(a) The ADU or JADU is within the proposed space of a single-family dwelling or existing space of a single-family dwelling or accessory structure and may include an expansion of not more than 150 square feet beyond the same physical dimensions as the existing accessory structure. An expansion beyond the physical dimensions of the existing accessory structure shall be limited to accommodating ingress and egress.

(b) The space has exterior access from the proposed or existing single-family dwelling.

(c) The side and rear setbacks are sufficient for fire and safety.

(d) The JADU complies with the requirements of this Section.

(2) One detached, new construction, ADU that does not exceed four-foot side and rear yard setbacks for a lot with a proposed or existing single-family dwelling. The ADU may be combined with a JADU described in subparagraph X.1 above.

(3) Multiple ADUs within the portions of existing multifamily dwelling structures that are not used as livable space, including, but not limited to, storage rooms, boiler rooms, passageways, attics, basements, or garages, if each unit complies with state building standards for dwellings. The number of ADUs permitted within an existing multifamily dwelling structure shall be capped at twenty five percent (25%) of the existing units in the multifamily dwelling, or one ADU, whichever is greater.

(4) Not more than two (2) ADUs that are located on a lot that has an existing multifamily dwelling, but are detached from that multifamily dwelling and are subject to four (4) foot rear yard and side setbacks.

(Y) For the development of ADUs and JADUs described in subdivision (X), no additional parking or other development standards as set forth in subdivisions (I) through (J), (N) through (Q), and (S) through (V) of this Section shall be applied except for Building Code requirements.

(Z) The City shall not require, as a condition for ministerial approval of a permit application for the creation of an ADU or JADU, the correction of nonconforming zoning conditions. For purposes of this Section, "Nonconforming zoning condition" means a physical improvement on a property that does not conform with current zoning standards.

* * *

§9021 REQUIRED PARKING

A. The minimum parking area required in single-family residential (R-1) districts is two (2) on site independently accessible spaces for each dwelling unit. Accessory Dwelling Units (ADU) require one additional onsite independently accessible parking space per ADU or per bedroom, whichever is less,except as provided in Section 9016 of this Chapter. The parking requirements for all other allowed or permitted uses shall be subject to the provisions of section 9198 of this chapter.

SECTION 6

Article 4 of Division 9, Chapter 2 of the Ukiah City Code is hereby amended to read as follows (unchanged text is omitted and is shown by "* * *"):

§9031 ALLOWED USES

The following uses are allowed in medium density residential (R-2) districts:

Accessory buildings and accessory uses.

Accessory Dwelling Units and Junior Accessory Dwelling Units, as defined in Section 9278 of this Code and regulated in Section 9016 of this Code.

SECTION 11

Section 9278 in Division 9, Chapter 2, Article 21 of the Ukiah City Code (unchanged text is omitted and is shown by "* * *"):

*** * ***

DWELLING UNIT: A residential building or portion thereof providing complete, independent living facilities for one family including permanent provisions of living, sleeping, eating, cooking, and sanitation.

DWELLING UNIT, ACCESSORY:
An attached or a detached residential dwelling unit, located on a lot in any zoning district where residential uses are allowed by-right or with the securing of a use permit that has been developed with an existing or proposed primary single-family or multifamily residence, which provides complete independent living facilities for one or more persons. It can be wholly contained within the footprint of the proposed existing primary dwelling, including attached garages, storage areas or similar uses or an accessory structure, or detached from the proposed or existing primary dwelling and located on the same lot as the proposed or existing primary dwelling.. It shall include permanent provisions for living, sleeping, eating, cooking, and sanitation on the same lot as the primary dwelling is situated. An Accessory Dwelling Unit also includes the following:
(A) An efficiency unit, as defined in Section 17958.1 of Health and Safety Code.
(B) A manufactured home, as defined in Section 18007 of the Health and Safety Code.

DWELLING UNIT, JUNIOR ACCESSORY:
An attached residential dwelling unit, located on a lot in the R-1, R-2, and R-3 Zoning Districts, not exceeding 500 sq. ft. in size and contained within a legally established bedroom within the existing walls of an existing or proposed single-family dwelling. A Junior Accessory Dwelling Unit (JADU) shall include an efficiency kitchen, which shall include a cooking facility with appliances and a food preparation counter and storage cabinets that are of reasonable size in relation to the size of the JADU. The JADU may include separate sanitation facilities or share sanitation facilities with the existing structure. A Junior Accessory Dwelling Unit shall have a separate entrance, and interior access to the remainder of the primary dwelling.

SECTION 12

1. SEVERABILITY.

If any section, subsection, subdivision, paragraph, sentence, clause or phrase of this Ordinance, or its application to any person or circumstance, is for any reason held to be invalid or unenforceable, such invalidity or unenforceability shall not affect the validity or enforceability of the remaining sections, subsections, subdivisions, paragraphs, sentences, clauses or phrases of this Ordinance, or its application to any other person or circumstance. The City Council of the City of Ukiah hereby declares that it would have adopted each section, subsection, subdivision, paragraph, sentence, clause or phrase hereof, irrespective of the fact that any one or more other sections, subsections, subdivisions, paragraphs, sentences, clauses or phrases hereof be declared invalid or unenforceable.

2. EFFECTIVE DATE.

This Ordinance shall be published as required by law in a newspaper of general circulation in the City of Ukiah, and shall become effective thirty (30) days after its adoption.

AGENDA SUMMARY REPORT

SUBJECT: Consideration of Restructuring Proposal for the Community Development Department and Corresponding Budget Amendment.

DEPARTMENT: Community Development

PREPARED BY: Craig Schlatter, Community Development Director

PRESENTER: Craig Schlatter, Community Development Director

ATTACHMENTS:

1. CDD Housing Division Revenue 2020-2022
2. Planning Manager Job Description (revised 7-28-20)

Summary: Council will receive and consider a recommended proposal to restructure the Community Development Department's organization and position allocation.

Background: On December 20, 2017, the City Council approved a restructuring proposal and corresponding budget amendment for the Community Development Department, integrating the three divisions of Planning, Building, and Housing. The approved restructuring added two new staff positions, Building Inspector and Associate Planner-Housing, and reclassified an existing Planning and Building Technician position to a Community Development Technician position. The restructuring was completed to improve the customer service experience, as well as to effectively utilize current resources and plan for growth and succession.

Further review and evaluation of the effectiveness of the current structure in meeting the expectations of customers and planning for the future has been completed since 2017. This review has also incorporated the needs of the expanding Housing Division--and how best to assign resources to meet those needs.

Discussion: As a result of changes in state law due to the numerous California housing bills passed in 2017-2020, the proactive focus by the City Council on housing, and the City's recovery response to the COVID-19 pandemic, the programs and funding sources managed by the Housing Division have rapidly increased in the last three years. The Division currently manages and/or directly implements a variety of State and Federal programs and grants, totaling approximately $7 million. Of this, $111,800 was budgeted this fiscal year as revenue for the reimbursement of staff time in administering and implementing programs and projects. An additional $200,000 is anticipated to be earned in revenue to offset staff costs in the next 1-2 years. See Attachment 1 for details.

As part of integration of the three divisions in the 2017 approved restructuring proposal, planners within the Planning Division administer and implement programs and projects within the Housing Division. The Director has been the principal team member implementing the work of the Housing Division since 2017 and currently administers all Housing Division programs and projects while sharing current and advanced planning duties with the Associate Planner, who is also implementing current planning and ministerial planning permits. As the breadth and diversity of the duties of the Housing Division have increased, this has become less sustainable.

Reviewing the duties of administering and implementing programs and projects within the Housing Division to

those of the Planning Division reveals similarities between the two Divisions. Overseeing multiple CDBG grants, for example, requires a similar skill set and abilities to that of analyzing an application for a major use permit and preparing a staff report for approval. Where the two fields, housing and planning, differ in terms of qualified professionals is the latter generally requires more specialized training and education than the former. It is not uncommon for urban planners to become housing practitioners but less common for housing practitioners to become urban planners.

Based on this review, and with input from the City Manager, Deputy City Manager, and Human Resources/Risk Management Director, the following is recommended:

1. Reclassify the Associate Planner position to a Planning Manager position. This position is the Planning Division lead and will coordinate the budget and activities of the Division with the Director. The Planning Manager will also coordinate and administer Housing Division programs and projects with the Planning Manager-Housing and Director.

2. Add a second Planning Manager position, with an emphasis in Housing (Planning Manager-Housing). This position is the Housing Division lead and will coordinate the duties of the Division, serving as the principal implementer of all existing and new housing and community development programs, including state and federal-funded economic development program implementation duties, with the Director. The position will also coordinate and evaluate current and advanced planning projects with the other Planning Manager and Director.

Neither of the two Planning Managers would supervise subordinate staff within the Department but would oversee contracts, programs and projects, and budget preparation for the Housing and Planning Divisions. Both Planning Managers and all team members within the Community Development Department are expected to answer general customer inquiries, including at the public counter. The revised job description for both positions is attached as Attachment 2.

The salary schedule for the Planning Manager position, including the Planning Manager- Housing position, will remain unchanged at the 2621 range ($6,902.31 - $8,389.80).

If the staffing recommendations are approved, the new Community Development Department team will consist of the following:

Community Development Director
Planning Manager-Housing
Planning Manager
Building Official
Building Inspector

3. Authorize a corresponding budget amendment, as follows:

Expenditures for new personnel:
$125,451; FY 20-21 Personnel 10023100.51110 - for additional Planning Manager- Housing
$ 29,568; FY 20-21 Personnel 10023100.51110 - for reclassified Planning Manager
Please note: these salary estimates are fully loaded estimates based on hiring at the top step in the salary schedule. The hiring of the new Planning Manager- Housing assumes 10 full months of employment. It is not anticipated the costs for these positions will be as high as shown.

To plan for existing and future critical functions of the Department, this restructuring would assign resources

where appropriate and most effective. Monitoring of revenues versus expenditures will continuously be evaluated, including regular review and analysis of cost recovery efforts. The anticipated short- and long-term fiscal impacts of this restructuring proposal are listed below.

For Fiscal Year 2020-21: Transfer of grant revenue of $111,800 to the General Fund will offset the costs of the new position and reclassified position for the remainder of the fiscal year. Further transfers of anticipated revenue could also occur, bringing the net impact to the City to close to zero.

For Fiscal Year 2021 and beyond: Due to increasing revenue from the Housing Division, the overall net impact to the General Fund is expected to be minimal. New funding to assist communities and businesses recover from the economic impacts of COVID-19 has already been released, and additional funding is expected to be made available within the next 1-2 years.

Recommended Action: Approve Community Development Department restructuring proposal and corresponding budget amendment.

JOB DESCRIPTION

PLANNING MANAGER

(Exempt, Management Position)

DEFINITION

Under direction of the Director of Community Development, administers, coordinates, and/or directly implements the activities of the Housing Division which is responsible for the development, implementation, and delivery of housing program and project activities, particularly within the City's Housing Element, but also including neighborhood enhancement programs, operations, and services to program participants; manages and supervises land use and environmental planning activities; performs complex and difficult administrative and technical planning work, assists in the preparation of work programs and strategic planning activities or projects; and performs related work as assigned.

CLASS CHARACTERISTICS

The Planning Manager is the management level in the Planner series. This class is responsible for monitoring work flow, timelines and delivery of services; designing and managing the activities of the Housing Division with the Director; conducting planning research, analysis, and conflict resolution on projects of planning issues having a high degree of complexity and public interest; making recommendations for comprehensive long-term planning and for changes in planning policies and procedures; regularly representing the department at meetings and hearings before the Planning Commission, various public agencies, community organizations, and interest groups, and occasionally before the City Council.

There are two Planning Manager positions within the Community Development Department, each with different areas of specialization. However, each Planning Manager may perform assignments in both areas. One position primarily focuses in the area of housing and community and economic development, including grant and project management and implementing the City's Housing Element. The other position primarily focuses in general planning, including over the counter planning permits and current planning. Both Planning Managers will be involved in long range planning, including development and eventual implementation of the City's 2040 General Plan.

EXAMPLES OF DUTIES: These examples are intended only as illustrations of the various types of work performed in positions allocated to this class. The examples of work performed are neither restricted to nor all-encompassing of the duties to be performed under this job title. **(E) Essential Duty; (M) Major Portion of Time**

- Organize, implement, and monitor CDBG, HOME, and/or other State, Federal, and local City of Ukiah housing and community and economic development programs. (E, M)
- Formulate Housing Division goals, objectives, policies, strategies, and goals with the Director and assist in goal setting for the Planning Division. (E, M)

- Depending on assignment, supervises and participates in the preparation of site evaluations, feasibility studies and master plans. (M)
- Coordinates the work of consultants, other City departments, citizen groups and others on planning and housing projects and programs. (E)
- Performs complex and difficult current and/or long range planning staff work. (E)
- Prepares detailed work programs. Monitors, tracks, reports and is accountable for workflow activities. (E)
- Makes recommendations before boards, commissions, and community groups involved with planning and housing and community development functions. (E)
- Initiates, analyzes, and interprets policies for the physical, social and economic development of the City of Ukiah. (M)
- May provide conflict resolution in regards to community and regional issues having a high degree of complexity and public interest. (M)
- Develops public informational and/or educational materials. (M)
- Reviews, analyzes, and recommends proposals initiated by staff, the Planning Commission, City Council and the public. (E)
- Participates in the preparation and administration of the department budget and grant applications. (E)
- Prepares staff reports and studies on a variety of planning, housing, and development issues and projects, including California Environmental Quality Act (CEQA) documents. (E)
- Utilizes a variety of computer software programs to prepare reports, maps, diagrams, graphs and other material related to planning studies. (M)
- May serve as Acting Community Development Director in his or her absence, if necessary. (E)
- Other duties as assigned.

Knowledge of:

- Principles, practices and trends in one or more fields of planning, such as current, advance, affordable housing, environmental, transportation, regional and/or sustainable development planning.
- Intensive practices and trends in planning policy development and analysis.
- Environmental and land use analysis.
- Legislative developments affecting regional and advanced planning including federal, state and local laws and ordinances.
- Difficult research, analytical and statistical methods and comprehensive cost analysis techniques.
- Research and statistical methods as applied to the collection, tabulation and analysis of data essential to planning studies.
- Principles of the California Environmental Quality Act (CEQA).
- Permit requirements of regulatory agencies.
- Comprehensive knowledge of land use and site planning.
- Basic municipal budgeting principals.

Ability to:

- Compose planning and housing reports, technical studies, and other related documents.
- Actively manage complex and/or controversial projects and complete within applicable time limits.
- Conceive, organize, and execute assigned projects with innovation and independence; develop work systems and timelines for housing and community development projects and programs.
- Develop and implement housing projects and programs, including associated funding sources.
- Effectively relate to a variety of concerned groups in clarifying and resolving problems or conflicts of a sensitive nature and a high degree of difficulty.

- Think critically, prepare analytical analysis and conduct strategic planning.
- Establish and maintain cooperative and productive working relationships with the public and staff; work effectively with a variety of organizations.
- Communicate effectively both verbally and in written form.
- Effectively apply technical, social, and political skills to solve problems in a timely manner.
- Work collaboratively with Community Development personnel and other Departments to assure the provision of comprehensive and coordinated related services.

Education and Experience:

Any combination equivalent to experience and education that could likely provide the required knowledge and abilities would be qualifying. A typical way to obtain these qualifications would be Bachelor's Degree with a major in planning, urban studies, geography, environmental studies, architecture, landscape architecture, biological sciences or closely related field and four years of increasingly responsible professional land use planning experience. Graduate degree desirable.

Necessary Special Requirement:

Possession of a valid Class C California Driver License.

ITEM NO: 2020-488

City of Ukiah

AGENDA SUMMARY REPORT

SUBJECT: Consideration of 1) Approval of Community Development Director Determination that the Identified Project for Homekey Funding Qualifies for a CEQA Exemption; and 2) Adoption of Resolution Authorizing an Application for Funding to the Homekey Program.

DEPARTMENT: Community Development

PREPARED BY: Craig Schlatter, Community Development Director

PRESENTER: Craig Schlatter, Community Development Director

ATTACHMENTS:

1. 2020_HCD_HomeKey-NOFA_07-15-2020
2. Resolution- 2020 CDBG-CV1 application

Summary: Council will consider 1) approval of Community Development Director determination that the identified project for Homekey Program funding qualifies for a CEQA exemption; and 2) adoption of a resolution authorizing an application for funding to the Homekey Program.

Background: On July 16, 2020, the California Department of Housing and Community Development (HCD) announced the availability of approximately $600 million of Homekey Program (Homekey) grant funding through a Notice of Funding Availability (NOFA). Homekey is "a statewide effort to rapidly sustain and expand housing for persons experiencing homelessness and impacted by COVID-19." See Attachment 1 for a copy of the Homekey NOFA.

Applications submitted through the priority application period are due August 13, 2020. Applications submitted after the priority application will be accepted until September 29, 2020, or until all funds are expended. However, it is only during the priority application period that funding is reserved for different regions on a time-limited basis. After August 13, applications compete with other applications from all-sized jurisdictions across the state.

Section 301 of the NOFA lists eligible uses for Homekey. These uses include, but are not limited to, the following:

- Acquisition or rehabilitation of motels, hotels, or hostels.
- Acquisition of other sites and assets, including purchase of apartments or homes, adult residential facilities, residential care facilities for the elderly, manufactured housing, and other buildings with existing residential uses that could be converted to permanent or interim housing.
- Relocation costs for individuals who are being displaced as a result of rehabilitation of existing units.

Section 302 of the NOFA lists eligible projects, which include, but are not limited to, the following:

- Nonresidential structures with a certification of occupancy as a motel, hotel, or hostel.
- Adult residential facilities, residential care facilities for the elderly, manufactured housing, and other buildings

with existing residential uses.
- Multifamily rental housing projects with five or more housing units.
- Shared housing or scattered site housing is permitted as long as the housing has common ownership, financing, and property management, and each household signs a lease. For example, a single-family home is one unit, a duplex is two units, a triplex is three units, etc.

For acquisition projects, "Homekey will generally fund up to $100,000 per door, as supported by an appraisal." If there is a higher per door cost per project, local match is required. All Homekey projects must be fully completed by December 30, 2020 and occupied, at least on an interim basis, within 90 days of completion.

AB 83 exempted certain Homekey projects from CEQA requirements and set forth a CEQA exemption specific to Homekey in Health and Safety Code Section 50675.1.2. There are additional streamlining pathways described in the appended CEQA guidance.

Discussion: Since release of the NOFA, Staff have been working with local partners to identify a housing project that may qualify for Homekey funding. Given the short timeline to submit an application and the restrictions around the Homekey funding, a project has not been identified as of the date of preparation of this staff report.

However, in the event a project is identified by August 5, 2020, and given the application due date of August 13, this agenda item is necessary for the City Council to approve the Community Development Director determination that the the identified Homekey project for Homekey funding qualifies for a CEQA exemption; and adopt a resolution (Attachment 2) authorizing submittal of an application to the Homekey Program.

Recommended Action: Approve Community Development Director determination that the identified project for Homekey Program funding qualifies for a CEQA exemption; and adopt resolution authorizing an application for funding to the Homekey Program.

MEMORANDUM FOR: All Potential Applicants

FROM: Jennifer Seeger, Acting Deputy Director
Division of Financial Assistance

SUBJECT: **NOTICE OF FUNDING AVAILABLITY**
HOMEKEY PROGRAM

The California Department of Housing and Community Development (Department) is pleased to announce the availability of approximately $600 million of Homekey Program (Homekey) grant funding through this Notice of Funding Availability (NOFA). Building on the success of Project Roomkey, Homekey is a statewide effort to rapidly sustain and expand housing for persons experiencing homelessness and impacted by COVID-19.

Of the $600 million in Homekey funding, $550 million is derived from the state's direct allocation of the federal Coronavirus Relief Fund (CRF) and $50 million is state General Fund. The $50 million in state General Fund money is intended to supplement the acquisition of, and provide initial operating subsidies for, Homekey sites to promote Project feasibility. Accordingly, the Department will use these moneys to fund 24-month operating subsidies. **Projects receiving an award from the state's direct allocation of the federal CRF must expend the funds by December 30, 2020.** The portion of a Project's award associated with state General Fund must be expended by June 30, 2022. Depending on the funding award, the successful applicant must close escrow by the expenditure deadline.

Due to the Homekey expenditure deadline, and the potential for program oversubscription, eligible applicants are encouraged to submit their completed application as soon as possible. The Department will begin accepting applications on an over-the-counter basis on or about July 22, 2020. Review will be prioritized based on tiered criteria and date of submission. Applicants must submit a complete online application available at https://www.hcd.ca.gov/grants-funding/active-funding/homekey.shtml.

On July 24, 2020, the Department will hold a webinar to review the Homekey NOFA and application process. To register, please go to the Department's Homekey webpage. To receive information on the workshop and other updates, please subscribe to the Department's Homelessness Prevention Programs listserv at http://www.hcd.ca.gov/HCD_SSI/subscribe-form.html.

If you have any questions, please submit them to Homekey@hcd.ca.gov.

HOMEKEY PROGRAM
NOTICE OF FUNDING AVAILABILITY

Article I – Program Overview

Section 100. Notice of Funding Availability (NOFA)

The California Department of Housing and Community Development (Department) is announcing the availability of approximately $600 million in Homekey funding to rapidly sustain and expand the inventory of housing for people experiencing homelessness or at risk of homelessness and impacted by COVID-19. The COVID-19 pandemic has exacerbated existing community needs and inequalities. In many communities, homelessness was already experienced disproportionately by race and other protected classes and persons experiencing homelessness are at increased risk of infection and death due to COVID-19. The Centers for Disease Control and Prevention is also reporting that evidence points to disproportionate impacts by race and ethnicity for COVID-19 hospitalization and death. As of June 12, age-adjusted hospitalization rates are highest among non-Hispanic American Indian or Alaska Native (5 times white persons) and non-Hispanic Black persons (5 times white persons), followed by Hispanic or Latino persons (4 times white persons).

Homekey is an opportunity for local public agencies to purchase motels and a broad range of other housing types in order to increase their community's capacity to respond to homelessness and the current COVID-19 pandemic. While Homekey builds off the success of Project Roomkey, applications are not limited to Project Roomkey sites.

Of the $600 million in Homekey grant funds, $550 million is derived from the state's direct allocation of the federal Coronavirus Aid Relief Funds (CRF) and $50 million is derived from the state's General Fund to supplement the acquisition of and to provide initial operating subsidies for, Homekey sites.

Each Homekey allocation has the following expenditure deadlines:

- **The $550 million in CRF must be expended by December 30, 2020.** The Department recognizes this expenditure deadline is challenging; however, the deadline is a requirement of federal CRF funding. The Department will provide ongoing support to assist Grantees in meeting the expenditure deadline and has already developed an accelerated application and award process.

  NOTE: For Projects that involve an acquisition and are receiving CRF awards, Grantees must expend the funds by the expenditure deadline and the Project escrow must be closed by December 30, 2020.

- **The $50 million in state General Funds must be expended by June 30, 2022.**

Section 101. Purpose and Program Objectives

The purpose of the Homekey program is to provide grant funding to Eligible Applicants and facilitate a partnership with the state to quickly acquire or rehabilitate or master lease a

variety of housing types. Once developed, these projects will provide interim or permanent housing options for persons experiencing homelessness and who are also at risk of COVID-19. For this NOFA, people experiencing homelessness or who are at risk of experiencing homelessness are considered inherently "impacted by COVID-19," as they are most likely to have a lower life expectancy, be at a higher risk of infectious and chronic illness, and suffer from substance abuse and poor health. The Target Population may also have the same underlying medical conditions that result in increased risk for severe illness from COVID-19. Additionally, Homekey recognizes the disproportionate racial impacts of homelessness and COVID-19 and encourages Eligible Applicants to examine disproportionate impact in their own communities and to develop strategies to address these impacts.

Section 102. Authorizing Legislation and Applicable Law

Assembly Bill No. 83 (2019-2020 Reg. Sess.) created the statutory basis for Homekey by adding section 50675.1.1 to the Health and Safety Code and exempted certain Homekey Projects from the California Environmental Quality Act (CEQA) by adding section 50675.1.2 to the Health and Safety Code.

Health and Safety Code section 50675.1.1, subdivision (d) states, "The Department of Housing and Community Development may adopt guidelines for the expenditure of the funds appropriated to the Department [for Homekey]. The guidelines shall not be subject to the requirements of Chapter 3.5 (commencing with Section 11340) of Part 1 of Division 3 of Title 2 of the Government Code."

The Multifamily Housing Program (MHP) (Chapter 6.7 (commencing with Section 50675) of Part 2 of Division 31 of the Health and Safety Code), and as subsequently amended, is hereby incorporated by reference. In accordance with Health and Safety Code section 50675.1.1, subdivision (c), in the event of a conflict between this NOFA and the Multifamily Housing Program, the provisions of this NOFA are controlling.

The MHP Final Guidelines (MHP Guidelines), effective June 19, 2019, and as subsequently amended, are hereby incorporated by reference. In the event of a conflict between any of the MHP Guidelines and this NOFA, the provisions of this NOFA are controlling.

This NOFA establishes the terms, conditions, forms, procedures, and other mechanisms that the Department deems necessary to exercise its powers and to perform its duties pursuant to MHP in relation to Homekey.

The Department reserves the limited right to amend this NOFA after the close of the application period. Such right does not extend to material provisions of the application submission, review, and award process (e.g., scoring and tiering criteria). Post-NOFA amendments will take immediate effect and will govern the Standard Agreement process. After Standard Agreements have been executed, the Department will only amend this NOFA as necessary to provide clarification or to avoid a conflict of law.

The matters set forth herein are regulatory mandates and are adopted as regulations that have the dignity of statutes (*Ramirez v. Yosemite Water Company, Inc.* (1999) 20 Cal.4th 785, 799 [85 Cal.Rptr.2d 844]).

Section 103. Program Timeline

Homekey funds will be initially available to Eligible Applicants on an over-the-counter basis. Applications will be accepted from the release of this NOFA until September 29, 2020. The Department is also reserving a priority application period to allow for geographic equity in the disbursement of funds. The following table summarizes the Homekey program anticipated timeline.

Table 1: Anticipated timeline for Homekey applications

NOFA release	July 16, 2020
Stakeholder Call	July 16, 2020
Stakeholder Webinar	July 24, 2020
Pre-application consultations and the priority application period	July 16 – August 13, 2020
Final application due date	September 29, 2020
Award announcements	Rolling (Starting August 2020)
Final awards issued	October 2020
Standard agreements mailed	Upon submittal of required information and documentation
The Department redeploys unutilized funds	November 2020
CRF expenditure deadline	December 30, 2020
Grantee Expenditure and Program Report	Feb 1, 2021
State General Funds expenditure deadline	June 30, 2022
State General Funds expenditure report due dates	▪ January 31, 2021 ▪ July 31, 2021 ▪ January 31, 2022, ▪ July 31, 2022

The Department reserves the right to make adjustments to the projected timeline at any time.

Article II. Application Submission, Review, and Award Process

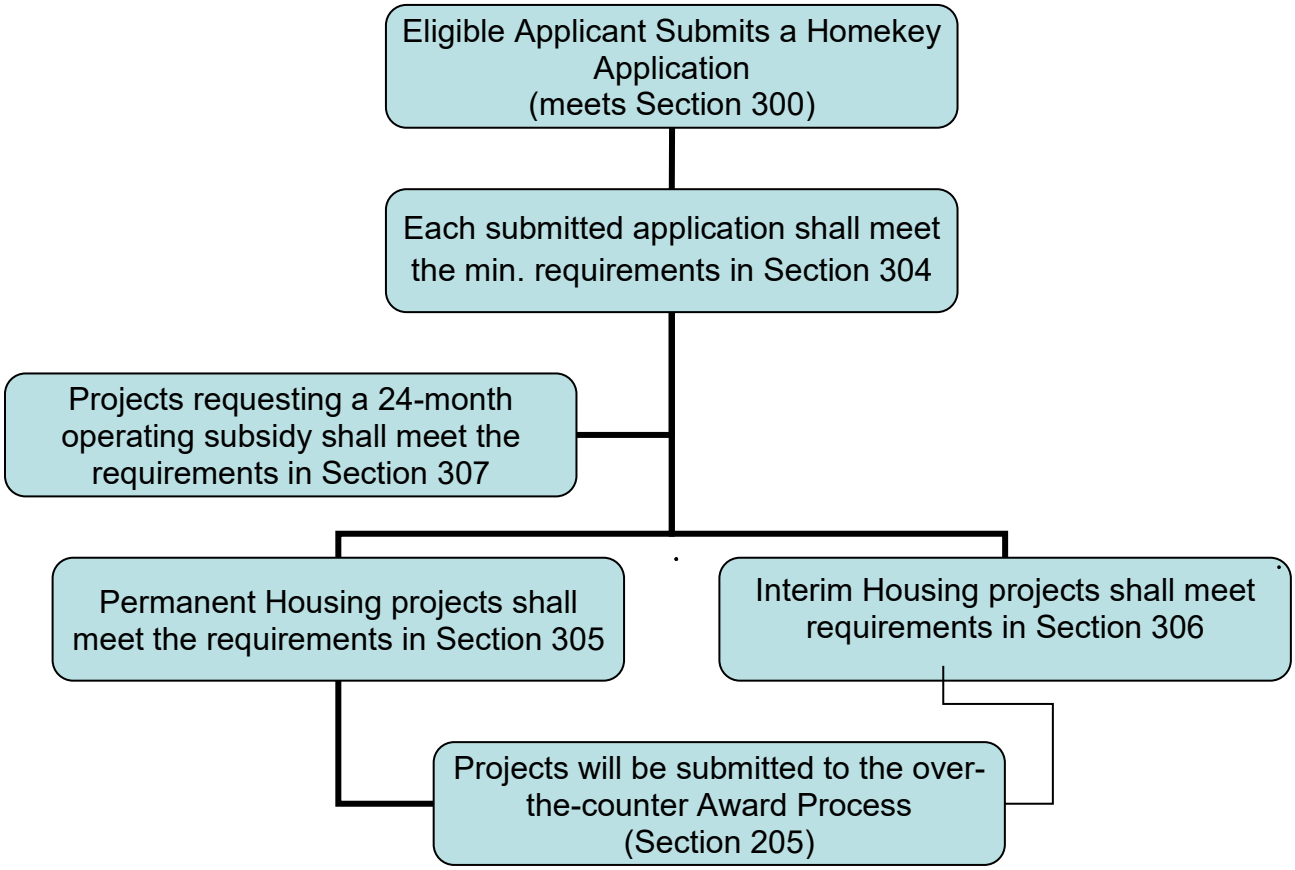
Section 200. Application Process Overview

The Homekey application is available electronically on the Homekey webpage. **The Department anticipates releasing the Homekey application on or about July 22, 2020.**

i. Applications for this NOFA will be received and reviewed on a rolling, over-the-counter basis until the CRF and the state General Fund moneys are committed.

ii. Applications will be prioritized as described in Section 202.

iii. The Department will evaluate applications for compliance with the minimum program requirements set forth in Section 304 and depending on the proposed Project Applicants should review requirements in Sections 304, 305, and 306. See the Homekey Application Process Flowchart at the end of this Section.



iv. After each Applicant has been certified to meet the minimum program requirements, to be considered for a funding award, each Project must receive a minimum overall score of 110 points, as outlined in Section 204.

v. The Department reserves the right to do the following:

   a. Score an application as submitted even if information is missing from the application; and/or

   b. Request clarification of unclear or ambiguous statements made in an application or request additional clarifying documentation or information.

Chart 1: Homekey Application Process Flowchart

Section 201. Pre-Application Consultation and Technical Assistance

The Department requires all Applicants to engage in a pre-application consultation with the Department and/or the Department of General Services (DGS) prior to submitting an application. The consultation will allow the prospective Applicant to discuss the proposed Project, along with other applicable programmatic considerations, including those related to site acquisition, CEQA, land use and land entitlements, and long-term financing approaches. Application consultations will be available upon the release of this NOFA and may be requested by emailing Homekey@hcd.ca.gov.

Section 202. Geographic Distribution and Project Prioritization

COVID-19 impacts people who are experiencing or who are at risk of homelessness throughout California. As such, the Department would like to ensure jurisdictions throughout the state have an equitable opportunity to apply for Homekey funds to protect the health and safety of their most vulnerable residents.

To this end, the Department has divided the state into eight regions, as outlined in Table 2, below. The regions are largely aligned with the various Councils of Government (COGs). As detailed in Table 2, 3, and 4 below, each region has funding reserved on a time-limited basis during the priority application period. Each region's share of the Homekey allocation is calculated based on its proportionate share of the persons experiencing homelessness of both the sheltered and unsheltered 2019 Homeless Point-in-Time counts and extremely low-income (ELI) renter households that are paying more than 50 percent of their income for rent.

Table 2: Homekey Counties by Region

Counties by Geographic Distribution			
Los Angeles County	**San Joaquin Valley**	**Central Coast**	**Balance of State (Cont.)**
Bay Area	Fresno	Monterey	Mendocino
Alameda	Kern	San Benito	Modoc
Contra Costa	Kings	San Luis Obispo	Mono
Marin	Madera	Santa Barbara	Nevada
Napa	Merced	Santa Cruz	Plumas
San Francisco	San Joaquin	**Balance of State**	Shasta
San Mateo	Stanislaus	Alpine	Sierra
Santa Clara	Tulare	Butte	Siskiyou
Solano	**San Diego County**	Calaveras	Tehama
Sonoma	**Sacramento Area**	Colusa	Trinity
Southern California	Amador	Del Norte	Tuolumne
Imperial	El Dorado	Glenn	
Orange	Placer	Humboldt	
Riverside	Sacramento	Inyo	
San Bernardino	Sutter	Lake	
Ventura	Yolo	Lassen	
	Yuba	Mariposa	

Table 3: Estimated Homekey Allocations by Region

Geographic Regions	PIT Count	Severely Rent-burdened ELI	CRF Allocation	GF Allocation
Los Angeles County	58,936	415,970	$161,572,217	$14,688,383
SF Bay Area	35,028	213,910	$91,134,470	$8,284,952
Southern California (w/o LA)	15,360	200,095	$55,577,540	$5,052,504
San Joaquin Valley	10,271	105,370	$32,987,450	$2,998,859
Central Coast	8,439	38,395	$20,025,927	$1,820,539
Sacramento Area	8,381	73,780	$25,125,077	$2,284,098
San Diego County	8,102	94,480	$27,690,283	$2,517,298
Balance of State	7,254	32,140	$17,087,036	$1,553,367

Two percent (2%) of the $550 million in Homekey funds is for Department administrative costs. Twenty percent (20%) of the remaining $550 million in Homekey funds is being held back by the Department to ensure there is adequate flexibility to issue awards expediently.

Table 4: Estimated Homekey Allocations

Funding Categories	CRF	General Fund
Total Homekey Allocation	$550,000,000	$50,000,000
Administrative at 2%	$11,000,000	$1,000,000
Discretionary Set Aside at 20%	$107,800,000	$9,800,000
Total Geographic Regional Allocation	$431,200,000	$39,200,000

Eligible Applicants who apply within the 30-day priority application period will be grouped into one of the eight geographic regions. The Department will further sort the applications into one of two tiers.

Tier One*:*

1. Tier One applications will be those Projects that: (1) can be occupied within 90 days from the date of acquisition; and (2) are permanent housing or will result in permanent housing as indicated on the application; or

2. Tier One projects include Projects that can be occupied within 90 days and used for Interim Housing, provided the project is expected to be developed into permanent housing at a later date **OR** Interim Housing with a coordinated exit strategy adopted by the Continuum of Care to support transitions into other permanent housing. Interim Housing projects shall submit a letter of support from the local Continuum of Care that demonstrates the coordinated exit strategy of the Target Population.

Tier Two*:*

Tier Two projects are all other Projects and uses, including housing that will be used for interim only and with no expectation of development into permanent housing.

For Projects received within the priority application period, the Department will award Tier One projects meeting the program requirements on a rolling basis, up to the regional cap, on a first-come, first-served basis. Tier Two projects meeting the program requirements will be waitlisted and awarded funding if funds are available, after the priority application period, according to the date stamp. Applications that were received after the priority application period, and that met the specified program requirements, will be awarded according to date stamp, as funds are available.

The Department can reimburse eligible Homekey expenditures that occurred prior to the release of this NOFA. Applicants are encouraged to discuss their options at the required pre-application consultation described in Section 201.

The following table summarizes the Homekey application prioritization process and timeline.

Table 5: Anticipated Homekey Application Prioritization Timeline

	Priority Application Review Period July 16 - August 13	Review Period 2 August 14 - September 29	September 30 – December 30, 2020
Applications	Sorted by: a. Regions b. Within Regions, by Tier One or Two c. Within Tiers, by a date stamp	Sorted by date stamp only (not by region or tier) Note: These applications will be put on a waitlist, and not sorted by Region or Tier.	No applications submitted during this period will be accepted.
Awards	Pre-application consultations and application review period. The Department will begin awarding Tier One projects meeting threshold within each region on a rolling basis, up to cap for the region.	For applications received through August 13, the Department will continue awarding Tier One projects meeting the Homekey program requirements on a rolling basis, up to the cap for the region. If these Tier One projects are undersubscribed, the Department will award qualified Tier Two projects. If the Tier Two projects are oversubscribed, the Department will award according to date stamp. If Tier Two projects are undersubscribed, The Department will proceed with awards in the following order: a. Any waitlisted applications from other regions received up to August 13, by tier and date stamp. b. Any waitlisted applications received on August 14 or later, by date stamp. For any tiebreaker needed (e.g., applications received on the same date), the Department will use ability to spend quickly, followed by PIT count, then leverage.	

Section 203. Maximum Grant Amounts

For acquisition projects, Homekey will generally fund up to $100,000 per door, as supported by an appraisal. "Door" refers to the number of units at the time of the acquisition, which may differ from the number of units after a future conversion. For those projects that undergo a future conversion, the number of units may need to be reduced to accommodate kitchenettes and other amenities.

The Department recognizes that some acquisitions may have a higher per-door appraised value in certain high-cost areas. Some properties may also have a higher per-door value because they need less upfront work and already have the necessary amenities to support permanent housing solutions—for example, units with kitchenettes.

To support these efforts, the Department will accept requests from Tier One projects up to $200,000 per door. However, for this $200,000 per door maximum, the following applies:

i. The Department will contribute the first $100,000 per door of the Homekey proposed Project. This contribution does not require a local match.

ii. The Eligible Applicant will be required to contribute an identical match of $50,000 or a 1:1 local match to receive an additional $50,000 contribution from the Homekey program.

iii. The Eligible Applicants will be required to contribute $100,000 or a 2:1 local match to receive an additional $50,000 contribution from the Homekey program.

Table 6: State contributions to projects

Homekey	Eligible Applicant Contribution	Total Per Door
FIRST $ 100,000	No Match Required	$100,000
NEXT $ 50,000 (TIER ONE PROJECTS)	1:1, Up to $50,000	$200,000
NEXT $ 50,000 (TIER ONE PROJECTS)	2:1, Up to $100,000	$350,000

Eligible Applicants can request the highest state contribution of Homekey funds if they meet the following criteria:

i. The proposed Project meets the Tier One category specified in Section 202.

ii. The proposed Project is close to permanent occupancy, or there is a clear demonstration of occupying the units with tenants from the Target Population within 90 days of acquisition, e.g., higher purchase price with minimal rehabilitation needed.

iii. The Department may consider additional criteria unique to the proposed Project that reduce the overall cost of a project when future rehabilitation needs are considered, support catalytic investments in disadvantaged communities without causing displacement, and affirmatively further fair housing.

Section 204. Application Scoring Criteria

Applications meeting the minimum program requirements outlined in Article III will require a **minimum score of 110 points to be eligible for funding**. Scores will be based on the following:

Table 7: Homekey Application Scoring Criteria

Homekey Application Scoring Categories and Max Point Scores	Evaluation Criteria
1. Ability to expend funds by December 30, 2020. **(Up to 50 points)**	a. Identification of the site suitable for development and evidence of site control, or a plan and timeline for obtaining site control along with other supporting evidence (e.g., letter of intent, an exclusive negotiating agreement, ground lease, etc.). **(Up to 20 points)** b. A proposed development vision that identifies the financial and regulatory mechanisms to be used to maintain the ongoing affordability of the Project. **(Up to 20 points)** c. An overview of the planned and timeline for any required entitlements, permits, environmental clearances. **(Up to 10 points)**
2. Demonstration of the development team's experience and capacity to acquire and operate the Project. **(Up to 40 points)**	a. Demonstration of the development's team experience to acquire and/or rehabilitate and operate the project. **(Up to 10 points)** b. A map of how the development team is connected and a description of how the team will work together, e.g., MOU, etc. **(Up to 10 points)** c. Development, ownership, or operation of a project similar in scope and size to the proposed Project. **(Up to 10 points**) d. The extent to which the Project can demonstrate the range of on-site and off-site supportive services that will be provided to the target population, e.g., mental health services, substance use disorder services, primary health, employment, and other tenancy support services. **(Up to 10 points)**
3. A demonstration of how the Project will address racial equity, other systemic inequities, state and federal accessibility requirements, and serve members of the Target Population. **(Up to 25 points)**	a. Eligible Applicant shall provide non-discrimination statement per Section 311, which references the Fair Employment and Housing Act. The Fair Employment and Housing Act is supported by accompanying regulations, 2 CCR Section 12005 et seq, covering tenant screening and affirmative marketing requirements. Eligible Applicant will also include a description of how the Project will address racial equity and inequities for the target population, including any local disproportionate impact of COVID-19 and homelessness by race and other protected classes. The description should include supporting evidence of the strategies' effectiveness if available. (**Up to 15 points)** b. The extent to which the Project exceeds the state and federal accessibility requirements set forth Section 311, specifically providing a minimum of 10 percent of units with features accessible to persons with mobility disabilities, as defined in 24 C.F.R. Section 8.22 and the parallel ADAAG 2010 and CBC provisions, and a minimum of 4 percent of units with features accessible to persons with hearing or vision disabilities, as defined in 24 C.F.R. Section 8.22 and the parallel ADAAG 2010 and CBC Chapter 11B provisions**. (Up to 5 points)**

Homekey Application Scoring Categories and Max Point Scores	Evaluation Criteria
	c. The Applicant or development team has three or more years of experience serving persons of the target population. **(Up to 5 points)**
4. The extent to which the Eligible Applicant can demonstrate the Project's community impact and site selection. **(This category is worth 45 points)**	a. The extent to which the Eligible Applicant can demonstrate the Project's impact on the community as demonstrated by a reduction of at least 5 percent of the local 2019 Point-in-Time Count. **(Up to 10 points**) b. The proposed Project is a Tier One project and requires no rehabilitation, or the rehabilitation and the occupancy can be completed within 30 days after acquisition. **(Up to 10 points)** c. The Project is expected to acquire and maintain 100 or more units for the target population. **(Up to 5 points)** d. For any Project below $350,000 per door, if the Eligible Applicant contributes more than a minimum match outlined in Table 5, above, the application will receive one (1) extra point for every additional 5% per door contributed to the Project. For example, for an acquisition that costs $100,000 per door, the Applicant will receive 1 extra point for every $5,000 per door in match contributed. **(Up to 10 points)** e. Site Selection **(Up to 10 points**) The project site is located within 1/3 mile of a bus rapid transit station, light rail station, commuter rail station, ferry terminal, bus station, or public bus stop. Commuter rail station, ferry terminal, bus station, or public bus stop OR the project includes an alternative transportation service for residents (e.g., van or dial-a-ride service), if costs of obtaining and maintaining the van and its service are included in the budget and the operating schedule is either on demand by tenants or a regular schedule is provided **(4 points)** The project site is in proximity to essential services: i. Grocery store – within 1/2 mile of a full-scale grocery store/supermarket of at least 25,000 gross interior square feet where staples, fresh meat, and fresh produce are sold (1 mile for projects in rural areas); **(2 points)** ii. Health facility – within 1/2 mile (1 mile for projects in rural areas) of a qualifying medical clinic with a physician, physician's assistant, or nurse practitioner on-site for a minimum of 40 hours each week, or hospital (not merely a private doctor's office). A qualifying medical clinic must accept Medi-Cal payments, or Medicare payments, or Health Care for the Homeless, or have an equally comprehensive subsidy program for low-income patients; **(1 point)** iii. Library – within 1/2 mile of a book-lending public library (1 mile for projects in rural areas); (**1 point**) iv. Pharmacy: within 1/2 mile of a pharmacy (1 mile for projects in rural areas). (**2 points**)

In the event of program oversubscription, where Applicants have the same score and the same date stamp, the following tiebreaker system will be applied to determine the Project funding:

i. The Department will take into consideration the highest score for each project received in the expenditure category (e.g. immediate ability to expend funds by December 30, 2020).

ii. If a funding determination cannot be made from (i) above, the Department will provide the grant funding to the project with the highest 2019 Homeless Point-in-Time count.

iii. If the funding determination cannot be made from (i) or (ii) above, the Department will provide funding to project that leverages the most non-Homekey funds (government, private, or philanthropic).

iv. The Department may consider additional criteria, including but not limited to the cost-effectiveness; community impact; affirmative furtherance of fair housing; innovative housing type; tenant stability; and proximity to transit, services and amenities.

Section 205. Application Submission

The Department will be accepting over-the-counter applications beginning on or about **July 22, 2020**. Instructions for submittal of an application can be found on the website. The Department will set aside a priority application period to immediately begin reviewing and awarding qualified Projects from **July 16, 2020 to August 13, 2020**. All other applications received after the priority application period must be received by the Department no later than 5:00 p.m. PDT on **September 29, 2020**.

Applicants must submit the Homekey application and required attachments provided by the Department. The Department will not accept modified application forms. It is the Applicant's responsibility to ensure that the submitted application is accurate. Department staff may request additional clarifying information.

The application is a public record, which is available for public review pursuant to the California Public Records Act (CPRA) (Chapter 3.5 (commencing with Section 6250) of Division 7 of Title 1 of the Government Code). After final Homekey awards have been issued, the Department may disclose any materials provided by the Applicant to any person making a request under the CPRA. The Department cautions Applicants to use discretion in providing information not specifically requested, including but not limited to, bank account numbers, personal phone numbers, and home addresses. By providing this information to the Department, the Applicant is waiving any claim of confidentiality and consents to the disclosure of submitted material upon request.

Section 206. Application Award Process

The Department will send both an award letter and a Standard Agreement to the successful Applicant. When the Standard Agreement is signed and returned by the Applicant, the Applicant will simultaneously submit a request for funds. Funds will be disbursed after the Department has received a request for funds and a fully executed Standard Agreement.

The Department is committed to disbursing Homekey funds in a timely manner. To avoid any expenditure delays, funds may be issued directly to the Applicant that is listed on the application, to the designated payee identified by successful co-Applicants, or to an escrow company that has been approved by the Department. For the latter option, the Applicant shall identify the name and address of the escrow company, the name of the escrow officer, the escrow number, and any other information requested by the Department.

Section 207. Appeals

Federal CRF money is the primary source of funding for the Homekey program, and it is subject to a short expenditure deadline. Section 601(f)(2) of the Social Security Act, as added by section 5001(a) of the federal Coronavirus Aid, Relief, and Economic Security (CARES) Act, provides that the U.S. Department of the Treasury will recoup CRF money that have not been used to cover expenses incurred by December 30, 2020. In view of this abbreviated timeframe for award and expenditure, as well as the specific needs and objectives of the Homekey program, the Department, in accordance with its authority under Health and Safety Code section 50675.7, subdivision (d), will not accept appeals of its award determinations. The Department encourages aggrieved Applicants to resubmit their applications within the specified timeframe.

Article III Program Requirements

Section 300. Eligible Applicants

i. Cities, counties, or any other Local Public Entity as that term is defined by Health and Safety Code section 50079; or

ii. Cities, counties, or any other Local Public Entity as that term is defined by Health and Safety Code section 50079, in partnership with nonprofit or for-profit corporations.

Cities, counties, or other Local Public Entities, including housing authorities or federally recognized tribal governments within California, may apply independently as a Development Sponsor. Alternatively, a Local Public Entity may apply jointly with a for-profit or nonprofit corporation.

Section 301. Eligible Uses

Awarded funds must be used to provide housing for individuals and families experiencing homelessness or at risk of experiencing homelessness and who are impacted by the COVID-19 pandemic. With respect to the list of eligible uses below, an Eligible Applicant may choose to target Project Roomkey properties, or other, non-Project Roomkey properties. The list of eligible uses for the CRF $550 million allocation and the $50 million state General Fund allocation is as follows:

i. Acquisition or rehabilitation of motels, hotels, or hostels.

ii. Master leasing of properties.

iii. Acquisition of other sites and assets, including purchase of apartments or homes, adult residential facilities, residential care facilities for the elderly, manufactured housing, and other buildings with existing residential uses that could be converted to permanent or interim housing.

iv. Conversion of units from nonresidential to residential in a structure with a certificate of occupancy as a motel, hotel, or hostel.

v. The purchase of affordability covenants and restrictions for units.

vi. Relocation costs for individuals who are being displaced as a result of rehabilitation of existing units.

vii. Capitalized operating subsidies for units purchased, converted, or altered with funds provided pursuant to Health and Safety Code section 50675.1.1.*

**Projects seeking capitalized operating subsidies for units purchased, converted, or altered will be awarded with funds from the $50 million state General Fund allocation. The $550 million in Homekey derived from the CRF is not permitted to be used for this purpose.*

Section 302. Eligible Projects

i. Nonresidential structures with a certificate of occupancy as a motel, hotel, or hostel.

ii. Adult residential facilities, residential care facilities for the elderly, manufactured housing, and other buildings with existing residential uses.

iii. Multifamily rental housing projects with five or more housing units.

iv. Shared housing or scattered site housing is permitted as long as the housing has common ownership, financing, and property management, and each household signs a lease. For example, A single-family home is one unit, a duplex is two units, a triplex is three units, et cetera.

The above list of eligible projects is not exhaustive. The Department welcomes and will consider a variety of other forms of housing as eligible projects. Interested Applicants should discuss other projects types with the Department during the pre-application consultation.

Section 303. Match

Eligible Applicants are required to demonstrate a five-year commitment to provide operating funds for the proposed project. The first two years of operating funds may include an award from the $50 million in state General Fund. Matching contributions may be obtained from any source, including any federal source as well as state, local, and private sources. Eligible Applicants will have an opportunity to discuss the match requirements and potential match sources during the pre-application consultation described in Section 201.

Additionally, the following requirements apply to match contributions:

i. The Eligible Applicant must ensure the laws governing any funds to be used as matching contributions do not prohibit those funds from being used to match Homekey funds; and

ii. If the state General Funds are used to satisfy the matching requirements of another program, then funding from that program may not be used to fulfill the matching requirements of the Homekey program.

Section 304. General Program Requirements

To be eligible to receive funding, projects must meet the following requirements as they relate to the Eligible Applicant and the project types:

i. Applications must be submitted independently by a single County, City, Public Housing Authority, or federally recognized tribal government as the Development Sponsor. Alternatively, applications must be submitted by a single County, City, Public Housing Authority, federally recognized tribal government and jointly with another entity as the Development Sponsor.

ii. Projects must serve persons qualifying as members of the Target Population.

iii. Developer experience

a. If the Eligible Applicant is acquiring, rehabilitating, and operating an eligible project type as outlined in Section 305 below, the Eligible Applicant shall demonstrate the following minimum experience requirements:

1) Development, ownership, or operation of a project similar in scope and size to the proposed Project, or at least two affordable rental housing projects in the last ten years, with at least one of those projects containing at least one unit housing a tenant who qualifies as a member of the Target Population.

2) The property manager shall have three or more years of experience serving persons of the Target Population. If a property manager is not yet selected for the proposed Project, the selected property manager shall have three or more years of experience serving persons of the Target Population, **OR** the Grantee shall certify that this requirement will be reflected in any future solicitation or Memorandum of Understanding.

b. If the Eligible Applicant is acquiring, rehabilitating, and operating an Interim Housing project, the Eligible Applicant shall demonstrate the following minimum experience requirements:

1) Development or ownership of an Interim Housing project in the last ten years for members who qualify as the Target Population.

2) The Eligible Applicant has successfully operated an emergency shelter or Transitional Housing or other Interim Housing for at least three years or more for members of the Target Population.

3) Demonstrated experience in linking Interim Housing program participants to permanent housing to ensure long-term housing stability.

4) Experience administering a Housing First program including principles of harm reduction and low barriers to entry.

c. The Eligible Applicant applying for the Homekey funding is the entity that the Department relies upon for experience and capacity, and will control the Project during acquisition, development, and occupancy. In a project with multiple layers of ownership, the Development Sponsor cannot have more than two corporate entities between itself and the borrowing entity.

iv. Evidence of strong organizational and financial capacity to develop the project, including but not limited to:

a. The urgency to acquire a site to provide affordable housing to the Target Population;

b. A development plan to meet the expenditure period;

c. If the project will leverage other funding sources.

v. Assisted units and other units of the Project must meet all applicable state and local requirements pertaining to rental housing, manufactured housing, including but not limited to requirements for minimum square footage, and requirements related to maintaining the project in a safe and sanitary condition.

vi. The Department encourages Eligible Applicants to consider the CEQA exemption set forth at Health and Safety Code section 50675.1.2, the provision for land use consistency and conformity at Health and Safety Code section 50675.1.1, subdivision (g), as well as the additional streamlining pathways described in the appended CEQA guidance.

vii. The Department will require Eligible Applicants to submit the following documents:

a. Overview of project vision;

b. Description of project team, including partnerships with any other entities;

c. Demonstration of the development's team experience to acquire and/or rehabilitate and operate the project;

d. Identification of the site suitable for development and evidence of site control or a plan and timeline for obtaining site control along with other supporting evidence (e.g., letter of intent, exclusive negotiating agreement, ground lease, etc.);

e. A proposed development vision that identifies the financial and regulatory mechanisms to be used to maintain the ongoing affordability of the project;

f. A summary of the committed and intended sources, and uses, of the project awarded with Homekey funds;

g. A proposed timeline for the entire project, including major milestones, any required entitlements, permits, environmental clearances, board or governing body approvals, etc., and completion of the project;

h. A proposed financing plan for any eventual development of the project;

i. Preliminary commitment for title insurance. If no title report is available, the Applicant shall identify any known encumbrances on the property;

j. Environmental site assessment (i.e., Phase 1 Environmental Assessment), or evidence that the assessment is in process and timeline to complete;

k. Appraisal or evidence that the appraisal is in process and timeline to complete;

l. Physical Needs Assessment or evidence that the physical needs assessment is in process and timeline to complete. This assessment must include consideration of accessibility requirements (Section 311);

m. Non-Discrimination Statement and descriptions of tenant selection and/or coordinated entry system practices that meet non-discrimination requirements (Section 311);

n. Documented ability to obtain the insurance coverages outlined in Article VI of this NOFA; and

o. Authorizing Resolution (AR) approved by the Applicant's governing body.

The Department reserves the right to request clarification of unclear or ambiguous statements made in an application and other supporting documents.

Section 305. Permanent Housing Requirements

Permanent housing projects will be evaluated on the following requirements:

i. The Sponsor shall have control of the property, and such control shall not be contingent on the approval of any other party. The status and nature of the Sponsor's title and interest in the property shall be subject to the Department's approval. Site control may be evidenced by one of the following:

a. Fee title;

b. A leasehold interest on the property with provisions that enable the lessee to make improvements on and encumber the property provided that the terms and conditions of any proposed lease shall permit compliance with all program requirements;

c. An executed disposition and development agreement, or irrevocable offer of dedication to a public agency;

d. A sales contract, or other enforceable agreement for the acquisition of the property;

e. A letter of intent, executed by a sufficiently authorized signatory of the Eligible Applicant, that expressly represents to the Department, without condition or reservation, that, upon successful application, the Eligible Applicant shall purchase or otherwise acquire a sufficient legal interest in the property to accomplish the purpose of the award. The letter of intent must also be acknowledged by the party selling or otherwise conveying an interest in the subject property to the Eligible Applicant. If this form of evidence is relied upon at the time of application, the Department may impose additional milestones, in the Standard Agreement, regarding increased evidence of eventual site control closer to the likely close of escrow; or

f. Other forms of site control that give the Department assurance (equivalent to items a. through e. above) that the Applicant will be able to complete the project in a timely manner and in accordance with all the program's objectives and requirements.

ii. The Eligible Applicant's plan to extend a local covenant restricting the use and Target Population for 55 years.

iii. A plan to cover operations and service costs with specific funding sources (government/philanthropic/private) for the proposed Project for five years and must demonstrate a path to ultimate use of the site for ten years.

iv. To the extent possible, the project shall provide a description of the services that will be available at the housing site including but not limited to case management, behavioral health services, physical health services, assistance obtaining benefits and essential documentation, and education and employment services. Please describe the on-site staffing plan proposed to deliver these services. Also describe the approach to securing off-site services including primary care and other needed physical health and behavioral health services as well as other tenancy supports.

v. One-for-one replacement of assisted housing

a. If the acquired housing or site is to be redeveloped/repositioned as part of the locality's overall goal to address the needs of the Target Population and the community, the Applicant shall provide as part of the application a commitment to ensure one-for-one replacement of units.

b. If the target site is going to be demolished before it is occupied as part of the Project being proposed by the Applicant, no one-for-one replacement commitment needs to be provided. The unit mix will be evaluated based on the project proposal.

c. The application shall include a site map indicating the original target housing location and all proposed housing location(s). If all proposed housing will be located within the neighborhood, no additional documentation is necessary. If replacement housing is proposed outside the target neighborhood, the application must also include a justification explaining why it is necessary to locate this

replacement housing outside the target neighborhood (i.e., offsite) and how doing so supports and enables the Target Population to maintain housing.

vi. If the development of any Project results in the displacement of tenants, regardless of whether the tenant meets the definition of the Target Population, the Applicant must describe the assistance and benefits to be provided in compliance with local, state, and federal law.

Section 306. Interim Housing Requirements

Interim Housing projects with no plan for conversion to permanent housing will be evaluated on the following requirements:

i. The Sponsor shall have control of the property, and such control shall not be contingent on the approval of any other party. The status and nature of the Sponsor's title and interest in the property shall be subject to the Department's approval. Site control may be evidenced by one of the following:

   a. Fee title;

   b. A leasehold interest on the property with provisions that enable the lessee to make improvements on and encumber the property provided that the terms and conditions of any proposed lease shall permit compliance with all program requirements;

   c. An executed disposition and development agreement, or irrevocable offer of dedication to a public agency;

   d. A sales contract, or other enforceable agreement for the acquisition of the property;

   e. A letter of intent, executed by a sufficiently authorized signatory of the Applicant, that expressly represents to the Department, without condition or reservation, that, upon successful application, the Applicant shall purchase or otherwise acquire a sufficient legal interest in the property to accomplish the purpose of the award. The letter of intent must also be acknowledged by the party selling or otherwise conveying an interest in the subject property to the Applicant. If this form of evidence is relied upon at the time of application, the Department may impose additional milestones, in the Standard Agreement, regarding increased evidence of eventual site control closer to the likely close of escrow; or

   f. Other forms of site control that give the Department assurance (equivalent to a-e above) that the Applicant will be able to complete the project in a timely manner and in accordance with all the program's objectives and requirements.

ii. A plan to cover operations and service costs with specific funding sources (government/philanthropic/private) for the proposed Project for five years and must demonstrate a path to the ultimate use of the site for ten years.

iii. To the extent possible, the project shall provide a description of the services that will be available at the housing site including but not limited to case management, behavioral health services, physical health services, assistance obtaining benefits

and essential documentation, and education and employment services. Please describe the on-site staffing plan proposed to deliver these services. Also describe the approach to securing off-site services including primary care and other needed physical health and behavioral health services as well as other tenancy supports.

Section 307. Other Requirements

i. The purchase of existing residential units, or affordability covenants and restrictions require the units to be restricted to individuals and families who are experiencing homelessness or who are at risk of homelessness defined in Section 578.3 of Title 24 of the Code of Federal Regulation, for no fewer than 20 years. Additionally, the Sponsor shall provide a plan to cover operations and service costs with specific funding sources (government/philanthropic) for the proposed Project for five years and must demonstrate a path to the ultimate use of the site for ten years.

ii. Master leasing projects will be evaluated on the following requirements:

   a. The Sponsor shall have adequate site control of the property, and such control shall not be contingent on the approval of any other party. Site control may be evidenced by one of the following:

      1) Fee title;

      2) A leasehold interest on the property with provisions that enable the lessee to make improvements on and encumber the property provided that the terms and conditions of any proposed lease shall permit compliance with all program requirements;

      3) An executed disposition and development agreement, or irrevocable offer of dedication to a public agency;

      4) A sales contract, or other enforceable agreement for the acquisition of the property;

      5) A letter of intent, executed by a sufficiently authorized signatory of the Eligible Applicant, that expressly represents to the Department, without condition or reservation, that, upon successful application, the Eligible Applicant shall purchase or otherwise acquire a sufficient legal interest in the property to accomplish the purpose of the award. The letter of intent must also be acknowledged by the party selling or otherwise conveying an interest in the subject property to the Eligible Applicant. If this form of evidence is relied upon at the time of application, the Department may impose additional milestones, in the Standard Agreement, regarding increased evidence of eventual site control closer to the likely close of escrow.

      6) Other forms of site control that give the Department assurance (equivalent to 1-5 above) that the Applicant will be able to complete the project in a timely manner and in accordance with all the program's objectives and requirements.

   b. The Sponsor shall provide a plan to cover operations and service costs with specific funding sources (government/philanthropic) for the proposed Project for five years.

c. To the extent possible, the Eligible Applicant shall demonstrate the range of on-site and off-site supportive services to participants, e.g., mental health services; substance use disorder services; and primary health, employment, and other tenancy support services.

Section 308. 24-Month Operating Subsidy

i. The total amount for each project requesting the 24-month operating subsidy shall not exceed $1,000 per month per unit to address project operating deficits attributable to the Assisted Units.

ii. The 24-month operating subsidy must be expended by June 30, 2022.

Section 309. Article XXXIV

Per Health and Safety Code section 37001, subdivision (h), Article XXXIV, section 1 of the California Constitution ("Article XXXIV") is not applicable to development involving the acquisition, rehabilitation, reconstruction, alterations work, or any combination thereof, of lodging facilities or dwelling units using moneys received from the CRF established by the federal CARES Act (Public Law 116-136).

Section 310. Housing First

Upon occupancy, the Eligible Applicant shall certify to employ the core components of Housing First (set forth in the Welfare and Institutions Code Section 8255) in the property management and tenant selection practices.

Section 311. Accessibility and Non-Discrimination

All developments shall adhere to the accessibility requirements set forth in California Building Code Chapter 11A and 11B and the Americans with Disabilities Act, Title II. In addition, developments shall adhere to either the Uniform Federal Accessibility Standards (UFAS) standards, 24 C.F.R. Part 8, or HUD's modified version of the 2010 ADA Standards for Accessible Design (Alternative 2010 ADAS), HUD-2014-0042-0001, 79 F.R. 29671 (5/27/14) (commonly referred to as "the Alternative Standards" or "HUD Deeming Memo"). Accessibly units shall, to the maximum extent feasible and subject to reasonable health and safety requirements, be distributed throughout the project and be available in a sufficient range of sizes and amenities consistent with 24 CFR Section 8.26.

All Sponsors shall adopt a written non-discrimination policy requiring that no person shall, on the grounds of race, color, religion, sex, gender, gender identity, gender expression, sexual orientation, marital status, national origin, ancestry, familial status, source of income, disability, age, medical condition, genetic information, citizenship, primary language, immigration status (except where explicitly prohibited by federal law), arbitrary characteristics, and all other classes of individuals protected from discrimination under federal or state fair housing laws, individuals perceived to be a member of any of the preceding classes, or any individual or person associated with any of the preceding classes be excluded from participation in, be denied the benefits of, or be subjected to discrimination under, any program or activity funded in whole or in part with program funds made available pursuant to this NOFA.

All recipients shall comply with the requirements contained in the Americans with Disabilities Act, the Fair Housing Amendments Act, the California Fair Employment and Housing Act, the Unruh Act, Government Code Section 11135, Section 504 of the Rehabilitation Act, and regulations promulgated pursuant to those statutes, including 24 C.F.R. Part 100, 24 C.F.R. Part 8, and 28 C.F.R. Part 35, in all of the Sponsor's activities.

Section 312 State Prevailing Wage

Applicant's contemplated use of Homekey funds may be subject to California's prevailing wage law (Lab. Code, § 1720 et seq.). Applicants are urged to seek professional legal advice about the law's requirements. Prior to disbursing the Homekey funds, the Department will require a certification of compliance with California's prevailing wage law. The certification must verify that prevailing wages have been or will be paid (if such payment is required by law), and that labor records will be maintained and made available to any enforcement agency upon request. The certification must be signed by the general contractor(s) and the Sponsor.

Article IV Program Operations

Section 401. Program Oversight

As requested by the Department, Grantees will be required to provide progress reports of the development plan and any updates to the timeline of the completion of the project. The development plan should include the project's completion milestones and any updates or substantial changes.

Section 402. Reporting

Grantees shall submit the following data:

i. The amount of funds expended for the project.

ii. The location of any properties for which the funds are used.

iii. The number of useable housing units produced, or planned to be produced, using the funds.

iv. The number of individuals housed, or likely to be housed, using the funds.

v. The number of units, and the location of those units, for which operating subsidies have been, or are planned to be, capitalized using the funds.

vi. Any lessons learned from the use of the funds.

vii. The proposed development vision that identifies the financial and regulatory mechanisms to be used to maintain the long-term affordability of the project.

viii. The progress and status in securing any required entitlements, permits, environmental clearances.

ix. The proposed timeline for the completion of the project.

If a project received an award for a 24-month operating subsidy, Grantees shall submit the use of the expenditures bi-annually 30 days after the reporting periods of January 1 to June 30 and July 1 to December 31. The first report will be due to the Department on January 31, 2021, and the final bi-annual report is due on July 31, 2022.

The Grantee that receives funds under the Homekey Program is responsible for ensuring that the expenditure of those funds is consistent with the requirements of the Program and for eligible activities described in Section 302. The Department shall monitor the expenditures to ensure that those expenditures comply with this NOFA.

The Department may request the repayment of funds or pursue any other remedies available to it by law for failure to comply with program requirements. After the contract has expired, any funds not expended for eligible uses shall revert and must be remitted to the Department. The deadline for expenditures under the contract is June 31, 2022.

The requested data shall be submitted in electronic format on a form provided by the Department.

Section 403. Disbursement of Grant Funds

The Department will disburse funds to cover Homekey-critical expenditures that were incurred during the period of March 1, 2020 through December 30, 2020. Homekey program funds shall be disbursed to the Sponsor after the Department has received a request for funds from the Sponsor and a Standard Agreement between the Sponsor and the Department is fully executed. The Standard Agreement will set forth the general conditions of disbursement, any conditions precedent to disbursements (e.g., documentation requirements for pre-Standard Agreement expenditures), and the Department's remedies upon an event of default. The Standard Agreement will also identify the payee. Where Co-Sponsors wish to receive the grant award outside of escrow, they must identify, and memorialize in the Standard Agreement, which Sponsor will serve as the designated payee for all award amounts.

Section 404. Legal documents

Upon the award of Homekey funds to a Project, the Department shall enter into one or more agreements with the Sponsor(s), including a Standard Agreement, which shall commit funds from the Homekey program, subject to specified conditions. The agreement or agreements shall include, but not be limited to, the following provisions:

i. A description of the approved project and the permitted uses of funds;

ii. The amount and terms of the program grant;

iii. The use, occupancy, and rent restrictions, if any, to be imposed on the project through a use restriction (e.g., covenant, regulatory agreement) recorded against the property of the project;

iv. Performance milestones, and other progress metrics, governing the completion of the project, along with the remedies available to the Department in the event of a failure to meet such milestones or metrics;

v. Provisions governing the manner, timing, and conditions of the disbursement of the program grant;

vi. Special conditions imposed as part of the Department's approval of the project;

vii. Terms and conditions required by federal and state law;

viii. Requirements for reporting to the Department;

ix. Remedies available to the Department in the event of a violation, breach, or default of the agreement; and

x. Provisions regarding Sponsor liability. Specifically, the Sponsor will remain liable to the Department for the performance of all program requirements regardless of any Department-approved transfer or assignment of interest. Likewise, each co-Sponsor will remain jointly and severally liable to the Department for the performance of all program requirements regardless of any Department-approved transfer or assignment of interest, and notwithstanding the co-Sponsors' identification of a designated payee.

The agreement will also include such other provisions as are necessary to ensure adherence to the objectives and requirements of the program.

Section 405. Sales, Transfers, and Encumbrances

An Applicant(s) shall not sell, assign, transfer, or convey the awarded project, or any interest therein or portion thereof, without the express prior written approval of the Department.

Section 406. Defaults and Grant Cancellations

Funding commitments may be canceled by the Department under any of the following conditions:

i. The objectives and requirements of the Homekey program cannot be met and the implementation of the project cannot proceed in a timely fashion in accordance with the timeframes established in the regulatory agreement/contract.

ii. In the event of a breach or violation by the Grantee, the Department may give written notice to the Development Sponsor to cure the breach or violation. If the breach or violation is not cured to the satisfaction of the Department within a reasonable time period, the Department, at its option, may declare a default under

the relevant document and may seek legal remedies for the default including the following:

a. The Department may seek, in a court of competent jurisdiction, an order for specific performance of the defaulted obligation or the appointment of a receiver to complete the project in accordance with Homekey program requirements; and

b. The Department may seek such other remedies as may be available under the relevant agreement or any law.

Article V. Definitions

Below are the definitions for purposes of the Homekey program:

i. "Applicant" or “Eligible Applicant” means a city, county, or other “local public entity,” as that term is defined at the Health and Safety Code section 50079, applying to be a Development Sponsor either on its own or with another entity (such as a for-profit or nonprofit corporation, or another local public entity).

ii. "Area Median Income" or "AMI" means the most recent applicable county median family income published by the California Tax Credit Allocation Committee (TCAC) or the Department.

iii. "Assisted Unit" means a residential housing unit that is subject to rent, occupancy or other restrictions associated with a Homekey site.

iv. "At Risk of Homelessness" has the same meaning as defined in Section 578.3 of Title 24 of the Code of Federal Regulations.

v. "City" means a city or city and county that is legally incorporated to provide local government services to its population. A city can be organized either under the general laws of this state or under a charter adopted by the local voters.

vi. "Chronic Homelessness" means a person who is chronically homeless, as defined in 578.3 of Title 24 of the Code of Federal Regulations.

vii. "Continuum of Care" means the same as defined by the United States Department of Housing and Urban Development at Section 578.3 of Title 24 of the Code of Federal Regulations.

viii. "Department" means the Department of Housing and Community Development.

ix. "Development Sponsor" or "Sponsor", as defined in Section 50675.2 of the Health and Safety Code and subdivision (c) of Section 50669 of the Health and Safety Code, means any individual, joint venture, partnership, limited partnership, trust, corporation, cooperative, local public entity, duly constituted governing body of an Indian reservation or rancheria, or other legal entity, or any combination thereof, certified by the Department as qualified to own, manage, and rehabilitate a rental housing development. A Development Sponsor may be organized for profit, limited profit or be nonprofit, and includes a limited partnership in which the Development Sponsor or an affiliate of the Development Sponsor is a general partner.

x. "Environment Assessment – Phase 1" is a report that demonstrates whether the property is free from severe adverse environmental conditions.

xi. "Grantee" means an Eligible Applicant that has been awarded funds under the program.

xii. "Homeless" has the same meaning as defined in Section 578.3 of Title 24 of the Code of Federal Regulations.

xiii. "Housing First" has the same meaning as in Welfare and Institutions Code Section 8255, including all of the core components listed therein.

xiv. "HUD" means the U.S. Department of Housing and Urban Development.

xv. "Interim Housing" Transitional Housing" or "Congregate Shelter" means any facility whose primary purpose is to provide a temporary shelter for the Homeless in general or for specific populations of the Homeless, and which does not require occupants to sign leases or occupancy agreements.

xvi. “Local Public Entity” means any county, city, city and county, the duly constituted governing body of an Indian reservation or rancheria, tribally designated housing entity as defined in Section 4103 of Title 25 of the United States Code and Section 50104.6.5, redevelopment agency organized pursuant to Part 1 (commencing with Section 33000) of Division 24, or housing authority organized pursuant to Part 2 (commencing with Section 34200) of Division 24, and also includes any state agency, public district, or other political subdivision of the state, and any instrumentality thereof, that is authorized to engage in or assist in the development or operation of housing for persons and families of low or moderate income. “Local public entity” also includes two or more local public entities acting jointly.

xvii. "NOFA" means a Notice of Funding Availability.

xviii. "Permanent Supportive Housing" has the same meaning as "supportive housing," as defined in Section 50675.14 of the Health and Safety Code, except that "Permanent Supportive Housing" shall include associated facilities if used to provide services to housing residents.

xix. "Permanent Housing" means a housing unit where the landlord does not limit length of stay in the housing unit, the landlord does not restrict the movements of the tenant, and the tenant has a lease and is subject to the rights and responsibilities of tenancy.

xx. "Project" means a multifamily structure or set of structures providing housing with common financing, ownership, and management.

xxi. "Program Award" means the portion of program funds available for a Grantee to expend toward eligible program uses.

xxii. "Point-in-Time Count" means a count of sheltered and unsheltered Homeless persons on a single night conducted by Continuums of Care as prescribed by HUD.

xxiii. “Rural Area” means an area defined in Health and Safety Code section 50199.21.

xxiv. "Target Population" means members of the target population identified in Health and Safety Code section 50675.1.1(a) are individuals and families who are experiencing homelessness or who are at risk of homelessness defined in Section 578.3 of Title 24 of the Code of Federal Regulation and who are impacted by the COVID-19 pandemic.

xxv. "Unit" means a residential unit that is used as a primary residence by its occupants, including individual units within the Project.

Article VI Insurance Requirements
Section 600. Insurance Requirements

i. Commercial general liability

Local public entities shall maintain general liability on an occurrence form with limits not less than $1,000,000 per occurrence and $2,000,000 aggregate for bodily injury and property damage liability. The policy shall include coverage for liabilities arising out of premises, operations, independent contractors, products, completed operations, personal and advertising injury, and liability assumed under an insured agreement. This insurance shall apply separately to each insured against which claim is made, or suit is brought subject to the local public entity's limit of liability. **The policy must name the State of California and the Department of Housing and Community Development, as well as the respective appointees, officers, agents, and employees of each, as additional insureds, but only with respect to work performed under the contract.**

If available in the open market at a reasonable cost, the policy shall also include an endorsement for physical abuse and child/sexual molestation coverage. Coverage shall include actual or threatened physical abuse, mental injury, sexual molestation, negligent hiring, employment, supervision, investigation, reporting to proper authorities, and retention of any person for whom the local public entity is responsible. This insurance shall apply separately to each insured against which claim is made, or suit is brought subject to the local public entity's limit of liability. Coverage shall include the cost of defense and the cost of defense shall be provided outside the coverage limit.

If available in the open market at a reasonable cost, the policy shall also include an endorsement for assault and battery.

ii. Automobile liability

Local public entity shall maintain motor vehicle liability with limits not less than $1,000,000 combined single limit per accident. Such insurance shall cover liability arising out of a motor vehicle including owned, hired, and non-owned motor vehicles. **The policy must name the State of California and the Department of Housing and Community Development, as well as the respective appointees, officers, agents, and employees of each, as additional insureds, but only with respect to work performed under the contract.**

If local public entity will not have any commercially owned vehicles used during the life of the Standard Agreement, by signing the Standard Agreement, the local public entity certifies that the local public entity and any employees, subcontractors or servants possess valid automobile coverage in accordance with California Vehicle Code sections 16450 to 16457, inclusive. The Department reserves the right to request proof at any time.

iii. Workers' Compensation and Employer's Liability

Local public entity shall maintain statutory worker's compensation and employer's liability coverage for all its employees who will be engaged in the performance of the contract. In addition, employer's liability limits of $1,000,000 are required. By signing the Standard Agreement, local public entity acknowledges compliance with these regulations. **A Waiver of Subrogation or Right to Recover endorsement in favor of the State of California and the Department of Housing and Community Development must be attached to the certificate.**

iv. Builder's risk/installation floater

If there is installation or construction of property/materials on or within the facility at any time during the life of the Standard Agreement, the local public entity shall maintain in force, at its own expense, Builders Risk/Installation Floater covering the local government entity's labor, materials, and equipment to be used for completion of the Work performed under this contract against all risks of direct physical loss, excluding earthquake and flood, for an amount not less than the full amount of the property and/or materials being installed and/or constructed on or within the facility. The Eligible Applicant agrees as a provision of the contract to waive all rights of recovery against the state.

v. Property insurance

The local public entity shall maintain fire, lightning and extended coverage insurance on the facility which shall be in a form of a commercial property policy, in an amount equal to one hundred percent (100%) of the then current replacement cost of the facility, excluding the replacement cost of the unimproved real property constituting the site. The extended coverage endorsement shall, as nearly as practicable, include but not be limited to loss or damage by an explosion, windstorm, riot, aircraft, vehicle damage, smoke, vandalism, and malicious mischief and such other hazards as are normally covered by such endorsement.

vi. Self-insured

If the local public entity is self-insured in whole or in part as to any of the above-described types and levels of coverage, the local government entity shall provide the Department with a written acknowledgment of this fact at the time of the execution of this Permit. If, at any time after the execution of the Standard Agreement, local public entity abandons its self-insured status, the local public entity shall immediately notify the Department of this fact and shall comply with all of the terms and conditions of this Section pertaining to insurance requirements.

RESOLUTION NO. 2020-__

A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF UKIAH AUTHORIZING APPLICATION TO THE HOMEKEY PROGRAM

WHEREAS:

A. The Department of Housing and Community Development (Department) has issued a Notice of Funding Availability ("**NOFA**"), dated July 16, 2020, for the Homekey Program ("**Homekey**" or "**Homekey Program**"). The Department has issued the NOFA for Homekey grant funds pursuant to Health and Safety Code section 50675.1.1 (Assem. Bill No. 83 (2019-2020 Reg. Sess.), § 21.)

B. City of Ukiah ("**Applicant**") desires to apply for Homekey grant funds. Towards that end, Applicant is submitting an application for Homekey funds ("**Application**") to the Department for review and consideration.

C. The Department is authorized to administer Homekey pursuant to the Multifamily Housing Program (Chapter 6.7 (commencing with Section 50675) of Part 2 of Division 31 of the Health and Safety Code). Homekey funding allocations are subject to the terms and conditions of the NOFA, the Application, the Department-approved STD 213, Standard Agreement ("**Standard Agreement**"), and all other legal requirements of the Homekey Program.

THEREFORE, IT IS RESOLVED THAT:

1. Applicant is hereby authorized and directed to submit an Application to the Department in response to the NOFA, dated July 16, 2020, and to apply for Homekey grant funds in a total amount not to exceed $_____. That amount includes $_____ for capital expenditures (as allowed under Health and Saf. Code, § 50675.1.1, subd. (a)(1)-(6)) and $_____ for a capitalized operating subsidy (as allowed under Health and Saf. Code, § 50675.1.1, subd. (a)(7)).

2. If the Application is approved, Applicant is hereby authorized and directed to ensure that any funds awarded for capital expenditures are spent by December 30, 2020, and that any funds awarded for capitalized operating subsidies are spent by June 30, 2022.

3. If the Application is approved, Applicant is hereby authorized and directed to enter into_____, any and all other documents required or deemed necessary or appropriate to secure the Homekey funds from the Department and to participate in the Homekey Program, and all amendments thereto (collectively, the "Homekey Documents").

4. Applicant acknowledges and agrees that it shall be subject to the terms and conditions specified in the Standard Agreement, and that the NOFA and Application will be incorporated in the Standard Agreement by reference and made a part thereof. Any and all activities, expenditures, information, and timelines represented in the Application are enforceable through the Standard Agreement. Funds are to be used for the allowable expenditures and activities identified in the Standard Agreement.

5. Sage Sangiacomo, City Manager, or his or her designee, is authorized to execute the Application and the Homekey Documents on behalf of Applicant for participation in the Homekey Program.

PASSED AND ADOPTED at a regular meeting of the City Council of the City of Ukiah held on August 5, 2020 by the following vote:

Agenda Item No: 13.c.
MEETING DATE/TIME: 8/5/2020
ITEM NO: 2020-491

City of Ukiah

AGENDA SUMMARY REPORT

SUBJECT: Consider Adoption of Resolution for Authorization to Submit an Application to Join the Upper Russian River Water Agency (URRWA).

DEPARTMENT: Water Resources **PREPARED BY:** Sean White, Water Resources Director
PRESENTER: Sean White, Water Resources Director

ATTACHMENTS:
1. URRWA.Resolution

Summary: The Council will receive a report and consider whether to adopt the attached Resolution directing staff to apply to join the Upper Russian River Water Agency.

Background: The Upper Russian River Water Agency ("URRWA") is a Joint Exercise of Powers Authority (Attachment 1), formed in accordance with the Joint Exercise of Powers Act. URRWA was initially formed by four original Constituents: Willow County Water District, Redwood Valley County Water District, Calpella County Water District, and Millview County Water District. The Joint Powers Agreement provides for other public agencies within the Russian River Watershed to apply to join URRWA, provided they are either a purveyor of water or an operator of a sewer treatment or collection system. As a provider of water and wastewater services the City meets the criteria for membership.

Discussion: The URRWA was developed as a first step in unifying water and wastewater policy in the greater valley with a long term goal consolidating the number entities providing water and wastewater service in the region.

To date, the City has not been a member of the URRWA. However, as the membership has evolved, and the City develops it's long-range planning efforts, participation in a regional water and wastewater entity seems appropriate.

Staff recommends that the Council adopt the Resolution (Attachment 2) directing staff to apply to join URRWA.

Recommended Action: Approve resolution for authorization to submit an application to join the Upper Russian River Water Agency (URRWA)

BUDGET AMENDMENT REQUIRED: N/A

CURRENT BUDGET AMOUNT: N/A

PROPOSED BUDGET AMOUNT: N/A

RESOLUTION NO. 2020-

A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF UKIAH AUTHORIZING AN APPLICATION TO JOIN THE UPPER RUSSIAN RIVER WATER AGENCY

WHEREAS:

1. The City of Ukiah was incorporated as a general law city in 1876; and

2. The Upper Russian River Water Agency is a Joint Powers Authority, as defined by California Government Code section 56047.7, formed pursuant to Chapter 5 of Division 7 of Title 1 of the California Government Code (Sections 6500, ff) (the "Joint Exercise of Powers Act") and created through a joint powers agreement dated December 29, 2014 (the Joint Powers Agreement"); and

3. Article 11 of the Joint Powers Agreement provides for the "Addition of Constituents," which provides further that "[a]ny public agency that is a purveyor of water, or an operator of a sewer treatment or collection system, or both, which is located within the Russian River Watershed may apply to become a Constituent. The Board may approve the application, approve it with conditions or reject the application. The application shall be deemed completed when each of the governing bodies of the Constituents signifies ratification of the action of the Board and delivers such resolution to the Secretary of the Agency[]"; and

4. Article 1 defines "Constituents" to "refer[] to Willow [County Water District], Redwood Valley [County Water District], Calpella [County Water District] and Millview [County Water District]"; and

5. In addition to other rights to divert water, the City of Ukiah holds the two most senior municipal rights to divert water in the Ukiah Valley: a pre-1914 appropriative right and a 1954 appropriative right, and exercises its water rights to deliver water to its 16,000 residents and is therefore properly understood to be "a purveyor of water … located within the Russian River Watershed"; and

6. The City of Ukiah provides wastewater collection and treatment for about two-thirds of the City's residents and operates its own wastewater treatment plant and is therefore properly understood to be "an operator of a sewer treatment or collection system … located within the Russian River Watershed"; and

7. The City of Ukiah desires to join the Upper Russian River Water Agency so that it may participate in developing and implementing a bright and sustainable future for its residents and all of Ukiah Valley.

NOW, THEREFORE, the City Council does hereby resolve:

1. The City of Ukiah shall submit an application, pursuant to the Joint Powers Agreement, to become a Constituent of the Upper Russian River Water Agency.

DRAFT

2. The City Manager or his designee is authorized to take any and all actions necessary to submit such an application.

3. The City Council thanks the Boards of Directors of the Upper Russian River Water Agency and of the Constituents for their thoughtful consideration of this Resolution and the impending application and looks forward to a constructive partnership with its neighbors.

PASSED AND ADOPTED at a Regular Meeting of the City Council of the City of Ukiah, conducted in accordance with the Governor's March 12, 2020, Executive Order N-25-20 regarding teleconferencing of Meetings under the Ralph M. Brown Act, and signed in Ukiah, California, this 5th day of August, 2020.

City of Ukiah

AGENDA SUMMARY REPORT

SUBJECT: Discussion and Possible Adoption of Resolution Amending Procedures for Annual Appointment and Rotation of Mayor, Vice Mayor, and City Councilmembers.

DEPARTMENT: City Clerk **PREPARED BY:** Kristine Lawler, City Clerk
PRESENTER: Kristine Lawler, City Clerk

ATTACHMENTS:
1. Dais Seating
2. Mayor Rotation Scenarios
3. Resolution - Redline
4. Resolution A
5. Resolution B

Summary: The City Council will discuss and possibly adopt a resolution amending the guidelines for the annual councilmember rotations.

Background: In 2011, the City Council adopted resolution 2011-44, which established guidelines for how the Mayor and Councilmembers rotate their seating from year to year. The guidelines are based on seniority in a number of given situations, which can sometimes be unclear and requires interpretation by staff for what recommendations to make to Council.

On December 4, 2019, the Council held a discussion followed by the appointment of Mayor Crane and Councilmember Brown to serve on a Mayor Rotation ad hoc, to review the Mayor rotation guidelines and determine if they could be modified to address the discussed concerns.

Discussion: The Mayor Rotation ad hoc met and a revised rotation method – shown below - was proposed.

Proposed Method:

Based on the following seating arrangement *(See Attachment 1 for image of Dais seating)*:
Seat 1 – Farthest to Mayor's right
Seat 2 – Middle seat to Mayor's right
Seat 3 – Directly to Mayor's right
Vice Mayor
Mayor

Each year, all members will rotate as follows:
Seat 1 to Seat 2
Seat 2 to Seat 3
Seat 3 to Vice Mayor
Vice Mayor to Mayor
Outgoing Mayor to Seat 1

Rotation with Incoming Councilmembers:
• Outgoing Mayor will rotate into Seat 1.

• New member will rotate into Seat 2, which will give the new member a chance to be Mayor once during their first term.

o If there are two new members, then they will rotate into Seat 2 & 3.

o If there are three new members:

– This is the only scenario where – using the new method – a new member would rotate directly into the Vice Mayor position *(see Attachment 2, highlighted scenario.)* Alternatively, the three new members could rotate into Seat 1, 2 & 3; this would put the outgoing mayor back into the vice mayor position, and put the incoming member with the least amount of votes into Seat 1, which would most likely not give them a chance to be mayor in their first term.

– The seniority given to three new members would remain the same as the current method. With the member having received the most votes going into the most advanced seat.

• Appointed members to unfulfilled terms will be treated as new members in respect to the rotations.

There are an infinite number of combinations and possibilities for how various rotations would look over time; however, Attachment 2 provides some scenarios to show how the proposed method could look over the next couple of years.

Staff Recommendations:

Staff recommends that the City Council have a discussion regarding the following points:

• To keep the old method of rotation, go with the new method, or return back to the ad hoc with direction.

• If going with the new method, discuss the following options regarding the scenario of three new members:

Option A – Incoming members would go into Seat 2, 3, and the Vice Mayor position – meaning the member with the most votes would be placed directly into the Vice Mayor position; this option giving all three incoming members a chance to be mayor once during their first term.

Option B – Incoming members would go into Seat 1, 2, and 3 - meaning the outgoing mayor would rotate directly back to the vice mayor position, and the new member with the least votes would likely not be mayor in their first term.

• If going with the new method, then adopt one of the following resolutions *(a redline version has been provided for reference as Attachment 3)*:

- Resolution for Option A (Attachment 4)

- Resolution for Option B (Attachment 5)

Recommended Action: 1) Conduct a discussion per staff recommendations; and 2) If Council decides to go with the proposed method of rotation, then adopt Resolution A or B, depending on which option Council chooses; or 3) If Council decides not to go with the proposed method, then give direction to the ad hoc and staff.

RESOLUTION NO. ~~2011~~2020-

RESOLUTION OF THE CITY COUNCIL OF THE CITY OF UKIAH AMENDING RULES GOVERNING COUNCIL MEETINGS

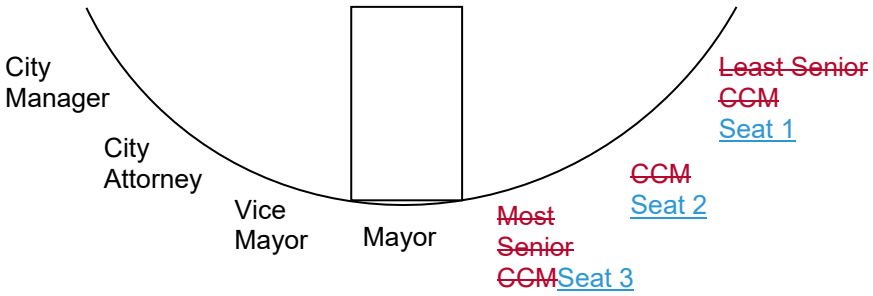
WHEREAS,

1. The City Council has adopted by resolution Procedures of Conduct for City Council Meetings, last revised on ~~July 20, 2005~~November 2, 2011 ("Procedures"); and

2. The City Council has determined to revise the rules governing the Mayoral Rotation and Seating Arrangement for Council.

NOW, THEREFORE, BE IT RESOLVED that the title and Section 7 of the Procedures are amended as follows:

TITLE: City of Ukiah City Council Meeting Procedures



SECTION 7. VOTING PROCEDURE

I. Mayoral Rotation and Seating Arrangement for Council

It is the policy of the City Council that the office of Mayor be rotated ~~insofar as possible~~ among the members of the City Council and that the Mayor shall serve a term of one year or until a successor is appointed. The City Council shall choose one of its members as Mayor, and one of its members as Vice Mayor, at the same regular meeting in the month of December when the election results are presented.

Rotation is based on the following seating arrangement:

Seat 1 – Farthest to Mayor's right
Seat 2 – Middle seat to Mayor's right
Seat 3 – Directly to Mayor's right
Vice Mayor
Mayor

Each year, all members will rotate as follows:

Seat 1 to Seat 2
Seat 2 to Seat 3
Seat 3 to Vice Mayor
Vice Mayor to Mayor
Outgoing Mayor to Seat 1

Incoming Councilmembers:

- Outgoing Mayor will
  [Resolution A] rotate into Seat 1.
  [Resolution B] either rotate into Seat 1, or into Vice Mayor position if there are three incoming members.
- New member will rotate into Seat 2;
- If there are two new members, then they will rotate into Seat 2 & 3.
- If there are three new members:

[Resolution A] then incoming members will go into Seat 2, 3, and the Vice Mayor position, with the member having received the most votes going into Vice Mayor position, and the member with the least votes going into Seat 2.

[Resolution B] then incoming members will go into Seat 1, 2, and 3, with the member having received the most votes going into Seat 3, and the member with the least votes going into Seat 1.

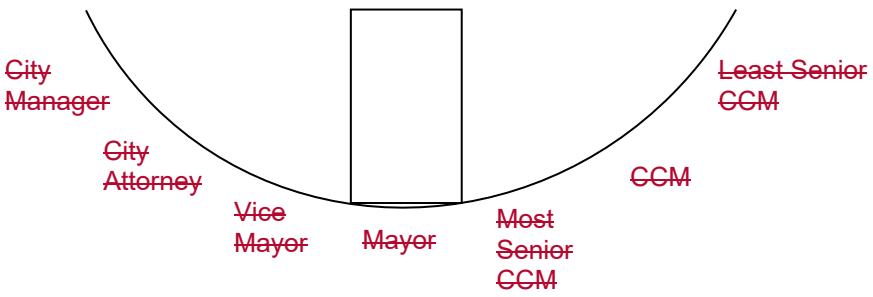
- Appointed members to unfulfilled terms will be treated as new members in respect to the rotations.

~~The rotation is based on seniority. The Vice Mayor shall replace the outgoing Mayor. It is the intent and desire of the City Council to allow every member the opportunity to serve as Mayor, and consideration is given to those members of the Council who have not previously served as Mayor unless all members have so served.~~

~~The City Council shall, at its first regular meeting in the month of December, meet and choose one of its members as Mayor, and one of its members as Vice Mayor~~. ~~The Mayor's seat shall be filled by the most senior member in length of uninterrupted service who has not previously served as Mayor. The Councilmember selected as Mayor, however, shall have served at least one year as a member of the City Council.~~

~~Where all Councilmembers have served a term as Mayor, the person to be selected as Mayor shall be the person who has not served as Mayor for the longest period of time. If the person who has not served as Mayor for the longest period of time declines the position, then the person who has not served as Mayor for the longest period of time other than the declining Councilmember or Councilmembers shall be selected.~~

~~When a selection of Mayor is to be made from a Councilmember who has not yet served as Mayor, the person who is otherwise qualified and has served on the Council the longest without being Mayor shall be selected as Mayor. In the case where two or more persons qualified to be selected as Mayor have served the same amount of time as a~~



~~Councilmember without being Mayor, the person selected shall be the person who received the most votes at their initial election.~~

~~At the time of selection of the Mayor in any given year, the individual who would qualify to be selected as Mayor in the next following year, using the criteria above, shall be named Vice Mayor for the current year.~~

If a Councilmember declines to serve as Vice Mayor, the Council will decide by formal action where the member will fit into the rotation at the December meeting. The Council has the ultimate discretion to elect or not elect any Councilmember for any office at the December meeting.

~~The Mayor and Councilmembers shall be seated as follows, seating assignments given from the perspective facing the audience:~~

~~A. The Mayor and Councilmembers shall sit in the five of seven furthest rightward positions on the dais.~~
~~B. The Mayor's position shall be the fourth from the right or center of the dais.~~
~~C. The Vice Mayor shall be seated immediately to the Mayor's left or left hand side.~~
~~D. Following the installation of new Councilmembers into office, Councilmembers leaving office shall immediately step down from the dais. Incumbent Councilmembers shall then assume any positions vacated to their left. Newly elected or appointed Councilmembers shall be seated at the far right of the dais. If more than one Councilmember is newly elected, they shall be seated in order of votes cast, with the lowest vote getter being seated furthest right and the highest vote getter being seated to the left.~~
~~E. Except as described in subsection F below, following the annual rotation of the Vice Mayor, the exiting Vice Mayor shall move right to the Mayor's position in the center of the dais, the newly selected Vice Mayor shall move to the Mayor's left hand side, and the remaining Councilmembers shall move one seat to their left.~~
~~F. Following the annual rotation of the Vice Mayor during general election years, the newly elected Councilmembers shall remain in the furthest right seats and only incumbent Councilmembers shall rotate positions as described in subsection E above.~~
~~G. To the extent that the foregoing rules do not address Councilmember seating changes or rotations, the City Council shall determine the seating location by formal action of the same at a regular, special, or adjourned meeting.~~

BE IT FURTHER RESOLVED that the amended version of Section 7 as contained in this Resolution shall replace Section 7 in the City Council Meeting Procedures as it read prior to the adoption of this Resolution.

City of Ukiah

AGENDA SUMMARY REPORT

SUBJECT: Receive Updates on City Council Committee and Ad Hoc Assignments, and, if Necessary, Consider Modifications to Assignments and/or the Creation/Elimination of Ad Hoc(s).

DEPARTMENT: City Clerk **PREPARED BY:** Kristine Lawler, City Clerk
PRESENTER: Sage Sangiacomo, City Manager

ATTACHMENTS:

1. 2020 City Council Special Assignments - 07-06-20

Summary: City Council members will provide reports and updates on their committee and ad hoc assignments. If necessary, the Council may consider modifications.

Background: City Council members are assigned to a number of committees and ad hoc activities. These assignments are included as Attachment #1.

Discussion: Previously, the City Council discussed having more time allocated to reporting on committee and ad hoc activities. Often, the Council Reports section of the regular agenda is rushed due to impending business (i.e., public hearings), and not enough time is afforded for reports beyond community activities.

In an effort to foster regular updates on committee and ad hoc assignments, this item is being placed on the agenda to provide the City Council members an expanded opportunity to report on assignments and modify assignments as necessary.

Recommended Action: Receive report(s). The Council will consider modifications to committee and ad hoc assignments along with the creation/elimination ad hoc(s).
