   1. Shop drawings: For roof walkway system, including details on connections to roof.
   2. Calculations:
      a. Complete test reports indicating maximum allowable loading, both uniform and concentrated, and the associated deflections.
      b. Use methods outlined in the AISI Cold-Formed Steel Design Manual.
      c. Use a live load safety factor of 2.

1.05 DELIVERY, STORAGE, AND HANDLING

A. Storage and protection:
   1. Store planks and accessories at the site stacked on platforms or pallets and covered with tarpaulins or other suitable weathertight covering.
   2. Remove damaged, unlabeled, untagged, rusty, and deteriorated material from the job site.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. The following or equal:
   1. Unistrut Corp., Roofwalks.

2.02 DESIGN AND PERFORMANCE CRITERIA

A. Design requirements:
   1. Design roof walkway to support a uniform live load of 180 pounds per square foot and a concentrated load of 426 pounds per plank.
   2. Design of attachment assembly to roof shall not penetrate roof deck.

B. Performance requirements:
   1. Top of planks shall have an anti-skid surface that provides 360-degree positive traction.

2.03 MATERIALS

A. Planks, supporting plates, and clips shall have G90 coating in accordance with ASTM A653.

B. Planks shall be a minimum of 18 gauge roll-formed sheet steel:
   1. Supporting plates shall be a minimum of 14 gauge sheet steel.
   2. Clips shall be a minimum of 16 gauge sheet steel.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install products as indicated on the Drawings and in accordance with shop drawings and manufacturer's printed instructions, applicable except where specified otherwise.

END OF SECTION

SECTION 07900

JOINT SEALANTS

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Acrylic-Latex sealant.
   2. Precast concrete joint sealant.
   3. Silicone sealant.
   4. Synthetic rubber sealing compound.
   5. Synthetic sponge rubber filler.
   6. Related materials.

1.02 REFERENCES

A. American Association of State Highway and Transportation Officials (AASHTO):
   1. M198 - Standard Specification for Joints for Concrete Pipe, Manholes, and Precast Box Sections Using Preformed Flexible Joint Sealants.

B. ASTM International (ASTM):
   1. C920 - Standard Specification for Elastomeric Joint Sealants.
   2. C990 - Standard Specification for Joints for Concrete Pipe, Manholes, and Precast Box Sections Using Preformed Flexible Joint Sealants.
   3. C1330 - Standard Specification for Cylindrical Sealant Backing for Use with Cold Liquid-Applied Sealants.
   4. C1521 - Standard Practice for Evaluating Adhesion of Installed Weatherproofing Sealant Joints.
   5. D412 - Standard Test Methods for Vulcanized Rubber and Thermoplastic Elastomers - Tension.
   6. D624 - Standard Test Method for Tear Strength of Conventional Vulcanized Rubber and Thermoplastic Elastomer.

1.03 SUBMITTALS

A. Product data.

B. Samples, include color selections.

C. Manufacturer's Installation Instructions.

D. Warranty.

1.04 QUALITY ASSURANCE

A. Manufacturer qualifications: Manufacturer of proposed product for minimum 5 years with satisfactory performance record.

B. Installer qualifications: Manufacturer approved installer of products similar to specified products on minimum 5 projects of similar scope as Project with satisfactory performance record.

1.05 PROJECT/SITE CONDITIONS

A. Environmental requirements: Do not apply sealant on wet or frosty surfaces or when surface temperature is higher than 100 degrees Fahrenheit or lower than recommended by the manufacturer.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Deliver, store, and handle products in accordance with manufacturer's recommendations.

B. Code date packages. Do not use material older than manufacturer’s published shelf life. Store materials at temperatures lower than 80 degrees Fahrenheit. Condition materials in accordance with manufacturer’s instructions prior to installation.

1.07 SEQUENCING AND SCHEDULING

A. Caulk joints prior to painting.

1.08 WARRANTY

A. Warrant to correct defective products for minimum 1 year in accordance with manufacturer's standard warranty.

PART 2 PRODUCTS

2.01 SEALANTS

A. General:
   1. Provide colors matching materials being sealed.
   2. Where compound is not exposed to view in finished work, provide manufacturer's color which has best performance.
   3. Nonsagging sealant for vertical and overhead horizontal joints.
   4. Sealants for horizontal joints: Self-leveling pedestrian/traffic grade.
   5. Joint cleaner, primer, bond breaker: As recommended by sealant manufacturer.
   6. Sealant backer rod and/or compressible filler made from closed cell polyethylene, polyethylene jacketed polyurethane foam, or other flexible, nonabsorbent, non-bituminous material recommended by sealant manufacturer to:
      a. Control joint depth.

b. Break bond of sealant at bottom of joint.
c. Provide proper shape of sealant bead.
d. Serve as expansion joint filler.

2.02 ACRYLIC-LATEX SEALANT

A. Permanently flexible, nonstaining, and nonbleeding latex modified acrylic sealant compound, colors as selected by Engineer from manufacturer's standard options:
1. Manufacturers: One of the following or equal:
a. Tremco, Tremflex 834.
b. Pecora Corp., Number AC-20.
c. Sonneborn, Sonolac.

2.03 PRECAST CONCRETE JOINT SEALANT

A. Preformed, cold-applied, ready-to-use, flexible joint sealant in accordance with ASTM C990 and AASHTO M 198:
1. Manufacturers: One of the following or equal.
a. Henry Corp., Ram-Nek.
b. Concrete Sealants Division, ConSeal.

2.04 SILICONE SEALANT

A. ASTM C920, Type S, Grade NS, Class 25, single component silicone sealant:
1. Manufacturers: One of the following or equal:
a. Tremco, Proglaze.
b. Pecora Corp., Number 864.
c. Dow Corning, Number 795.
d. General Electric, Number 1200 Series.

2.05 SYNTHETIC RUBBER SEALING COMPOUND

A. Manufacturer: One of the following or equal:
1. Sika Corporation, Sikaflex 2c NS or SL
2. Sika Corporation, Sikaflex 2c NS EZ Mix.
3. Pacific Polymers, Elastothane 227R.

B. Material: In accordance with ASTM C920 Type M, Grade P (pourable), Class 25 and Type M, Grade NS (non-sag), Class 25; multi-part polyurethane; able to cure at room temperature to firm, highly resilient polymer; able to perform satisfactory when continuously submerged in water or sewage and exposed to direct sunlight in dry condition; with the following properties determined at 75 degrees Fahrenheit and 50 percent relative humidity:
1. Base: Polyurethane rubber.
2. Application time: Minimum 2 hours.
3. Cure time: Maximum 3 days.
4. Tack free time: Maximum 24 hours.
5. Ultimate hardness: Non-sag 25, Pourable/SL 40, within 5 Shore A.
6. Tensile strength: Non-sag 95 pounds per square inch minimum and self-leveling minimum 170 pounds per square inch when tested in accordance with ASTM D412.

7. Ultimate elongation: Minimum 340 percent when tested in accordance with ASTM D412.
8. Tear resistance: Non-sag 45 pounds per inch minimum and self-leveling minimum 85 pounds per inch when tested in accordance with ASTM D624, Die C.
9. Service temperature range: Minus 25 degrees to 158 degrees Fahrenheit.

C. Color: Gray to match concrete, unless indicated on the Drawings.

2.06 SYNTHETIC SPONGE RUBBER FILLER

A. Closed-cell expanded sponge rubber manufactured from synthetic polymer neoprene base, or resilient polyethylene foam backer rod. In accordance with ASTM C1330, Type C:
1. Manufacturers: The following or equal:
a. Presstite, No. 750.3 Ropax Rod Stock.

B. Characteristics:
1. Suitable for application intended.
2. Strength: As necessary for supporting sealing compound during application.
3. Resiliency: Resistance to environmental conditions of installation.
4. Bonding: No bonding to the sealing compound.
5. Structure: Cellular, prevents absorption of water.
6. Compatibility with other materials in joint and acceptance by manufacturer of sealing compound.
7. Size: Minimum 25 percent greater than nominal joint width.

2.07 RELATED MATERIALS

A. Primer: Nonstaining type, recommended by sealant manufacturer to suit application.

B. Joint cleaner: Noncorrosive, nonstaining, compatible with joint forming materials and as recommended by sealant manufacturer.

C. Bond breaker tape: Pressure-sensitive tape recommended by sealant manufacturer to suit application.

PART 3 EXECUTION

3.01 EXAMINATION

A. Verify acceptability of joint dimensions, physical, and environmental conditions.

B. Verify that surfaces are dry, clean, and free of dirt, grease, curing compound, and other residue which might interfere with adhesion of sealants.

3.02 PREPARATION

A. Allow concrete to cure thoroughly before caulking.

B. Synthetic sponge rubber filler:
   1. Prepare surfaces designated to receive filler in accordance with manufacturer's installation instructions.
   2. Do not stretch filler beyond its normal length during installation.

C. Caulking:
   1. Verify that surfaces are dry, clean, and free of dirt, grease, curing compounds, and other residue that might interfere with adhesion of sealant.
   2. Concrete, masonry, wood, and steel surfaces: Clean and prime in accordance with manufacturer's instructions prior to caulking.

D. Synthetic rubber sealing compound:
   1. Ensure surfaces to which synthetic rubber must bond are dry and free of dust, dirt, and other foreign residue.
   2. Heavy sandblasted caulking groove to sound surface, and prime with manufacturer's recommended primer for particular surface.

E. For sidewalks, pavements, and similar joints sealed with elastomeric sealants and subject to traffic and other abrasion and indentation exposures, fill joints to depth equal to 75 percent of joint width, but neither more than 5/8 inches deep nor less than 3/8 inches deep.

F. For normal moving building joints sealed with elastomeric sealants not subject to traffic, fill joints to depth equal to 50 percent of joint width, but neither more than 1/2 inch deep nor less than 1/4 inch deep.

G. For joints sealed with acrylic-latex sealants, fill joints to depth in range of 75 percent to 125 percent of joint width.

H. Use joint filler to achieve required joint depths, to allow sealants to perform properly.

I. Prepare surfaces and install synthetic sponge rubber filler in accordance with manufacturer's recommendations.

J. Do not stretch filler beyond normal length during installation.

K. Apply bond breaker when recommended by joint sealer manufacturer.

3.03 INSTALLATION

A. Synthetic sponge rubber filler: Install filler in accordance with manufacturer's installation instructions.

B. Caulking, joints, and sealing:
   1. Construct expansion, contraction, and construction joints as indicated on the Drawings.
   2. Install pipe and conduit in structures as indicated on the Drawings.

3. Caulk doors, windows, louvers, and other items installed in or over concrete openings inside and out.
4. Use synthetic rubber sealing compound for caulking where indicated on the Drawings or as specified, except for masonry construction and where specified otherwise.
5. Complete caulking prior to painting.
6. Verify that concrete is thoroughly cured prior to caulking.
7. When filler compressible material is used, use untreated type.
8. Apply caulking with pneumatic caulking gun.
9. Use nozzles of proper shape and size for application intended.
10. Maintain continuous bond between caulking and sides of joint to eliminate gaps, bubbles, or voids and fill joint in continuous operation without layering of compound.
11. Employ experienced applicators to caulk joints and seams in neat workmanlike manner.
12. To hasten curing of compound when used on wide joints subject to movement, apply heat with infrared lamps or other convenient means.
13. Apply synthetic rubber sealing compound with pneumatic caulking tool or other acceptable method.

3.04 CLEANING

A. Clean surfaces adjacent to sealant as work progresses.

B. Remove excess uncured sealant by soaking and scrubbing with sealant cleaning solvent.

C. Remove excess cured sealant by sanding with Number 80 grit sandpaper.

D. Leave finished work in neat, clean condition.

3.05 SCHEDULE

A. Acrylic latex:
   1. Use where indicated on the Drawings.
   2. Interior joints with movement less than 7.5 percent and not subject to wet conditions.

B. Silicone:
   1. Use where indicated on the Drawings.
   2. Joints and recesses formed where window, door, louver and vent frames, and sill adjoin masonry, concrete, stucco, or metal surfaces.
   3. Door threshold bedding.
   4. Moist or wet locations, including joints around plumbing fixtures.
   5. Stainless steel doors and frames, including joints between applied stops and frames, and around anchor bolts.
   6. Plenum joints.

C. Synthetic rubber sealing compound, non-sag Type II:
   1. Use where indicated on the Drawings.
   2. Water-bearing and earth-bearing concrete structures.

3. Joints in masonry, concrete vertical surfaces, and metal-faced panels in vertical surfaces.
4. Joints between sheet metal flashing and trim.
5. Joints between sheet metal flashing and trim, and vertical wall surfaces.
6. Small voids between materials requiring filling for weathertight performance in vertical surfaces.
7. Perimeters of frames of doors, windows, louvers, and other openings where bonding is critical to airtight performance.
8. Expansion and control joints in masonry vertical surfaces.

D. Synthetic rubber sealing compound, self-leveling Type I:
1. Use where indicated on the Drawings.
2. Expansion and control joints in masonry, concrete horizontal surfaces, and metal panels in horizontal surfaces.
3. Small voids between materials requiring filling for weathertight performance in horizontal surfaces.
4. Pavement joints.
5. Perimeters of frames of doors, windows, louvers, and other openings in horizontal surfaces where bonding is critical to airtight performance.

3.06 FIELD QUALITY CONTROL

A. Adhesion testing:
1. Perform adhesion tests in accordance with ASTM C1521 per the following criteria:
a. Water bearing structures: 1 test per every 1,000 LF of joint sealed.
b. Exterior precast concrete wall panels: 1 test per every 2,000 LF of joint sealed.
c. Chemical containment areas: 1 test per every 1,000 LF of joint sealed.
d. Building expansion joints: 1 test per every 500 LF of joint sealed.
e. All other type of joints except butt glazing joints: 1 test per every 3,000 LF of joint sealed.
f. Manufacturer's authorized factory representative provide written recommendations for remedial measures on failing tests.

END OF SECTION

SECTION 08110

HOLLOW METAL DOORS AND FRAMES

PART 1 GENERAL

1.01 SUMMARY

A. Section includes: Steel Fire Resistive Rated and Non-Fire Resistive Rated:
   1. Doors.
   2. Door frames.
   3. Combination door frames and window frames with mullions, muntins, and transom bars.

1.02 REFERENCES

A. American National Standards Institute (ANSI):
   1. A250.6 - Hardware on Steel Doors (Reinforcement Application).
   2. A250.8 - Recommended Specification for Standard Steel Doors and Frames.

B. ASTM International (ASTM):
   1. A653 - Standard Specification for Sheet Steel, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.
   2. A924 - Standard Specification for General Requirements for Steel Sheet, Metallic-Coated by the Hot-Dip Process.
   3. A1008 - Standard Specification for Steel, Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low-Alloy, High-Strength Low-Alloy With Improved Formability, Solution Hardened, and Bake Hardenable.
   4. A1011 - Standard Specification for Steel, Sheet and Strip, Hot-Rolled, Carbon, Structural, High-Strength Low-Alloy, High-Strength Low-Alloy With Improved Formability, and Ultra-High Strength.
   5. E413 - Classification for Rating Sound Insulation.

C. National Association of Architectural Metal Manufacturers (NAAMM)/Hollow Metal Manufacturers Association (HMMA):
   1. HMMA 861 - Guide Specifications for Commercial Hollow Metal Doors and Frames.

D. National Fire Protection Association (NFPA):
   1. 80 - Standard for Fire Doors and Other Opening Protectives.
   2. 252 - Standard Methods of Fire Tests of Door Assemblies.

E. Steel Door Institute (SDI):
   1. SDI-111 - Recommended Details for Standard Steel Doors, Frame, Accessories and Related Components.

   1. UL 10C - Positive Pressure Fire Tests of Door Assemblies.
   2. UL 102 - Sustainability Assessment for Swinging Door Leafs.

1.03 SUBMITTALS

A. Product data.

B. Shop drawings: Show the following with references to the Engineer's door marks and hardware groups:
   1. Location of door and frame types.
   2. Details of fabrication, including core construction, glass lights, louvers, weatherstripping, and factory finish for each door.
   3. Cutouts and reinforcements for hardware.
   4. Methods of installation and anchorage to adjacent construction.

C. Certificates documenting:
   1. Fire-rated units have been successfully tested as specified in this Section.

D. Manufacturer's instructions: Submit manufacturer's installation instructions.

E. Pre-Submittal Conference:
   1. Conduct conference in compliance with requirements in Section 01312 - Project Meetings with attendance by representatives of Supplier, Installer.
   2. Contractor to review proper methods and procedures for installing hollow metal doors and frames.

1.04 QUALITY ASSURANCE

A. Testing agency qualifications: Approved by ultimate enforcing authority for the Project; regularly engaged in inspection of materials and workmanship at factory.

1.05 DELIVERY, STORAGE, AND HANDLING

A. Before delivery, identify type and size of each door and frame in such a way that markings will not damage finish.

B. Preassemble doorframes in shop and deliver to Project site with spreader bar at sill or tie them in pairs to form box.

C. Protect doors and frames with resilient packaging sealed with heat shrunk plastic. Break seal on-site to permit ventilation.

D. Protect doors and frames during shipment and storage to prevent warping, bending, and corrosion.

1.06 SEQUENCING AND SCHEDULING

A. Ensure timely delivery of reviewed hardware schedule and hardware templates such that no delay occurs in the work of the Contract.

PART 2 PRODUCTS

2.01 MATERIALS

A. Sheet steel: ASTM A1008, commercial quality, level, cold rolled steel, or ASTM A1011, hot rolled, pickled and oil rolled steel. Galvanize by hot-dip process with zinc-coating in accordance with ASTM A924 or with ASTM A653 and the coating designation A60 or G60.

B. Clips, bolts, screws, and rivets: sized as recommended by manufacturer.

C. Primer: Rust- inhibitive epoxy primer compatible with high-solids epoxy finish coating system as specified in Section 09960 - High-Performance Coatings.

D. Touch-up materials: Primer as recommended by manufacturer.

E. Door hardware: As specified in Section 08710 - Door Hardware.

F. Grout: As specified in Section 04220 - Concrete Unit Masonry.

2.02 DOOR AND FRAME TYPES

A. Interior doors: ANSI 250.8, Grade III, Model 3 or NAAMM HMMA 810 Type A and NAAMM HMMA 861, flush steel rib-stiffened, minimum 18-gauge face sheets.

B. Exterior doors: ANSI 250.8, Grade III, Model 3, or NAAMM HMMA 810 Type A and NAAMM HMMA 861, flush steel rib-stiffened, minimum 16-gauge face sheets.

C. Interior frames: ANSI 250.8 or NAAMM HMMA 861, fully welded frames, minimum 16-gauge, sizes and shapes as indicated on the Drawings.

D. Exterior frames: ANSI 250.8 or NAAMM HMMA 861, fully welded frames HMMA 861, except minimum 14-gauge sizes and shapes as indicated on the Drawings.

2.03 FABRICATION OF FRAMES

A. Galvanize all frames installed in exterior openings.

B. Frames: Sheet steel, integral type, welded continuous to full depth of frames with minimum 5/8-inch deep stops, unless otherwise indicated on the Drawings.

C. Hardware reinforcements: Fabricate according to SDI A250.6 with reinforcing plates from same material as door face sheets.

D. Jamb Anchors: As required for adjacent wall construction, minimum 3 per jamb, unless otherwise indicated on the Drawings.

E. Floor anchors: Fixed type, except where adjustable anchors are indicated on the Drawings, 1 per jamb, with minimum 2 holes for anchorage. Where floor fill occurs,

terminate bottom of frames at indicated finished floor level and support by adjustable extension clips resting on and anchored to structural slabs.

F. Anchors at masonry: Adjustable strap and stirrup, minimum 16-gauge corrugated or perforated steel at maximum of 30 inches on center and extending minimum 8 inches into masonry.

G. Anchors at previously placed concrete: Countersink machine screws through the frame into expansion devices spaced at maximum 30 inches on center.

H. Anchors at structural steel framing: Welded or otherwise securely fastened with stainless steel screws.

I. Anchors for fire resistive frames: Conform to requirements of labeling authority having jurisdiction.

J. Masonry angle stiffeners: Factory welded into heads of frames for installation in openings more than 48 inches wide.

K. Mullions, muntins, and transom bars: Minimum 18-gauge, tubular sheet steel matching, and butt-welded to head and jamb members.

L. Removable stops: Fasten at approximately 12 to 16 inches on center.

2.04 FABRICATION OF DOORS

A. Galvanize all doors installed in exterior openings.

B. Reinforce face sheets with steel rib stiffeners, spaced at maximum 6 inches apart, and securely attached to face sheets by spot welds at maximum 5 inches on center.

C. Fill voids between face sheets and stiffeners with fiberglass insulation having a minimum density of 0.8 pounds per cubic foot.

D. Edges: Full weld without visible joints. Bevel striking edge 1/8 inch in 2 inches.

E. Door cores:
   1. Stiffeners: Vertical steel ribs formed from minimum 22-gauge plain sheet steel, spaced at maximum 6 inches apart and securely attached to face sheets by spot welds at maximum 5 inches on center.
   2. Core fillers: Insulation, minimum 0.60 pound density noncombustible type, installed in spaces between stiffeners for full height of door; labeled door core material shall conform to requirements of labeling authority.

F. Tops and bottoms of doors: Close with continuous recess steel channel of minimum 16-gauge, extending full width of door and spot welded to both faces.

G. Tops and bottoms of exterior doors: Flush closing channels welded to make tops and bottoms waterproof with weep holes for escape of moisture.

H. Hardware reinforcements: Fabricate according to SDI A250.6 with reinforcing plates from same material as door face sheets.

I. Astragals:
   1. Install on active leaf of double doors in accordance with UL listing requirements for fire resistive ratings as indicated on the Drawings, and for exterior pairs of doors.
   2. Do not install on doors swinging in pairs with rating of 90 minutes or less in means of egress where both leaves are required to provide building code required exiting widths.
   3. Do not provide astragal cutouts for hardware operations.

J. Astragal clearances for fire resistive rated doors:
   1. Door bottoms at doors designated to receive non-combustible threshold: Not to exceed 3/8 inch between threshold and door bottom.
   2. Door bottoms where there is no threshold: Maximum clearance between door and floor not to exceed 1/2 inch.
   3. Door bottoms at doors designated to receive combustible floor coverings: Not to exceed 1/2 inch between floor covering and door bottom.
   4. Clearance between door and frame and between meeting edges of pairs of doors: Not to exceed 1/8 inch.

K. Astragal clearances for non-fire resistive rated doors: Same as fire resistive rated doors, unless otherwise indicated on the Drawings.

2.05 FABRICATION OF FIRE RATED DOORS AND FRAMES

A. Fabricate to meet requirements of the building code as specified in Section 01410 - Regulatory Requirements, UL 10C, UL 102, and NFPA 252, except hose stream test shall not be required for opposite swing double egress exit doors and for doors of fire endurance rating of less than 45 minutes with or without approved glass lites.

B. Temperature rise requirements of doors at exit enclosures and exit passageways: Maximum transmitted temperature end point of less than 450 degrees Fahrenheit above ambient at end of 30 minutes when tested in accordance with the building code as specified in Section 01410 - Regulatory Requirements.

C. Apply approved testing agency labels on fire rated doors and frames.

D. Fabricate oversized fire rated doors in accordance with requirements for ratings indicated on the Drawings.

2.06 ACCESSORIES

A. Mullions and transom bars: Join to adjacent members by welding or rigid mechanical anchors.

B. Grout guards: Formed from same material as frames, not less than 0.016 inches thick.

C. Silencers:
   1. Drill single leaf doorframe jamb stops for minimum 3 silencers.
   2. Drill double-leaf doorframe head stops for minimum 2 silencers.
   3. Do not drill doorframes for silencers when weatherstripping is to be installed.

2.07 FINISHING

A. Thoroughly clean surfaces of oil, grease, and other impurities; touch-up abraded galvanizing; and chemically etch.

B. Fill irregularities and sand smooth finish surface. Apply 1 coat of manufacturer's standard rust inhibitive baked-on primer.

C. Finish painting: High solids epoxy polyurethane system:
   1. Interior doors in non-corrosive environment: As specified in Section 09910 - Painting.
   2. Exterior doors and interior doors in corrosive environments: As specified in Section 09960 - High-Performance Coatings.

PART 3 EXECUTION

3.01 EXAMINATION

A. Examine reviewed hardware schedules and verify proper coordination of hardware and doors and frames.

B. Examine opening locations and verify the following:
   1. Correctness of dimensions, backing, or support conditions.
   2. Absence of defects that would adversely affect frame or door installation.

3.02 INSTALLATION

A. Install doors and frames in accordance with approved shop drawings and manufacturer's instructions.

B. Frames:
   1. Set accurately in position, plumb, align, and attach securely to structure.
   2. Set in place before construction of adjacent masonry or framed walls.
   3. Anchor frames to previously placed concrete.
   4. Set frames before removing spreader bars.
   5. Fully grout frames in masonry as the Work progresses.
   6. Grout frames at concrete through keyways provided at head and jambs.

C. Doors:
   1. Install at correct openings, ensure smooth swing and proper closure with frame.

D. Fire resistive frames and doors:
   1. Install to conform to NFPA 80 for fire resistive rated class as indicated on the Drawings.

E. Door hardware:
   1. Install in accordance with Section 08710 - Door Hardware.
   2. Drill and tap doors and frames to receive non-template, mortised, and surface-mounted door hardware.

F. Separate or isolate dissimilar metals with neoprene gaskets, sleeves, and washers, or with coatings acceptable to the Engineer.

3.03 TOLERANCES

A. Manufacturing and installation tolerances: As indicated on the Drawings or in conformance to SDI 117 as minimum.

3.04 ADJUSTING AND CLEANING

A. Prime coat touch-up: Immediately after installation, sand smooth and touch-up rust areas, and other areas where primer has been damaged, with prime touch-up paint.

B. Make adjustments as required for correct, proper, and free function and smooth operation without binding of hardware or doors and frames.

C. Protect doors and frames from damage to surface or profile.

END OF SECTION

SECTION 08320

FLOOR ACCESS DOORS

PART 1 GENERAL

1.01 SUMMARY

A. Section includes: Non-fire-rated floor access doors.

1.02 REFERENCES

A. American Association of State Highway and Transportation Officials (AASHTO):
   1. Standard Specifications for Highway Bridges.

B. Occupational Safety and Health Administration (OSHA):
   1. 29 CFR 1910-Occupational Safety and Health Standards.

1.03 SUBMITTALS

A. Product data.

B. Shop drawings that include the following:
   1. Floor access door installation recommendations.
   2. Locations of floor access doors.
   3. Door size and configuration.
   4. Live load capacity.
   5. Materials of construction and finishes provided.

1.04 DELIVERY, STORAGE, AND HANDLING

A. Identify type and size of each floor access door in way not to damage finish prior to delivery.

B. Deliver products only after proper facilities are available.

C. Deliver and store packaged products in original containers with seals unbroken and labels intact until time of use.

D. Handle carefully to prevent damage and store on clean concrete surface or raised platform in safe, dry area.
   1. Do not dump onto ground.

E. Protect floor access doors during shipment and storage to prevent warping, bending, and corrosion.

1.05 WARRANTY

A. Provide manufacturer’s warranty against defects in material and workmanship for a period of 5 years.

1.06 MAINTENANCE

A. Deliver 2 keys for each cylinder lock to Owner.

PART 2 PRODUCTS

2.01 MEDIUM-DUTY FLOOR ACCESS DOORS

A. Manufacturers: One of the following or equal:
   1. The Bilco Co., Model J or JD (double leaf).
   2. Babcock Davis Associates, Inc., Model BFDDP-SAL or BFDDP-DAL (double leaf).

B. Style: Single leaf or double leaf as indicated on the Drawings, steel, capable of withstanding minimum live load of 300 pounds per square foot, channel frame, with drainage couplings.

C. Door leaf: Minimum 1/4-inch, diamond-pattern plate reinforced with stiffeners as required to meet specified live load.

D. Frame: 1/4-inch channel with anchor flange around perimeter.

E. Hardware:
   1. Hinges: Each leaf equipped with a minimum of 2 heavy forged-brass hinges with stainless steel pins.
   2. Lock: Snap lock with removable handle mounted on door leaf.
   3. Grip handle: Provide vinyl grip handle designed to release cover for closing.
   4. Operating mechanism: Spring operators designed for ease of operation and automatic hold-open arm with release handle.
   5. Drainage assembly: Provide 1-1/2-inch drainage coupling located in corner of the channel frame.

2.02 FINISHES

A. Floor access door finishes:
   1. Aluminum: Manufacturer's standard mill finish.
   2. Aluminum in contact with dissimilar metals and concrete: Manufacturer's standard bituminous coating.
   3. Steel: Manufacturer's standard red oxide primer.

B. Hardware finishes:
   1. Provide optional Type 316 stainless steel hardware throughout, including parts of the latch and lifting mechanism assemblies, hold-open arms, and all brackets, hinges, pins, and fasteners.

PART 3 EXECUTION

3.01 EXAMINATION

A. Examine construction to receive floor access door and verify correctness of dimensions and other supporting or adjoining conditions.

3.02 PREPARATION

A. Coordinate details with other work supporting, adjoining, or requiring floor access doors.

B. Verify dimensions and profiles for each opening.

C. Verify that location will serve portion of work to which access is required.
   1. Where proposed functional location conflicts with other work, notify the Engineer before installation.

D. Apply coating to aluminum surfaces that will be in contact with dissimilar metals or concrete when there is none.

3.03 INSTALLATION

A. Install floor access doors in accordance with manufacturer's instructions.

B. Ensure correct types and adequate sizes at proper locations.

C. Securely attach frames to supporting work and ensure doors, frames, and hardware operate smoothly and are free from warp, twist, and distortion.

3.04 ADJUSTING

A. Adjust doors, frames, and hardware to operate smoothly, freely, and properly without binding.

3.05 CLEANING

A. Thoroughly clean surfaces of grease, oil, or other impurities; touch up abraded prime coat where applicable.

END OF SECTION

SECTION 08710

DOOR HARDWARE

PART 1 GENERAL

1.01 SUMMARY

A. Section includes: Door hardware.

1.02 REFERENCES

A. Builders Hardware Manufacturers Association (BHMA):
   1. A156.1 - Butts and Hinges.156.2 - Bored and Preassembled Locks and Latches.
   2. A156.3 - Exit Devices.
   3. A156.4 - Door Controls.
   4. A156.13 - Mortise Locks and Latches.
   5. A156.14 - Sliding and Folding Door Hardware.
   6. A156.16 - Auxiliary Hardware.
   7. A156.18 - Materials and Finishes.
   8. A156.23 - Electromagnetic Locks.
   9. A156.26 - Continuous Hinges.
   10. A156.31 - Electric Strikes and Frame Mounted Actuators.
   11. A156.36 - Auxiliary Locks.

B. International Building Code (ICC):
   1. A117.1 - Accessible and Usable Buildings and Facilities.

C. National Fire Protection Association (NFPA):
   1. 80 - Fire Doors and Windows.
   2. 105 - Installation of Smoke Door Assemblies.
   3. 252 - Standard Methods of Fire Tests of Door Assemblies.

D. Underwriters Laboratories, Inc. (UL):
   1. 10C - Positive Pressure Fire Tests of Door Assemblies.
   2. 1784 - Standard for Air Leakage Tests of Door Assemblies and Other Opening Protectives.

1.03 SUBMITTALS

A. Product data:
   1. Manufacturer's product data sheets including installation details, material descriptions, dimensions of individual components and profiles, operational descriptions and finishes.
   2. Product Test Reports: Indicating compliance with cycle testing requirements, based on evaluation of comprehensive tests performed by manufacturer and witnessed by a qualified independent testing agency.

B. Hardware schedule:
   1. Include references to Engineer's hardware group number, door type designations, locations, other pertinent data, and manufacturer names or suitable abbreviation opposite items scheduled.
   2. Prepared by or under the supervision of supplier, detailing fabrication and assembly of door hardware, as well as procedures and diagrams. Coordinate the final Door Hardware Schedule with doors, frames, and related work to ensure proper size, thickness, hand, function, and finish of door hardware.
      a. Format: Comply with scheduling sequence and vertical format in DHI's "Sequence and Format for the Hardware Schedule."
      b. Organization:
         1) Organize the Door Hardware Schedule into door hardware sets indicating complete designations of every item required for each door or opening.
         2) Organize door hardware sets in same order as in the Door Hardware Sets at the end of this Section.
         3) Submittals that do not follow the same format and order as the Door Hardware Sets will be rejected and subject to resubmission.
      c. Content: Include the following information:
         1) Type, style, function, size, label, hand, and finish of each door hardware item.
         2) Manufacturer of each item.
         3) Fastenings and other pertinent information.
         4) Location of door hardware set, cross-referenced to Drawings, both on floor plans and in door and frame schedule.
         5) Explanation of abbreviations, symbols, and codes contained in schedule.
         6) Mounting locations for door hardware.
         7) Door and frame sizes and materials.
         8) Warranty information for each product.
      d. Submittal Sequence:
         1) Submit the final Door Hardware Schedule at earliest possible date, particularly where approval of the Door Hardware Schedule must precede fabrication of other work that is critical in the Project construction schedule.
         2) Include Product Data, Samples, Shop Drawings of other work affected by door hardware, and other information essential to the coordinated review of the Door Hardware Schedule.

C. Keying schedule:
   1. After a keying meeting with the owner has taken place prepare a separate keying schedule detailing the final instructions.
   2. Submit the keying schedule in electronic format.
   3. Include keying system explanation, door numbers, key set symbols, hardware set numbers and special instructions.
   4. Owner must approve submitted keying schedule prior to the ordering of permanent cylinders/cores.

D. Samples: Include for each different type and manufacturer for review of finish.

E. Construction key distribution list: Submit upon Owner's request.

F. Templates:
   1. Furnish hardware templates to fabricators of doors, frames, and other work to be factory-prepared for hardware.
   2. Check shop drawings of other work to confirm that adequate hardware backing is available.

G. Project record documents: Include corrected hardware schedule.

H. Operating and Maintenance Manuals:
   1. Provide manufacturers operating and maintenance manuals for each item comprising the complete door hardware installation.
   2. As specified in Section 01782 - Operation and Maintenance Manuals.

1.04 REGULATORY REQUIREMENTS

A. Provide hardware for fire-resistive rated openings that complies with UL and listed by UL.

1.05 DELIVERY, STORAGE, AND HANDLING

A. Deliver hardware where directed in unopened packages with items packed separately, complete and ready for installation with necessary fittings, trim, fasteners, and accessories.

B. Provide packages bearing the manufacturers' labels with each item or group of items identified according to the accepted hardware schedule.

1.06 QUALITY ASSURANCE

A. Certified products: Where specified, products must maintain a current listing in the Builders Hardware Manufacturers Association (BHMA) Certified Products Directory (CPD).

B. Installer qualifications: A minimum 3 years documented experience installing both standard and electrified door hardware similar in material, design, and extent to that indicated for this Project and whose work has resulted in construction with a record of successful in-service performance.

C. Door hardware supplier qualifications:
   1. Experienced commercial door hardware distributors with a minimum 5 years documented experience supplying both mechanical and electromechanical hardware installations comparable in material, design, and extent to that indicated for this Project.
   2. Supplier recognized as a factory direct distributor by the manufacturers of the primary materials with a warehousing facility in Project's vicinity.
   3. Supplier to have on staff a certified Architectural Hardware Consultant (AHC) available during the course of the Work to consult with Contractor, Architect, and Owner concerning both standard and electromechanical door hardware and keying.

D. Source limitations: Obtain each type and variety of door hardware specified in this section from a single source unless otherwise indicated.
   1. Electrified modifications or enhancements made to a source manufacturer's product line by a secondary or third party source will not be accepted.

E. Each unit to bear third party permanent label demonstrating compliance with the referenced standards.

F. Pre-submittal conference:
   1. Conduct coordination conference in compliance with requirements in Section 01312 - Project Meetings with attendance by representatives of Supplier(s), Installer(s), and Contractor(s) to review proper methods and the procedures for receiving, handling, and installing door hardware.
   2. Prior to installation of door hardware, conduct a project specific training meeting to instruct the installing contractors' personnel on the proper installation and adjustment of their respective products.
   3. Product training to be attended by installers of door hardware (including electromechanical hardware) for aluminum, hollow metal and wood doors. Training will include the use of installation manuals, hardware schedules, templates and physical product samples as required.
   4. Inspect and discuss electrical roughing-in, power supply connections, and other preparatory work performed by other trades.
   5. Review sequence of operation narratives for each unique access controlled opening.
   6. Review and finalize construction schedule and verify availability of materials.
   7. Review the required inspecting, testing, commissioning, and demonstration procedures.

1.07 MAINTENANCE

A. Require lockset manufacturers to deliver permanent removable cylinder cores and keys and minimum 2 extractor keys to Owner directly.

1.08 SCHEDULING AND SEQUENCING

A. Upon receipt of accepted hardware schedule, coordinate accepted hardware schedule, templates, reinforcing units, and template instructions to door and frame sections.

B. Restrict distribution of construction keys to superintendents and foremen. Maintain record of persons who have received keys on construction distribution list.

1.09 MAINTENANCE TOOLS AND INSTRUCTIONS

A. Furnish a complete set of specialized tools and maintenance instructions as needed for Owner's continued adjustment, maintenance, and removal and replacement of door hardware.

1.10 WARRANTY

A. Provide warranty as specified in Section 01783 - Warranties and Bonds.
   1. Written warranty, executed by manufacturer(s), agreeing to repair or replace components of standard and electrified door hardware that fails in materials or workmanship within specified warranty period after final acceptance by the Owner. Failures include, but are not limited to, the following:
      a. Structural failures including excessive deflection, cracking, or breakage.
      b. Faulty operation of the hardware.
      c. Deterioration of metals, metal finishes, and other materials beyond normal weathering.
      d. Electrical component defects and failures within the systems operation.

B. Special warranty:
   1. Duration for electromechanical door hardware: 2 years.
   2. Duration for standard duty cylindrical (bored) locks and latches: 5 years.
   3. Duration for exit hardware: 5 years.
   4. Duration for mortise locks and latches: 10 years.
   5. Duration for manual overhead door closer bodies: 10 years.
   6. Duration for heavy duty floor closers: 10 years.

PART 2 PRODUCTS

2.01 GENERAL

A. Door hardware includes, but is not necessarily limited to, the following:
   1. Mechanical door hardware.
   2. Electromechanical door hardware.
   3. Automatic operators.
   4. Cylinders.

2.02 FASTENERS

A. Types:
   1. To concrete, marble, or masonry: Machine screws and flush shells.
   2. To wood: Wood screws.
   3. On gypsum board or plaster: Screws of sufficient length to provide solid connection to framing or backing behind gypsum board or plaster.
   4. To mineral and hollow core doors: Hex bolts.
   5. Of exit devices to doors: Thru-bolts, unless otherwise specified.

B. Screws exposed: Phillips-head type, full-threaded screws, not combination type.

C. Sizes: Suitable for heavy use.

D. Finish: Stainless steel, unless otherwise required to match material and hardware finish.

2.03 HANGING DEVICES

A. Hinges: BHMA A156.1 certified butt hinges with number of hinge knuckles and other options as specified in the Door Hardware Sets.
   1. Quantity: Provide the following hinge quantity:
      a. 2 Hinges: For doors with heights up to 60 inches.
      b. 3 Hinges: For doors with heights 61 to 90 inches.
      c. 4 Hinges: For doors with heights 91 to 120 inches.
      d. For doors with heights more than 120 inches, provide 4 hinges, plus 1 hinge for every 30 inches of door height greater than 120 inches.
      e. Hinge size: Provide the following, unless otherwise indicated, with hinge widths sized for door thickness and clearances required:
         1) Widths up to 3 feet 0 inches: 4-1/2 inches standard or heavy weight as specified.
         2) Sizes from 3 feet 1inch to 4 feet 0 inches: 5 inches standard or heavy weight as specified.
      f. Hinge weight and base material: Unless otherwise indicated, provide the following:
         1) Exterior doors: Heavy weight, non-ferrous, ball bearing or oil impregnated bearing hinges unless Hardware Sets indicate standard weight.
         2) Interior doors: Standard weight, steel, ball bearing or oil impregnated bearing hinges unless Hardware Sets indicate heavy weight.
      g. Hinge options: Comply with the following:
         1) Non-removable pins: Provide set screw in hinge barrel that, when tightened into a groove in hinge pin, prevents removal of pin while door is closed; for the all out-swinging lockable doors.
      h. Manufacturers: One of the following or equal:
         1) Hager Companies (HA).
         2) Ives (IV).
         3) McKinney Products; ASSA ABLOY Architectural Door Accessories (MK).

2.04 MECHANICAL LOCKS AND LATCHING DEVICES

A. Mortise Locksets, Grade 1 (Heavy Duty): BHMA A156.13, Series 1000, Operational Grade 1 Certified Products Directory (CPD) listed. Locksets are to be manufactured with a corrosion resistant steel case and be field-reversible for handing without disassembly of the lock body.
   1. Manufacturers: One of the following or equal:
      a. Corbin Russwin Hardware (RU) – ML2000 Series.
      b. Sargent Manufacturing (SA) – 8200 Series.
      c. Schlage (SC) – L9000 Series.

B. Cylindrical Locksets, Grade 1 (Heavy Duty): BHMA A156.2, Series 4000, Operational Grade 1 Certified Products Directory (CPD) listed.
   1. Furnish with solid cast levers, standard 2-3/4 inch backset, and 1/2 inch (3/4 inch at rated paired openings) throw brass or stainless steel latchbolt.
   2. Locks are to be non-handed and fully field reversible.

3. Manufacturers: One of the following or equal:
    a. Corbin Russwin Hardware (RU) - CL3300 Series.
    b. Sargent Manufacturing (SA) - 10 Line.
    c. Schlage (SC) - ND Series.

2.05 LOCK AND LATCH STRIKES

A. Strikes: Provide manufacturer's standard strike with strike box for each latch or lock bolt, with curved lip extended to protect frame, finished to match door hardware set, unless otherwise indicated, and as follows:
    1. Flat-lip strikes: For locks with 3-piece antifriction latch-bolts, as recommended by manufacturer.
    2. Extra-long-lip strikes: For locks used on frames with applied wood casing trim.
    3. Aluminum-frame strike box: Provide manufacturer's special strike box fabricated for aluminum framing.
    4. Double-lipped strikes:
        a. For locks at double acting doors.
        b. Furnish with retractable stop for rescue hardware applications.

B. Standards: Comply with the following:
    1. Strikes for Mortise Locks and Latches: BHMA A156.13.
    2. Strikes for Bored Locks and Latches: BHMA A156.2.
    3. Strikes for Auxiliary Deadlocks: BHMA A156.36.
    4. Dustproof Strikes: BHMA A156.16.

2.06 CONSTRUCTION KEYING

A. Type: Removable core system.

2.07 PERMANENT CYLINDERS AND KEYING

A. Manufacturers: One of the following or equal:
    1. Corbin Russwin Hardware (RU).
    2. Sargent Manufacturing (SA).
    3. Schlage (SC).

B. Cylinders: Original manufacturer cylinders complying with the following:
    1. Mortise type: Threaded cylinders with rings and cams to suit hardware application.
    2. Rim type: Cylinders with back plate, flat-type vertical or horizontal tailpiece, and raised trim ring.
    3. Bored-lock type: Cylinders with tailpieces to suit locks.
    4. Mortise and rim cylinder collars to be solid and recessed to allow the cylinder face to be flush and be free spinning with matching finishes.
    5. Keyway: Manufacturer’s Standard. Match Facility Standard.

C. Removable cores: Provide removable cores as specified, core insert, removable by use of a special key, and for use with only the core manufacturer's cylinder and door hardware.

D. Keying system: Each type of lock and cylinders to be factory keyed.
   1. Supplier shall conduct a "Keying Conference" to define and document keying system instructions and requirements.
   2. Furnish factory cut, nickel-silver large bow permanently inscribed with a visual key control number as directed by Owner.
   3. New system: Key locks to a new key system as directed by the Owner.

E. Key quantity: Provide the following minimum number of keys:
   1. Change keys per cylinder: 2.
   2. Master keys (per master key level/group): 5.
   3. Construction control keys (where required): 2.
   4. Permanent control keys (where required): 2.

F. Construction keying: Provide temporary keyed construction cores.

G. Key registration list (biting list):
   1. Provide keying transcript list to Owner's representative in the proper format for importing into key control software.
   2. Provide transcript list in writing or electronic file as directed by the Owner.

2.08 PUSH/PULL PLATES

A. Manufacturers: One of the following or equal:
   1. Ives.
   2. Trimco.
   3. Rockwood.

B. Pulls:
   1. Material: As scheduled.
   2. Size: Minimum 8 inches center to center, minimum grip diameter of 3/4 inch, minimum projection of 2-1/4 inch.

C. Pull plates:
   1. Material: As scheduled.
   2. Plate size: Minimum 3 by 12 inches by 0.050-inch thick, with beveled edges on 4 sides with pull.
   3. Pull size: Minimum 8 inches center to center, minimum grip diameter of 3/4 inch, minimum projection of 2-1/4 inch.

D. Push plates:
   1. Material: As scheduled.
   2. Size: Minimum 3 by 12 inches by 0.050-inch thick, with beveled edges on 4 sides.

2.09 CLOSERS

A. Manufacturers:
   1. Features:
      a. Heavy-duty.
      b. Non-handed and non-sized.
      c. Adjustable spring power from size 1 through 4.

2. One of the following or equal:
    a. Sargent, 351 Series.
    b. LCN, Super Smoothee Model 4041 Series.
    c. Norton Door Controls, Multi-Size Door Closers Model 7500BF Series.

B. Type: Full rack and pinion type with steel spring and non-gumming, non-freezing hydraulic fluid.

C. Controls: Separate set for regulating sweep speed, latch speed, backcheck and backcheck positioning, or where schedules, spring power.

D. Sizes: As recommended by accepted manufacturer.

E. Covers: Metal, capable of receiving finishes to match adjacent hardware finishes, unless otherwise specified.

F. Narrow frame provisions: Drop plates.

G. Effort to operate: As follows:
1. Exterior: Maximum 8-1/2 pounds.
2. Interior: Maximum 5 pounds.
3. Fire-resistive rated doors: Maximum 15 pounds.

H. Adjust closers in accordance with manufacturer's directions for size of door.

2.10 EXIT DEVICES

A. Lever design:
1. Manufacturers: The following or equal:
    a. Von Duprin, Lever Model 06.

B. Rim device, non-fire resistive rated:
1. Manufacturers: One of the following or equal:
    a. Von Duprin Inc., Model Series 98.
    b. Sargent Essex Ind., Model Series 8800.

C. Rim device, fire-resistive rated:
1. Manufacturers: One of the following or equal:
    a. Von Duprin Inc., Model Series 98-F.
    b. Sargent Essex Ind., Model Series 12-8800.

D. Mortise lock device, non-fire-resistive rated:
1. Manufacturers: The following or equal:
    a. Von Duprin Inc., Model Series 9875L.

E. Mortise lock device, fire-resistive rated:
1. Manufacturers: The following or equal:
    a. Von Duprin Inc., Model Series 9875L-F.

F. Material: As scheduled.

G. Corrosive environment provisions: Zinc dichromate coated internal parts.

2.11 MISCELLANEOUS DOOR HARDWARE

A. Wall stops: As scheduled.
   1. Manufacturers: One of the following or equal:
      a. Ives.
      b. Trimco.
      c. Rockwood.

B. Floor stops: As scheduled with strike of suitable height to compensate for clearance between door and floor.
   1. Manufacturers: One of the following or equal:
      a. Ives.
      b. Trimco.
      c. Rockwood.

C. Mechanical holders: Foot-operated plunger with instant release by touch of toe and integral spring to keep constant shoe pressure against floor; brass.
   1. Manufacturers: The following or equal:
      a. Glynn-Johnson.

D. Electromagnetic holders: Electromagnetic hold open device; able to be connected to smoke alarm system; UL BHMA listed; consisting of completely flush wall-mounted electro-magnetic holder and door thru-bolted contact plate; depth as required; with minimum holding force of 25 and maximum of 40 pounds; voltage and mounting height as indicated on the Drawings; steel.
   1. Manufacturers: One of the following or equal:
      a. Rixson-Firemark Inc., Electromagnetic Door Release Model 990 Series.
      b. LCN Electromagnetic Door Release Model SEM 7800 Series.
      c. Dorma Door Controls Inc., Electromagnetic Door Holder Model Series EM.

E. Flush bolts and surface bolts:
   1. BHMA A156.3 and A156.16, Grade 1, certified.
      a. Flush bolts to be furnished with top rod of sufficient length to allow bolt retraction device location approximately 6 feet from the floor.
      b. Furnish dust proof strikes for bottom bolts.
      c. Surface bolts to be minimum 8 inches in length, UL listed for labeled fire doors, and UL listed for windstorm components where applicable.
      d. Provide related accessories (mounting brackets, strikes, coordinators, etc.) as required for appropriate installation and operation.
      e. Manufacturers: One of the following or equal:
         1) Ives (IV).
         2) Rockwood Products; ASSA ABLOY Architectural Door Accessories (RO).
         3) Trimco (TC).

F. Kick plates:
   1. As scheduled, 0.050-inch thick, beveled edges, 10 inches high, 1-1/2 inches narrower than single doors, 1 inch narrower than leaf of door pairs.
   2. Manufacturers: One of the following or equal:
      a. Ives.
      b. Trimco.

G. Architectural seals:
   1. General:
      a. Thresholds, weatherstripping, and gasket seals to be of type and design as specified below or in the Hardware Sets.
      b. Provide continuous weatherstrip gasketing on exterior doors and provide smoke, light, or sound gasketing on interior doors where indicated.
      c. At exterior applications provide non-corrosive fasteners and elsewhere where indicated.
   2. Smoke labeled gasketing:
      a. Assemblies in accordance with NFPA 105 that are listed and labeled by a testing and inspecting agency acceptable to authorities having jurisdiction, for smoke control ratings indicated, based on testing in accordance with UL 1784.
      b. Provide smoke labeled perimeter gasketing at all smoke labeled openings.
   3. Fire labeled gasketing:
      a. Assemblies in accordance with NFPA 80 that are listed and labeled by a testing and inspecting agency acceptable to authorities having jurisdiction, for fire ratings indicated, based on testing in accordance with UL 10C.
      b. Provide intumescent seals as indicated to meet UL 10C, and NFPA 252.
   4. Sound-rated gasketing:
      a. Assemblies that are listed and labeled by a testing and inspecting agency, for sound ratings indicated.
   5. Replaceable seal strips:
      a. Provide only those units where resilient or flexible seal strips are easily replaceable and readily available from stocks maintained by manufacturer.
   6. Manufacturers: One of the following or equal:
      a. National Guard Products (NG).
      b. Pemko Products; ASSA ABLOY Architectural Door Accessories (PE).
      c. Zero (ZE).

H. Thresholds:
   1. As scheduled, extruded aluminum, maximum 1/2-inch high, maximum slope of 1 foot in 2 feet.
   2. Manufacturers: One of the following or equal:
      a. National Guard Products Inc.
      b. Pemko Mfg. Co.

I. Dustproof strike:
   1. As scheduled.
   2. Manufacturers: One of the following or equal:
      a. Ives.
      b. Trimco.

J. Coordinator with filler bar:
   1. As scheduled, non-handed, series type length as required for door sizes indicated, complete with filer lengths as required, with mounting brackets and carry bars when required for proper operation; steel with manufacturer's standard prime finish capable of receiving painted finish.
   2. Manufacturers: One of the following or equal:
      a. Glynn-Johnson Coordinators, Model COR Series.
      b. Ives, Door Co-Ordinator, Model 900 Series.

K. Door bottoms:
   1. As scheduled, extruded aluminum with vinyl insert, surface mounted, length equal to door width minus 2 inches, automatic, recessed in bottom of door.
   2. Manufacturers: One of the following or equal:
      a. Pemko.
      b. Reese.

L. Astragals:
   1. As specified in Sections 08110 - Hollow Metal Doors and Frames.

M. Silencers:
   1. As scheduled, pneumatic gray rubber.
   2. Manufacturers: One of the following or equal:
      a. Trimco.
      b. Ives.
      c. Rockwood.

2.12 FINISHES

A. Brass and bronze: BHMA A156.18 626 (US26D), satin chrome.

B. Steel: BHMA A156.18 652 (US26D), satin chrome.

C. Stainless steel: BHMA A156.18 630 (US32D), satin stainless steel.

D. Aluminum: BHMA A156.18 628 (US28).

E. Plastic closer covers: Spray paint to match typical door hardware finish.

F. Metal closer covers: Plate covers to match typical door hardware finish.

G. Electromagnetic hold open devices: Manufacturer's standard brushed zinc finish.

PART 3 EXECUTION

3.01 EXAMINATION

A. Inspect doors and door frames for damage or defects and examine hardware for compatibility with receiving conditions and suitable to intended use.

B. Verify that required wall backing has been installed.

3.02 INSTALLATION

A. Install finish hardware in accordance with manufacturer's templates and instructions.
   1. Install each item of mechanical and electromechanical hardware and access control equipment to comply with manufacturer's written instructions and according to specifications.
   2. Installers are to be trained and certified by the manufacturer on the proper installation and adjustment of fire, life safety, and security products including: Hanging devices; locking devices; closing devices; and seals.

B. Accurately and properly fit hardware.

C. Securely fasten fixed parts for smooth, trouble-free, non-binding operation.

D. Fit faces of mortise parts snug and flush.

E. Ensure that operating parts move freely and smoothly without binding, sticking, or excessive clearance.

F. Mounting heights:
   1. Mount door hardware units at heights indicated in following applicable publications, unless specifically indicated or required to comply with governing regulations:
   2. Standard steel doors and frames: DHI's "Recommended Locations for Architectural Hardware for Standard Steel Doors and Frames."
   3. Wood doors: DHI WDHS.3, "Recommended Locations for Architectural Hardware for Wood Flush Doors."
   4. Where indicated to comply with accessibility requirements, in accordance with ICC A117.1 "Accessibility Guidelines for Buildings and Facilities."
   5. Provide blocking in drywall partitions where wall stops or other wall mounted hardware is located.

G. Retrofitting:
   1. Install door hardware to comply with manufacturer's published templates and written instructions.
   2. Where cutting and fitting are required to install door hardware onto or into surfaces that are later to be painted or finished in another way, coordinate removal, storage, and reinstallation of surface protective trim units with finishing work specified in Section 09910 - Painting.
   3. Do not install surface-mounted items until finishes have been completed on substrates involved.

H. Protection:
   1. Protect door hardware from damage or marring of finish during construction, use strippable coatings, removable tapes, or other acceptable means.
   2. Ensure door hardware displays no evidence of finish paint after final building cleanup.

I. Latch guard and dead bolts: Install so that bolts automatically engage in keeper, whether activated by closer or by manual pressure.

J. Closers:
   1. Mount on opposite sides of corridors or vestibules, except at exterior doors.
   2. Mount for 180-degree swing wherever possible.
   3. Mount with drop plates at narrow top rail doors.
   4. Adjust to operate noiselessly and evenly.
   5. Have closer manufacturer regulate closers prior to final acceptance of project.

K. Kick plates: Screw on push side of doors, unless otherwise indicated on the Drawings.

L. Gasketing: Mount to provide complete contact between door and frame, finished floor, or both; and weathertight enclosure.

M. Thresholds:
   1. Install immediately before inspection for Substantial Completion or protect from heavy traffic damage during construction.
   2. Cope to fit door frame profile and drill to suit required flush bolts and panic bolts.
   3. Unless indicated on the Drawings to be set in grout, set in double bead of sealant, tightly fit at jambs, and make waterproof.
   4. Set thresholds for exterior and acoustical doors in full bed of sealant complying with requirements specified in Section 07900 - Joint Sealants.
   5. Fasten to concrete slab with 5/16-inch stainless steel flat head countersunk machine screws and concrete anchors at 8-inch centers.

N. Silencers:
   1. Insert into predrilled holes in frames.

O. Storage:
   1. Provide a secure lock up for hardware delivered to the project but not yet installed.
   2. Control the handling and installation of hardware items so that the completion of the work will not be delayed by hardware losses before and after installation.

3.03 DOOR HARDWARE SETS

A. They are a guideline only and should not be considered a detailed hardware schedule.

B. Omitted items not included in a hardware set should be scheduled with the appropriate additional hardware required for proper application and functionality.

C. Quantities listed are for each pair of doors, or for each single door.

D. The Supplier is responsible for handing and sizing all products.

E. Where multiple options for a piece of hardware are given in a single line item, the Supplier shall provide the appropriate application for the opening.

F. Provide a list of Manufacturer’s Abbreviations.

3.04 CONSTRUCTION KEYING

A. Insert construction inserts in cylinder cores of exterior doors, and doors requiring security and access for workman, unless otherwise directed by the Engineer.

3.05 ADJUSTING

A. Examine hardware in place for complete and proper installation. Lubricate bearing surfaces for proper function.

B. Replace, rework, or otherwise correct defective door hardware, including incorrect hand or function.

3.06 CLEANING

A. Remove protective materials and devices and thoroughly clean exposed surfaces of hardware.

B. Check for surface damage prior to final cleaning for acceptance of project.

END OF SECTION

SECTION 09910

PAINTING

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Field applied paints and coatings for normal exposures.
   2. Painting Accessories.

1.02 DEFINITIONS

A. Paints: Manufacturer's best ready-mixed coatings, except when field catalyzed, with fully ground pigments having soft paste consistency and capable of being readily and uniformly dispersed to complete homogeneous mixture, having good flowing and brushing properties, and capable of drying or curing free of streaks or sags.

B. Volatile Organic Compound (VOC): Content of air polluting hydrocarbons in uncured coating product measured in units of grams per liter or pounds per gallon.

1.03 SUBMITTALS

A. General: Submit as specified in Section 01330 - Submittal Procedures.

B. Shop drawings: Include schedule of where and for what use coating materials are proposed in accordance with requirements for Product Data.

C. Product data: Include description of physical properties of coatings including solids content and ingredient analysis, VOC content, temperature resistance, typical exposures and limitations, and manufacturer's standard color chips.

D. Samples: Include 8-inch square draw-downs or brush-outs of topcoat finish when requested. Identify each sample as to finish, formula, color name and number and sheen name and gloss units.

E. Manufacturer's instructions: Submit in accordance with requirements for Product Data. Include:
   1. Special requirements for transportation and storage.
   2. Mixing instructions.
   3. Shelf life.
   4. Pot life of material.
   5. Precautions for applications free of defects.
   6. Surface preparation.
   7. Method of application.
   8. Recommended number of coats.
   9. Recommended thickness of each coat.
   10. Recommended total thickness.

11. Drying time of each coat, including prime coat.
12. Required prime coat.
13. Compatible and non-compatible prime coats.
14. Recommended thinners, when recommended.
15. Limits of ambient conditions during and after application.
16. Time allowed between coats.
17. Required protection from sun, wind, and other conditions.
18. Touch-up requirements and limitations.

F. Submit notarized certificate that:
   1. All paints and coatings to be used on this project comply with the State of California Air Resources Board Rule 1113 VOC Regulations effective as of January 1, 2004; and that
   2. All paints and coatings to be used on this project comply with the VOC regulations of the State of California Air Management District in which the coatings will be used, effective January 1, 2004.

1.04 QUALITY ASSURANCE

A. Products: First line or best grade.

B. Materials for each paint system: By single manufacturer.

C. Applicator qualifications: Applicator of products similar to specified products with minimum 3 years of experience.

D. Regulatory requirements: Comply with by using paints that do not exceed governing agency's VOC limits or do not contain lead.

E. Field samples:
   1. Paint 1 complete surface of each color scheme to show colors, finish texture, materials, and workmanship.
   2. Obtain approval before painting other surfaces.

1.05 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Deliver, store, and handle products as specified in Section 01600 - Product Requirements.

B. Remove unspecified and unapproved paints from Project site immediately.

C. Deliver containers with labels identifying:
   1. Manufacturer's name.
   2. Brand name.
   3. Product type.
   4. Batch number.
   5. Date of manufacturer.
   6. Expiration date or shelf life.
   7. Color.
   8. Mixing and reducing instructions.

D. Store coatings in well-ventilated facility that provides protection from the sun weather, and fire hazards.
   1. Maintain ambient storage temperature between 45 and 90 degrees Fahrenheit, unless otherwise recommended by the manufacturer.

E. Take precautions to prevent fire and spontaneous combustion.

1.06 ENVIRONMENTAL CONDITIONS

A. Surface moisture contents: Do not paint surfaces that exceed manufacturer specified moisture contents, or when not specified by the manufacturer, the following moisture contents:
   1. Plaster and gypsum wallboard: 12 percent.
   2. Masonry, concrete, and concrete block: 12 percent.
   3. Interior located wood: 15 percent.
   4. Concrete floors: 7 percent.

B. Do not paint or coat:
   1. Under dusty conditions.
   2. When light on surfaces measures less than 15 foot-candles.
   3. When ambient or surface temperature is less than 50 degrees Fahrenheit or unless manufacturer allow a lower temperature.
   4. When relative humidity is higher than 85 percent, unless manufacturer allows a higher relative humidity.
   5. When surface temperature is less than 5 degrees Fahrenheit above dew point.
   6. When surface temperature exceeds the manufacturer's recommendation.
   7. When ambient temperature exceeds 90 degrees Fahrenheit, unless manufacturer allows a higher temperature.
   8. Apply clear finishes at minimum 65 degrees Fahrenheit.

C. Provide fans, heating devices, or other means recommended by coating manufacturer to prevent formation of condensate or dew on surface of substrate, coating between coats and within curing time following application of last coat.

D. Provide adequate continuous ventilation and sufficient heating facilities to maintain minimum 50 degrees Fahrenheit for 24 hours before, during and 48 hours after application of finishes.

1.07 PROTECTION

A. Protect adjacent surfaces from paint and damage. Repair damage resulting from inadequate or unsuitable protection.

B. Furnish sufficient drop cloths, shields, and protective equipment to prevent spray or droppings from fouling surfaces not being painted and in particular, surfaces within storage and preparation area.

C. Place cotton waste, cloths, and material that may constitute fire hazard in closed metal containers and remove daily from site.

D. Remove electrical plates, surface hardware, fittings and fastenings, prior to painting operations.
   1. Carefully store, clean and replace on completion of painting in each area.
   2. Do not use solvent or degreasers to clean hardware that may remove permanent lacquer finish.

1.08 EXTRA MATERIALS

A. Extra materials: Deliver as specified in Section 01770 - Closeout Procedures. Include minimum 1 gallon of each type and color of coating applied:
   1. When manufacturer packages material in gallon cans, deliver unopened labeled cans as comes from factory.
   2. When manufacturer does not package material in gallon cans, deliver material in new gallon containers, properly sealed and identified with typed labels indicating brand, type, and color.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Paints: One of the following or equal:
   1. Carboline: Carboline.
   2. PPG Paints/PMC.
   3. S/W: Sherwin-Williams Co.
   4. Tnemec: Tnemec Co.

B. Submit requests for substitutions as specified in Section 01600 - Product Requirements:
   1. Include certified ingredient analyses.
   2. Provide colors that match specified colors.

2.02 PRETREATMENT, PRIMERS, PRIMER-SEALERS, AND WOOD STAIN

A. Aluminum primer:
   1. Manufacturers: One of following or equal:
      a. Carboline Co.: Carbocrylic 120.
      b. PPG: Pitt-Tech® Plus 4020 PF Interior/Exterior Primer/Finish, 4020PF.
      c. Sherwin-Williams Co.: DTM Wash Primer.

B. Concrete masonry filler/primer:
   1. Manufacturers: One of following or equal:
      a. Carboline Co.: Sanitile 100.
      b. PPG: Perma-Crete® Interior/Exterior Block and Masonry Surfacer/Filler, 4-100XI.
      c. Sherwin-Williams Co.: HD Block Filler, B42W46.
      d. Tnemec:
         1) Series 130, Envirofill.
         2) Series 180, Tneme-crete.

C. Concrete, porous, filler/primer:
   1. Manufacturers: One of following or equal:
      a. Carboline Co.: Sanitile 100.
      b. PPG: Perma-Crete® Interior/Exterior Block and Masonry Surfacer/Filler, 4-100XI.
      c. Sherwin-Williams Co.: HD Block Filler, B42W46.
      d. Tnemec:
         1) Series 130, Envirofill.
         2) Series 180, Tneme-crete.

D. Concrete, smooth, filler/primer:
   1. Manufacturers: One of following or equal:
      a. Carboline Co.: Sanitile 100.
      b. Carboline Co.: Carbocrylic 120.
      c. PPG:
         1) Perma-Crete® Interior/Exterior Block and Masonry Surfacer/Filler, 4-100XI.
         2) Seal Grip® Hydrosealer Exterior Bonding Primer/Sealer, 17-6001.
      d. Sherwin-Williams Co.:
         1) HD Block Filler, B42W46.
         2) Epoxy Masonry Tilt Primer White B42WW49.
      e. Tnemec: Series 180, Tneme-Crete.

E. Ferrous metal primer:
   1. Manufacturers: One of following or equal:
      a. Carboline Co.: Carboguard 890.
      b. PPG: PITT-GUARD® Rapid-Coat Direct-to-Rust Epoxy Mastic Coating, 95-245 Series.
      c. Sherwin-Williams Co.: Macropoxy 646.
      d. Tnemec: Series 104.

F. Galvanized metal surface pretreatment materials:
   1. Manufacturers: One of following or equal:
      a. Carboline Co.: Surface Cleaner 3.
      b. PPG: Duraprep® Concentrated Degreaser, Prep125.

G. Galvanized metal surface primer:
   1. Manufacturers: One of following or equal:
      a. Carboline Co.: Carboguard 890.
      b. PPG: PITT-GUARD® Rapid-Coat Direct-to-Rust Epoxy Mastic Coating, 95-245 Series Sherwin-Williams Co.: Macropoxy 646.
      c. Tnemec: Series 104.

H. Plaster sealer:
   1. Manufacturers: One of following or equal:
      a. Carboline Co.: Sanitile 120.
      b. PPG: Seal Grip® Gripper® Universal Interior/Exterior Primer/Sealer, 17-921XI.
      c. Sherwin-Williams Co.:
         1) Promar 200 Primer B28W8200.
         2) Loxon Masonry Primer A24W300.

I. Plywood, latex finishes:
   1. Manufacturers: One of following or equal:
      a. Carboline Co.: Sanitile 120.
      b. PPG:
         1) Exterior: Seal Grip® Hydrosealer Exterior Bonding Primer/Sealer, 17-6001.
         2) Interior: PPG Seal Grip Gripper Interior/Exterior 100 percent Acrylic Latex Primer, 17-921XI Series.
      c. Sherwin-Williams Co.: A100 Latex Primer B42W8041.

J. Wood primer for opaque finish paint, interior exposure:
   1. Manufacturers: One of following or equal:
      a. Carboline Co.: Sanitile 120.
      b. PPG: PPG Seal Grip Gripper Interior/Exterior 100 percent Acrylic Latex Primer, 17-921XI Series.
      c. Sherwin-Williams Co.: PrepRite Latex Primer B28W111.

K. Wood primer for opaque finish paint, exterior exposure:
   1. Manufacturers: One of following or equal:
      a. Carboline Co.: Sanitile 120.
      b. Sherwin-Williams Co.: A-100 Primer B42W.
      c. PPG: Seal Grip® Hydrosealer Exterior Bonding Primer/Sealer, 17-6001.

L. Wood stain:
   1. Manufacturers: One of following or equal:
      a. Sherwin-Williams Co.:
         1) Interior: Wood Classic.
         2) Exterior: Woodscapes.
      b. PPG:
         1) Interior: DEFT.
         2) Exterior: PROLUXE.

2.03 PAINTS, INTERIOR EXPOSURE

A. Latex, flat:
   1. Manufacturers: One of following or equal:
      a. Carboline Co.: Carbocrylic 3359 MC flat.
      b. PPG:
         1) Speedhide® Zero Interior Flat, 6-5110 Series.
         2) Ultralast Interior Matte, 13-210 Series.
      c. Sherwin-Williams Co.: Promar 200, B30W200.

B. Latex, semi-gloss:
   1. Manufacturers: One of following or equal:
      a. Carboline Co.: Carbocrylic 3359 MC.
      b. PPG:
         1) Speedhide® Zero Interior Semi-Gloss, 6-5510 Series.
         2) Copper Armor Interior Latex Paint + Primer Semi-Gloss, 29-1510.
      c. Sherwin-Williams Co.: Promar 200, B77W3402D.

C. Acrylic, semi-gloss:
    1. Manufacturers: One of following or equal:
        a. Carboline Co.: Carbocrylic 3359 MC.
        b. PPG:
            1) Speedhide® Zero Interior Semi-Gloss, 6-5510 Series.
            2) Copper Armor Interior Latex Paint + Primer Semi-Gloss, 29-1510.
        c. Sherwin-Williams Co.: Promar 200, B77W3402D.
        d. Tnemec: Series 1029, Enduratone.

2.04 PAINTS, EXTERIOR EXPOSURE

A. Latex, flat:
    1. Manufacturers: One of following or equal:
        a. Carboline Co.: Carbocrylic 3359 MC flat.
        b. PPG:
            1) Speedhide® Exterior Flat, 6-6510XI.
        c. Sherwin-Williams Co.: A-100, Flat Exterior Latex A6-100.
        d. Tnemec: 1028 Enduratone.

B. Acrylic latex, semi-gloss:
    1. Manufacturers: One of following or equal:
        a. Carboline Co.: Carbocrylic 3359 MC flat.
        b. PPG:
            1) Speedhide® Exterior Semi-Gloss, 6-901XI.Sherwin-Williams Co.: A-100, Flat Exterior Latex A6-100.
        c. Tnemec: 1028 Enduratone.

PART 3 EXECUTION

3.01 INSPECTION

A. Thoroughly examine surfaces scheduled to be painted before starting work.

B. Start painting when unsatisfactory conditions have been corrected.

3.02 SURFACE PREPARATION

A. Prepare surfaces in accordance with paint manufacturer's instructions or when none, the following:
    1. Aluminum:
        a. Remove surface contamination by steam, high-pressure water, or degreasers.
        b. Abrade surface by abrasive blasting, power tool cleaning or hand tool cleaning.
        c. Apply etching primer.
    2. Reinforced concrete panels:
        a. Remove dirt, powdery residue, and foreign matter.
        b. Paint immediately; both sides when applicable.
    3. Canvas and cotton insulation coverings: Remove dirt, grease, and oil.

4. Concrete floors:
    a. Remove contamination, abrasive blast or acid etch and rinse with clear water.
    b. Ensure required acid-alkali balance is achieved. Allow to dry thoroughly.
5. Copper for paint finish:
    a. Remove contamination by steam, high-pressure water, or degreasers.
    b. Abrade surface by abrasive blasting, power tool cleaning or hand tool cleaning.
    c. Apply vinyl etch primer.
6. Copper for oxidized finish:
    a. Remove contamination.
    b. Apply oxidizing solution of copper acetate and ammonium chloride in acetic acid.
    c. Rub on repeatedly for correct effect.
    d. Once attained rinse surfaces well with clear water and allow to dry.
7. Gypsum wallboard:
    a. Remove contamination and prime to show defects.
    b. Repair and prime defects.
8. Galvanized surfaces:
    a. Remove surface contamination and oils and wash with degreasers.
    b. Apply coat of etching type primer.
9. Zinc coated surfaces: Remove surface contamination and oils and prepare for priming in accordance with metal manufacturer's recommendations.
10. Concrete and concrete masonry:
    a. Remove dirt, loose mortar, scale, powder, and other foreign matter.
    b. Remove oil and grease with solution of tri-sodium phosphate.
    c. Remove stains caused by weathering of corroding metals with solution of sodium metasilicate.
    d. Rinse well and allow to thoroughly dry.
    e. Spot prime exposed metal with alkyd primer.
11. Plaster:
    a. Fill hairline cracks, small holes and imperfections with patching plaster.
    b. Smooth off to match adjacent surfaces.
    c. Wash and neutralize high alkali surfaces where they occur.
12. Unprimed steel and iron: Remove grease, rust, scale, dirt, and dust by wire brushing, sandblasting or other necessary method.
13. Shop primed steel:
    a. Sand and scrape to remove loose primer and rust.
    b. Feather out edges to make touch-up patches inconspicuous.
    c. Clean surfaces.
    d. Prime bare steel surfaces.
14. Wood and millwork:
    a. Sandpaper to smooth even surface.
    b. Wipe off dust and grit prior to priming.
    c. Spot coat knots, pitch streaks, and sappy sections with sealer.
    d. Fill nail holes and cracks after primer has dried and sand between coats.
15. Exterior wood siding:
    a. Remove dust, grit, and foreign matter.
    b. Seal knots, pitch streak, and sappy sections.
    c. Fill nail holes with exterior caulking compound after prime coat has been applied.

16. Mildew:
    a. Remove by scrubbing with solution of tri-sodium phosphate and chlorine bleach.
    b. Rinse with clean water and allow surface to dry completely.
17. Glue laminated woods:
    a. Remove grease and dirt.
    b. Wash down surfaces with degreasers.

3.03 APPLICATION

A. Apply each coat at proper consistency.

B. Tint each coat of paint slightly darker than preceding coat.

C. Sand lightly between coats to achieve required finish.

D. Do not apply finishes on surfaces that are not sufficiently dry.

E. Allow each coat of finish to dry before following coat is applied, unless directed otherwise by manufacturer.

F. Where clear finishes are required ensure tint fillers match wood.
1. Work fillers well into grain before set.
2. Wipe excess from surface.

G. Backprime exterior woodwork, which is to receive paint finish, with exterior primer paint.

H. Backprime interior woodwork, which is to receive paint or enamel finish, with enamel undercoat paint.

I. Backprime interior and exterior woodwork, which is to receive stain or varnish finish, with gloss varnish reduced 25 percent with mineral spirits.

J. Prime top and bottom edges of wood and metal doors with enamel undercoat when they are to be painted.

K. Prime top and bottom edges of wood doors with gloss varnish when they are to receive stain or clear finish.

3.04 MECHANICAL AND ELECTRICAL EQUIPMENT

A. Identify equipment, ducting, piping, and conduit in accordance with Related Sections.

B. Remove grilles, covers, and access panels for mechanical and electrical system from location and paint separately.

C. Finish paint primed equipment with color selected by the Engineer.

D. Prime and paint insulated and bare pipes, conduits, boxes, insulated and bare ducts, hangers, brackets, collars, and supports, except where items are plated or covered with prefinished coating.

E. Replace identification markings on mechanical or electrical equipment when painted over or spattered.

F. Paint interior surfaces of air ducts, convector, and baseboard heating cabinets that are visible through grilles and louvers with 1 coat of flat black paint, to limit of sight line.

G. Paint dampers exposed immediately behind louvers, grilles, convector, and baseboard cabinets to match face panels.

H. Paint exposed conduit and electrical equipment occurring in finished areas with color and texture to match adjacent surfaces.

I. Paint both sides and edges of plywood backboards for electrical equipment before installing backboards and mounting equipment on them.

J. Color code equipment, piping, conduit, exposed ductwork, and apply color banding and identification, such as flow arrows, naming and numbering, in accordance with the Contract Documents.

3.05 SURFACES NOT REQUIRING FINISHING

A. Stainless steel, brass, bronze, copper, Monel®, chromium, anodized aluminum: Specially finished articles such as porcelain enamel, plastic coated fabrics, and baked enamel.

B. Finished products such as ceramic tile, windows, glass, brick, resilient flooring, acoustical tiles, board and metal tees; other architectural features, such as finish hardware, furnished in aluminum, bronze or plated ferrous metal, prefinished panels, or other items that are installed prefinished.

C. Items completely finished at factory, such as preformed metal roof and wall panels, aluminum frames, toilet compartments, sound control panels, acoustical tiles, shower compartments, folding partition, and flagpole.

3.06 CLEANING

A. As work proceeds and upon completion, promptly remove paint where spilled, splashed, or spattered.

B. During progress of work, keep premises free from unnecessary accumulation of tools, equipment, surplus materials, and debris.

C. Upon completion of work, leave premises neat and clean.

3.07 INTERIOR PAINT SCHEDULE

A. Aluminum: 2 coats of following finish paints over specified primer:
   1. Acrylic, semi-gloss:
      a. Surfaces not scheduled otherwise.

B. Concrete masonry: 2 coats of following finish paints over block filler:
   1. Latex, semi-gloss:
      a. Walls.

C. Concrete, smooth: 2 coats of following finish paints over specified sealer:
   1. Latex, flat:
      a. Surfaces not scheduled otherwise.

D. Metal, non-galvanized ferrous: 2 coats of following finish paints over specified primer:
   1. Acrylic, semi-gloss:
      a. Surfaces not scheduled otherwise.

3.08 EXTERIOR PAINT SCHEDULE

A. Aluminum: 2 coats of following finish paints over specified primer:
   1. Acrylic, semi-gloss:
      a. Surfaces not scheduled otherwise.

B. Concrete masonry: 2 coats of following finish paints over specified block filler:
   1. Latex, flat:
      a. Surface not scheduled otherwise.

C. Concrete, smooth: 2 coats of following finish paints over specified primer:
   1. Latex, flat:
      a. Surface not scheduled otherwise.

D. Metal, ferrous: Following finish coat over specified primer:
   1. Acrylic, semi-gloss:
      a. Surface not scheduled otherwise.

E. Metal, galvanized: 2 coats of following finish paints over pretreatment and specified primer:
   1. Acrylic, semi-gloss:
      a. Surface not scheduled otherwise.

   2. SP0188 - Discontinuity (Holiday) Testing of New Protective Coatings on Conductive Substrates.

D. National Association of Pipe Fabricators (NAPF):
   1. 500-03 - Surface Preparation Standard for Ductile Iron Pipe and Fittings in Exposed Locations Receiving Special External Coatings and/or Special Internal Linings.

E. NSF International (NSF):
   1. 61 - Drinking Water System Components - Health Effects.

F. Occupational Safety and Health Administration (OSHA).

G. Society of Protective Coatings (SSPC):
   1. Glossary - SSPC Protective Coatings Glossary.
   2. Guide 6 - Guide for Containing Surface Preparation Debris Generated during Paint Removal Operations.
   3. Guide 15 - Field Methods for Retrieval and Analysis of Soluble Salts on Steel and Other Nonporous Substrates.
   4. PA 1 - Shop, Field, and Maintenance Painting of Steel.
   5. PA 2 - Procedure for Determining Conformance to Dry Coating Thickness Requirements.
   6. PA 9 - Measurement of Dry Coating Thickness Using Ultrasonic Gages.
   7. QP 1 - Standard Procedure for Evaluating the Qualifications of Industrial/Marine Painting Contractors.
   8. SP 1 - Solvent Cleaning.
   9. SP 3 - Power Tool Cleaning.
   10. SP 5 - White Metal Blast Cleaning.
   11. SP 10 - Near-White Metal Blast Cleaning.
   12. SP 11 – Power Tools Cleaning to Bare Metal.
   13. SP 13 - Surface Preparation of Concrete.
   14. SP 16 - Brush-Off Blast Cleaning of Coated and Uncoated Galvanized Steel, Stainless Steels, and Non-Ferrous Metals.
   15. SP COM - Surface Preparation Commentary.
   16. SP VIS 1 - Guide and Reference Photographs for Steel Surfaces Prepared by Dry Abrasive Blast Cleaning.
   17. SP WJ-1 - Waterjet Cleaning of Metals - Clean to Bare Substrate.
   18. SP WJ-2 - Waterjet Cleaning of Metals - Very Thorough Cleaning.
   19. SP WJ-3 - Waterjet Cleaning of Metals - Thorough Cleaning.
   20. SP WJ-4 - Waterjet Cleaning of Metals - Light Cleaning.

1.03 DEFINITIONS

A. Definitions used in this Section are in accordance with definitions referenced in ASTM D16, ASTM D3960, and SSPC Glossary of Definitions.

B. Specific definitions:
   1. Abrasive: Material used for blast cleaning, such as sand, grit, or shot.
   2. Abrasive Blast Cleaning: Cleaning/surface preparation by abrasive propelled at high speed.
   3. Anchor Pattern: Profile or texture of prepared surface(s).
   4. Biogenic Sulfide Corrosion: Corrosion caused by sulfuric acid formed when *Thiobacillus* bacteria metabolizes hydrogen sulfide.

5. Bug Holes: Small cavities resulting when air bubbles are entrapped in the surface of formed concrete during placement and consolidation.
6. System: Protective film with 1 or more coats applied in a predetermined order, including surface preparation and quality control requirements.
7. Coating/Paint/Lining Thickness: Total thickness of primer, intermediate, and/or finish coats after drying or curing.
8. Dew point: Temperature a given air/water vapor mixture starts to condense.
9. Drying Time: Time interval between application and material curing.
10. Dry to Recoat: Time interval between material application and its ability to receive the next coat.
11. Dry to Touch: Time interval between material application and its ability to tolerate a light ouch without coating damage.
12. Exposed Surface: Any indoor or outdoor surface not buried or encased.
13. Feather Edging: Reducing coating thickness at its edge to blend with existing surrounding coating.
14. Feathering: Tapering off a wet edge with a comparatively dry brush.
15. Ferrous: Cast iron, ductile iron, wrought iron, and all steel alloys except stainless steel.
16. Field Coat: Application of a surface coating system at the work site.
17. Finish Coat: Final coat in a paint system, including texture, color, smoothness of surface, and other properties affecting appearance.
18. Hold Point: A defined point, specified in this Section, at which work shall be halted for inspection.
19. Holiday: A discontinuity, skip, void, or pinhole in coating or coating system film that exposes the substrate.
20. Honeycomb: Segregated and porous surface of hardened concrete due to insufficient consolidation.
21. Hydroblast: High or ultra-high-pressure water jet surface preparation.
22. Incompatibility: One coating's inability to overlay another coating or surface as evidenced by bleeding, poor bonding, or lifting of old coating; inability of a coating to bond to a substrate.
23. Immersed/Immersion: A service condition in which substrate is submerged, is immediately above liquids, or is subject to frequent wetting, splashing, or washdown.
24. Laitance: A thin, weak, brittle layer of cement and aggregate fines on a concrete surface.
25. Mil: 0.001 inch.
26. Overspray: Dry spray, particularly paint bonded to an unintended surface.
27. Pinhole: A small diameter discontinuity in a coating or coating system film, created by offgassing from a void in a concrete or masonry substrate causing a void between coats or exposing the substrate. Usually caused by coating application while temperature is rising.
28. Pot Life: Time interval after components are mixed and coating can be satisfactorily applied.
29. Prime Coat: First full paint coat applied to a surface when using a multicoat system. Primers adhere to a new substrate, protect the substrate, and promote adhesion of subsequent coats of paint. The prime coat on metal surfaces is the first full coat and does not include solvent wash, grease emulsifiers, or other pretreatment applications.

30. Resurfacer/Resurfacing Material: A layer of cementitious and/or resin-based material used to fill or otherwise restore surface continuity to worn or damaged concrete surfaces.
31. Shelf Life: Maximum storage time a material may be stored without losing its usefulness.
32. Shop Coat: 1 or more coats applied in an off-site shop or plant before shipment to work site where field or finishing coat(s) are applied.
33. Spreading Rate: Area covered by a unit volume of paint at a specific thickness.
34. Stripe Coat: A separate brush coat of paint applied to all weld seams, pits, nuts/bolts/washers, and edges. This coat shall not be applied until previous coats have cured. Once applied, the coat shall be allowed to cure before subsequent coats are applied.
35. Tie Coat: An intermediate coat that bonds different types of paint material, improving succeeding coat adhesion.
36. Thick Film Coating System: A coating system applied with a minimum dry film thickness of 25 mils.
37. Touch-Up Painting: Application of paint on previously painted surfaces to repair marks, scratches, and deteriorated or damaged areas to restore the appearance and performance of the coating.
38. Water Blast: An alternative to air abrasive blast cleaning that can be used with or without abrasive injection. Water cleaning at pressures up to 5,000 pounds per square inch is called low-pressure water cleaning or power washing. High-pressure water cleaning uses water pressures between 5,000 and 10,000 pounds per square inch. Water jetting is water blasting with added abrasive at pressures between 10,000 and 25,000 pounds per square inch. Ultra-high-pressure water jetting is water blasting at pressures above 25,000 pounds per square inch.
39. Weld Splatter: Beads of non-structural weld metal that adhere to the surrounding surface, removed as part of surface preparation.

1.04 ABBREVIATIONS

A. CSM - Coating System Manufacturer.

B. CMU - Concrete Masonry Units.

C. CSA - Coating System Applicator. Specialty subcontractor retained by the Contractor to install the coating systems specified in this Section.

D. CTR - Coating System Manufacturer's Technical Representative.

E. DFT - Dry-Film Thickness. Thickness of cured film, usually expressed in mils (0.001 inch).

F. SSD - Surface Saturated Dry. Refers to concrete surface condition where the surface is saturated (damp) without the presence of standing water.

G. TPC - Technical Practice Committee.

H. VOC - Volatile Organic Compound. Portion of the coating that is a compound of carbon, is photochemically reactive, and evaporates during drying or curing; expressed in grams per liter (g/l) or pounds per gallon (lb/gal). VOC is determined by EPA Method 24.

I. WFT - Wet Film Thickness. Coating thickness as measured immediately after application. Usually expressed in mils (0.001 inch).

1.05 SUBMITTALS

A. As specified in Section 01330 - Submittal Procedures, submit the following:
   1. Schedule of proposed coating materials.
   2. Schedule of surfaces to be coated with each coating material.
   3. Dehumidification and heating plan.
   4. Product data:
      a. Physical properties of coatings, including the following:
         1) Solids content.
         2) Ingredient analysis.
         3) VOC content.
         4) Temperature resistance.
         5) Typical exposures and limitations.
         6) Manufacturer's standard color chips.
      b. Compliance with regulatory requirements:
         1) VOC limitations.
         2) Lead compounds and polychlorinated biphenyls.
         3) Abrasives and abrasive blast cleaning techniques and disposal.
         4) Methods for tenting blasting areas and methods to protect existing equipment from dust and debris.
         5) NSF certification of coatings for potable water supply systems.
      c. CSM's current printed recommendations and product data sheets for coating systems, including:
         1) Surface preparation recommendations.
         2) Primer type.
         3) Maximum dry and wet-mil thickness per coat and number of coats.
            a) Coating Coverage Worksheets.
         4) Minimum and maximum curing time between coats, including atmospheric conditions for each.
         5) Curing time before submergence in liquid.
         6) Thinner to be used for each coating.
         7) Ventilation requirements.
         8) Minimum and maximum atmospheric conditions during which the paint shall be applied.
         9) Allowable application methods.
         10) Maximum allowable substrate moisture content.
         11) Maximum shelf life.
         12) Requirements for transportation and storage.
         13) Mixing instructions.
         14) Shelf life.
         15) Material Pot life.
         16) Precautions for applications free of defects.
         17) Method of application.

18) Drying time of each coat, including prime coat.
19) Compatible prime coats.
20) Limits of ambient conditions during and after application.
21) Required protection from sun, wind, and other conditions.
22) Touch-up requirements and limitations.
23) Minimum adhesion of each system submitted in accordance with ASTM D4541 and ASTM D7234.

d. Samples: Include 8-inch square drawdowns or brushouts of topcoat finish when requested. Identify each sample as to finish, formula, color name and number, sheen name, and gloss units.
e. Affidavits signed by an officer of the CSM's corporation attesting to full compliance of each coating system component with current federal, state, and local air pollution control regulations and requirements.
f. List of cleaning and thinner solutions allowed by the CSMs.
g. Storage requirements, including temperature, humidity, and ventilation for Coating System Materials as recommended by the CSMs.
h. Thick film coating systems (greater than 25 mils):
1) CSM's detailed written instructions for coating system treatment and graphic details for coating system terminations in coated structures, including pipe penetrations, metal embedments, gate frames, and other terminations encountered.
2) Include detail treatment for coating system at concrete joints.
3) Manufacturer's Representative's (CTR) Field Reports.

5. Quality assurance submittals:
a. Quality assurance plan.
b. Qualifications of CSA, including:
1) List of Similar Projects.
a) Name and address of project.
b) Year of installation.
c) Year placed in operation.
d) Point of contact: Name and phone number.
2) Provide a minimum of 5 project references, each including contact name, address, and telephone number where similar coating work has been performed by their company in the past 5 years.
c. CSA Reports:
1) Written daily quality control inspection reports.
d. CTR Reports:
1) Reports on visits to project site to view and approve surface preparation of structures to be coated.
2) Reports on visits to project site to observe and approve coating application procedures.
3) Reports on visits to coating plants to observe and approve surface preparation and coating application on shop-coated items.

1.06 QUALITY ASSURANCE

A. CSA qualifications:
   1. Minimum of 5 years of experience applying specified type or types of coatings under conditions similar to those of the Work:
      a. Provide qualifications of applicator and references listing 5 similar projects completed in the past 5 years.
   2. SSPC-QP 1 certified.
   3. Manufacturer-approved applicator when manufacturer has approved applicator program or when required in these specifications.

B. CTR qualifications:
   1. Certification, one of the following:
      a. NACE Level 2 or 3 Certified Coating Inspector.
      b. SSPC Level 3 Protective Coatings Inspector.
   2. Minimum of 5 years of experience evaluating application of manufacturer's coatings under conditions similar to those of the Work:
      a. Provide CTR qualifications and references listing 5 similar projects completed in the past 5 years.

C. Regulatory requirements: Comply with governing agencies' regulations by using coatings conforming to their VOC limits.
   1. Lead-based coatings are not permitted.
   2. Do not use coal-tar epoxy in contact with drinking water or exposed to ultraviolet radiation.

D. Pre-installation conference: Conduct as specified in Section 01312 - Project Meetings.
   1. Coordinate Hold Point schedule.

E. Field samples:
   1. Prepare and coat a minimum 100-square-foot area of each system between corners or limits such as control or construction joints.
   2. Approved field sample may be part of the Work.

F. Obtain approval before coating other surfaces. Use products by same manufacturer for prime coats, intermediate coats, and finish coats on same surface, unless specified otherwise.

G. CSM services:
   1. CSA shall arrange for CTR to attend pre-installation conferences.
   2. Visit the project site periodically to consult on and inspect specified surface preparation and application Hold Points.
   3. Visit coating plants to observe and approve surface preparation procedures and coating application of items to be shop primed and coated.
   4. CTR shall provide written inspection reports.

H. Quality control requirements:
   1. Contractor shall be responsible for the workmanship and quality of the coating system installation.
      a. Inspections by Owner, Engineer, CSA, or CTR will not relieve or limit Contractor’s responsibilities.
   2. Conform to this specification's requirements and the standards referenced in this Section. Changes in the coating system application requirements will be allowed only with the Engineer's written acceptance.
   3. Specially trained crews with experience applying the specified coating system coating are required for:
      a. Coating application using plural component spray equipment or other specialty equipment.
      b. Coating with specialty linings for severe service conditions, including floor coatings, and with linings for corrosive headspaces or secondary containment areas.
   4. CTR shall specially train personnel for coating systems as specified in Attachment B - Coating Detail Sheets.
      a. CSM shall approve personnel in writing applying the coating system.
   5. Do not use contaminated, outdated, diluted materials, and/or materials from previously opened containers.
   6. Identify inspection access points used by Owner's or Engineer's personnel.
   7. Provide ventilation, ingress, egress, or other means as necessary for Owner's or Engineer’s personnel to safely access the work areas.
   8. Conduct and continually inspect work so the coating system is installed as specified. The CSM shall provide written directions to correct coating work not conforming to the specifications or is otherwise unacceptable.
   9. Provide written daily reports summarizing test data, work progress, surfaces covered, ambient conditions, quality control inspection test findings, and other information pertinent to the coating system application.
      a. Determine relative humidity in accordance with ASTM E337. Confirm other conditions, such as proper protective measures for surfaces not to be coated and safety requirements for personnel.
         1) Measure daily at shift's beginning and end and at intervals not to exceed 4 hours during the shift.
         2) Determine the acceptability of weather and/or environmental conditions within the structure in accordance with the CSM's requirements.
      b. Monitoring surface preparation: Spot check cleanliness, surface profile, and surface pH testing at least 3 times daily. Check each surface at least once. In accordance with:
         1) ASTM D4262.
         2) ASTM D4263.
         3) ASTM D4417.
         4) ICRI 310.2 requirements.
         5) SSPC Surface Preparation Standards.
      c. Confirm that compressed air used for surface preparation or blow-down cleaning is free of oil and moisture.
      d. Monitor surface preparation daily at shift's beginning and end and at intervals not to exceed 4 hours during the shift.
      e. Do not apply coatings when environmental conditions are outside of the CSM's published limits.

f. Monitoring coatings application: Continuously inspect, measure, and record the wet film thickness and general film quality (visual inspection) for runs, sags, pinholes, holidays, etc. during coating.
    1) Perform WFT measurements in accordance with ASTM D4414.
g. Post cure evaluation: Measure and inspect the overall dry film thickness on all surfaces. Conduct a DFT survey and perform adhesion testing, holiday detection, or cure testing as required in this Section and/or the CSM's written instructions. Perform all applicable tests in accordance with ASTM D4541, ASTM D4787, ASTM D5162, ASTM D7234, SSPC-PA 1, SSPC-PA 2, SSPC-PA 9, and other pertinent standards and recommended practices.

I. Inspection at Hold Points:
1. Conduct inspections at Hold Points during the coating system application and record the results.
2. Coordinate Hold Points with the Engineer so the Engineer can observe Contractor's inspections on a scheduled basis.
3. Provide the Engineer a minimum of 24 hours of notice before conducting Hold Point Inspections.
4. Hold Points shall be as follows:
    a. Conditions before surface preparation: Before starting surface preparation, observe, record, and confirm that oil, grease, and/or soluble salts are gone from the surface.
    b. Post surface preparation: After completing surface preparation, measure and inspect for cleanliness and proper surface profile as specified in this Section and in the CSM's written instructions.
    c. Coatings application: At the beginning of any coating system application, measure, record, and confirm acceptability of surface and ambient air temperature and humidity. Inspect applicator's equipment for serviceability and suitability for coatings application.
    d. Post application inspection: Identify defects in application work on all surfaces, including pinholes, holidays, excessive runs or sags, inadequate or excessive film thickness, and other problems.
    e. Follow-up corrective actions and final inspection: Measure and re-inspect corrective coating work performed to repair defects at prior Hold Points, and repeat until the surface condition is acceptable. Conduct final visual inspection with follow-up tests, such as holiday detection, adhesion tests, and DFT surveys.
    f. Coatings application: At the beginning of coating system application, measure, record, and confirm acceptability of surface and ambient air temperature and humidity. Inspect applicator's equipment for serviceability and suitability for coatings application.
        1) Observe conditions during the Pre-application Meeting.

1.07 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Deliver, store, and handle products as specified in Section 01600 - Product Requirements.

B. Immediately remove unspecified and unapproved coatings from Project site.

C. Deliver new labeled, unopened containers:
   1. Do not deliver materials after manufacturer's expiration date or over 12 months from manufacturing date, whichever is more stringent. Store materials in well-ventilated enclosed structures and protect from weather and excessive heat or cold in accordance with the CSM's recommendations.
      a. Store flammable materials in accordance with federal, state, and local requirements.
      b. Store rags and cleanup materials appropriately to prevent fire and spontaneous combustion.
   2. Store and dispose of hazardous waste in accordance with federal, state, and local requirements. This requirement specifically applies to waste solvents and coatings.
   3. Container labels shall show the following:
      a. Brand name or product title.
      b. CSM's batch number.
      c. CSM's manufacture date.
      d. CSM's name.
      e. Generic material type.
      f. Application and mixing instructions.
      g. Hazardous material identification label.
      h. Shelf life expiration date.
      i. Color.
      j. Mixing and reducing instructions.
   4. Clearly mark containers to indicate safety hazards associated with the use of or exposure to materials.

1.08 PROJECT CONDITIONS

A. Apply coatings to dry surfaces.
   1. Surface moisture: Comply with manufacturer's requirements or as specified in this Section.
      a. Plaster and gypsum wallboard: 12 percent.
      b. Masonry and concrete block: 12 percent.
      c. Interior located wood: 15 percent.
      d. Concrete floors: Moisture vapor transmission rate of no more than 3.0 pounds per 1,000 square feet per 24 hours in accordance with ASTM F1869 or relative humidity no greater than 80 percent if tested in accordance with ASTM F2170 unless the CSM's recommendations are more restrictive.
      e. Concrete structures: Negative results from Plastic Sheet Test in accordance with ASTM D4263, and maximum of 80 percent relative humidity in accordance with ASTM F2170.

B. Do not apply coatings when the following conditions exist. If such conditions exist, provide containment, covers, environmental controls, and other necessary measures.
   1. During rainy, misty, or damp weather, or to surfaces with frost or condensation.
   2. When the surface temperature is below 10 degrees Fahrenheit above the dew point.

3. When ambient or surface temperature:
    a. Is less than 55 degrees Fahrenheit unless manufacturer allows a lower temperature.
    b. Is less than 65 degrees Fahrenheit for clear finishes, unless manufacturer allows a lower temperature.
    c. Exceeds 90 degrees Fahrenheit, unless manufacturer allows a higher temperature.
    d. Exceeds manufacturer's recommendation.
4. When relative humidity is higher than 85 percent.
5. Under dusty or adverse environmental conditions.
6. When light on surfaces measures less than 15 foot-candles.
7. When wind speed exceeds 15 miles per hour.

C. Apply coating only under evaporation conditions rather than condensation.
    1. Use dehumidification equipment, fans, and/or heaters inside enclosed areas to maintain required atmospheric and surface temperature requirements for proper coating application and cure.
    2. Measure and record relative humidity and air and surface temperatures at the start and end of each shift to confirm proper humidity and temperature levels inside the work area.
        a. Submit test results.

D. Continuously ventilate, dehumidify, and heat enclosed spaces with high humidity during surface preparation, coating application, and curing.
    1. Maintain minimum air temperature of 55 degrees Fahrenheit and 10 degrees Fahrenheit above the dew point.
    2. Maintain dew point of at least 10 degrees Fahrenheit less than the temperature of the coldest part of the structure where work is performed.
    3. Reduce dew point temperature in conditioned space by at least 10 degrees Fahrenheit within 20 minutes.
    4. Seal work areas and maintain positive pressure per dehumidification equipment supplier's recommendations.
    5. Maintain these conditions before, during, and after application to ensure proper adhesion and cure of coatings for no less than:
        a. Entire curing period.
        b. 8 hours after coating.

E. Systems:
    1. Site electrical power availability as specified in Section 01500 - Temporary Facilities and Controls.
    2. Internal combustion engine generators may be used.
        a. Obtain required permits and provide air pollution and noise control devices on equipment as required by permitting agencies require.
        b. Comply with state, federal, and local fire and explosion protection measures when locating and operating generator.
        c. Locate engine generator outside hazardous classified areas per NFPA 820.
        d. Provide daily fuel service for generator for duration of use.

3. Dehumidification:
    a. Provide desiccant or refrigeration drying.
    b. Use only desiccant types with a rotary desiccant wheel capable of continuous operation.
    c. Liquid, granular, or loose lithium chloride drying systems are not acceptable.
4. Heating:
    a. Use electric, indirect combustion, or steam coil.
    b. Direct-fired combustion heaters are not acceptable heat sources during abrasive blasting, coating application, or coating cure.
5. Filters:
    a. Use a filtration system for dust removal designed to not interfere with dehumidification equipment's ability to control dew point and relative humidity inside the reservoir.
    b. Do not allow air from the working area or dust filtration equipment to recirculate through thein dehumidifier during coating application or when solvent vapors are present.
6. Design and submittals:
    a. Prepare and submit dehumidification and heating plan, including all equipment and operating procedures.
    b. Suppliers of services and equipment shall have at least 3 years of experience in similar applications.

F. Provide containment and ventilation system components in accordance with SSPC-Guide 6, Level 3 and as required for hazardous materials.

1.09 MAINTENANCE

A. Provide table of products applied organized by surface type. List coating manufacturer, color, color formulation, distributor name, telephone number, and address.

B. Provide extra materials:
1. Minimum 1 gallon of each type and color of coating applied or provide additional quantities if specified in the Contract Documents:
    a. Deliver unopened factory-labeled cans when manufacturer packages material in gallon cans.
    b. Deliver material in new gallon containers, properly sealed and identified with permanently affixed, durable, printed labels indicating brand, type, and color, when manufacturer does not package material in gallon cans, deliver.

1.10 CTR RESPONSIBILITIES

A. General:
1. Attend pre-installation conference.
2. Perform onsite application training.
3. Periodically inspect coating system application.

B. Coating system installation training:
   1. Provide a minimum of 8 hours of classroom and off-site training for application personnel and supervisory personnel in one of the following ways:
      a. Train a minimum of 2 supervisory personnel and 2 application personnel.
      b. Submit a letter from the CSM stating that CSM approves the supervisory and application personnel, listed by name and responsibility, and no additional training is required.
   2. CTR can train up to 14 application personnel and 3 supervisory personnel at a time.
   3. Minimum training requirements:
      a. Explain in detail the mixing, application, curing, and termination requirements.
      b. Provide hands-on demonstration of coating system mixing.
      c. Explain in detail the ambient condition requirements for temperature and humidity.
      d. Explain in detail the surface preparation requirements.
      e. Explain in detail the re-coat times, cure times, and related ambient condition requirements.
      f. Write a letter stating that training was satisfactorily completed by the personnel, listed by name and responsibility.
   4. Provide special training as specified in the Coating Detail Sheets.

C. Coating system inspection:
   1. CTR inspection is in addition to the CSA's inspection as specified in this Section.
   2. Be on-site to oversee:
      a. Coating application at least once a week.
      b. End of surface preparation.
      c. During coating application.
      d. Post-cure inspection.
   3. Routinely inspect and verify in writing that application personnel have successfully performed surface preparation, filler/surfacer application, coating system application, and Quality Control Inspection in accordance with this Section and to warrantable quality.
   4. Perform the following activities to confirm conformance with the specifications:
      a. Inspect ambient conditions during coating system installation at Hold Points for conformance with the specified requirements.
      b. Inspect each coated surface type and coating system applied to verify the following:
         1) Cleanliness.
         2) Surface pH for concrete substrates.
         3) Confirm surface preparation of substrates where coating system will terminate or will be applied for conformance to the specified application criteria.
      c. Verify surface profile of substrates by completing the following:
         1) Inspect preparation and application of coating detail treatment at terminations, transitions, metal embedments in concrete, and joints and cracks in substrates.
         2) Inspect application of filler/surfacer materials for concrete and masonry substrates.
         3) Verify proper mixing of coating materials.

4) Inspect application of primers and finish coats, including wet and dry film thickness.
5) Inspect coating systems for proper cure times and conditions.

d. Review adhesion testing of cured coating systems.
e. Review coating system continuity testing.
f. Inspect and record representative-localized repairs.
g. Conduct final review of completed coating system installation.
h. Prepare and submit site visit reports after each site visit to document that the coating work is in accordance with the CSM's Recommendations.

D. Final report:
1. Prepare a final report, after coating work ends, summarizing each day's test data, observations, drawings, and photographs. Include substrate conditions, ambient conditions, and application procedures observed during the CTR's site visits. Include a statement that completed work was performed in accordance with the requirements of the CSM's recommendations.

PART 2 PRODUCTS

2.01 DESIGN AND PERFORMANCE CRITERIA

A. Coating materials shall be formulated for environments encountered in water and wastewater treatment processes.

B. Coating materials that come in contact with water distributed as potable water shall be certified in accordance with NSF 61.

2.02 MATERIALS

A. General:
1. Product requirements as specified in Section 01600 - Product Requirements.

2.03 COATING SYSTEMS IDENTIFICATION

A. Naming Conventions: Coating Systems Identifications contain the elements defined in Table 1.

Table 1 Coating System Identification Elements

First Element	-	Second Element	-	Third Element	-	Fourth Element (optional)
3 or 4 alpha characters		1-3 alpha characters		1 number		3 or 4 alpha characters
Coating Type		Substrate		System Number		Additional Substrate or Special Condition
Example: EPX	-	C	-	6	-	BSC

1) First element identifies the coating type using the following abbreviations:
a) ACR: Acrylic.
b) CTE: Coal tar epoxy.
c) ELA: Elastomeric acrylic.
d) EPU: Epoxy-polyurethane.

e) EPX: Epoxy.
f) POL: Polyurethane.
g) SIL: Silicone.
h) SILX: Siloxane or silane.
i) VE: Vinyl ester.

2) Second element identifies the substrate using the following abbreviations:
a) C: Concrete or masonry.
b) F: Concrete flooring.
c) FRP: Fiber-reinforced plastic.
d) GM: Galvanized metal.
e) M: Metal.
f) PVC: Polyvinyl chloride, chlorinated polyvinyl chloride.

3) Third element identifies the sequential system number.
a) For example, EPX-C-2 is the second standard epoxy coating system for concrete substrates.

4) Fourth element is optional and identifies the additional substrate or special condition with the following abbreviations:
a) PWS: Potable water service applications (NSF-61 approved).
b) BSC: Biogenic sulfide corrosion-resistant applications in wastewater.
c) BG: Below grade or buried.
d) OZ: Organic zinc primer, epoxy polyurethane system.
e) SC: Secondary containment.

2.04 PRODUCTS FOR COATING SYSTEMS

A. Products: As specified in Attachment B - Coating Detail Sheets.

B. Cleaning solvents:
1. Requirements for solvent wash, solvent wipe, or cleaner used, including, but not limited to, those used for surface preparation in accordance with SSPC-SP 1:
a. Emulsifying type.
b. Containing no phosphates.
c. Biodegradable.
d. Does not damage zinc.
e. Compatible with the specified primer.
f. Complying with applicable air-quality control board requirements.
2. Use clean white cloths and clean fluids in solvent cleaning.

PART 3 EXECUTION

3.01 GENERAL PROTECTION REQUIREMENTS

A. Protect adjacent coated surfaces from coatings and damage associated with coating work. Repair damage resulting from inadequate or unsuitable protection.

B. Use drop cloths and other coverings to protect adjacent surfaces not to be coated against spatter and droppings.

C. Mask off surfaces of items not to be coated or remove items from area.

D. Furnish and deploy sufficient drop cloths, shields, and protective equipment to prevent spray or droppings from fouling surfaces not being coated and, in particular, surfaces within storage and preparation areas.

E. Place coating waste, cloths, and material that may pose a fire hazard in closed metal containers and remove daily from site.

F. Remove electrical plates, surface hardware, fittings, and fasteners before coating application. Carefully store, clean, and replace items after completing coating in each area. Do not use solvent or degreasers to clean hardware that may remove permanent lacquer finishes.

G. Erect and maintain protective enclosures in accordance with SSPC-Guide 6.

H. Protect the following surfaces from abrasive blasting by masking or by other means:
   1. Threaded portions of valve and gate stems, grease fittings, and identification plates.
   2. Machined surfaces for sliding contact.
   3. Surfaces to be assembled against gaskets.
   4. Surfaces of shafting where sprockets will be fit.
   5. Surfaces of shafting where bearings will be fit.
   6. Machined bronze surfaces, including slide gates.
   7. Cadmium-plated items, except cadmium-plated, zinc-plated, or sherardized fasteners used to assemble equipment requiring abrasive blasting.
   8. Galvanized items, unless scheduled to be coated.

I. Protect installed equipment, mechanical drives, and adjacent coated equipment from abrasive blasting to prevent damage caused by spent abrasive blast media, dust, or dirt entering such equipment.

J. Schedule cleaning and coating to keep dust and spray from the cleaning process from falling on wet, newly coated surfaces.
   1. Whenever possible, coordinate with other trades and complete surface preparation and coating work before installing hardware, hardware accessories, nameplates, data tags, electrical fixtures, and similar uncoated items that will be in contact with coated surfaces. Mask machined surfaces, sprinkler heads, and other small items that will not be coated.
   2. After completing coating, reinstall removed items.
   3. Disconnect and move equipment adjacent to walls to clean and coat equipment and walls. Replace and reconnect equipment after coating.

3.02 GENERAL SURFACE PREPARATION REQUIREMENTS

A. Prepare surfaces in accordance with CSM's instructions unless more stringent requirements are specified in this Section.

B. Coating detail sheets in Attachment B - Coating Detail Sheets include additional surface preparation requirements.

C. Follow more stringent requirement if information conflicts.

D. Where required by the Owner’s representative, a NACE International certified coatings inspector, provided by the Owner, will inspect and approve surfaces to be coated before applying a coating.
   1. CSA shall coordinate coating inspections.
      a. Identify coating inspection Hold Points during the pre-installation conference.
      b. Provide at least 2 days' notice before inspection.
   2. Contractor shall correct surface defects identified by the inspector at no additional cost to Owner.

3.03 MECHANICAL AND ELECTRICAL EQUIPMENT PREPARATION

A. Identify equipment, ducting, piping, and conduit as specified in Section 15050 - Common Work Results for Mechanical Equipment, Section 15076 - Pipe Identification, and Section 16075 - Identification for Electrical Systems.

B. Remove grilles, covers, and access panels for mechanical and electrical system and coat separately.

C. Prepare and finish coat equipment primed by the manufacturer using specified intermediate and top coats, as applicable, and color selected by the Owner.

D. Prepare, prime, and coat both insulated and bare pipes, conduits, boxes, insulated and bare ducts, hangers, brackets, collars, and supports, except where items are covered with material not requiring coating, or with a prefinished coating.

E. Replace identification markings on mechanical or electrical equipment when coated over or spattered.

F. Prepare and coat interior surfaces of air ducts and convector and baseboard heating cabinets visible through grilles and louvers with 1 coat of flat black paint to limit of sight line.

G. Prepare and coat dampers exposed immediately behind louvers, grilles, and convector and baseboard heating cabinets to match face panels.

H. Prepare and coat exposed conduit and appurtenances occurring in finished areas with color and texture to match adjacent surfaces.

I. Prepare and coat sides' front, back, and edges of plywood backboards for electrical equipment before installing backboards and mounting equipment on them.

J. Color code equipment, piping, conduit, and exposed ductwork and apply color banding and identification, such as flow arrows, naming, and numbering, in accordance with the Contract Documents.

3.04 CLEANING OF NEW AND PREVIOUSLY COATED OR NEW SURFACES

A. Utilize cleaning agent to remove soluble salts, such as chlorides, from concrete and metal surfaces:
   1. Cleaning agent: Biodegradable non-flammable and containing no VOC.

2. Manufacturers: The following or equal:
    a. CHLOR*RID International, Inc.
        1) Complete soluble salt removal with steam or warm water cleaning.
3. Steam clean and degrease surfaces to be coated to remove oils and grease.
4. Clean surfaces with decontamination agent in conjunction with abrasive blast cleaning, steam cleaning, high-pressure washing, or hand washing, as approved by the CTR and the Engineer.
5. Test cleaned surfaces to ensure removal of soluble salts. Carry out additional cleaning as needed.
6. Complete final surface preparation before applying new coating system in strict accordance with CSM's printed instructions.

3.05 BLAST CLEANING

A. Surface preparation requirements:
    1. Do not reuse spent blast abrasive.
    2. Ensure that filter compressed air used for blast cleaning is free of condensed water and oil. Clean moisture traps at least once every 4 hours or more frequently, as required, to prevent moisture from entering the abrasive blasting equipment air supply. Check blast air for moisture and oil after each cleaning in accordance with ASTM D4285.
    3. Install oil separators just downstream of compressor discharge valves and at the discharge point of blast pot discharges. Check separators on the same frequency as the moisture traps.
    4. Keep regulators, gauges, filters, and separators on compressor air lines to blasting nozzles operational at all times.
    5. Install an air dryer or desiccant filter drying unit to dry the compressed air before blast pot connections. Use and maintain the dryer throughout surface preparation work.
    6. Use a venturi-type, or other high velocity-type, abrasive blast nozzles supplied with at least 100 pounds per square inch gauge air pressure at the nozzle and enough volume to obtain appropriate blast cleaning production rates and surface cleanliness.
    7. Provide airborne particulate evacuation and filtering that meets OSHA safety standards. Maintain optimal visibility both to clean and provide the specified surface profile and to allow inspection of the substrate during surface preparation work.
    8. If prepared and cleaned metallic substrates become contaminated between final surface preparation work and coating system application, or if the prepared substrate darkens or changes color, re-clean by water blasting, or abrasive blast cleaning as appropriate until the specified degree of cleanliness is restored.

B. Water jetting or water blasting:
    1. Use water jetting or water blasting for recoating or relining where an adequate surface profile exists.
    2. Perform water jetting or water blasting in accordance with SSPC-SP 13 and SSPC-WJ-1, WJ-2, WJ-3, WJ-4.

3.06 PREPARATION REQUIREMENTS FOR CONCRETE SURFACES

A. Cure for at least 28 days before coating.

B. Remove degraded concrete using abrasive blast cleaning or high or ultra-high-pressure water jetting, chipping, or other abrading tools until achieving a sound, clean substrate. Remove all bruised or cracked concrete.

C. Prepare substrate cracks and areas requiring resurfacing; perform detail treatment, including, but not limited to, terminating edges per the CSM's recommendations and as indicated on the Drawings.
   1. Prepare concrete surfaces in accordance with SSPC-SP 13.

D. Prepare concrete surfaces in accordance with SSPC-SP 13.
   1. Inspect concrete surfaces to select appropriate surface preparation method to provide a suitable substrate for the specified coating system.
   2. Use blast cleaning or other means to expose the complete perimeter of air voids or bug holes. Do not leave shelled over, hidden air voids beneath the exposed concrete surface.
   3. Repair concrete defects and physical damage.
   4. Clean concrete surfaces of dust, mortar, formwork, fins, loose concrete particles, form release materials, oil, and grease.
   5. Fill voids to provide surface as specified in Section 03366 - Tooled Concrete Finishing.

E. Provide clean substrate visually free of calcium sulfate, loose, coarse, or fine aggregate, laitance, loose hydrated cement paste, and otherwise harmful substances.
   1. Confirm concrete surface minimum pH of 9.0 with surface pH testing.
   2. If after surface preparation the surface pH remains below 9.0, perform additional water blasting, cleaning, or abrasive blast cleaning until additional pH testing indicates an acceptable pH level.

F. Prepare concrete surface for coating in accordance with SSPC-SP 13.
   1. Provide ICRI 310.2 minimum No. 3 concrete surface profile (CSP) or as specified on Coating Detail Sheets.
   2. Evaluate profile of the prepared concrete using ICRI 310.2 surface profile replicas.

G. Blast clean cementitious repair mortars or grouts to the same profile and degree of cleanliness requirements required for concrete substrates.

H. Blast clean polymer-based surfacers or waterborne modified cementitious surfaces only if they have exceeded the CSM's recommended recoat time.

I. Vacuum all concrete surfaces before coating application, leaving a dust free, sound concrete substrate.
   1. Thoroughly clean concrete surfaces to be coated to remove loose dirt and spent abrasive.
   2. Remove debris produced by blast cleaning from the structures to be coated, and legally dispose of it off-site.

J. Test moisture content of concrete to be coated:
   1. Conduct ASTM D4263 plastic sheet test at least once for every 500 square feet of surface area to be coated.
      a. Any moisture on plastic sheet after test period constitutes a non-acceptable test, and the concrete must be dried further.
   2. Conduct ASTM F1869 test at least once for every 1,000 square feet of concrete floor surface area to be coated.
   3. Conduct ASTM F2170 one relative humidity moisture test at least once for each 500 square feet of non-floor concrete surface area where the opposite side is exposed to soil or water.
      a. Waterproof surfaces exposed to soil or water where specified in Section 07110 - Dampproofing.
   4. Comply with specified minimum moisture content and CSM's written recommendations for moisture vapor transmission rates or relative humidity values.

K. Masonry surfaces:
   1. Cure for at least 28 days before coating.
   2. Prepare masonry surfaces to remove chalk, laitance, loose dirt, dried mortar splatter, dust, peeling, or loose existing coatings, or otherwise deleterious substances to leave a clean, sound substrate.
   3. Wash and scrub masonry surfaces with clear water. Do not use muriatic acid.
   4. Seal or fill masonry surfaces with a sealer or block filler compatible with the specified primer after cleaning.
   5. Confirm that masonry surfaces are dry before coating application.
      a. If using pressure washing or low-pressure water blast cleaning for preparation, allow the masonry to dry for at least 5 days under dry weather conditions or until the minimum ambient temperature is 70 degrees Fahrenheit before coating.

3.07 GENERAL PREPARATION REQUIREMENTS FOR METALLIC SURFACES

A. Remove rust, scale, and welding slag and spatter.
   1. Remove and grind smooth all excessive weld material and weld spatter on metal surfaces before blast cleaning in accordance with NACE SP0178, Appendix C, Level C.
   2. Grind sharp edges on metal substrate to approximately 1/16-inch radius before abrasive blast cleaning.

B. Prepare metallic surfaces in accordance with applicable portions of surface preparation specifications of the SSPC specified for each coating system.
   1. Remove grease and oil in accordance with SSPC-SP 1.
   2. Use solvent as recommended by the CSM.
   3. Measure profile depth of the surface to be coated in accordance with Method C of ASTM D4417. Contractor shall select blast particle size and gradation to produce the specified surface profile.
   4. Constantly monitor and maintain ambient environmental conditions to ensure cleanliness and that no "rust back" occurs before coating material application.

C. Prepare metallic surfaces by blast cleaning in accordance with SSPC-VIS 1 (ASTM D2200). Prepare abrasive blast representative areas for the Owner's representative to inspect on the first day of cleaning.

D. Unless otherwise specified, the requirements for blast cleaning steel, ductile iron, and stainless steel substrates are as follows:
   1. Ferrous metal surfaces not to be submerged: Abrasive blast in accordance with SSPC-SP 10 unless blasting may damage adjacent surfaces, is prohibited, or is specified otherwise. Where abrasive blasting is not possible, clean surfaces to bare metal with power tools in accordance with SSPC-SP 11.
   2. Ferrous metal surfaces to be submerged: Abrasive blast in accordance with SSPC-SP 5, unless specified otherwise, to clean and provide roughened surface profile with a depth between 2 and 4 mils.
   3. Remove traces of grit, dust, dirt, rust scale, friable material, loose corrosion products, or embedded abrasive from substrate before coating application.
   4. When abrasive blasted surfaces rust or discolor before coating, abrasive blast clean surfaces again.

E. Field preparation of shop-primed surfaces:
   1. Smooth welds and prominences with power tools before applying field-applied coatings.
   2. Clean and dry shop-primed ferrous metal surfaces and fabricated assemblies before applying field coats.
   3. Prepare shop epoxy primed surfaces with light abrasive blasting or abrading and then vacuum before applying finish coats.
      a. Follow CSM instructions for surface preparation when the primer recoat limit has been exceeded.
   4. Non-immersion service: Clean in accordance with SSPC-SP 2 (Hand Tool Cleaning) or SSPC-SP 3 (Power Tool Cleaning) and uniformly roughen.
   5. Immersion, BSC, and SC service: Remove shop primer in accordance with SSPC-SP 5 (Near-White Blast Cleaning).

F. Damaged shop primer or rust bleeding:
   1. Ferrous metals: Clean in accordance with SSPC-SP 1 (Solvent Cleaning) and spot blast in accordance with SSPC-SP 10 (Near-White Metal Blast Cleaning) to achieve a uniform surface profile between 2.0 and 2.5 mils before recoating.
   2. Reject galvanized steel with rust bleeding.

G. Damaged coating: Repair by abrasive blast cleaning surfaces as specified for the coating system; feather to a smooth transition before touching up.

3.08 PREPARATION REQUIREMENTS BY SURFACE TYPE

A. Galvanized steel and non-ferrous metal surfaces:
   1. Degrease or solvent clean (SSPC-SP 1) to remove oily residue.
   2. Abrasive blast clean in accordance with SSPC-SP 16.
      a. If abrasive blast cannot be performed, abrade in accordance with SSPC-SP 3 (Power Tool Cleaning).

3. Apply metal pretreatment within 24 hours before coating galvanized surfaces that cannot be thoroughly abraded, such as bolts, nuts, or preformed channels.
4. Test surface for contaminants using copper sulfate solution.

B. Stainless-steel surfaces:
1. Abrasive blast clean in accordance with SSPC-SP 16 to leave a clean, uniform appearance with surface profile between 1.5 and 2.5 mils.

C. Ductile iron pipe and fittings to be lined or coated: Abrasive blast clean in accordance with NAPF 500-03.

D. Sherardized, aluminum, copper, and bronze surfaces:
1. Abrasive blast clean in accordance with SSPC-SP 16.
2. Prepare in accordance with CSM's instructions.

E. Cadmium-plated, zinc-plated, or sherardized fasteners:
1. Abrasive blast in the same manner as uncoated metal when assembling equipment designated for abrasive blasting.

F. PVC and FRP surfaces:
1. Lightly sand surfaces to be coated.
a. Sand to remove gloss and establish uniform surface profile.
2. Vacuum to remove loose dust, dirt, and other materials.
3. Solvent clean with clean white rags and allow solvent to evaporate completely before applying coating materials.

3.09 APPLICATION REQUIREMENTS

A. Apply coatings in accordance with manufacturer's instructions.

B. Empty aboveground piping to be coated of contents when applying coatings.

C. Mechanical equipment shop primed by the manufacturer.
1. Pumps and valves: Shop coat with manufacturer's highest quality coating system meeting the project specifications.
a. Contractor shall provide CTR shop coating reports.
2. Non-immersed equipment: Touch up shop primer, and coat in the field with specified coating system after installation.
a. If project requires equipment removal and reinstallation, complete touch-up coating after final installation.
3. Immersed equipment not shop coated: Remove shop primer before surface preparation and field apply coating.

D. Verify surface preparation immediately before applying coating in accordance with SSPC-SP COM and the SSPC visual standard for the specified surface preparation method.

E. Allow surfaces to dry, except where coating manufacturer requires surface wetting before coating.

F. Wash coat and prime sherardized, aluminum, copper, and bronze surfaces, or prime with manufacturer's recommended special primer.

G. Do not apply coatings to a surface until it has been prepared as specified.

H. Use equipment designed to apply materials specified.
   1. Use compressors with moisture traps and filters that remove water and oils from the air.
      a. Perform a paper blotter test at the Engineer's request to verify air is sufficiently free of oil and moisture. Do not allow the amount of oil and moisture to exceed CSM-recommended amount.
   2. Equip spray equipment with properly sized mechanical agitators, pressure gauges, pressure regulators, and spray nozzles.

I. Where 2 or more coats are required, tint prime coat intermediate coats as necessary to distinguish each coating and to help indicate coverage.
   1. Do not use color additives with chromium, lead or lead compounds that hydrogen sulfide, other corrosive gases, might destroy or alter. Apply the specified number of coats.

J. Apply coating by brush, roller, trowel, or spray unless a specific application method is required by coating manufacturer's instructions or these Specifications.
   1. Apply primer or first coat by brush to power tool cleaned ferrous surfaces.
   2. Brush or spray-apply coats for blast-cleaned ferrous surfaces and subsequent coats for non-blast cleaned ferrous surfaces.
   3. After prime coat dries, mark, repair, and retest pinholes and holidays before intermediate or top coats are applied.

K. Spray application:
   1. With a brush, stripe coat edges, welds, corners, nuts, bolts, and difficult-to-reach areas, as necessary, before spray application to ensure specified coating thickness along edges.
   2. When using spray application, apply each coat to thickness no greater than recommended in coating manufacturer's instructions.
   3. Use airless spray method unless air spray method is required by CSM's instruction or these Specifications.
   4. Conduct spray coating under controlled conditions. Protect adjacent construction and property from coating mist, fumes, or overspray.

L. Lightly sand and thoroughly clean surfaces to receive high-gloss finishes unless CSM instructs otherwise.

M. Remove all dust on coatings between coats.

N. Shop and field coats:
   1. Prime coat: Shop-apply or field-apply prime coats as specified. Use shop-applied primer compatible with the specified field coating system and apply at the minimum dry film thickness recommended by the finish coat CSM.
      a. Provide data sheets identifying the shop primer to on-site coating application personnel.
      b. Perform adhesion tests on the shop primer.

c. Remove and recoat damaged, deteriorated, and poorly applied shop coatings.
d. If shop primer coat meets this Section's requirements, spot prime exposed metal of shop-primed surfaces before spray applying primer over the entire surface.

2. Field coats: Apply field coats with 1 or more prime coats and finish coats to build up coating to dry film thickness specified for the coating system.
   a. Do not apply finish coats until other work in the area is complete and previous coats are inspected.
3. Adhesion confirmation: Perform adhesion tests after proper coating cure in accordance with ASTM D3359. Demonstrate that:
   a. Prime coat adheres to the substrate.
   b. Coatings adhere to the prime and intermediate coats.
      1) Coating 5 mils or more DFT: Achieve adhesion test result of 5A on immersed surfaces and 4A or better on other surfaces.
      2) Coating less than 5 mils DFT: Achieve adhesion test results of 5B on immersed surfaces and 4B or better on other surfaces.

O. Brush, roll, trowel, or spray and back roll coats for concrete and masonry.

P. Plural component coating application:
1. Premix contents of component drums if required by the CSM each day.
2. Before starting application:
   a. Verify gauges are working properly.
   b. Complete ratio checks.
   c. Sample the mix on plastic sheeting to ensure set time is appropriate and complete.
   d. Label and retain all spray samples. Submit to Engineer when requested.

Q. Drying and recoating:
1. Provide fans, heating devices, or other means to prevent condensate or dew on substrate surface or between coats and during curing after applying the last coat.
2. Allow each coat to cure or dry thoroughly, in accordance with if required in CSM’s printed instructions, before recoating.
3. Use CSM's printed instructions and the requirements specified in this Section to determine minimum required drying time.
   a. Do not allow excessive drying time or exposure, which may impair bond between coats.
   b. Recoat all coatings within time limits recommended by CSM.
   c. If time limits are exceeded, abrasive blast clean and de-gloss clean before applying another coat.
4. If limitations on time between abrasive blasting and coating are not met before attaching components to surfaces that cannot be abrasive blasted, coat components before attachment.
5. Ensure primer and intermediate coats of coating are unscarred and completely integral when applying each succeeding coat.
6. Touch up suction spots between coats and apply additional coats where required to produce finished surface of solid, even color, free of defects.

7. Leave no holidays. Repair all holidays in accordance with the requirements on pertinent Coating Detail Sheets or as recommended by the CSM.
8. Sand and feather into a smooth transition and recoat scratched, contaminated, or otherwise damaged coating surfaces so repairs are invisible to the naked eye.

R. Workmanship:
1. Ensure that coated surfaces are free from runs, drips, ridges, waves, laps, and brush marks. Coats shall be applied to produce a smooth, even film of uniform thickness completely coating corners and crevices.
2. Coat surfaces without drops, overspray, dry spray, excessive runs, ridges, waves, holidays, laps, or brush marks.
3. Remove splatter and droppings after coating work is completed.
4. Evenly apply each coat of material and sharply cut to a line created with masking tape or other suitable materials.
5. Avoid over spraying or spattering paint on surfaces not to be coated. Protect glass, hardware, floors, roofs, vehicles, and other adjacent areas and installations by taping, drop cloths, or other suitable measures.
6. When coating complex steel shapes, stripe coat welds, edges of structural steel shapes, metal cut-outs, pits in steel surfaces, or rough surfaces with the primer before overall coating system application.
    a. Brush apply stripe coat to ensure proper coverage.
    b. Do not stripe coat with spray or roller.
7. Ensure that finish coat, including repairs, has a uniform color and gloss.

S. Coating properties, mixing, and thinning:
1. Thin prime coat and apply as recommended by the CSM. Thinned coating must comply with prevailing air pollution control regulations.
2. If maximum recoat time is exceeded, prepare surface with solvent washing, light abrasive blasting, or other procedures per CSM’s instructions.
3. Allow adequate drying time between coats as instructed by the CSM, adjusted as necessary for the site conditions.
4. Ensure that coatings, when applied, provide a satisfactory film and a smooth even surface. Lightly sand glossy undercoats to provide a surface suitable for proper application and adhesion of subsequent coats. Thoroughly stir and strain coating materials during application and maintain uniform consistency.
5. Mix coatings with 2 or more components in accordance with CSM’s instructions.
6. Where necessary to suit conditions of the surface, temperature, weather, and method of application, thin the coating per CSM's recommendations.
    a. Ensure that volatile organic content (VOC) of the thinned coating complies with prevailing air pollution control regulations.
    b. Thin coatings to only what is necessary to obtain proper application characteristics.
    c. Use a thinner recommended by the CSM.

T. Film thickness and continuity:
1. Apply coating to the specified thicknesses.
    a. Apply additional coats when necessary to achieve specified thicknesses, especially at edges and corners.

2. Verify WFT of the coating system first coat and after applying each subsequent coat.
3. Do not allow the minimum thickness at any point to deviate more than 25 percent from the required average.
4. Do not allow the surface area covered per gallon of coating for various types of surfaces to exceed those recommended by the CSM.
    a. Provide coating coverage worksheets listing the maximum and minimum coverage for each unit volume of coating for concrete surfaces.
5. Apply additional coats to achieve the specified dry film thickness if brush or roller application methods cannot achieve the specified film thicknesses per coat.

U. Protecting coated surfaces:
1. Do not handle, work on, or otherwise disturb coated items until the coating is completely dry and hard.
2. After installation, recoat shop-coated surfaces with specified coating system as necessary to match surrounding surfaces, and to coordinate with the specified color identification requirements.

V. Special requirements:
1. Before erection, apply all but the final finish coat to interior surfaces of roof plates, roof rafters and supports, pipe hangers, piping in contact with hangers, and contact surfaces inaccessible after assembly. Apply final coat after erection.
2. Coat structural slip-critical connections and high strength bolts and nuts after erection.
3. Areas damaged during erection:
    a. Prepare surface for spot repairs as specified for the coating system.
    b. Recoat with prime coat before applying subsequent coats.
    c. Touch up surfaces after installation.
    d. Clean and dry surfaces to be coated at time of application.
4. Coat underside of equipment bases and supports not galvanized with at least 2 coats of primer specified before setting the equipment in place.
5. Coat aluminum in contact with concrete.

3.10 APPLICATION REQUIREMENTS FOR CONCRETE COATING SYSTEMS

A. Apply filler/surfacer as recommended by CSM to fill bug holes and air voids in concrete or block texture in CMU, leaving a uniformly filled surface that does not produce blowholes or outgassing causing the coating system to pinhole.
1. Allow filler/surfacers to cure sufficiently before applying prime coat as required by the CSM. Use the CSM-recommended drying time between coats.

B. Apply surfacer or filler and let dry before coating application.
1. Use the drying time between filler/surfacer and coating system specified by the CSM for the site conditions.
    a. Let concrete substrate dry before applying filler/surfacers or coating system materials.
2. If the maximum recoat time is exceeded, prepare surfaces by solvent washing, light abrasive blasting, and other procedures per CSM's instructions.

3. Apply a complete parge coat of the specified filler/surfacer material over the entire substrate before applying the coating system.
    a. Scrub filler/surfacer into the substrate to completely fill open air voids and bug holes.
    b. Completely cover the substrate, unless otherwise specified, above such filled voids by 1/8 inch of thickness.
    c. Provide relatively flat, uniformly even surface before coating application.
4. Secondary containment: Place surfacer or filler 1/16 inch thick above concrete plane to create a monolithic surface free of pinholes.
    a. Floor surfaces: Broadcast with aggregate to create a non-slip surface texture.
    b. Remove excess aggregates and apply base coat to encapsulate embedded non-slip aggregate.

C. Concrete substrate temperatures:
1. Apply filler/surfacers and the coating system when temperatures are falling, typically late afternoon or evening.
    a. Do not coat concrete with rising concrete substrate surface temperatures or substrates in direct sunlight, to minimize outgassing from the substrate and formation of pinholes, and/or blistering.
2. Should bubbles, pinholes, or other discontinuities form in the applied coating system material, they shall be repaired.
    a. Should discontinuities develop in the filler/surfacer material or in the first coat of the coating material, repair them before the next coat.
    b. When discontinuities occur, open the air void behind or beneath the discontinuities and completely fill with specified coating material. Then, abrade the coated area around the discontinuities repair reapply coating over that area.

D. Perform application detail work in accordance with these Specifications, the CSM's current written recommendations, and drawings, whichever is stricter.

E. Concrete coating systems application requirements:
1. Concrete coating minimum dry film thickness excludes parge coat, block filler, and sealer.

3.11 COATING SYSTEM SCHEDULE

A. Attachment A - Schedule of Surfaces to be Field Coated specifies surfaces to be coated in the field with the coating systems required.

3.12 SURFACES NOT REQUIRING COATING

A. Stainless steel piping, valves, pipe supports, instrument sunshades.

B. Sliding surfaces on expansion joints, motor and pump shafts, machined surfaces at bearings and seals, grease fittings, etc.

C. Galvanized structural steel framing, galvanized roof decking, galvanized pipe supports.

D. Copper and brass pipe, fittings, valves, etc.

E. Bronze valves, bearings, bushings, and fasteners.

F. Corrosion resistant special alloys: Inconel, Alloy 20, Hastelloy, etc.

G. Exterior Concrete.

H. Plastic surfaces except coat PVC, CPVC, and other plastic piping system exposed to sunlight.

I. Buried Piping that is encased in concrete or cement mortar.

3.13 QUALITY CONTROL

A. Owner-provided inspection or inspection by others does not limit the Contractor's or CSA's responsibilities for quality workmanship or quality control as specified or as required by the CSM's instructions. Owner inspection is in addition to any inspection required of the Contractor.

B. Owner may perform, or contract with an inspection agency to perform, quality control inspection and testing of the coating work covered by this Section. These inspections may include the following:
   1. Inspect materials upon receipt to ensure that the CSM supplied them.
   2. Verify that specified storage conditions for the coating system materials, solvents, and abrasives are provided.
   3. Inspect and record findings for substrate cleanliness.
   4. Inspect and record pH of concrete and metal substrates.
   5. Inspect and record substrate profile (anchor pattern).
   6. Measure and record ambient air and substrate temperature.
   7. Measure and record relative humidity.
   8. Check for substrate moisture in concrete.
   9. Verify that mixing of coating system materials is in accordance with CSM's instructions.
   10. Inspect, confirm, and record that coating system materials' "pot life" is not exceeded during installation. Inspect to verify that recoat limitations for coating materials are not exceeded.
   11. Perform adhesion testing.
   12. Measure and record the coating system's thickness.
   13. Verify proper curing of the coating system in accordance with the CSM's instructions.
   14. Holiday or continuity testing in accordance with NACE SP0188 for coatings that will be immersed or exposed to aggressively corrosive conditions.

C. Contractor shall perform holiday testing in accordance with NACE SP0188 to identify holidays or pinholes needing repair for coating over 100 percent of surfaces:
   1. Coated steel that will be immersed or exposed to aggressively corrosive conditions.
   2. Coated concrete.
   3. Perform holiday tests after proper application and coating system cure.

3.14 CORRECTIVE MEASURES

A. Repair pinholes or holidays identified by Holiday Testing as follows:
   1. Remove the coating system with a grinder or other suitable power tool.
   2. Remove coating system at all pinholes and holidays at least 2 inches diameter around the defect back to expose substrate.
   3. Concrete voids: chip back to expose entire cavity in all directions.
      a. Completely fill void with approved filler/surfacer material using a putty knife or other suitable tool and strike off. Cure per CSM's recommendations.
   4. Aggressively abrade or sand the intact coating system surface at least 3 inches beyond the removal area in all directions to produce a uniform 6- to 8-mil profile in the intact coating system.
   5. Vacuum the prepared area to remove all dust, dirt, etc., leaving clean, sound surfaces.
   6. Tape to mask the periphery of the prepared intact coating area to prevent coating repair application onto the prepared area.
   7. Apply the coating system with enough coats to achieve the specified finish coat thickness over the defect and coating removal area. Feather the coating onto the abraded coated surfaces around the removal area to avoid a lip and to achieve a neat repair outline.
   8. Follow curing time between coats as specified by CSM for the site conditions. Solvent wash and abrasive blast per CSM's instructions, if the maximum recoat time is exceeded.
   9. Apply coating at specified dry film thickness.

3.15 CLEANUP

A. Remove surplus materials, protective coverings, and accumulated rubbish after completing coating. Thoroughly clean surfaces and repair overspray or other coating-related damage.

3.16 FINAL INSPECTION

A. Conduct final inspection of coating system work to determine whether it meets specifications requirements.

B. Conduct subsequent final inspection with Engineer to ensure work conforms to contract documents requirements.

C. Mark any rework required.
   1. Re-clean and repair, as specified, at no additional cost to the Owner.

END OF SECTION

ATTACHMENT A - SCHEDULE OF SURFACES TO BE COATED

APPENDIX A
Schedule of Surfaces to be Coated

A. The following schedule is incomplete. Coat unlisted surfaces with same coating system as similar listed surfaces. Contact Engineer for clarification.

EPU-M-1	Metals, exterior, non-immersed
EPX-M-2	Metals, interior, non-immersed
EPX-M-3	Metals, immersed; all exterior and interior surfaces of the AWT tanks as indicated on Drawing 85S01
EPX-M-5	Aluminum surfaces in contact with concrete or masonry. Locations where Alkali-resistant bitumastic is specified.
EPX-M-6-BG	Below grade or buried pipes, valves, pits/chambers
EPX-C-7-BG	Below grade or buried pits/chambers

Notes:

1: Non-immersed ferrous metal surfaces include:
- a. Doors, doorframes, ventilators, louvers, grilles, exposed sheet metal, and flashing.
- b. Pipe, valves, pipe hangers, supports and saddles, conduit, cable tray hangers, and supports.
- c. Motors and motor accessory equipment.
- d. Drive gear, drive housing, coupling housings, and miscellaneous gear drive equipment.
- e. Valve and gate operators and stands.
- f. Structural steel.
- g. Crane and hoist rails.
- h. Exterior of tanks and other containment vessels.
- i. Mechanical equipment supports, drive units, and accessories.
- j. Bare electrical equipment: boxes, exposed conduit, and accessories.
- k. Pumps not submerged.
- l. Other miscellaneous metals.

2: Immersed ferrous metal surfaces include:
- a. Interior surfaces of ferrous metal tanks.
- b. Field priming of ferrous metal surfaces with defective shop-prime coat; including non-submerged service.
- c. Bell rings, underside of manhole covers and frames.
- d. Sump pumps, including underside of base plates and submerged suction and discharge piping.
- e. Exterior of submerged piping and valves other than stainless steel or PVC piping.
- f. Submerged pipe supports and hangers.
- g. Stem guides.
- h. Other submerged iron and steel metal unless specified otherwise.

ATTACHMENT B - COATING DETAIL SHEETS

Appendix B			
Coating Detail Sheet			
Coating System	EPU-M-1		
Coating Material	Two coats epoxy with polyurethane finish coat		
Substrate	Metal		
Products: One of the following or equal:	Primer	Intermediate Coat	Finish Coat
Carboline	Carboguard 890	Carboguard 890	Carbothane 134 VOC
International Paint	Devran 224V	Devran 224V	Devthane 379H
PPG	Amerlock 2VOC	Amerlock 2VOC	Amershield VOC
Sherwin Williams	Macropoxy 646 100	Macropoxy 646 100	Hi Solids Polyurethane 250
Tnemec	Series 69	Series 69	Series 1095
Service Condition	Interior or Exterior, subject to direct sunlight. Non-immersion.		
Surface Preparation			
General	Prepare surfaces as specified in this Section and as follows.		
Ferrous Metal	Bare surfaces: SSPC-SP10, Near-White Blast Cleaning. Shop primed surfaces: SSPC-SP2, Hand Tool Cleaning or SSPC-SP3, Power Tool Cleaning. Damaged primer or rust: SSPC-SP10, Near White Blast Cleaning and spot prime.		
Nonferrous Metal	SSPC-SP16, Brush Blast Cleaning.		
Galvanized Metal	SSPC-SP16, Brush Blast Cleaning. Test for surface contaminants.		
Surface profile			
Ferrous Metal	2.5 to 3.0 mils		
Nonferrous Metal	1.5 to 2.0 mils		
Galvanized Metal	1.5 to 2.0 mils		
System Thickness (Dry Film)			
Total	10 to 13 mils		
Primer	4 to 5 mils		
Intermediate Coat	4 to 5 mils		
Finish Coat	2 to 3 mils		
Application			
Special CTR Training	Not required.		

Appendix B			
Coating Detail Sheet			
Coating System	EPX-M-2		
Coating Material	Epoxy		
Substrate	Metal		
Products: One of the following or equal:	Primer	Intermediate Coat	Finish Coat
Carboline	Carboguard 890	Carboguard 890	Carboguard 890
International Paint	Bar-Rust 236	Bar-Rust 236	Bar-Rust 236
PPG	Amerlock 2/400 Series	Amerlock 2/400 Series	Amerlock 2/400 Series
Sherwin Williams	TankClad HS	TankClad HS	TankClad HS
Tnemec	Series 69	Series 69	Series 69
Service Condition	Immersed, non-immersed, moderately corrosive environment.		
Surface Preparation			
General	Prepare surfaces as specified in this Section and as follows.		
Ferrous Metal	Bare surfaces: SSPC-SP5, White Metal Blast Cleaning. Shop primed surfaces: SSPC-SP7, Brush-Off Blast Cleaning. Damaged primer or rust: SSPC-SP5, White Metal Blast Cleaning and spot prime.		
Nonferrous Metal	SSPC-SP16, Brush-Off Blast Cleaning.		
Galvanized Metal	SSPC-SP16, Brush-Off Blast Cleaning.		
Surface profile			
Ferrous Metal	2 to 4 mils		
Nonferrous Metal	1.0 to 1.5 mils		
Galvanized Metal	1.0 to 1.5 mils		
System Thickness (Dry Film)			
Total	12 to 16 mils		
Primer	4 to 6 mils		
Intermediate Coat	4 to 6 mils		
Finish Coat	4 to 6 mils		
Application			
Special CTR Training	Not required.		

Appendix B			
Coating Detail Sheet			
Coating System	EPX-M-3		
Coating Material	Epoxy		
Substrate	Metal		
Products: One of the following or equal:	Primer	Intermediate Coat	Finish Coat
Carboline	Carboguard 891VOC	Carboguard 891VOC	Carboguard 891VOC
International Paint	Bar-Rust 236	Bar-Rust 236	Bar-Rust 236
PPG	Amercoat 240	Amercoat 240	Amercoat 240
Sherwin Williams	Tank Clad HS	Tank Clad HS	Tank Clad HS
Tnemec	Series 104	Series 104	Series 104
Service Condition	Immersed; non-immersed, corrosive environment. Not for Biogenic Sulfide Corrosion areas in wastewater.		
Surface Preparation			
General	Prepare surfaces as specified in this Section and as follows.		
Ferrous Metal	Bare surfaces: SSPC-SP5, White Metal Blast Cleaning. Shop primed surfaces: SSPC-SP7, Brush-Off Blast Cleaning. Damaged primer or rust: SSPC-SP5, White Metal Blast Cleaning and spot prime.		
Nonferrous Metal	SSPC-SP16, Brush-Off Blast Cleaning.		
Galvanized Metal	SSPC-SP16, Brush-Off Blast Cleaning.		
Surface profile			
Ferrous Metal	2.5 to 3.0 mils		
Nonferrous Metal	1.5 to 2.0 mils		
Galvanized Metal	1.5 to 2.0 mils		
System Thickness (Dry Film)			
Total	16 to 20 mils		
Primer	4 to 8 mils		
Intermediate Coat	4 to 8 mils		
Finish Coat	4 to 8 mils		
Application			
Special CTR Training	Not required.		

Appendix B			
Coating Detail Sheet			
Coating System	EPX-M-5		
Coating Material	Epoxy mastic		
Substrate	Metal		
Products: One of the following or equal:	Primer	Intermediate Coat	Finish Coat
Carboline	CSM recommended	None applied	Carbomastic 15
International Paint	CSM recommended	Bar-Rust 231LV	Bar-Rust 231LV
PPG	No product specified	No product specified	No product specified
Sherwin Williams	CSM recommended	No product specified	No product specified
Tnemec	CSM recommended	Series 135	Series 135
Service Condition	Interior, corrosive environment, confined enclosures, where minimal surface preparation is possible.		
Surface Preparation			
General	Prepare surfaces as specified in this Section and as follows.		
Ferrous Metal	Bare surfaces: SSPC-SP11, Power to Cleaning to Bare Metal. Shop primed surfaces: SSPC-SP3, Power Tool Cleaning. Damaged primer or rust: SSPC-SP11, Power to Cleaning to Bare Metal.		
Nonferrous Metal	SSPC-SP16, Brush-Off Blast Cleaning.		
Surface profile			
Ferrous Metal	2.0 to 2.5 mils		
Nonferrous Metal	1.0 to 1.5 mils		
System Thickness (Dry Film)			
Total	15 to 19 mils		
Primer	2 to 4 mils		
Finish Coat	15 mils		
Application			
Special CTR Training	Not Required.		

Appendix B			
Coating Detail Sheet			
Coating System	EPX-M-6-BG		
Coating Material	Epoxy		
Substrate	Metal		
Products: One of the following or equal:	Primer	Intermediate Coat	Finish Coat
Carboline	Carboguard 890	Carboguard 890	Carboguard 890
International Paint	Bar-Rust 236	Bar-Rust 236	Bar-Rust 236
PPG	Amerlock 400	Amerlock 400	Amerlock 400
Sherwin Williams	No product specified	No product specified	No product specified
Tnemec	Series 69	Series 69	Series 69
Service Condition	Below grade in contact with soil.		
Surface Preparation			
General	Prepare surfaces as specified in this Section and as follows.		
Ferrous Metal	SSPC-SP10, Near White Metal Blast Cleaning.		
Nonferrous Metal	SSPC-SP16, Brush-Off Blast Cleaning.		
Galvanized Metal	SSPC-SP16, Brush-Off Blast Cleaning.		
Surface profile			
Ferrous Metal	2.5 to 3.0 mils		
Nonferrous Metal	1.5 to 2.0 mils		
Galvanized Metal	1.5 to 2.0 mils		
System Thickness (Dry Film)			
Total	16 mils		
Primer	4 to 6 mils		
Intermediate Coat	4 to 6 mils		
Finish Coat	4 to 6 mils		
Application			
General	Fill all bugholes with a filler/surfacer compatible with the coating.		
Special CTR Training	Not Required.		

Appendix B			
Coating Detail Sheet			
Coating System	EPX-C-7-BG		
Coating Material	Polyamidoamine epoxy or epoxy coating type with similar performance		
Substrate	Concrete		
Products: One of the following or equal:	Primer	Intermediate Coat	Finish Coat
Carboline	Carboguard 890	Carboguard 890	Carboguard 890
International Paint	Bar-Rust 236	Bar-Rust 236	Bar-Rust 236
PPG	Amerlock 400	Amerlock 400	Amerlock 400
Sherwin Williams	Tank Clad HS	Tank Clad HS	Tank Clad HS
Tnemec	Series 69	Series 69	Series 69
Service Condition	Below grade in contact with soil.		
Surface Preparation			
General	Prepare surfaces as specified in this Section and as follows.		
Surface profile			
Concrete	ICRI CSP 3.		
Existing Coated Concrete	ICRI CSP 3.		
System Thickness (Dry Film)			
Total	16 mils		
Primer	4 to 6 mils		
Intermediate Coat	4 to 6 mils		
Finish Coat	4 to 6 mils		
Application			
General	Fill all bugholes with a filler/surfacer compatible with the coating.		
Special CTR Training	Not Required.		

SECTION 09986

PAINTING PRESTRESSED CONCRETE WATER TANKS

PART 1 GENERAL

1.01 SUMMARY

A. Section includes: Painting and coatings for prestressed concrete water tanks.

1.02 REFERENCES

A. Military Specifications (MS):
   1. MIL-P-23236 - Paint Coating Systems, Fuel and Salt Water Ballast Tanks.

B. Society for Protective Coatings (SSPC):
   1. SP-1 - Solvent Cleaning.

C. United States Navy (USN):
   1. QPL/QMLs - Qualified Products/Manufacturers Lists.

1.03 SUBMITTALS

A. Product data.

B. Quality control submittals.

1.04 QUALITY ASSURANCE

A. Qualifications of off-site applicator of coal tar epoxy: Will not be allowed unless by applicator with proven, documented, experience acceptable to Engineer in application of coal tar epoxy systems.

1.05 PROJECT CONDITIONS

A. Environmental requirements:
   1. Application of coal tar epoxy: Do not apply coal tar epoxy when ambient and/or surface temperature is less than 50 degrees Fahrenheit.

PART 2 PRODUCTS

2.01 MATERIALS

A. Prestressed Concrete Tank Shotcrete Finish Painting: Non-Cementitious, high build, 100-percent acrylic resin polymer:
   1. Tnemec: Envirocrete 156.
   2. Sherwin Williams: Loxon XP WP.

~~B. Prestressed Concrete Tank Roof Coating: Type II asphalt conforming to ASTM D449 and gravel.~~[AD3]

B. Prestressed Concrete Tank Roof Coating: Non-cementitious, high build, 100 percent acrylic resin polymer:
   1. Tnemec: Envirocrete 156.
   2. Sherwin Williams: Loxon XP WP.[AD3]

2.02 MIXES

A. Mix in accordance with manufactures instructions.

PART 3 EXECUTION

3.01 PREPARATION

A. Surface preparation: For surfaces designated to be painted:
   1. General: Prepare surfaces in accordance with manufacturer's installation instructions.

Surface Preparation Number	Surface Preparation Process
SP-1	Painting Concrete And Shotcrete: Remove form release agents from poured or precast surfaces by sandblasting or as recommended by paint manufacturer.

3.02 PRESTRESSED CONCRETE TANK SHOTCRETE FINISH PAINTING

A. Preparation: Prepare surfaces in accordance with general application requirements and in strict accordance with coating manufacturer's instructions.

B. Application:
   1. Apply primer if required by coating manufacturer.
   2. Apply 2 or more coats as recommended by coating manufacturer to receive a minimum total DFT of 12 mils; color as selected by the Owner.
   3. Apply finish paint to a depth of one foot below finish grade.

3.03 PRESTRESSED CONCRETE ROOF COATING

A. Preparation:
   1. Prepare surfaces in accordance with general application requirements and in strict accordance with coating manufacturer's instructions.

B. Application:
   1. Apply suitable concrete primer.
   2. Cover with Type II asphalt, conforming to ASTM D449, at a minimum rate of 60 lbs per 100 sqft.
   3. While the asphalt is still hot embed an approved gravel or small rock at the rate of approximately 10 psf.

3.04 FIELD QUALITY CONTROL

A. Inspection:
   1. Coal tar epoxy paints: Check film thickness after application and before coating has cured to be sure that sufficient coating thickness has been applied before coal tar epoxy coating is allowed to set overnight.

3.05 ADJUSTING

A. Remedial work for coal tar epoxy coatings:
   1. Non-conformance with application or thickness requirements:
      a. If surface coatings are not applied in accordance with following:
         1) Time limits listed in Table A in this Section or,
         2) Coatings have cured or set and,
         3) Coatings have not been applied to specified thickness, then areas that are below specified thickness requirements are to be sandblasted.
      b. Sandblasting:
         1) Sandblast as required to remove surface film from coatings.
         2) Sandblasted areas:
            a) Wash and clean with solvent as recommended by manufacturer, and then recoat within time limits specified for coating over fresh coating.
            b) Washing or cleaning surface of paint with solvents or other solutions will not be satisfactory substitute for specified sandblasting where painted surface is older than time limits listed in Table A in this Section.
   2. In event that recoating of overage coated surface occurs without sandblasting and solvent treatment specified in this article: Entire painting system, down to substrate, is to be removed by sandblasting or other means, and complete new painting system applied.

END OF SECTION

[AD3] Addendum No. 3

SECTION 10400

SIGNAGE

PART 1 GENERAL

1.01 SUMMARY

A. Section includes: Plastic and metal signs for building and site use.

1.02 REFERENCES

A. National Fire Protection Association (NFPA):
   1. 704 - Standard System for the Identification of the Hazards of Materials for Emergency Response.

B. Occupational Safety and Health Administration (OSHA).

1.03 SUBMITTALS

A. Product data.

B. Shop drawings: Include lists of sign types, sizes, text, and colors; mounting details; locations; and cast metal plaque rubbings and templates.

C. Samples: Include actual materials.

D. Manufacturer's installation instructions.

1.04 QUALITY ASSURANCE

A. Manufacturer qualifications: Manufacturer of proposed products for minimum 5 years with satisfactory performance record of minimum 5 years.

B. Installer qualifications: Manufacturer approved installer of products similar to specified products on minimum 10 projects of similar scope as Project with satisfactory performance record.

C. Regulatory requirements: Provide signage in accordance with Americans with Disabilities Act as published in the Federal Register, Volume 56, No. 144, Friday, July 26, 1991.

PART 2 PRODUCTS

2.01 PLASTIC SIGNAGE SYSTEM

A. Manufacturers:
   1. One of the following or equal:
      a. Best Manufacturing Sign Systems, System 900013.
      b. Andco Industries Corp., equivalent product.
      c. Vomar Products, Inc., equivalent product.

B. Attachment:
   1. Vinyl tape, self-adhering.

C. Lettering:
   1. Helvetica medium, 3/4 inches high.

D. Material for interior use:
   1. Plastic 1/8-inch-thick raised letters.

E. Material for exterior use:
   1. Fiberglass 1/4-inch thick with high gloss finish, raised letters, blasted from single piece of fiberglass for integral letter and background.
   2. No adhesive as mechanical fastening of letters shall be allowed.

F. Colors:
   1. As selected by Engineer from manufacturer's standard colors.

G. See Attachment A - Plastic Signage System Schedule for specific sign size, location, text, pictogram, and quantity.

2.02 METAL SAFETY SIGNS

A. Manufacturer: Meeting OSHA Requirements; 40-mil thick aluminum with baked enamel finish. One of the following or equal:
   1. Seton Name Plate Co., Special Wording.
   2. Emedco.

B. Danger sign colors:
   1. Background: White.
   2. Heading: White lettering on red oval with white border in black rectangular panel.
   3. Message: Black lettering on white.
   4. Size: As scheduled.

C. Caution sign colors:
   1. Background: Yellow.
   2. Heading: Yellow lettering on black rectangular panel.
   3. Message: Black lettering on yellow.
   4. Size: As scheduled.

D. Safety instruction signs:
   1. Background: White.
   2. Heading: White lettering on green rectangular panel.
   3. Message: Black lettering.
   4. Size: As scheduled.

E. Warning sign colors:
   1. Background: Orange.
   2. Heading: Black lettering on orange diamond in black rectangular panel.
   3. Message: Flack lettering on orange.
   4. Size: As scheduled.

F. Notice information signs:
   1. Background: White.
   2. Heading: White lettering on blue rectangular panel.
   3. Message: Black lettering.
   4. Size: As scheduled.

G. Fasteners: Round head stainless steel bolts or screws.

H. See Attachment B - Metal Safety Sign Schedule for specific sign size, location, text, and quantity.

2.03 EXTERIOR INFORMATION SIGNS

A. Able to withstand 100 miles per hour wind load without damage:
   1. Manufacturers: One of the following or equal:
      a. Best Manufacturing Sign Systems; equivalent product.
      b. Andco Industries Corp., equivalent product.
      c. Vomar Products, Inc., equivalent product.

B. Sign panel: Nominal 3 inches thick, consisting of 1/8-inch-thick fiberglass material with integral returns fully encapsulating wood and foam core, 1/8-inch radius edges and corners, size as indicated on the Drawings.

C. Text: Helvetica medium, size and wording as indicated on the Drawings.

D. Posts: Nominal 3-inch square extruded aluminum sections with aluminum fillers at top and bottom, mounting hardware, and aluminum baseplates drilled for anchor bolts.

E. Fasteners: Manufacturer's standard, suitable for application.

F. Colors: As selected from manufacturer's standard colors.

2.04 CAST METAL PLAQUE

A. Manufacturers: One of the following or equal:
   1. Andco Industries Corp.
   2. Southwell Co.
   3. ARK-RAMOS Inc.

B. Material: Cast bronze.

C. Size: Approximately 28 by 34 inches by minimum 3/16 inches thick; lettering, center panel, and trim raised 1/8 inch.

D. Lettering: Text as directed by Engineer. Verify before fabrication.

E. Finishes:
   1. Lettering, center panel, and trim: Fine satin.
   2. Background: Finely pebbled, oxidized to dull black color.

F. Mounting: Concealed with fasteners.

2.05 HAZARD MATERIAL SIGNALS

A. Manufacturer: One of the following or equal:
   1. Seton Name Plate Co.
   2. Emedco.

B. Hazard material signals: In accordance with NFPA 704; 40-mil thick aluminum with baked enamel finish panels, letters, and symbols with pressure sensitive adhesive, sizes as required for viewing distances, letters and symbols in accordance with Attachment C - Hazard Material Signals.

2.06 CAST ALUMINUM LETTERS

A. Manufacturers:
   1. One of the following or equal:
      a. Metal Arts.
      b. Southwell Co.
      c. OMC Industries.

B. Material:
   1. Cast aluminum.

C. Text size and font:
   1. As indicated on the Drawings.

D. Finish:
   1. Black duranodic coating.

E. Mounting:
   1. Projected jamb nut mounting, concealed.

2.07 DECAL SIGNS ON GLASS

A. Provide decal signs of the international symbol for accessibility, in accordance with requirements of CBC 1127B.3 for entry signs. Signs to comply with CBC 1117B.5 through 1117B.5.9. Locate signs as follows:
   1. Door or sidelight of Door No.

PART 3 EXECUTION

3.01 PREPARATION

A. Protect adjacent surfaces which may be damaged by installation of signs.

B. Prepare substrates in accordance with sign manufacturer's instructions.

C. Remove scale, dirt, grease, and other contaminates from substrates.

3.02 INSTALLATION

A. Install signs in accordance with sign manufacturer's instructions.

B. Fasten signs securely in level, plumb, and true to plane positions.

C. Install signs where indicated on the Drawings.

END OF SECTION

ATTACHMENT A - PLASTIC SIGNAGE SYSTEM SCHEDULE

PLASTIC SIGNAGE SYSTEM SCHEDULE

A. Room Names:
   1. Location: On wall outside room adjacent to latch side of doors or when not enough space on latch side, on nearest adjacent wall.
   2. Height: 60 inches above floor to center or sign.
   3. Size: 6 inches square.
   4. Colors: As selected by Engineer.
   5. Text: Sign per door describing room function as indicated on the Drawings.

B. Fire Extinguishers:
   1. Location: Adjacent to fire extinguishers.
   2. Height: 60 inches above floor to center of sign.
   3. Size: 6 inches square.
   4. Colors: White letters on OSHA Red background.
   5. Text: FIRE EXTINGUISHER.

C. Nonpotable Water:
   1. Location: At impure water and nonpotable water hose valves in accordance with Typical Detail M276.
   2. Height: In accordance with Typical Detail.
   3. Size: 10 inches wide by 7 inches high.
   4. Heading: CAUTION
   5. Text: IMPURE WATER
      DO NOT DRINK

ATTACHMENT B - METAL SAFETY SIGN SCHEDULE

METAL SAFETY SIGN SCHEDULE

A. CHLORINATION AND SULFONATION EQUIPMENT:
   1. Location: Adjacent to exterior doors and gate of Chlorination-Dechlorination building.
   2. Size: 14 inches wide by 10 inches high.
   3. Heading: CAUTION
   4. Wording: CHLORINATION AND SULFONATION EQUIPMENT
      DANGEROUS GAS

B. NONPOTABLE WATER:
   1. Location: At impure water and nonpotable water hose valves in accordance with Typical Detail M276.
   2. Height: In accordance with Typical Detail.
   3. Size: 10 inches wide by 7 inches high.
   4. Heading: DANGER
   5. Wording: DO NOT DRINK THIS WATER

C. REMOTELY CONTROLLED AUTOMATIC EQUIPMENT:
   1. Location: On front and back of equipment that starts automatically by remote control.
   2. Heading: DANGER
   3. Wording: THIS EQUIPMENT STARTS AUTOMATICALLY
      BY REMOTE CONTROL

D. HIGH VOLTAGE WARNING:
   1. Location: On front and back of equipment, adjacent to doors to rooms containing devices, and devices that operate at 600 volts or greater.
   2. Heading: DANGER
   3. Wording: HIGH VOLTAGE
      KEEP OUT

E. NO SMOKING INFORMATIONAL SIGNS:
   1. Location: On exterior face of wall, adjacent to each entry point (exterior door) to all buildings.
   2. Height: 60 inches above floor to center of sign. Where metal safety signs are also located adjacent to entry points, place no smoking signs below these signs.
   3. Size: 6 inches square.
   4. Heading: None.
   5. Wording: None.
   6. Pictogram: International “No Smoking” symbol.

F. NO SMOKING WITHIN 25 FEET OF BUILDING ENTRY:
   1. Location: As indicated on the Drawings.
   2. Height: Pole mounted with top of sign at 5 feet above grade.
   3. Size: 14 inches wide by 10 inches high.
   4. Heading: NOTICE
   5. Wording: NO SMOKING WITHIN 25 FEET OF BUILDING.
   6. Pictogram: International “No Smoking” symbol.

G. ACCESSIBLE PARKING SIGN (POST MOUNTED AND REFLECTORIZED):
   1. Location: Centered on the parking space reserved for persons with disabilities in accordance with UBC 1129B5.
   2. Height: 60 inches from the bottom of sign to parking space finished grade, in accordance with UBC 1129B5.
   3. Size: Not smaller than 70 square inches.
   4. Wording: As required to suit local regulations.
   5. Pictogram: Symbol of accessibility in white on dark blue.

ATTACHMENT C - HAZARD MATERIAL SIGNALS

HAZARD MATERIAL SIGNALS

A. HAZARD SIGNAL FOR FERRIC CHLORIDE 35 - 45 PERCENT:
   1. Location: At entrances to locations where stored and on storage tanks.
   2. Health: 3
   3. Flammability: 0
   4. Reactivity: 0
   5. Special: -

SECTION 10520

FIRE PROTECTION SPECIALTIES

PART 1 GENERAL

1.01 SUMMARY

A. Section includes: Fire extinguishers and cabinets.

1.02 REFERENCES

A. ASTM International (ASTM):
   1. E814-11a - Standard Test Method for Fire Tests of Penetration Firestop Systems.

B. National Fire Protection Association (NFPA):
   1. 10 - Standard for Portable Fire Extinguishers.

C. Underwriters Laboratories, Inc. (UL):
   1. 711 - Rating and Fire Testing of Fire Extinguishers.

1.03 SUBMITTALS

A. Product data.
   1. Cabinets: Materials description for fire extinguisher cabinets include roughing-in dimensions, details showing mounting methods, relationships to surrounding construction, door hardware cabinet type and materials, trim style and door construction, door style and materials.
   2. Extinguishers: Materials description for fire extinguishers; include ratings and classifications.
   3. Installation instructions for each product specified.

B. Shop drawings:
   1. Small-scale plans showing locations of fire extinguisher cabinets and individual fire extinguishers.
   2. Schedule showing each type of cabinet and extinguisher to ensure proper fit and function.
   3. Indicate installation procedures and accessories required for a complete installation.

1.04 QUALITY ASSURANCE

A. Manufacturer qualifications: Minimum 5 years with satisfactory performance record.

1.05 WARRANTY

A. As specified in Section 01783 - Warranties and Bonds.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. The following or equal:
   1. Activar Construction Products Group – JL Industries.

2.02 FIRE EXTINGUISHERS

A. Multi-purpose chemical type:
   1. Extinguisher unit containing a fluidized and siliconized mono ammonium phosphate powder; nonconductive and nontoxic.
   2. Construction: Heavy duty steel cylinder with metal valve and siphon tube, o-ring seal, replaceable valve stem seal, visual pressure gage, pull pin and upright squeeze grip.
   3. Finish: Factory powder-coated: Red.
   4. UL Effectiveness Rating in accordance with UL 711: Class A, B, and C fires.
   5. UL Rating in accordance with UL 711: 4A-80BC.
   6. Drawing will use the symbol FE for “Fire Extinguisher”.

B. Regular dry chemical type:
   1. Extinguisher unit containing Halotron™.
   2. Size minimum: 11 pounds.
   3. Construction: Heavy duty steel cylinder with metal valve and siphon tube, o-ring seal, replaceable valve stem seal, visual pressure gage, pull pin, and upright squeeze grip.
   4. Finish: Factory powder-coated; Red.
   5. UL Effectiveness Rating in accordance with UL 711: Class B and C fires.
   6. UL Rating in accordance with UL 711: 2A-10BC.
   7. Drawing will use the symbol EFE for “Electrical Fire Extinguisher”.

2.03 WALL BRACKETS

A. Type: Standard as manufactured by fire extinguisher manufacturer.

2.04 EXTRA MATERIALS

A. Furnish a minimum 10 percent, but not less than 1, of fire extinguishers with brackets installed in addition to the number indicated on the Drawings.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install in accordance NFPA 10, Standard for Portable Fire Extinguishers.

3.02 LOCATIONS

A. Install fire extinguisher type, FE and EFE, as indicated on the Drawings.

B. Install fire extinguisher mounting in cabinets or wall brackets as indicated on the Drawings.

END OF SECTION

SECTION 10732

SHADE FABRIC

PART 1 GENERAL

1.01 SUMMARY

A. Work included: Fabricate, and install shade fabric on the structure as detailed including:
   1. Fabricated shade panels.
   2. Stainless steel cables.
   3. Clamping.
   4. Fasteners.

1.02 REFERENCES

A. ASTM International (ASTM):
   1. A307 - Standard Specification for Carbon Steel Bolts and Studs, 60 000 PSI Tensile Strength.
   2. F593 - Standard Specification for Stainless Steel Bolts, Hex Cap Screws, and Stops.
   3. F3125 - Standard Specification for High Strength Structural Bolts, Steel and Alloy Steel, Heat Treated, 120 ksi and 150 ksi Minimum Tensile Strength.

1.03 QUALITY ASSURANCE

A. Fabrication and erection is limited to firms with proven experience in design and construction of fabric shade structures and such firms shall meet the following minimum requirements:
   1. A single Contractor shall manufacture and erect the fabric shade.
   2. The Contractor shall demonstrate to have a minimum of 10 years of experience in the engineering, fabrication, and erection of permanent fabric structures.
   3. Contractor shall demonstrate that it has a staff of experienced fabric structure installation personnel who will undertake the installation of each project.

1.04 WARRANTY

A. After final payment, the Contractor shall furnish the Owner with a written 10-year warranty, which warrants that the fabric panels (cloth, stitching, and fading), its perimeter attachment system, and the structural support systems supplied and installed by the subcontractor has been installed in accordance with the project and manufacturer's specifications and will be free from defects in materials and workmanship which will impair its normal use or service.
   1. The warranty shall extend from the date of substantial completion of the fabric panel shade structure, specifically the first date on which the entire fabric panel system is subject to design pre-stress conditions.

1.05 SUBMITTALS

A. Contractor shall submit drawings and calculations showing the design meets all code provisions.

B. Calculations shall include the fabric attachment and tensioning.

PART 2 PRODUCTS

2.01 MANUFACTURERS/FABRICATORS

A. The following or equal:
   1. Sun Ports International, Inc.

2.02 DESIGN AND PERFORMANCE CRITERIA

A. Comply with the requirements of the building code specified in Section 01410 - Regulatory Requirements.

B. Design and fabricate shade fabric and support system for resistance to the following loads as specified in Section 01850 - Design Criteria:
   1. Seismic loading
   2. Wind loading, based on the requirements for "components and cladding."

C. Shade fabric shall be flame-resistant.

D. Life safety:
   1. Fabric shade structures shall be designed so no life safety issue is created in the event of a loss of a part of the fabric.
   2. The fabric structure shall not rely on the fabric for structural stability.

2.03 MATERIALS

A. Erection hardware:
   1. Bolt and fastening hardware shall be determined based on calculated engineering loads.
   2. Specifications, based on the following load requirements are:
      a. Low strength: ASTM F593 stainless steel bolts, nuts, and washers.
      b. Medium strength: ASTM A307 zinc-plated steel bolts, nuts, and washers.
      c. High strength: ASTM F3125, Grade A325 zinc-plated steel bolts, nuts, and washers.

B. Cable:
   1. Steel cable is a determined based on calculated engineering load.
      a. For light and medium loads: 1/4-inch (nominal) galvanized 7 by 19 cable is used.
      b. For heavy loads: 3/8-inch (nominal) galvanized 7 by 19 cable is used.

C. Thread:
   1. Gore™ TENARA® sewing thread is made up of 100 percent expanded polytetrafluorethylene fiber, known as Teflon™.
      a. The sewing thread carries a 10-year warranty against deterioration from exposure to the elements.
   2. Shall be high strength and low shrinkage.
   3. Shall have a wide temperature and humidity range.
   4. Flew and abrasion resistant and ultraviolet radiation immunity.
   5. Shall be unaffected by cleaning agents, acid rain, mildew, rot, chlorine, saltwater, and pollution.
   6. Lockstitch thread: 1200 Denier or approved equal.
   7. Chainstitch thread: 2400 Denier or approved equal.

D. Edge details:
   1. Perimeter shall contain cables and be double lock stitched.
      a. The cable shall be contained in a non-tear cloth edge firmly sewed to the fabric.
   2. Brass grommets spaced at one foot centers shall be installed inside the cable and in the non-tear edge.

E. Fabric:
   1. Raw material:
      a. Shadesure® High Density Polyethylene (or equal).
      b. Special chemicals for ultraviolet stability.
   2. Construction:
      a. Monofilament tape construction.
   3. Fabric panel material:
      a. Cloth shall be made of Shadesure® high density polyethylene cloth with ultraviolet stabilizer treatment (or equal).
      b. Color shall be as selected by Engineer.
         1) Red is not acceptable.
      c. The material shall be manufactured with tensioned fabric structures in mind.

d. The fabric knit is to be made using monofilament and tape filler which has weight of 0.6 ounce per square foot.
    1) Material to be Rachel knitted so material will not unravel if cut.
e. Burst strength of 35 pounds per square inch.

Finish	Stentored
Shade Protection	80 percent
UV Protection	90 percent
Tear Tests (lbs)	Warp 200 Weft 450 pounds
Fabric Weight (oz/m2)	6.9
Life Expectancy	12 years in sun
Fading	Minimum fading after 10 years
Temperature	-22 degrees Fahrenheit
Maximum Temperature	+ 176 degrees Fahrenheit

F. Rope:
    1. Polypropylene rope: Polypropylene rope for lacing the shade to the frame shall be ultraviolet resistant and have sufficient capacity to carry the weight of the shade, tension force and any wind and live loads applied to the fabric panel.

PART 3 EXECUTION

3.01 INSTALLATION AND SAFETY PROCEDURES

A. The Contract Work to be performed shall consist of furnishing all labor, materials, equipment, parts, and supplies necessary for installation.

B. Shade shall be attached to steel pipe frame using polypropylene rope.
    1. Shade shall be taut and be sloped to drain as indicated on the Drawings.

END OF SECTION

SECTION 11242

LIQUID CHEMICAL DIAPHRAGM-TYPE METERING PUMPS

PART 1 GENERAL

1.01 SUMMARY

A. Section includes: Positive displacement, diaphragm metering pumps; accessories, drives, and control panel requirements for pumping chemical solutions.

B. Tag numbers:
   1. As specified in Pump Schedule.

1.02 REFERENCES

A. Instrumentation Controls Specialty Contractor (ICSC).

B. International Society of Automation (ISA):
   1. ISA5.4 - Instrument Loop Diagrams.

C. National Electrical Code (NEC).

D. National Electrical Manufacturer's Association (NEMA):
   1. 250 - Enclosures for Electrical Equipment (1000 V Maximum).

E. NSF International (NSF):
   1. 61 - Drinking Water System Components - Health Effects.

F. Underwriters Laboratories, Inc. (UL):
   1. 508 - Standard for Industrial Control Equipment.
   2. 508A - Standard for Industrial Control Panels.
   3. 698A – Standard for Industrial Control Panels Relating to Hazardous (Classified) Locations.
   4. 1283 - Standard for Electromagnetic Interference Filters.
   5. 1449 - Surge Protective Devices.

1.03 SUBMITTALS

A. Submit as specified in Section 01330 - Submittal Procedures.

B. Product data: As specified in Section 15050 - Common Work Results for Mechanical Equipment.
   1. Design data, test reports, certificates, manufacturer’s instructions, manufacturer’s field reports:
      a. Chemical feed pumps:
         1) For each pump type, submit calibration charts and tables relating flow rate to stroke length and stroke rate.

2) Submit hydraulic modeling results for each pumping system.
    a) Confirm scheduled values or recommend new pressure setpoints for the backpressure valves and pressure relief valves listed in the Pump Schedule.
3) Submit calculations for each metering pump showing the suitability of each pump for the suction and discharge conditions of each application point.
    a) Pump manufacturer shall recommend and size an accumulator to be piped to the suction side of each metering pump, when required based on calculations.
4) Submit calculations recommending dimensions of pulsation dampener indicated on the Drawings.

C. Shop drawings: As specified in Section 15050 - Common Work Results for Mechanical Equipment.
    1. Provide a list of parameters, ratings, or other characteristics where the proposed chemical feed systems deviate from the requirements.
    2. Dimensions, including anchor bolt layout, materials of construction, size, weight, and performance data.
    3. Drawings: Provide electrical and instrumentation drawings showing coordination with electrical control devices operating in conjunction with the associated feed system.
    4. Dimensioned inlet and outlet connections.
    5. Current NSF 61 Certification for components to be in contact with associated chemical or potable water.
    6. Provide data showing chemical compatibility and history of service with the associated chemical for materials in the system.
    7. Control panel views showing equipment arrangement, doors, equipment layout inside the panel and dimensional information.
    8. Internal interconnecting wiring diagrams showing terminal strips and external devices connected to the panel as specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.
    9. Loop drawings for analog and discrete signals in accordance with ISA5.4.
    10. Complete schematic and diagrams including terminal block and wire identification numbers and device location symbols consistent with the Contract Documents.
    11. Panel bill of material with detailed description of components and equipment data sheets.
    12. Field cable numbers and terminations.
    13. Manufacturer’s Representative’s qualifications as specified in Section 01756 - Commissioning.
    14. Manufacturer’s certificate stating that the materials of construction are compatible with the pumped fluid.
    15. Manufacturer’s Certificate of Source Testing as specified in Section 01756 - Commissioning.
    16. Manufacturer’s Certificate of Installation and Functionality Compliance as specified in Section 01756 - Commissioning.
    17. Calibration curves for each pump relating stroke length to flow rate shall be supplied.

18. Capacity control shall be 0 to 100 percent with delivery repeatable within plus or minus 1 percent accuracy over at least a 10 to 1 range.
19. Motor and VFD supplier shall carefully review the intended application of the VFD and certify in writing that sizes provided are adequate for continuous or intermittent operations (whichever is the most severe operating condition.

D. Calculations: As specified in Section 15050 - Common Work Results for Mechanical Equipment.

E. Vendor operation and maintenance manuals: As specified in Section 01782 - Operation and Maintenance Manuals.
1. Provide information on each piece of equipment, including instrumentation.
2. Provide all safety considerations relating to operations and handling of the associated chemical.
3. Maintenance data shall include all information and instructions required by plant personnel to keep equipment properly cleaned, lubricated, and adjusted so that it functions economically throughout its full design life.
4. Lubrication charts and tables of alternate lubricants.
5. Name, address, and phone number of manufacturer and manufacturer's local service representative.

F. Commissioning submittals:
1. Provide Manufacturer's Certificate of Source Testing as specified in Section 01756 - Commissioning.
2. Provide Manufacturer's Certificate of Installation and Functionality Compliance as specified in Section 01756 - Commissioning.

1.04 WARRANTY

A. Provide warranty as specified in Section 01783 - Warranties and Bonds.

B. Special warranty:
1. Provide an additional 2 years manufacturer's warranty, issued in the name of the Owner, for all equipment provided under this Section.

1.05 DELIVERY, STORAGE AND HANDLING

A. Packing, shipping, handling, and unloading:
1. Pack for shipping and outdoor storage at the project site for up to 6 months.
   a. Apply temporary corrosion protective coatings to unpainted components and pack components to protect from the elements.
2. Ship pump and drive completely assembled.
   a. VFD shall be shipped unwired to the motor for field wiring.

PART 2 PRODUCTS

2.01 GENERAL

A. A single pump manufacturer shall furnish and coordinate all drives and pump components specified in this Section, including motors, gears, couplings, supports,

and other specified accessories and appurtenances to ensure compatibility and integrity of the individual components.

B. The manufacturer of the pumps shall have sole-source responsibility for furnishing the complete assemblies and meeting the specified performance requirements.

2.02 DESIGN AND PERFORMANCE CRITERIA

A. General: Provide mechanically actuated, positive displacement, diaphragm type chemical metering pumps, accessories, and other items required for a complete and operational system. Each chemical metering pump system shall include, but not be limited to, the following items, which shall be supplied by the chemical metering pump manufacturer.
   1. Pumps.
   2. Motors.
   3. Variable frequency drive (VFD) (as applicable).
   4. DC Drive (as applicable)
   5. Control panels.
   6. Calibration columns.
   7. Pulsation dampeners.
   8. External pressure relief valves.
   9. Diaphragm back pressure valves.

B. Fluid characteristics:
   1. Ferric chloride:
      a. Dry chemical formula: $2FeCl_3$.
      b. Solution concentration: 40 percent by weight.
      c. Solution pH: < 2.
      d. Solution specific gravity: 1.4.

C. Design requirements:
   1. Pump:
      a. Dry self-priming, capable of being run dry without damaging effects to pump.
   2. Motor characteristics:
      a. As specified in this Section and in Section 16222 - Low Voltage Motors up to 500 Horsepower.
      b. Minimum acceptable motor size is 1/2 horsepower.
   3. VFD characteristics: As specified in this Section.
   4. Shafting and couplings: Design shafting and couplings to withstand a minimum of 1.5 times the maximum operating torque or other imposed loads.
   5. Supports:
      a. Provide pump and driver supported on a common base.
      b. Design anchor bolts to withstand a minimum of 1.5 times the maximum imposed operating loads or 1.0 times the imposed seismic loads, whichever is greater.

D. Performance requirements:
   1. Systems shall deliver the pressures and volumes listed for their respective services in the Pump Schedule.

E. Product requirements as specified in Section 01600 - Product Requirements and Section 15050 - Common Work Results for Mechanical Equipment.

2.03 PUMPS

A. Existing products:
   1. Existing facility has ProMinent brand pumps.
   2. New pumps must match style, material, finish, operation, and dimensions.

B. Equipment:
   1. Pump:
      a. Manufacturer, no equal:
         1) Prominent Fluid Controls, Inc.
   2. Type: Simplex chemical proportioning pumps of the positive displacement diaphragm type.
   3. Materials:
      a. The metering pumps and their components and accessories shall be suitable for the following chemical concentrations, as scheduled in this Section:
         1) Ferric chloride:
            a) Wetted parts shall be suitable for use with 23 to 43 percent ferric chloride solution.
            b) Other non-specified materials are to be manufacturer’s standard for continuous service with 23 to 43 percent ferric chloride solution.
      b. Diaphragm materials:
         1) Flat, composite, mechanically actuated diaphragms shall be Viton™, EPDM or PTFE faced as pump manufacturer deems suitable for the pumped liquid, fiber reinforced and bonded to an elastomeric support with a Type 316 stainless steel backing plate.
         2) Flat, composite, hydraulically actuated diaphragms shall be Viton™, EPDM or PTFE faced as pump manufacturer deems suitable for the pumped liquid.
         3) Tubular, hydraulically actuated diaphragms shall be Viton™, EPDM or PTFE lined, as pump manufacturer deems suitable for the pumped liquid.
      c. Other parts in contact with pumped liquid: PTFE, PVC, or other suitable thermoplastic.
   4. Characteristics:
      a. Diaphragm simplex chemical proportioning pumps of the positive displacement diaphragm type.
      b. The diaphragm shall be mechanically actuated.
      c. Liquid end:
         1) Liquid end shall be sealed by means of an O-ring of material compatible with the pumped liquid.

2) Pumps for sodium hypochlorite service shall be equipped with an off-gassing valve.
3) Liquid end of each metering pump shall be fitted with a system to detect early stage diaphragm failure. Upon actuation, the leak detector shall stop the pump, light a locally visible LED and sound a remote alarm.

5. Components:
   a. Manually controlled external stroke controllers.
   b. Suction and discharge single check valves.
   c. Built-in internal or external, adjustable pressure relief valve to relieve pressure in the event of discharge line stoppage; which shall be factory set to relieve at 100 pounds per square inch gauge.
   d. Hydraulic make-up and air bleed valves.
6. Accessories: As indicated on the Drawings, pumps shall be equipped with:
   a. Calibration column in suction piping.
   b. Diaphragm backpressure, pulsation dampener, and pressure relief valve in discharge piping.
7. Tests and inspections:
   a. As scheduled in this Section.
8. Verification of performance.

2.04 MOTOR

A. Type:
1. Each chemical metering pump shall be motor-driven through a flexible coupling, or direct-connected to the pump when manufacturer's standard.
2. Pumps and motors shall be mounted on floor-mountable base plates.
   a. Coupler:
      1) Manufacturers: One of the following or equal:
         a) Dodge, Para-flex.
         b) Falk, Type WA.
         c) Baldor.

B. Characteristics:
1. Electric motors shall be as specified in Section 16222 - Low Voltage Motors up to 500 Horsepower.

2. Motors and motor starters shall be furnished by the pump manufacturer and shall be coordinated with the requirements of the pumps and the following characteristics:

Tag Number	PMP-85183
Driver Type	DC Drive
Drive Coupling	Close-coupled, Verfical
Horsepower (Minimum)	1/2
Supply Voltage/Phase/Hertz	120/1/60
Speed (Maximum)	1,750 rpm
Service Factor	1.0
Ambient Temperature	40 degrees Centigrade
Maximum Temperature Rise	40 degrees Centigrade
Enclosure	TENV
Insulation	Class F
Bearings	6203
Fasteners	

3. PMP-85183 (Coagulant Pump): The motor shall be a permanent magnet type, having a 90-volt direct current armature rating, and horsepower not less than the minimum specified rating. If the pump and motor are replaced to match the existing system, use Baldor Motor CDP3330 with Spec No. 33-2092Z122. This is a special-order motor with longer motor leads and should also be suitable for mounting an encoder on the NDE of the motor. Use Dart Controls DC Drive MD50P with encoder for monitoring speed feedback.
4. Motor shall have a thermostat for high temperature shutdown.
5. The motor brushes shall have tinned leads.

2.05 VENDOR CONTROL PANEL

A. General:
   1. Replace existing DC drive only, all other existing components to remain in place.

B. DC drive with integrated controller:
   1. Manufacturer: The following, no equal:
      a. Dart Controls, MD50P with OPT420 module.
   2. Display: 1/2 inch LED.
   3. Ambient temperature: -10 – 45 degrees Celsius.
   4. Line input frequency: 60 Hz.
   5. Overload capacity: 200 percent for 1 minute.

C. Monitoring and control:
    1. Dry contact rating: 120 VAC at 10 A.
    2. Analog signal type: 4-20 mA.
    3. Provide optional modules as needed for inputs and outputs listed below.
    4. VCP Inputs:
        a. Control:
            1) Accept a pump speed set point (4-20 mA input).
    5. VCP Outputs:
        a. Status:
            1) Running (dry contact).
            2) ESTOP pressed (dry contact).

2.06 CONTROL STRATEGY

A. General.

B. Hardwired control functions:
    1. Provide components required so that existing dilution water solenoid valve located in non-potable water line on the discharge side of the pump will be commanded to open when the pump is running and commanded to close when the pump is stopped.
    2. With the HOA switch in HAND:
        a. The pump may be started, stopped, and speed adjusted by the DC drive controller.
    3. With the HOA switch in OFF:
        a. The pump is stopped.
    4. With the HOA switch in AUTO:
        a. The pump receives a speed setpoint from the PCS via 4 – 20 mA input. If the speed is set to 0 percent (4mA), the pump shall stop.

2.07 SPARE PARTS

A. Vendor to provide spare parts that are required to provide uninterrupted operation for a minimum of 2 years.

B. Additional spare part requirements as specified in the Contract Documents.

2.08 ACCESSORIES

A. Pulsation dampeners:
    1. Manufacturers: One of the following or equal:
        a. Kemlon Products.
        b. Blacoh Fluid Controls, Inc.
        c. Pulsafeeder.
    2. Pulsation dampeners shall be furnished and installed on each chemical metering pump’s discharge lines as indicated on the Drawings and scheduled in this Section.

3. Materials:
    a. Pulsation dampeners shall have Hypalon diaphragms and CPVC, PVC, stainless steel, or lined cast iron chamber.
        1) Materials shall be compatible with the pumped liquid at the specified concentration, and suitable for outdoor use and exposure.
4. Characteristics:
    a. Pulsation dampeners shall be gas or air charged, single diaphragm type complete with valved gas/air charge valve connection and pressure gage graduated from 0 to 150 pounds per square inch.
    b. Pulsation dampeners shall allow no more than 6 percent discharge pressure fluctuation.
5. Dampeners shall be provided with a true-union ball valve for shutoff.

B. Calibration columns:
1. Materials:
    a. Materials shall be compatible with the pumped liquid and concentration specified in this Section, and suitable for outdoor use and exposure.
2. Characteristics:
    a. Furnish and install calibration columns, 1 for each chemical metering pump, on each chemical pump's inlet line as indicated on the Drawings and specified in this Section.
        1) Columns shall be translucent.
    b. Provide top cap threaded connection with vent piped to floor to prevent entry of foreign materials and to direct spillage or overflow.
    c. End connections shall be threaded.
    d. Capacities and graduations shall be as indicated in the schedule in this Section.

C. Diaphragm backpressure and pressure relief valves:
1. As specified in Section 15118 - Pressure Reducing and Pressure Relief Valves.
2. Manufacturers: One of the following or equal:
    a. Wallace and Tiernan.
    b. Pulsafeeder.
    c. Griffco.
    d. Milton Roy Co.
3. Materials:
    a. Valves shall be of suitable materials for the pumped liquid.
4. Characteristics:
    a. Ported to serve as either a backpressure valve or a pressure relief valve.
    b. Relief valve shall be plumbed to the nearest chemical drain, or back to the pump suction on the non-pump side of the pump suction isolation valve, to avoid spillage, as indicated on the Drawings.
    c. Valves shall be furnished and installed on each chemical metering pump's discharge lines as indicated on the Drawings and scheduled in this Section.

d. Valves shall have an adjustable spring range to match existing. Valves shall be factory adjusted for the backpressure recommended by the pump manufacturer.
e. Valves shall produce a back pressure no greater than 10 pounds per square inch above valve set pressure when metering pumps are operating at full capacity, pulsating flow.

D. Additional accessories:
1. Additional accessories required for the system but not required to be supplied by the pump manufacturer include:
a. Isolation valves as specified in Section 15111 - Ball Valves for suction and discharge piping as indicated on the Drawings.

2.09 NAMEPLATES

A. Each pump, gearbox, and motor shall have, securely affixed in a conspicuous location, a stainless steel nameplate with raised letters providing the manufacturer's model, serial number, rating, range, speed and other pertinent data.

2.10 SPARE PARTS AND SPECIAL TOOLS

A. Spare parts: Furnish the following spare parts packed and labeled for warehouse storage:
1. Complete set of inlet and outlet ball check valves (balls, seats and gaskets) and a diaphragm for each pump.
2. 1 complete spare parts kit for each pump provided.
3. An initial supply of all oils, greases, and lubricants required to start operations. Supply an amount of these materials equivalent to 1 year of continuous operation for each system.

B. Special tools: Deliver 1 set for each furnished pump type and size needed to assemble and disassemble pump system.

PART 3 EXECUTION

3.01 COMMISSIONING

A. As specified in Section 01756 - Commissioning and this Section.

B. Manufacturer services:
1. Provide certificates:
a. Manufacturer's Certificate of Source Testing.
b. Manufacturer's Certificate of Installation and Functionality Compliance.
2. Manufacturer's Representative onsite requirements:
a. Installation: 1 trip, 1 day minimum.
b. Functional Testing: 1 trip,1 day minimum each.
3. Training:
a. Maintenance: 4 hours per session, 1 sessions.
b. Operation: 2 hours per session, 21 sessions.

4. Process operational period:
    a. As required by Owner or Contractor.

C. Source testing: As specified in Pump Schedule.

D. Functional testing: As specified in Pump Schedule.

3.02 SCHEDULES

A. Pumps:

Tag Number	PMP-85183
Feed Point	AWT Packaged Filter/Clarifiers No. 1 to No. 4
Service	Ferric Chloride
Pump Type	Single Diaphragm
Number of Pumps	1
Named Manufacturer	Prominent
Pump Characteristics	
Design Conditions:	
Maximum Flow, (gallons per hour)	20.4
Pump Stroke Range (strokes per hour)	144
Source Testing	
Test Witnessing	Not Witnessed
Performance Test Level	1
Vibration Test Level	None
Noise Test Level	None
Functional Testing	
Performance Test Level	1
Vibration Test Level	1
Noise Test Level	1

1. Provide pumps that deliver the maximum capacity, listed in the above table, when at full speed and maximum stroke length.

END OF SECTION

SECTION 11294B

HEAVY-DUTY FABRICATED STAINLESS STEEL SLIDE GATES

PART 1 GENERAL

1.01 SUMMARY

A. Section includes: Heavy-duty fabricated stainless steel slide gates.
   1. Gate Schedule is included in the Drawings.

B. As specified in Section 01600 - Product Requirements.

1.02 REFERENCES

A. American Water Works Association (AWWA):
   1. C561 - Fabricated Stainless Steel Slide Gates.

B. American Welding Society (AWS):
   1. D1.6 - Structural Welding Code-Stainless Steel.

C. ASTM International (ASTM):
   1. A276 - Standard Specification for Stainless Steel Bars and Shapes.
   2. B584 - Standard Specifications for Copper Alloy Sand Castings for General Application.
   3. D1248 - Standard Specification for Polyurethane Plastics Extrusion Materials for Wire and Cable.
   4. D2000 - Standard Classification for Rubber Products in Automotive Applications.
   5. D4020 - Standard Specification for Ultra-High Molecular-Weight Polyethylene Molding and Extrusion Materials.

1.03 DEFINITIONS

A. Design Head: Depth from surface of water to centerline of gate. Use value specified in the gate schedule.

B. Seating Head: Pressure applied to gate slide from weight of water column above gate centerline that forces gate slide into seat.

C. Slenderness Ratio (l/r): The largest ratio obtained by dividing the unsupported length of the stem by the radius of gyration of the stem cross section.

D. Substantially Similar:
   1. Similar in size, design head, and service.
   2. Utilizes the proposed design for critical components including guides and seals.

E. Unseating Head: Pressure applied to gate slide from weight of water column above gate centerline that forces gate slide away from seat.

1.04 SUBMITTALS

A. Submit as specified in Section 01330- Submittal Procedures.

B. Product data: As specified in Section 15050 - Common Work Results for Mechanical Equipment.

C. Shop drawings: As specified in Section 15050 - Common Work Results for Mechanical Equipment.

D. Calculations: As specified in 15050 - Common Work Results for Mechanical Equipment:
   1. Calculations and design data substantiating conformance with the Drawings and specifications.
   2. For coordination purposes, gate manufacturer shall supply calculations verifying the suitability of the selected operator for the application.
      a. For all gates:
         1) The maximum torque required for operation of the gate (including breakaway from seat) with a safety factor of 1.4.
         2) Indicate thrust value and stem factor.
      b. For manually operated gates coordinate with Section 13446 - Manual Actuators.
   3. Gate opening and closing thrust forces that will be transmitted to the support structure with operator at extreme positions and load.
   4. Breakaway torque from seat. Indicate thrust value and stem factor.
   5. Guide frame in accordance with AWWA C561 stress threshold compliance for exterior guide leg and fasteners.
   6. Anchorage calculations in accordance with Section 15050 - Common Work Results for Mechanical Equipment.

E. Shop drawings:
   1. Layout and installation drawings for each gate size and type.
   2. Wall thimbles design.
   3. Complete bill of materials.

F. Vendor operation and maintenance manuals: As specified in Section 01782 - Operation and Maintenance Manuals.

G. Commissioning submittals:
   1. Provide Manufacturer’s Certificate of Installation and Functionality Compliance as specified in Section 01756 - Commissioning.
   2. Leakage test results.

H. Manufacturer's installation instructions.

1.05 QUALITY ASSURANCE

A. Manufacturer qualifications:
   1. Minimum 10 years of experience in production of fabricated stainless steel slide gates substantially similar to the equipment specified.

2. Submit evidence of satisfactory operation in at least 20 different installations in the United States using the proposed guides and seals design.
3. Multiple gates at a plant shall be considered as one installation toward meeting the experience requirements.

B. Manufacturer's shop welds, welding procedures, and welders: Qualified and certified in accordance with the requirements of AWS D1.6.

C. Factory markings:
1. Mark gates according to the scheduled equipment tag numbers when such numbers are used.
2. For thimbles, frames, and other non-interchangeable components, match mark the entire system.

D. Assembled gates: Shop inspected, adjusted, and tested before shipment.

1.06 WARRANTY

A. Provide warranty as specified in Section 01783 - Warranties and Bonds.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Manufacturers: One of the following or equal.
1. H. Fontaine, Series 20.
2. Whipps, Inc., Series 900.
3. Waterman Industries, SS-250.
4. Rodney Hunt, Series A-113 or A-114.
5. Hydro Gate, Model HG-561.
6. RW Gate, Model RW1000-S.

B. Operator anchor bolts and wall thimbles: Provided by manufacturer of slide gates.

2.02 DESIGN AND PERFORMANCE CRITERIA

A. Maximum allowable leakage shall be 0.10 gallons per minute per foot of sealing perimeter, the allowable limits set forth in AWWA C561. Leakage testing shall be conducted in accordance with AWWA C561.

B. Except as modified or supplemented as specified in this Section, all gates and operators shall conform to the requirements of AWWA C561, latest edition.

C. Gate components:
1. Frames:
a. Design for the design head scheduled with a minimum safety factor of 5 with regard to ultimate tensile, compressive, and shear strength.
b. Self-contained gates: Where frames extend above the operating floor, design to be self-supporting so that no further reinforcing or support is required.

2. Stem: Select stem diameter, stem guide quantity and stem guide spacing based on following criteria:
    a. Slenderness ratio (l/r): Shall not exceed 200.
    b. Maximum diameter: Provide stem guides at a spacing to maintain stem diameter of 2 inches or less.
    c. Tensile strength: Suitable to withstand the force generated by the operator with the application of a 200-pound force applied to the crank or handwheel or a 250-foot-pound torque applied to the wrench nut.
    d. Compressive strength:
        1) Suitable to withstand buckling due to the force generated by the operator with the application of an 80-pound force applied to the crank or handwheel or a 100-foot-pound torque applied to the wrench nut.
        2) Determine buckling load using Euler Column formula in accordance with AWWA C561, where C = 2.
    e. Design force for power actuators:
        1) Hydraulic cylinder operators: 1.25 times the output thrust at maximum hydraulic fluid operating pressure.
        2) Electric motor operators: 1.25 times the output thrust in the stalled-motor condition.
    f. Gates having widths greater than 2 times the height: Provide with 2 lifting mechanisms connected by a tandem shaft.
3. Thrust nut: Suitable to withstand thrust developed by operator with the application of a 40-pound force on the crank or handwheel with safety factor of 5. Base design on ultimate strength of material used.
4. Yokes for self-contained gates:
    a. Design yoke using design loading criteria for stem with safety factor of 5 based on the ultimate strength of the material used.
    b. Maximum deflection at design load: Not to exceed 1/360th of the span.
5. Slide:
    a. Deflection shall be less than or equal to 1/1000 of the span of the gate or 1/16 inch, whichever is less, under the design head.
    b. Design for the maximum design head specified with a minimum safety factor of 5 with regard to ultimate tensile, compressive, and shear strength.

2.03 MATERIALS

A. Stainless steel: ASTM A276, Type 304:
    1. Components or structural shapes which are welded: ASTM A276, Type 304L.
        a. Manufacturer's shop welds, welding procedures, and welders:
            1) Qualified and certified in accordance with the requirements of AWS D1.6.
    2. All wetted and unwetted parts including all fasteners and hardware, except as specified in this Section, shall be stainless steel.

B. Ultra-high molecular weight polyethylene: ASTM D1248 and D4020, virgin materials only.

C. Neoprene: ASTM D2000, Grade 2 BC 510.

D. Manganese bronze: ASTM B584, UNS Number C86500 or Alloy 432.

E. Silicon bronze: ASTM B584 UNS Number C87300.

2.04 COMPONENTS

A. Slide:
   1. Type 304L stainless steel.
   2. Rectangular or square.
   3. Fabricated with a flat plate reinforced with formed plates or structural members.

B. Frame:
   1. Construct gate frame of Type 304L stainless steel structural members or formed plate welded to form a rigid 1-piece frame.
      a. Capable of providing true dimensions within tolerances and preventing binding and excessive wear of sliding parts.
   2. Mounting: As indicated on the Drawings and Slide Gate Schedule.
      a. Centerline of anchors shall be located no closer than 4-1/2 inches from the edge of concrete opening for face-mounted gates.
   3. Adjustable ultra-high molecular weight polyethylene pressure pads.
   4. Flush bottom type unless otherwise indicated on the Drawings.
   5. Allow replacement of top, side, and bottom seals without removing the gate frame from concrete or wall thimble.
   6. Machine surfaces matching with thimble. Provide seal between gate frame and thimble that will meet leakage performance requirements.
   7. Embedded gates: Extend frame to provide access to pressure pad adjusting screws (For seal design alternatives A and B only).

C. Yoke for self-contained gates:
   1. Type 304L stainless steel.
   2. Extend guides and frame so that bottom of yoke is at least 12 inches above top of slide at full open position.
   3. Bolt or weld to frame.
   4. Provide mounting plate on top of yoke to mount operator.
   5. Design yoke to allow removal of gate slide.

D. Guides:
   1. Type 304L stainless steel with ultra-high molecular weight polyethylene insert in contact with gate.
   2. Minimum face width of 1 inch.
   3. Length: To support the slide fully in the open position.
   4. Anchor bolts shall not pass through the guides and seals.

E. Seals:
   1. Designed to achieve the specified leakage requirements.
   2. Sealing and sliding surfaces shall provide a low coefficient of friction with the surface of the slide.
   3. Field replaceable without removing gate from concrete or wall thimble.
   4. Anchor bolts shall not pass through the guides and seals.
   5. J-bulb seals are not acceptable.

6. Minimum seating surface width: 3/4 inch in contact with slide.
7. Bottom seal:
    a. Resilient neoprene, minimum durometer of 45.
    b. Attached to the bottom of the slide or embedded in gate frame invert.
    c. Compressed by closing action of gate slide against plate for all standard upward opening gates.
8. Side and top seals:
    a. Provide one of the seal design alternatives listed below.
    b. Seal design alternative A:
        1) UHMWPE fixed sealing surfaces that surround the clear opening.
        2) Held in place in the guide with Type 304 stainless steel fasteners.
        3) Seal compression shall be maintained by UHMWPE field adjustable pressure pads mounted to the slide with Type 304 stainless steel fasteners.
    c. Seal design alternative B:
        1) Neoprene crown seal with UHMWPE bearing bars.
        2) Attached to the slide with Type 304 stainless steel fasteners.
        3) Crown seal shall be actuated by water pressure in either the seating or unseating direction.
        4) Primary contact with the slide shall be through the UHMWPE bearing bar. The neoprene shall not be solely relied upon for the contact seal.
        5) Seal compression may be maintained by UHMWPE field adjustable pressure pads mounted to the guide with Type 304 stainless steel fasteners.
    d. Seal design alternative C:
        1) UHMWPE self-adjusting type seals: Utilize a continuous compression cord to ensure contact between the seals and the slide.
            a) An O-ring is not acceptable in lieu of compression cord.
        2) Side seals:
            a) Attach to frame using one of the following approaches.
                (1) Held in place between the front and back angles of the guide with Type 316 stainless steel bolts passing through the guide and seal along the length of the guide.
                (2) Held in place between front and back of a formed, 1 piece, rigid channel guide. Attach seals to frame using Type 316 stainless steel bolts.
            b) Design and installation shall provide access to and removal of the bolt to allow removal of the side seal without removing the gate from the concrete.
        3) Top Seal: UHMWPE self-adjusting type seal with double compression cord.
9. Provide invert seal for all downward (weir) gates.
10. Set seals to be slightly compressed with slide in closed position.

F. Stem:
1. Type 304 stainless steel.
2. Machine cut or rolled full depth ACME threads.
3. Diameter: Capable of withstanding anticipated opening and closing thrusts under head as indicated on the Drawings. Minimum stem diameter: 1-1/2 inch at the threads.
4. Length: Capable of permitting easy installation and removal.

5. Stem couplings:
    a. Silicon bronze or Type 304 stainless steel.
    b. Threaded and keyed to stem or threaded and bolted to stem.
6. Stem guides:
    a. Type 304 stainless steel.
    b. Split collar.
    c. Adjustable in 2 directions.
    d. Ultra-high molecular weight polyethylene bushing.
7. Provide manganese bronze stop collar on stem above actuator.
8. Drill and connect stem to slide structural sections with Type 304 stainless steel bolts.
9. Coordinate the selection of the gate stem configuration with the gate operator and operating speed.
    a. The selected gate stem configuration shall provide the most efficient combination of stem diameter/pitch/lead and keep the operating temperature at the stem nut to a minimum during operation.
    b. For motorized applications, if the proposed gate stem configuration would result in any deviation from the operating rise rate specified in Section 13447 - Electric Actuators, submit proposed deviation for approval by the Engineer.

G. Operating nut:
1. Locate at operator level.
2. Material: Manganese bronze.

H. Gate operators: As scheduled and specified in Section 13446 - Manual Actuators.
1. Provide cranks and gears necessary to bring operator to height specified, or typical operator height of 3 feet 6 inches if not otherwise shown.

I. Bolts, nuts, and fittings: Type 304 stainless steel.

J. Anchor bolts: Type 316 stainless steel of sufficient quantity and length to anchor the gate.
1. Quantity, size, and location of anchor bolts shall be determined by the gate manufacturer in accordance with requirements of Section 15050 - Common Work Results for Mechanical Equipment.

2.05 WALL THIMBLES

A. Provide wall thimbles for gates where scheduled and as indicated on the Drawings.

B. F-section of a depth equal to the thickness of the structure wall upon which the gate is mounted.
1. Modify F-sections where required for F-section and pipe bell ring connections in a wall.
    a. Provide flange-by-mechanical joint or flange by push on joint wall thimble where ductile iron piping connects to the wall thimble. Ensure that joint wall thimble has sufficient embedment to resist pipe thrust.
    b. Provide flange-by-bell ring wall thimble insert where reinforced concrete piping connects to the wall thimble.

C. Fabricated Type 304L stainless steel of sufficient section to resist permanent distortion; minimum 3/8-inch-thick plate.

D. Width of mounting flange of wall thimble: 1/2 inch wider than mounting flange of gate.

E. Fully machine front flange of thimble to a plane Drill and tap to match the drilling on the flange back gate seat.

F. Clearly mark top center of each thimble for installation.

G. Provide Type 304 stainless steel studs for attaching the gate frame.

H. Seal joint between thimble and gate watertight, in accordance with AWWA C561.

I. To permit entrapped air to escape as the thimble is being cast in concrete, drill holes in each entrapment zone formed by ribs, flanges, and water stops.

J. Provide annular weep ring to control seepage and resist thrust, where needed to anchor the pipe thrust restraint system.
   1. Continuously weld weep ring to outside of the wall thimble.
   2. Weep ring shall be minimum 1/4 inch thick and minimum 2 inches deep.

2.06 FINISHES

A. Stainless steel:
   1. Surface preparation of gates and stop plates after fabrication to remove weld splatter and to polish scratches:
      a. Shot blast.
   2. Clean the entire surface to produce an even color and sheen.

B. Operators, stands, and other accessory equipment: Surface preparation, factory prime, field prime, and finish coats as specified in Section 09960 - High-Performance Coatings.

2.07 FABRICATION

A. Shop assembly:
   1. Gates shall be factory assembled, adjusted, and tested.
   2. Mount all accessories and appurtenances including, but not limited to, motor operators and limit switches so that the complete system may be tested at the factory.

PART 3 EXECUTION

3.01 EXAMINATION

A. Inspect all components for shipping damage, conformance to specifications, and proper torques and tightness of fasteners, as specified in Section 15050 - Common Work Results for Mechanical Equipment.

3.02 INSTALLATION

A. Install equipment as indicated on the Drawings and as specified in Section 15050 - Common Work Results for Mechanical Equipment and the manufacturer's written installation instructions.

B. Mount thimbles and gates plumb in both vertical planes and level in horizontal plane.

C. Coat seating surfaces between frame and wall thimble with a waterproof plastic compound or provide EPDM gasket prior to tightening frame studs.

D. Adjust wedges or other parts of the gate to the point where it will not be possible to insert a 0.004 inch feeler gauge between the gate slide and the gate frame at any point.
   1. Securely lock wedges into position after adjustment.

E. Adjust limit switches in electric and hydraulic operators in accordance with manufacturer's instructions.

F. Face mounted gates:
   1. Where wall thimbles are not provided, mount gate to wall with anchor bolts and provide a 1-inch grout pad in accordance with manufacturer’s recommendations.

G. Embedded gates:
   1. Provide blockouts in sidewalls and channel bottom for installation of gates.
   2. After gate placement, adjustment, and alignment in accordance with manufacturer’s recommendations, grout frame with non-shrink grout.

3.03 COMMISSIONING

A. As specified in Section 01756 - Commissioning and this Section.

B. Manufacturer services:
   1. Provide certificates:
      a. Manufacturer’s Certificate of Installation and Functionality Compliance.
   2. Manufacturer’s Representative onsite requirements:
      a. Installation: 1 trip, 1 day minimum.
      b. Functional Testing: 1 trip, 1 day minimum each.
   3. Training:
      a. Maintenance: 2 hours per session, 2 sessions.
      b. Operation: 2 hours per session, 2 sessions.
   4. Process operational period:
      a. As required by Owner or Contractor.

C. Functional testing:
   1. Test witnessing: Witnessed.
   2. After gate installation and checking, run gates through at least 2 full cycles from the closed position to full open position and back to the closed position.

3. Leakage tests:
    a. Conduct in accordance with AWWA C561. Comply with specified allowable leakage limits.

3.04 GATE SCHEDULE

A. The Gate Schedule is indicated on the Drawings.

B. Gate Schedule is not a take-off list.
    1. Contractor shall provide gates specified and as indicated on the Drawings.

END OF SECTION

SECTION 11312D

VERTICAL TURBINE SHORT SETTING CENTRIFUGAL PUMPS

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Pump systems including vertical turbine pumps with radial, mixed flow, or axial (propeller) type impellers and drivers as scheduled.

B. Tag numbers: As specified in Pump Schedule.

1.02 REFERENCES

A. American Bearing Manufacturers Association (ABMA):

   12. B584 - Standard Specification for Copper Alloy Sand Castings for General Applications.

13. F593 - Standard Specification for Stainless Steel Bolts, Hex Cap Screws, and Studs.
14. F594 - Standard Specification for Stainless Steel Nuts.

E. Hydraulic Institute (HI):
1. 9.1-9.5 - Pumps - General Guidelines for Types, Definitions, Application, Sound Measurement and Decontamination.
2. 14.1-14.2 – Rotodynamic Pumps for Nomenclature and Definitions.
3. 14.3 - Rotodynamic Pumps for Design and Application.
4. 14.4 - Rotodynamic Pumps for Installation Operation and Maintenance.
5. 14.6 - Rotodynamic Pumps for Hydraulic Performance Acceptance Tests.

1.03 DEFINITIONS

A. Pump head (total dynamic head, TDH), flow capacity, pump efficiency, net positive suction head available (NPSHa), and net positive suction head required (NPSHr): As defined in HI 9.1-9.5, 14.1-14.2, 14.3, 14.4, and 14.6 and as modified in the Specifications. The pump head and efficiency are evaluated at the outlet of the discharge head and include the net losses in the pump column and discharge head, and intake basket or strainer (when specified).

B. Flow, head, efficiency, and motor horsepower specified in this Section are minimums unless stated otherwise.

C. Suction head: Gauge pressure available at pump intake flange or bell in feet of fluid above atmospheric.

D. Tolerances: This Section and related sections contain tolerances that may be more stringent than Hydraulic Institute Standard tolerances. Where tolerances are not mentioned, Hydraulic Institute Standards 9.1-9.5, 14.1-14.2, 14.3, and 14.4 shall apply.

E. Allowable Operating Region (AOR): The region over which the service life of the pump is not seriously compromised by hydraulic loads, vibration, or flow separation where the pump's vibration, noise, and cavitation are within acceptable limits.

F. Preferred Operating Region (POR): The region over which the service life of the pump will not be significantly affected by hydraulic loads, vibration, or flow separation where the pump's vibration, noise, and cavitation are within acceptable limits.

1.04 SUBMITTALS

A. Submit as specified in Section 01330 - Submittal Procedures.

B. Vibration analysis: Submit as specified in Section 15050 - Common Work Results for Mechanical Equipment when scheduled.

C. Product data: As specified in Section 15050 - Common Work Results for Mechanical Equipment:
    a. Pump certification as specified in Section 01600 - Product Requirements.
    b. Weighted average lead calculations as specified in Section 01600 - Product Requirements.

D. Shop drawings: As specified in Section 15050 - Common Work Results for Mechanical Equipment.

E. Calculations: As specified in Section 15050 - Common Work Results for Mechanical Equipment:
    1. Torsional analysis: Submit as specified in Section 15050 - Common Work Results for Mechanical Equipment when scheduled.

F. Vendor operation and maintenance manuals: As specified in Section 01782 - Operation and Maintenance Manuals.

G. Commissioning submittals:
    1. Provide Manufacturer's Certificate of Source Testing as specified in Section 01756 - Commissioning.
    2. Provide Manufacturer's Certificate of Installation and Functionality Compliance as specified in Section 01756 - Commissioning.

1.05 QUALITY ASSURANCE

A. As specified in Section 15050 - Common Work Results for Mechanical Equipment.

B. Provide pumps specified in this Section from same manufacturer.

C. Vibration analysis: Provide equipment vibration analysis as specified in this Section.
    1. Vibration analysis level: As scheduled and as specified in Section 15050 - Common Work Results for Mechanical Equipment.
    2. Vibration analysis expert: Provide when scheduled.

D. Manufacture's Certificate of Installation and Functionality Compliance as specified in Section 01756 - Commissioning.

1.06 WARRANTY

A. As specified in Section 01783 - Warranties and Bonds.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. One of the following or equal:
    1. Flowserve; model as scheduled.
    2. Sulzer/Johnston Pumps; similar to scheduled model.
    3. Peerless Pump; similar to scheduled model.
    4. Weir/Floway; similar to scheduled model.

5. National Pump Co.; similar to scheduled model.
6. Cascade Pump Company; similar to scheduled model.

2.02 DESIGN AND PERFORMANCE CRITERIA

A. Components: Pumps, drivers, motors, variable frequency drives, and drive arrangements as specified or as scheduled with shafts, columns, barrels, intermediate bearings, seals or packing, couplings, base plates, guards, supports, anchor bolts, necessary valves, gauges, taps, lifting eyes, stands, and other items as required for a complete and operational system.

B. Design requirements:
   1. Pump performance characteristics:
      a. As specified in the Pump Schedule.
      b. All required conditions (flow/head) shall be within the pump manufacturer's Allowable Operating Range (AOR).
      c. Performance tolerances shall be the same as the test tolerances specified in Section 15958 - Mechanical Equipment Testing.
      d. Pump curve shall be continuously rising throughout the design conditions listed in the pump schedule.
   2. Motor characteristics: As specified in the Pump Schedule.

C. Product requirements as specified in Section 01600 - Product Requirements and Section 15050 - Common Work Results for Mechanical Equipment.

2.03 MATERIALS

A. General:
   1. Pump Schedule materials: As specified in this Section.

B. Cast iron: ASTM A48, Class 30 minimum.

C. Nickel cast iron: ASTM A48, minimum Class 30, cast iron with 3 percent nickel.

D. Gray iron casting: ASTM A278, Class 30.

E. Iron-chromium alloy: ASTM A743, Grade CA40; ASTM A276, Type 420 Stainless Steel may be substituted; Brinell Hardness Number of 350 to 380.

F. Lead-free bronze except for bearings that require lead for lubricity: ASTM B584.

G. Leaded tin bronze: ASTM B505, Alloy C92700.

H. Bronze or high lead tin bronze: ASTM B584, Alloy 93800.

I. Leaded red brass: ASTM B584, Alloy C83600, leaded red brass.

J. Type 416 stainless: ASTM A582, Type 416 Stainless Steel.

K. Neoprene: Polychloroprene rubber.

L. Steel: ASTM A283, Grade D or ASTM A516 Gr. 70.

M. Steel pipe: ASTM A53, Grade B.

N. Aluminum bronze meeting the requirements of Section 15050 - Common Work Results for Mechanical Equipment.

O. Lead-free aluminum bronze: ASTM B30.

2.04 GENERAL PUMP CONSTRUCTION

A. Type: Industrial, heavy duty, vertical turbine, centrifugal type pumps meeting performance requirements and features as scheduled and as specified.

B. Discharge flange: ASME B16.1 or B16.5 drilled; rated for 1.2 times the pump shutoff head at 150 degrees Fahrenheit.

C. Discharge nozzles: Provide 1/2-inch NPT taps for pressure gauges; install nipple and gauge with block valve.

D. Bearings:
   1. Design driver/motor bearings to support the line shaft assembly and rated for ABMA L10 life of 40,000 hours at Design Rated Point flow and head in accordance with ABMA 9 or ABMA 11.
   2. Design motor to withstand continuous duty full load thrust and momentary up thrust that may occur during pump on/off or other operations.

E. Fasteners: Provide Type 316 stainless steel fasteners in accordance with ASTM F593 or ASTM F594.

2.05 PUMP SUCTION ASSEMBLY

A. Pump suction assembly: Provide suction bell. Provide anti-vortex baffles and strainer when scheduled.

B. Design suction bells and provide strainers and anti-vortex baffles to minimize solids plugging and vortexing. Screens to have a flow area at least 4 times the suction pipe area.

C. Materials:
   1. Pump suction bell: As scheduled.
   2. Anti-vortex baffles: Same material as scheduled for pump suction bell.
   3. Pump suction bell bearing: As scheduled.
   4. Pump suction strainer: When strainer scheduled, provide Type 316 stainless steel.

2.06 PUMP IMPELLER BOWL ASSEMBLIES

A. Pump impeller assembly:
   1. Type: As scheduled.
   2. Maximum number of vanes: As scheduled.
   3. Number of stages: As scheduled.

4. Required balance: As specified in Section 15050 - Common Work Results for Mechanical Equipment to meet vibration criteria as specified in Section 15958 - Mechanical Equipment Testing.
5. Method of securing impellers to shafts: Keyed and secured by a bronze nut locked in place or locked by other methods acceptable to the Engineer. Provide any special tools required for removal and installation of pump impellers.
6. Provisions for adjustment of axial clearance: Make such adjustment through use of motor adjusting nut or adjustable coupling.
7. Impeller thrust: When appropriate for the specified impeller type, provide hydraulically balanced impeller to minimize down thrust.

B. Intermediate and discharge impeller cases:
1. Material: As scheduled.
2. Attached with bolting.

C. Pump impeller bowl bearings: Provide bearing for each impeller; material as scheduled.

D. Diffusion vanes: Provide vanes cast into bowl.

E. Suction bowl bearings:
1. Provide bronze sleeved bearings with self-contained lubrication system filled with graphite type non-soluble grease when grease lubrication scheduled; provide bearing with sand cap.

F. Design with smooth water passages to reduce clogging by stringy or fibrous materials on impellers or shafting.

G. Design replaceable wear rings for both the bowl and impeller on each impeller bowl.

H. Design capable of passing solids with a sphere size as scheduled or larger.

I. Design impellers capable of working on pumps that may be abnormally started against closed manual valve or normally against a closed pump control valve.

2.07 LINE SHAFTS

A. Provide line shaft type and lubrication type as scheduled and as specified in this Section.

B. Open line shaft, product lubricated:
1. Shaft and couplings:
a. Provide keyed shaft type mechanical couplings with key or set screw locking of shaft couplings.
1) Threaded shaft connections are not allowed.
2. Bearings and bearing retainers: Provide bearings and retainers spaced as scheduled, but not to exceed 10 feet; provide at least 1 bearing for each line shaft length; provide grease fitting for top bearing extended to outside any guards when grease lubrication specified.

3. Materials:
    a. Shaft and couplings: As scheduled; where hard faced steel shaft is specified, hard face at sleeve bearings to 550 Brinell minimum.
    b. Bearings and bearing retainers: As scheduled; when not scheduled, Neoprene rubber bearings with bronze retainers.

C. Enclosed line shaft, oil lubricated:
    1. Shaft and couplings: Provide flanged shaft couplings with key or set screw locking of shaft couplings.
    2. Shaft bearings and spiders: Provide bearings and retainers as scheduled, but not to exceed 10 feet and enclosing tube spiders spaced at 30 feet maximum; provide oil reservoir volume for 3 days continuous use.
    3. Enclosing tube: Pipe, thickness as scheduled.
    4. Materials: As scheduled; when not scheduled provide:
        a. Shaft and couplings: ASTM A108, Grade 1045 steel with ASTM A276, Type 316 hardened stainless steel journal or sleeve at each bearing.
        b. Shaft bearings and spiders: ASTM B584, Alloy C83600 leaded red brass bearings; Neoprene rubber spider on enclosing tube.
        c. Enclosing tube: Steel pipe, ASTM A53, Grade B unless scheduled otherwise.

D. Design strength: Able to withstand minimum 1.5 times maximum operating torque and other loads.

E. Resonant frequency: As specified in Sections 15050 - Common Work Results for Mechanical Equipment and 15958 - Mechanical Equipment Testing.

F. Sleeves: Provide shafting with Type 316 stainless steel sleeve or hardened sleeves where shafts pass through bearings or stuffing boxes as scheduled; Brinell 550 or higher for hardened shaft; when the specified mechanical seals cannot be installed on a hardened shaft, hardened shafts are not required in the area of the mechanical seal.

G. Design pump line shafting in interchangeable lengths as scheduled, but not to exceed 10 feet; shaft lengths to match scheduled pump column lengths.

H. Coupling strength: Design driver to pump line shaft coupling of sufficient length and strength to maintain line shaft alignment.

I. Adjustment:
    1. Design a means to adjust shaft position to adjust impeller position.
    2. For motor driven units with solid shaft motors, design driver to pump line shaft coupling to allow adjustment of the impeller position.
    3. For motor driven units with hollow shafts, an adjusting nut may be provided at the top of the motor shaft.

J. Spacer coupling: When mechanical seals are scheduled, provide an adjustable spacer coupling to allow removal of the seal without driver removal.

2.08 PUMP COLUMN PIPE

A. Pump column pipe: Thickness and material as scheduled.

B. Head connection: Design with flanged and bolted connection to discharge head and flanged and bolted connection to impeller assembly to permit removal of impeller bowl assembly without disturbing the column or discharge connections.

C. Design Working Pressure: Design to withstand a design working pressure not less than 1.20 times the maximum shutoff total dynamic head with the maximum diameter impeller at the maximum operating speed plus the maximum suction static head.

D. Pressure test: Design to withstand a 5-minute hydrostatic test pressure not less than 1.5 times the design working pressure; perform test at source.

E. Lengths and connections: Design with maximum 10-foot length, or less if scheduled, interchangeable column sections with flanged or threaded with registered fit screwed connections as scheduled.

F. Diameter: Design column inside diameter for no more than 4 feet of fluid friction loss per 100 feet of column length.

2.09 PUMP BARREL/CAN

A. Pump barrel/can: Pipe thickness and material as scheduled and shall be provided by manufacturer; inlet as indicated on the Drawings.

B. Mounting flange: Sufficient strength and thickness to withstand 1.5 times the imposed loads under any operating condition.

C. Can lining: When scheduled, provide cement mortar lining in accordance with AWWA C205.

D. Can diameter: Provide can diameter so that free-flow cross-sectional area in the can after lining or coating is at least 10 percent more than the can inlet nozzle flow area.

2.10 PUMP DISCHARGE HEAD ASSEMBLY

A. Design the discharge head for above or base discharge as scheduled.

B. Design the discharge vertical to horizontal flow transition as a smooth pipe elbow or from a minimum of 3 pipe pieces mitered to form the elbow.

C. Design discharge head to mate with the driver as scheduled.

D. Head and base plate construction: Sufficient strength, weight, and thickness to provide accurate alignment, prevent excessive deflection and support the drive motor.

E. Stuffing box and seal:
   1. Design the discharge head with a stuffing box to accommodate packing or mechanical seals as scheduled.
   2. Shaft seal type: As scheduled and as specified in Section 15050 - Common Work Results for Mechanical Equipment.
      a. Packing: When packing scheduled, provide stuffing box arranged for packing (sized for bronze lantern ring and 6 packing rings minimum); provide hollow shaft motor with top adjusting nut.
      b. Mechanical seal: When scheduled, provide stuffing box suitable for the specified seal and provide solid shaft motor with spacer coupling.
   3. Drain: Provide drain, minimum 3/4-inch size, for pump stuffing box leakage, together with drain line to the pump can or wet well or to nearest equipment drain as indicated on the Drawings.

F. Discharge vent: Provide 3/4-inch NPT threaded high point vent on discharge; install pipe nipple with threaded ball valve in vent.

G. Barrel/Can vent: When pump is indicated to be installed in a barrel/can, provide 1 inch NPT threaded tap on base plate to vent accumulated air at the barrel/can high point; install pipe nipple with threaded ball valve in vent.

H. Materials: As scheduled; when not scheduled, provide:
   1. Pump discharge head/driver stand: Steel, ASTM A283, Grade B and/or ASTM A53, Grade B; or cast iron, ASTM A48, Class 30 minimum.
   2. Pump discharge head sleeve bearing: Bronze.
   3. Stuffing box and seal: Container and gland, cast iron, ASTM A48, Class 30 minimum; Neoprene top shaft seal.

2.11 EQUIPMENT GUARDS

A. Provide equipment safety guards as specified in Section 15050 - Common Work Results for Mechanical Equipment.

2.12 DRIVERS

A. Horsepower:
   1. As scheduled.
   2. Listed driver horsepower is the minimum to be supplied.
      a. Increase driver horsepower if required to prevent driver overload while operating at any point of the supplied pump operating head-flow curve including runout.
      b. When scheduled driver is a motor, increase motor horsepower if required to prevent operation in the service factor.
      c. Make all structural, mechanical, and electrical changes required to accommodate increased horsepower.

B. Motors: Provide motors as specified in Section 16222 - Low Voltage Motors up to 500 Horsepower and as specified in this Section:
   1. RPM: As scheduled:
   2. Enclosure: As scheduled.
   3. Electrical characteristics: As scheduled.

4. Efficiency, service factor, insulation, and other motor characteristics: As specified in Section 16222 - Low Voltage Motors up to 500 Horsepower.
5. Motor accessories: As specified in Section 16222 - Low Voltage Motors up to 500 Horsepower and in this Section.
6. Coordinate motors with the variable frequency drive manufacturer to ensure compatibility between the motor and variable frequency drive.

C. Variable frequency drives (VFDs): As scheduled and as specified in Sections 16262 - Variable Frequency Drives 0.50 - 50 Horsepower and 16265 - Reduced Harmonic Variable Frequency Drives.
1. Contractor to coordinate with the existing pump manufacture to replace existing pump motor with new VFD duty rated motor.

D. Other drivers: As scheduled and as specified in sections listed in the Schedule.

E. Non-reverse ratchets: When scheduled, provide driver with non-reverse ratchets or pin mechanism to prevent reverse rotation of the pump and driver in the event of discharge valve failure.

2.13 SUPPORTS

A. Strength: Design pump discharge head and driver (motor or engine) supports to withstand a minimum of 1.5 times the maximum imposed operating loads or the imposed seismic loads, whichever is greater.

B. Resonant frequency: Design supports in conjunction with the pump, shafting, drivers, bearings, and other components to avoid natural resonant frequencies, either torsional, radial, or axial as specified in Section 15958 - Mechanical Equipment Testing.

C. Coordinate pump and drive system supports with the foundation designs as indicated on the Drawings.

D. Anchor bolts: As specified in Section 05190 - Mechanical Anchoring and Fastening to Concrete and Masonry.

2.14 SPARE PARTS AND SPECIAL TOOLS

A. Spare parts:
1. Seal packing material: 1 set of each type supplied.
2. Line shaft rubber bearings: 1 set for each type pump.
3. Line shaft bronze bearings: 1 set for each type pump.
4. Impeller and bowl wear rings: 1 set for each type of pump.
5. Mechanical seal: 1 complete seal of each type.
6. Motor/gear thrust bearing set: 1 for each type of pump.
7. Motor radial bearing set: 1 for each size of motor (if specified).
8. Pump impeller/bowl assembly: 1 of each type supplied.
9. Line shaft: 1 length of each size and type.

B. Special tools: Deliver 1 set for each furnished pump type and size needed to assemble and disassemble pump system.

PART 3 EXECUTION

3.01 PREPARATION

A. Anchoring and bracing to structures:
   1. Prepare equipment anchor setting template(s) and use to position anchors during construction of supporting structure(s).
   2. Install anchors of type and material indicated on approved anchoring designs.
   3. Install anchors with embedment indicated on approved anchoring designs.

3.02 INSTALLATION

A. Install the equipment in accordance with the accepted installation instructions and anchorage details.

B. General:
   1. Install free-standing enclosures on a raised concrete housekeeping pad:
      a. Provide structural leveling channels in accordance with the manufacturer's recommendations to provide proper alignment of the units.
      b. Weld and/or bolt the VFD frame to the leveling channels.
   2. Provide openings in top or bottom of the VFD (free-standing or within motor control center) enclosure for conduit only, no additional openings will be allowed:
      a. Improperly cut holes will require that the entire panel be replaced:
         1) No hole closers or patches will be allowed.
   3. Bundle circuits together and terminate in each unit:
      a. Tie with nylon wire ties.
      b. Label all wires at each end with wire numbers shown on the approved control drawings.
   4. Replace existing motor for the existing carousel pump(s) with new VFD duty rate motor. Motor selection shall be coordinated with the existing pump manufacturer, and specification section 16222 and 16262. The existing motors are manufactured by NIDIC Motor Corporation, Model BF48A, and Catalog No.: H040S2BLG.

3.03 COMMISSIONING

A. As specified in Section 01756 - Commissioning and this Section.

B. Manufacturer services:
   1. Provide certificates:
      a. Manufacturer's Certificate of Source Testing.
      b. Manufacturer's Certificate of Installation and Functionality Compliance.
   2. Manufacturer's Representative onsite requirements:
      a. Installation: 1 trip, 1-day minimum.
      b. Functional Testing: 1 trip, 1-day minimum each.
   3. Training:
      a. Maintenance: 4 hours per session, 2 sessions.
      b. Operation: 2 hours per session, 2 sessions.
   4. Process operational period:
      a. As required by Owner or Contractor.

C. Source testing: As specified in the Pump Schedule.

D. Functional testing: As specified in the Pump Schedule.

END OF SECTION

SECTION 11312O

HORIZONTAL ANSI CENTRIFUGAL PUMPS

PART 1 GENERAL

1.01 SUMMARY

A. Section includes: Frame mounted, centrifugal, horizontal end suction pumps in accordance with ASME B73.1, with drivers and features as scheduled.

B. Tag numbers: As specified in Pump Schedule.

1.02 REFERENCES

A. American Bearing Manufacturers Association (ABMA).

B. American Society of Mechanical Engineers (ASME):
   1. B73.1 - Specification for Horizontal End Suction Centrifugal Pumps for Chemical Process.

C. ASTM International (ASTM):
   1. A48 - Standard Specification for Gray Iron Castings.
   2. A108 - Standard Specification for Steel Bar, Carbon and Alloy, Cold-Finished.
   3. A276 - Standard Specification for Stainless Steel Bars and Shapes.
   4. A283 - Standard Specification for Low and Intermediate Tensile Strength Carbon Steel Plates.
   5. A322 - Standard Specification for Steel Bars, Alloy, Standard Grades.
   6. A395 - Standard Specification for Ferritic Ductile Iron Pressure-Retaining Castings for Use at Elevated Temperatures.
   7. A494 - Standard Specification for Castings, Nickel, and Nickel Alloy.
   8. A743 - Standard Specification for Castings, Iron-Chromium, Iron-Chromium-Nickel, Corrosion Resistant, for General Application.
   9. B367 - Specification for Titanium and Titanium Alloy Castings.
   10. E10 - Standard Test Method for Brinell Hardness of Metallic Materials.

D. Hydraulic Institute (HI):
   1. 9.1-9.5 - Pumps - General Guidelines.
   2. 14.1-14.2 - Rotodynamic Pumps for Nomenclature and Definitions.
   3. 14.3 - Rotodynamic Pumps for Design and Application.
   4. 14.6 - Rotodynamic Pumps for Hydraulic Performance Acceptance Tests.

1.03 TERMINOLOGY

A. The words and terms listed below are not defined terms that require initial capital letters, but, when used in this Section have the indicated meaning.
   1. Allowable Operating Region (AOR): The region over which the service life of the pump is not seriously compromised by hydraulic loads, vibration, or flow

separation where the pump's vibration, noise, and cavitation are within acceptable limits.
2. Preferred Operating Region (POR): The region over which the service life of the pump will not be significantly affected by hydraulic loads, vibration, or flow separation where the pump's vibration, noise, and cavitation are within acceptable limits.
3. Pump head (total dynamic head, TDH), flow capacity, pump efficiency, net positive suction head available (NPSHa), and net positive suction head required (NPSHr): As defined in HI 9.1-9.5, 14.1-14.2, 14.3, 14.6 and as modified in this Section.
4. Suction head: Gauge pressure available at pump intake flange or bell in feet of fluid above atmospheric; average when using multiple suction pressure taps, regardless of variation in individual taps.
5. Tolerances: In accordance with HI 9.1-9.5, 14.1-14.2, 14.3, and 14.6 unless specified more restrictively.

1.04 DELEGATED DESIGN

A. As specified in Section 01357 - Delegated Design Procedures.

B. Anchoring and bracing.

C. Rotordynamic analysis.

1.05 SUBMITTALS

A. Submit as specified in Section 01330 - Submittal Procedures.

B. Delegated Design Submittals:
1. Provide project-specific calculations based on support conditions and requirements to resist loads specified in Section 01850 - Design Criteria.
2. Anchoring and bracing:
   a. Design of equipment support structures or pedestals and associated anchoring to structures.
3. Rotordynamic analysis:
4. Level as scheduled.

C. Commissioning Submittals:
1. For commissioning submittals listed below and specified in this Section and as specified in Section 01756 - Commissioning:
   a. Manufacturer's representative qualifications.
   b. Certificates.
      1) Requirements as specified in this Section.
   c. Test Plans:
      1) Test requirements as specified in this Section.
   d. Test Reports:
   e. Manufacturer's representatives field notes and data.
   f. Owner training.

D. As specified in Section 01600 - Product Requirements.
   1. Product data.
      a. Pump certification.
      b. Weighted average lead.
   2. Shop drawings.
   3. Calculations:
      a. Torsional analysis.

E. Vendor operation and maintenance manuals: As specified in Section 01782 - Operation and Maintenance Manuals.

1.06 WARRANTY

A. As specified in Section 01783 - Warranties and Bonds.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Pump: One of the following or equal:
   1. Flowserve Co., model as scheduled.
   2. ITT Ind., similar to scheduled model.

2.02 DESIGN AND PERFORMANCE CRITERIA

A. Horizontal, centrifugal, ASME B73.1 end suction pump, drivers, motors, seals or packing, couplings, base plates, guards, supports, anchor bolts, necessary valves, gauges, taps, lifting eyes, stands, and other items as required for a complete and operational system.

B. Design requirements:
   1. Pump performance characteristics:
      a. As specified in Pump Schedule.
      b. Rotordynamic analysis level: As scheduled and as specified in Section 15050 - Common Work Results for Mechanical Equipment.
         1) Vibration analysis expert: Provide when scheduled.
      c. All required conditions (flow/head) shall be within the pump manufacturer's Allowable Operating Range (AOR).
      d. Performance tolerances shall be the same as the test tolerances specified in Section 15958 - Mechanical Equipment Testing
   2. Motor characteristics: As specified in Pump Schedule.

C. Product requirements as specified in Section 01600 - Product Requirements and Section 15050 - Common Work Results for Mechanical Equipment.

2.03 MATERIALS

A. General:
   1. Materials in the Pump Schedule shall be the type and grade as specified in this Section.
   2. Drinking Water Pumps: Provide materials in conformance with Section 15050 - Common Work Results for Mechanical Equipment.

B. Cast iron: ASTM A48, Class 30 minimum.

C. Ductile iron: ASTM A395.

D. Steel: ASTM A108, grade as scheduled or ASTM A322, grade as scheduled.

E. Stainless steel: ASTM A276, type as scheduled.

F. Iron-chromium alloy: ASTM A743, Grade CA40.

G. Structural steel: ASTM A283, Grade D.

H. Hastelloy C: ASTM A494, Grade CW-12M-2.

I. Titanium: ASTM B367, Grade C-3.

2.04 GENERAL PUMP CONSTRUCTION

A. Type: Horizontal centrifugal, end suction pumps manufactured in accordance with ASME B73.1, except as modified in this Section.

B. Other requirements:
   1. Vibration: In accordance with ASME B73.1 or as specified in Section 15958 - Mechanical Equipment Testing, whichever is more stringent.

2.05 PUMP CASINGS

A. Type: 1-piece volute type with integral suction and discharge nozzles.

B. Material: As scheduled.

C. Design working pressure: Minimum 1.10 times maximum shutoff total dynamic head with maximum installable impeller diameter at maximum operating speed plus maximum suction static head.

D. Hydrostatic test: 10-minute hydrostatic test at minimum 1.5 times design working pressure.

2.06 IMPELLERS

A. Type: As scheduled.

B. Material: As scheduled.

C. Method of securing to shafts: Threaded impeller in accordance with ASME B73.1.

D. Balance: As specified in Section 15050 - Common Work Results for Mechanical Equipment and vibration criteria as specified in Section 15958 - Mechanical Equipment Testing.

2.07 PUMP SHAFTS

A. Material: As scheduled.

B. Strength: Able to withstand minimum 1.5 times maximum operating torque and other loads.

C. Solid shaft without sleeve.

2.08 STUFFING BOXES

A. Type: In accordance with ASME B73.1, Figure 3, with universal cover adapter.

B. Materials: As scheduled.

C. Shaft seal type: As scheduled and as specified in Section 15050 - Common Work Results for Mechanical Equipment.

D. Drain: Minimum 3/8-inch size, with drain line to nearest equipment floor drain.

2.09 BEARINGS AND BEARING FRAME

A. Bearing type: Anti-friction meeting ABMA standards; self-aligning spherical roller type radial bearings; double row ball type or tapered roller for thrust bearings.

B. Bearing lubrication: Grease or oil lubricated as scheduled:
   1. For oil lubricated, provide pressure lubricating system or separate oil reservoir type system with oil filler pipe and external level indicator gauge.
   2. For grease lubricated, provide external grease fittings with grease relief pipe.
   3. Size sufficiently to safely absorb heat energy normally generated in bearing under maximum ambient temperature of 60 degrees Celsius.

C. Bearing life: In accordance with ASME B73.1.

D. Pump bearing frames:
   1. Material: As scheduled.
   2. Provide a 1-piece rigid construction with bearing housing at outboard (pump) end, and end cover or housing at inboard (driver) end.

E. Grease seals and deflectors: Lip type seals and labyrinth type deflectors at both ends of bearing housings, able to prevent entrance of contaminants.

F. Bearing isolators: Provide bearing isolators on each end with integral locking ring to prevent leakage past the shaft.
   1. Manufacturers: The following or equal:
      a. Inpro Model VBX.

2.10 COUPLINGS

A. Types: As scheduled and as specified in Section 15050 - Common Work Results for Mechanical Equipment.

B. Design coupling to withstand a minimum of 1.5 times the maximum operating torque and other imposed loads.

2.11 SUPPORTS, PEDESTALS, AND BASEPLATES

A. Type: Provide baseplate and supports in accordance with ASME B73.1.

B. Materials: Same as pump casing or ASTM A283 steel, hot-dip galvanized after fabrication and coated as specified in Section 09960 - High-Performance Coatings.

C. Pump and driver support strength: Able to withstand minimum 1.5 times maximum imposed operating loads or imposed seismic loads, whichever is greater.

D. Anchor bolts: As specified in Section 05190 - Mechanical Anchoring and Fastening to Concrete and Masonry.

2.12 EQUIPMENT GUARDS

A. Provide equipment safety guards as specified in Section 15050 - Common Work Results for Mechanical Equipment.

2.13 DRIVERS

A. Horsepower:
   1. As scheduled.
   2. Listed driver horsepower is the minimum to be supplied:
      a. Increase driver horsepower if required to prevent driver overload while operating at any point of the supplied pump operating head-flow curve including runout.
      b. When scheduled driver is a motor, increase motor horsepower if required to prevent operation in the service factor.
      c. Make all structural, mechanical, and electrical changes required to accommodate increased horsepower.

B. Motors: Provide motors as specified in Section 16222 - Low Voltage Motors up to 500 Horsepower and as specified in this Section:
   1. Revolutions per minute: As scheduled.
   2. Enclosure: As scheduled.
   3. Electrical characteristics: As scheduled.
   4. Efficiency, service factor, insulation, and other motor characteristics: As specified in Section 16222 - Low Voltage Motors up to 500 Horsepower.

5. Motor accessories: As specified in Section 16222 - Low Voltage Motors up to 500 Horsepower and in this Section.
6. Coordinate motors with the variable frequency drive manufacturer to ensure compatibility between the motor and variable frequency drive.

C. Other drivers: As scheduled and as specified in sections listed in the Schedule.

2.14 SPARE PARTS AND SPECIAL TOOLS

A. Special tools: Deliver 1 set for each furnished pump type and size needed to assemble and disassemble pump system.

B. Spare parts: Deliver the following as specified in Section 01600 - Product Requirements:
1. Pump thrust bearing set.
2. Pump radial bearing set.
3. Gasket set.
4. Motor bearing set of each type.
5. Pump impeller, trimmed to match installed impeller.
6. Mechanical seal rebuild set.

PART 3 EXECUTION

3.01 PREPARATION

A. Anchoring and bracing to structures:
1. Prepare equipment anchor setting template(s) and use to position anchors during construction of supporting structure(s).
2. Install anchors of type and material indicated on approved anchoring designs.
3. Install anchors with embedment indicated on approved anchoring designs.

3.02 INSTALLATION

A. Install the equipment in accordance with the accepted installation instructions and anchorage details.

3.03 COMMISSIONING

A. As specified in Section 01756 - Commissioning.

B. Source Testing (Factory Acceptance Tests):
1. Not witnessed.
2. Furnish test reports and Manufacturer’s Certificate of Source Testing.
3. Equipment Testing:
   a. Pump:
      1) Performance test: Test level as scheduled; test as specified in Section 15958 - Mechanical Equipment Testing.
      2) Vibration test: Test level as scheduled; test as specified in Section 15958 - Mechanical Equipment Testing.

3) Noise test: Test level as scheduled; test as specified in Section 15958 - Mechanical Equipment Testing.
4) Pump casing: Hydrostatic pressure tests if specified in this Section.

b. Motor: Test as specified in Section 16222 - Low Voltage Motors up to 500 Horsepower.

C. Installation Verification:
1. Furnish Manufacturer's Certificate of Installation Verification.

D. Functional testing:
1. Equipment testing:
a. Pump:
1) Performance test: Test level as scheduled; test as specified in Section 15958 - Mechanical Equipment Testing.
2) Vibration test: Test level as scheduled; test as specified in Section 15958 - Mechanical Equipment Testing.
3) Noise test: Test level as scheduled; test as specified in Section 15958 - Mechanical Equipment Testing.
b. Motor: Test as specified in Section 16222 - Low Voltage Motors up to 500 Horsepower.

E. Owner Training:
1. Perform Owner training as specified in Section 01756 - Commissioning.
2. Number of sessions:
a. Operations: 1.
b. Maintenance: 1.

3.04 PUMP SCHEDULE

Tag Numbers	PMP-85104
General Characteristics:	
Application	Wastewater
Service	Secondary Effluent
Quantity	1
First Named Manufacturer's Model	2K3X2-10ARV
Normal Pumped Fluid Degrees Fahrenheit	60
Rotordynamic Analysis Level	None
Vibration Analysis Expert	Not Required

Tag Numbers	PMP-85104
Pump Characteristics:	
Impeller Type	Open
Bearing Lubrication	Grease
Shaft Seal Type	Type 3
Speed Control	Fixed
Maximum Pump Revolutions per Minute	1750
Suction Flange Size, Minimum (in.)	3
Discharge Flange Size, Minimum (in.)	2
Rated Design Point (at Maximum Revolutions per Minute):	
Flow, Gallons per Minute	140
Head, Feet	75
Minimum Efficiency, Percent	50
Pump Materials:	
Pump Casing	Ductile Iron
Impeller	Ductile Iron
Impeller Wear Ring	420 Stainless
Casing or Suction Head Wear Ring	420 Stainless
Shaft	316 Stainless
Shaft Sleeve	316 Stainless
Stuffing Boxes	Ductile Iron
Driver Characteristics:	
Driver Type	Motor
Drive Arrangement	Horizontal, Coupled
Minimum Driver Horsepower	7.5
Maximum Driver Speed, Revolutions per Minute	1800
Motor Characteristics (When Motor is Driver Type):	
Inverter Duty Rated	No
Motor Voltage/Phases/Hertz	460/3/60
Enclosure Type	TEFC

Tag Numbers	PMP-85104
Source Testing:	
Performance Test Level	1
Vibration Test Level	1
Noise Test Level	1
Functional Testing:	
Performance Test Level	1
Vibration Test Level	1
Noise Test Level	1

SECTION 11313E

HORIZONTAL SELF-PRIMING SAMPLE CENTRIFUGAL PUMPS

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Requirements for provision of pump systems including self-priming centrifugal motor driven pumps are included.

B. Tag numbers: As specified in Pump Schedule.

1.02 REFERENCES

A. American Welding Society (AWS):
   1. D1.1 - Structural Welding Code - Steel.

B. ASTM International (ASTM):
   1. A48 - Standard Specification for Gray Iron Castings.
   2. A108 - Standard Specification for Steel Bar, Carbon and Alloy, Cold-Finished.
   3. A276 - Standard Specification for Stainless Steel Bars and Shapes.
   4. A283 - Standard Specification for Low and Intermediate Tensile Strength Carbon Steel Plates.
   5. A322 - Standard Specification for Steel Bars, Alloy, Standard Grades.
   6. A536 - Standard Specification for Ductile Iron Castings.
   7. A582 - Standard Specification for Free-Machining Stainless Steel Bars.
   8. A666 - Standard Specification for Annealed or Cold-Worked Austenitic Stainless Steel Sheet, Strip, Plate, and Flat Bar.
   9. F593 - Standard Specification for Stainless Steel Bolts, Hex Cap Screws, and Studs.
   10. F594 - Standard Specification for Stainless Steel Nuts.

C. Hydraulic Institute (HI):
   1. 9.1-9.5 - Pumps - General Guidelines.
   2. 14.1-14.2 - Rotodynamic Pumps for Nomenclature and Definitions.
   3. 14.3 - Rotodynamic Pumps for Design and Application.
   4. 14.6 - Rotodynamic Pumps for Hydraulic Performance Acceptance Tests.

D. National Electrical Manufacturers Association (NEMA).

1.03 DEFINITIONS

A. Allowable Operating Region (AOR): The region over which the service life of the pump is not seriously compromised by hydraulic loads, vibration, or flow separation where the pump's vibration, noise, and cavitation are within acceptable limits.

B. Flow, head, efficiency, and driver horsepower specified in this Section are minimums unless stated otherwise.

C. Preferred Operating Region (POR): The region over which the service life of the pump will not be significantly affected by hydraulic loads, vibration, or flow separation where the pump's vibration, noise, and cavitation are within acceptable limits.

D. Pump head (Total Dynamic Head, TDH), flow capacity, pump efficiency, net positive suction head available (NPSHa), and net positive suction head required (NPSHr): As defined in HI 9.1-9.5, 14.1-14.2, 14.3, 14.6 and as modified in this Section.

1.04 SUBMITTALS

A. Submit as specified in Section 01330 - Submittal Procedures.

B. Vibration analysis: Submit as specified in Section 15050 - Common Work Results for Mechanical Equipment when scheduled.

C. Product data: As specified in Section 15050 - Common Work Results for Mechanical Equipment.

D. Shop drawings: As specified in Section 15050 - Common Work Results for Mechanical Equipment.

E. Calculations: As specified in Section 15050 - Common Work Results for Mechanical Equipment.

F. Vendor operation and maintenance manuals: As specified in Section 01782 - Operation and Maintenance Manuals.

G. Commissioning submittals:
   1. Provide Manufacturer's Certificate of Source Testing as specified in Section 01756 - Commissioning.
   2. Provide Manufacturer's Certificate of Installation and Functionality Compliance as specified in Section 01756 - Commissioning.

1.05 QUALITY ASSURANCE

A. As specified in Section 15050 - Common Work Results for Mechanical Equipment.

B. Provide pumps specified in this Section from same manufacturer.

C. Vibration analysis: Provide equipment vibration analysis as specified in this Section.
   1. Vibration analysis level: As scheduled and as specified in Section 15050 - Common Work Results for Mechanical Equipment.
   2. Vibration analysis expert: Provide when scheduled.

D. Manufacture's Certificate of Installation and Functionality Compliance as specified in Section 01756 - Commissioning.

1.06 WARRANTY

A. As specified in Section 01783 - Warranties and Bonds.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Pumps:
   1. One of the following or equal:
      a. Gorman-Rupp Company, AMT.
      b. Barnes Pumps, similar to series listed.

2.02 DESIGN AND PERFORMANCE CRITERIA

A. Centrifugal self-priming pump with components: Pump, close coupled driver, bearings, seals, supports, anchor bolts, necessary valves, taps, and other items as required for a complete and operational system.

B. Provide pumps, drivers, couplings, and other components capable of intermittent or continuous operation while pumping specified fluid; loss of prime and possible siphoning of liquid from the pump casing shall be considered in design of the self-priming features.

C. Design requirements:
   1. Pump performance characteristics:
      a. As specified in the Pump Schedule.
      b. All required conditions (flow/head) shall be within the pump manufacturer's Allowable Operating Range (AOR).
      c. Performance tolerances shall be the same as the test tolerances specified in Section 15958 - Mechanical Equipment Testing.
   2. Motor characteristics: As specified in Pump Schedule.

D. Product requirements as specified in Section 01600 - Product Requirements and Section 15050 - Common Work Results for Mechanical Equipment.

2.03 MATERIALS

A. General: Materials in the Pump Schedule shall be the type and grade as specified in this Section.

B. Cast iron: ASTM A48, Class 30 minimum.

C. Ductile iron: ASTM A536, Grade as scheduled.

D. 316 Stainless: ASTM A276, Type 316 stainless steel or ASTM A666, Type 316 Stainless Steel.

E. 416 Stainless: ASTM A582, Type 416 stainless steel.

F. Steel: ASTM A108, Grade as scheduled.

G. Hot-wrought alloy steel: ASTMA322, Grade 4140, UNS Alloy G41400.

H. Structural steel: ASTM A283, Grade D.

2.04 GENERAL PUMP CONSTRUCTION

A. Type: Self-priming, centrifugal, sewage type pumps meeting performance and design requirements and features as specified in this Section.

B. Fasteners: Provide Type 316 stainless steel fasteners in accordance with ASTM F593 and ASTM F594.

2.05 PUMP CASINGS

A. Type: 1 or 2-piece.

B. Material: Cast Iron.

C. Construction: Of sufficient strength, weight, and thickness to provide accurate alignment, prevent excessive deflection, and support drive motor.

D. NPT suction and discharge ports meeting design working pressure.

E. Design internal suction check valve that can be removed through the cover plate. Check valve plate shall be constructed of neoprene.

F. Hardware: Stainless steel.

G. Maximum working pressure: 75 pound per square inch.

H. Maximum temperature: 160 degrees Fahrenheit.

I. Vent and taps:
   1. Provide castings with both 3/4-inch threaded low point and initial priming fill vent on casing. Install pipe nipples with threaded gate valves in drain and priming vent.

2.06 IMPELLERS

A. Type: Self-cleaning, semi-open or open.

B. Material: Ductile iron.

C. Design with smooth water passages to prevent clogging by stringy or fibrous materials.

D. Design impeller and volute for automatic unattended self-priming and repriming with a dry suction leg and without reliance on a suction check valve to maintain prime.

E. Rotation: Clockwise looking from top, unless otherwise indicated on the Drawings.

F. Balance: As specified in Section 15050 - Common Work Results for Mechanical Equipment to meet vibration criteria as specified in Section 15958 - Mechanical Equipment Testing.

2.07 SHAFT

A. Material: Stainless steel.

B. Strength: Able to withstand minimum 1.5 times maximum operating torque and other loads.

C. Resonant frequency: As specified in Sections 15050 - Common Work Results for Mechanical Equipment and 15958 - Mechanical Equipment Testing.

D. Deflection: Maximum 0.002 inches under operating conditions.

E. Impeller attachment: Taper fitted at impeller with key and bolt for securing impeller.

F. Pump shaft seal:
   1. Silicon carbide mechanical seal.
   2. Self-lubricating.

2.08 COUPLINGS

A. Type: Close coupled.

B. Flexible coupling life: Infinite at up to 0.3-degree misalignment angle total or per disk for disk type at maximum operating loads.

C. Design coupling to withstand a minimum of 1.5 times the maximum operating torque and other imposed loads.

2.09 DRIVERS

A. Horsepower:
   1. As scheduled.
   2. Listed driver horsepower is the minimum to be supplied.
      a. Increase driver horsepower if required to prevent driver overload while operating at any point of the supplied pump operating head-flow curve including runout.
      b. However, electrical equipment is sized for scheduled horsepower.

B. Motors: Provide motors as specified in Section 16222 - Low Voltage Motors up to 500 Horsepower and as specified in this Section:
   1. Revolutions per minute: As scheduled:
   2. Enclosure: As scheduled.
   3. Electrical characteristics: As scheduled.
   4. Efficiency, service factor, insulation, and other motor characteristics: As specified in Section 16222 - Low Voltage Motors up to 500 Horsepower.
   5. Motor accessories: As specified in Section 16222 - Low Voltage Motors up to 500 Horsepower and in this Section.

2.10 ANCHOR BOLTS

A. As specified in Section 05190 - Mechanical Anchoring and Fastening to Concrete and Masonry.

2.11 SPARE PARTS AND SPECIAL TOOLS

A. Spare parts: None.

B. Special tools: For each type or size of pump specified, provide 1 set of all special tools required for complete assembly or disassembly of all pump system components.

PART 3 EXECUTION

3.01 COMMISSIONING

A. As specified in Section 01756 - Commissioning and this Section.

B. Manufacturer services:
   1. Provide certificates:
      a. Manufacturer's Certificate of Source Testing.
      b. Manufacturer's Certificate of Installation and Functionality Compliance.
   2. Manufacturer's Representative onsite requirements:
      a. Installation: 1 trip, 5-day minimum.
      b. Functional Testing: 2 trips, 2-day minimum each.
   3. Training:
      a. Maintenance: 4 hours per session, 2 sessions.
      b. Operation: 2 hours per session, 2 sessions.
   4. Process operational period:
      a. As required by Owner or Contractor.

C. Source testing: As specified in Pump Schedule.

D. Functional testing: As specified in Pump Schedule.

3.02 PUMP SCHEDULE

Tag Numbers	PMP-87134
General Characteristics:	
Service	Final Effluent
Quantity	1
Maximum Noise, dBA at 3 Feet	85
Minimum Pumped Fluid Degrees Fahrenheit	50
Normal Pumped Fluid Degrees Fahrenheit	70

Tag Numbers	PMP-87134
Maximum Pumped Fluid Degrees Fahrenheit	85
Vibration Analysis Level	None
Vibration Analysis Expert	Not Required
Rated Design Point (at Maximum Revolutions per Minute):	
Flow, gpm	20
Head, Feet	20
Motor Characteristics (When Motor is Driver Type):	
Motor Specification Section	16222 - Low Voltage Motors up to 500 Horsepower
Motor Horsepower	0.5
Maximum Speed, Revolutions per Minute	1750
Service Factor	1.15
Voltage/Phases/Hertz	480/3/60
NEMA Enclosure Type	TEFC

SECTION 11376A

ROTARY-LOBE BLOWERS

PART 1 GENERAL

1.01 SUMMARY

A. Section includes: Rotary-lobe blowers to supply air to the packaged water treatment system specified in Section 11802 - Packaged Water Treatment System Rehabilitation, including the related appurtenances specified herein and as indicated on the Drawings:
   1. Automatic air supply valves and valve actuators as indicated on the Drawings and specified elsewhere.
   2. Blower piping, valving, inlet filters, silencers, and instrumentation indicated on the Drawings and specified elsewhere.

B. As specified in Section 15050 - Common Work Results for Mechanical Equipment.

C. Tag numbers:
   1. Air Wash Blower 1 (BLO-85106).
   2. Air Wash Blower 2 (BLO-85107).
   3. Air Wash Blower 3 (BLO-85108).

1.02 REFERENCES

A. American Bearing Manufacturers Association (ABMA):
   1. 9 - Load Ratings and Fatigue Life for Ball Bearings.
   2. 11 - Load Ratings and Fatigue Life for Roller Bearings.

B. American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE):
   1. 52.1 - Testing for HVAC Air Filtration.

C. American Society of Mechanical Engineers (ASME):
   1. B16.1 - Gray Iron Pipe Flanges and Flanged Fittings: Classes 25, 125, and 250.

D. National Electrical Manufacturers Association (NEMA):
   1. 250 - Enclosures for Electrical Equipment (1,000 V Maximum).

1.03 SUBMITTALS

A. Submit as specified in Section 01330 - Submittal Procedures.

B. Product data:
   1. As specified in Section 15050 - Common Work Results for Mechanical Equipment.
   2. Blower information:
      a. Manufacturer.

b. Model.
c. Blower speed in revolutions per minute.
d. Blower site capacity, actual cubic feet per minute.
e. Discharge pressure, pounds per square inch absolute.
f. Horsepower required including loss in V-belt drive.
g. Weight of blower.
h. Weight of motor.
i. Free-field noise level at 3 feet from blower acoustic enclosure.

3. Motor performance and construction data.
4. Construction details of acoustic enclosure.
5. Descriptive brochures and applicable performance and construction data for each item of auxiliary equipment along with their weights.
6. Test data on equipment performance, vibration, and noise.

C. Shop drawings: As specified in Section 15050 - Common Work Results for Mechanical Equipment:
1. Blower panel device layout and material list.

D. Calculations: As specified in Section15050 - Common Work Results for Mechanical Equipment.

E. Vendor operation and maintenance manuals: As specified in Section 01782 - Operation and Maintenance Manuals.

F. Commissioning submittals:
1. Provide Manufacturer’s Certificate of Source Testing as specified in Section 01756 - Commissioning.
2. Provide Manufacturer’s Certificate of Installation and Functionality Compliance as specified in Section 01756 - Commissioning.

1.04 ENVIRONMENTAL CONDITIONS

A. Blower shall be suitable for continuous service and indoor installation.

1.05 WARRANTY

A. Provide warranty as specified in Section 01783 - Warranties and Bonds.

PART 2 PRODUCTS

2.01 DESIGN AND PERFORMANCE CRITERIA

A. System components: Aeration blowers, blower panel, and appurtenances.

B. General: Aeration blowers and appurtenances shall include the following items and supplied by blower manufacturer:
1. Rotary positive displacement blower and motor.
2. Air intake filters.
3. Silencers, inlet, discharge, and vent.
4. Butterfly valves and silencer in blowoff circuit.

5. Check valves.
6. Relief valves.
7. Flexible pipe connectors.
8. Pressure gauges.
9. Acoustic enclosure.
10. Discharge Temperature gauge.
11. Appurtenances as required.

C. Design criteria:

Type of Blower	Rotary lobe, positive displacement
Number of blowers	3
Rated speed	4,535 RPM
Rated inlet air flow at rated speed SCFM	447
Inlet filter/Silencer pressure loss	0.5 pounds per square inch
Rated discharge pressure	19.1 psia
Rated inlet pressure	14.1 psia
Inlet temperature	104 degrees F

1. Motor: As specified in Section 16222 - Low Voltage Motors up to 500 Horsepower, except as otherwise specified or supplemented below:

Power supply	480-volt, 3-phase, 60-hertz
Horsepower	20
Speed, maximum	4,535 RPM
Enclosure	TEFC
Service factor	1.15

2. Drive: Belt.
3. Noise control:
   a. Sound pressure levels radiated from equipment furnished shall not exceed 78 dBA (mean, A-weighted) at 3 feet (RE 2 x 10^{-5} N/m^2) for free field condition when unit is in operation at rated flow.
4. Vibration:
   a. Maximum acceptable peak vibration velocity (unfiltered) for blower equipment is 0.45 inches per second.
5. Provide instrumentation, and alarms as indicated on the P&ID Drawings and as specified in Sections 17100 - Control Strategies and 17101 - Specific Control Strategies.

D. System operation: System operation shall be as specified in Sections 17100 - Control Strategies and 17101 - Specific Control Strategies.

2.02 AERATION BLOWERS

A. Manufacturers: One of the following or equal:
   1. Kaeser Compressors, Com-paK Series.
   2. Aerzen.
   3. FPZ, Inc., MS Series.

2.03 MATERIALS

A. General:
   1. Aeration blower assembly: Complete with blower, drive, inlet and discharge silencers, valves, and appurtenances.
   2. Blower rating: As specified above.
   3. Rotation direction of blower shall match requirements of piping.

B. Blower and drive:
   1. General:
      a. Blower shall deliver oil-free air.
      b. Blower and motor mounting: On common base.
      c. Lifting provisions: Lifting eyes on blowers, motors, and base so each major component or entire unit can be lifted.
      d. Piping connections: 125 pound class flanges in accordance with ASME B16.1.
   2. Type: Positive displacement rotary blowers using 2 impellers to pressurize a trapped volume of air at a controlled rate prior to exposing it to a discharge pressure.
   3. Casing and head plates:
      a. Blower casing: 1 piece with separate head plates and end covers.
      b. Casing and head plates: Made of close-grained, machined cast iron.
      c. End covers and head plates: Reinforced with bosses at penetrations with cast, machined support feet.
   4. Impellers:
      a. Material: Ductile iron or cast iron.
      b. Design: Straight, 3-lobe, involute type.
      c. Balance: Dynamically, by removing metal from impeller body.
      d. Operation: Free of rubbing without need for liquid seals or lubrication.
      e. Timing: positively by a pair of accurately machined, heat-treated, alloy steel timing gears.
      f. Shafts: Alloy steel forgings, pressed into each end of each impeller and pinned.
      g. Impeller assembly support: Anti-friction type bearings, sized for a minimum ABMA 9 and 11 L10 life for bearings of 100,000 hours.
   5. Lubrication:
      a. Positive oil seal: Provided at each bearing.
      b. Seal design: Capable of preventing lubricant from leaking into air stream.
      c. Vent provisions: Capable of venting impeller side of oil seal to atmosphere while eliminating possible carryover of lubricant into air stream.
      d. Drive-end bearings: Grease or oil lubricated.
      e. Timing gears and gear-end bearings: Splash oil lubricated.
      f. Blower’s shipment: With openings sealed after injection of rust inhibitor.

2.04 APPURTENANCES

A. Inlet filter shall have front access for filter element access. Filter shall provide 99 percent removed efficiency of 5 micron particle size and larger.

B. Silencers:
   1. Manufacturers: The following or equal:
      a. Burgess-Manning, Model BMSI, BMSS, or equal.
   2. Construction: Welded steel.
   3. Discharge silencer: Furnished with copper wool absorption material and shall have connections for a pressure relief valve, pressure gauge, temperature gauge, and drain.
   4. Silencers sizing: For design conditions and specifically designed for use with positive displacement blowers, size as indicated on the Drawings unless a larger size is recommended by the manufacturer.
   5. Mounting of silencers: As indicated on the Drawings.
   6. Noise attenuation of silencers shall as a minimum, meet the following:

Octave Band Center Frequency, hertz	Attenuation, dBA
63	12
125	20
250	27
500	30
1,000	31
2,000	29
4,000	25
8,000	21

C. Acoustic enclosure:
   1. Galvanized sheet-metal sandwich construction.
   2. With noise attenuating walls and with ventilation openings ported, ducted, shielded, and lined with acoustic absorptive material as required to achieve specified noise levels.
   3. Design criteria:
      a. Seismic design criteria: As specified in Section 01850 - Design Criteria.
      b. Wind design criteria: As specified in Section 01850 - Design Criteria.
   4. Raintight and dusttight, suitable for outdoor unprotected installation.
   5. With ventilation system designed for not more than 15 degrees Fahrenheit air temperature rise with aeration blower operating at maximum load.
   6. With fan interlocked with blower motor to start when blower starts and to stop with an adjustable time delay after the blower motor stops.
   7. With a weather-protected ventilation air intake filter:
      a. Of disposable, dry type, pleated lofted cotton and polyester fiber media construction, securely bonded to a welded galvanized wire backing, with a frame of heavy-duty paperboard.
      b. Sized for not more than 400 feet per minute face velocity.

c. With ASHRAE Standard 52.1 cleaning efficiency of not less than 25 percent.
d. With thickness not less than 1 inches.
e. With an easily visible and resettable "replace filter" indicator with retained indication independent of blower on/off status.

8. With removable access panels located for maintenance and inspection access to the housed equipment, each weighing not more than 40 pounds, or hinged if weight exceeds 40 pounds.

D. Relief valve: High-capacity, full-nozzle type; 2 inch minimum valve inlet:
1. Manufacturers: The following or equal:
a. Kunkle Valve Co.

E. Butterfly valves:
1. Constructed as specified in Sections 13446 - Manual Actuators.
2. Lined with 10 mils of epoxy suitable for temperatures to 350 degrees Fahrenheit.
3. Sealed with seals suitable for temperatures of 350 degrees Fahrenheit.

F. Check valves: No. 8808-GAX-SSF; dual disc, wafer style with torsion spring induced closure:
1. Manufacturers: The following or equal:
a. Val-Matic.
2. Consisting of following components:
a. Valve body: ASTM A126 cast iron.
b. Disc: ASTM B148-9A, aluminum bronze.
c. Spring: ASTM A276, Type 316 stainless steel.
d. Pins and thrust bearings: ASTM A276 Type 316, stainless steel.
e. Seals, rated for minimum 350 degrees Fahrenheit.

G. Pressure gauges:
1. Provide one gauge for the discharge side of each blower and one for the discharge header.
2. Manufacturers: One of the following or equal:
a. Ashcroft:
1) Maximum pressure less than 10 pounds per square inch: Model 1188.
2) Maximum pressure greater or equal to 10 pounds per square inch: Model 1279.
b. Wika.
c. Ametek.
3. Accuracy: Grade 2A, as defined by ASME B40.100.
4. Where the maximum pressure is less than 10 pounds per square inch, provide socket and bellows; for all other pressure ranges, employ a Bourdon® tube.
5. Liquid filled case with minimum 4 1/2 inch dial face.
6. Type on discharge side of blower: Pressure gauge calibrated in pounds per square inch gauge.
7. A suitable tee handled corporation stop or ball valve and snubber shall be installed between each gauge and connection to air piping.

H. Pressure switches:
   1. Provide one differential pressure switch for each inlet filter, one direct switch for the discharge side of each blower, and one direct switch for the discharge header.
   2. Manufacturers: One of the following or equal:
      a. Ashcroft, N series.
      b. United Electric, Series One.
   3. Accuracy: Within 1.0 percent of range.
   4. Overpressure:
      a. Minimum 130 percent of maximum range pressure without damage to switch or sensing element.
      b. Minimum 400 percent of nominal range without leakage or rupture.
   5. Relay outputs: 2 Form C contacts.

I. Pressure transmitters:
   1. Provide on pressure sensor/transmitter for the discharge side of each blower.
   2. Manufacturers: One of the following or equal:
      a. Emerson, Rosemount 3051 Series.
      b. Yokogawa, EJA Series.
      c. Endress & Hauser, Cerebar S Series.
   3. Maximum ratio of total instrument range to calibrated span: 10 to 1.
   4. Accuracy:
      a. Reference accuracy: Plus or minus 0.075 percent of calibrated span, including effects of hysteresis, nonlinearity, and repeatability.
      b. Total performance accuracy: Plus or minus 0.30 percent of calibrated span, including reference accuracy effects, static pressure and ambient temperature effects.
   5. Stability: Plus or minus 0.15 percent of upper range limit over 5 years.
   6. Power supply: 24 VDC - 2 wire loop powered.
   7. Outputs: 4 – 20 mA.

J. Other safety devices and controls: As recommended by blower manufacturer.

K. Rubber expansion joints:
   1. Provided at inlet and discharge flanges of blowers.
   2. Suitable for pressures up to 15 pounds per square inch gauge and temperature up to 350 degrees Fahrenheit.
   3. At discharge joints, provided with control rods to restrict axial pipe movement.
   4. Manufacturers: The following or equal:
      a. General Rubber.

L. Discharge piping and silencer insulation: As specified in Section 15082 - Piping Insulation, and as indicated on the Drawings. Insulation inside acoustic enclosure by blower manufacturer.

M. Supports and bracing: As required to support blower, associated equipment and piping, and to prevent excessive or harmful vibration or movement of equipment or piping.

2.05 SPARE PARTS AND SPECIAL TOOLS

A. Spare parts: Provide the following:
   1. 1 complete set of bearings.
   2. 4 complete sets of ventilation and air intake filters.
   3. 4 lubrication oil filter cartridges.
   4. 2 complete sets of gaskets and o-rings.
   5. 2 sets of drive belts:
      a. Label spare parts as specified in Section 01600 - Product Requirements and box for storage.

B. Special tools: Provide the following:
   1. 1 set of special tools with equipment when required for normal operation and maintenance.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install adequate supports and bracing to support blower, associated equipment and piping, and to prevent excessive or harmful vibration or movement of equipment or piping resulting from operation of the system.

B. Mount blower on base plate: Properly align and grout base plate as required for blower and base for electric motor with sliding rails.

C. Secure silencers with hold-down bolts.

3.02 COMMISSIONING

A. As specified in Section 01756 - Commissioning, 15958 - Mechanical Equipment Testing, 11802 - Packaged Water Treatment System Rehabilitation, and this Section.

B. Manufacturer services:
   1. Provide certificates:
      a. Manufacturer’s Certificate of Source Testing.
      b. Manufacturer’s Certificate of Installation and Functionality Compliance.
   2. Manufacturer’s Representative onsite requirements:
      a. Installation: 1 trip, 2-day minimum.
      b. Functional Testing: 2 trips, 1-day minimum each.
   3. Training:
      a. Maintenance: 4 hours per session, 2 sessions.
      b. Operation: 2 hours per session, 2 sessions.
   4. Process operational period:
      a. As required by Owner or Contractor.

C. Source testing:
    1. Test as specified in Section 15958 - Mechanical Equipment Testing.
    2. Blower:
        a. Test witnessing: Not witnessed.
        b. Conduct Level 1 General Equipment Performance Test.
        c. Conduct Level 1 Vibration Test.
        d. Conduct Level 1 Noise Test.
    3. Electrical and Controls:
        a. Conduct testing as specified in Section 17950 - Commissioning for Instrumentation and Controls.

D. Functional testing:
    1. Electrical and Controls:
        a. Conduct testing as specified in Section 17950 - Commissioning for Instrumentation and Controls.
    2. Rotary Lobe Blower System:
        a. Test witnessing: Witnessed.
        b. Conduct Level 2 General Equipment Performance Test.
        c. Conduct Level 2 Vibration Test.
        d. Conduct Level 2 Noise Test.

END OF SECTION

SECTION 11802

PACKAGED WATER TREATMENT SYSTEM REHABILITATION

PART 1 GENERAL

1.01 SUMMARY

A. Section includes: Provisions for rehabilitation of four (4) existing packaged water treatment system units. The existing units are Microfloc Trident Model TR-840A Water Treatment units as manufactured by WesTech Engineering, Inc.

B. The Contractor shall assign responsibility of these units to WesTech Engineering, Inc., herein referred to as the manufacturer.
   1. The Contractor shall provide all labor, materials, equipment, and incidentals as shown, specified and required to refurbish, install, and test (if applicable) the treatment equipment, to be supplied by the specified manufacturer, complete with piping, internals and appurtenances.
   2. The specified manufacturer shall assist in the installation of all required equipment, including all instrumentation and controls connections, in order to provide a complete and operational system. Any electrical and wiring components shall be provided and installed by the Contractor unless otherwise specified.

1.02 SUBMITTALS

A. Submit as specified in Section 01330 - Submittal Procedures.

B. Product data:
   1. As specified in Section 15050 - Common Work Results for Mechanical Equipment.

C. Shop drawings: As specified in Section 15050 - Common Work Results for Mechanical Equipment:
   1. Approval Drawings: Submit six sets for approval of the following:
      a. Shop drawings showing plan, elevation and sectional views/materials of construction, tank reinforcing, and electrical and piping connections.
      b. Materials list of items proposed to be provided under this Section.
      c. Manufacturer's literature and catalog cuts of purchased items.
      d. Manufacturer’s specifications and other data needed to prove compliance with the specified requirements.
      e. Manufacturer’s installation instructions and diagrams.
      f. Control panel wiring schematics and layouts:
         1) Scaled exterior front and side elevations with dimensional information.
         2) Scaled interior panel layout showing all components coordinated with the bill of materials.
         3) Bill of materials with detailed description of components.
         4) Wiring schematics including wire numbers and terminal numbers.

5) Single-line diagram of power distribution.
6) Control wiring, control logic, and instrumentation.

g. Paint System.
h. ANAB-accredited ISO 9001 quality system certification.

D. Calculations: As specified in Section15050 - Common Work Results for Mechanical Equipment.
1. Thermal management calculations for each control panel.

E. Vendor installation, operation and maintenance manuals: As specified in Section 01782 - Operation and Maintenance Manuals.
1. This information shall be provided to the Contractor and Engineer at least two weeks prior to the shipment of the equipment.
2. Submit three copies in electronic format and three copies in hard copy format, each including the following:
a. Complete manufacturer's installation instructions with detailed installation drawings.
b. Complete manufacturer's operational instructions.
c. Complete manufacturer's maintenance instructions with complete catalog information, electric motor information, parts list, recommended spare parts list and instructions for periodic maintenance of the treatment unit.

F. Commissioning submittals:
1. Provide Manufacturer’s Certificate of Source Testing as specified in Section 01756 - Commissioning.
2. Provide Manufacturer’s Certificate of Installation and Functionality Compliance as specified in Section 01756 - Commissioning.

1.03 WARRANTY

A. Provide warranty as specified in Section 01783 - Warranties and Bonds.

1.04 PRODUCT DELIVERY, STORAGE AND HANDLING

A. Comply with the pertinent provisions of the delivery schedule.

B. Equipment and materials to be shipped F.O.B. shipping points, with freight prepaid to the jobsite. Fabricated parts when delivered to the site shall be stored off the ground and protected from weather and damage. Control and electrical devices shall be stored indoors.

C. Ship fabricated assemblies in largest sections permitted by carrier regulations. Match-mark all sections for ease of field installation.

D. Handle so as to prevent damage to equipment during handling and transportation.

E. Equipment supplied under this section shall not be delivered to the site until construction has progressed to the point where installation may properly commence.

PART 2 PRODUCTS

2.01 GENERAL

A. The following items, most of which are supplied by the specified manufacturer, some of which are provided by the Contractor, describe the elements required to ensure a properly designed and integrated water treatment system:
   1. Modify existing factory built steel tanks as indicated on the Drawings, including the following:
      a. Repair, replacement, and/or addition of structural support components.
      b. Addition of an air grid connection.
      c. These modifications to be done when the internals are removed and prior to repairing, sandblasting, and re-painting the tankage.
   2. Refurbishing/repair/replace various ancillaries of the factory built steel modular tanks, including but not limited to:
      a. Clarifier section:
         1) Removing and cleaning existing media retaining screens and buoyant media.
         2) Removing, inspecting, repairing, replacing influent distribution header and lateral assembly.
         3) Replacing with new air distribution header and lateral assembly to updated versions.
         4) Updating media to mixed media.
         5) Replacing pressure switch assembly and/or add pressure transducer.
      b. Filter section:
         1) Removing surface wash system.
         2) Removing existing media, gravel support, and underdrain.
         3) Removing and reusing tubular underdrains.
         4) Replacing media and gravel support.
         5) Incorporating an air grid, tank connection, air check, and control valve.
         6) Replacing automatic process valves and/or actuators.
         7) Replace headloss-pressure switch assembly and/or add pressure transducer.
         8) Replace existing filter level with radar level control.
      c. Air blowers:
         1) Contractor shall replace air wash blowers as indicated on the Drawings and as specified in Section 11376A - Rotary-Lobe Blowers. Blowers shall be provided by packaged water treatment supplier.
      d. Control panel:
         1) Remove and replace existing vendor control panel (VCP).
         2) Installing new vendor control panel.
         3) Providing all new conduit to valves and instruments from new control panel.
         4) Incorporating enhanced chemical feed control.
      e. Backwash supply system:
         1) Replace and install new backwash supply valves with electric valve actuators for each unit.
      f. Chemical feed:
         1) Replace and update the chemical treatment for remote control from the VCP PLC.

B. Painting:
   1. The contractor shall be responsible for coating the filter tank interior and complete treatment unit (filter tank and adsorption clarifier tank) exterior tankage surface and as specified in Section 09960 - High-Performance Coatings.
      a. Surface defects repaired and any tank modifications required shall be completed as suggested by the manufacturer. The surface shall then be prepared by a method defined in Section 09960 - High-Performance Coatings.
      b. All coatings shall be NSF 61 approved.

C. Technical Services: Training shall be provided to the operators for the purpose of review and understanding of any updates or modifications that have been made during the refurbishment.
   1. A competent technical service representative from the manufacturer shall be provided to instruct the Owner's personnel in the operation and maintenance of the equipment. The time listed below includes only on-site time. No travel time should be considered as part of the required training time. Comply with the requirements of Section 01756 - Commissioning.
   2. Instruction during modifications to the existing water treatment units shall happen as described in the table in Section 3.02.K. Instruction and observation shall be included for the following:
      a. Underdrain placement and clarifier influent and air assemblies of the first unit rehabilitated.
      b. Equipment inspection, media placement, start-up and Owner training for the first unit rehabilitated.
      c. Calibration of replaced or updated valves, flow meters and or pressure switches.
      d. Calibration of existing or newly supplied instrumentation.
      e. Equipment inspection and start-up of the second unit rehabilitated.
      f. The minimum days specified above do not relieve the system manufacturer of providing sufficient service to place the system in satisfactory operation.
      g. Advise and adjust chemical feed equipment to optimize process to include optimal clarifier and filter run times.

D. Use adequate numbers of skilled workers who are thoroughly trained and experienced in the necessary crafts and who are completely familiar with the specified requirements and the methods needed for proper performance of the work of this Section.

E. The water system manufacturer shall coordinate all activities, design, installation, and operation with all other suppliers of related equipment to ensure that the final water treatment system is properly designed and functions correctly.

F. Teardown/repaint/refurbish 4 tanks with Adsorption Clarifier section and integral filter, each capable of 1,400 GPM. The following pre-engineered treatment system reflects the equipment already existing on site:

	Nominal Tank	Surface Area/Tank (sq.ft.)	
Model No.	**Capacity (GPM)**	**Clarifiers**	**Filters**
TR-840A	1400	140	280

2.02 WATER TREATMENT FILTER UNIT REHABILITATION

A. Adsorption Clarifier Section:
   1. The contractor shall refurbish/repair 4 Adsorption Clarifier section(s) as shown on the contract drawings.
      a. The adsorption media retention hold-down beams, fasteners, gaskets and retaining screens shall be removed to gain access to the internal.
      b. Beams shall be recoated as set forth in this section and set aside.
      c. The media retaining screen and grating assemblies shall be cleaned by power washer.
      d. All gasket surfaces cleaned and free of old adhesive, sealants, and glues.
      e. The media hold down fasteners shall be cleaned for reuse or replace if the threads or material has been corroded or damaged.
   2. The adsorption media can be removed or floated to the filter section while clarifier repairs/refurbishments are conducted.
   3. The raw water inlet header shall be removed, cleaned, and inspected for damage. Any damage shall be repaired by replacing with new material or replacement of complete assembly. All stainless steel fasteners showing signs of corrosion or damage shall be replaced with new 18-8 SS/304 SS fasteners.
   4. All inlet air piping shall be removed and replaced after system coating. Any Flow-EZ type air nozzles shall be replaced with new media retaining, non-clog air diffusers consisting of a slotted plastic nozzle body consisting of six slot, 0.040 inch slot size, ABS-SST material.
   5. All couplings for the influent water and air headers to be fitted with new gaskets/seals.
   6. For complete repair/repainting of the interior clarifier, see section regarding interior finish coating.
   7. All openings and threaded areas shall be protected from epoxy coating.
   8. For spot repairs: All painted mounting surfaces that show signs of rust or damage shall be sandblasted, cleaned, dried and prepared for repainting per section regarding interior finish coating.
   9. A bottom media retention screen with stainless steel screen support shall be provided to prohibit mixed media from entering and coalescing with the influent and air piping. The adsorption media retention screen shall be a corrosion resistant assembly that allows free passage of water but contains the adsorption media particles.
   10. A 24-inch depth of fiber ball media shall be provided. Media shall be neutrally buoyant with specific gravity of approximately 1.0. Half of the buoyant media that currently is in use shall be reused and set aside during rehabilitation. This existing material is manufactured of recycled HDPE beads. At least one-half of the beads in the bed shall be rolled to produce an elliptical shape and shall also be scarified to place a groove on the media surface. The rolled and

scarified shape provides improved floc retention inside of the clarifier bed. Media that does not include the rolled and scarified design is not acceptable due to its lower capability of floc retention.

11. A stainless steel grating assembly shall sit above the air scour system near the bottom of the ADSORPTION CLARIFIER unit. The grating allows for free passage of water but contains the adsorption media particles.
12. Splash guards shall outline the perimeter of the ADSORPTION CLARIFIER system to prevent water from burping over the edge during the flushing process.
13. Once the AC Media is installed, new adhesive seal shall be installed for the media retaining screen and on the screens as described in the Owners' Manual. Media hold down beams replaced and torqued per specifications.
14. The clarifier check valve shall be replaced, or the seals shall be replaced with new.

B. Filter Section:
1. The floats, level controller, and other instrumentation as required shall be removed.
2. The surface wash sweep(s) and pipework shall be removed from the washtrough.
3. The coupling in the washtrough shall be plugged.
4. The filter media shall be removed as well as any support gravel.
5. The filter underdrain shall be removed.
6. The tank shall be modified with the required tank connection to allow for an air flow into the in-bed air wash grid.
7. The interior shall be cleaned, inspected, repaired or modified as shown on the drawings prior to sandblasting and repainted as noted per the interior finish coating specification.
8. All required supports shall be properly welded and/or installed into the tank(s) as required proper installation. Additional structural supports may be required to be welded to the tank walls to provide stiffening.
9. Effluent piping shall be cleaned prior to installing the new underdrain to ensure no debris in present that could cause damage to the new underdrain during a backwash process.
10. The following procedure will be followed for installation of the underdrain assembly:
    a. In-Bed Air Wash Grid:
        1) The contractor shall install the in-bed air wash grid in the filter section per the manufacturer's requirement.
        2) The gravel support layers shall be installed per the required configuration.
        3) The contractor shall install the in-bed air wash grid assembly into the filter section. The grid shall consist of a main air header pipe with laterals. The header will be flanged on one end and capped on the other end. The laterals shall have cut slots perpendicular to the length of the pipe and in predetermined sections along the length of the lateral pipes. The in-bed air wash assembly shall be placed at the interface of the gravel support and filter media. The assembly shall be supported with the required supports and hardware to ensure the header pipe and laterals are secure and allow air flow into the underdrain system for the filter backwash process.

11. Replacing filter media per specifications below:
    a. Filter mixed media:
        1) The filter media shall be a 30 inch deep mixed media separation bed composed of three materials, each of different size and specific gravity, providing uniform void distribution from coarse to fine in the direction of flow. The mixed media shall consist of the following as noted in the original equipment bills of material:
            a) 18 inches of anthracite coal, MS-4, 1.0–1.1 mm ES, ≤1.7 SG.
            b) 9 inches of silica sand, MS-18, 0.35–0.45 mm ES, ≤1.4 SG.
            c) 3 inches of high-density sand, MS-21, 0.20-0.32 mm ES, ≤1.7 SG.
        2) The filter media shall be supplied by the manufacturer and shall be shipped in bags for ease of installation.

2.03 PLANT PROCESS VALVES-ELECTRIC

A. Refer to Section 13447 for all process control valves in the sizes shown on the drawings.

B. The existing valves and actuators for influent, Adsorption Clarifier air scour, filter effluent, filter-to-waste, backwash and air assisted backwash shall be replaced with new seal kits and replacement actuators.

C. One automatic high-rate valve, one manual high-rate valve, and one manual low-rate valve is provided for backwash flow control. These valves are common to all tanks.

D. The automatic valves with motor actuator shall be provided for process valves. Valves 1-1/2-inch and smaller shall be ball type with bronze body, brass ball, and Teflon * seats. Valves 2-inch and larger shall be wafer butterfly valves with nylon coated ductile iron disc, EPDM seat, 416SS stem and cast-iron body.

E. Motor actuators shall have 480VAC, 60 Hz supply. NEMA 4 enclosure.

F. All electric operated valves will maintain position upon loss of power.

G. A manual wafer-type butterfly valve, complete with handwheel operator, shall be provided for backwash rate setting.

H. New valves with electric motor actuators shall be provided for influent, effluent, filter to waste, Adsorption Clarifier air scour, filter air scour, and backwash inlet.

2.04 PROCESS AND CONTROL EQUIPMENT

A. Filter Level Transmitter:
    1. Utilize the existing level sensor and transmitter selectively demolished from each filter unit.

B. Clarifier Headloss Transmitter and Switch:
    1. Utilize the existing pressure indicating elements, transmitters, gauges, and switches selectively demolished from each filter unit.

C. Filter Headloss Transmitter:
   1. Utilize the existing pressure indicating sensor, transmitter, and gauge selectively demolished from each filter unit.

D. Filter Backwash Switches:
   1. Provide two (2) new float level switches per filter (8 total) for backwash control.

2.05 PLANT BLOWER(S) - REPLACEMENT

A. Refer to Section 11376A - Rotary Lobe Blowers for all blowers shown in drawings.

B. The treatment plant manufacturer shall supply blowers, to provide an air flow capacity for aiding in the cleaning of the Adsorption Clarifier and Filter sections during flushing and backwashing.

C. Air flow capacity for the Adsorption Clarifier flush process shall be 475 scfm at 5 psi and 950 scfm at 5 psi for the filter backwash process.

D. The blower(s) shall be positive displacement (PD) type with a Tri-Lobe design.

E. Each blower shall be provided with an inlet filter, pressure relief valve and dirty filter indicator.

2.06 REPLACEMENT VENDOR CONTROL PANEL (VCP)

A. General:
   1. Vendor control panel components and construction shall be as specified in Section 17710 - Control Systems: Panels, Enclosures, and Panel Components.
   2. Provide components and equipment with UL 508 listing.
   3. Provide control panels with UL 508A labeled.
   4. Provide intrinsically safe circuits and equipment in accordance with UL698A.
   5. VCP shall be programmed, wired, and factory tested for proper operation prior to shipment.
      a. Factory-assemble and wire the control panel such that field wiring only requires connections to terminals.
      b. Additional testing requirements as specified in Section 17950 - Commissioning for Instrumentation and Controls.
   6. Provide surge protection on the incoming power feed.
   7. Provide necessary control hardware, software, and components as required for a fully functional and operational installation.
   8. Provide heating, cooling, and dehumidifying equipment to maintain instrumentation and control devices within their rated operational temperature range.
   9. Power supply: 120 VAC, 1-phase 60 Hz.

B. Enclosures and panel components:
   1. Manufacturers: One of the following or equal:
      a. nVent/Hoffman.
      b. Saginaw Control & Engineering.

2. Panel shall be rated as follows, unless otherwise specified:
    a. Indoor panels:
        1) Electrical/control rooms: NEMA 12, powder coated mild steel.
        2) Process floor: NEMA 4X:
            a) Non-Corrosive Areas: Type 316 stainless steel.
            b) Corrosive Areas: Polycarbonate**.**
3. Programmable logic controller (PLC):
    a. Manufacturers:
        1) Allen-Bradley:
            a) CompactLogix 5380, 5069-L3 Series.
    b. As specified in Section 17720 - Control Systems: Programmable Logic Controllers.
    c. Provide PLC programming software system from same manufacturer as the PLC hardware manufacturer.
    d. PLC Power Supply:
        1) Voltage: 120 VAC.
    e. I/O Modules:
        1) Provide external fuses mounted on the field connection terminal block for discrete input, discrete output, and analog input I/O points.
        2) Discrete modules:
            a) Voltage: 120 VAC.
        3) Individually isolated points are required.
4. Local operator interface (LOI):
    a. As specified in Section 17721 - Local Operator Interface (LOI).
    b. Manufacturers: The following, no equal:
        1) Allen-Bradley:
            a) PanelView Plus 7.
    c. General:
        1) Provide the LOI graphic software system manufactured by the LOI hardware manufacturer.
        2) NEMA rating shall match enclosure rating.
        3) Capable of stand-alone operation in conjunction with 1 PLC.
        4) Communications protocol:
            a) EtherNet/IP.
        5) Touchscreen operator input.
    d. Display:
        1) Type: TFT color.
        2) Standard aspect ratio:
            a) Screen size: 10-inch.
5. Network materials and equipment:
    a. As specified in Section 17733 - Control Systems: Network Materials and Equipment.
        1) Ethernet switches:
            a) Manufacturers: The following, no equal:
                (1) Allen-Bradley Stratix.
                (2) Cisco.
                (3) Hirschmann.
                (4) N-Tron.
            b) Properties:
                (1) Hardware:
                    (a) 100/1000 BASE-FX.

(b) 10/100/1000 BASE-TX.
(c) No fans or moving parts.
(2) Environment:
(a) Operating temperature range: 32 to 140 degrees Fahrenheit.
(b) Humidity: 5 to 95 percent, non-condensing.
(3) Provide Ethernet switch capable of performing basic switching without special programming or configurations.
(4) Connector type:
(a) Fiber: SFP.
(b) Copper: RJ-45.
(5) Mounting:
(a) DIN Rail.

6. Provide 120 VAC to 24 VDC (or other voltages as required) power supply arrangement that is configured with several modules to supply adequate power in the event of a single module failure in either a 1+1 or N+1 configuration as required:
   a. Provide automatic switchover upon module failure.
   b. Alarm contacts monitored by the PLC.
   c. Design power supplies so the either the primary or backup supply can be removed, repaired, and returned to service without disrupting the system operation.
7. Provide GFCI duplex 120 VAC convenience receptacle.
8. Provide NEC Class 2 power to devices requiring NEC Class 2 or SELV supply power.
9. Pilot devices:
   a. Controls:
      1) Power ON-OFF switch.
   b. Lights:
      1) Power ON-OFF indicator.

2.07 CONTROL STRATEGY

A. General:
1. Provide signals over network communication protocol as indicated on the Drawings.
   a. Plant PLC monitoring I/O shall be over the network connection.
2. Coordinate signal transfer with Programmer at programming meetings as specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.
3. Provide access to control parameters and settings.
4. PCS shall only have visibility to Vendor’s PLC. No other vendor furnished Ethernet devices shall be visible to the PCS.
5. Provide security lock out capability for vital settings and functions.
6. Provide real time clock within the PLC to select and initiate unit start times.
   a. Include programming functions for syncing the PLC clock with the plant network time server.
7. Refer to and coordinate with Section 17101 - Specific Control Strategies and Digital I/O Tables provided in the Contract Drawings.

B. Common control functions:
   1. Alarms:
      a. Generate alarms within the PLC logic.
      b. Indicate alarms at the LOI. Enable acknowledgement from either the PCS or the LOI.
      c. Use interlocks and proving timers to prevent alarms from operating due to power loss, except for loss of power alarms.
   2. Analog magnitude checking:
      a. Provide clamps to prevent operator-entered values (setpoints, etc.) that fall outside acceptable limits.
   3. I/O filtering and processing:
      1) Monitor analog input signal quality:
         a) Generate alarms for over or under range inputs.
   4. Display the current status of operator selections (HAND/AUTO, START/STOP, etc.) on the LOI and send those signals to the Plant Control System (PCS) for display on HMI screens.
   5. PLC status:
      a. Provide an LOI screen that depicts the status of the enclosure, including but not limited to the following:
         1) PLC cabinet over-temperatures from high temperature switch.
         2) Intrusion status on enclosures equipped with intrusion switches.
         3) AC power failure.
         4) DC power supply failure.
   6. PLC system communication status:
      a. Provide a minimum of 1 screen to display communication errors and status within the control system network and generate alarms for:
         1) Communication with Plant PLC.

C. Control system requirements as specified in Sections 17100 - Control Strategies and 17101 - Specific Control Strategies.

D. Provide complete program in electronic format, unlocked, via USB drive.

2.08 SPECIFIC CONTROL STRATEGY:

A. Normal operation:
   1. Provide logic to run all clarification and filtration operations automatically.

B. Absorption Clarifier Backwashing:
   1. The control system shall provide means for automatically initiating a flush cycle for each Adsorption Clarifier section by a timeclock or preset adjustable clarifier headloss pressure switch.
   2. An interlock shall be provided so that only one unit can be flushed at a time.
   3. A selector switch shall provide override of the automatic flush initiation to allow manual flushing of each unit.
   4. During the flush cycle, collected solids shall be removed by proper sequencing of valves and the blower.
   5. Return to service shall be automatic.

C. Mixed Media Filter Backwashing and Air Scour:
   1. The control system shall provide means for automatically initiating backwash and air scouring of each Mixed Media Filter by a timeclock or a preset filter headloss pressure switch or transmitter.
   2. An interlock shall be provided so that only one filter can backwash at a time.
   3. A selector touch button shall provide override of the automatic backwash initiation to allow manual backwash of each unit.
   4. Flushing of the corresponding Adsorption Clarifier section can be initiated automatically at the PCS.
   5. The control system shall automatically sequence valves, blowers, and pumps during the backwash cycle.
   6. Return to service shall be automatic.

D. Backwashing Interlocks:
   1. On receipt of backwash pump station low level signal from the PCS, the VCP shall prevent backwashing of additional units.
   2. On receipt of backwash pump station high level signal from the PCS, the VCP shall stop production of water through all units.

E. Automatic Chemical Control:
   1. Coagulant feed shall be controlled by the Aquaritrol logic within the VCP PLC. The controller shall be capable of automatically changing chemical coagulant by pacing chemical feeder to maintain plant effluent turbidity at an established setpoint.
      a. Control inputs shall be from existing turbidimeters and pH monitors.
      b. Control output to the coagulant feed pump shall be a speed percentage output to the PCS via the EtherNet/IP connection to control the pump stroke (or pump motor speed).
   2. Operator interface:
      a. The Aquaritrol Program parameters will be accessible through the control panel LOI.

F. Communication with the PCS:
   1. The VCP shall receive the following signals from the PCS via the EtherNet/IP connection:
      a. All setpoints shall be adjustable from the PCS.
      b. Handshake signal.
      c. Unit 1 run.
      d. Unit 2 run.
      e. Unit 3 run.
      f. Unit 4 run.
      g. Backwash pump station low level.
      h. Backwash pump station high level.
      i. Blower discharge header flow.
      j. Coagulant feed pump 1 running.
      k. Coagulant feed pump 2 running.
      l. Coagulant feed pump 3 running.
   2. The VCP shall send the following signals to the PCS via the EtherNet/IP connection:
      a. Handshake signal.
      b. Unit 1 ready.

c. Unit 1 in semi-auto mode.
d. Unit 1 in auto mode.
e. Unit 1 mode status.
f. Unit 2 ready.
g. Unit 2 in semi-auto mode.
h. Unit 2 in auto mode.
i. Unit 2 mode status.
j. Unit 3 ready.
k. Unit 3 in semi-auto mode.
l. Unit 3 in auto mode.
m. Unit 3 mode status.
n. Unit 4 ready.
o. Unit 4 in semi-auto mode.
p. Unit 4 in auto mode.
q. Unit 4 mode status.
r. Backwash in progress.
s. Flush in progress.
t. Blower 1 in auto mode.
u. Blower 1 running.
v. Blower 1 stopped.

eeee. Unit 4 waste gate valve mode.

2.09 CHEMICAL MIXING AND FEED SYSTEMS

A. Refer to Section 11242 - Liquid Chemical Diaphragm - Type Metering Pumps.

B. Chemical feed pumps electronically controlled by the Aquaritrol PLC Program.

NOTE: Tank and mixer for liquid chemical feed system to be provided by others.

2.10 FINISH

A. Oil, grease, dirt, rust, mill scale, and foreign matter shall be removed from the interior tankage surface by a method defined by the Steel Structures Painting Council (SSPC Spec-latest revision). Tankage interior shall receive at the factory, one coat Tnemec N140-1255 primer, or equivalent, followed by one coat of Tnemec N140-15BL, or equal. The tank exterior, except the bottom, shall be painted with one coat of Tnemec N140-1255 primer, or equal. Field finish painting shall be by the contractor. Tank bottom shall be bare, for the field placement onto a coal tar or asphaltic base mastic compound to be provided and installed on the equipment base pad by the Contractor.

2.11 SPARE PARTS

A. If needed, insert required spare parts for the project. This could include but not limited to, AC retaining screen gaskets, anthracite filter media, valves and actuators, instrumentation, control panel components, touch-up paint, etc.

B. If the PLC hardware provided for the VCP and local control panels are not the same type as the Plant's PLC system hardware, provide the following spare PLC hardware for the PLC equipment in the VCPs and LCPs.
   1. 1 spare CPU for every type of CPU in the system, with programming files preloaded.
   2. 1 spare network and/or communications card for every network or communications card in the system.

PART 3 EXECUTION

3.01 GENERAL REQUIREMENTS

A. Refurbishment of multiple units shall be coordinated with the Owner and Engineer to allow plant to continue to produce water if needed during the refurbishment phase. Refer to specific requirements in Section 01140 - Work Restrictions.

B. Coordination with plant control system and programmer:
   1. Coordinate requirements for data transfer with PCS:
      a. Include all data registers, data types, and engineering units, etc.
   2. Coordinate with the ICSC and programmer for factory testing. Vendor shall supply PLC and LOI programming file prior to the testing.
   3. Coordinate signal transfer with Owner at programming meetings as specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

3.02 TECHNICAL SERVICES

A. The field installation shall be approved by the equipment manufacturer's personnel, who is directly employed by the equipment manufacturer, and normally engaged in the field installation of the equipment specified herein.

B. The manufacturer's authorized personnel shall be present during the placement of filter Mixed Media and underdrains to instruct and observe installation for the first unit rehabilitated.

C. The manufacturer shall inspect all equipment in this section prior to start-up to confirm that all equipment is properly installed and working, both individually and as a system.

D. The manufacturer will be responsible for calibration of equipment specified herein.

E. The Manufacturer shall be present during placement of filter Mixed Media that is not pre-installed.

F. The Manufacturer shall inspect the installation of all equipment in this section prior to start-up in order to verify that the equipment has been properly installed and operates properly as a system and individually.
   1. Submit field reports to the Engineer.
   2. The field reports should include the following items:
      a. Agenda.
      b. Contact time.
      c. Work completed.

G. The Manufacturer after the equipment has been properly installed shall calibrate the equipment with the Owner's operator present.

H. The Manufacturer's representative shall be present for installation assistance described above as listed in the table in Section 3.02.K.

I. After start-up, the Manufacturer shall furnish the service of a competent technical service representative one month after Contractor's start-up to instruct the Owner's personnel in the operation and maintenance of the equipment for a three-day period during one trip.

J. Effluent quality laboratory analysis shall be provided by the Owner.

K. Equipment manufacturer is required to provide qualified personnel to assist the Contractor as listed in the following table.

Total Trips	Total Duration (Days)	Description
1	2	Initial site visit for equipment inventory review
4	10	Mechanical Components; AC, filter air scour grid, and filter media installation inspection and startup
2	6	Instrumentation on-site assistance, inspection, and startup
4	8	Controls on-site assistance, inspection, and startup
1	3	Operator Training

3.03 TESTING AND INITIAL OPERATION

A. Place units in service utilizing services of equipment manufacturer's service personnel.

B. Fill the plant with liquid to test the hydrostatic design.
   1. Any failure or excessive deflection shall be remedied.

C. Demonstrate proper installation and operation of all equipment with a 72-hour test.
   1. Any failure is to be corrected and the system is to be retested for the specified time period.
   2. Licensed operators at the water treatment plant will be responsible for actual operation of the plant.

3. The equipment manufacturer's service technician will be available by phone during the entire test and will provide on-site service as needed.
4. All testing, including schedules, etc. will be coordinated with the Owner, Contractor, and Engineer.

3.04 WARRANTY

A. A warranty shall be provided covering all replacement parts and workmanship for twelve months after Substantial Completion.

B. It shall be the Supplier's responsibility to provide the necessary service engineers to repair and/or replace any defective components during this warranty period including any and all travel expenses incurred for same.

END OF SECTION

SECTION 13206F

HYDROPNEUMATIC BLADDER TANK

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. ASME-rated hydropneumatic bladder tank with removable bladder.

1.02 REFERENCES

A. American Society of Mechanical Engineers (ASME):
   1. Boiler and Pressure Vessel Code (BPVC).
      a. Section VIII-Rules for Construction of Pressure Vessels, Division 1.

B. NSF International (NSF):
   1. Standard 61 - Drinking Water System Components.

1.03 DELEGATED DESIGN

A. As specified in Section 01357 - Delegated Design Procedures.

B. Equipment anchoring and bracing to structures.

1.04 SUBMITTALS

A. Submit as specified in Section 01330 - Submittal Procedures and Section 01600 - Product Requirements.

B. Contractor is responsible for completing the Pressure Vessel Inspection Request Form that can be found at the California Department of Industrial Relations website http://www.dir.ca.gov/dosh/pressure.html#PresureVessel.
   1. City will pay for the permit fees and should be listed as “Company Contact.” Contractor to coordinate point of contact with City.

C. Product data:
   1. List of materials and coatings used with specifications and physical properties for each.
   2. Manufacturer's standard operations and maintenance information.

D. Shop Drawings:
   1. Detailed drawings or manufacturer's literature to indicate compliance with the specified requirements.
   2. Dimensional drawings indicating vessel dimensions, wall thicknesses, and mounting, and anchorage requirements.

E. Delegated Design Submittals:
    1. Anchoring and bracing: Project-specific calculations with anchoring and bracing details based on support conditions and requirements to resist loads specified in Section 01850 - Design Criteria.
        a. To structures for tanks installed in structures designated as seismic design category C, D, E, or F.
        b. For tanks installed outdoors.
        c. For tanks installed indoors and having a height to diameter ratio greater than 1.0.Installation instructions.

F. Installation instructions.
    1. Manufacturer's installation instructions.
    2. Equipment anchor setting template.
    3. Complete details for installation of the equipment including rigging, moving, and setting into place.

G. Certifications:
    1. Certification of compliance with ASME BPVC, and data reports in accordance with the ASME BPVC and other local codes as required.

1.05 WARRANTY

A. Provide manufacturer's standard warranty.

PART 2 PRODUCTS

2.01 GENERAL

A. As specified in Section 01600 - Product Requirements and Section 15050 - Common Work Results for Mechanical Equipment.

2.02 MANUFACTURERS

A. Hydropneumatic bladder tank:
    1. One of the following or equal:
        a. John Wood Co., JOPR-22-020.
        b. Wessels Co., Model FXA 4000.
        c. AAtanks., Model FXA-4000.
        d. Elbi of America, Series WTL-2.

2.03 DESIGN AND PERFORMANCE CRITERIA

A. General:
    1. Design, fabricate, and test tanks in accordance with the requirements of:
        a. ASME BPVC.
        b. As specified in Section 01850 - Design Criteria.
        c. Applicable local codes and regulations.
    2. Where conflicts between design criteria exist, request clarification from the Engineer.

B. Hydropneumatic bladder tank:
   1. Vertically mounted tanks, designed for the operating conditions specified:

Minimum Drawdown Volume	1,000 gallons
Maximum Diameter	8 feet
Pressure Cut-In (psi)	85
Pressure Cut-Out (psi)	120
Maximum Operating Pressure	125 pounds per square inch
Temperature Range	20 to 120 degrees Fahrenheit
Minimum Bladder Lifetime Cycles(1)	50,000
Notes: (1) 1 Cycle = When hydropneumatic tank bladder experiences 1 duration of Cut-In to Cut-Out pressure.	

   2. Pressure rating: Unless otherwise indicated on the Drawings, hydropneumatic bladder tanks shall be fabricated in accordance with the ASME BPVC for unfired pressure vessels, for a design pressure rating not less than the lesser of:
      a. 150 percent of the maximum operating pressure, or
      b. 50 pounds per square inch gauge above the maximum operating pressure.
   3. Corrosion allowance: 1/8-inch at shell, heads, and attachments.
   4. Tank seal water volume shall be a minimum of 10 percent of the overall tank capacity.

2.04 MATERIALS

A. Tank:
   1. Constructed using carbon steel with interior and exterior coatings in unless otherwise indicated on the Drawings.
   2. Lifting lugs: Provide lifting lugs at top of tank.
   3. Anchor clips:
      a. Manufacturer's standard configuration, attached to tank skirt, and as required to resist design forces specified.

B. Bladder: Provide sealed bladder system to separate liquid from the steel tank and the air cushion:
   1. Heavy-duty butyl rubber bladder rated for the maximum operating temperature specified.
   2. Liquid contained inside the bladder through an exterior system fill connection.
      a. Material in direct contact with water certified under NSF-61.
   3. Bladder and system connection mounted on a tank flanged connection so that bladder is replaceable through the tank flanged connection.
   4. Tank factory pre-charged to 30 pounds per square inch gauge with minus 40-degree Fahrenheit dew point dry air.

C. Nameplates and certification stamps:
   1. Nameplate:
      a. Each tank shall bear a stainless steel ASME nameplate.
      b. Each nameplate shall bear the applicable code symbol.
   2. ASME Stamp:
      a. Stamp applied to the tank shell.
      b. Manufacturer shall be authorized by ASME to apply the applicable code symbols.

D. Fittings and attachments:
   1. Fittings as specified in Section 15120 - Piping Specialties or as indicated on the Drawings.
   2. Fittings larger than 1 inch shall be flanged.
   3. Fittings 1 inch and smaller shall be National Pipe Thread.

E. Access openings:
   1. Access openings shall be flanged and, unless otherwise indicated on the Drawings, have a nominal diameter of at least 24 inches.
   2. The coverplate and flange of access openings shall each have a net thickness, after machining, of at least 1/2-inch or as required to meet the vessel design pressure.
   3. Reinforce openings in accordance with the ASME BPVC.

F. Weld shell attachments for pipe supports, tank gauges, instruments, and other items as indicated on the Drawings before application of the tank interior coating.

2.05 APPURTENANCES

A. Air charging valve:
   1. Standard Schrader valve or approved equal industry standard.

B. Air relief valve:
   1. Air relief valve shall be sized by manufacturer in accordance with ASME BPVC for unfired pressure vessels.
      a. Drain connection located on tank air side.
      b. Manufacturer's standard size for the tank size.

C. Manual air vent valve:
   1. Screwdriver operated, low projection type vent for shallow height clearance installation; or needle valve, designed for the tank pressure rating at the maximum operating temperature with 1/8-inch male pipe thread connection.
   2. Manufactures: One of the following or equal:
      a. Armstrong, 505A.
      b. Bell and Gossett, 4V.

D. Pressure gauge:
   1. Pressure gauges shall be as specified in Section 17404 - Pressure/Vacuum Measurement: Gauges, with a 0 to 125 pounds per square inch gauge dial range.
   2. Pressure gauge shall be separated from the tank by ball valves and insulating bushings.

E. Anchors:
    1. Anchoring to structures:
        a. As indicated on the Drawings and as specified in Section 05190 - Mechanical Anchoring and Fastening to Concrete and Masonry.

2.06 FABRICATION

A. Welding:
    1. Weld and test welding in accordance with ASME BPVC.
    2. Excessive reinforcement shall be ground down to within the ASME BPVC requirements, and as required to install the lining systems.
    3. Internal corners and edges shall be ground to a 1/8-inch radius, or a greater radius if required by the lining system.

B. Protective coating:
    1. Interior surfaces: Factory coated with high solids epoxy coating as specified in Section 09960 - High-Performance Coatings.
    2. Exterior surfaces: Factory coated with primed for field coating as specified in Section 09960 - High-Performance Coatings.

PART 3 EXECUTION

3.01 PREPARATION

A. Anchoring and bracing to structures:
    1. Prepare equipment anchor setting template(s) and use to position anchors during construction of supporting structure(s).
    2. Install anchors of type and material indicated on approved anchoring designs.
    3. Install anchors with embedment indicated on approved anchoring designs.

3.02 INSTALLATION

A. Install tanks:
    1. As indicated on the Drawings.
    2. As specified in Section 15050 - Common Work Results for Mechanical Equipment.
    3. In accordance with accepted manufacturer’s installation instructions and accepted anchorage design details.

B. Field finishes:
    1. Not required: Provide tanks with manufacturer's factory-applied coating.

3.03 COMMISSIONING

A. As specified in Section 01756 - Commissioning.

B. Source Testing (Factory Acceptance Tests):
    1. Not witnessed.

2. Furnish: Test reports and Manufacturer's Certificate of Source Testing.
    a. Certification of compliance with ASME BPVC for design and performance criteria specified with be considered acceptable Source Testing.

C. Installation Verification:
    1. Furnish: Documentation not required.

D. Functional Testing:
    1. Equipment testing:
        a. Hydropneumatic bladder tank(s).

E. System Testing:
    1. As specified in Section 01756 - Commissioning, Attachment G.
    2. As specified in this Section.
    3. Furnish Manufacturer's Certificate of Functional Compliance.

PART 1 GENERAL

1.01 SUMMARY

A. Work includes:
   1. This section specifies the design and construction of an AWWA D110, Type 1, strand-wrapped circular prestressed concrete tank, furnishing, installation, testing, and disinfection. The tank shall consist of: foundation, underdrain system, concrete membrane floor slab, cast-in-place concrete core wall, cast-in-place concrete domed roof, and all associated appurtenances. The core wall shall be vertically post-tensioned with thread bars, prestressed circumferentially with machine-wrapped 7-wire galvanized strand, and protected with several coats of shotcrete. The foundation shall be constructed with continuous shallow concrete spread footings below the perimeter wall. The concrete floor shall be constructed with a concrete slab below grade.
   2. In the event of a discrepancy between this section of the Specifications and any other section of the Specifications, this section shall govern.
   3. The Tank Contractor shall furnish all labor, materials, tools, and equipment necessary to design, construct, disinfect, and test the prestressed concrete tank.

B. Related sections:
   1. Section 01410 - Regulatory Requirements.
   2. Section 01759 - Water Leakage Test for Concrete Structures.
   3. Section 02300 - Earthwork.
   4. Section 03102 - Concrete Formwork.
   5. Section 03150 - Concrete Accessories.
   6. Section 03200 - Concrete Reinforcing.
   7. Section 03300 - Cast-in-Place Concrete.
   8. Section 03931 - Epoxy Injection System.
   9. Section 09960 - High-Performance Coatings.

1.02 REFERENCES

A. Abbreviations:
   1. cfm - cubic feet per minute.
   2. f'c - specified compressive strength of concrete.
   3. g - gravitational constant, equal to 32.2 feet per second squared.
   4. gpm - gallons per minute.
   5. ksi - kips per square inch.
   6. MG - million gallons.
   7. mph - miles per hour.
   8. pcf - pounds per cubic foot.
   9. psf - pounds per square foot.
   10. psi - pounds per square inch.
   11. PVC - polyvinyl chloride.
   12. sec - seconds.

B. Definitions:
   1. Core Wall - That portion of the concrete tank wall that is circumferentially post-tensioned.

2. Prestressed Concrete - Concrete in which internal compressive stresses of such magnitude and distribution have been introduced through post-tensioning to offset tensile stress development from service loads.
3. Prestressing Reinforcement - High-strength steel used to prestress the concrete tank wall.
4. Rebound - The shotcrete material that ricochets off of the receiving surface and falls.
5. Shotcrete - Pneumatically applied wet mortar or concrete used for embedment protection of the circumferential prestressed wall reinforcement.
6. Strand - A symmetrically arranged and helically twisted assembly of 7 high-strength steel wires used for prestressing reinforcement or as nonprestressed seismic cables.
7. Stressing Machine - May refer to the automated wrapping machinery used to post-tension the strand around the tank circumference or vertical post-tensioning equipment used to post-tension vertical thread bars.
8. Tank Contractor - A qualified tank manufacturer and/or contractor that specializes in the design and construction of an AWWA D110 type of tank specified herein.
9. Tank Prestressor - A contractor or sub-contractor that specializes in the design of an AWWA D110 type of tank and specializes in the construction of the prestressed elements of the tank, such as the strand/wire wrapping and the vertical post-tensioning of the wall.
10. Tendon - High-strength thread bar, including end anchorages, used to impart vertical prestressed forces to the tank wall.
11. Wire - High-strength, cold-drawn steel wire used to assemble strands.

1.03 SUBMITTALS

A. Product data:
   1. Waterstops:
      a. Submit samples, prints, and complete physical property data covering waterstops.
      b. Laboratory test reports: Submit reports indicating that average properties of polyvinyl chloride waterstops material and finish conform to requirements specified in this Section.
   2. Epoxy grouting equipment: Submit product information.
   3. Neoprene bearing pads: Submit product information.

4. Stressing machine:
    a. Submit a description of the proposed equipment.
    b. Submit calibration reports for force recording equipment used installation of vertical thread bars and circumferential prestressing.

B. Shop drawings:
1. Drawings showing all plan views, sections, and details of the tank construction, including, but not limited to, all structural elements, all appurtenances, connections, joints, waterstop, roof hatches, vents, ladders, fall arrest and protection systems, guardrails, piping, pipe penetrations, pipe supports, sub-grade preparation, base liners, tank instrumentation, and materials for roof drainage and conductance.
2. Drawings of entire prestressing operation showing vertical thread bar and circumferential strand placement with associated schedules and intermediate lock-off elevations, prestressing bar and strand size, ducts for vertical thread bars, and anchorage details.
3. Drawings for placement and detailing of all reinforcing steel.
4. Drawings showing:
    a. Neoprene bearing pads and methods of pad installation.
    b. Waterstop and methods of installation.
    c. Sponge filler pads or sleeves and methods of installation.
    d. Exterior coating system.
5. All shop drawings shall be signed and sealed by a registered California structural or civil engineer.

C. Design submittals:
1. Structural calculations for all aspects of the structural design of the tank, along with calculations for prestressing reinforcement, elongation estimates, soil capacity checks, and calculations for any other structural design aspect.
2. Concrete mix designs in accordance with Section 03300 - Cast-in-Place Concrete and additional provisions specified herein.
3. Shotcrete mix designs in accordance with the provisions specified herein.
4. Admixtures to be used in the concrete and/or shotcrete and their purpose.
5. All design submittals shall be signed and sealed by a registered California structural or civil engineer.

D. Tank responsibility statement:
1. The Tank Contractor shall submit a statement attesting that they have assumed responsibility for the tank design and construction. The statement shall be signed and sealed by the Tank Contractor’s engineer-in-responsible-charge of the tank design. No other submittal items will be reviewed until a satisfactory statement has been received.

E. Qualification Statement:
1. Failure to submit a qualifications statement package will be deemed an irregularity, which will cause bid to be rejected as nonresponsive.
2. Submit pertinent information that demonstrates conformance with Quality Assurance requirements specified herein.

3. To include:
    a. Company history, contact person(s), address, and telephone number.
    b. Project references with owner and engineer's contact information.
    c. Name and work history of the on-site project manager to be assigned to the project.

F. Quality control submittal:
    1. Certificates of Compliance:
        a. Thread Bars: Submit certified test reports that verify bars and anchorage meet specified material standards.
        b. Waterstop: Submit certificates certifying that waterstops provided on this project meet or exceed physical property requirements of current USACE CRD C 572.
        c. Circumferential prestressing: Submit certified test reports for each size, heat, and reel that verify conformance to applicable ASTM standards for materials, strength, and yield properties.

G. Test reports:
    1. Strand and vertical thread bar prestressing records.

H. Manufacturer's instructions:
    1. Tank appurtenances: Submit manufacturer's installation instructions.

1.04 NON-RESPONSIVE BID

A. Qualifications statement package:
    1. Submit a qualifications statement package with the bid. The package shall contain information as required per Section 1.03.E.
    2. Failure to submit a qualifications statement package will be deemed an irregularity that may cause bid to be rejected as non-responsive.

1.05 QUALITY ASSURANCE

A. Qualifications:
    1. Singular Responsibility:
        a. It is the intent of these Specifications to create singular responsibility for design, construction, and performance of the prestressed concrete tank. The design and construction of all aspects of the foundation, floor slab, core wall, columns, prestressing, shotcrete, and roof of the tank shall be performed by the Tank Contractor.
            1) No portion of the work on the tank shall be subcontracted unless:
                a) Prior acceptance is obtained from the Engineer; and
                b) The Tank Contractor's on-site project manager personally supervises the work of any subcontractors and their personnel.
        b. If the Tank Contractor believes that any requirement of this Section represents a departure from its normal recommendations that will affect the quality or performance of the tank, notify the Engineer in writing of such concerns. For each provision of concern, cite the relevant

paragraphs of this Section and indicate the Tank Contractor's recommended modifications or alternatives to those provisions.
1) Acceptance of Tank Contractor's alternatives shall be at the discretion of the Engineer, and the decision of the Engineer shall be final.

2. The specified tank shall be designed and constructed by the Tank Contractor. The Tank Contractor shall be experienced in the design and construction of circumferentially prestressed tanks with cast-in-place concrete core wall sections using freed neoprene bearing pad connections at the top and base of the wall, PVC waterstops, seismic cables placed between the wall and the foundation, and a domed concrete roof deck.
   a. No Tank Contractor is considered qualified unless it has designed and built the following projects in its own name:
      1) At least then circumferentially prestressed concrete tanks conforming to AWWA D110, Type I in the last 20 years.
      2) At least 5 circumferentially prestressed concrete tanks conforming to AWWA D110, Type I used for water storage that have been in successful operation for at least 5 years.
      3) At least 5 circumferentially prestressed concrete tanks with domed roofs conforming to AWWA D110, Type I that are 1.5 MG or larger in the last 10 years.
   b. The Tank Contractor shall have in its employ a design engineer with a minimum of 10 years of experience in the design of AWWA D110 Type I tanks. The design engineer shall have been the engineer of record for a minimum of 10 AWWA D110 Type I tanks designed for and constructed by the Tank Contractor in its own name. The design engineer shall be licensed as a civil or structural engineer in the state of California.
   c. The Tank Contractor shall have in its employ for this project a team consisting of an on-site project manager, concrete foreman, shotcrete foreman, shotcrete nozzleman, and prestressing foreman, each of whom shall have constructed in the last 10 years a minimum of five AWWA D110 Type I tanks having a capacity of 1.5 MG or greater.
      1) Experience gained on shotcrete pool and ditch construction will not be considered as qualifying experience for nozzleman.
      2) Skill of nozzleman:
         a) Capable of applying thin coats of even and uniform thickness.
         b) Certified shotcrete nozzleman in accordance with ACI 506R.
3. Experience in the design and construction of AWWA D110 Type II, Type III, or Type IV tanks will not be accepted as demonstrating the qualifications required by the preceding paragraphs.
4. Soil Anchors:
   a. Qualifications and Experience:
      1) The design, construction, testing and quality control of the deep foundation system shall be the responsibility of the Tank Contractor. The Tank Contractor may subcontract labor for the deep foundation installation under the Tank Contractor's direct supervision.

1.06 DESIGN CRITERIA

A. Except as modified herein, the prestressed concrete tank shall be designed and constructed in compliance with the provisions of AWWA D110 for strand-wound circular, prestressed concrete water tanks with Type I core wall.
   1. The prestressed concrete tank core wall shall be of cast-in-place concrete construction. Shotcrete or precast core walls are not permitted under the provisions of this Section.

B. Standards/Codes:
   1. The prestressed concrete tank shall be designed and constructed as specified herein, and in accordance with provisions of the following standards and codes:
      a. AWWA D110-13.
      b. ACI 350-06.
      c. ACI 350.3-06.
      d. ASCE 7-10.
   2. Where conflicts between the requirements of this Section and of these standards and codes occur, the more restrictive provisions shall apply.
      a. Exception: Requirements for concrete cover and member thickness shall be as specified in this Section.

C. Load criteria and requirements to be used by the Tank Contractor in the design calculations:
   1. Capacity: 2.0 MG usable storage below the maximum water elevation shown on the Drawings.
      a. Inside Diameter: 115 feet.
   2. Dead Load: shall be the estimated weight of all permanent imposed loads.
      a. Unit weight of concrete shall be taken as 150 pounds per cubic foot.
      b. Unit weight of steel shall be taken as 490 pounds per cubic foot.
   3. Fluid Load: shall be the lateral pressure and weight of the water when the tank is filled to a level that is 6 inches above the elevation of the top of the overflow elevation as indicated on the Drawings (to allow for overflow conditions).
      a. Unit weight of water shall be taken as 62.4 pounds per cubic foot.
   4. Roof Live Load:
      a. Uniform: 40 pounds per square foot, non-reducible.
      b. Any concentrated reactions due to the use of fall protection equipment.
      c. Application of fall protection equipment reaction loads shall be applied concurrently with uniform roof live load. However, load factors for the load case where the combination of uniform and fall protection reactions are considered simultaneously may be taken as unity.
   5. Construction Loads:
      a. Loads applied to the tank during construction shall be accounted for in the design of the tank.
   6. Geotechnical Report: See Section 00800 - Supplementary Conditions.

7. Foundation Loads: the tank foundation shall be proportioned so that the net foundation bearing pressure shall be less than the net allowable soil bearing pressure specified in the Geotechnical Report.
    a. The allowable soil bearing pressure may be increased by 33 percent for load combinations that include wind or seismic loads.
    b. Settlement Loads: the tank shall be designed to resist the effects of total and differential settlement indicated in the Geotechnical Report.
8. The final design for wind and seismic loads shall consider a reduced capacity to resist sliding due to any membranes placed between the bottom of the concrete foundation and the soil.
9. Wind Load: determined in accordance with ASCE 7-10.
    a. Exposure Category C.
    b. Basic Wind Speed = 104 mph (3-sec gust).
    c. Importance Factor, I_W = 1.00.
10. Seismic Design Criteria: seismic design shall be based on the applicable sections of AWWA D110-13, ASCE 7-10, and ACI 350.3-06. The seismic forces shall be calculated using each code separately. The total base shear used for design shall be the maximum value obtained from the three codes used.
    a. When comparing force and base shear values, those obtained from ASCE and ACI shall be based on service level loads.
    b. AWWA D110-13 Design Criteria:
        1) Occupancy Category, IV.
        2) Importance Factor, I = 1.50.
        3) Mapped Spectral Acceleration for Short Period, S_S = 1.48 g.
        4) Mapped Spectral Acceleration for 1-second Period, S_1 = 1.58 g.
        5) Site Class D.
        6) Impulsive Structure Coefficient, R_I = 3.5.
        7) Convective Structure Coefficient, R_C = 1.0.
        8) Overstrength Factor,Ω_o, 2.0.
    c. ASCE 7-10 Design Criteria:
        1) Risk Category IV.
        2) Mapped Spectral Acceleration for Short Period, S_S = 1.48 g.
        3) Mapped Spectral Acceleration for 1-second Period, S_1 = 1.58 g.
        4) Site Class D.
        5) Response Modification Factor, R = 3.25.
        6) Overstrength Factor,Ω_o, 2.0.
        7) Long-period Transition Period, T_L = 12 sec.
        8) Importance Factor, I = 1.50.
    d. ACI 350.3-06 Design Criteria:
        1) Mapped Spectral Acceleration for Short Period, S_S = 1.48 g.
        2) Mapped Spectral Acceleration for 1-second Period, S_1 = 1.58 g.
        3) Site Class D.
        4) Response Modification Factor, R = 3.25.
        5) Long-period Transition Period, T_L = 12 sec.
        6) Importance Factor, I = 1.50.
    e. The sloshing wave height shall be taken as the larger of the values calculated in accordance with AWWA D110-13, ASCE 7-10, and ACI 350.3-06.
        1) In the event that the calculated height of the “sloshing wave” exceeds the freeboard of the tank (distance from the maximum operating

water surface elevation to the bottom of the roof deck at the wall), the tank and the roof deck shall be designed to accommodate the dynamic effects as follows:

a) Any portion of the convective sloshing wave that extends above the top of the tank wall (bottom of the roof deck at the wall) shall be calculated and applied to the roof deck as an uplift pressure in accordance with section 15.7.6.1.2.c of ASCE 7-10.
b) Additionally, the mass of any confined portion of the convective sloshing wave shall be included with the impulsive mass used in the estimation of the hydrodynamic forces applied to the tank for design, also in accordance with section 15.7.6.1.2.c of ASCE 7-10.
c) Any revisions to the tank, including but not limited to, the roof elevation, water overflow level, and roof slab that are required to meet the specified provisions to resist sloshing loads and its effect on the hydrodynamic design shall not result in additional costs to the Owner.

11. Temperature and moisture gradients: effects due to changes in temperature and due to temperature and moisture gradients across structural members shall be considered in the design. Refer to Section 01850 - Design Criteria.
12. Prestressing application: forces applied to the wall shall be considered in the design of the wall, especially where wall penetrations result in locally increased prestressing force application to the wall.
13. On screen mesh size and screen open area:
    a. The vent shall be sized for a minimum rate of 750 cfm or the rate of volumetric withdrawal assuming the outlet pipe has ruptured, whichever is greater.
14. Overflow Design Capacity: 2,000 gpm with maximum 9-inch water height over the top of the overflow weir.

D. Floor Slab and Wall Footing Requirements:
    1. The floor slab shall be designed as a membrane floor slab as defined in ACI 372R, Section 3.2.2 that is not less than 18 inches thick; or the floor slab may be designed as a slab-on-ground with a thickness not less than 18 inches.
    2. Construction joint locations shall be submitted to the Engineer for review.
        a. Where construction joint spacing exceeds 50 feet, provide means for reducing shrinkage below the limit specified in Section 03300 - Cast-in-Place Concrete in proportion to the extent the spacing limit of 50 feet is exceeded.
        b. Use of construction joints in the floor slab shall be minimized.
    3. Minimum ratio of floor slab reinforcement area to concrete area shall be 0.5 percent for each orthogonal direction, with bars spaced no greater than 12 inches on center or 2 times the slab thickness, whichever is less.
    4. Minimum concrete cover over reinforcing steel shall be in accordance with Table 3.3.2.3 of ACI 350.5.

5. Wall footings shall bear below floor sub-grade and shall be placed monolithically with the floor slab.
    a. The bottom of the wall footing shall be embedded a minimum of 60 inches below the lowest finish grade elevation over the outside edge of the footing or as indicated on the Drawings, whichever is greater.
6. Design of the floor and wall footing shall consider the differential base stiffness and at concrete encasements or hard points below the floor and wall footing.

E. Wall Design Requirements:
1. The prestressed concrete tank wall shall be constructed with a cast-in-place core wall that is circumferentially wrapped with 7-wire strand prestressing reinforcement at the exterior and encapsulated within protective shotcrete layers. The core wall is to be vertically prestressed with post-tensioned thread bars.
2. The thickness of the core wall shall not be less than 10 inches thick.
3. The minimum average vertical compressive axial prestress in the core wall provided by the vertical prestressing reinforcement shall be 200 psi after deduction for all losses.
    a. Vertical prestressing reinforcement shall be spaced on average no greater than 50 inches on center or 7 times the thickness of the core wall, whichever is less.
4. The minimum average circumferential residual prestress compression in the wall shall not be less than 200 psi for the aboveground portion of the tank wall, tapering linearly to 50 psi at 6 feet below grade.
5. The connection between the base of the wall and the foundation shall be an anchored flexible connection in accordance with Section 4.2.1 and Figure 4B of AWWA D110-13.
    a. The joint at the base of the wall shall permit unrestrained radial expansion and contraction of the wall relative to the foundation.
    b. The joint at the base of the wall shall provide restraint against lateral seismic loads acting tangentially to the wall.
    c. Restraint cables shall be provided between the core wall and the foundation to resist seismic loads. The cable installation shall be detailed in a manner that does not introduce radial restraint between the wall and the foundation.
6. The joint at the wall to the roof shall allow the roof to expand and contract radially while maintaining full vertical load bearing capacity under all conditions.
7. The minimum concrete cover over non-prestressed reinforcing shall be in accordance with Table 3.3.2.3 of ACI 350.5.
8. Vertical non-prestressed reinforcing:
    a. Provide vertical non-prestressed reinforcing over the full height of the wall.
    b. The tensile stress shall be limited to a maximum of 18,000 psi.
    c. Reinforcing size shall not exceed 3/4-inch in diameter.
    d. Reinforcing spacing shall not exceed 12 inches on center.

F. Domed Rood Design Requirements:
1. The roof shall be a domed, cast-in-place concrete structure. Columns or interior supports will not be allowed.
2. The minimum thickness of the domed roof shall be 4 inches.
3. The dome shall be fixed to the tank wall.

4. Minimum concrete cover over reinforcing steel shall be in accordance with Table 3.3.2.4 of ACI 350.5.
5. The reinforcing steel for the roof structure shall be sized in accordance with ACI 350 with the environmental durability factor, S_d, applied to limit flexural stress. Reinforcing steel shall be proportioned and distributed to control cracking for normal environmental exposure.
6. The effects of thermal expansion and contraction shall be accounted for in the design of the roof structure. Appurtenances and roof connections shall be detailed to limit restraint to the thermal radial movement.
7. The Tank Contractor shall submit, for the Engineer's approval, a plan showing the roof configuration that includes construction joints. Construction joints shall incorporate 6-inch PVC waterstop.

G. Uplift:
1. Tank to resist uplift forces from design flood elevation of 604 feet, in tank empty conditions.

1.07 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Prestressing steel shall be adequately packaged for protection against corrosion and physical damage during shipping and storage.

B. Prestressing steel that has rusted or has otherwise sustained damage will be rejected.

C. Prestressing material and appurtenances delivered to project site: Store off ground on planks, supported by 4-by-4 timber. Cover with polyethylene sheeting or treated paper to prevent exposure to moisture.

1.08 PROJECT CONDITIONS

A. Environmental requirements:
1. Cold weather epoxy grouting of tendons:
a. In cold weather, and especially during frosts, take special precautions to avoid freezing of epoxy.
b. In event that grouting procedure cannot be postponed, keep wall temperature above freezing point with hot blankets or by other means acceptable to Engineer.

B. Site safety precautions:
1. Take every precaution to keep personnel and visitors outside the area of danger from breaking prestressing strands or bars.
2. At no time shall anyone stand in the line of stressed circumferential strand.
3. No work shall be performed by anyone, other than the prestressing crew within 100 feet of circumferential wrapping operation or vertical bar stressing operation.
4. Where access to the site by unauthorized persons cannot be controlled while prestressing work is in progress, or where property lines are less than 100 feet from the wrapping operation, erect protective fencing to prevent breaking strands from endangering such persons.

C. Welding:
   1. Perform no welding to anchor plates after prestressing tendons have been assembled.
   2. Do not use prestressing steel as ground for welding operations.

1.09 SEQUENCING AND SCHEDULING

A. Polyvinyl chloride waterstops:
   1. Welding of polyvinyl chloride waterstops: Prior to installing waterstops in forms, demonstrate ability to weld acceptable joints in waterstops.
   2. Quality of welded joints: Are to be subject to acceptance of the Engineer.

B. Restrictions on shotcrete operations:
   1. Abrasive Blasting:
      a. Do not commence prior to the completion date of curing period of tank corewall.
      b. Do not commence until all form tie holes have been drypacked.
   2. Wind conditions: Do not apply shotcrete under such strong wind conditions that considerable amount of cement and moisture is removed by wind from mortar spray between nozzle and surface on which shotcrete is applied.
   3. Temperature requirements:
      a. Peak temperature during day must be expected to rise to at least 55 degrees Fahrenheit.
      b. Night temperature of first night after shotcrete application must not be expected to drop below 33 degrees Fahrenheit.
   4. Cold weather conditions:
      a. Application of shotcrete under cold weather conditions is solely at the Tank Contractor's risk.
      b. Shotcrete may be applied in cold weather provided surfaces are not frozen.
      c. Damage to shotcrete: Whenever rain or frost damages shotcrete which has not had chance to take set:
         1) Remove and replace such shotcrete.
         2) Remove damaged shotcrete before applying any new layers of shotcrete.
      d. Type III Portland cement may be utilized for shotcrete for cold weather application.

C. Ultimate initial prestressing force for vertical thread bars: Do not apply until concrete compressive strength in walls reaches specified strength.

D. Wrapping of circumferential prestressing strands:
   1. May start when core wall concrete has reached a compressive strength of 3,000 pounds per square inch and intermediate layers of shotcrete coats over prestressing strands has reached a compressive strength of 250 pounds per square inch or 12 hours after the shotcrete coat was applied, whichever is greater.
   2. The compressive stress in the concrete due to wrapping shall not exceed 55 percent of f'_c at any time.

E. Backfilling of tanks:
   1. Do not backfill until and unless the Engineer has accepted leakage testing results and the concrete has reached specified strength.

1.10 GUARANTEE

A. The Tank Contractor shall guarantee the structure against defective materials or workmanship for a period of 2 years from the final date of completion. If any materials or workmanship prove to be defective within 2 years, those materials shall be replaced or repaired by the Tank Contractor at the expense of the Tank Contractor.

B. Access hatch (through-roof access) warranty:
   1. Manufacturer is to warranty proper operation and against defects in material or workmanship for a period of 5 years.

PART 2 PRODUCTS

2.01 MATERIALS

A. General:
   1. Materials of construction for the strand-wound prestressed concrete tank shall be selected by the Tank Contractor, subject to the limitations of this Section.

B. Concrete:
   1. Concrete shall conform to Section 03300 - Cast-in-Place Concrete and ACI 301, except as modified herein.
   2. Unless otherwise specified, all concrete for tank construction shall have a minimum 28-day compressive strength of 4,000 psi.
   3. The concrete for the tank floor, footings, and pipe encasement shall conform to the following requirements.
      a. Concrete shall not be air entrained.
      b. The coarse and fine aggregate shall meet the requirements of ASTM C33 and sized to meet member thickness and clearance requirements of ACI 350.
      c. Superplasticizer and water-reducing admixtures shall be incorporated into the concrete for the floor slab and wall footing.
   4. Proportioning for concrete shall be in accordance with ACI 301.
   5. All concrete shall have a maximum water-soluble chloride ion concentration of 0.06 percent by weight of cement.
   6. Cement shall conform to ASTM C 150, Type I or Type II.
   7. Accelerating and retarding admixtures shall not be incorporated into the any concrete mix without prior acceptance by the Engineer.

C. Reinforcing Steel:
   1. Reinforcing steel shall be new billet steel Grade 60 meeting the requirements of ASTM A 615.
   2. Reinforcing steel that is to be welded shall be ASTM A 706, Grade 60.
   3. Reinforcing steel shall be accurately fabricated and shall be free from loose rust, scale, and contaminants.

4. Reinforcing steel shall be accurately positioned on supports, spacers, hangers, or other reinforcement and shall be secured in place with wire ties or suitable clips. Rebar chair supports shall be provided in accordance with Section 03200 - Concrete Reinforcing.

D. Prestressing Materials:
   1. 7-wire strand:
      a. Prestressing strand shall be in accordance with ASTM A 416 prior to hot-dip galvanizing.
      b. Individually hot-dip galvanize each wire of strand before forming the wires into a strand.
      c. Hot-dip galvanized 7-wire strand shall meet following minimum requirements:

Physical Characteristics	Required Results
Nominal Strand Diameter Before Galvanizing	3/8 inch
Nominal Area After Galvanizing	0.089 square inch
Nominal Weight Per 1,000 Linear Feet	303 pounds
Pitch of Strand	12 to 16
Minimum Yield Strength At 1 Percent Extension	180,000 psi
Minimum Ultimate Strength After Galvanizing	240,000 psi
Elongation In 24 Inches At Fracture	4.5 percent
Weight Of Zinc Coating per ASTM A475	0.85 ounces per square foot

   2. High strength thread bars:
      a. Thread bars and deformations: Hot rolled.
         1) Thread bars with cold rolled threads or with quenched or tempered steels will not be permitted.
      b. Deformations of thread bars:
         1) Provide deformations that form screw-thread suitable for mechanically coupling lengths of thread bar and provide positive attachment of anchor assemblies.
         2) Provide deformations that are in accordance with ASTM A 722, Type II requirements and are uniform such that any length of bar may be cut at any point and internal threads of coupler designated for that size of bar can be freely screwed on bar.
      c. Tensile and physical properties: Bars manufactured in accordance with ASTM A 722, Type II requirements are to comply with following minimum requirements:

Physical Characteristics	Required Results
Nominal Diameter	1.25 inches or 1.375 inches
Nominal Cross-Sectional Area	1.245 square inches or 1.577 square inches

Physical Characteristics	Required Results
Nominal Bar Weight	4.39 pounds per foot or 5.56 pounds per foot
Minimum Tensile Stress	150 ksi
Minimum Yield Stress at 0.2 Percent Offset	120 ksi
Elongation At Rupture In Gauge Length of 20 Bar Diameters	4 percent minimum
Maximum Carbon Content of Bar	0.55 percent

   d. Nuts: Minimum ultimate strength shall be 95 percent of minimum ultimate strength of thread bar.

3. Anchorages for vertical post-tensioned thread bars:
   a. All post-tensioned prestressing shall be secured at the ends by means of approved permanent anchoring devices, which shall hold the prestressing steel at a force not less than 95 percent of the guaranteed minimum tensile strength of the prestressing steel.
   b. The load from the vertical prestressing anchoring device shall be distributed to the concrete through steel bearing plates and shall not exceed the values specified by the Post-Tensioning Institute (PTI), Guide Specifications, Paragraph 3.1.7.
   c. Fully threaded anchor connections shall be used at both ends of the vertical prestressing bar, which shall incorporate a spherical-shaped bearing surface to match the conical surface in the bearing plate.
   d. Wedge anchors shall not be used for permanent anchor hardware.
4. Testing of Prestressing Material:
   a. Provide mill certificates.
   b. Prior to preparation of shop drawings and installation of vertical thread bars, provide proof that the thread bar anchorage system meets the requirements specified herein.
   c. Before any prestressing operations may be started, the Tank Contractor shall calibrate all recording equipment at an approved testing laboratory to the satisfaction of the Engineer.
   d. All continuous force readings for either the vertical or the circumferential prestressing operations shall be developed with electronic (or the substantial equivalent) force (strain gauge method) sensing transducers, all having a maximum nonlinearity error of +/- 0.5 percent and a maximum hysteresis error of +/- 0.25 percent.
5. Anchor pockets for vertical thread bars:
   a. Consist of steel cans fabricated from steel tubing, hot-dip galvanized after cutting and subsequently welded to the top bearing plate.
   b. Provide adequate means for flushing of vertical ducts during concrete placement.
6. Ducts for vertical thread bars:
   a. Duct enclosures shall be standard 1.25 inch or 1.375 inch diameter PVC pipe class 160 or class 200, respectively, unless otherwise specified on the Drawings.

b. Threaded hose connections shall be provided at the top of each duct for water flushing.
c. All ducts shall be provided with expandable valves to facilitate the injection of epoxy grout after prestressing.

7. Epoxy grout for vertical thread bars:
   a. The vertical thread bar system shall offer complete 2-part epoxy protection of the prestressing steel inside ducting and anchors.
   b. Portland cement grout will not be accepted.

E. Seismic Cables and Sleeves:
1. Seismic cables:
   a. Hot-dipped galvanized 7-wire strand:
   b. Prestressing strand shall be in accordance with ASTM A 416 prior to galvanizing and ASTM A 475 after galvanizing.
   c. Individually hot-dip galvanize each wire of strand before forming the wires into a strand.
   d. The galvanized strand shall have a minimum ultimate tensile strength of 240,000 psi.
   e. The cables shall be installed to connect the wall and the foundation.
   f. The minimum weight of zinc galvanic coating shall be 0.85 ounces per square foot.
   g. Only 7-wire strand will be allowed. Single wire will not be allowed.
2. Neoprene sleeves for seismic cables shall conform to SCE-43 of ASTM D 1056 and as further modified by the following:

Physical Characteristics	Required Results
Compressive deflection	9 to 13 psi
Shore 00 durometer	60 to 80 pcf
Density	12 to 28 pcf
Water absorption by weight	5 percent
Temperature range: Low (flex without cracking) High continuous High intermittent	-40 degrees F 150 degrees F 250 degrees F
Compressive set (average): 1/2-inch sample compressed at 50 percent for 22 hours at 70 degrees F and 24 hour recovery	15 to 35 percent
Maximum linear shrinkage during heat aging (7 days at 158 degrees F)	5 percent
Minimum tensile strength	175 psi
Minimum elongation	180 percent
Resilience (bayshore - percent rebound average 1/2-inch thickness at 72 degrees F)	20 to 40 percent

F. Shotcrete:
1. General:
   a. Shotrcrete shall conform to ACI 506.2, except as modified herein.
   b. Minimum compressive strength of shotcrete shall be 4,500 psi at 28 days.

c. Shotcrete used in the tank construction shall have a maximum water soluble chloride ion concentration of 0.06 percent by weight of cement.
d. Rebound materials shall not be reused in any form for shotcrete

2. Portland cement shall meet the general requirements in Section 03300 - Cast-in-Place Concrete.
3. Fine aggregates:
   a. Fine aggregates shall meet the requirements as specified in Section 03300 - Cast-in-Place Concrete and the following paragraphs.
   b. Coarse sand:
      1) Shotcrete applications: Use well graded coarse sand, unless otherwise noted.
      2) Gradations:

Sieve Size	Percent Passing by Weight
3/8 inch	100
Number 4	95-100
Number 8	80-100
Number 16	50-85
Number 30	25-60
Number 50	10-30
Number 100	2-10

   c. Fineness modulus shall be between 2.7 and 3.0.
4. Water shall be in accordance with Section 03300 - Cast-in-Place Concrete.
5. Class F fly ash shall conform to ASTM C618 and shall not make up more than 20 percent of the cementitious material in the shotcrete mix.

G. Elastomeric Materials:
1. Bearing pads shall be natural rubber or neoprene:
   a. Natural rubber bearing pads shall contain only virgin natural polyisoprene as the raw polymer and the physical properties shall comply with ASTM D 2000 Line Call-Out M4AA414A13.
   b. Neoprene bearing pads shall have a hardness of 40 to 50 durometer, a minimum tensile strength of 1,500 psi, a minimum elongation of 500 percent, and a maximum compressive set of 50 percent. Pads shall meet the requirements of ASTM D 2000 Line Call-Out M2BC410 A14 B14 or 2 BC 415 A1 4 B14 for 40 durometer material.
2. Sponge filler shall be closed-cell neoprene or rubber conforming to ASTM D 1056, Type 2, Class A, and Grade 3. Compression deflection limited to 25 percent at 2 to 5 psi.

H. Waterstops:
1. Requirements:
   a. Material: Polyvinyl chloride.
   b. Size and type:
      1) Centered at construction joints in cast-in-place concrete: 6-inch flat ribbed type.

2) At tank walls to tank wall-footing joints: 9-inch wide with 1-inch diameter hollow bulb ribbed type.
3) Type not allowed: Dumbbell type.

c. Physical characteristics:

Physical Characteristics	Test Method	Required Results
Specific Gravity	ASTM D 792	Not less than 1.3
Hardness	ASTM D 2240	70 to 90 Type A Shore durometer
Tensile Strength	ASTM D 638	Not less than 2,000 pounds per square inch
Ultimate Elongation	ASTM D 638	Not less than 300 percent
Alkali Extraction	CRD C 572	7 day weight change between minus 0.1 percent and plus 0.25 percent. Hardness change within 5 points.
Low Temperature Brittle Point	ASTM D 746	No sign of cracking or chipping at minus 35 degrees Fahrenheit
Water Absorption	ASTM D 570	24 hours, not more than 0.15 percent
Accelerated Extraction Tensile	CRD C 527	Not less than 1,600 pounds per square inch
Stiffness in Flexure	ASTM D 747	Not less than 600 pounds per square inch
Tear Resistance	ASTM D 624	225 pounds per square inch
Weight Requirements		
Thickness		3/8 inch
Center Bulb Outside Diameter		1 inch nominal
Allowable Tolerances		
Width		Plus or minus 3/16 inch
Thickness		Plus or minus 1/32 inch

d. Manufacturers: One of the following or equal:
1) Burke Concrete Accessories, Inc.
2) Greenstreak PVC Waterstops, Sika Corporation.
3) Kirkhill Rubber Company.
4) Williams Products, Inc.
5) Vinylex Corporation.

I. Tank Appurtenances:
1. General:
a. Provide and install all appurtenances as shown on the Drawings and as specified herein.

2. Piping:
    a. Inlet: As indicated on the Drawings.
    b. Outlet: As indicated on the Drawings,
    c. Overflow piping and overflow cone: As indicated on the Drawings.
3. Pipe Supports:
    a. Provide as required to adequately support piping under all load and operating conditions.
    b. Refer to Section 15061 - Pipe Supports.
4. Ladders:
    a. Conforming to all requirements of OSHA and as indicated on the Drawings.
        1) Provide brackets and fasteners required for support and secure mounting to tank structure.
        2) Rungs: solid bar stock.
        3) Welds: fillet or full penetration as appropriate to the condition.
        4) Fasteners Ladder bolts, concrete anchors, nuts, washers, and flush steel inserts: Type 316 stainless steel.
    b. Interior:
        1) Materials: Type 304/304L stainless steel.
        2) Fall protection: Fall arrest device as specified in the following paragraphs. Material to match that of ladder. Provide removable center rail extension projecting at least 48 inches above top rung of ladder.
    c. Exterior:
        1) Materials: As indicated on the Drawings.
        2) Fall protection: “Saf-T-Climb” as indicated on the Drawings.
        3) Anti-climb door: Per ladder manufacturer. Material to match that of the exterior ladder.
    d. Horizontal lifeline fall protection system: As indicated on the Drawings.
    e. Fall arrest device consisting of sliding/locking mechanism with safety belt and belt attachment to center climbing rail.
        1) Device material: Type 304 stainless steel.
        2) Devices: To include following items, all fabricated of device material unless otherwise accepted by the Engineer:
            a) Rails: Lengths as required.
            b) Brackets: Complete with brackets necessary for attaching rail to ladders.
            c) Removable rail extension: 48-inch long.
        3) Sleeve assemblies and safety belts: 2.
        4) Manufacturers: The following or equal:
            a) Norton Company, Air Space Device Division, Cerritos, CA, Saf-T-Climb with SAF-T-NOTCH RAIL and SAF-T-LOCK SLEEVE.
5. Access hatches (through-roof access):
    a. Sizes: Nominal size(s) as indicated on the Drawings.
    b. Material and construction:
        1) Door leaf/leaves: Aluminum diamond pattern plate with reinforcement if required for spans provided.
        2) Frame: Minimum 1/4-inch thick, aluminum channel with anchor flange around perimeter.

3) Door hardware: Equip doors with following:
a) Hinges: Minimum 2 heavy forged stainless steel hinges and pins for each leaf.
b) Operators, hold-open and handle: Spring operators and automatic hold-open arm with release handle for each leaf.
c) Lock: A Type 316 stainless steel snap lock with fixed handle shall be mounted on the underside of 1 cover. In addition, the lock shall be a cylinder style with a threaded security cover plug.
d) Seals: Leaf seals shall be dust and watertight.
e) Drainage coupling: 1-1/2-inch coupling located in front right corner of frame. Drain shall be installed to drain to the exterior side of the tank, adjust curb height as required.
4) Finish: Manufacturer's standard mill finish.
5) Manufacturers: One of the following or equal:
a) Bilco Co., Type JD-AL.
b) Babcock-Davis Associates, Inc., Type AM or GT.
c) Nystrom, Inc.

6. Grating, Guardrail, and Miscellaneous Fabrications:
a. Refer to Section 05500 - Metal Fabrications.
b. Materials: As indicated on the Drawings.
7. Roof Ventilator:
a. Size: As required to meet the air flow design requirements, but not less than indicated on the Drawings.
b. Materials and construction:
1) Aluminum components.
2) Stainless steel anchors.
3) Flashing shall wrap over the edge of the concrete curb and extend down a minimum of 2 inches.
4) 2-inch aluminum filters.
5) Insect screens.
6) 12-inch tall base.
7) Fiberglass hood insulation.
c. Manufacturers: The following or equal:
1) Greenheck Fabra Hood.
d. Finish: Manufacturer’s standard mill finish.

J. Form ties:
1. General: The requirements of this Section supplement the form ties requirements stated in Section 03102 - Concrete Formwork.
2. Requirements:
a. Form ties for forming system selected for concrete other than corewall: Cone-snap tie or flat bar type with waterstops.
b. Form ties for forming system selected for tank corewall: Tapered ties.

K. Wall Forms: As specified in Section 03102 - Concrete Formwork, regular plywood forms may be used for forming of circular walls, as long as there are no straight sections longer than 36 inches at any place around the outside circumference of such walls.
1. Forms shall be designed to resist the construction loads for full height wall pours.

L. Polyethylene sheeting:
   1. Minimum 6 mils thick and in accordance with ASTM C 171.

M. Granular leveling base:
   1. Material shall meet the requirements for aggregate base course specified in Section 02050 - Soils and Aggregates for Earthwork.

N. Epoxy injection materials: As specified in Section 03931 - Epoxy Injection Systems and the following products:
   1. Epoxy materials: Nontoxic to potable water.
   2. Grout injection pipes: Provide with positive mechanical shutoff valves.

O. Materials for repair of chipped out concrete areas:
   1. Epoxy bonding agent: As specified in Section 03071 - Epoxies.

P. Membrane Liner:
   1. Thickness: Minimum 30 mil.
   2. Material: Impermeable PVC.
   3. Manufacturers: One of the following or equal:
      a. York Manufacturing, Inc., Wasco Seal.
      b. Watersaver Co., Inc. equivalent product.
      c. Palco Linings, Inc. equivalent product.
      d. Install liner per manufacturer's recommendations to provide a waterproof layer below the tank foundation as indicated on the Drawings.

2.02 SOURCE QUALITY CONTROL

A. Concrete testing:
   1. As specified in Section 03300 - Cast-in-Place Concrete.

2.03 COMPLIANCE TESTING (NOT USED)

PART 3 EXECUTION

3.01 SUPERVISION

A. The Tank Contractor shall provide a full-time on-site project manager or site superintendent during all aspects of tank construction.

3.02 INSTALLATION

A. Waterstops:
   1. General: The requirements of this Section supersede the waterstop requirements stated in Section 03150 - Concrete Accessories.
   2. Requirements:
      a. Install in concrete joints where indicated on the Drawings.
      b. Connect the ends of the radial waterstop in the wall footing joints to the circumferential waterstop in the wall to wall footing joint and to the circumferential waterstops in the floor to wall-footing joints if they should exist.

c. Provide waterstop in each joint in water-bearing structures, whether indicated on the Drawings or not.
d. Provide waterstops that are continuous.
e. Set accurately to position and line indicated on the Drawings.
f. Hold and securely fix edges in position at intervals of not more than 12 inches and secure in manner that they cannot move during placing of concrete.
g. A hog-ring or nail may be driven through both ends of the waterstop to facilitate placing and tying of waterstops to reinforcing steel forms or form-ties.
h. Tank Contractor's option: One of the following:
    1) Use waterstop tie wires at not more than 12 inches on centers, near outer ribs, to tie waterstops into position.
    2) Use special clips.
i. Waterstop terminations: Terminate 3 inches from top of finished surfaces of walls and slabs unless otherwise specified or indicated on the Drawings.
j. Installation of waterstops:
    1) Install so that joints are watertight.
    2) Provide field welded polyvinyl chloride waterstop joints such as unions, crosses, ells, and tees.
    3) Make all splices to waterstop in accordance with manufacturer's recommendations.
    4) Clean waterstops of all concrete, dirt, and foreign matter.

B. Form and accessories removal:
1. General: The requirements of this Section supercede the form and accessories removal requirements stated in Section 03102 - Concrete Formwork.
2. Requirements:
    a. Other forms supporting concrete and shoring: Remain in place as follows:
        1) Sides of footings, sides of slabs, and columns: 24 hours minimum.
        2) Core walls: 12 hours minimum.

C. Neoprene bearing pads:
1. General:
    a. Secure bottom surface of pads by positive attachment to structure such that horizontal crawling is prevented.

D. Closed cell neoprene joint fillers and sleeves (“sponge filler”):
1. When joint filler pads or sponge filler sleeves are indicated on the Drawings or specified, place materials in correct position before concrete is placed against them.
2. Holes and joints in pads are to be filled with caulking to prevent passage of mortar or concrete from 1 side of the joint to the other.

3.03 FLOOR

A. Prior to placement of the floor reinforcing, a 6-mil polyethylene moisture barrier shall be placed over the leveling base material. Joints in the polyethylene shall be overlapped a minimum of 6 inches.

B. Prior to placement of the floor concrete, all piping that penetrates the floor shall be set and encased in concrete to the limits indicated on the Drawings. Provide waterstops at the joints between the encasement and the concrete floor slab where indicated on the Drawings.

C. The vertical waterstops between the wall and footing shall be placed and supported to locate the center bulb within the joint as indicated on the Drawings and as required by the Tank Contractor. The waterstop shall be spliced using a thermostatically controlled sealing iron and each splice shall be successfully spark tested prior to encasement in concrete.

D. The floor shall be poured without construction joints, except as otherwise allowed by the Engineer. There shall be no construction joints between the floor and wall footing.

3.04 CONCRETE

A. All concrete shall be conveyed, placed, finished, and cured as specified in Section 03300 - Cast-in-Place Concrete, except as modified herein.

B. Requirements:
   1. Cold joints:
      a. Cold joints in floors, roof slabs, and wall footings are not allowed.
      b. Continuously cover joints with new concrete, and thoroughly integrate through vibration, even if it means that horizontal passes of only 6 inches in width can be made until additional concrete and equipment becomes available to permit wider passes in concrete placement.
   2. Blockouts or other types of wall openings: Do not provide openings other than those indicated on the Drawings.

C. Weather Limitations:
   1. Unless specifically authorized in writing by the Engineer, concrete shall not be placed without special protection during cold weather when the ambient temperature is below 35 degrees Fahrenheit and when the concrete is likely to be subjected to freezing temperatures before initial set has occurred and the concrete strength has reached 500 psi. Concrete shall be protected in accordance with ACI 306.1. The temperature of the concrete shall be maintained in accordance with the requirements of ACI 301 and ACI 306.1. All methods and equipment for heating and for protecting concrete in place shall be subject to the approval of the Engineer.
   2. During hot weather, concreting shall be in accordance with the requirements of ACI 305.1.
   3. Placement of concrete during periods of low humidity (below 50 percent) shall be avoided when feasible and economically possible, particularly when large surface areas are to be finished. In any event, surfaces exposed to drying wind shall be covered with polyethylene sheets immediately after finishing, or flooded with water, or shall be water cured continuously from the time the concrete has taken initial set. Curing compounds may be used in conjunction with water curing, provided they are compatible with coatings that may be applied later and if they are degradable.

D. Finishes:
   1. Tank Designer to define concrete finishes in accordance with manufactures specifications.

E. Curing:
   1. Except where specified herein, concrete curing shall be as specified in Section 03300 - Cast-in-Place Concrete.
   2. Requirements:
      a. Any concrete surface that is designated to receive paint or upon which any material is to be bonded: No curing compound shall be used.
      b. Concrete designated to be painted: Water or plastic membrane cure.
      c. Tank core walls: Water curing.
      d. Floor slab:
         1) The floor shall be cured by flooding with water and shall remain saturated for a minimum of 7 days after placement.
         2) Alternatively, the floor slab may be cured with a sprayed-on curing compound and prepared as follows:
            a) After the surface is dry to the touch, a 6-mil thick polyethylene sheet shall be carefully taped and sealed to the concrete surface and kept on such surface for as long as possible, but not less than 7 days, to minimize the loss of moisture trapped between the polyethylene sheet and the concrete.
            b) Alternatively, heavy curing blankets may be used in lieu of the polyethylene sheet.
      e. Roof slab: Water or plastic membrane cure.
      f. Other concrete surfaces: Water curing.

F. Testing Cast-in-Place Concrete:
   1. All concrete testing shall be in accordance with Section 03300 - Cast-in-Place Concrete, except as noted herein.
   2. Testing shall be at the expense of the Tank Contractor, and shall be conducted by an independent testing agency approved by the Engineer.

3.05 SEISMIC CABLES

A. Requirements:
   1. Provide seismic cables to connect wall and wall footing.
   2. Quantity and spacing of seismic cables shall be as indicated on the Shop Drawings.
   3. Where necessary, seismic cables shall be pre-bent before placing units in wall and wall footing.
   4. Tie seismic cables to lower horizontal circumferential tie-bar for vertical prestress tendons as indicated on the Drawings.
   5. In wall-footing, tie seismic cables to radial footing bars.

3.06 PRESTRESSING

A. Circumferential Prestressing Equipment:
   1. The circumferential stressing system shall produce a continuously, electronically (or substantial equivalent) monitored permanent stress or force recording along its full length as it is being applied and the stress variation in

any strand at any point around the circumference shall not be greater than +/- 1.5 percent of the ultimate strength of the steel. In addition to this recording, any system which deflects the tensioned prestressing material between the tensioning device and the wall after it has left the tensioning device, shall provide a similar continuously monitored stress or force record along its full length as it is being applied to the wall. These recordings shall show that either before or after deflection that the stress variation in the prestressing material at any point around the circumference shall not be greater than +/- 1.5 percent of the ultimate strength of the steel.

2. Due to prior instances of force measurement inaccuracies and the inherent problems associated with hand-held stressometers, no manually recorded force readings will be accepted. This requirement shall be strictly followed.
3. Any wrapping that does not meet the stress tolerances specified and/or cannot meet the requirements of above will not be accepted and will be removed at the expense of the Tank Contractor. The Tank Contractor is responsible for all costs associated with meeting the specified tolerances.
4. Since intermittent force applications can result in an unequal stress distribution around the wall (due to friction losses), the prestressing system shall be capable of applying a continuous wrapped force at any point around the circumference within the specified tolerances. Circumferential stressing systems based on jack-operated cable or rod-type tendons (such as those placed inside of ducts incorporated in the corewall or placed manually around the exterior of the corewall) will not be allowed.
5. Since wrapping systems which utilize single solid prestressing material will not provide the desired bond between the prestressing material and the shotcrete and since single solid prestressing material will not provide an adequate safety factor against failure, only machine wrapping systems which utilize 7-wire prestressing strandwrapping will be allowed.

B. Circumferential Prestressing Application:
   1. All cracks in the core wall and floor slab shall be repaired as specified following the circumferential prestressing of the tank walls.
   2. Wrapped strand shall be anchored to the wall at least once for every coil or reel.
   3. Permanently anchoring 1 strand to a previously wrapped strand will not be permitted. Wrapped strand ends shall be joined by suitable splicing methods that shall develop 90 percent of the full strength of the strand.
   4. Use of different alloys in the splicing material shall not be permitted.
   5. The clear vertical spacing between any 2 wrapped strands shall be 1.5 strand diameters or 3/8-inch, whichever is larger. A 1/4-inch construction tolerance shall apply to strand spacing, as well as to this minimum spacing requirement.
   6. All wrapped strand not meeting the spacing requirements shall be spread by approved methods or shall otherwise be removed.

C. Vertical Prestressing Equipment:
   1. The Tank Contractor shall provide a continuously, electronically (or substantial equivalent), monitored permanent force elongation record from zero to full force at the final lock-off for all of the vertical prestressing work.
   2. The ordinate of the permanent recording shall show the elongation in inches and the abscissa shall show the force in pounds or kips.
   3. Manually recorded force and elongation readings will not be accepted.

4. The vertical prestressing machinery shall have automatic electronic tensioning cut-off devices or equivalent means to ensure that the specified force and elongation is not exceeded at any time during any thread bar stressing operation.
5. The force readings at the stressed bar ends, immediately after lock-off, for any stressing operation, on any thread bar, shall not fluctuate more than +/- 1.5 percent (of the minimum ultimate strength of the steel) from the desired average force setting.
6. The applied force, immediately after lock-off for the final stressing operation on any thread bar, shall be no less than 72 percent of the ultimate strength of the steel and the applied force before lock-off shall be no greater than 75 percent of the ultimate strength of the steel.

D. Vertical Prestressing Application:
1. All permanent anchor hardware shall have a ball-shaped threaded nut that can be screwed down on to a matching cone-shaped bearing surface in the bearing plate after the desired tension on the anchor hardware and/or prestressing steel has been applied.
2. The number and spacing of the thread bars shall not be altered under any condition.
3. High-strength thread bars shall be used for vertical prestressing.
4. All ducts shall be clean and free of water and deleterious materials that would impair bonding of the grout or interfere with grouting procedures.
5. Grout injection pipes shall be fitted with positive mechanical shutoff valves, which shall not be removed within the first 24 hours.
6. Grouting of thread bars shall begin at the lowest grout connection.
7. Each vertical thread bar duct shall be pumped until the entire nut at the top anchor has been covered with epoxy.
8. In cold weather, and especially during frosts, special precautions must be taken to avoid the freezing of grout. In the event that the grouting procedure cannot be postponed, the wall temperature must be kept above the freezing point with hot blankets or by other approved means.
9. Upon completion of the vertical stressing and grouting operation, all anchor pocket areas above the anchor nuts shall be dry packed with a 1 part cement to 2 parts sand mortar mix immediately after the epoxy coating on the inside can surface has become tacky, or alternatively, the metal can may be filled with concrete aggregates and epoxy.
10. The inside surfaces of any metal cans to be dry packed shall be coated with a 2 part epoxy. Dry packing shall not proceed until the epoxy coat has become tacky. The dry pack surface shall be finished flush with the adjoining concrete surface.
11. Damaged PVC tubing shall be replaced unless repairs are made and approved by the Engineer.
12. Vertical thread bar components shall be assembled off the ground and as detailed on the Shop Drawings. All vertical thread bars must be fully assembled before they are installed in the forms.
13. Vertical thread bars shall be accurately placed and fastened securely in place to reinforcing steel and form ties to prevent movement during placement of concrete.
14. All vertical thread bars must be flushed with water from the top immediately upon completion of the concrete vibrating operation. Water shall be introduced

through a taped-off hole in the wooden lids on the anchor pockets and be permitted to drain through the bottom grout tube. Flushing shall not be accomplished by introducing water through the bottom connection. Should a thread bar duct not flush properly, the Engineer shall be notified immediately.

15. Cleaning of ducts with air only (not water), or removal of water with air from the bottom connection, will not be permitted.
16. Placing of vertical thread bars shall be done to proper locations, elevations, and alignments, with a maximum tolerance of plus or minus 1/4 inch.
17. All vertical thread bars shall be properly tied at the anchor plates and shall be tied with No. 4 bars at intervals of 24 inches or less between the anchor plates. The maximum permissible misalignment of the anchor plate to the vertical thread bar is +/- 2.5 degrees.
18. Anchor plates must be installed at right angles to the thread bar alignment near the anchor. Anchor plates must be installed with long sides, aligned parallel with the wall forms and secured to prevent their rotation while concrete is placed.
19. Unless indicated otherwise on the Plans, the minimum concrete cover around steel anchor pockets and bearing plates shall be 1.5 inches.
20. The vertical clearance between bottom anchor plate and the waterstop at the base of the tank walls shall be no less than 2 inches nor more than 4 inches.

E. Circumferential and Vertical Prestressing Operations:
   1. The maximum initial electronically recorded steel stress shall not exceed 75 percent of the guaranteed minimum ultimate strength of the steel at any time during or after stressing.
   2. An automatic, continuously electronically (or substantial equivalent) monitored permanent recording of the applied force, at any point on the strand, at any point on and around the tank wall, must be made during the entire circumferential prestressing application. All such recordings must be based on a continuous sensing of the applied force on the strand between the tensioning drum and the wall when, and as, the strand is being wrapped and laid on the wall.
   3. The force setting on wrapping and vertical thread bar stressing machinery shall be such that the applied forces fall within the specified minimum or maximum stress or force limitations; the force setting shall be corrected immediately when the applied force falls outside the required force tolerance limitations.
   4. In the event that the stressing machinery is incapable of holding the applied forces within the specified stress or force limitations, the Engineer will order, at the expense of the Tank Contractor, the removal and replacement of such machinery in favor of a different unit capable of maintaining such tolerance requirements.
   5. The loss in stress in post-tensioned prestressing steel due to creep and shrinkage of concrete and sequence stressing is to be assumed as 25,000 psi. The final stress is the average initial stress reduced by the stress loss of 25,000 psi.
   6. The final force is the steel section multiplied by the final stress.
   7. The final force for the vertical thread bars shall be no less than the required final force shown on the Shop Drawings.
   8. The initial force for the circumferential wrapped strand shall be no less than the required initial force shown on the Shop Drawings.

9. The continuous, electronically produced force application chart during the wrapping application becomes the property of the Owner.
10. An automatic, continuously electronically (or substantial equivalent) monitored and simultaneously recorded force-elongation reading must be made for each vertical stressing application.
11. The force-elongation reading must represent the true relationship between the elongation at any given point of the vertical stressing operation and the applied force on the prestressing steel at that same point.
12. The force-elongation relationship must be constantly maintained from the beginning, starting with the removal of the slack to the point of lock-off and complete release of the force on the vertical prestressing steel after retraction of the stressing piston or equivalent stressing device.
13. All electronically produced force-elongation readings during the vertical thread bar stressing operations become the property of the Owner.
14. After the concrete core wall has reached the specified 28-day compressive strength, the vertical thread bars shall be stressed.
15. Circumferential wrapping shall not start until the vertical thread bars have been stressed.
16. In the event gaps between concrete core wall and wrapped strand develop that exceed 3/8 inch, discontinue wrapping. Before resuming any wrapping, either:
    a. Build-up walls with shotcrete to provide proper curvature before resuming any wrapping.
    b. If acceptable to Engineer, drypack gaps after wrapping is completed and before shotcreting is started.
17. Wrapping over intermediate shotcrete coats or built-up shotcrete areas may commence 12 hours after shotcrete has been applied, or when the shotcrete has reached a strength of 250 psi, whichever duration is longest.
18. Prestressing strand exposed to excessive temperatures greatly increases the possibility of irrevocable damage to the strand such as steel embrittlement, stress corrosion, and strand splitting. The temperature of the prestressed strand during wrapping shall not be allowed to increase by more than 50 degrees at any time during application due to stressing technique.
19. All vertical thread bar ducting and anchors (both vertical and circumferential prestressing) shall be pressure grouted with an approved 2 part water insensitive epoxy and approved epoxy grouting equipment.

3.07 ABRASIVE BLASTING

A. Exterior surfaces of concrete walls shall be prepared prior to the commencement of any shotcreting or strand wrapping, to remove all deteriorated concrete and bond-inhibiting contaminants. The surface preparation shall achieve a minimum profile of International Concrete Repair Institute (ICRI) CSP5 over a minimum of 90 percent of the surface area required to be prepared. The prestressing operator who is performing the abrasive blasting shall make available to the inspector an ICRI surface preparation sample to assist with evaluation of the surface preparation.

B. The concrete surface shall have no traces of laitance, form-oil, original surface smoothness, or surface color.

C. In order to mitigate environmental concerns, conform to environmental constraints, and achieve the desired profile, the Tank Contractor shall utilize either a self-contained mechanical etching or shot blast system, combined with a vacuum recovery system, or a high pressure water jetting system. Abrasive blasting systems which rely on sandblasting or steel shot without a vacuum recovery system, or systems that have not been used successfully in the past to prepare surfaces for shotcreting and standwrapping, will not be permitted.

3.08 SHOTCRETING

A. Shotcrete Equipment:
   1. Shotcrete mixing shall be in conformance with the requirements of Section 03300 - Cast-in-Place Concrete.
   2. The delivery equipment shall be of an approved design and size that has given satisfactory results in similar previous work.
   3. The equipment must be capable of discharging mixed materials into the hose under close control and it must be able to deliver a continuous smooth stream of uniformly mixed material at the proper velocity to the discharge nozzle, free from slugs of any kind.
   4. The nozzle shall be of a design and size that will insure a smooth and uninterrupted flow of materials.
   5. Delivery equipment shall be thoroughly cleaned at the end of each shift.
   6. Equipment parts shall be regularly inspected and replaced as required.
   7. The capacity of the compressor shall be large enough that the minimum amount of air to be available at the nozzle shall be no less than 400 cfm, irrespective of whether or not air from the same air supply is used for other purposes.

B. Placement and Testing of Shotcrete:
   1. Shotcrete shall be applied by an ACI 506 certified nozzleman.
   2. Manually applied shotcrete shall be applied with the nozzle held at a small upward angle not exceeding 5 degrees and constantly moving during application in a smooth motion with the nozzle pointing in a radial direction toward the center of the tank. The nozzle distance from the prestressing shall be such that shotcrete does not build up or cover the front face of the wire or strand until the spaces behind and between the prestressing elements are filled.
   3. Unless applied by an automated shotcrete process, total cover coat thickness shall be controlled by shooting guide wires. Vertical wires shall be installed under tension and spaced no more than 2 feet apart to establish uniform and correct coating thickness. Monofilament line (100 pound test) or 18 or 20 gauge high tensile strength steel wire shall be used. Guide wires shall be removed after placement of the cover coat.
   4. Shotcrete applied by an automated shotcrete process shall be applied using the wet mix only. Nozzles shall be kept mounted on power driven machinery enabling the nozzle to travel parallel to the surface to be sprayed at a uniform linear or bi-directional speed. The nozzle shall be kept at a uniform constant distance from the surface, always maintaining a right angle spray of the material to the surface. The high velocity impact shall be developed pneumatically by injecting compressed air at the nozzle.

5. Testing:
    a. Testing shall be by an independent testing laboratory, acceptable to Engineer, and engaged by and at the expense of the Tank Contractor.
    b. Test shotcrete in accordance with ACI 506, except as specified herein. One test panel shall be made for each of the following operations: core wall, cove, wire cover, and cover coat. Test panels shall be made from the shotcrete as it is being placed, and shall, as nearly as possible, represent the material being applied. The method of making a test sample shall be as follows: A frame of wire fabric (1 foot square, 3 inches in depth) shall be secured to a plywood panel and hung or placed in the location where shotcrete is being placed. This form shall be filled in layers simultaneously with the nearby application. After 24 hours, the fabric and plywood backup shall be removed and the sample slab placed in a safe location at the site.
    c. The sample slab shall be moist cured in a manner identical to that used for the regular surface application. The sample slab shall be sent to the testing laboratory. Nine 3-inch cubes shall be cut from the sample slab and subjected to compression tests in accordance with current ASTM Standards. Three cubes shall be tested at the age of 7 days, three shall be tested at the age of 28 days, and three shall be retained as spares.

C. Shotcrete Placing and Finishing:
1. Shotcrete shall be applied in a steady, uninterrupted flow. Should the flow become intermittent for any cause, the machine operator shall direct the nozzle away from the work until it again becomes constant, or shut off the flow of materials.
2. The nozzle shall be held at approximately right angles to the surface and shall be kept at the proper and the same distance from the surface dictated by good practice standards for the type of application, type of nozzle and air pressure employed.
3. Sufficient time shall be allowed for each layer of shotcrete to set up so it may take the next layer without sagging.
4. The shotcrete shall be started at the bottom of the wall until all wrapped strand has been covered. Subsequent shotcrete layers may be applied from the top down or from the bottom up at the discretion of the Tank Contractor.
5. While the nozzle travels around the wall, the nozzle shall be raised or lowered at a uniform rate in such a manner that an adequate overlapping of coatings and a uniform finish will develop.
6. The nozzle shall be spiraled up or down around the tank to either the top or the bottom of the wall or to the termination of the intermediate strand layer.
7. To ensure proper penetration around the strand and proper conveyance of the material through the hose, a 5- to 7-inch slump of the mortar at the pump is recommended.
8. The application of the shotcrete in the number and thickness of layers specified herein is mandatory for proper penetration of shotcrete behind prestressing material and to reduce shrinkage due to more uniform in-depth drying of the shotcrete.
9. Each layer of wrapped prestressing steel shall be covered with shotcrete until a minimum clear cover of 3/8-inch or the diameter of the strand, whichever is greater, has been placed over the prestressing steel.
10. The final cover coat, to make up for the full thickness of shotcrete over the final strand layer, shall be applied in at least 3 layers of equal thickness.

11. Each layer of shotcrete shall be completed for the full circumference of the tank and substantially the full height of that layer before the next layer of shotcrete may be applied.
12. All shotcrete coatings shall be built up in layers of approximately 3/8-inch in thickness until the final required thickness has been obtained. The Tank Contractor shall demonstrate by a reliable means that the proper thickness of shotcrete has been obtained with each layer applied.
13. Unless otherwise specified on the Drawings, the minimum shotcrete cover over all wrapped steel shall not be less than the following:
    a. For shotcrete in contact with soil: 2 inches.
    b. For other shotcrete exposures: 1.5 inches.
14. The Tank Contractor shall make provisions to protect adjacent structures, equipment, vehicles, etc., from being damaged by overshooting shotcrete and rebound materials. Overshot shotcrete deposited onto the roof slab shall be removed before it adheres to the concrete surface.
15. After the minimum shotcrete cover specified over the wrapped prestressing strand has been completed by the automated shotcrete procedure, and if such finish requirements are shown on the Drawings, the exterior surface shall be given an acceptable float finish true to line and curvature and to details shown on the Drawings.
16. If a float finish is required on the Drawings, plaster or hand-applied shotcrete may be used to build up and level the surface and to obtain the desired surface finish and projections.
17. The finish coat mix (if a smooth float finish is required on the Drawings), shall consist of a minimum of one sack of cement for each 3-1/2 cubic feet of moist plaster sand.
18. The Tank Contractor shall be responsible for all damages caused by shotcreting operations and shall bear the cost for making repairs.

D. Hand Placed Shotcrete for Repairs Only:
    1. To ensure a high quality shotcrete, the Tank Contractor shall satisfy the Engineer that the nozzleman has had sufficient and acceptable experience in the application of structural shotcrete and is a certified nozzleman in accordance with ACI 506.
    2. Experience gained on shotcrete pool and ditch construction will not be considered as experience for qualifying the nozzleman.
    3. The nozzleman shall be capable of applying thin coats of even and uniform thickness.
    4. The nozzleman's skill shall be tested and the results of such tests shall be acceptable to the Engineer before that nozzleman may start any work.

E. Restrictions on Shotcrete Operation:
    1. Shotcrete shall not be applied under such strong wind conditions that a considerable amount of cement and moisture will be removed by the wind from the mortar spray between the nozzle and the surface on which the shotcrete is applied.
    2. Shotcrete may be applied in cold weather provided the surfaces are not frozen.
    3. The temperature during the day must be expected to rise to at least 40 degrees Fahrenheit and the night temperature of the first night after the

shotcrete application must not be expected to drop below 27 degrees Fahrenheit.

4. The use of Type 3 Portland cement is required (when readily available) in the event shotcrete is applied at temperatures below 40 degrees Fahrenheit.
5. The Tank Contractor may apply shotcrete under the conditions specified herein solely at his own risk.
6. Whenever rain or frost has damaged shotcrete which has not had a chance to set up, such shotcrete must be removed and replaced.
7. The Tank Contractor shall consult with the Engineer to determine whether or not he will accept the shotcrete damaged by rain or frost before applying any new layers of shotcrete.

F. Shotcrete Curing:
   1. Intermediate layers of shotcrete shall be kept damp by hand curing or other means no sooner than 12 hours after the shotcrete has been applied.
   2. Watercuring is not required should additional shotcrete be applied on the entire wall surface within the following 12 hours.
   3. Indiscriminate use of continuous watercure for intermediate layers should be avoided.
   4. Complete shotcrete surfaces, which do not receive any additional shotcrete coatings, shall be membrane cured with plastic for a period of at least 7 days. Plastic membrane used shall contain and prevent loss of moisture from shotcrete as much as possible. Membrane curing methods utilizing curing compounds or wax-based residuals will not be permitted.
   5. Wall coatings, specified in Section 09986 - Painting Prestressed Concrete Water Tanks, shall be applied no later than 5 days after completion of the curing. If conditions make it impossible to apply coatings within the 5-day period, or if no coatings are required, shotcrete shall be membrane cured for a period of 10 days instead of the 7 days specified herein.

3.09 CLEANING

A. After construction is completed, the interior of the tank shall be completely cleaned of debris and flushed with clean water to remove all dirt and loose material.

3.10 DISINFECTING (NOT USED)

3.11 FILLING AND WATERTIGHTNESS TESTING

A. Filling:
   1. The water used for the first filling of the tank will be furnished by the Owner. If the leakage test fails, the Tank Contractor shall refill the tank and retest it. The Tank Contractor shall be responsible for the cost of refilling the tank for subsequent tests.
   2. The tank shall be filled in approximately 8-foot increments with 8 working hours between each increment for observation of possible leaks through ring drains, wall, and wall-footing.

B. Testing:
   1. If only damp spots and small puddles of water are observed during filling, the filling of tank can continue. If leaks that are large enough to potentially fail the

leakage test specified in Section 01759 - Water Leakage Test for Concrete Structures are observed, the filling process shall cease, and those leaks shall be thoroughly investigated prior to continuing to fill the tank.

2. Fill tank with water and hold water level at 3 inches below the overflow level for a period of 24 hours.
3. Test tank for leakage in accordance with the provisions of Section 01759 - Water Leakage Test for Concrete Structures.
4. Examine the tank and soil at the perimeter of the tank footings for evidence of leaks.
    a. Acceptance criteria shall be as specified in Section 01759 - Water Leakage Test for Concrete Structures.

C. Repairing tank leaks:
    1. Repair leaks to satisfaction of the Engineer.
    2. Any areas that, in the opinion of the Engineer, are exposed to contamination during repair work shall be sprayed with disinfection water mix.
    3. Leakage through joints, which may have resulted from bent over waterstops or honeycomb under or around waterstops, may require removal of concrete around waterstops in suspected areas.
    4. Repair of chipped out concrete areas:
        a. Coat chipped out concrete surface with epoxy bonding agent.
        b. Properly drypack with drypack mix for repair of concrete tank areas.
    5. Any cracks, voids, honeycomb, or cold joints showing or causing running leaks of water, shall be repaired by epoxy injection as specified in Section 03931 - Epoxy Injection System until such cracks and voids have been completely sealed.

END OF SECTION

[AD3] Addendum No. 3

SECTION 13446

MANUAL ACTUATORS

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Valve and gate actuators.
   2. Handwheel actuators.
   3. Hand-cranked geared actuators.
   4. Floor Boxes.
   5. Floor stands.
   6. Key operated valves.
   7. Bench stands.
   8. Accessory equipment and floor boxes.

1.02 REFERENCES

A. Aluminum Association (AA):
   1. DAF-45 - Designation System for Aluminum Finishes.

B. American Water Works Association (AWWA).

C. National Electrical Manufacturers Association (NEMA):
   1. 250 - Enclosures for Electrical Equipment (1000 V Maximum).

D. National Electrical Code (NEC).

1.03 SUBMITTALS

A. Shop drawings: Include shop drawings and product data with associated gate or valve as an integrated unit.

1.04 QUALITY ASSURANCE

A. Provide valve actuators integral with valve or gate, except for valve actuators utilizing T-wrenches or keys, and portable gate actuators intended to operate more than 1 valve.

B. Provide similar actuators by 1 manufacturer.

C. Provide gates and hand operating lifts by 1 manufacturer.

D. Provide hydraulic gate lifts by 1 manufacturer.

E. Provide hydraulic valve actuators and motorized actuators by 1 manufacturer.

1.05 MAINTENANCE

A. Extra materials:
   1. Key operated valve keys or wrenches: Furnish a minimum 4 keys with 4-foot shafts and 3-foot pipe handles or wrenches with 4-foot shafts and 3-foot handles for operating key operated valves.

PART 2 PRODUCTS

2.01 VALVE AND GATE ACTUATORS

A. Valve actuators:
   1. Manual actuators:
      a. Material: Type 316 stainless steel.
      b. Design: Hand lever.
      c. Spring release handle: 12-inch.
      d. Notch plate: 10 position.
      e. Secure with mounting bolts.
      f. Locking device so that valve can be locked in any position with a wing nut.
   2. Stem and cover:
      a. For submerged valves, provide extension stem as indicated on the Drawings.

B. Stem covers:
   1. Aluminum pipe:
      a. Threaded cap on top.
      b. Bolted aluminum flange on bottom.
      c. Slots cut 1- by 12-inch at 18 inches on center in front and back of pipe.
      d. Capable of covering threaded portion of greased stems that project above actuators when gates or valves are opened or closed.
   2. Ultraviolet light resistant, clear butyrate plastic or polycarbonate pipe:
      a. Capped on the upper end.
      b. Either threaded into the top of the gate operators or held in place by bolt-down aluminum brackets.
      c. Capable of covering threaded portion of greased stems that project above actuators when gates or valves are opened or closed.
   3. Staff gauges:
      a. Adhesive-backed mylar, suitable for outdoor service.
      b. Calibrated in hundredths of feet.
      c. Read the weir crest elevations directly.
      d. Gauge range: 1.5 feet minimum.
      e. Indicate the following elevations on each staff gauge:
         1) -0.75, -0.50, -0.25, 0.0, 0.25, 0.50, 0.75.
      f. Supplement with a stem-mounted pointer or indicator that permits direct observation of the weir gate crest elevation.
      g. Apply staff gauges to each stem cover after installation of the cover and after calibration and testing of the weir gates.
      h. Set gauges precisely by a survey crew using instruments acceptable to the Engineer.

C. Stem cover flanges, pipes, and caps:
   1. After fabrication, etch and anodize to produce the following chemical finishes in accordance with AA publication DAF-45:
      a. A 41 - Clear Anodic Coating.
      b. C 22 - Medium Matte Finish.

D. Gate stem covers: Concentric with stem.

E. Position indicators:
   1. For all aboveground worm gear or traveling nut manual actuators, provide position indication on the actuator enclosure.
   2. Tail rods on hydraulic cylinders, or dial indicators with clear full-open and closed position indicators, calibrated in number of turns or percentage of opening.

F. Manual or power actuator size:
   1. Sized to deliver maximum force required under most severe specified operating condition, including static and dynamic forces, seat and wedge friction, and seating and unseating forces with safety factor of 5, unless otherwise specified.

G. Actuator size: Capable of supporting weight of suspended shafting unless carried by bottom thrust bearings; shaft guides with wall mounting brackets.

H. Provisions for alternate operation: Where specified or indicated on the Drawings, position and equip crank or handwheel operated geared valve actuators or lifts for alternate operation with tripod mounted portable gate actuators.

I. Operation: Counterclockwise to open with suitable and adequate stops, capable of resisting at least twice normal operating force to prevent overrun of valve or gate in open or closed position.

J. Open direction indicator: Cast arrow and legend indicating direction to rotate actuator on handwheel, chain wheel rim, crank, or other prominent place.

K. Buried actuator housing: Oil and watertight, specifically designed for buried service, factory packed with suitable grease, completely enclosed space between actuator housing and valve body so that no moving parts are exposed to soil; provide actuators with 2-inch square AWWA operating nut.

L. Worm gear actuators: Provide gearing on worm gear actuators that is self-locking with gear ratio such that torque in excess of 160 foot-pounds will not need to be applied to operate valve at most adverse conditions for which valve is designed.

M. Traveling nut actuators: Capable of requiring maximum 100 foot-pounds of torque when operating valve under most adverse condition; limit stops on input shaft of manual actuators for fully open and closed positions; non-moving vertical axis of operating nut when opening or closing valve.

2.02 HANDWHEEL ACTUATORS

A. Manufacturers: One of the following or equal:
   1. Rodney Hunt Co.
   2. Waterman Industries, Inc.

B. Coating: Handwheel as specified in Section 09960 - High-Performance Coatings.

C. Mounting: Floor stand or bench stand. Unless otherwise indicated on the Drawings position actuator 36 inches (nominal) above top of walkway surface.

D. Bearings above and below finished threaded bronze operating nut: Ball or roller.

E. Wheel diameter: Minimum 24 inches.

F. Indicator: Counterclockwise opening with arrow, and word OPEN cast on top of handwheel indicating direction for opening.

G. Pull to operate: Maximum 40 pounds pull at most adverse design condition.

H. Stem travel limiting device: Setscrew locked stop nuts above and below lift nut.

I. Grease fittings: Suitable for lubrication of bearings.

2.03 HAND-CRANKED GEARED ACTUATORS

A. Type: Single removable crank; fully enclosed.

B. Mounting: Floor and bench stand. Unless otherwise indicated on the Drawings position actuator 36 inches (nominal) above top of walkway surface.

C. Operating nut: When scheduled for portable gate actuators.

D. Geared lifts: Single speed with minimum ratio of 2 to 1.

E. Teeth on gears, spur pinions, bevel gears, and bevel pinions: Cut.

F. Lift nuts: Cast manganese bronze.

G. Exterior surfaces on cast-iron lift parts: Smooth.

H. Bearings above and below flange on lift nuts: Ball or roller; capable of taking thrust developed by opening and closing of gates under maximum operating head; with bronze sleeve bearings and sufficient grease fittings for lubrication of moving parts, including bearings and gears.

I. Crank rotation indicator: Cast arrow with word OPEN in prominent location readily visible indicating correct rotation of crank to open gate.

J. Hand cranks: 15-inch radius; requiring maximum 25 pounds pull to operate gate at maximum operating head; with:
   1. Revolving brass sleeves.

2. Gears, spur pinions, bevel gears, and bevel pinions with cut teeth.
3. Cast manganese bronze lift nuts.
4. Cast-iron lift parts with smooth exterior surfaces.

K. Indicator: Dial position type mounted on gear actuator; enclosed in cast-iron or aluminum housing with clear plastic cover; marked with fully open, 3/4, 1/2, 1/4, and closed positions.

2.04 FLOOR BOXES

A. Manufacturers: The following or equal:
1. Waterman Industries, Inc.

B. Floor boxes: Cast-iron; with:
1. Counter type indicator.
2. Hinged, lockable lid with directional arrow.
3. 2-inch square AWWA operating nut.
4. Packing gland providing drip-tight seal around valve shaft.

2.05 FLOOR STAND

A. Manufacturers: One of the following or equal:
1. Rodney Hunt Co.
2. Waterman Industries, Inc.

B. Floor stand assemblies: Heavy-duty cast-iron, suitable for mounting specified actuator.

2.06 BENCH STANDS

A. Manufacturers: One of the following or equal:
1. Rodney Hunt Co.
2. Waterman Industries, Inc.

B. Bench stands: Handwheel actuators or hand crank, geared actuators conforming to hand-cranked geared actuator requirements, except capacity to be mounted on haunch, wall bracket, or self-contained gate yoke.

2.07 ACCESSORY EQUIPMENT

A. Wall brackets or haunches: As indicated on the Drawings.

B. Stems: Stainless steel; sized to match output of actuator; minimum gate or valve operating stem diameter; maximum 200 slenderness ratio.

C. Stem couplings: Stainless steel; internally threaded to match stem; lockable to stem by set screw.

D. Stem guides: Cast-iron with silicon bronze bushing; maximum 200 slenderness ratio; capable of being mounted with wall bracket; adjustable in 2 directions.

E. Wall brackets: Cast-iron, capable of withstanding output of actuator, adjustable in 2 directions.

F. Stem stuffing boxes: Cast-iron, with adjustable gland and packing.

G. Fasteners: Type 316 stainless steel.

H. Anchor bolts: As specified in Section 05190 - Mechanical Anchoring and Fastening to Concrete and Masonry except that the material shall be Type 316 stainless steel.

I. Geared valve actuators: Provided with cut gears, either spur or worm; sized to operate valves at most adverse design condition; with maximum 40-pound pull at handwheel or chain wheel rim.

J. Geared valve traveling nut actuators: Acceptable only where specified or indicated on the Drawings.

K. Accessory equipment for valves and gates requiring remote actuators: Operating stems, stem couplings, stem guides, wall brackets, and stem stuffing boxes.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install floor boxes in concrete floor with lid flush with floor.

B. After installation of gate and stem covers, mark stem covers at point where top of stems are at full-open position and at closed position.

C. Attach floor stand to structure with anchor bolts.

D. Install stem stuffing boxes where operating stems pass through intermediate concrete floor slabs.

3.02 SCHEDULES

A. Geared actuators: Provide geared actuators for following valves:
   1. Butterfly valves larger than 6 inches, nominal size, on liquid service.
   2. Butterfly valves larger than 10 inches, nominal size, on gas and air service.
   3. Plug valves 6 inches, nominal size, and larger.

B. Handwheel actuators: Provide handwheel actuators for valves mounted 6 feet or less above floors.

C. Chain wheel actuators: Provide chain wheel actuators for valves mounted more than 6 feet to centerline above floors.

END OF SECTION

SECTION 13447

ELECTRIC ACTUATORS

PART 1 GENERAL

1.01 SUMMARY

A. Section includes: Electric motor-driven actuators for valves and gates.

1.02 REFERENCES

A. American Water Works Association (AWWA):
   1. C504 - Standard for Rubber-Seated Butterfly Valves.
   2. C542 - Standard for Electric Motor Actuators for Valves and Slide Gates.

B. National Electrical Manufacturers Association (NEMA):
   1. 250 - Enclosures for Electrical Equipment (1000 V Maximum).

1.03 SUBMITTALS

A. Submit as specified in Section 01330 - Submittal Procedures and Section 15050 - Common Work Results for Mechanical Equipment.

B. Provide a complete list/schedule of all actuators being provided with their associated tag names as indicated on the design drawings and/or specifications, service process area and the size of the valve they are actuating.

C. Product data:
   1. Electrical ratings:
      a. Voltage and number of phases.
      b. Starting and running current.
      c. Voltage levels and source for control and status.
   2. Description of integral control interface.
   3. Remote control station components (If applicable).
   4. Environmental ratings, including NEMA enclosure rating and submergence capabilities.
   5. Gear ratios for both manual and motorized actuation.
   6. Opening and closing directions.
   7. Allowable starts per hour.
   8. List of all included options and accessories.
   9. Full travel times.
   10. Gearbox data including gear ratio, and gearbox efficiency.

D. Shop drawings:
   1. Wiring diagrams:
      a. Include all options and expansion cards furnished with each actuator.
   2. Dimensioned drawings of each valve and actuator combination.

3. Dimensioned drawings of each valve gearbox.
4. Electric motor data.

E. Calculations:
1. Operating torque.
2. Maximum torque calculations for seating and unseating.
3. Maximum operating torque at starting and normal operation.
4. Signed by Professional Engineer licensed in the State where project is located.

F. Provide draft vendor operation and maintenance manual as specified in Section 01782 - Operation and Maintenance Manuals:
1. Include a list of all configurable parameters, and the final values for each.
2. Include a troubleshooting chart covering the complete valve and controls/electrical power systems, showing description of trouble, probable cause, and suggested remedy.

G. Commissioning submittals:
1. Provide Manufacturer's Certificate of Source Testing as specified in Section 01756 - Commissioning.
a. Affidavit in accordance with AWWA C542.
2. Provide Manufacturer's Certificate of Installation and Functionality Compliance as specified in Section 01756 - Commissioning.

H. Project closeout documents:
1. Provide final vendor operation and maintenance manual as specified in Section 01782 - Operation and Maintenance Manuals.

1.04 WARRANTY

A. Provide warranty as specified in Section 01783 - Warranties and Bonds.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Manufacturer for actuators on valves FV-60100 and FV-60102:
1. The following, no equal:
a. Bray, Series 70.

B. Manufacturers for actuators on other valves:
1. The following or equal:
a. Rotork Controls Inc. IQ3 Range:
1) IQ for multi-turn applications.
2) IQT for quarter-turn applications.
b. Limitorque Corp.:
1) Accutronix MX for multi-turn applications.
2) Accutronix QX quarter-turn applications.

C. Linear actuators:
    1. The following or equal:
        a. Rotork Controls Inc.:
            1) CML Series.
    2. As required to actuate the waste gates for the advanced water treatment (AWT) clarifier/filter units. Refer to Specification Section 11802 - Packaged Water Treatment System Rehabilitation.

2.02 CHARACTERISTICS FOR ACTUATORS ON LINES 4 INCHES AND LARGER

A. Provide actuators complete and operable with all components and accessories required for operation.

B. Power supply:
    1. Voltage and phases as indicated in the Motorized Actuator Schedule.
    2. Valve or gate motion independent of power supply phase rotation.
    3. Provide an internal backup power source or mechanical indicator to maintain settings and track valve position when main power is off.
    4. The actuators shall incorporate all major components such as the motor, starter, local controls, terminals, etc. housed within a self-contained, sealed enclosure.

C. Size actuator to move gates or valves from full open to closed position within the time indicated in the Motorized Actuator Schedule:
    1. If an operating time is not indicated on the Motorized Actuator Schedule, size the actuator to move gates or valves at minimum 12 inches per minute under maximum load. Measure rate of closure for valves at maximum diameter of disc, plug, or ball.
    2. Size actuators so that gear boxes are not required where possible.

D. Control interface:
    1. Configuration:
        a. Provide a non-intrusive, non-contacting interface for configuring all input and output settings, control values, ranges, torque switch settings, valve positions switch settings, and options.
            1) Configurable from a handheld configuring tool or input devices on the actuator.
    2. Local interface, integral to actuator:
        a. Non-intrusive, non-contacting selector switches:
            1) LOCAL-STOP-REMOTE:
                a) Motor actuator operation is prevented with the switch in STOP.
            2) OPEN-CLOSE:
                a) Controls the valve when LOCAL-STOP-REMOTE is in LOCAL.
                b) Spring return to center.
                c) Configurable between maintained (actuator runs until end of travel, high torque, or a LOCAL-STOP-REMOTE is switched to STOP) and momentary (actuator stops when lever is released).
        b. Local display:
            1) Valve fully open and fully closed indicators.
            2) Numerical display showing actual valve or gate position in percent of travel.

3. Remote control station - (VCP):
    a. Provide remote control stations for all actuators located more than 5 feet above finished floor/grade or where indicated on the Drawings in the Schedule.
        1) NEMA rating to match those to the associated Actuator Schedule.
            a) Where the rating is not listed, use NEMA Type 4X enclosures for non-hazardous areas, and explosion-proof (XP) Class I Division 1 for hazardous areas.
            b) All pilot devices shall 30 millimeters, and pilot lights shall be illuminated by LEDs.
        2) LOCAL-STOP-REMOTE selector switch.
        3) LOCAL mode control devices:
            a) Operate valve when LOCAL-STOP-REMOTE integral to actuator is in REMOTE and LOCAL-STOP-REMOTE on remote control station is in LOCAL.
            b) OPEN-STOP-CLOSE maintained switch or OPEN, STOP, and CLOSE pushbuttons where Maintained operation is indicated in the Actuator Schedule.
            c) OPEN-CLOSE spring-return switch or OPEN and CLOSE pushbuttons where momentary operation is indicated in the Attachment A - Intelligent Actuator Schedule.
        4) Pilots' lights to indicate valve position:
            a) Fully open.
            b) Fully closed.
4. Coatings:
    a. Material requirements:
        1) Factory prime and coat with an ISO 12944 classification coating of C5M (Marine, offshore estuaries with high salinity) coating with 15-year durability.
        2) Touch-up damaged coatings with manufacturer provided coating repair kit.
    b. Application requirements:
        1) Painting shall commence within four hours of blast cleaning.
        2) Each paint coat within the system is to be applied in accordance with the paint manufacturer's instructions.
        3) Paint thickness shall be checked for each coat on each actuator.
    c. Qualification requirements:
        1) Operators shall be experienced and proficient in surface preparation and coating application techniques.
        2) Personnel shall have relevant knowledge of health and safety hazard, use of protective equipment, coating materials, mixing and thinning coatings, coating pot life, surface requirements etc.
        3) Personnel carrying out inspection or verification shall be certified as NACE coating inspector or equivalent such as ICorr.
5. Control inputs:
    a. Capable of using discrete 120 VAC.
    b. Controls the valve when LOCAL-STOP-REMOTE is in REMOTE.
    c. Isolated inputs capable of operating from external control voltage source or internal power supply:

d. Provide the following inputs:
    1) OPEN.
    2) CLOSE.
    3) STOP.
e. OPEN and CLOSE inputs configurable between maintained (actuator runs until end of travel, high torque, or a STOP input) and momentary (actuator stops when command is removed).

6. Status outputs:
    a. Monitor relay output: Dry contact, normally closed, opens when actuator is not in REMOTE or in the event of any internal fault or alarm condition.
    b. Dry contact outputs configured for the functions indicated on the Drawings. Provide the following outputs for all actuators:
        1) Fully closed.
        2) Fully open.
        3) LOCAL-STOP-REMOTE in REMOTE position.
    a. All output contacts rated for 5 amps, 120 VAC, and 24 VDC.
7. Analog input:
    a. Provide a 4-20 milliampere analog input for analog modulating valves when indicated on the Drawings.
    b. Modulate valve to maintain position based on analog input value.
    c. Maximum input impedance 250 ohms.
8. Analog output:
    a. Provide an isolated 4-20 milliampere analog output(s) when indicated on the Drawings.
        1) Loop power sourced from the actuator power supply.
        2) Capable of driving into a load up to 500 ohms.
        3) Output proportional to process value(s) indicated on the Drawings.
        4) Valve or gate position.
        5) Operating torque.
9. For actuators for non-vendor provided systems, provide native EtherNet/IP connectivity.

E. Features:
1. Time delay on reversal: Incorporate time delay between stopping actuator and starting in opposite direction to limit excessive current, torque, and heating from instantaneous reversal.
2. Data logging:
    a. Store diagnostic data and reference data.
    b. Time-stamped historical operating data, including number of operations and most recent operations.
3. Provide display of logged data on the actuator, or provisions to download to a personal computer.

F. Materials:
1. Construct motorized actuators of materials suitable for the environment in which actuator is to be installed.
    a. Enclosure ratings:
        1) As scheduled with the following requirements.
            a) All actuators will be double sealed for corrosion protection rated at ip68.

2) NEMA 4X for all actuators located outside of Class I areas.
3) All others shall be rated FM - Class I Groups B,C and D and Class II E, F, and G.

G. Components:
1. Motors:
a. Specifically designed for valve actuator service with high starting torque, totally enclosed non-ventilated construction.
b. Torque ratings equal to or greater than that required for valve seating and dynamic torques with a 25 percent factor of safety.
1) Design requirements for rubber-seated AWWA butterfly valves:
a) Design actuators for maximum gate or valve operating torque, in accordance with and using safety factors required in AWWA C504 and AWWA C542.
(1) Valve actuator torque requirement for open-close service: Not less than the required valve-seating and dynamic torques under design operating conditions in accordance with AWWA C504.
(2) Valve actuator torque requirement for modulating service: Not less than twice the required valve dynamic torque under design operating conditions in accordance with AWWA C504.
2) Design requirements for slide gates, gate valves, knife gate valves, globe valves, and diaphragm valves:
a) Design valves and actuators for maximum operating torque, in accordance with and using safety factors required in AWWA C542.
b) Design for the maximum torque and thrust running load over the full cycle.
c) Maximum torque or thrust rating: The actuator stall torque or maximum thrust output shall not exceed the torque or thrust capability of the valve or gate, as determined by the valve or gate manufacturer.
c. Capable of being removed and replaced without draining the actuator gear case.
d. Motor bearings shall be amply proportioned of the anti-friction type and permanently lubricated.
e. Rated for operating under the following conditions without exceeding temperature limits with ambient temperature of 40 degrees Celsius.
1) Continuous operation for 15 minutes or twice the open-to-close operating time (whichever is greater) at normal operating torque or 33 percent of maximum torque (whichever is greater).
2) 60 starts per hour for open/close service or 1,200 starts per hour for modulating service.
f. Provide the following motor protection features:
1) Jammed valve (no valve motion detected through a time delay).
2) High motor temperature (sensed by an embedded thermostats).
3) High torque.
4) Single phasing protection.

H. Enclosures:
   1. Actuator housing ratings as indicated in the Motorized Actuator Schedule.
   2. Stainless steel external fasteners.
   3. Provide O-ring seals for each of the following areas:
      a. Between the terminal compartment and the internal electrical elements.
      b. Between the mechanical and electrical portions to protect from the ingress of oil, and to protect the mechanical components of oil from dust and moisture when the electrical terminal is open.
   4. Provide actuators with the following minimum enclosure ratings as scheduled:
      a. NEMA Type 4X enclosure for general applications.
      b. NEMA Type 6P rated for actuators in underground vaults or where possible submergence is indicated in the Drawings.
         1) Suitable for a minimum of 48 hours submerged under 3 meters of water.
      c. NEMA Type 7 certified by FM for Class I, Division 1, Groups C, D, E, F, and G, for actuators installed in Class I, Division 1 and 2 areas.

I. Position sensing:
   1. Electronic and adjustable using a solid-state encoder wheel.
      a. Mechanical limit switches and potentiometers are not acceptable.
   2. Capable of retaining position and monitoring valve or gate motion when valve is manually actuated and when main power is not present.
   3. Valve range and position switch outputs field adjustable.

J. Torque sensing:
   1. Torque shutdown setting: 40 percent to 100 percent rated torque:
      a. Adjustable in 1 percent increments.
   2. Capable of interrupting control circuit during both opening and closing and when valve torque overload occurs.
   3. Electrical or electronic torque sensing.
   4. Independent of variations in frequency, voltage, or temperature.
   5. The actuator shall store actual operational torque curves for retrieval by plant maintenance staff.
   6. Provide a temporary inhibit of the torque sensing system during unseating or during starting in mid-travel against high inertia loads.
   7. Provide visible verification of torque switch status without any housing disassembly.

K. Manual actuators:
   1. Hand wheel for manual operation.
      a. Maximum 80-pound pull on rim when operating gate or valve under maximum load.
      b. Provide pull chain when motorized actuator is located more than 6 feet above floor surface.
         1) Chain shall be of sufficient length to reach approximately 4 feet above the operating level.

2) Where the chain obstructs an aisle or walkway, provide holdback or other means to ensure chain does not create a nuisance or hazard to operating personnel.
3) Provide Type 316 stainless steel.

2. Declutch lever: Padlockable, capable of mechanically disengaging motor and related gearing and freeing hand wheel for manual operation.

L. Gearing: Hardened alloy steel spur or helical gears and self-locking, alloy bronze worm gear set.
1. Accurately cut to ensure minimum backlash.

M. Bearings:
1. Anti-friction bearing with caged balls or rollers throughout.
2. Sealed-for-life type thrust bearings housed in a separate thrust base.

N. Drive bushing:
1. Easily detachable for machining to suit the valve stem or gearbox input shaft.
2. Positioned in a detachable base of the actuator.

O. Lubrication:
1. Provide totally enclosed actuator gearing with oil or grease filled gear case suitable for operation at any angle.
2. Actuators requiring special or exotic lubricants are not acceptable.

2.03 ACCESSORIES

A. Software:
1. Furnish PC-based diagnostic and configuration software to display diagnostic data.
2. Provide software communications to the valve actuator using Bluetooth wireless communications.
a. Provide all accessories and drivers required for operation and communications with a standard personal computer running Microsoft Windows.

B. Termination module cover:
1. For actuators on a valve network, provide a means to keep the valve network in service, in the event where the actuator must be removed.
2. Provide sunshades for all outdoor installations of remote control stations that use an LCD or similar screen. Regular pushbutton, sector switches, and pilot light control stations will not require a sunshade.

2.04 SPARE PARTS AND SPECIAL TOOLS

A. As specified in Section 01600 - Product Requirements.

B. Spare parts:
1. Provide the following (minimum 10 percent of total number of actuators of each model type furnished, but not less than 1 for each model of actuator furnished):
a. Stem nut.

b. Worm shaft subassembly.
c. Drive sleeve subassembly.
d. Complete actuator seal kit.
e. Actuator gearbox oil (sufficient quantity to fill 4 gearboxes).
f. Encoder.
g. Control module.

2. Provide 1 spare motor for each size motor furnished.

PART 3 EXECUTION

3.01 GENERAL

A. As specified in Section 15050 - Common Work Results for Mechanical Equipment.

B. Position visual indicators so that they are most easily visible.

3.02 COMMISSIONING

A. As specified in Section 01756 - Commissioning, Section 15958 - Mechanical Equipment Testing, and this Section.

B. Manufacturer services:
1. Provide certificates:
a. Manufacturer's Certificate of Source Testing:
1) Proof-of-Design and Performance Test Reports in accordance with AWWA C542.
b. Manufacturer's Certificate of Installation and Functionality Compliance.
2. Manufacturer's Representative on-site requirements:
a. Installation: 2 trips, 2-day minimum each.
b. Functional testing: 2 trips, 2-day minimum each.
3. Training:
a. Maintenance: 4 hours per session, 2 sessions.
b. Operation: 2 hours per session, 2 sessions.

C. Source testing:
1. Design and Performance Test Reports in accordance with AWWA C542.
2. Test each actuator with a simulated load.
a. Simulate a typical valve load.
3. Electrical Instrumentation and Controls:
a. Test witnessing: not witnessed.
b. Conduct testing as specified in Section 17950 - Commissioning for Instrumentation and Controls.

D. Functional testing:
1. Installed actuator:
a. Test witnessing: Witnessed.
b. Conduct Level 2 General Equipment Performance Tests.
c. Conduct Level 2 Vibration Tests.
d. Conduct Level 2 Noise Tests.

2. Electrical Instrumentation and Controls:
    a. Test witnessing: Witnessed.
    b. Conduct testing as specified in Section 17950 - Commissioning for Instrumentation and Controls.

3.03 INTELLIGENT ACTUATOR SCHEDULE

A. Provide actuators indicated on the Drawings:
    1. Major process actuators are listed in the Intelligent Actuator Schedule shown in Attachment A - Intelligent Actuator Schedule
        a. Attachment A - Intelligent Actuator Schedule does not include all number and types of actuators required for the Project.

Notes:
None.

Abbreviations:

Types:
BFV = Butterfly Valve.
BV = Ball Valve.
PV = Plug Valve.
SG = Slide Gate.

Duty:
ST = Standard service (0-60 starts/hr) duty.
MD = Modulating duty (~1000 starts/hr).

Service:
O/C = Open/Close.
MOD = Modulating.

Controls:
PA = Profibus PA.
DP = Profibus DP.
DN = DeviceNet.
E-IP = Ethernet/IP.
E-TCP = Ethernet TCP or TCP/IP.
FF = Foundation Fieldbus H1.
MB = Modbus RTU (RS-485).
NET = Manufacturer’s proprietary network.
A = Analog (4-20 mA) control, modulating.
D O/C = Discrete open/close.
D JOD = Position control using discrete jumps.

SECTION 15050

COMMON WORK RESULTS FOR MECHANICAL EQUIPMENT

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Mechanical equipment requirements for:
      a. Basic design and performance criteria.
      b. Prescriptive requirements for common components.
      c. Installation requirements.

1.02 REFERENCES

A. American Bearing Manufactures Association (ABMA):
   1. 9 - Load Ratings and Fatigue Life for Ball Bearings.
   2. 11 - Load Ratings and Fatigue Life for Roller Bearings.

B. American Gear Manufacturer's Association (AGMA) Standards.

C. ASTM International (ASTM):
   1. A193 - Standard Specification for Alloy-Steel and Stainless Steel Bolting for High Temperature or High Pressure Service and Other Special Purpose Applications.
   2. A194 - Standard Specification for Carbon and Alloy Steel Nuts for Bolts for High Pressure or High Temperature Service, or Both.
   3. A320 - Standard Specification for Alloy-Steel and Stainless Steel Bolting for Low-Temperature Service.
   4. F593 - Standard Specification for Stainless Steel Bolts, Hex Cap Screws, and Studs.
   5. F594 - Standard Specification for Stainless Steel Nuts.

D. Hydraulic Institute (HI):
   1. 9.6.8 - Guideline for Dynamics of Pumping Machinery.

E. International Concrete Repair Institute (ICRI):
   1. Guideline No. 310.2R, Selecting and Specifying Concrete Surface Preparation for Sealers, Coatings, Polymer Overlays, and Concrete Repair.

F. International Organization for Standardization (ISO):
   1. 21940 - Mechanical Vibration - Rotor Balancing - Part 1: Introduction.

G. National Electrical Manufacturers Association (NEMA):
   1. MG-1 - Motors and Generators.

H. Society for Protective Coatings (SSPC):
   1. SP-1-Solvent Cleaning.

1.03 DEFINITIONS

A. Definitions used in this specification and equipment submittals for terms related to rotor-dynamic pumps shall be in accordance with HI 9.6.8, Appendix A, as clarified below.

B. These definitions shall be applied to equipment other than pumps, unless otherwise specified in technical sections.

C. Rotordynamic Analysis Level:
   1. The level of detail required for rotordynamic analysis is indicated in the technical sections schedules as None (no analysis required), Analysis Level 1, Analysis Level 2, or Analysis Level 3, which correlate to increasing levels of required detailed equipment design analysis. Analysis Levels 1, 2 and 3 are based on HI 9.6.8.
   2. Where these specifications differ from HI the more stringent shall apply.

D. Resonant Frequency:
   1. The frequency of a periodic excitation force that is close to the natural frequencies of an object. Also known as critical frequency, critical speed, or resonant speed.
   2. An undamped resonant frequency within the separation margin is always considered harmful under Level 1 analysis.
   3. A resonant frequency that occurs within a separation margin of 15 percent above or below the operating speed range and has a log decrement greater than +0.3 is considered harmful under Level 2 and Level 3 analysis.

E. Separation margin:
   1. The span of operating speeds within which interference between excitation orders and resonant frequencies indicate the possibility of harmful vibrations.
   2. The separation margin for a specific application extends 15 percent above and 15 percent below the span of operating speed required for the specified performance conditions.

1.04 ADMINISTRATIVE REQUIREMENTS

A. Roof coordination:
   1. Show roof penetrations for mechanical equipment on roof drawing submittal and include mechanical equipment information:
      a. Type.
      b. Size.
      c. Location.
      d. Configuration of penetration and the surround.
      e. Weight.
      f. Anchoring and support details.

1.05 SUBMITTALS

A. Items in this Section are components of equipment or systems specified in other sections.
   1. Include data for this Section’s components with the equipment or system submittal.

PART 2 PRODUCTS

2.01 DESIGN AND PERFORMANCE CRITERIA

A. General:
   1. Equipment manufacturer's responsibility extends to selection and mounting of gear drive units, motors or other prime movers, accessories, and auxiliaries to provide a complete, operable unit.
   2. Manufacturer shall analyze all rubber-bearing vertical-column pumps, and equipment identified as non-reversing in the technical sections for reverse rotation and provide non reversing motor ratchets.
   3. Equipment that prevents reverse rotation shall be capable of both:
      a. Handling 150 percent of the maximum torque at maximum operating speed.
      b. 150 percent of torque that will be generated in reverse direction due to equipment shutoff head as calculated by the manufacturer.
   4. The motor shall be designed to run safely in the reverse direction at up to 140 percent times the reverse runaway speed under shutoff head conditions.

B. Rotordynamic analysis and vibration testing:
   1. Submit information for the Rotordynamic Analysis Level specified for each piece of equipment as shown in the Technical Sections prior to manufacture of the equipment.
   2. Rotordynamic analysis shall be performed on "like-new" and "as-worn" conditions, representing conditions when first installed and conditions when parts wear to the manufacturer's maximum allowable operating tolerances. Conditions assumed for the "as-worn" condition shall be 2 times the "like-new" tolerances unless specified otherwise.
   3. Rotordynamic analysis criteria:
      a. Torsional excitation forcing function magnitudes shall be no less than 1 percent of the maximum transmitted torque at given speed.
      b. Motor mass elastic information in accordance with NEMA MG-1 shall be obtained from the original equipment manufacturer and included in the analysis. Motors shall be precision balanced to ISO 21940 grade G2.5.
      c. Bearings:
         1) At maximum bearing loads an L-10 life of 100,000 hours in accordance with ABMA 9-11 to be proven.
   4. Submit factory and field testing requirements as specified in the Technical Sections and specified in Section 15958 - Mechanical Equipment Testing after manufacture and installation respectively.

5. Repair, replace, and modify equipment exhibiting vibration performance that does not meet criteria specified in this Section at no additional cost to Owner. Acceptable remedies include adjustments to equipment component geometry, materials, energy absorbing couplings, etc. Locking out speed interval(s) within equipment specified operating range is unacceptable.
6. Vibration analysis expert:
    a. Provide vibration analysis expert when specified in the equipment Technical Sections:
        1) The vibration analysis expert must be a 3rd party, unaffiliated with the equipment vendor or Contractor.
    b. The vibration analysis expert, and analysis shall be provided by one of the following or equal:
        1) Mechanical Solutions, Inc. (MSI, New Jersey).
        2) Engineering Dynamics Inc. (EDI, Texas).
    c. The analysis shall be:
        1) Stamped by a registered professional mechanical engineer.
        2) Verified in-situ by the vibration analysis expert including certification that installation conforms to field conditions assumed in the reports.
        3) Verified in-situ by the vibration analysis expert including witness of at least one field vibration test, and certification that vibration measurements corroborate the rotordynamic analysis.
        4) Supplemented with additional field investigation and analysis should conditions during field vibration testing activity indicate non-compliance with these specifications; supplemental field investigation and analysis shall indicate remedies to comply with the specifications and shall be stamped by a registered professional mechanical engineer.
7. Rotordynamic Analysis Level 1:
    a. Before the equipment is released for manufacture it shall be determined that the equipment/motor structures do not have any harmful resonant frequencies in the lateral and torsional modes. Representative analysis results for identical equipment may be submitted.
    b. Calculate rotor lateral and torsional and equipment structural components' lateral frequencies with a spreadsheet calculation or finite element analysis software.
        1) Equipment structure lateral frequency shall include the motor.
        2) Speed changing drive systems (belt, gear) effects on rotational inertia and stiffness shall be incorporated.
    c. Determine the equipment system components (rotor and structure) resonant frequencies.
    d. An intersection of an equipment component resonant frequency with the 1x run speed excitation order that occurs within separation margin is unacceptable.
8. Rotordynamic Analysis Level 2:
    a. Before the equipment and motor are released for manufacture it shall be determined that the equipment/motor structures do not have any harmful critical speeds in the lateral and torsional modes.
    b. Calculate rotor lateral and torsional and structure lateral frequencies with finite element analysis software.
        1) Equipment structure lateral frequency shall include the motor.

2) Speed changing drive systems (belt, gear) effects on rotational inertia and stiffness shall be incorporated.
3) The rotational inertia of water within the impeller, in the wet well and inside the equipment structure, e.g., the column of a vertical pump, shall be included in the calculation at both the high level and low level conditions.

c. Potentially harmful critical speeds shall be investigated further with a forced, damped analysis to determine component stresses do not exceed material properties.

d. Forced damped analysis:
1) Forced lateral analysis shall include forcing function magnitudes at least 10 percent of rotor disc weight at each disc position and hydraulic imbalance at 5 operating conditions spaced equally over the equipment operating range. If synchronous motors are used ensure that the rotor analysis includes startup, shutdown, and motor control transients.
2) Forced torsional analysis shall include not less than 1 percent of the maximum permitted torque at any given speed. Damping shall be one percent of critical at all shaft elements.
3) The equipment rotor total stress (steady-state and alternating torque components plus lateral-bending stresses) shall not exceed:
a) Constant torque: Total stress limited to 30 percent of the material fatigue limit and to a maximum of 18 percent of ultimate tensile strength.
b) Variable torque (including variable speed equipment): Total stress limited to 50 percent of the material fatigue limit and to a maximum of 4 percent of the material ultimate tensile strength.
c) Submit documentation of material fatigue limit.

e. Report submittals:
1) Confirmation of compliance with this Section, or detailed exceptions taken.
2) Software used for analysis.
3) Results with interpretation.
4) Preparer's professional engineering stamp and seal.
5) Input data including component properties, materials, and connectivity to other components.
6) Schematic diagram of model mode shapes, nodes, and elements.
7) Bearing stiffness and damping properties, impeller/diffuser interaction coefficients, and seal dynamic properties.
8) Campbell diagrams showing the system natural frequencies, excitation orders, and operating speed range for both lateral and torsional analysis.
a) Campbell diagram shall include equipment operating range; excitation lines at 1x, 2x run speed, and vane pass (or equivalent); and critical speeds associated with equipment system components including the rotor, each major equipment structural component and the motor.
9) Forced, damped analysis indicating acceptable material stress limits are maintained at interference points shown on the Campbell diagram.

9. Rotordynamic Analysis Level 3:
    a. Before the equipment and motor are released for manufacture it shall be determined that the equipment/motor structures do not have any harmful critical speeds in the lateral and torsional modes.
    b. Calculate rotor lateral and torsional and structure lateral frequencies with finite element analysis software.
        1) Equipment structure lateral frequency shall include the motor.
        2) Speed changing drive systems (belt, gear) effects on rotational inertia and stiffness shall be incorporated.
        3) The rotational inertia of water within the impeller, in the wet well and inside the equipment structure, e.g., the column of a vertical pump, shall be included in the calculation at both the high level and low level conditions.
    c. Potentially harmful critical speeds shall be investigated further with a forced, damped analysis to determine component stresses do not exceed material properties.
    d. Forced damped analysis:
        1) Forced lateral analysis shall include forcing function magnitudes at least 10 percent of rotor disc weight at each disc position and hydraulic imbalance at 5 operating conditions spaced equally over the equipment operating range. If synchronous motors are used ensure that the rotor analysis includes startup, shutdown, and motor control transients.
        2) Forced torsional analysis shall include 1 percent of the maximum permitted torque at any given speed. Damping shall be 1 percent of critical at all shaft elements.
        3) The equipment rotor total stress (steady-state and alternating torque components plus lateral-bending stresses) shall not exceed:
            a) Constant torque: Total stress limited to 30 percent of the material fatigue limit and to a maximum of 18 percent of ultimate tensile strength.
            b) Variable Torque (including variable speed equipment): Total stress limited to 50 percent of the material fatigue limit and to a maximum of 4 percent of the material ultimate tensile strength.
            c) Submit documentation of material fatigue limit.
    e. Report submittals:
        1) Report 1: Executive Summary including:
            a) Confirmation of compliance with this specification section, or detailed exceptions taken.
            b) Software used for analysis.
            c) Results with interpretation.
            d) Preparer's professional engineering stamp and seal.

e) Campbell diagrams showing the system natural frequencies, excitation orders, and operating speed range for both lateral and torsional analysis.
(1) Campbell diagram shall include equipment operating range; excitation lines at 1x, 2x run speed, vane pass (or equivalent), line- and twice-line frequency, motor-pole frequency, torsional harmonics from reciprocating drivers (including up to 6 times operating speed), control pulse frequencies induced by VFDs (with certification from VFD manufacturer of frequencies up to 24 times motor running speed), any torque harmonic greater than 1 percent of steady torque at primary excitation, and synchronous motor requirements; and critical speeds associated with equipment system components including the rotor and each major equipment structural component.
f) Report 1 shall not include detailed analysis elements listed for submittal under Report 2 below, submittal of full analysis details in Report 1 is unacceptable.
g) Following submittal of Report 1, submit Report 2: Detailed Analysis including responses to comments made on Report 1: Rotor-dynamic Executive Summary.
2) Report 2: Rotor-dynamic Detailed Analysis including:
a) Input data including component properties, materials, and connectivity to other components.
b) Schematic diagram of model mode shapes, nodes, and elements.
c) Bearing stiffness and damping properties, impeller/diffuser interaction coefficients, and seal dynamic properties.
d) Forced, damped analysis indicating acceptable material stress limits are maintained at interference points shown on the Campbell diagram.
e) Synchronous motor information including time-integration study results showing transient peak stresses at startup, shutdown, and motor control transient events. Provide tomographic diagrams including root and keyway stress concentration locations and the corresponding speeds that result in reported peak stresses.

2.02 POWER TRANSMISSION SYSTEMS

A. V-belts, sheaves, shaft couplings, chains, sprockets, mechanical variable-speed drives, variable frequency drives, gear reducers, open and enclosed gearing, clutches, brakes, intermediate shafting, intermediate bearings, and U-joints:
1. Rated for 24 hour-a-day continuous service, or for intermittent service with frequent stops-and-starts, whichever is most severe.
2. Sized with a service factor of 1.5 or greater:
a. Apply service factor to nameplate horsepower and torque of prime source of power and not to actual equipment loading.
b. Apply service factors in accordance with AGMA or as specified in the Technical Sections.

2.03 BEARINGS

A. Oil or grease lubricated, ball or roller antifriction type, of standard manufacture.
   1. Design lubrication system based on the equipment location to operate in the temperatures as specified in Section 01850 - Design Criteria.
      a. Design lubrication system to safely start after being shut off for 24 hours and operate safely:
         1) Suitable for the outdoor winter temperature as specified in Section 01850 - Design Criteria.

B. Oil-lubricated bearings:
   1. Provide either pressure lubricating system or separate oil reservoir splash-type system as specified in the Technical Section.
   2. Design oil-lubrication system to safely absorb heat energy generated in bearings when equipment is operating in the following conditions:
      a. With the highest load and the temperature 15 degrees Fahrenheit above the outdoor summer temperature as specified in Section 01850 - Design Criteria.

C. Grease lubricated bearings, except those specified to be factory sealed:
   1. Fit with easily accessible grease supply, flush, drain, and relief fittings.
   2. Lubrication lines and fittings:
      a. Lines: Minimum 1/4-inch diameter stainless steel tubing.
      b. Multiple fitting assemblies: Mount fittings together in easily accessible location.
      c. Use standard hydraulic-type grease supply fittings:
         1) Manufacturers: One of the following or equal:
            a) Alemite.
            b) Zerk.

D. Ratings: Rated in accordance with ABMA 9 or ABMA 11 L10 life for bearings rating life of not less than 50,000 hours.

2.04 BELT DRIVES

A. Sheaves:
   1. Separately mounted on bushings by means of at least 3 pull-up bolts or cap tightening screws.
   2. When 2 sheave sizes are specified, provide separate belts sized for each set of sheaves.
   3. Statically balanced for all; dynamically balanced for sheaves that operate at a peripheral speed of more than 5,500 feet per minute.
   4. Key bushings to drive shaft.

B. Belts:
   1. Anti-static type when explosion-proof equipment or environment is specified.
   2. When spare belts are specified, furnish 1 spare belt for every different type and size of belt-driven unit:
      a. Where 2 or more belts are involved, furnish matched sets.

b. Identify as to equipment, design, horsepower, speed, length, sheave size, and use.
c. Package in boxes labeled with identification of contents.

C. Manufacturers: One of the following or equal:
1. Dodge, Dyna-V belts with matching Dyna-V sheaves and Taper-Lock bushings.
2. T. B. Woods, Ultra-V belts with matching Sure-Grip sheaves and Sure-Grip bushings.

2.05 FLANGED PIPING CONNECTIONS

A. Unless otherwise in the Technical Sections or indicated on the Drawings, provide flat face flanges.

2.06 ASSEMBLY FASTENERS

A. General service: Stainless steel, Type 316:
1. Bolts: In accordance with ASTM F593, Alloy Group 2.
2. Nuts: In accordance with ASTM F594, Alloy Group 2.
3. Washers: Alloy group matching bolts and nuts.

B. High-temperature service or high-pressure service: Stainless steel, Type 316:
1. Bolts: In accordance with ASTM A193, Grade B8M, Class 1, heavy hex.
2. Nuts: In accordance with ASTM A194, Grade 8, heavy hex.
3. Washers: Alloy group matching bolts and nuts.

C. Low-temperature service: Stainless steel, Type 316:
1. Bolts: In accordance with ASTM A320, Grade B8M, Class 1, heavy hex.
2. Nuts: In accordance with ASTM A194, Grade B8M, heavy hex.
3. Washers: Alloy group matching bolts and nuts.

2.07 GUARDS AT HIGH-TEMPERATURE SURFACES

A. Exposed surfaces having an external surface temperature of 120 degrees Fahrenheit or higher and located within 7 feet measured vertically from floor or working level or within 15 inches measured horizontally from stairways, ramps, or fixed ladders.

B. Cover with a thermal insulating material unless otherwise guarded against contact.
1. Insulation thickness such that the insulation exterior temperature is below 120 degrees Fahrenheit.
2. Insulation Type 3 and cover Type 5 as specified in Section 15082 - Piping Insulation.

2.08 GUARDS AT MOVING COMPONENTS

A. Provide guards on rotating components that are within 7.5 vertical feet of an operating floor or platform.

B. Allow visual inspection of moving parts without removal.

C. Allow access to lubrication fittings.

D. Easily removable for maintenance.

E. Prevent entrance of rain or dripping water for outdoor locations.

F. Size belt and sheave guards to allow for installation of sheaves 15 percent larger and addition of 1 belt.

G. Materials:
   1. Sheet metal: Carbon steel, 12-gauge minimum thickness, hot-dip galvanized after fabrication.
   2. Fasteners: Type 316 stainless steel.

2.09 SHOP FINISHES

A. Manufacturer's standard primer and finish coatings.
   1. Primer only if field coatings are to be applied.

2.10 GEAR MOTORS

A. Parallel shaft drives: Helical gearing.

B. Right-angle drives: Worm gearing.

C. Manufacturers: One of the following or equal:
   1. Baldor Electric Company.
   2. Bodine Electric Company.

2.11 GEAR REDUCTION UNITS

A. Design and performance criteria:
   1. Gear type:
      a. Helical or herringbone.
   2. AGMA Class II service:
      a. Use more severe service condition when such is recommended by unit's manufacturer.
   3. Cast-iron housing with gears running in oil.
   4. Anti-friction bearings.
   5. Thermal horsepower rating based on maximum horsepower rating of prime mover, not actual load.

2.12 MOUNTING AND LIFTING PROVISIONS FOR EQUIPMENT

A. Equipment bases and base plates:
   1. Provide equipment bases with machined support pads, dowels for alignment for mating of adjacent items, openings for electrical conduits, and openings to facilitate grouting.
   2. Provide jacking screws in bases and supports for equipment and for equipment weighing 500 pounds or more.

3. Materials:
    a. Match equipment material or steel.
    b. Coating: Match equipment.

B. Steel support frames:
    1. Carbon steel:
        a. At exterior locations, and at interior wet or moist locations, provide continuous welds on both sides to close seams and edges between steel members.
        b. Grind closure welds smooth.

C. Lifting lugs or eyes:
    1. Equipment units weighing 50 pounds or more:
        a. Provide with lifting lugs or eyes to allow removal with lifting device.

2.13 SPRING VIBRATION ISOLATORS

A. Design requirements:
    1. Telescopic top and bottom housing with vertical stabilizers to resist lateral and vertical forces.
    2. Use steel coil springs.
    3. Design vibration isolators in accordance with seismic design criteria as specified in Section 01850 - Design Criteria.

B. Performance requirements: Minimum spring deflection of 1-inch under static load and capable of limiting transmissibility to 10 percent maximum at design operating load.

C. Manufacturers: One of the following or equal:
    1. California Dynamics Corporation, Type RJSD.
    2. Mason Industries, equivalent product.

D. Materials:
    1. Fabricate isolators using welded-steel or shatterproof ductile iron in accordance with ASTM A536 Grade CS-45-12.
    2. Spring steel: ASTM A125.

2.14 NAMEPLATES

A. Fastened to equipment at factory in an accessible and visible location.

B. Metal engraved or stamped with text, holes drilled or punched for fasteners.

C. Material: Aluminum or stainless steel.

D. Fasteners: Number 4 or larger oval head stainless steel screws or drive pins.

E. Text:
    1. Manufacturer’s name, equipment model number, equipment serial number, and identification tag number.
    2. Additional items indicated in the Technical Sections.

3. Indicate the following additional information as applicable:
    a. Maximum and normal rotating speed.
    b. Service class per applicable standards.
4. Include for pumps:
    a. Rated total dynamic head in feet of fluid.
    b. Rated flow in gallons per minute.
    c. Impeller, gear, screw, diaphragm, or piston size.
5. Include for motors:
    a. Drive speed.
    b. Motor horsepower with rated capacity.
6. Include for gear reduction units:
    a. AGMA class of service.
    b. Service factor.
    c. Input and output speeds.

2.15 PUMP SHAFT COUPLINGS

A. General:
1. Type and ratings: Non-lubricated designed for not less than 50,000 hours of operating life.
2. Sizes: Provide as recommended by manufacturer for specific application, considering horsepower, speed of rotation, balance, and type of service.
3. Suitable for an ambient temperature range between -40 degrees to +200 degrees Fahrenheit.

B. Close-couplings for electric-motor-driven equipment:
1. Manufacturers: One of the following or equal:
    a. Lovejoy.
    b. T.B. Woods.
2. Provide flexible couplings designed to accommodate angular misalignment, parallel misalignment, and end float.
3. Manufacture flexible component of coupling from synthetic rubber or urethane.
4. Provide service factor of 2.5 for electric motor drives and 3.5 for engine drives.
5. Do not allow metal-to-metal contact between driver and driven equipment.

C. Flexible couplings for direct connected electric-motor-driven equipment:
1. Manufacturers: One of the following or equal:
    a. Rexnord.
    b. T.B. Woods.
2. Provide flexible couplings designed to accommodate shock loading, vibration, and shaft misalignment or offset.
3. Provide flexible connecting element of rubber and reinforcement fibers.
4. Provide service factor of 2.0.
5. Connect stub shafts through collars or round flanges, firmly keyed to their shafts with neoprene cylinders held to individual flanges by through pins.

D. Spacer couplings:
1. Where cartridge-type mechanical seals or non-split seals are specified, provide a spacer-type coupling of sufficient length to remove the seal without disturbing the driver or driven equipment.

2.16 PUMP SEAL CHAMBER AND SEALS

A. Seal chamber (stuffing box):
   1. Large enough to retrofit with double mechanical seal.

B. Seal Types: Based on the following and as specified in the Technical Section:
   1. Type 1: Packing:
      a. Provide when specified in the Technical Section for wastewater, non-potable water, and sludge applications:
         1) Asbestos free.
         2) PTFE (Teflon™) free.
         3) Braided graphite.
         4) Manufacturers: One of the following or equal:
            a) Chesterton, 1400.
            b) John Crane.
      b. Provide when specified for drinking water service:
         1) Asbestos free.
         2) Material: Braided PTFE (Teflon™).
         3) Manufacturers: One of the following or equal:
            a) Chesterton, 1725.
            b) John Crane.
      c. Design:
         1) Packing gland to allow adjustment and repacking without dismantling pump except to open up stuffing box.
         2) Seal chamber (stuffing box) large enough to retrofit with double mechanical seal.
         3) Manufacturers: One of the following or equal:
            a) Chesterton, 1725.
            b) John Crane.
   2. Type 2: Mechanical seal, flushing, cartridge, single O-ring.
      a. Manufacturers: One of the following or equal:
         1) Chesterton, S10.
         2) John Crane, 5610 Series.
   3. Type 3: Mechanical seal, flushing, cartridge, double O-ring:
      a. Manufacturers: One of the following or equal:
         1) Chesterton, S20.
         2) John Crane, 5620 Series.
   4. Type 4: Mechanical seal, flushing, cartridge, double split-ring:
      a. Manufacturers: One of the following or equal:
         1) Chesterton, S20.
         2) John Crane, 5620 Series.
   5. Type 5: Mechanical seal, flushing, cartridge, single split-ring:
      a. Manufacturers: One of the following or equal:
         1) Chesterton, 442.
         2) John Crane, 5860.
   6. Type 6: Mechanical seal, flushless, cartridge, single split-ring:
      a. Manufacturers: One of the following or equal:
         1) Chesterton, 156.
         2) John Crane, 3740 Series.

C. Mechanical seals, Types 2 to 6:
    1. Balanced hydraulically.
    2. Spring:
        a. Stationary, out of pumping fluid.
        b. Material as specified in the Technical Section. Hastelloy C; Type Elgiloy or 17-7 PH stainless steel for split seals.
    3. O-ring: Viton™ 747.
    4. Gland: Type 316L stainless steel.
    5. Set screws: Type 316L stainless steel.
    6. Faces: Reaction bonded, silicon carbide/carbon.
    7. Minimum differential pressures in either direction: 300 pounds per square inch gauge.
        a. Manufacturers: One of the following or equal:
            1) Chesterton, 1400.
            2) John Crane, equivalent product.
    8. Drinking water service:
        a. Asbestos free.
        b. Material: Braided PTFE (Teflon™).
        c. Manufacturers: One of the following or equal:
            1) Chesterton, 1725.
            2) John Crane, equivalent product.

D. Flushing system:
    1. Provide flushing connections:
        a. 3/4-inch size.
        b. Provide API Standard 682 seal water plan arrangement as specified in the Technical Section:
            1) Plan 11 - Product stream seal water from discharge thru seal.
            2) Plan 13 - Product stream seal water thru seal to suction.
            3) Plan 23 - Closed loop seal water with cooler and pumping ring.
            4) Plan 32 - Production seal water discharged to product stream.
            5) Plan 54 - Production Seal Water Excluded from Product Stream.

2.17 SAFETY SIGNS

A. Material, sign size, and text: As specified in Section 10400 - Signage.

2.18 SHIPPING

A. Prior to shipment of equipment:
    1. Bearings (and similar items):
        a. Pack separately or provide other protection during transport.
        b. Greased and lubricated.
    2. Gear boxes:
        a. Oil filled or sprayed with rust preventive protective coating.
    3. Fasteners:
        a. Inspect for proper torques and tightness.

PART 3 EXECUTION

3.01 PRE-INSTALLATION

A. Field measurements:
   1. Prior to shop drawings preparation, take measurements and verify dimensions indicated on the Drawings.
   2. Ensure equipment and ancillary appurtenances fit within available space.

B. Sequencing and scheduling:
   1. Coordinate details of equipment with other related parts of the Work, including verification that structures, piping, wiring, and equipment components are compatible.
   2. Equipment anchoring: Obtain anchoring material and setting drawings from equipment manufacturers in adequate time for templates to be constructed and anchors to be cast-in-place.

3.02 LUBRICATION LINES AND FITTINGS

A. Support and protect lines from source to point of use.

B. Fittings:
   1. Bring fittings to outside of equipment in manner such that they are readily accessible from outside without necessity of removing covers, plates, housings, or guards.
   2. Mount fittings together wherever possible using factory-mounted multiple fitting assemblies securely mounted, parallel with equipment lines, and protected from damage.
   3. Fittings for underwater bearings: Bring fittings above water surface and mount on edge of structure above.

3.03 ALIGNMENT OF DRIVERS AND EQUIPMENT

A. Where drive motors or other drivers are connected to driven equipment by flexible coupling, disconnect coupling halves and align driver and equipment after driven equipment has been leveled on its foundation.

B. Comply with procedures of appropriate HI, AGMA Standards, alignment tolerances of equipment manufacturers and the following requirements to bring components into angular and parallel alignment:
   1. Maximum total coupling offset (not the per-plane offset): Not to exceed 0.5 mils per inch of coupling length for spacer couplings based on coupling length (not dial separation).
   2. Utilize jacking screws, wedges, or shims as recommended by the equipment manufacturer and as specified in the equipment sections.

C. Use reverse-indicator arrangement dial-type or laser-type alignment indicators: Mount indicators on the driver/coupling flange and equipment/coupling flange. Alignment instrumentation accuracy shall be sufficient to read angular and radial misalignment at 10 percent or less of the manufacturer's recommended acceptable misalignment.

D. Alignment and calculations shall include measurement and allowance for thermal growth, spacer coupling length, indicator separation, and axial spacing tolerances of the coupling.

E. When alignment satisfies most stringent tolerance of system components, grout between base and foundation.
   1. Allow minimum 48 hours for grout to harden.
   2. After grout hardens, remove jacking screws, tighten anchor bolts and other connections, and recheck alignment.
   3. Correct alignment as required.

3.04 EQUIPMENT SUPPORT AND ANCHORING TO STRUCTURES

A. Anchor equipment to structures as indicated on the Drawings and as specified.

B. Obtain final anchor bolt layouts for equipment prior to:
   1. Detailing reinforcement for equipment pads.
   2. Preparation of shop drawings for metal structures supporting equipment.

C. Anchor bolt templates:
   1. Provide templates as specified in the Technical Sections.
   2. Use final anchor bolt layout to construct templates for setting anchor bolts.
   3. Make templates:
      a. Rigid, and non-deformable during use.
      b. With longitudinal axes of anchors parallel.
      c. With longitudinal axes of anchors perpendicular to surface supporting the equipment.
   4. Templates may be reused for multiple locations of the same equipment only if:
      a. Templates are in "like-new" condition prior to each reuse.
      b. The anchor layout has not been deformed or damaged by previous installation, removal, or handling of templates.
   5. Sequence:
      a. Set and support templates prior construction of structures surrounding anchors.
      b. Position anchors in templates to provide designated embedment in supporting structure, with required projection for installation of grout, base plates, and hardware for tightening.
      c. Construct concrete or masonry around anchors using methods that preserve required anchor positions and alignment, and clearances to edges of supports or structures.

D. Anchor adjustment sleeves:
   1. Use of adjustment sleeves around anchors:
      a. Is at the option of the Contractor.
      b. Does not relieve Contractor of obligation to construct and use templates for setting of anchors.
      c. May required increased anchor embedment length to develop the strength of the anchor in the embedded length below the adjustment sleeve.
   2. Submittal requirements for anchor adjustment sleeves:
      a. Provide within sufficient time for Engineer approval and not less than 10 working days before setting those items.

b. Proposed locations of sleeves.
c. Details and dimensions of sleeves.
d. Sleeve materials of construction, and coatings.
e. Information on sleeve filler material and means of filler removal.
f. Type, details, and dimensions of anchor bolts or anchor rods to be used with sleeves.
g. Calculations showing development of anchor load capacity below the bottom of the sleeve.
h. Plan for removal of sleeve fillers, if any.
i. Plan for placement and consolidation of flowable grout inside sleeves and to a level equal to top of concrete slab or equipment pad surrounding the sleeve.

3.05 GROUTING UNDER EQUIPMENT BASES, BASE PLATES, SOLE PLATES, AND SKIDS

A. General:
1. Comply with equipment manufacturer's installation instructions including:
a. Tolerances for level.
b. Tolerances for vertical and horizontal alignment.
c. Requirements or recommendations for grouting spaces and grout installation.
d. Recommendations for tightening of equipment anchors after grout has cured.
2. Install equipment over grout as indicated on the Drawings or specified only after:
a. Equipment is leveled and in proper alignment.
b. Piping connections are complete and in alignment with no strain transmitted to equipment.
3. Install flowable grout, as specified in Section 03600 - Grouting, placed with forms and head boxes.
a. Use flowable, non-shrink grout.
b. Use flowable, non-shrink epoxy grout, only where indicated on the Drawings, where specified in Technical Sections, or when approved in advance by the Engineer.
c. Grouting with dry-pack materials is not permitted.

B. Prepare equipment bases, base plates, soleplates, and skids for grouting:
1. Concrete equipment bases:
a. Roughen surface in accordance with ICRI, Guideline No. 310.2R, Surface Preparation Profiles CSP-3 and CSP-4.
b. Clean roughened concrete surfaces:
2. Base plates, soleplates, and skids:
a. Clean surfaces in accordance with SSPC-SP-1-Solvent Cleaning, to remove dirt, dust, oil, grease, paint, and other material.

C. Level equipment for grouting:
1. Use removable jack screws, or removable steel wedges and shims to support and level equipment bases, base plates, sole plates, and skids.
a. Do not use leveling nuts placed on equipment anchors to support or level equipment bases, base plates, sole plates, and skids.

2. Removable jack screws:
    a. Provide number, size, and locations of jack screws required to support and level equipment in accordance with manufacturer's recommendations.
    b. Drill and tap equipment base plates, sole plates, and skids for jack screws.
    c. Support jack screws on circular steel plates that have been epoxy bonded to the equipment foundation.
        1) Provide plates fabricated from Type 316 stainless steel where edges of support plates will have grout side cover of 3 inches or less in the finished work.
    d. Make provision for removal of jack screws after grouting:
        1) Prevent grout from bonding to jack screws by wrapping jack screw threads that will be in contact with grout with multiple layers of tape or other material acceptable to Engineer.
    e. Place and cure grout.
    f. After grout is placed and cured:
        1) Remove jack screws and material used to prevent grout from bonding to jack screws.
        2) Provide jack screws to Owner for future use.
        3) Fill jack screw holes with grout.
        4) Cure grout as specified.
3. Removable steel wedges and shims:
    a. Use for equipment bases, base plates, sole plates, and skids where it is not practical to use jack screws.
    b. Provide number, size, and locations of wedges and shims required to support and level equipment in accordance with manufacturer's recommendations.
    c. Make provision for removal of wedges and shims after grouting:
        1) Prevent grout from bonding to wedges and shims by wrapping wedges and shims that contact grout with multiple layers of tape or other material acceptable to Engineer.
        2) Locate and orient wedges and shims to allow for removal after grouting, and to facilitate placement of grout in the remaining voids.
    d. Place and cure grout.
    e. After grout is placed and cured:
        1) Remove wedges and shims, and material used to prevent grout from bonding to them.
        2) Fill jack screw holes with grout.
        3) Cure grout as specified.

D. Construct grout forms:
1. Provide forms:
    a. Rigid with adequate strength to withstand placement of grout.
    b. With surfaces that will produce a smooth, uniform finish for grout edges exposed in the finished work.
    c. That allow grout to flow horizontally beyond the perimeter of the equipment base plate a distance not less than the thickness of the grout, and not less than 1 inch.

2. Install forms:
    a. Seal form cracks and joints with elastomeric sealant to make form watertight.
    b. Line form surfaces in contact with grout with polyethylene film, or coat with 2 coats of heavy-duty paste wax.
3. Construct grout "head box" over entire length of one side of form.
    a. Make head box height sufficient to force grout to flow under full dimensions of equipment base and to the surrounding form faces.

E. Pre-grouting procedures:
1. Concrete surfaces receiving flowable, non-shrink grout:
    a. Saturate concrete surface in contact with grout and concrete surfaces extending not less than least 6 inches beyond limits of grout with clean water for a minimum of 24 hours prior to grouting.
    b. Just prior to grout placement, remove standing water using clean rags or oil-free compressed air. Provide "saturated surface dry" (SSD) concrete for grout placement.
2. Concrete surfaces receiving flowable, non-shrink epoxy grout:
    a. Do not saturate concrete prior to grout placement.

F. Grout placement and curing:
1. Place and cure grout as specified in Section 03600 - Grouting, and in this Section.
2. Grouting:
    a. Keep level of grout in head box above bottom of equipment bases, base plates, sole plates, and skids always to drive flow under base.
    b. Maintain continuous grout flow from head box to opposite sides of forms without trapping air or forming voids.
    c. Vibrate, rod, or chain grout to facilitate grout flow, to consolidate grout, and to remove entrapped air.
3. After grout sets, remove forms and trim grout edges at 45-degree angle from bottom edge of equipment bases, base plates, sole plates, and skids.
4. Cure grout as specified in Section 03600 - Grouting.

G. After grout is cured:
1. Remove jack screws or wedges and shims, and material used to prevent grout from bonding to leveling devices.
2. Fill pockets from removed leveling devices with grout.
3. Cure filled voids as specified in Section 03600 - Grouting.
4. Tighten equipment anchors in accordance with equipment manufacturer requirements.

3.06 FIELD FINISHES

A. When touchup or repair is required, apply primer and coating systems as recommended by the equipment manufacturer.

END OF SECTION

SECTION 15052

COMMON WORK RESULTS FOR GENERAL PIPING

PART 1 GENERAL

1.01 SUMMARY

A. Section includes: Basic materials and methods for metallic and plastic piping systems.

1.03 DEFINITIONS

A. Buried pipes: Pipes that are buried in the soil with or without a concrete pipe encasement.

B. Exposed pipe: Pipes that are located above ground, or located inside a structure, supported by a structure, or cast into a concrete structure.

C. Underground pipes: Buried pipes - see A. above.

D. Underwater pipes: Pipes below the top of walls in basins or tanks containing water.

E. Wet wall: A wall with water on at least 1 side.

F. Pipes adjacent to a wet wall: Pipe centerline within 10 inches of the wet wall.

PART 2 PRODUCTS

2.01 GENERAL

A. Materials as specified in Section 01600 - Product Requirements including special requirements for materials in contact with drinking water.

2.02 LINK TYPE SEALS

A. Characteristics:
   1. Modular mechanical type, consisting of interlocking neoprene or synthetic rubber links shaped to continuously fill the annular space between the pipe and wall opening.
   2. Links to form a continuous rubber belt around the pipe.
   3. Provide a nylon polymer pressure plate with Type 316 stainless steel hardware. Isolate pressure plate from contact with wall sleeve.
   4. Hardware to be Type 316 stainless steel.
      a. Provide anti-galling lubricant for threads.

B. One of the following or equal:
   1. Link-Seal.
   2. Pipe Linx.

2.03 FLANGE BOLTS AND NUTS

A. General:
   1. Washer:
      a. Provide a washer for each nut.
      b. Washer shall be of the same material as the nut.

2. Nuts: Heavy hex-head.
3. Cut and finish flange bolts to project:
    a. Face of the bolt shall exceed face of nut by 1/8 inch minimum.
    b. A maximum of 1/4 inch beyond outside face of nut after assembly.
4. Tap holes for cap screws or stud bolts when used.
5. Lubricant for stainless steel bolts and nuts:
    a. Chloride-free.
    b. Manufacturers: One of the following or equal:
        1) Huskey FG-1800 Anti-Seize.
        2) Weicon Anti-Seize High-Tech.

B. Ductile iron pipe:
1. On exposed pipes with pressures equal to or less than 150 pounds per square inch gauge (psig):
    a. Bolts: In accordance with ASTM A307, Grade B.
    b. Nuts: In accordance with ASTM A563, Grade A.
    c. Bolts and Nuts: Hot-dip galvanized in accordance with ASTM F2329.
2. On exposed pipes with pressures greater than 150 psig:
    a. Bolts: In accordance with ASTM A193, Grade B7.
    b. Nuts: In accordance with ASTM A194, Grade 2H.
    c. Bolts and nuts: Hot-dip galvanized in accordance with ASTM F2329.
3. On underwater pipes and pipes adjacent to wet walls:
    a. Bolts: In accordance with ASTM A193, Grade B8M.
    b. Nuts: In accordance with ASTM A194, Grade 8M.

C. Plastic pipe:
1. On exposed pipes:
    a. Bolts: In accordance with ASTM A307, Grade B.
    b. Nuts: In accordance with ASTM A563, Grade A.
    c. Bolts and Nuts: Hot-dip galvanized in accordance with ASTM F2329.
2. On underwater pipes and pipes adjacent to wet walls:
    a. Bolts: In accordance with ASTM A193, Grade B8M.
    b. Nuts: In accordance with ASTM A194, Grade 8M.

D. Steel pipe:
1. On exposed pipes:
    a. For ASME B16.5 Class 150 flanges and AWWA C207 Class D flanges:
        1) Bolts: In accordance with ASTM A307, Grade B.
        2) Nuts: In accordance with ASTM A563, Grade A.
        3) Bolts and Nuts: Hot-dip galvanized in accordance with ASTM F2329.
    b. For ASME B16.5 and B16.47 Class 300 flanges and AWWA C207 Class E and F flanges:
        1) Bolts: In accordance with ASTM A193, Grade B7.
        2) Nuts: In accordance with ASTM A194, Grade 2H.
2. On underwater pipes and pipes adjacent to wet walls:
    a. Bolts: In accordance with ASTM A193, Grade B8M.
    b. Nuts: In accordance with ASTM A194, Grade 8M.
3. Low-temperature service: Stainless steel, Type 316:
    a. Bolts: In accordance with ASTM A320, Grade B8M, Class 1, heavy hex.
    b. Nuts: In accordance with ASTM A194, Grade B8M, heavy hex.
    c. Washers: Alloy group matching bolts and nuts.

4. High-temperature service or high-pressure service: Stainless steel, Type 316:
    a. Bolts: In accordance with ASTM A193, Grade B8M, Class 1, heavy hex.
    b. Nuts: In accordance with ASTM A194, Grade 8, heavy hex.
    c. Washers: Alloy group matching bolts and nuts.

2.04 MECHANICAL JOINTS BOLTS AND NUTS

A. Bolts including T-Bolts:
    1. High strength low alloy steel in accordance with AWWA C111.

B. Heavy Hex Nuts:
    1. High strength low alloy steel in accordance with AWWA C111.

2.05 GASKETS

A. General.
    1. Gaskets shall be suitable for the specific fluids, pressure, and temperature conditions.
    2. Capable of being applied on surface of piping with cavities to provide for an improved seal with the internal piping pressure.

B. Gaskets for flanged joints in ductile iron and steel piping for sewage service:
    1. Suitable for pressures equal and less than 150 pounds per square inch gauge, temperatures equal and less than 250 degrees Fahrenheit, and raw sewage service.
    2. Gasket material:
        a. SBR or neoprene elastomer with minimum Shore A hardness value of 70.
        b. Reinforcement: Cloth or synthetic fiber.
        c. Thickness: Minimum 3/32-inch thick for less than 10-inch pipe; minimum 1/8 inch thick for 10-inch and larger pipe.
    3. Manufacturers: One of the following or equal:
        a. Pipe less than 48 inches in diameter:
            1) Garlock, Style 7797.
            2) John Crane, similar product.
        b. Pipe 48 inches in diameter and larger:
            1) Garlock, Style 3760.
            2) John Crane, similar product.

C. Gaskets for flanged joints in polyvinyl chloride and polyethylene piping:
    1. Suitable for pressures equal to and less than 150 pounds per square inch gauge, with low flange bolt loadings, temperatures equal to and less than 120 degrees Fahrenheit, and polymer, chlorine, caustic solutions, and other chemicals, except chemicals which liberate free fluorine including fluorochemicals and gaseous fluorine.
    2. Material:
        a. Chemical systems: 0.125-inch thick Viton™ rubber.
        b. Sewer and water: 0.125-inch thick SBR.
    3. Manufacturers: One of the following or equal:
        a. Garlock.
        b. John Crane, similar product.

D. Gaskets for flanged joints in low pressure air piping:
   1. Suitable for pressures equal to and less than 150 pounds per square inch gauge, temperatures equal to and less than 300 degrees Fahrenheit, and compressed air service.
   2. Material: EPDM elastomer, 1/8-inch thick, 60 Shore hardness, smooth surface.
   3. Manufacturers: One of the following or equal:
      a. Garlock, Style 8314.
      b. John Crane, similar product.

E. Gaskets for flanged joints in ductile iron or steel water piping:
   1. Suitable for hot or cold water, pressures equal to and less than 150 pounds per square inch gauge, and temperatures equal to and less than 160 degrees Fahrenheit.
   2. Material:
      a. SBR or neoprene elastomer, compressed, with non-asbestos fiber reinforcement.
   3. Manufacturers: One of the following or equal:
      a. Garlock, Bluegard 3300.
      b. John Crane, similar product.

F. Gaskets for flanged joints in ductile iron or steel drinking water piping meeting NSF 61 requirements:
   1. Suitable for hot or cold water, pressures equal to or less than 150 pounds per square inch gauge, and temperatures equal to or less than 160 degrees Fahrenheit.
   2. Material:
      a. EPDM material with 80 Shore A durometer rating.
   3. Manufacturers: One of the following or equal:
      a. Garlock, 98206.
      b. John Crane, similar product.

PART 3 EXECUTION

3.01 INSTALLATION

A. General:
   1. Piping drawings:
      a. Except in details, piping is indicated diagrammatically. Not every offset and fitting, or structural difficulty that may be encountered has been indicated on the Drawings. Sizes and locations are indicated on the Drawings.
      b. Perform minor modifications to piping alignment where necessary to avoid structural, mechanical, or other type of obstructions that cannot be removed or changed.
         1) Modifications are intended to be of minor scope, not involving a change to the design concept or a change to the Contract Price or Contract Times.
   2. Piping alternatives:
      a. Provide piping as specified in this Section, unless indicated on the Drawings or specified otherwise.

b. Alternative pipe ratings:
    1) Piping with greater pressure rating than specified may be substituted in lieu of specified piping without changes to the Contract Price.
    2) Piping of different material may not be substituted in lieu of specified piping.
c. Valves in piping sections: Capable of withstanding specified test pressures for piping sections and fabricated with ends to fit piping.
d. Grooved joints: Use couplings, flange adapters, and fittings of the same manufacturer.
    1) Manufacturer's factory trained representative:
        a) Provide on-site training for Contractor's field personnel.
        b) Periodically visit the jobsite to verify Contractor is following best recommended practices.
    2) Distributor's representative is not considered qualified to conduct the training or jobsite visits.
e. Flanged joints: where 1 of the joining flanges is raised face type, provide a matching raised face type flange for the other joining flange.

3. Unless otherwise indicated on the Drawings, piping at pipe joints, fittings, couplings, and equipment shall be installed without rotation, angular deflection, vertical offset, or horizontal offset.

B. Wall and slab penetrations:
1. Provide sleeves for piping penetrations through aboveground masonry and concrete walls, floors, ceilings, roofs, unless specified or otherwise indicated on the Drawings.
2. For piping 1 inch in nominal diameter and larger, provide sleeves with minimum inside diameters of 1 inch plus outside diameter of piping. For piping smaller than 1 inch in nominal diameter, provide sleeve of minimum twice the outside diameter of piping.
    a. Arrange sleeves and adjacent joints so piping can be pulled out of sleeves and replaced without disturbing the structure.
    b. Cut ends of sleeves flush with surfaces of concrete, masonry, or plaster.
    c. Conceal ends of sleeves with escutcheons where piping runs through floors, walls, or ceilings of finished spaces within buildings.
    d. Seal spaces between pipes and sleeves with link-type seals when not otherwise specified or indicated on the Drawings.
3. Provide flexibility in piping connecting to structures to accommodate movement due to soil settlement and earthquakes. Provide flexibility using details indicated on the Drawings.
4. Core drilled openings:
    a. Do not damage or cut existing reinforcing bars, electrical conduits, or other items embedded in the existing concrete without acceptance by Engineer.
    b. Determine location of reinforcing bars or other obstructions with a non-destructive indicator device.
    c. Remove dust and debris from hole using compressed air.

C. Exposed piping:
    1. Install exposed piping in straight runs parallel to the axes of structures, unless otherwise indicated on the Drawings:
        a. Install piping runs plumb and level, unless otherwise indicated on the Drawings.
            1) Slope plumbing drain piping with a minimum of 1/4-inch per foot downward in the direction of flow.
    2. Install exposed piping after installing equipment and after piping and fitting locations have been determined.
    3. Support piping: As specified in Sections 15061 - Pipe Supports, 15062 - Preformed Channel Pipe Support System, and 15063 - Non-Metallic Pipe Support System:
        a. Do not transfer pipe loads and strain to equipment.
    4. In addition to the joints indicated on the Drawings, provide unions, flexible couplings, flanged joints, flanged coupling adapters, and other types of joints or means which are compatible with and suitable for the piping system, and necessary to allow ready assembly and disassembly of the piping.
    5. Assemble piping without distortion or stresses caused by misalignment:
        a. Match and properly orient flanges, unions, flexible couplings, and other connections.
        b. Do not subject piping to bending or other undue stresses when fitting piping.
        c. Do not correct defective orientation or alignment by distorting flanged joints or subjecting flange bolts to bending or other undue stresses.
        d. Flange bolts, union halves, flexible connectors, and other connection elements shall slip freely into place.
        e. Alter piping assembly to fit when proper fit is not obtained.
        f. Install eccentric reducers or increasers with the top horizontal for pump suction piping.

D. Buried piping:
    1. Bury piping with minimum 4-foot cover without air traps, unless otherwise indicated on the Drawings.
    2. Where 2 similar services run parallel to each other, piping for such services may be laid in the same trench.
        a. Lay piping with sufficient room for assembly and disassembly of joints, for thrust blocks, for other structures, and to meet separation requirements of public health authorities having jurisdiction.
    3. Laying piping:
        a. Lay piping in finished trenches free from water or debris. Begin at the lowest point with bell ends up slope.
        b. Place piping with top or bottom markings with markings in proper position.
        c. Lay piping on an unyielding foundation with uniform bearing under the full length of barrels.
        d. Where joints require external grouting, banding, or pointing, provide space under and immediately in front of the bell end of each section laid with sufficient shape and size for grouting, banding, or pointing of joints.
        e. At the end of each day's construction, plug open ends of piping temporarily to prevent entrance of debris or animals.

E. Venting piping under pressure:
   1. Lay piping under pressure flat or at a continuous slope without air traps, unless otherwise indicated on the Drawings.
   2. Install plug valves as air bleeder cocks at high points in piping.
      a. Provide 1-inch plug valves for water lines, and 2-inch plug valves for sewage and sludge lines, unless otherwise indicated on the Drawings.
   3. Provide additional pipe taps with plug cocks and riser pipes along piping as required for venting during initial filling, disinfecting, and sampling.
   4. Before piping is placed into service, close plug valves and install plugs. Protect plugs and plug valves from corrosion in as specified in Section 09960 - High-Performance Coatings.

F. Restraining buried piping:
   1. Restrain piping at valves and at fittings where piping changes direction, changes sizes, and at ends:
      a. When piping is underground, use concrete thrust blocks, mechanical restraints, or push-on restraints.
      b. Determine thrust forces by multiplying the nominal cross-sectional area of the piping by design test pressure of the piping.
   2. Provide restraints with ample size to withstand thrust forces resulting from test pressures:
      a. During testing, provide suitable temporary restraints where piping does not require permanent restraints.
   3. Place concrete thrust blocks against undisturbed soil.
   4. Place concrete so piping joints, fittings, and other appurtenances are accessible for assembly and disassembly.
   5. Provide underground mechanical restraints where specified in Attachment A - Piping Schedule.

G. Restraining above ground piping:
   1. Restrain piping at valves and at fittings where piping changes direction, changes sizes, and at ends:
      a. When piping is aboveground or underwater, use mechanical or structural restraints.
      b. Determine thrust forces by multiplying the nominal cross-sectional area of the piping by design test pressure of the piping.
   2. Provide restraints with ample size to withstand thrust forces resulting from test pressures:
      a. During testing, provide suitable temporary restraints where piping does not require permanent restraints.

H. Connections to existing piping:
   1. Expose existing piping to which connections are to be made with sufficient time to permit, where necessary, field adjustments in line, grade, or fittings:
      a. Protect domestic water/potable water supplies from contamination:
         1) Make connections between domestic water supply and other water systems in accordance with requirements of public health authorities.
         2) Provide devices approved by Owner of domestic water supply system to prevent flow from other sources into the domestic supply system.

2. Make connections to existing piping and valves after sections of new piping to be connected have been tested and found satisfactory.
3. Provide sleeves, flanges, nipples, couplings, adapters, and other fittings needed to install or attach new fittings to existing piping and to make connections to existing piping.
4. For flanged connections, provide stainless steel bolts with isolation bushings and washers, and full-face flange gaskets.

I. Connections between ferrous and nonferrous metals:
1. Connect ferrous and nonferrous metal piping, tubing, and fittings with dielectric couplings especially designed for the prevention of chemical reactions between dissimilar metals.
2. Nonferrous metals include aluminum, copper, and copper alloys.

J. Flanged connections between dissimilar metals such as ductile iron pipe and steel pipe:
1. Provide stainless steel bolts with isolation bushings and washers, and full-face flange gaskets.

3.02 CLEANING

A. Piping cleaning:
1. Upon completion of installation, clean piping interior of foreign matter and debris.
2. Perform special cleaning when required by the Contract Documents.

B. Conduct pressure and leak test, as specified.

3.03 PIPING SCHEDULE

A. As specified in Attachment A - Piping Schedule.

END OF SECTION

ATTACHMENT A - PIPING SCHEDULE

PIPING SCHEDULE											
Process Abbrev.	**Service**	**Nominal Diameter (inches)**	**Material**	**Pressure Class Special Thickness Class Schedule Wall Thickness**	**Pipe Spec. Section**	**Joints/ Fittings**	**Test Pressure/ Method**	**Lining**	**Coating**	**Service Conditions**	**Comments**

Abbreviations:

1. The following abbreviations used in the column of test method refer to the respective methods as specified in Section 15956 - Piping Systems Testing.
   - AM Air method
   - GR Gravity method
   - HH High head method
   - LH Low head method
   - SC Special case
2. Abbreviations to designate piping include the following:
   - B&SP Bell and spigot
   - BSP Black Steel Pipe
   - CE Ceramic epoxy lining
   - CI Cast iron
   - CISP Cast iron soil pipe
   - CL Class, followed by the designation
   - CM Cement mortar
   - CTP Coal tar pitch
   - DIP Ductile iron piping
   - EPP Epoxy polyurethane coating
   - FL Flange
   - GA Gauge, preceded by the designation GEGrooved end joint
   - GL Glass lined
   - GSP Galvanized steel pipe
   - MJ Mechanical joint
   - MWA Mechanical wedge action
   - NPS Nominal pipe size, followed by the number in inches
   - psi pounds per square inch
   - psig pounds per square inch gauge
   - PE Polyethylene
   - PEE Polyethylene encasement
   - PTW Polyethylene tape wrap
   - PVC Polyvinyl Chloride
   - RPO Restrained push-on
   - SCH Schedule, followed by the designation
   - SCRD Screwed-On
   - SST Stainless steel
   - STP Steel pipe
   - SW Solvent welded
   - VCP Vitrified clay piping
   - WLD Weld

SECTION 15061

PIPE SUPPORTS

PART 1 GENERAL

1.01 SUMMARY

A. Section includes: Supports for pipe, fittings, valves, and appurtenances.

1.02 REFERENCES

A. ASTM International (ASTM):
   1. A123 - Standard Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products.
   2. A380 - Standard Practice for Cleaning, Descaling, and Passivation of Stainless Steel Parts, Equipment, and Systems.
   3. A967 - Standard Specification for Chemical Passivation Treatments for Stainless Steel Parts.

B. Manufacturer's Standardization Society (MSS):
   1. SP-58 - Pipe Hangers and Supports - Materials, Design, and Manufacture.

1.03 SUBMITTALS

A. Submit as specified in Section 01330 - Submittal Procedures

B. Product data:
   1. Design features.
   2. Load capacities.
   3. Material designations by UNS alloy number or ASTM Specification and Grade.
   4. Data needed to verify compliance with the Specifications.
   5. Catalog data.
   6. Clearly mark submittal information to show specific items, materials, and accessories or options being furnished.

1.04 WARRANTY

A. Provide warranty as specified in Section 01783 - Warranties and Bonds.

PART 2 PRODUCTS

2.01 GENERAL

A. As specified in Section 01600 - Product Requirements.

2.02 MATERIALS

A. General:
   1. Hot dip galvanized:
      a. Fabricate as specified in Section 05120 - Structural Steel Framing.
      b. Hot dip after fabrication of support in accordance with ASTM A123.
      c. Repair galvanized surface as specified in Section 05120 - Structural Steel Framing.
   2. Stainless steel:
      a. Fabricate as specified in Section 05120 - Structural Steel Framing.
      b. Finish requirements: Remove free iron, heat tint oxides, weld scale, and other impurities, and obtain a passive finished surface.
      c. At the shop, perform pickling and passivation on all surfaces inside and out in accordance with ASTM A380 or A967.
         1) Passivation treatments using citric acid are not allowed.
      d. Field welding is prohibited unless specifically allowed by the Owner. All field welds shall be passivated.

B. Outdoor areas: Areas exposed to the natural outdoor environment:
   1. Hot Dip Galvanized.

C. Indoor areas: Areas exposed to an indoor environment including galleries and tunnels:
   1. Hot Dip Galvanized.

D. Submerged, 3 feet or less above water level in a structure, or inside a water bearing structure:
   1. Type 316 Stainless Steel.

E. Stainless steel piping system:
   1. Type 316 Stainless Steel or Type 316L Stainless Steel.

F. Chemical containment areas and chemical piping:
   1. Type 316 Stainless Steel.

G. Fasteners:
   1. As specified in Section 05120 - Structural Steel Framing.

2.03 PIPE SUPPORTS

A. Hanger rods: Sized to match suspended pipe hanger, or as indicated on the Drawings:
   1. Manufacturers: One of following or equal:
      a. For stainless steel piping:
         1) Bergen-Power, Figure 133.
         2) Nibco-Tolco, Figure 103.

b. For all other piping, unless indicated on the Drawings:
1) Anvil International, Figure 140.
2) Bergen-Power, Figure 133.
3) Cooper B-Line Systems, Inc., Figure B3205.

B. Hanger rods, continuously threaded: Sized to match suspended pipe hanger, or as indicated on the Drawings:
1. Manufacturers: One of the following or equal:
a. For stainless steel piping:
1) Bergen-Power, Figure 94.
2) FM Stainless Fasteners.
b. For steel and ductile iron piping:
1) Anvil International, Figure 146.
2) Bergen-Power, Figure 94.

C. Eye bolts:
1. For stainless steel piping:
a. Type 316 stainless steel, welded and rated equal to full load capacity of rod.
2. For all other piping, unless indicated on the Drawings:
a. Welded and rated equal to full load capacity of rod.

D. Welded eyebolt rod:
1. Manufacturers: One of the following or equal:
a. For stainless steel piping:
1) Nibco-Tolco, Figure 101.
2) FM Stainless Fasteners.
b. For all other piping, unless indicated on the Drawings:
1) Anvil International, Figure 278.
2) Bergen-Power, Figure 93.
3) Cooper B-Line Systems, Inc., Figure B3210.

E. Adjustable ring hangers: MSS SP-58, Type 7 or Type 9 (system dependent):
1. Manufacturers: One of the following or equal:
a. For stainless steel piping:
1) Nibco-Tolco, Figure 1C.I.
2) Bergen-Power, Figure 100SS.
b. For all other piping, unless indicated on the Drawings:
1) Anvil International, Figure 69.
2) Cooper B-Line Systems, Inc., Figure B3172.

F. Adjustable clevis hangers: MSS SP-58, Type 1:
1. Manufacturers: One of the following or equal:
a. For stainless steel piping:
1) Cooper B-Line Systems, Inc., Figure B3100 or B3102.
2) FM Stainless Fasteners, Figure 60.
b. For all other piping, unless indicated on the Drawings:
1) Anvil International, Figure 260 or Figure 590.
2) Bergen-Power, Figure 100.
3) Cooper B-Line Systems, Inc., Figure B3100 or B3102.

G. Adjustable clevis hangers for insulated pipe: Oversize:
    1. Manufacturers: One of the following or equal:
        a. For stainless steel piping:
            1) Nibco-Tolco, Figure 1A.
        b. For all other piping, unless indicated on the Drawings:
            1) Anvil International, Figure 300.
            2) Bergen-Power, Figure 100EL.
            3) Cooper B-Line Systems, Inc. Figure B3108.

H. Single rod hangers for steam pipe: MSS SP-58, Type 43; malleable iron or steel yoke and roller hangers; swivel to allow rotation of yoke on rod:
    1. Manufacturers: One of the following or equal:
        a. For stainless steel piping:
            1) Nibco-Tolco, Figure 324.
            2) Cooper B-Line Systems, Inc., Figure B3110.
            3) FM Fasteners, Figure 81.
        b. For all other piping, unless indicated on the Drawings:
            1) Anvil International, Figure 181.
            2) Cooper B-Line Systems, Inc., Figure B3110.

I. Double rod hangers for steam pipe: MSS SP-58, Type 41:
    1. Manufacturers: One of the following or equal:
        a. For stainless steel piping:
            1) FM Stainless Fasteners, Figure 71.
        b. For all other piping, unless indicated on the Drawings:
            1) Anvil International, Figure 171.
            2) Cooper B-Line Systems, Inc., Figure B3114.

J. Brackets: MSS SP-58, Type 32 with back plate; rated for 1,500 pounds:
    1. Manufacturers: One of the following or equal:
        a. For stainless steel piping:
            1) Nibco-Tolco, Figure 30M.
            2) Cooper B-Line Systems, Inc., Figure B3066.
            3) FM Stainless Fasteners, Figure 98.
        b. For all other piping, unless indicated on the Drawings:
            1) Anvil International, Figure 195.
            2) Cooper B-Line Systems, Inc., Figure B3066.

K. Brackets, heavy duty: MSS SP-58, Type 33 with back plate; rated for 3,000 pounds:
    1. Manufacturers: One of following or equal:
        a. Anvil International, Figure 199.
        b. Cooper B-Line Systems, Inc., Figure B3067.

L. Standard U-bolt: MSS SP-58, Type 24:
    1. Manufacturers: One of the following or equal:
        a. For stainless steel piping:
            1) Nibco-Tolco, Figure 110.
            2) Cooper B-Line Systems, Inc., Figure B3188.
            3) FM Stainless Fasteners, Figure 37.

b. For all other piping, unless indicated on the Drawings:
1) Anvil International, Figure 137.
2) Bergen-Power, Figure 283.
3) Cooper B-Line Systems, Inc., Figure B3188.

M. Riser clamps: MSS SP-58, Type 8:
1. Manufacturers: One of the following or equal:
a. For stainless steel piping:
1) Cooper B-Line Systems, Inc., Figure B3373.
2) FM Stainless Fasteners, Figure 61.
b. For all other piping, unless indicated on the Drawings:
1) Anvil International, Figure 261.
2) Bergen-Power, Figure 126.
3) Cooper B-Line Systems, Inc., Figure B3373.

N. Pipe clamps: MSS SP-58, Type 4:
1. Manufacturers: One of the following or equal:
a. For stainless steel piping:
1) Nibco-Tolco, Figure 4.
2) Cooper B-Line Systems, Inc., Figure 3140.
b. For all other piping, unless indicated on the Drawings:
1) Anvil International, Figure 212.
2) Bergen-Power, Figure 175.
3) Cooper B-Line Systems, Inc., Figure B3140.

O. Adjustable offset pipe clamp:
1. Manufacturers: One of the following or equal:
a. For stainless steel piping:
1) Nibco-Tolco, Figure 4.
2) Cooper B-Line Systems, Inc., Figure B3149.
3) FM Stainless Fasteners, Figure 63.
b. For all other piping, unless indicated on the Drawings:
1) Anvil International, Figure 100.
2) Cooper B-Line Systems, Inc., Figure B3149.

P. Offset pipe clamp:
1. Manufacturers: One of the following or equal:
a. For stainless steel piping:
1) Nibco-Tolco, Figure 8.
2) Cooper B-Line Systems, Inc., Figure 3148.
b. For all other piping, unless indicated on the Drawings:
1) Anvil International, Figure 103.
2) Cooper B-Line Systems, Inc., Figure B3148.

Q. Floor stand or stanchion saddles: MSS SP-58, Type 37. Provided with U-bolt hold down yokes:
1. Manufacturers: One of the following or equal:
a. For stainless steel piping:
1) Nibco-Tolco, Figure 318.
2) FM Stainless Fasteners, Figure 59.

b. For all other piping, unless indicated on the Drawings:
1) Anvil International, Figure 259.
2) Bergen-Power, Figure 125.
3) Cooper B-Line Systems, Inc., Figure B3090.
c. Threaded pipe stand support stanchion. Match pipe support material:
1) Anvil International, Figure 63T.
2) Bergen-Power, Figure 138.
3) Cooper B-Line Systems Inc., Figure B3088ST.

R. Spring hangers:
1. Manufacturers: One of the following or equal:
a. For stainless steel piping:
1) Bergen-Power, Figure 920.
b. For all other piping, unless indicated on the Drawings:
1) Anvil International, Figure B-268, Type G.
2) Bergen-Power, Figure 920.

S. One hole pipe clamps:
1. Manufacturers: One of the following or equal:
a. For stainless steel piping: Engineer knows of no product.
b. For all other piping:
1) Anvil International, Figure 126.
2) Carpenter & Paterson, Figure 237S.

T. Welded beam attachment: MSS SP-58, Type 22:
1. Manufacturers: One of the following or equal:
a. For stainless steel piping:
1) Nibco-Tolco, Figure 304.
2) Cooper B-Line Systems, Inc., Figure 3083.
b. For all other piping, unless indicated on the Drawings:
1) Anvil International, Figure 66.
2) Bergen-Power, Figure 113A or 113B.
3) Cooper B-Line Systems, Inc., Figure B3083.

U. Heavy pipe clamp: MSS SP-58, Type 4:
1. Manufacturers: One of the following or equal:
a. For stainless steel piping:
1) Nibco-Tolco, Figure 4H.
b. For all other piping, unless called out otherwise on the drawings:
1) Anvil International, Figure 216.
2) Bergen-Power, Figure 298.

V. PTFE pipe slide assembly: MSS SP-58, Type 35 with lateral and vertical restraint:
1. Manufacturers: One of the following or equal:
a. For stainless steel piping:
1) Nibco-Tolco, Figure 426.

b. For all other piping, unless indicated on the Drawings:
   1) Anvil International, Figure 257, Type 3.
   2) Cooper B-Line Systems, Inc., Figure B3893.

W. Anchor bolts, concrete anchors, concrete inserts, powder-actuated fasteners, and sleeve anchors: As specified in Section 05120 - Structural Steel Framing.

2.04 THERMAL PIPE HANGER SHIELD

A. Thermal shields shall be provided at hanger, support and guide locations on pipe requiring insulation.

B. The shield shall consist of an insulation layer encircling the entire circumference of the pipe and a steel jacket encircling the insulation layer.

C. The thermal shield shall be the same thickness as the piping system insulation specified in Section 15082 - Piping Insulation.

D. The standard shield shall be used for hot systems and the vapor barrier shield shall be used for cold systems.

E. Stainless steel band clamps shall be used where specified to protect against slippage between the pipe wall and the thermal shield.

F. Standard shield:
   1. Insulation:
      a. Hydrous calcium silicate, high density, waterproof.
      b. Compressive strength: 100 pounds per square inch average.
      c. Flexural strength: 75 pounds per square inch average
      d. K factor: 0.38 at 100 degrees Fahrenheit mean.
      e. Temperature range: 20 degrees Fahrenheit to 500 degrees Fahrenheit.
   2. Steel jacket:
      a. The jacket shall be galvanized steel.
      b. Gage shall be the manufacturer's standard supplied for the given pipe size.
   3. Connection:
      a. Shield shall have butt connection to pipe insulation.
      b. Steel jacket and insulation ends shall be flush.

G. Vapor barrier shield:
   1. Insulation:
      a. Hydrous calcium silicate, high density, waterproof.
      b. Compressive strength: 100 pounds per square inch average.
      c. Flexural strength: 75 pounds per square inch average.
      d. K factor: 0.38 at 100 degrees Fahrenheit mean.
      e. Temperature range: 20 degrees Fahrenheit to 500 degrees Fahrenheit.

H. Steel jacket:
   1. The jacket shall be of galvanized steel.
   2. Gage shall be the manufacturer's standard supplied for the given pipe size.

I. Connection:
   1. Shield shall have butt connection to pipe insulation.

J. Insulation shall extend 1 inch each side of steel jacket for vapor tight connection to the pipe insulation vapor barrier.

PART 3 EXECUTION

3.01 INSTALLATION

A. Support, suspend, or anchor exposed pipe, fittings, valves, and appurtenances to prevent sagging, overstressing, or movement of piping; and to prevent thrusts or loads on or against connected pumps, blowers, and other equipment.

B. Field verify support location, orientation, and configuration to eliminate interferences prior to fabrication of supports.

C. Carefully determine locations of inserts. Anchor to formwork prior to placing concrete.

D. Use flush shells only where indicated on the Drawings.

E. Do not use anchors relying on deformation of lead alloy.

F. Do not use powder-actuated fasteners for securing metallic conduit or steel pipe larger than 1-inch to concrete, masonry, or wood.

G. Suspend pipe hangers from hanger rods and secure with double nuts.

H. Install continuously threaded hanger rods only where indicated on the Drawings.

I. Use adjustable ring hangers or adjustable clevis hangers for 4-inch and smaller diameter pipe.

J. Use adjustable clevis hangers for pipe larger than 4 inches in diameter.

K. Secure pipes with double nutted U-bolts or suspend pipes from hanger rods and hangers.
   1. For stainless steel piping, use stainless steel U-bolts.
   2. For all other piping, use galvanized U-bolts.

L. Support spacing:
   1. Support 2-inch and smaller piping on horizontal and vertical runs at maximum 5 feet on center, unless otherwise specified.
   2. Support larger than 2-inch piping on horizontal and vertical runs at maximum 10 feet on center, unless otherwise specified.
   3. Support exposed polyvinyl chloride and other plastic pipes at maximum 5 feet on center, regardless of size.

4. Support tubing, PVC pipe 1-inch and smaller, copper pipe and tubing, fiber-reinforced plastic pipe or duct, and rubber hose and tubing at intervals close enough to prevent sagging greater than 1/4-inch between supports.
5. Do not suspend or support valves, pipe and fittings from another pipe or conduit.

M. Install supports at:
1. Any change in direction.
2. Both sides of flexible pipe connections.
3. Base of risers.
4. Floor penetrations.
5. Connections to pumps, blowers, and other equipment.
6. Valves and appurtenances.

N. Securely anchor plastic pipe, valves, and headers to prevent movement during operation of valves.

O. Anchor plastic pipe between expansion loops and direction changes to prevent axial movement through anchors.

P. Provide elbows or tees supported from floors with base fittings where indicated on the Drawings.

Q. Support base fittings with metal supports or when indicated on the Drawings support on concrete piers.

R. Do not use chains, plumbers' straps, wire, or similar devices for permanently suspending, supporting, or restraining pipes.

S. Support plumbing drainage and vents in accordance with plumbing code as specified in Section 01410 - Regulatory Requirements.

T. Supports, clamps, brackets, and portions of support system bearing against copper pipe: Copper plated, copper throughout, or isolated with neoprene or polyvinyl chloride tape.

U. Where pipe is insulated, install over-sized supports and hangers.

V. Install thermal pipe shield in accordance with MSS SP-58, Type 40 on all pipe supports for insulated pipes.

W. Install riser clamps at floor penetrations and where indicated on the Drawings.

X. Coat support system components as specified in Section 09960 - High-Performance Coatings.

END OF SECTION

SECTION 15062

PREFORMED CHANNEL PIPE SUPPORT SYSTEM

PART 1 GENERAL

1.01 SUMMARY

A. Section includes: Preformed channel pipe support system consisting of preformed channels, fittings, straps, and fasteners engineered to support piping.

1.02 REFERENCES

A. American Institute of Steel Construction (AISC).

B. American Iron and Steel Institute (AISI).

C. Manufacturer's Standardization Society (MSS):
   1. SP-58 - Pipe Hangers and Supports - Materials, Design, and Manufacture.

1.03 SUBMITTALS

A. Submit as specified in Section 01330 - Submittal Procedures.

B. Product data.

1.04 QUALITY ASSURANCE

A. Design preformed channel pipe support system for loads in accordance with applicable provisions of:
   1. AISC Manual of Steel Construction.
   2. AISI Cold-Formed Steel Design Manual.

B. Product standards:
   1. Pipe support materials: In accordance with MSS SP-58.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Fabricate preformed channel pipe support system using, as a minimum, parts specified below and meeting the requirements specified under Design Criteria.
   1. Manufacturers: One of the following or equal:
      a. Unistrut, Series P1000 or P1001; P5500 or P5501.
      b. Allied Support Systems, Power Strut, Figure PS-200 or PS-200 2TS; PS-150 or PS-150 2TS.
      c. Cooper Ind., B-Line, Channel Type B22 or B22A; B12 or B12A.

2.02 DESIGN AND PERFORMANCE CRITERIA

A. Design responsibility:
   1. The manufacturer of the preformed channel pipe support system is responsible for the design of the support system.
   2. Prepare design calculations utilizing the design criteria included in these Specifications.
   3. Prepare detailed shop drawings illustrating the layout of the support system and identifying the components of the support system.

B. Design criteria:
   1. Include live, dead, and seismic loads associated with piping, valves, and appurtenances. Consider the content of the pipes in load calculations.
   2. Minimum gauge thickness: 12-gauge.
   3. Allowable stress of channels:
      a. Steel channels: The lesser of 25,000 pounds per square inch, or 0.66 times yield stress of steel.
      b. Stainless steel channels: 0.66 times the yield stress of the stainless steel alloy.
   4. Maximum deflection: 1/240 of span.
   5. Allowable column loads: As recommended by manufacturer in published instruction for column's unsupported height and "K" value for calculating effective column length of not less than 1.0.
   6. Future loads:
      a. Support systems indicated on the Drawings may include spaces intended to accommodate future pipes.
      b. Assume such spaces are occupied by 6-inch diameter ductile iron pipes. Only the number of pipes that would physically fit into the space need be considered.
      c. Include the weight of the pipe contents in determining future loads. Assume pipe contents are water.
   7. Seismic design criteria: As specified in Section 01850 - Design Criteria as specified for mechanical equipment.
   8. Spacing of supports: As required to comply with design requirements but not more than 5 feet.

C. Supports below the top of walls of water bearing structures: Use Type 316 stainless steel for support system components.
   1. Supports in other locations: Use hot-dipped galvanized components unless other materials are specifically indicated on the Drawings.

2.03 ACCESSORIES

A. Preformed channel concrete inserts: Minimum 12 inches long:
   1. Manufacturers: One of the following or equal:
      a. Unistrut, Series P-3200.
      b. Allied Support Systems, Figure 282.
      c. Cooper Ind., B-Line Series B32I.

B. 90-degree angle fittings:
   1. Manufacturers: One of the following or equal:
      a. Unistrut, P1026.
      b. Allied Support Systems, Power Strut, P603.

C. Pipe straps:
   1. For pipes 8 inches in diameter and smaller: Use 2-piece universal strap with slotted hex head screw and nut.
      a. Manufacturers: One of the following or equal:
         1) Unistrut, Series P1109 through P1126.
         2) Allied Support Systems, PS1100.
         3) Cooper Ind., B-Line Series B2000.
   2. For pipes greater than 8 inches in diameter: Unless different material is otherwise indicated on the Drawings use 1-piece 1-inch wide by 1/8-inch thick steel strap, hot-dip galvanized after fabrication.
   3. For stainless steel pipes: Use type of strap required for the pipe sizes specified above, but use Type 316 stainless steel materials.

D. Prefabricated double channel bracket:
   1. Manufacturers: One of the following or equal:
      a. Unistrut, P2542-P2546.
      b. Cooper Ind., B-Line Series B297.

E. Touch-up paint for galvanized surfaces:
   1. Manufacturers: The following or equal:
      a. Galvinox, Galvo-Weld.

F. Touch-up paint for painted surfaces: Same formulation as factory paint.

G. Cushion strip:
   1. For solvent welded plastic pipes in elevated temperatures, use a thermoplastic elastomer, cushion wrap designed for use from -50 degrees Fahrenheit to 275 degrees Fahrenheit. Contractor to add a cushion strip at each pipe support strap that meets this criteria.
      a. Manufacturers: One of the following or equal:
         1) Anvil, AS 3795.
         2) Unistrut, P2600 Unicushion.

2.04 FABRICATION

A. Hot-dip galvanize support system components after fabrication to required length and shape.

B. Do not galvanize or paint stainless steel components.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install preformed channel concrete inserts for vertical support, quantity based on manufacturer's structural design calculations.

B. Fasten preformed channel pipe supports to existing walls using Z-fittings and concrete anchors as indicated on the Drawings.

C. Fasten preformed channel pipe supports to preformed channel concrete inserts embedded in ceiling using U-shaped fittings.

D. Suspend threaded rods from concrete inserts embedded in ceiling. Support preformed channel pipe supports with threaded rods.

E. Touchup cut or damaged galvanized surfaces.

F. Prevent contact between pipes and support components of dissimilar metals. Utilize rubber coated, plastic coated, or vinyl coated components, stainless steel components, or wrap pipe with PVC or polyethylene tape.

G. Install support as near as possible to concentrated loads.

H. Install support within 2 feet of horizontal and vertical changes in pipe alignment.

I. Adjust supports or install shims to obtain specified slope or elevation.

END OF SECTION

SECTION 15063

NON-METALLIC PIPE SUPPORT SYSTEM

PART 1 GENERAL

1.01 SUMMARY

A. Section includes: Non-metallic pipe support system including the following:
   1. Channel framing and components.
   2. Pipe clamps.
   3. Fittings.
   4. Fasteners.

1.02 REFERENCES

A. ASTM International (ASTM):
   1. E84 - Standard Test Method for Surface Burning Characteristics of Building Materials.

1.03 SUBMITTALS

A. Submit as specified in Section 01330 - Submittal Procedures.

B. Shop drawings.

C. Calculations.

1.04 QUALITY ASSURANCE

A. Supply materials from a single manufacturer with sole responsibility for the pipe support system.

B. The supplied system, including pipe clamps, shall be interchangeable with industry standard 1-5/8-inch steel and fiberglass channel framing systems.

1.05 DELIVERY, STORAGE, AND HANDLING

A. Transportation, handling, storage, and installation shall be in accordance with the manufacturers printed instructions.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. One of the following or equal:
   1. StrutTech.
   2. Unistrut.

2.02 DESIGN AND PERFORMANCE CRITERIA

A. Design responsibility:
   1. The manufacturer of the non-metallic pipe support system shall be considered the designer of the support system.
   2. Prepare design calculations utilizing the design criteria included in these Specifications.
   3. Prepare detailed shop drawings illustrating the layout of the support system and identifying the components of the support system.

B. Design requirements:
   1. Include live, dead, and seismic loads associated with piping, valves, and appurtenances. Consider the content of the pipes in load calculations.
   2. Maximum allowable deflection: 1/240 of span.
   3. Allowable column loads: As recommended by manufacturer in published instruction for column's unsupported height and "K" value for calculating effective column length of not less than 1.0.
   4. Future loads:
      a. Support systems indicated on the Drawings may include spaces intended to accommodate future pipes.
      b. Assume such spaces are occupied by 6-inch diameter ductile iron pipes. Only the number of pipes that would physically fit into the space need be considered.
      c. Include the weight of the pipe contents in determining future loads. Assume pipe contents are water.
   5. Seismic design criteria: As specified in Section 01850 - Design Criteria as specified for mechanical equipment.
   6. Spacing of supports: As required to comply with design requirements but not more than 5 feet.

2.03 MATERIALS

A. Fiberglass resin: Corrosion-resistant premium grade vinylester.

B. Injection molded components: Polyurethane thermoplastics.

C. Flame spread of fiberglass:
   1. Vinylester fiberglass (Series VF): Class 1, ASTM E84.
   2. Polyurethane: V-O UL 94V.

D. Physical properties of fiberglass:

Physical Property	Longitudinal	Transverse
Tensile Strength	37,500 pounds per square inch (psi)	10,000 psi
Tensile Modules	3.0 X 10^6 psi	1.0 X 10^6 psi
Flexural Strength	37,500 psi	14,000 psi
Flexural Modules	2.0 X 10^6 psi	1.0 X 10^6 psi
Compressive Strength	37,500 psi	20,000 psi
Shear Strength	6,000 psi	5,500 psi
Izod Impact	30 foot-pounds per square inch	5 foot-pounds per square inch

E. Surface veil: Fiberglass channel shall have polyester surface veil over 100 percent of the surface to provide protection against degradation from ultraviolet light.

F. Touch-up resin:
1. Manufacturers: The following or equal:
   a. Krylon, 7006-Satin Polyurethane Clear Finish.

2.04 COMPONENTS

A. Channel framing:
1. All channel framing shall be supplied with integral notches 1 inch on center.
2. Locate notches on interior flange to prevent slippage of pipe clamps and fittings after installation.

B. Pipe clamps:
1. Adjustable type: Non-metallic and non-conductive.
2. Fixed type:
   a. Pipe clamps for pipe less than 6 inches in diameter shall be non-metallic and non-conductive.
   b. Pipe clamps for pipe equal to and greater than 6 inches in diameter shall be fiberglass.

C. Channel fittings:
1. Make fittings and post bases from glass-filled polyurethane or polyester.

D. Fasteners:
1. Make fasteners from one of the following materials:
   a. Glass-filled polyurethane.
   b. Vinylester fiberglass.

E. Cushion strip:
1. For solvent welded plastic pipes in elevated temperatures, use a thermoplastic elastomer, cushion wrap designed for use from -50 degrees Fahrenheit to

275 degrees Fahrenheit. Contractor to add a cushion strip at each pipe support strap that meets this criteria.

a. Manufacturers: One of the following or equal:
    1) Anvil, AS 3795.
    2) Unistrut, P2600 Unicushion.

PART 3 EXECUTION

3.01 INSTALLATION

A. General:
1. Install in accordance with manufacturer's instructions, shop drawings, and as indicated on the Drawings.
2. Seal machined edges and holes with touch-up resin.

END OF SECTION

SECTION 15076

PIPE IDENTIFICATION

PART 1 GENERAL

1.01 SUMMARY

A. Section includes: Pipe identification including the following:
   1. Pipe identification markers, flow direction arrows, tags, and bands.
   2. Underground warning tape.
   3. Tracer wire.
   4. Witness markers.

1.02 REFERENCES

A. American Society of Mechanical Engineers (ASME):
   1. A13.1 - Scheme for the Identification of Piping Systems.

1.03 SUBMITTALS

A. Submit as specified in Section 01330 - Submittal Procedures.

B. Submit following:
   1. Product data.
   2. Samples.
   3. Manufacturer's installation instructions.
   4. Submit following as specified in Section 01770 - Closeout Procedures:
      a. Operation and Maintenance Data.
      b. Warranty.

PART 2 PRODUCTS

2.01 EXPOSED AND IN-CHASE PIPE IDENTIFICATION

A. For piping with outer diameter greater than or equal to 3/4-inch, provide lettered pipe markers and flow direction arrows:
   1. General requirements:
      a. Pipe markers shall include the following, minimum:
         1) Printed text identifying the pipe fluid.
            a) The text shall be all capital letters matching the text listed in the "Service" column of the Piping Schedule for the corresponding piping system.

2) An arrow identifying the direction of fluid flow:
   a) The arrow can either be integral to the text marker or provided separately. If provided separately, the arrow must be placed immediately adjacent to each text marker, with the arrow aligned with the text such that the text and arrow are both visible from the same viewpoint.
   b) The arrow color shall match the text color, and the arrow background color shall match the text background color.

b. Suitable for outdoor application from -40 degrees to 180 degrees Fahrenheit; in accordance with ASME A13.1 requirements.

c. Lettering:

Outside Pipe Diameter Including Covering	Lettering Height
Less than 0.75 inches	N/A
0.75 to 1.5 inches	1/2-inch
1.5 inches to 2 inches	3/4-inch
2.5 inches to 6 inches	1-1/4 inches
8 inches to 10 inches	2-1/2 inches
Over 10 inches	3-1/2 inches

d. Marker colors:

Marker Color System ID[(1)]	Fluid Service	Text/Arrow Color	Background Color
1	Flammable and oxidizing fluids	Black	Yellow
2	Potable, cooling, boiler feed, and other waters	White	Green
3	Compressed air	White	Blue
4	Fire quenching fluids	White	Red
5	Toxic and corrosive fluids	Black	Orange
6	Combustible fluids	White	Brown
7	Recycled Water	White	Purple
Notes: (1) See Piping Schedule.			

2. Self-adhesive type markers:
   a. Manufacturers: One of the following or equal:
      1) Seton, (of Brady Corporation), Opti Code Pipe Markers.
      2) Marking Services, Inc.
   b. Materials:
      1) Self-adhesive vinyl.
3. Snap-on markers:
   a. Manufacturers: One of following or equal:
      1) Brady Snap-On.
      2) Seton (of Brady Corporation) Setmark.

B. For piping with outer diameter less than 3/4-inch, provide identification tags and flow direction arrows:
   1. Manufacturer: One of the following or equal:
      a. Seton (of Brady Corporation).
   2. Tag and chain materials:
      a. Copper piping: Brass.
      b. Ferrous piping: Type 316 stainless steel.
      c. Plastic piping: PVC.
   3. Flow direction arrow colors shall adhere to the same requirements as for piping with outer diameter greater than or equal to 3/4-inch, as specified in this Section.

C. Pipe bands:
   1. When bands are required by the Piping Schedule for a specific piping system, provide solid-colored 4-inch-wide bands.
      a. Color as specified in the Piping Schedule.
   2. Self-adhesive type.
   3. Suitable for outdoor application from -40 degrees to 180 degrees Fahrenheit.

2.02 BURIED PIPELINE IDENTIFICATION

A. Underground warning tape:
   1. Manufacturer: One of the following or equal:
      a. Seton (of Brady Corporation).
      b. T. Christy Enterprises, Inc.
   2. Material:
      a. Polyethylene tape for prolonged underground use.
      b. Minimum tape thickness: 4 mils.
      c. Overall tape width: 4 inches.
      d. Message: “CAUTION” with the name of the service followed by “LINE BURIED BELOW.” in black lettering on colored background in accordance with approved APWA colors.

Service	Color
Potable water	Blue
Reclaimed water, irrigation, and slurry lines	Purple
Sewers and drain lines	Green
Gas, oil, steam, petroleum, chemicals, or other service	Yellow

B. Tracer wire:
   1. Manufacturers: One of the following or equal:
      a. Kris-Tech Wire.
      b. Aegion Corrpro.
   2. Materials: One of the following or equal:
      a. Solid copper conductor
      b. Thickness minimum: 10 gauge.

c. Insulation:
1) Match insulation color to the color of the pipe being installed.
2) UF type, direct bury.
3) 30 mil HMWPE.

3. Splicing kit:
a. Manufacturers: One of the following or equal:
1) 3M, Model 82 A1N.

4. Station box:
a. Lid and collar materials: Cast iron.
b. Lid type: Locking.
c. Able to withstand heavy traffic loading.
d. Manufacturers: One of the following or equal:
1) CP Test & Valve Products, Inc., Glenn Test Station.
2) Farwest Corrosion Control.

C. Witness markers:
1. Manufacturers: One of the following or equal:
a. Carsonite Composites, Utility Marker.
2. Materials:
a. Glass fiber and resin reinforced thermosetting composite material.
b. UV resistant.
3. Constructed as a single piece.
4. Pointed at the bottom end.
5. Information to be included on the marker:
a. “Caution” (type of service) “Pipeline”.
b. Phone number for Underground Service Alert.
c. Phone number for Owner in case of emergency.
d. Station number.
e. Offset:
1) Only provide offset if marker is not directly over the pipe.
f. Name of appurtenance or fitting (e.g., 45, BO, ARV, etc.)

PART 3 EXECUTION

3.01 EXAMINATION

A. Verify satisfactory conditions of substrate for applying identification.

B. Verify that conditions are satisfactory for installation and application of products as specified in Section 01600 - Product Requirements.

3.02 PREPARATION

A. Prepare and coat piping with the coating systems defined in the Piping Schedule.

B. Prepare surface in accordance with identification product manufacturer's instructions.

3.03 EXPOSED AND IN-CHASE PIPING IDENTIFICATION

A. Identify exposed and in-chase piping with flow direction arrows and lettering (for piping with outer diameter greater than or equal to 3/4-inch) or tags (for piping with outer diameter less than 3/4-inch).

B. Provide lettering (or tags for pipes with outer diameter less than 3/4-inch) and flow direction arrows near equipment served, adjacent to valves, both sides of walls and floors where pipe passes through, at each branch or tee, and at intervals of not more than 50 feet in straight runs of pipe.
   1. Label all chemical tank fill pipelines at locations that are visible from chemical fill stations.
   2. Place markers on piping so they are visible from operator's position in walkway or working platform near piping. Locate markers along horizontal centerline of pipe, unless better visibility is achieved elsewhere.
   3. Do not apply markers, arrows, or tags to piping that is regularly submerged.

C. Where scheduled in the Piping Schedule, space solid-color bands along piping at 10-foot intervals.
   1. Do not apply bands to piping that is regularly submerged.

3.04 BURIED PIPING IDENTIFICATION

A. Underground warning tape:
   1. Non-detectable warning tape:
      a. Place continuous run of warning tape in pipe trench, 12 inches above the pipe.
   2. Detectable warning tape:
      a. Place continuous run of warning tape in pipe trench, 12 inches above the pipe or a greater height if necessary to limit the tape bury depth to 36 inches. Do not bury detectable warning tape deeper than 36 inches.

B. Tracer wire:
   1. Install on all non-metallic pipe.
   2. Install an electrically continuous run of tracer wire along the entire length of the pipe with wire terminations in valve boxes, vaults, or structures.
   3. Install tracer wire on top of the pipe and secure to pipe with tape a minimum of every 10 feet.
   4. Where approved by the Engineer, splice sections of wire together using approved direct bury wire nuts.
      a. Twisting the wires together is not acceptable.

C. Witness markers:
   1. Install over pipe in unpaved open-space areas at intervals not greater than 200 feet.
   2. Place markers at appurtenances located in unpaved areas.
   3. Embed markers at least 18 inches into the soil.

END OF SECTION

SECTION 15082

PIPING INSULATION

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Insulation for piping and related systems that are not plumbing systems.

1.02 REFERENCES

A. American Association of State Highway and Transportation Officials (AASHTO):
   1. Standard Specifications for Highway Bridges.

B. ASTM International (ASTM):
   1. A53 - Standard Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded, and Seamless.
   2. C177 - Standard Test Method for Steady-State Heat Flux Measurements and Thermal Transmission Properties by Means of the Guarded-Hot-Plate Apparatus.
   3. C518 - Standard Test Method for Steady-State Thermal Transmission Properties by Means of the Heat Flow Meter Apparatus.
   4. C533 - Standard Specification for Calcium Silicate Block and Pipe Thermal Insulation.
   5. C547 - Standard Specification for Mineral Fiber Pipe Insulation.
   6. C552 - Standard Specification for Cellular Glass Thermal Insulation.
   7. C795 - Standard Specification for Thermal Insulation for Use in Contact with Austenitic Stainless Steel.
   8. C929 - Standard Practice for Handling, Transporting, Shipping, Storage, Receiving, and Application of Thermal Insulation Materials for Use in Contact with Austenitic Stainless Steel.
   9. C1136 - Standard Specification for Flexible, Low Permeance Vapor Retarders for Thermal Insulation.
   10. D1784 - Standard Specification for Rigid Poly(Vinyl Chloride) (PVC) Compounds and Chlorinated Poly(Vinyl Chloride) (CPVC) Compounds.
   11. D2310 - Standard Classification of Machine-Made "Fiberglass" (Glass-Fiber-Reinforced-Thermosetting-Resin) Pipe.
   12. E84 - Standard Test Method for Surface Burning Characteristics of Building Materials.
   13. E96 - Standard Test Methods for Water Vapor Transmission of Materials.

C. California Energy Commission:
   1. Title 24 - Building Energy Efficiency Standards.

1.03 DEFINITIONS

A. Buried: Piping that is installed below buildings, foundations, or finish grade, either in soil or encased in concrete in soil.

B. Concealed: Piping above suspended ceilings and within walls, partitions, shafts, or service spaces and spaces not normally exposed to view but not buried.

C. Exterior: Piping that is installed outside a building or within a pipe trench or tunnel.

D. Flame Spread and Smoke Density: Burning characteristics determined in accordance with ASTM E84.

E. Interior: Piping that is installed inside a building.

F. K Factor: Thermal conductivity determined in accordance with ASTM C177 or C518.

G. Mineral Fiber: Fibers manufactured of glass, rock, or slag processed from a molten state, with or without a binder.

H. Water Vapor Permeance: Water vapor transmission determined in accordance with ASTM E96 and expressed in units of perm-inch.

1.04 SUBMITTALS

A. Submit as specified in Section 01330 - Submittal Procedures.

B. Product data: As specified in Section15050 - Common Work Results for Mechanical Equipment.
   1. Insulation properties: Include K factor, thickness, density, operating temperature limits, tensile strength, compressive strength, moisture absorption, flame spread, and smoke developed in accordance with ASTM E84 and corrosivity to stainless steel piping in accordance with ASTM C795.
   2. Jacket properties: Include covering material, cover thickness, tensile strength, tear strength, permeability in accordance with ASTM E96, flame spread, and smoke developed in accordance with ASTM E84, closure type or devices, and accessories.
   3. Insulating blankets: Include materials, performance characteristics, method of attaching to equipment, listing of locations where insulating blankets will be installed.
   4. Manufacturer's application instructions: Include assembly and application drawings and detailed instructions.

1.05 WARRANTY

A. As specified in Section 01783 - Warranties and Bonds.

PART 2 PRODUCTS

2.01 GENERAL

A. As specified in Section 01600 - Product Requirements with additional requirements in Section 15050 Common Work Results for Mechanical Equipment and Section 15500 - Common Work Results for HVAC.

B. In accordance with California Energy Commission Title 24.

2.02 DESIGN AND PERFORMANCE CRITERIA

A. As specified in Section 15050 Common Work Results for Mechanical Equipment and Section 15500 - Common Work Results for HVAC.

B. Insulation thicknesses: Provide insulation thickness in inches in accordance with the following table. Insulation thickness shown is nominal. Manufacturing tolerance of 15 percent variation is permissible.

Table 1. Required Insulation Thicknesses

Required Insulation Thicknesses (inches)					
Service Temperature Range as Designated in Insulation Schedule at End of this Section	**Nominal Pipe Diameters**				
	1 inch and Less	**1.25 to 2 inches**	**2.5 to 4 inches**	**5 to 10 inches**	**Over 10 inches**
Above 200 degrees Fahrenheit	2.0	2.5	3.0	3.5	3.5
100 to 200 degrees Fahrenheit	1.5	1.5	1.5	2.0	2.5
40 to 100 degrees Fahrenheit	0.5	1.0	1.0	1.5	2.0
Below 40 degrees Fahrenheit	1.0	1.0	1.5	2.0	2.0
Airwash Air Pipes	0.5	0.5	1.0	1.0	1.0

2.03 PIPE INSULATION

A. Insulation types: Provide in accordance with the insulation types listed and scheduled.

B. Insulation, Type 2:
   1. Insulation material: Preformed mineral fiberglass insulation made from glass fibers bonded with a thermosetting resin.
      a. In accordance with ASTM C547, Class 1.
      b. Provide with factory installed vapor barrier.
         1) Material: White Kraft paper bound to aluminum foil in accordance with ASTM C1136, Type I.
         2) Longitudinal lap seals: Pressure-sensitive, self-sealing longitudinal lap strip with factory applied adhesive.
         3) Circumferential butt seals: 4-inch wide tape or similar properties or 4-inch wide overlap with adhesive seal.
         4) Vapor barrier permeability: 0.02 perms or lower.
         5) Vapor barrier flame spread rating: 25 or less.

2. Minimum temperature range: Minus 0 degrees Fahrenheit to plus 850 degrees Fahrenheit.
3. K factor at 75 degrees Fahrenheit: Not more than 0.23 BTU-inch/hour-square feet degrees Fahrenheit.
4. Maximum moisture absorption, volume percent: 5.
5. Manufacturers: One of the following or equal:
    a. Owens-Corning , Fiberglas™ FLEXWRAP® ASJ.
    b. Johns Manville, Micro-Lok® HP.
    c. Knauf Insulation, Earthwool® Redi-Klad® 1000° Pipe Insulation.

2.04 INSULATION JACKETS

A. Jacket, Type 2:
1. Material: Ultraviolet-resistant polyvinyl chloride jacketing, 20 mil minimum thickness.
2. Fire rating: 25 maximum flame spread, smoke developed 50 or less.
3. Color: White.
4. Overlap: 1-inch minimum at joints and fittings.
5. Joint seal: PVC solvent welded or adhesive as recommended by the manufacturer.
6. Fittings: Factory made with full thickness insulation.
7. Manufacturers: One of the following or equal:
    a. Johns Manville, Zeston® 2000 PVC.
    b. Proto Corp., LoSMOKE PVC.
    c. Speedline® Corp., Smoke-Safe™ PVC.

2.05 VAPOR BARRIERS

A. Vapor barrier, Type 1:
1. Material: White Kraft paper bound to aluminum foil in accordance with ASTM C1136, Type 1.
2. Permeability: 0.02 perms or lower.
3. Maximum flame spread rating: 25.
4. Edge seal: Pressure-sensitive tape lap seal.
5. Circumferential joints: 4-inch wide tape or 4-inch overlap with adhesive seal.

B. Vapor barrier, Type 2:
1. Material: Mastic.
2. Manufacturers: One of the following or equal:
    a. Benjamin Foster, No. 30-76.
    b. Insul-Coustic, No. I.C.-580.
    c. Foster Products, 36-10/46-10 Weatherite.
    d. Childers Products CP10/11 VI-CRYL.

2.06 RELATED MATERIALS

A. Cover adhesive: Premium adhesive as recommended by the insulation cover supplier for heavy-duty service in corrosive, wet environments. Standard-duty adhesives are not permitted.

2.07 REMOVABLE INSULATING BLANKETS

A. In piping systems specified to be insulated, use removable insulating blankets for valves, meters, strainers, filters, catalytic converters, engine exhaust silencers, pumps, and other in-line piping appurtenances and equipment requiring periodic servicing, regardless of pipe size.

B. Size limits: Use removable insulating blankets for equipment and piping appurtenances 3 inches in nominal size and larger. For equipment and piping appurtenances less than 3 inches that do not require periodic servicing, insulate with molded sections of insulation or by field cutting insulation to conform to the shape of the component and to fit tightly around the component.

C. Manufacturers: One of the following, or equal:
   1. Thermal Energy Products, Inc., Energy Wrap.
   2. Accessible Products, Thermazip 2000 Jacket.
   3. Owens Corning, Temp-Mat.

D. Low temperature insulating blankets rated up to 800 degrees Fahrenheit:
   1. Use: For service temperatures up to 800 degrees Fahrenheit.
   2. Insulation: Fiberglass fiber, K factor 0.27 at 75 degrees Fahrenheit.
   3. Cover: 17-ounce fabric with both sides covered with silicone-impregnated glass cloth suitable for temperatures up to 800 degrees Fahrenheit.
   4. Cover fasteners: Use one of the following systems:
      a. Grommets in the blanket and stainless steel wire.
      b. 1-inch wide straps with stainless steel rectangular ring buckles and Velcro on strap tail.

2.08 SHIPPING, SPARE PARTS, MAINTENANCE PRODUCTS, AND SPECIAL TOOLS

A. As specified in Section 01600 - Product Requirements.

PART 3 EXECUTION

3.01 GENERAL

A. As specified in Section 01600 - Product Requirements.

B. Handle and store insulation for use on stainless steel in accordance with ASTM C929.

3.02 PREPARATION

A. Pressure test piping and complete application of coating system before applying insulation.

B. When piping is to be heat traced, install and functionally test heat tracing before installation of insulation.

C. Before beginning installation of piping insulation, verify that the Engineer has accepted piping tests, pipe coating applications, and heat tracing tests.

3.03 INSULATION SCHEDULE

A. Table 2. Insulation Schedule, does not include insulation required for plumbing systems. Plumbing systems insulation: As specified in Section 15400 - Plumbing Systems.

Table 2. Insulation Schedule

Service Designation[1]	Location[2]	Insulation Type[3]	Jacket Type[3]	Service Temp. °F[4]	Vapor Barrier
Airwash Air (AA)[5]	Interior/Exterior	2	2	Note 4	Required

Notes:

(1) Refer to Piping Schedule in Section 15052 - Common Work Results for General Piping for service designations.
(2) Insulation jackets are not required for interior installations that are concealed. See definitions for description of concealed locations.
(3) Contractor may select from options listed.
(4) Unless noted otherwise, use service temperature range provided in this table to establish insulation thickness as required by TABLE 1. Required Insulation Thicknesses.
(5) Install insulation on all new AA piping located from the discharge of blowers to the AWTs. Insulation is not required for existing AA piping or new AA that is installed higher than 10 feet above the slab.

3.04 INSTALLATION

A. Install insulation and jacket materials in accordance with manufacturer's written instructions.

B. Apply insulation in smooth, clean manner with tight and finished smooth joints. Fit insulation tightly against surfaces. Insulate each continuous run of pipe with full-length sections of insulation with a single piece cut to length to complete the run of pipe. Do not use cut pieces or scraps to complete the installation.

C. Butt longitudinal and circumferential insulation joints firmly together.

D. Maintain the integrity of vapor barrier jacketing. Do not use staples to hold vapor barrier overlaps in place.

E. Apply sealant or cement when previous applications of adhesives and cement have thoroughly dried.

F. Apply insulation to permit expansion or contraction of pipelines without damage to insulation or jacketing.

G. Fittings:
   1. Insulate fittings by covering with mitered sections of insulation or utilize factory-made prefabricated fitting shapes.

2. Terminate preformed pipe jackets or covering at sufficient distance from flanges to permit removal of bolts.
3. Overlap flange and flanged fitting insulation on adjacent pipe covering by at least 2 inches.

H. Valves:
1. Insulate valves 3 inches in nominal size and larger with removable insulating blankets.
2. Size blanket to extend up to packing gland only so that replacement of packing does not require removal of insulating blanket.

I. Provide continuous insulation through and over pipe supports and provide protection saddles at supports.

J. Extend insulation against insulation end protection shields or covers so that insulation voids do not exist and provide watertight end seals and covers where insulation terminates.

K. Provide continuous pipe insulation and covering through sleeves or openings in walls and floors. When buried pipe enters a building through a below grade wall or slab penetration, begin insulation system on interior side of penetration.

L. Apply pre-molded pipe insulation with extended legs when used on pipe traced with either tubing or electric cable type.

M. Thermally isolate all insulation closure locations (end caps, transitions, etc.) Type 1 or 2 jacket installation on piping with potential reach temperatures greater than 150 degrees Fahrenheit.

N. Apply piping identification on jackets as specified in Section 15076 - Pipe Identification.

END OF SECTION

SECTION 15110

COMMON WORK RESULTS FOR VALVES

PART 1 GENERAL

1.01 SUMMARY

A. Section includes: Basic requirements for valves.

1.02 REFERENCES

A. American Water Works Association (AWWA):
   1. C111/A21.11 - Standard for Rubber-Gasket Joints for Ductile-Iron Pressure Pipe Fittings.

B. ASTM International (ASTM):
   1. A126 - Standard Specification for Gray Iron Casting for Valves, Flanges, and Pipe Fittings.
   2. A480 - Standard Specification for General Requirements for Flat-Rolled Stainless and Heat-Resisting Steel Plate, Sheet, and Strip.
   3. A536 - Standard Specification for Ductile Iron Castings.

C. NSF International (NSF):
   1. 61 - Drinking Water System Components - Health Effects.

D. Society for Protective Coatings (SSPC):
   1. SP7 - Brush-Off Blast Cleaning.
   2. SP10 - Near-White Blast Cleaning.

1.03 SUBMITTALS

A. Submit as specified in Section 01330 - Submittal Procedures.

B. Product data:
   1. Submit the following information for each valve:
      a. Valve type, size, pressure rating, Cv factor.
      b. Coatings.
      c. Power valve actuators:
         1) Information on valve actuator including size, manufacturer, model number, limit switches, mounting; and motor enclosure, seating and unseating torque coefficient, dynamic torque, and bearing friction for calculation of maximum operating torque.
         2) Complete wiring diagrams and control system schematics.
      d. Manual valve actuators:
         1) Information on valve actuator including size, manufacturer, model number.
      e. Certified drawings with description of component parts, dimensions, weights, and materials of construction.

f. Certifications of reference standard compliance:
    1) Submit certification that the valves and coatings are suitable in potable water applications in accordance with NSF 61.
g. Clearly mark submittal information to show specific items, materials, and accessories or options being furnished.
h. Factory test data.

C. Provide vendor operation and maintenance manual as specified in Section 01782 - Operation and Maintenance Manuals.
    1. Furnish bound sets of installation, operation, and maintenance instructions for each type of manual valve 4 inches in nominal size and larger, and all non-manual valves. Include information on valve operators.

D. Provide Manufacturer's Certificate of Source Testing as specified in Section 01756 - Commissioning.

E. Provide Manufacturer's Certificate of Installation and Functionality Compliance as specified in Section 01756 - Commissioning.

1.04 QUALITY ASSURANCE

A. Manufacturer qualifications:
    1. Valves manufactured by manufacturers whose valves have had successful operational experience in comparable service.

1.05 DELIVERY STORAGE AND HANDLING

A. Protect valves and protective coatings from damage during handling and installation; repair coating where damaged.

PART 2 PRODUCTS

2.01 DESIGN AND PERFORMANCE CRITERIA

A. Pressure rating:
    1. Suitable for service under minimum working pressures of 150 pounds per square inch gauge.
    2. When a piping system is specified in the Piping Schedule to be tested at a pressure greater than 150 pounds per square inch gauge, provide valves for that piping system with design working pressure which is sufficient to withstand the test pressure.

B. Valve to piping connections:
    1. Metallic valves:
        a. Valves 3 inches nominal size and larger: Flanged ends.
        b. Valves less than 3 inches nominal size: Screwed ends.

2. Plastic valves in plastic piping systems:
    a. Up to 4 inches: Provide solvent or heat welded unions, except for plastic butterfly valves.
        1) Plastic butterfly valves shall be flanged per Section 15112 - Butterfly Valves.
    b. 6 inches and above: Provide solvent or heat-welded flanges.

2.02 MATERIALS

A. Stainless steel: In accordance with ASTM A480, Type 316, or Type 304, UNS Alloy S31600 or S30400.

B. Valve and operator bolts and nuts (not including flange bolts and nuts, which are specified in Section 15052 - Common Work Results for General Piping):
    1. Fabricated of stainless steel for the following installation conditions:
        a. Submerged in sewage or water.
        b. In an enclosed space above sewage or water.
        c. In structures containing sewage or water, below top of walls.
        d. At openings in concrete or metal decks.
    2. Where dissimilar metals are being bolted, use stainless steel bolts with isolation bushings and washers.
    3. Underground bolts: Low-alloy steel in accordance with AWWA C111/A21.11.

C. Bronze and brass alloys: Use bronze and brass alloys with not more than 6 percent zinc and not more than 2 percent aluminum in the manufacture of valve parts; UNS Alloy C83600 or C92200 unless specified otherwise.

D. Cast iron valve bodies: In accordance with ASTM A126, Class 30 minimum.

E. Ductile iron valve bodies: In accordance with ASTM A536, Grade 65-45-12 minimum unless specified otherwise.

2.03 INTERIOR PROTECTIVE LINING

A. When specified in the particular valve specification, provide valves with type of protective lining specified in the particular valve Specification.

B. Apply protective lining to interior, non-working surfaces, except stainless steel surfaces.

C. Lining types:
    1. Fusion bonded epoxy:
        a. Manufacturers: The following or equal:
            1) 3-M Company, ScotchKote 134; certified to NSF 61 for drinking water use.
        b. Clean surfaces in accordance with SSPC SP 7 or SP 10, as recommended by epoxy manufacturer.
        c. Apply in accordance with manufacturer's published instructions.
        d. Lining thickness: 0.010 to 0.012-inch, except that:
            1) Lining thickness in grooves for gaskets: 0.005-inch.
            2) Do not coat seat grooves in valves with bonded seat.

e. Quality control:
    1) Lining thickness: Measured with a non-destructive magnetic type thickness gauge.
    2) Verify lining integrity with a wet sponge-testing unit operating at approximately 60 volts, or as recommended by the lining manufacturer.
    3) Consider tests successful when lining thickness meets specified requirements and when no pinholes are found.
    4) Correct defective lining disclosed by unsuccessful tests, and repeat test.
    5) Repair pinholes with liquid epoxy recommended by manufacturer of the epoxy used for lining.

2. High solids epoxy:
    a. Product equivalent to high solids epoxy as specified in Section 09960 - High-Performance Coatings.
        1) Certified in accordance with NSF 61 for drinking water use.
        2) Interior: Coat valve interior with manufacturer's equivalent high performance high solids epoxy coating system with a certifiable performance history for the service conditions and as approved by the Engineer. Manufacturer shall provide for approval, coating information sufficient to allow Engineer to assess equivalence to the specified high solids epoxy as specified in Section 09960 - High-Performance Coatings.
    b. Clean surfaces to meet SP-7 or SP-10, or as recommended by coating manufacturer.
    c. Quality control: After coating is cured, check coated surface for porosity with a holiday detector set at 1,800 volts, or as recommended by coating manufacturer.
        1) Repair holidays and other irregularities and retest coating.
        2) Repeat procedure until holidays and other irregularities are corrected.

2.04 UNDERGROUND VALVES

A. Provide underground valves with flanged, mechanical, or other type of joint required for the type of pipe to which the valve is to be connected.

B. Coating and wrapping:
    1. After installation, encase valves in polyethylene wrap as specified for ductile iron piping in Section 15211 - Ductile Iron Pipe: AWWA C151.
        a. Ascertain that polyethylene wrapping does not affect operation of valve.

2.05 STEAM VALVES

A. Valves in steam or steam condensate piping: Ductile iron body in accordance with ASTM A536, Grade 65-45-12 minimum or cast steel or forged steel.

2.06 VALVE BOXES

A. Provide cast-iron valve boxes at each buried valve to access valve and valve operators.

B. Do not support boxes on valve, valve operator, or pipe.

C. Boxes:
   1. 2-piece, fabricated of cast iron; provide cover, with asphalt varnish or enamel protective coating.
   2. Adjustable to grade, install centered around the upper portions of the valve and valve operator.

D. Manufacturers: One of the following or equal:
   1. Tyler Pipe Industries, Inc.
   2. Neenah Foundry Co.

2.07 VALVE OPERATORS

A. Valve operator "Open" direction: Open counterclockwise.

B. Provide valves located below operating level or deck with extensions for key operation or floor stands and handwheels, as indicated on the Drawings.

C. Provide manually operated valves located not more than 6 feet above the operating level with tee handles, wrenches, or handwheels.
   1. Make the valve operator more conveniently accessible by rolling valves, located more than 5 feet but less than 6 feet above the operating level, toward the operating side.
   2. Secure tee handles and wrenches to the valve head or stem, except where a handle or wrench so secured constitutes a hazard to personnel; in which case, stow handle or wrench immediately adjacent to the valve on or in a suitable hanger, bracket, or receptacle.

D. Fit valves located more than 6 feet above operating level with chain operated handles or valve wheels.
   1. Chains: Sufficient length to reach approximately 4 feet above the operating level.
   2. Where chains constitute a nuisance or hazard to operating personnel, provide holdbacks or other means for keeping the chains out of the way.

E. Provide an operator shaft extension from valve or valve operator to finished grade or deck level when buried valves, and other valves located below the operating deck or level, are specified or indicated on the Drawings to be key operated; provide 2 inches square AWWA operating nut, and box and cover as specified, or a cover where a box is not required.

PART 3 EXECUTION

3.01 EXAMINATION

A. Preparation prior to installation:
   1. Install valves after the required submittal on installation has been accepted.
   2. Determine after flanged valves and flanged check valves are selected, the face-to-face dimensions of flanged valves and flanged check valves.

B. Fabricate piping to lengths taking into account the dimensions of flanged valves and flanged check valves.

3.02 INSTALLATION

A. Provide incidental work and materials necessary for installation of valves including flange gaskets, flange bolts and nuts, valve boxes and covers, concrete bases, blocking, and protective coating.

B. Where needed, furnish and install additional valves for proper operation and maintenance of equipment and plant facilities under the following circumstances:
   1. Where such additional valves are required for operation and maintenance of the particular equipment furnished by Contractor.
   2. Where such additional valves are required as a result of a substitution or change initiated by Contractor.

C. Valve and actuator orientation:
   1. Contractor shall coordinate with valve supplier final orientation of valve and actuator assembly based on Contractor's selection of equipment manufacturers and the valve and piping arrangement as indicated on the Drawings.
      a. Contractor shall rotate valve and/or actuator mounting orientation as specified in this Section unless otherwise indicated on the Drawings.
   2. Install valves with their stems in vertical position above the pipe, except as follows:
      a. Butterfly valves, gate valves aboveground, globe valves, ball valves, and angle valves may be installed with their stems in the horizontal position.
      b. Install buried plug valves with geared operators with their stems in a horizontal position.
   3. Install valves so that handles clear obstructions when the valves are operated from fully open to fully closed.

D. Place top of valve boxes flush with finished grade or as otherwise indicated on the Drawings.

E. Valves with threaded connections:
   1. Install valves by applying wrench on end of valve nearest the joint to prevent distortion of the valve body.
   2. Apply pipe joint compound or Teflon™ tape on external (male) threads to prevent forcing compound into valve seat area.

F. Valves with flanged connections:
   1. Align flanges and gasket carefully before tightening flange bolts.
   2. When flanges are aligned, install bolts and hand tighten.
   3. Tighten nuts opposite each other with equal tension before moving to next pair of nuts.

G. Valves with soldered connections:
   1. Do not overheat connection to prevent damage to resilient seats and metal seat rings.
   2. Position valves in full open position before starting soldering procedure.
   3. Apply heat to piping rather than to valve body.

3.03 FIELD APPLIED COATING OF VALVE EXTERIOR

A. Match color and be compatible with manufacturer's coating system and as specified in Section 09960 - High-Performance Coatings.
   1. When shop applied finish coating matches field applied coating on adjacent piping, touch up shop coating in damaged areas in accordance with instructions recommended by the paint manufacturer.
   2. When shop applied coating does not match field coating on adjacent piping, or when damage has occurred to the shop applied coating that requires more than touchup, blast clean valve surfaces or utilize other surface preparation recommended by the manufacturer of the coating material and apply the coating system used for coating adjacent piping.

3.04 COMMISSIONING

A. As specified in Section 01756 - Commissioning and this Section.

B. Manufacturer services from each manufacturer for all valves supplied:
   1. Provide Manufacturer's Certificate of Source Testing.
   2. Provide Manufacturer's Certificate of Installation and Functionality Compliance.

C. As specified elsewhere for specific valve types, sizes, or actuators.
   1. Source testing.
   2. Manufacturers on site services for Owner Training, Installation Testing, Functional Testing, and during the Process Operational Period.

END OF SECTION

SECTION 15111

BALL VALVES

PART 1 GENERAL

1.01 SUMMARY

A. Section includes: Ball valves.

B. As specified in Section 15110 - Common Work Results for Valves.

1.02 REFERENCES

A. American Society of Mechanical Engineers (ASME):
   1. B16.1 - Gray Iron Pipe Flanges and Flanged Fittings: Classes 25, 125, and 250.
   2. B16.5 - Pipe Flanges and Flanged Fittings: NPS 1/2 through 24.

B. American Water Works Association (AWWA):
   1. C507 - Standard for Ball Valves 6 Inch Through 48 Inch.

C. ASTM International (ASTM):
   1. A48 - Standard Specification for Gray Iron Castings.
   2. A216 - Standard Specification for Steel Castings, Carbon, Suitable for Fusion Welding, for High-Temperature Service.
   3. A351 - Standard Specification for Castings, Austenitic, for Pressure-Containing Parts.

1.03 SUBMITTALS

A. Submit as specified in Section 01330 - Submittal Procedures.

B. Product data: As specified in Section 15110 - Common Work Results for Valves:
   1. Metal body ball valves: 6 inches and larger only: Submit affidavit of compliance in accordance with AWWA C507.
   2. Operation and maintenance manual.

C. Commissioning submittals:
   1. Provide Manufacturer's Certificate of Installation and Functionality Compliance as specified in Section 01756 - Commissioning.

1.04 WARRANTY

A. Provide warranty as specified in Section 01783 - Warranties and Bonds.

PART 2 PRODUCTS

2.01 DESIGN AND PERFORMANCE CRITERIA

A. General: Unless otherwise indicated on the Drawings use:
   1. Metal body ball valves on metallic pipelines.
   2. Plastic body ball valves on plastic pipelines.

B. Do not use metal body ball valves in sodium hypochlorite or sodium bisulfite systems.

2.02 METAL BODY BALL VALVES – FULL PORT (BAV00)

A. Metal Body Ball Valves, 6-Inch Size and Larger:
   1. Manufacturers: One of the following or equal:
      a. Crane ChemPharma Energy, Resilient seated valve.
      b. DeZURIK/APCO, Metal seated valve.
      c. Henry Pratt Company, Resilient seated valve.
   2. General:
      a. Type: Non-lubricated, resilient seated or metal seated and capable of sealing in either flow direction.
      b. In accordance with AWWA C507.
      c. Stem packing: Manually adjustable while valve is under pressure.
      d. ASME B16.1, Class 125 flanged ends.
   3. Materials:
      a. Body: ASTM A48 cast iron with 400 series Monel seats (metal seated valves only) and integrally cast bronze bushed trunnions.
      b. Ball: Type 304 or 316 stainless steel.
      c. Seats:
         1) Resilient seated valves:
            a) PTFE.
         2) Metal seated valves:
            a) 300 series stainless steel.
      d. Stem seals: PTFE or Viton™.
   4. Valve actuator:
      a. Manually operated valves: Self-locking worm gear type actuator with position indicator. Permanently lubricate gearing. Provide adjustable screws to stop travel at both open and closed positions.
      b. Electric motor operated valves: Provide electric motor operator as specified in Section 13447 - Electric Actuators.

B. Metal body ball valves, less than 6-inch size
   1. Manufacturers: One of the following, or equal:
      a. Conbraco Industries, Inc., Apollo Valves.
      b. Flow-Tek, Inc.
      c. Metso Automation/Jamesbury.
      d. NIBCO, Inc.
   2. General:
      a. Type: Non-lubricated, full port and capable of sealing in either direction.
      b. End connections:
         1) Threaded or solder ends for sizes 3-inch and smaller.

2) Class 150 flanged for sizes larger than 3 inches.
a) Flanges: In accordance with ASME B16.1 standards.
c. Stem packing: Manually adjustable while valve is under pressure.
d. Shafts:
1) Rigidly connected to the ball by a positive means.
a) Design connection to transmit torque equivalent to at least 75 percent of the torsional strength of the shaft.
e. Handles: Stainless steel latch lock handle with vinyl grip and stainless steel nut designed to open and close the valve under operating conditions.
f. Temperature limits: Suitable for operation between minus 20 and 350 degrees Fahrenheit.
3. Materials:
a. Valves in copper lines: Bronze body.
b. Valves in steel and ductile iron piping: Ductile iron or cast steel body.
c. Valves in stainless steel piping: Stainless steel body, material type to match piping material as specified in Section 15052 - Common Work Results for General Piping.
d. Ball: Type 304 or 316 stainless steel, Type 316 in digester gas applications.
e. Seats: PTFE.
f. Stem seals: PTFE or Viton™.
g. Bearings: Self-lubricated, corrosion resistant material that will not contaminate potable water.
h. Valves for combustible fluid applications (digester gas, natural gas, fuel oil, etc.) must be of fire safe design.
4. Venting requirements:
a. Metal ball valves for hydrogen peroxide service:
1) Provide valve with factory drilled 0.125-inch hole in the upstream side of the ball.
2) Provide an engraved Type 316 stainless steel tag permanently attached to the valve stem stating, "One side of ball drilled for hydrogen peroxide service".

2.03 PLASTIC BODY BALL VALVES – FULL PORT (BAV40)

A. Manufacturers: One of the following or equal:
1. Asahi America.
2. Chemtrol Division, NIBCO, Inc.
3. Georg Fischer Piping Systems.
4. Hayward Flow Control.
a. For sodium hypochlorite service, provide model TB-Z. Model TBH-Z shall not be used.
5. IPEX USA, LLC
6. Plast-O-Matic Valves, Inc.

B. General:
   1. Type: Non-lubricated and capable of sealing in either flow direction.
   2. End connections:
      a. 4 inches and smaller size: Socket end true unions for solvent welded connection to adjacent piping.
      b. 6-inch size: Socket end true unions with attached flanges for flanged connection to adjacent piping.
   3. All valves shall have integral ISO 5211 mounting pad for actuator installation.
   4. All valves shall have integral plate for lock-out/tag-out.
   5. Stem: Double O-ring seal with shear point above seal.
   6. Pressure rating: Suitable for the test pressure and maximum temperature of the corresponding piping system listed in the Piping Schedule.

C. Materials:
   1. Body and ball:
      a. PVC piping systems: PVC.
      b. CPVC piping systems: CPVC.
   2. Seats: PTFE (Teflon™).
   3. O-rings: Match gasket material of corresponding piping system listed in the Piping Schedule.

D. Limit switches, when indicated on the Drawings:
   1. Mechanical cam type with watertight enclosure and suited for remote indication of valve open-close status.
   2. Mount on valve actuator.
   3. Contacts: 120-volt alternating current, 20 amperes at 75 to 100 percent power factor and 24-volt direct current, 5 amperes minimum.

E. Valve actuator:
   1. Valves shall be quarter turn operated with valve seat adjustability.
   2. Manually operated valves: Lever.
      Electric motor operated valves, when indicated on the Drawings: Provide electric motor operator as specified in Section 13447 - Electric Actuators.

F. Venting requirements:
   1. PVC and CPVC ball valves for hypochlorite service:
      a. Provide valve with factory drilled 0.125-inch hole in the upstream side of the ball.
      b. Provide an engraved plastic tag permanently attached to the valve stem stating, "One side of ball drilled for hypochlorite service".
      c. Provide an arrow inscribed on the valve body to indicate direction of flow.

2.04 PLASTIC BODY BALL VALVES – V-PORT (BAV50):

A. Provide proportional flow control ("V-port") ball valve when indicated on the Drawings.

B. Manufacturer and model shall be the following or equal:
   1. Hayward Flow Control CVH Series.

PART 3 EXECUTION

3.01 INSTALLATION

A. General: Install each type of valve in accordance with manufacturers' printed instructions.

3.02 COMMISSIONING

A. As specified in Section 01756 - Commissioning and this Section.

B. Manufacturer services:
   1. Provide certificates:
      a. Manufacturer's Certificate of Installation and Functionality Compliance.

C. Functional testing:
   1. Valves:
      a. Test witnessing: Witnessed.
      b. Conduct pressure and leak test, as specified in Section 15956 - Piping Systems Testing.

END OF SECTION

SECTION 15112

BUTTERFLY VALVES

PART 1 GENERAL

1.01 SUMMARY

A. Section includes: Butterfly valves:
   1. As specified in Section 15110 - Common Work Results for Valves.

1.02 REFERENCES

A. American Society of Mechanical Engineers (ASME):
   1. B16.1 - Cast Iron Pipe Flanges and Flanged Fittings, Classes 25, 125 and 250.
   2. B16.5 - Pipe Flanges and Flanged Fittings, NPS 1/2 through NPS 24.

B. American Water Works Association (AWWA):
   1. C110 - Standard for Ductile-Iron and Gray-Iron Fittings.
   2. C504 - Rubber-Seated Butterfly Valves.
   3. C540 - Standard for Power-Actuating Devices for Valves and Sluice Gates.
   4. C550 - Protective Interior Coatings for Valves & Hydrants.
   5. C606 - Standard for Grooved and Shouldered Joints.

C. ASTM International (ASTM):
   1. A126 - Standard Specification for Gray Iron Castings for Valves, Flanges, and Pipe Fittings.
   2. A216 - Standard Specification for Steel Castings, Carbon, Suitable for Fusion Welding, for Higher-Temperature Service.
   3. A276 - Standard Specification for Stainless Steel Bars and Shapes.
   4. A351 - Standard Specification for Castings, Austenitic, for Pressure-Containing Parts.
   5. A395 - Standard Specification for Ferritic Ductile Iron Pressure-Retaining Castings for Use at Elevated Temperatures.
   6. A479 - Standard Specification for Stainless Steel Bars and Shapes for Use in Boilers and Other Pressure Vessels.
   7. A515 - Standard Specification for Pressure Vessel Plates, Carbon Steel, for Intermediate - and Higher-Temperature Service.
   8. A516 - Standard Specification for Pressure Vessel Plates, Carbon Steel, for Moderate - and Lower-Temperature Service.
   9. A536 - Standard Specification for Ductile Iron Castings.
   10. A564 - Standard Specification for Hot-Rolled and Cold-Finished Age-Hardening Stainless Steel Bars and Shapes.
   11. A582 - Standard Specification for Free-Machining Stainless Steel Bars.

12. A743 - Standard Specification for Castings, Iron-Chromium, Iron-Chromium-Nickel, Corrosion Resistant, for General Application.
13. A890 - Standard Specification for Castings, Iron-Chromium-Nickel-Molybdenum Corrosion-Resistant, Duplex (Austenitic/Ferritic) for General Application.
14. B462 - Standard Specification for Forged or Rolled UNS N06030, UNS N06022, UNS N06035, UNS N06200, UNS N06059, UNS N10362, UNS N06686, UNS N08020, UNS N08024, UNS N08026, UNS N08367, UNS N10276, UNS N10665, UNS N10675, UNS N10629, UNS N08031, UNS N06045, UNS N06025, UNS R20033 Alloy Pipe Flanges, Forged Fittings, and Valves and Parts for Corrosive High-Temperature Service.
15. B584 - Standard Specification for Copper Alloy Sand Castings for General Applications.
16. B691 - Standard Specification for Iron-Nickel-Chromium-Molybdenum Alloys (UNS N08366 and UNS N08367) Rod, Bar, and Wire.
17. D429 - Standard Test Methods for Rubber Property-Adhesion to Rigid Substrate.

D. Compressed Gas Association (CGA):
   1. Standard G-4.1 - Cleaning Equipment for Oxygen Service.

E. United States Code of Federal Regulations (CFR):
   1. 21 - Food and Drugs.

1.03 SUBMITTALS

A. Submit as specified in Section 01330 - Submittal Procedures.

B. Product data: 15110 - Common Work Results for Valves:
   1. For general purpose AWWA butterfly valves, include description of the method of attachment of the disc edge to the valve disc.
   2. Interior epoxy coatings: Affidavit of compliance attesting that epoxy coatings applied to interior surfaces of butterfly valves comply with all provisions in accordance with AWWA C550.

C. Commissioning submittals:
   1. Provide Manufacturer’s Certificate of Installation and Functionality Compliance as specified in Section 01756 - Commissioning.

1.04 WARRANTY

A. Provide warranty as specified in Section 01783 - Warranties and Bonds.

PART 2 PRODUCTS

2.01 DESIGN AND PERFORMANCE CRITERIA

A. Design requirements:
   1. Valve pressure rating shall be greater than or equal to the piping system test pressure specified in the Piping Schedule at the maximum service temperature.
   2. General purpose AWWA butterfly valves:
      a. Design standard: Provide valves designed and manufactured in accordance with AWWA C504.
      b. Class:
         1) Provide butterfly valves in accordance with AWWA Class 150B, unless otherwise specified.
         2) Provide butterfly valves in accordance with AWWA Class 250B in piping systems with test pressure greater than 150 pounds per square inch gauge and less than 250 pounds per square inch gauge.
   3. High pressure butterfly valves:
   4. Piping systems designed for test pressures greater than 250 pounds per square inch gauge and less than 500 pounds per square inch gauge: Provide ASME B16.5, Class 300 flanged high pressure valves.
   5. Industrial class butterfly valves:
      a. Industrial class butterfly valves capable of 150 pounds per square inch gauge leak tight shut off.
   6. Stainless steel butterfly valves:
      a. Stainless steel butterfly valves capable of a minimum of 100 pounds per square inch gauge leak tight shut off and with special cleaning, packaging, and handling.

B. Usage:
   1. Provide and install butterfly valve types as outlined in the Butterfly Valve Application Schedule at the end of this Section.

C. Design requirements for all butterfly valves with power actuating devices:
   1. Design valves and actuators for maximum operating torque, in accordance with and using safety factors required in AWWA C540, using the following values:
      a. Maximum water velocity: 16 feet per second with valve fully open.
      b. Maximum pressure differential across the closed valve equal to the pressure class designation.
      c. Coefficient for seating and unseating torque, dynamic torque, and bearing friction in accordance with valve manufacturer's published recommendations.
   2. Valve disc: Seat in an angular position of 90 degrees to the pipe axis and rotate an angle of 90 degrees between fully open and fully closed positions:
      a. Do not supply valves with stops or lugs cast with or mechanically secured to the body of the valve for limiting the disc travel.
   3. Unacceptable thrust bearings: Do not provide valves with thrust bearings exposed to the fluid in the line and consisting of a metal bearing surface in rubbing contact with an opposing metal bearing surface.

D. Performance requirements:
   1. Tight shutoff at the pressure rating of the valve with pressure applied in either direction.
   2. Suitable for the following service conditions:
      a. Throttling.
      b. Frequent operation.
      c. Operation after long periods of inactivity.
      d. Installation in any position and flow in either direction.

2.02 GENERAL PURPOSE AWWA BUTTERFLY VALVES (BFV00)

A. Manufacturers: One of the following or equal:
   1. DeZURIK/Sartell Model BAW.
   2. Mueller/Pratt Co.

B. Valve body:
   1. Material: Cast iron, ASTM A126, Grade B, or ductile iron, ASTM A536, Grade 65-45-12.
   2. Body design:
      a. Flanged body valves:
         1) Usage: Comply with limitations specified in the Butterfly Valve Application Schedule.
         2) Flanges: In accordance with ASME B16.1 Class 125 flanges for Class 150B valves, in accordance with ASME B16.1 Class 250 flanges for Class 250B valves.
      b. Mechanical joint body valves:
         1) Usage: Comply with limitations specified in the Butterfly Valve Application Schedule.
         2) Mechanical joint design: In accordance with AWWA C110.
         3) When mechanical joint body valves are used, incorporate valve into thrust restraint analysis as specified in Section 15211 - Ductile Iron Pipe: AWWA C151. Utilize test pressure on one side of valve and zero pressure on the opposite side of the valve. Restrain pipe joints on both sides of valve as determined by thrust analysis calculations.
      c. Grooved end body valves:
         1) Usage: Butterfly valves with grooved ends may be used in piping systems specified in the Piping Schedule to have grooved end joints. Comply with additional limitations specified in the Butterfly Valve Application Schedule.
         2) Grooved end joint design: In accordance with AWWA C606.

C. Disc:
   1. Material: Cast iron or ductile iron with Type 316 stainless steel edge that matches seat in valve body.
   2. Secure valve disc to shaft by means of smooth-sided, taper or dowel pins, Type 316 stainless steel, or Monel.
   3. Extend pins through shaft and mechanically secure in place.

D. Shaft and bearings:
   1. Shaft design:
      a. Valves 20-inches and less: 1-piece, through disc design.
      b. Valves greater than 20-inch size: 2-piece, stub shaft design.
   2. Shaft seal: Vee type, chevron design.
   3. Shaft material for Class 150B valves: Type 316 stainless steel, ASTM A276.
   4. Shaft material for Class 250B valves: Type 17-4 pH stainless steel, ASTM A564.
   5. Shaft bearings: Self-lubricating sleeve type:
      a. Valves 20 inches and less: Nylatron.
      b. Valves greater than 20-inch size: Teflon™ with stainless steel or fiberglass backing.

E. Seats:
   1. Seat materials:
      a. In low-pressure air applications: EPDM.
      b. In digester gas applications: Teflon™.
      c. In all other applications: NBR, natural rubber, or EPDM.
   2. For valves 20 inches in nominal size and smaller, bond or vulcanize seat into the valve body.
   3. For valves 24 inches in nominal size and larger, retain seats mechanically or by adhesive:
      a. Mechanical retainage: Retain seat by a clamping ring with segmented clamping ring locks with adjusting locking screws.
         1) Clamping ring, ring locks, and adjusting locking screws: Type 316 stainless steel.
         2) Provide means to prevent ring locks and screws used to retain seats from loosening due to vibration or cavitation.
      b. Adhesive retainage: Inset the seat within a groove in the valve body and retain in place with epoxy injected behind the seat so that the seat expands into the body.
      c. Do not provide valves with seats retained by snap rings or spring-loaded retainer rings.
   4. Resilient seat: Withstand 75 pound per inch pull when tested in accordance with ASTM D429, Method B.

F. Valve packing:
   1. Valves 4 inches to 48 inches nominal size: Self-adjusting V-type packing or chevron-type packing. NBR or EPDM to match seat material.
   2. Valves 54 inches nominal size and larger: Adjustable V-type packing with bronze packing gland or self-adjusting V-type packing. NBR or EPDM to match seat material.

2.03 INDUSTRIAL CLASS BUTTERFLY VALVES (BFV05)

A. Manufacturers: One of the following or equal:
   1. DeZURIK Style BOS.
   2. Emerson-Keystone, Series GR.

B. Valve body:
   1. Pressure rating: 150 pounds per square inch gauge, minimum.
   2. Material: Cast iron, ASTM A126, Class B or Ductile Iron, ASTM A395, Grade 60/40/18.
   3. Body design: Lugged style body with drilled and tapped boltholes in accordance with ASME B16.1, Class 125 and Class 150 flange drilling dimensions.

C. Disc:
   1. Materials:
      a. Air and water service: Cast iron, ASTM A126, Class B or Ductile Iron, ASTM A536, Grade 65/45/12 or Type 316 stainless steel, ASTM A351, Grade CF8M.
      b. Natural gas and digester gas service: Type 316 stainless steel, ASTM A351, Grade CF8M.
   2. Disc edge: Nickel-plated when cast iron or ductile iron disc is used.

D. Shaft and bearings:
   1. Shaft: Type 316 stainless steel, ASTM A276 or Type 416 stainless steel, ASTM A582.
   2. Shaft bearings: Self-lubricating sleeve type, Teflon™ with stainless steel or fiberglass backing.

E. Disc pins: Secure valve disc to shaft by means of solid, smooth-sided, taper or dowel pins, Type 316 stainless steel:
   1. Extend pins through shaft and mechanically secure in place.

F. Seats:
   1. Material:
      a. In digester gas applications: Teflon™.
      b. In natural gas applications: Neoprene or Buna N.
      c. All other applications: EPDM.
   2. Seat retention ring, if used on larger sizes: Type 316 stainless steel or bronze, ASTM B584, with stainless steel fasteners. For all such valves, bond the seat to the retention ring.

G. Valve shaft packing:
   1. Natural gas and digester applications: Neoprene or Buna N.
   2. All other applications: EPDM or Teflon™.

2.04 HIGH PRESSURE BUTTERFLY VALVES (BFV20)

A. Manufacturers: One of the following or equal:
   1. Neles-Jamesbury, Series 800 Model D.

B. Valve body:
   1. Material: Carbon steel ASTM A515 or A516, Grade 70, or ASTM A216, WCB.
   2. Body design: Flanged, in accordance with ASME B16.5, Class 300 dimensions. Wafer and lugged style valves may not be used for high-pressure service.

C. Disc:
   1. Offset disc.
   2. Material: Type 316 stainless steel, ASTM A351, Grade CF-8M.

D. Shaft and bearings:
   1. Shaft: Type 316 stainless steel, ASTM A479 or Type 17-4 PH stainless steel, ASTM A564.
   2. Shaft bearings: Self-lubricating sleeve type; Teflon™ with stainless steel or fiberglass backing.

E. Disc pins: Secure valve disc to shaft by means of solid, smooth-sided, taper or dowel pins, Type 316 stainless steel or Monel:
   1. Extend pins through shaft and mechanically secure in place.

F. Seats:
   1. Material: Teflon™, or Teflon™ with titanium back-up ring.
   2. Seat retainer ring:
      a. If used on sizes above 20 inches: Type 316 stainless steel with stainless steel fasteners.
      b. Type 316 stainless steel for digester gas applications.
      c. For all such valves, bond the seat to the retention ring.

G. Valve shaft packing: Teflon™, chevron type design. Field adjustable and field replaceable.

2.05 COATING REQUIREMENTS FOR METAL VALVES

A. Shop coat interior and exterior metal surfaces of valves, except as follows:
   1. Interior machined surfaces.
   2. Surfaces of gaskets and elastomeric seats and stem seals.
   3. Bearing surfaces.
   4. Stainless steel surfaces and components.

B. Coating material for components in contact with potable water applications:
   1. Formulate interior coating material from materials in accordance with CFR 21, AWWA C550, and NSF 61.
   2. Submit affidavit of compliance attesting that epoxy coatings applied to interior surfaces of butterfly valves in accordance with CFR 21, AWWA C550, and NSF 61.

C. Interior surfaces:
   1. Interior surfaces, except for valves used in low-pressure air service: High solids epoxy as specified in Section 09960 - High-Performance Coatings, Attachment A - Coating Schedule.
   2. Interior surfaces of valves used in low-pressure air service: High temperature coating for range of 150 to 350 degrees Fahrenheit as specified in Section 09960 - High-Performance Coatings, Attachment A - Coating Schedule.

D. Exterior surfaces:
   1. Exterior surfaces of valves, actuators, and accessories coating as specified in Section 09960 - High-Performance Coatings, Attachment A - Coating Schedule for the following conditions:
      a. Submerged valves: High solids epoxy.
      b. Buried valves: Coal tar epoxy.
      c. Other valves: High solids epoxy with polyurethane topcoat.
   2. Polished and machined surfaces: Apply rust-preventive compound,
      a. Manufacturers: One of the following or equal:
         1) Houghton, Rust Veto 344.
         2) Rust-Oleum, R-9.

E. Field applied coatings of valve exterior:
   1. Match color and be compatible with manufacturer's coating system and as specified in Section 09960 - High-Performance Coatings.
      a. When shop applied finish coating matches field applied coating on adjacent piping, touch up shop coating in damaged areas in accordance with instructions recommended by the paint manufacturer.
      b. When shop applied coating does not match field coating on adjacent piping, or when damage has occurred to the shop applied coating that requires more than touchup, blast clean valve surfaces or utilize other surface preparation recommended by the manufacturer of the coating material and apply the coating system used for coating adjacent piping.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install valves with valve shafts horizontal, unless a vertical shaft is required to suit a particular installation, and unless a vertical shaft is indicated on the Drawings.

B. Install pipe spools or valve spacers in locations where butterfly valve disc travel may be impaired by adjacent pipe lining, pipe fittings, valves, or other equipment.

3.02 COMMISSIONING

A. As specified in Section 01756 - Commissioning and this Section.

B. Manufacturer services:
   1. Provide certificates:
      a. Manufacturer's Certificate of Installation and Functionality Compliance.

C. Functional testing:
   1. Valves:
      a. Test witnessing: Witnessed.
      b. Conduct pressure and leak test, as specified in Section 15110 - Common Work Results for Valves.

3.03 BUTTERFLY VALVE APPLICATION SCHEDULE

A. Acceptable butterfly valve types and body styles are listed in the Butterfly Valve Application Schedule provided at the end of this Section. Furnish and install butterfly valves in accordance with this Schedule.

BUTTERFLY VALVE APPLICATION SCHEDULE	
Valve Type and Style	**Acceptable Applications**
General Purpose AWWA Butterfly Valves - Flanged Body Design.	Aboveground or submerged in the following service applications only: - Acceptable in all service applications except oxygen and ozone service and high-pressure service. - May be used in buried applications when required by the specified piping system.
General Purpose AWWA Butterfly Valves - Mechanical Joint Body Design.	Buried in the following service applications only: - Acceptable in all service applications except oxygen and ozone service and high-pressure service.
General Purpose AWWA Butterfly Valves - Lugged Body Design.	Aboveground in the following service applications only: - Aeration Air Systems.
General Purpose AWWA Butterfly Valves - Wafer (not lugged) Body Design.	Not allowed.
General Purpose AWWA Butterfly Valves - Grooved End Body Design.	Aboveground, in sizes 20 inches and less, with piping system test pressure less than 100 psi, and in the following service applications only: - Acceptable in all service applications, except oxygen and ozone service, where piping for that service is specified in the Piping Schedule to have grooved end joints.

BUTTERFLY VALVE APPLICATION SCHEDULE	
Valve Type and Style	**Acceptable Applications**
High Pressure Butterfly Valves - Flanged Body Design.	Service applications with piping system test pressure greater than 250 psi. Acceptable in aboveground and buried installations.
High Pressure Butterfly Valves - Wafer or Lugged Wafer Body Design.	Not allowed.
Industrial Class Butterfly Valves - Lugged Body Design.	Aboveground in the following service applications only: - Aeration Air Systems. - Natural Gas Systems. - Digester Gas Systems. - Chilled and Hot Water Systems.
Industrial Class Butterfly Valves - Wafer (not lugged) Body Design.	Not allowed.
Stainless Steel Butterfly Valves - Lugged Body Design.	Aboveground in the following service applications only: - Oxygen Systems. -Ozone Systems.
Stainless Steel Butterfly Valves - Wafer (not lugged) Body Design.	Not allowed.

FV-87230	87M01, 85N01	Backwash Pump Station	14 in.
FV-87330	87M01, 85N01	Backwash Pump Station	8 in.
BFV-89111	89M01, 89N01	Carousel Pump Station	16 in.
BFV-91111	91M01, 91N01	PAU Pump Station	10 in.

Notes:
(1) Operator: CO = Hand crank operator with 2-inch AWWA nut for portable operator; HW = Handwheel; HC = Hand crank; MO = Motor Operator; MOD = Modulating Motor Operator; BS = Bench Stand; FS = Floor Stand; IFS = Interconnect Floor Stand; PS = Pedestal Support.

END OF SECTION

SECTION 15114

CHECK VALVES

PART 1 GENERAL

1.01 SUMMARY

A. Section includes requirements for:
   1. Center Guide (Silent) Check Valves
   2. Swing Check Valves:
      a. General Swing Check Valves.
      b. Cushioned Swing Check Valves.
   3. Dual Flapper Check Valves:
      a. Metal hinge.
      b. Elastomer hinge.
   4. High-Pressure Gas Check Valves.
   5. Titling (Slanting) Disc Check Valves.
   6. Ball Check Valves:
      a. Metal Body Ball Check Valves.
      b. Plastic Ball Check Valves.
   7. Angled Disc Rubber Flapper Check Valves.

1.02 REFERENCES

1.03 SUBMITTALS

A. Submit as specified in Section 01330 - Submittal Procedures.

B. Product data: As specified in Section 01600 - Product Requirements

C. Commissioning submittals:
   1. Provide Manufacturer's Certificate of Installation Compliance as specified in Section 01756 - Commissioning.

1.04 WARRANTY

A. Provide warranty as specified in Section 01783 - Warranties and Bonds.

PART 2 PRODUCTS

2.01 GENERAL

A. As specified in 01600 - Product Requirements and 15110 - Common Work Results for Valves.

B. Provide check valves as shown on the Check Valve Schedule and suitable for service:
   1. In either horizontal or vertical position.
   2. For working pressures up to 150 pounds per square inch.

C. Check valve materials as follows unless otherwise specified:
   1. Cast iron conforming to ASTM A126 Grade B.
   2. Ductile iron conforming to ASTM A536 Grade 65-45-12.
   3. T-303 stainless steel conforming to ASTM A582 (UNS S30300).
   4. Type 316 stainless steel conforming to ASTM A313.

D. Flanges: Drilled per ASME B16 Class 125/150 unless otherwise specified or indicated on the Drawings.

2.02 GENERAL SWING CHECK VALVES (CKV00)

A. Valves 1/4-inch through 3 inches:
   1. Manufacturers: One of the following or equal:
      a. Crane Valve Co., Number 36.
      b. Lunkenheimer Co., Figure 554Y.

2. Valve design:
    a. Y-pattern body with integral seat.
    b. Female threaded ends.
    c. Renewable hinged disc.
    d. Threaded cap for access to valve seat without disassembly of piping.
    e. Integral seats suitable for regrinding.
3. Materials:
    a. Body: Bronze in accordance with ASTM B62-83600.
    b. Disc Bronze ASTM B62 C92200:
        1) On valves less than 1-inch: Brass in accordance with ASTM B16.
    c. Hinge: Bronze in accordance with ASTM B584 C 87600.
    d. Lock nut and hinge pin plug: Brass in accordance with ASTM B16 HO2.
    e. Hinge pin: Stainless steel in accordance with ASTM A276.
    f. Cap: Bronze in accordance with ASTM B61 C92200.
    g. If used for steam service:
        1) Body and disc:S1 steam bronze in accordance with ASTM B61.

B. Valves 4 inches through 24 inches:
1. Manufacturers: One of the following or equal:
    a. Kennedy, Figure 106LW or M&H, Model 159.
    b. Mueller Co., Model A-2600.
    c. APCO Model 250.
    d. Crispin SWL Series.
2. Valve design:
    a. In accordance with AWWA C508.
    b. Constructed to permit top entry and removal of internal components without removing the valve.
    c. Equipped with outside lever and weight.
3. Materials:
    a. Body: Cast iron, ASTM A126 Class B or ASTM A536 Grade 65-45-12 Ductile Iron.
    b. Disc:
        1) Valve disc shall be ASTM A126 cast iron, ASTM A536 ductile iron, or ASTM B584 bronze.
        2) 4-inch valves: Bronze or stainless steel rings and seats.
        3) 6 inches and larger valves: Bronze-faced or stainless steel rings and seats.
        4) Rubber seat Buna-N or EPDM.
    c. Hinge pins: Stainless steel.

2.03 CUSHIONED SWING CHECK VALVES (CKV20)

A. Manufacturers: One of the following or equal:
1. Crispin:
    a. Series SWC-OC for valve sizes 4-inch to 10-inch.
    b. Series SWC-BD for valve sizes 12-inch to 36-inch.
2. APCO:
    a. Series 6100 for valve sizes from 4-inch to 10-inch.
    b. Series 6000BMB for valve sizes from 12-inch to 36-inch.

B. Valve design:
   1. Counterweight:
      a. Single counterweight on sizes 4 inches to 12 inches.
         1) Mounted on the valve side indicated in the Check Valve Schedule.
      b. Dual counterweights on sizes 14 inches and larger.
   2. Disc:
      a. Single top-shaft mount with machined pin.
      b. Dual device hinge pinning on linkage arm to disc pinning.
      c. Disc seat: Bolted in replaceable seat.
      d. Shaft packing seals on both ends of body casting or O-rings.
      e. Shaft pin-shaft design for full rating of the valve fully extended through valve cast on each end of body casting.
      f. Shaft minimum sizing is:

Valve Size (inch)	8	10	12	14	16	18	20	24	30	36
Shaft Size (inch)	1.75	2.125	2.5	3 10	3.5	3.75	4	3	3.75	4

   3. Bottom-mounted hydraulic oil cushion system:
      a. Totally enclosed oil-dampening chambers with external adjustment for closing speed to permit free opening and positive non-slam controlled closure of the disc:
         1) Hydraulic cushion shall make contact with the disc during the last 10 percent of closure to control the disc until shutoff.
      b. Externally adjustable to suit operating conditions.
      c. Removable without need to remove the entire valve:
         1) Oil system shall be totally independent from the main line to prevent corrosion or contamination to the process water, side-mounted oil reservoir to be oriented in the vertical position after valve installation.

C. Materials: Valve body, cover, and disc: Ductile iron:
   1. Disc seat: As indicated in the Check Valve Schedule.
   2. Shaft: T303 high-strength stainless steel.
   3. Seat pins and lock screws: Type 316 stainless steel.

2.04 CENTER GUIDE (SILENT) CHECK VALVES (CKV60)

A. Manufacturers: One of the following or equal:
   1. APCO, CSC 600A.
   2. Crispin, GC Series.

B. Valve design:
   1. Center-guided, spring-loaded plug.
   2. Replaceable seat and plug.
   3. Shaft guide bushing.
   4. Non-slam, silent shutoff.
   5. Flanged body.

C. Materials:
   1. Body: Cast iron, ASTM A126 Grade B, or Type 316 stainless steel, ASTM A313.
   2. Plug and seat: Bronze, ASTM B584 C83600.

3. Spring: Stainless steel, ASTM A313 Type 316.
4. Shaft and bushing: Bronze, ASTM B584 C83600.
5. Seat: Buna-N or EPDM.

D. Certified hydrostatic shell and seat test report.
1. Only for valves larger than 16 inch.

2.05 DUCKBILL CHECK VALVES

A. Manufacturers: One of the following or equal:
1. Tide Flex, Series TF-1.
2. Tide Flex, Series TF-2.
3. J&S Valve Hedflex.
4. Proco Products, Inc. 700 Series.

B. Design:
1. Maximum downstream head: 0 feet.
2. With internal pressure 1 to 2 inches w.c. above backpressure, bill of valve opens, allowing flow.
3. With backpressure 1 inches w.c. above internal pressure, bill of valve closes, preventing backflow.

C. End connection:
1. Flanged.

D. Materials of construction:
1. Single piece elastomer construction with internal polyester fabric reinforcing all vulcanized into a composite material.
a. Internal reinforcing sufficient to maintain structural integrity under the specified operating conditions.
b. Exterior applications require coating for UV protection and to resist pest gnawing.
2. Elastomeric material: EPDM.

2.06 INTERIOR PROTECTIVE LININGS

A. As shown in the valve schedules and in accordance with Section 15110 - Common Work Results for Valves.

PART 3 EXECUTION

3.01 INSTALLATION

A. Flapper-type check valves:
1. Install with proper orientation of flow direction arrow on valve body or as indicated in the Manufacturer’s Recommendation (Instruction).
2. When installed in horizontal pipelines, mount with shaft on vertical locations.

3. When mounted in a vertical pipeline, directly downstream of an elbow, mount with the shaft perpendicular to the outermost portion of the elbow.
4. Mount on downstream side of discharge silencer when used on positive displacement and centrifugal blowers.

3.02 COMMISSIONING

A. As specified in Section 01756 - Commissioning and this Section.

B. Manufacturer services:
   1. Provide certificates:
      a. Manufacturer's Certificate of Installation and Functionality Compliance.

C. Functional testing:
   1. Test witnessing: Witnessed.
   2. Conduct pressure and leak test, as specified in Section 15956 - Piping Systems Testing.

END OF SECTION

SECTION 15115

GATE, GLOBE, AND ANGLE VALVES

PART 1 GENERAL

1.01 SUMMARY

A. Section includes: Gate, globe (non-pilot controlled), and needle valves.

B. As specified in Section 15110 - Common Work Results for Valves.

1.02 REFERENCES

A. American Society of Mechanical Engineers (ASME):
   1. B16.5 - Pipe Flanges and Flanged Fittings: NPS 1/2 through NPS 24 inch Standard.
   2. B16.47 - Large Diameter Steel Flanges: NPS 26 through NPS 60 inch Standard.

B. American Water Works Association (AWWA):
   1. C515 - Standard for Reduced-Wall, Resilient-Seated Gate Valves for Water Supply Services.
   2. C 550 - Protective Interior Coatings for Valves and Hydrants.

C. ASTM International (ASTM):
   1. B98 - Standard Specification for Copper-Silicon Alloy Rod, Bar, and Shapes.

1.03 SUBMITTALS

A. Submit as specified in Section 01330 - Submittal Procedures.

B. Product data: As specified in Section 15110 - Common Work Results for Valves.

C. Commissioning submittals: For valves larger than 16 inches:
   1. Provide Manufacturer's Certificate of Installation and Functionality Compliance as specified in Section 01756 - Commissioning.

1.04 WARRANTY

A. Provide warranty as specified in Section 01783 - Warranties and Bonds.

B. Interior epoxy coatings: Affidavit of compliance attesting that epoxy coatings applied to interior surfaces of valves comply in accordance with all provisions of AWWA C550.

PART 2 PRODUCTS

2.01 GATE VALVES - GENERAL SERVICE (GV00)

A. Gate valves aboveground:
   1. Valves less than 3 inches in size for clean water and air service:
      a. Manufacturers: One of the following or equal:
         1) Crane, Figure 431.
         2) Jenkins, Figure 47.
         3) Lunkenheimer Co., Figure 2151.
      b. Design:
         1) Size and configuration: Indicated on the Drawings.
         2) Manufacturer's standard bronze, solid wedge disc, rising stem, screwed end, Class 150 pounds.
   2. Valves 3 inches in size and larger, single disk:
      a. Manufacturers: One of the following or equal:
         1) M&H/Kennedy Valve Co.
         2) Mueller.
         3) American Flow Control, Series 2500.
      b. Design:
         1) Size, material, configuration: Indicated on the Drawings.
         2) Resilient wedge type in accordance with AWWA C515.
         3) Flange, iron body, and bonnet rated for 200-pound working pressure:
            a) Provide O-ring seal between valve body and bonnet.
         4) Ductile or cast iron wedge encapsulated in nitrile rubber and capable of sealing in either flow direction.
         5) Bronze stem with double or triple O-ring or braided packing stem seals.
         6) Rising stem configuration with handwheel diameter sized to allow opening of valve with no more than a 40-pound pull.
         7) Coat interior and exterior surfaces of valve body and bonnet with fusion-bonded epoxy in accordance with AWWA C550.
   3. Valves 3 inches in size and larger, double disc:
      a. Flanged.
      b. Materials:
         1) 200-pound iron body.
         2) Bronze mounted.
      c. Configuration:
         1) Outside screw and yoke (OS&Y).
         2) with stems of silicon bronze in accordance with ASTM B98, Alloy No. C66100.
      d. Inside configuration:
         1) Double disc; parallel seat.
         2) Handwheel.
      e. Manufacturers: One of the following or equal:
         1) M&H Valve Co., Figure 68-02.
      f. Design:
         1) Size, material, configuration: Indicated on the Drawings.

B. Gate valves underground:
   1. Manufacturers: One of the following or equal:
      a. M&H/Kennedy Valve Co.
      b. Mueller Co.
      c. American Flow Control.
   2. Design:
      a. Size, material, configuration: Indicated on the Drawings.
      b. Resilient wedge type in accordance with AWWA C515.
      c. Stem:
         1) Iron body, resilient seat, non-rising stem, double O-ring stem seal.
         2) Rising stem configuration with handwheel diameter sized to allow opening of valve with no more than a 40-pound pull.
      d. Ductile or cast iron wedge encapsulated in nitrile rubber and capable of sealing in either flow direction.
      e. Bronze stem with double or triple O-ring or braided packing stem seals.
      f. Coat interior and exterior surfaces of valve body and bonnet with fusion-bonded epoxy in accordance with AWWA C550.
      g. Valve operator: Provide standard AWWA 2-inch operating nut, matching valve key, and valve box for operating stem.

2.02 GATE VALVES - STEAM AND CONDENSATE SERVICE(GV20)

A. Valves 3 inches and smaller in size:
   1. Manufacturers: One of the following or equal:
      a. Crane, No. 428.
      b. Jenkins, Figure 47U.
      c. Lunkenheimer Co., Figure 2127.
   2. Design:
      a. Size and configuration: Indicated on the Drawings.
      b. Bronze, screwed, rising stem, solid wedge, screwed bonnet, suitable for service under pressures equal to and less than 125 pounds per square inch gauge, steam working pressure (SWP).

B. Valves larger than 3 inches in size:
   1. Manufacturers: One of the following or equal:
      a. Crane No. 465-1/2.
      b. Jenkins, Figure 651C.
      c. Lunkenheimer Co., Figure 1430.
   2. Design:
      a. Size and configuration: Indicated on the Drawings.
      b. Suitable for service under pressures equal to and less than 125 pounds per square inch gauge, steam working pressure (SWP), flanged, iron body, bronze mounted, solid wedge, outside screw and yoke (OS&Y).

2.03 KNIFE GATE VALVES (GV60)

A. Manufacturers: One of the following or equal:
   1. Non-AIS compliant valves:
      a. Dezurick KGC series.
      b. ITT Fabri-Valve, Standard C37.
      c. Pentair, Figure PCS17.

2. AIS compliant valves:
    a. ITT Fabri-Valve, C37.
    b. Dezurick Hilton, H-200 Series.

B. Design:
1. Size and configuration: Indicated on the Drawings.
2. Suitable for service under pressures equal to and less than 150 pounds per square inch gauge
3. Full round port, metal or resilient seated, raised face design.
4. Flanged wafer design drilled and tapped to ASME Class 125/150 standard. Face-to-face dimension shall meet MSS SP-81 for knife gate valves ASME B16.5 class 150, 2 to 24 inches or ASME 16.47 Series A class 150, 26 to 48 inches
5. Rounded gate with beveled edge, finish-ground to 32 RMS, maximum, on both sides. The bottom edge shall have a beveled knife edge.
6. Body to incorporate guides and jams to assist in seating.
7. Packing shall consist of multiple layers of packing.
8. Materials:
    a. Body: Cast or ductile iron or cast steel, with Type 316 stainless steel lining or cast Type 316 stainless steel or 2205 Duplex.
    b. Wetted components (including gate): Type 316 stainless steel or 2205 Duplex.
    c. Seat: Metal or NBR, EPDM, CR, Viton™.
    d. Yoke sleeve: Acid resisting bronze or aluminum bronze.
    e. Packing: PTFE.
    f. Packing gland: Match valve body material.
    g. Yoke: Type 304 stainless steel.
    h. Fasteners: Shall be stainless steel.
9. Outside screw and yoke (OS&Y) with handwheel operator.

2.04 GLOBE VALVES, NON-PILOT-CONTROLLED (GLV00 AND GLV 20)

A. Globe valves, non-pilot controlled, general (GLV00):
1. Valves 3 inches and smaller:
    a. Manufacturers: One of the following or equal:
        1) Except in welded steel piping:
            a) Crane, No. 1 Globe or No. 2 Angle.
            b) Lunkenheimer Co. Figure No. 2140 Globe or No. 2141 Angle.
        2) In Welded steel piping:
            a) Crane, No. 351.
            b) Lunkenheimer Co., Figure No. 1123; or equal with flanged ends.
    b. Design:
        1) Size and configuration: Indicated on the Drawings.
        2) Valve: Class 125 threaded ends, rated for 250 degrees Fahrenheit at pressure of 170 pounds per square inch.
2. Valves larger than 3 inches:
    a. Manufacturers: One of the following or equal:
        1) Crane, No. 351.
        2) Lunkenheimer Co., Figure No. 1123.
    b. Design:
        1) Size and configuration: Indicated on the Drawings.

B. Globe valves, non-pilot controlled, plug disc type for throttling or severe service (GLV20):
    1. Manufacturers: One of the following or equal:
        a. Crane, No. 212P or No. 384P.
        b. Lunkenheimer Co., 72-PS or 73-PS1.
    2. Design:
        a. Size and configuration: Indicated on the Drawings.
            1) Material: Iron body stainless steel trimmed plug type seat and disc.

C. Hose valves:
    1. Manufacturers:
        a. Globe threaded valve: One of the following or equal:
            1) Crane, No. 7TF.
            2) Stockham, Figure No. B22T.
        b. Angle threaded valve: One of the following or equal:
            1) Crane, No. 17TF.
            2) Stockham, Figure No. B222T.
    2. Design:
        a. Size and configuration: Indicated on the Drawings.
        b. Valve: Globe or angle valve with threaded ends.
        c. Disc: Renewable, made of Teflon™ or Buna-N.
        d. Threaded ends rated for a pressure of 200 pounds per square inch.

D. Yard hydrants:
    1. Freezeless yard hydrant:
        a. Manufacturers: One of the following or equal:
            1) Kupferle Foundry Co.
                a) No. 1 Total Eclipse Yard Hydrant - 3/4-inch and 1 inch.
            2) Murdock Company:
                a) No. M-75 - 3/4-inch or No. M100 - 1 inch.
            3) Zurn Company:
                a) No. 1385 - 3/4-inch or 1 inch.
        b. Design:
            1) Self-draining, non-freezing, compression type.
                a) Inlet connection size: Indicated on the Drawings.
                b) Outlet connection size: Indicated on the Drawings.
                c) Materials:
                    (1) Exterior casing pipe material: Indicated on the Drawings.
                    (2) Interior operating rod material: Indicated on the Drawings.
                    (3) Casing guard material: Indicated on the Drawings.
                    (4) Principal interior operating parts material: brass and/or bronze and removable from yard hydrant for servicing without excavation.
                d) Provide 4 Spoke, Ball Wheel Handle operated.
    2. Freezeless post hydrants (HYD01):
        a. Manufacturers: The following or equal:
            1) Kupferle Foundry Co.:
                a) No. 2 Eclipse Post Hydrant.
            2) Mueller Co.:
                a) No. A-411 Post Hydrant.

3) Murdock Co.:
    a) No. M-200 Post Hydrant.

b. Design:
    1) Self-draining, non-freezing, compression type with a 2-3/16-inch valve opening.
    2) Inlet connection size: Indicated on the Drawings.
    3) Outlet connection size: Indicated on the Drawings.
    4) Materials:
        a) Exterior casing pipe material: Indicated on the Drawings.
        b) Interior operating rod material: Indicated on the Drawings.
        c) Top stock material: Indicated on the Drawings.
        d) Principal interior operating parts material: Brass and/or bronze and removable from hydrant for servicing without excavation.
    5) Provide 1-1/2-inch pentagon operating nut operated by a hydrant wrench or 10-inch hand wheel:
        a) Manufacturers: The following or equal:
            (1) Kupferle Foundry Co.

2.05 NEEDLE VALVES (NV00)

A. Manufacturers: One of the following or equal:
    1. Powell, Figure No. 180.
    2. Lunkenheimer Co., Figure No. 906-BS or No. 907-BS.
    3. Crane No. 88 or No. 89.

B. Design:
    1. Size and configuration: Indicated on the Drawings.

PART 3 EXECUTION

3.01 INSTALLATION

A. Mount yard hydrants on minimum 1-inch supply pipe or size indicated on the Drawings.

B. Mount Post hydrants on minimum 2-inch supply pipe or size indicated on the Drawings.

C. Set yard and post hydrants in 4 cubic feet of 3/4-inch minimum crushed stone surrounding valve body to allow for proper drainage.
    1. Install in accordance with AWWA recommendations for hydrants.

3.02 COMMISSIONING

A. As specified in Section 01756 - Commissioning and this Section.

B. Manufacturer services: For valves larger than 16-inches.
    1. Provide certificates:
        a. Manufacturer’s Certificate of Installation and Functionality Compliance.

C. Functional testing:
    1. Valves:
        a. Test witnessing: Witnessed.
        b. Conduct pressure and leak test as specified in Section 15110 - Common Work Results for Valves.

END OF SECTION

SECTION 15116

PLUG VALVES

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Non-lubricated plug valves.
   2. Lubricated plug valves.
   3. Multi-port plug valves.

1.02 REFERENCES

A. American Water Works Association (AWWA):
   1. C517 - Resilient-Seated Cast Iron Eccentric Plug Valves.
   2. C606 - Grooved and Shouldered Joints.

B. ASTM International (ASTM):
   1. A126 - Standard Specification for Gray Iron Castings for Valves, Flanges, and Pipe Fittings.
   2. A536 - Standard Specification for Ductile Iron Castings.

1.03 SUBMITTALS

A. Submit as specified in Section 01330 - Submittal Procedures and 15110 - Common Work Results for Valves.

B. Product data as defined in 01600 - Product Requirements.

C. Shop drawings showing installation arrangement of major component assemblies.

D. Calculations.

E. Vendor operation and maintenance manual as specified in Section 01782 - Operation and Maintenance Data.

F. Commissioning submittals:
   1. Provide Manufacturer's Certificate of Source Testing as specified in Section 01756 - Commissioning:
      a. Interior coating.
   2. Provide Manufacturer's Certificate of Installation and Functionality Compliance as specified in Section 01756 - Commissioning.

1.04 WARRANTY

A. Provide warranty as specified in Section 01783 - Warranties and Bonds.

PART 2 PRODUCTS

2.01 GENERAL

A. As specified in Section 01600 - Product Requirements and Section 15110 - Common Work Results for Valves.

2.02 NON-LUBRICATED PLUG VALVES (PV00)

A. Manufacturers: One of the following or equal:
   1. DeZurik, "PEC".
   2. Clow Valve.
   3. Milliken Valve, Model 600/601.

B. Design:
   1. Type: Non-lubricated eccentric type, in accordance with AWWA C517.
   2. Plug face: Resilient material that operates satisfactorily at a temperature of 180 degrees Fahrenheit continuous and 215 degrees Fahrenheit intermittent, except for valves in compressed air or digester gas service.
      a. Valves in compressed air service: Resilient material suitable for continuous duty at 250 degrees Fahrenheit.
      b. Valves in digester gas service: Resilient material suitable for petroleum or digester gas at continuous duty at 180 degrees Fahrenheit.
   3. Compression washer: Provide flat compression washer made of Teflon™, or of a material having equal physical characteristics on valve stem between plug and bonnet.
   4. Stem seals: Provide stem seals serviceable without unbolting the valve bonnet assembly.
   5. Grit excluders: Provide PTFE grit excluders at upper plug journals to prevent entry of foreign solids in bearing area.
   6. Clearly mark valves to indicate their open and closed positions.
   7. Provide valves with ends as required by piping details indicated on the Drawings.
      a. Grooved end body valves:
         1) Usage: Plug valves with grooved ends may be used in piping systems specified in the Piping Schedule to have grooved end joints and as indicated on the Drawings.

C. Materials:
   1. Body and plug: ASTM A126, Class B, cast-iron, with plug face of Viton™ material suitable for the intended service as specified under paragraph "Design" above.
   2. Body seats in valves 3 inch size and larger: Provide with overlay of not less than 90-percent nickel and minimum thickness of 1/8-inch on surfaces contacting the plug face.
   3. Stem bearing and bottom bearing: Type 316 stainless steel.
   4. Internal parts, except the body and plug: Type 316 stainless steel.
   5. Exposed nuts, bolts, and washers: Zinc plated. Exception: Exposed nuts, bolts, and washers for buried service: Stainless steel.

2.03 NON-LUBRICATED PLUG VALVES, FULL PORT (PV05)

A. Manufacturers: One of the following or equal:
   1. DeZurik, PEF.
   2. Clow Valve.
   3. Milliken, 601F/600F.

B. Design:
   1. Type: Non-lubricated eccentric type, in accordance with AWWA C517.
   2. Plug face: Resilient material that operates satisfactorily at a temperature of 180 degrees Fahrenheit continuous and 215 degrees Fahrenheit intermittent, except for valves in compressed air or digester gas service.
      a. Valves in compressed air service: Resilient material suitable for continuous duty at 250 degrees Fahrenheit.
      b. Valves in digester gas service: Resilient material suitable for petroleum or digester gas at continuous duty at 180 degrees Fahrenheit.
   3. Compression washer: Provide flat compression washer made of Teflon™, or of a material having equal physical characteristics on valve stem between plug and bonnet.
   4. Stem seals: Provide stem seals serviceable without unbolting the valve bonnet assembly.
   5. Grit excluders: Provide PTFE grit excluders at upper plug journals to prevent entry of foreign solids in bearing area.
   6. Clearly mark valves to indicate their open and closed positions.
   7. Provide valves with ends as required by piping details indicated on the Drawings.
      a. Grooved end body valves:
         1) Usage: Plug valves with grooved ends may be used in piping systems specified in the Piping Schedule to have grooved end joints and as indicated on the Drawings.
         2) Grooved end joint design: In accordance with AWWA C606.

C. Materials:
   1. Body and plug: ASTM A126, Class B, cast-iron, with plug face of Viton™ material suitable for the intended service as specified under paragraph "Design" above.
   2. Body seats in valves 3 inch size and larger: Provide with overlay of not less than 90-percent nickel and minimum thickness of 1/8-inch on surfaces contacting the plug face.
   3. Stem bearing and bottom bearing: Type 316 stainless steel.
   4. Internal parts, except the body and plug: Type 316 stainless steel.
   5. Exposed nuts, bolts, and washers: Zinc plated. Exception: Exposed nuts, bolts, and washers for buried service: Stainless steel.

2.04 LUBRICATED PLUG VALVES (PV60)

A. Manufacturers: One of the following or equal:
   1. Nordstrom, Super Nordstrom.
   2. Walworth.

B. Type: Semi-steel tapered plug valves.

C. Design:
   1. Plug removable through top of valve.
   2. Combined lubricant screw and grease gun fitting, of the type where the pressure of the grease can be used to raise the plug slightly off its seat.

D. Where indicated on the Drawings or specified, provide plug valves with high head extension and floor stand with indicator. Provide worm gear-operated valves with worm shaft extension and floor stand, and with indicator supplied by manufacturer of plug valve:
   1. Equip floor stands serving plug valves with individual operating wrenches.

2.05 MULTI-PORT PLUG VALVES FOR SLUDGE SERVICE (PV80)

A. Manufacturers: One of the following or equal:
   1. DeZurik, PTW, for 3-way valve, and PFW for 4-way valve.
   2. Milliken, equivalent product.

B. Design: Non-lubricated tapered plug type including plugs faced with neoprene, body of cast iron, and stainless steel bearings in the upper and lower journal areas.

C. Furnish valves with single, double, or transfer style plug as indicated on the Drawings or as required.

2.06 VALVE OPERATORS

A. Furnish valves with an operating wrench or worm gear operator:
   1. Equip valves 4-inch nominal size and smaller with a lever operator.
   2. Equip valves 6-inch nominal size and larger with a worm gear operator.

2.07 COATING

A. Coat and test interior metal surfaces as specified in Section 15110 - Common Work Results for Valves.

B. Field applied coating of valve exterior:
   1. Match color and be compatible with manufacturer’s coating system and as specified in Section 09960 - High-Performance Coatings.
      a. When shop applied finish coating matches field applied coating on adjacent piping, touch up shop coating in damaged areas in accordance with instructions recommended by the paint manufacturer.
      b. When shop applied coating does not match field coating on adjacent piping, or when damage has occurred to the shop applied coating that requires more than touchup, blast clean valve surfaces or utilize other surface preparation recommended by the manufacturer of the coating material and apply the coating system used for coating adjacent piping.

2.08 SHIPMENT, SPARE PARTS, MAINTENANCE PRODUCTS, AND SPECIAL TOOLS

A. As specified in Section 01600 - Product Requirements.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install valves as specified in Section 15110 - Common Work Results for Valves and the manufacturer's instructions.
   1. Unless differently indicated on the Drawings install valves so that in the closed position the pressure in the pipeline applies a seating head on the valves.
   2. Install valves so that in the open position the plug is located in the top half of the valve body.

B. For valves requiring lubrication: Lubricate and fill extended lubricant pipes with lubricant suitable for service intended.

3.02 COMMISSIONING

A. As specified in Section 01756 - Commissioning and this Section.

B. Manufacturer services:
   1. Provide certificates:
      a. Manufacturer's Certificate of Installation and Functionality Compliance.

C. Functional testing:
   1. Valves:
      a. Test witnessing: Witnessed.
      b. Conduct pressure and leak test as specified in Section 15110 - Common Work Results for Valves.

END OF SECTION

SECTION 15117

SPECIALTY VALVES

PART 1 GENERAL

1.01 SUMMARY

A. Section includes: Specialty valves.

B. As specified in Section 15110 - Common Work Results for Valves.

1.02 REFERENCES

A. American Society of Civil Engineers (ASCE):
   1. 25 - Earthquake-Actuated Automatic Gas Shutoff Devices.

C. American Water Works Association (AWWA):
   1. C511 - Standard for Reduced Pressure-Principle Backflow-Prevention Assembly.
   2. C800 - Underground Service Line Valves & Fittings (Also Included: Collected Standards For Service Line Materials).

D. ASTM International (ASTM):
   1. A48 - Standard Specification for Gray Iron Castings.
   2. A126 - Standard Specification for Gray Iron Casting for Valves, Flanges, and Pipe Fittings.
   3. A276 - Standard Specification for Stainless Steel Bars and Shapes.
   4. A536 - Standard Specification for Ductile Iron Castings.
   5. B584 - Standard Specification for Copper Alloy Sand Castings for General Application.

E. National Electrical Manufacturers Association (NEMA):
   1. 250 - Enclosures for Electrical Equipment (1000 V Maximum).

1.03 SUBMITTALS

A. Submit as specified in Section 01330 - Submittal Procedures.

B. Product data: As specified in Section 15110 - Common Work Results for Valves.

C. Commissioning submittals:
   1. Backflow preventer certification.
   2. Provide Manufacturer’s Certificate of Installation and Functionality Compliance as specified in Section 01756 - Commissioning.

1.04 WARRANTY

A. Provide warranty as specified in Section 01783 - Warranties and Bonds.

PART 2 PRODUCTS

2.01 RESERVOIR (ALTITUDE) CONTROL VALVES

A. Manufacturers: One of the following or equal:
   1. ~~Cla~~Cal-Val Co., 131-0~~6~~6.[AD5]

B. Operation:
   1. Altitude control: Close at high water level and allow filling at levels less than high water level.
      a. Range of height control: 1 to 25.
      b. Factory setting of the valve shall be 24.5 feet.
   2. Flow direction: 1 way.
   3. Pressure reducing control: Reduce pressure on downstream side of valve.
      a. Valve factory setting: 30 feet.
      b. Pressure reducing setting shall be manually adjustable.
   4. Suitable at rated working pressure of 250 pounds per square inch.

C. Design:
   1. Maximum pressure: 250 pound per square inch.
      a. Valve Manufacturer to provide anti-cavitation trim if pressure drop causes cavitation.
   2. Maximum continuous flow: 1,400 gallons per minute.
   3. Minimum continuous flow: 600 gallons per minute.
   4. Pattern: Globe.
   5. Control:
      a. Hydraulic pilot control, valve shall have solenoid pilot override; coordinate with electrical drawings for details of override control.
      b. Valve shall close when high level has been reached, and shall open when a lower set point has been reached:
         1) Initial setpoint: 1 to 26 feet.
      c. Valve shall have the ability to modulate to maintain desired flow through valve.
         1) Flow rate shall be adjustable in SCADA.
   6. Pilot valve strainer.
   7. Adjustable pilot valve with stainless steel trim.
   8. Flanged ends.
   9. Reservoir sensing line: Shall be minimum 3/4-inch copper tubing.
   10. Electric Valve position indicator.
   11. Pilot insulation. Provide insulation to protect control valve pilots from freezing.

D. Materials:
   1. Valve body: Cast or ductile iron.
   2. Body trim: Bronze.
   3. Stem, nut, and spring: Type 303 stainless steel.
   4. Disc guide, seat and cover bearing: Type 304 or Type 316 stainless steel.
   5. Diaphragm: Buna-N rubber.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install as specified in Section 15110 - Common Work Results for Valves in accordance with manufacturer's published instructions.

B. Install with a minimum clearance of 12 inches and with maximum clearance of 30 inches between the relief port and the floor or finished grade or top of containment wall.

C. Plastic body diaphragm valves for sodium hypochlorite service:
   1. When valves are installed horizontally, install valves with valve stem position rotated as necessary such that no internal valve obstruction prevents the passage of vapors traveling along the top of adjacent piping from traveling through the valve.

D. Backflow preventers:
   1. Install with a minimum clearance of 12 inches and with maximum clearance of 30 inches between the relief port and the floor or finished grade or top of containment wall.
   2. Install with sufficient side clearance for access for testing and maintenance.

3.02 COMMISSIONING

A. As specified in Section 01756 - Commissioning and this Section.

B. Manufacturer services:
   1. Provide certificates:
      a. Manufacturer’s Certificate of Installation and Functionality Compliance.
   2. Manufacturer’s Representative onsite requirements:
      a. For the following valves:
         1) Altitude valves and flow control valves.
      b. Installation: 1 trip, 1 day minimum.
      c. Functional Testing: 1 trip, 1 day minimum each.
      d. Training:
         1) Maintenance: 2 hours per session, 2 sessions.
         2) Operations: 2 hours per session, 2 sessions.

C. Functional testing:
    1. Altitude valves:
        a. Test witnessing: Witnessed.
        b. Conduct pressure and leak test as specified in Section 15110 - Common Work Results for Valves.
    2. Flow control valves:
        a. Test witnessing: Witnessed.
        b. Conduct pressure and leak test as specified in Section 15110 - Common Work Results for Valves.

END OF SECTION

[AD5] Addendum No. 5

SECTION 15118

PRESSURE CONTROL VALVES

PART 1 GENERAL

1.01 SUMMARY

A. Section includes: Pressure reducing and pressure relief valves for water, air, sludge, and chemical service.

B. As specified in Section 15110 - Common Work Results for Valves.

1.02 REFERENCES

A. American Society of Mechanical Engineers (ASME):
   1. B16.42 - Ductile Iron Pipe Flanges and Flanged Fittings: Classes 150 and 300.

B. ASTM International (ASTM):
   1. A536 - Standard Specification for Ductile Iron Castings.

C. Underwriters Laboratories, Inc. (UL).

1.03 SUBMITTALS

A. Submit as specified in Section 01330 - Submittal Procedures.

B. Product data: As specified in Section 15110 - Common Work Results for Valves.

C. Commissioning submittals:
   1. Provide Manufacturer's Certificate of Installation and Functionality Compliance as specified in Section 01756 - Commissioning.

1.04 WARRANTY

A. Provide warranty as specified in Section 01783 - Warranties and Bonds.

PART 2 PRODUCTS

2.01 METAL BODY PRESSURE REDUCING VALVES - WATER SERVICE (PRV00)

A. Metallic pressure reducing valves for water service, 2 1/2 inches and smaller:
   1. Manufacturers: One of the following or equal:
      a. Watts, Series LF223.
      b. Zurn Wilkins, 500 Series.
   2. Direct operated, single seat type pressure reducing valve.
   3. Downstream pressure adjustment range: 30 to 300 pounds per square inch gauge (psig).

4. Materials:
    a. Body and spring cover: Bronze or brass alloy meeting the zinc and aluminum requirements of Section 15110 - Common Work Results for Valves.
    b. Valve seat: Series 300 stainless steel.
    c. Diaphragm: Match the gasket/elastomer material of the corresponding piping system, as specified in the Piping Schedule.
    d. Disk: Match the gasket/elastomer material of the corresponding piping system, as specified in the Piping Schedule.

B. Metallic pressure reducing valves for water service, 3 inches and larger:
1. Manufacturers: One of the following, or equal:
    a. Watts, Ames Fire & Waterworks ACV Series LF910GD.
    b. Cla-Val Model 90-01.
2. Design:
    a. Pilot controlled, hydraulically operated, diaphragm actuated, globe patterned valve.
    b. Rated for the test pressure of the corresponding piping system, as specified in the Piping Schedule.
    c. Downstream pressure adjustment range: 30 to 300 psig.
    d. Pilot line: Equipped with a strainer.
    e. Flanges: Class 150, in accordance with ASME B16.42.
3. Materials:
    a. Body and cover: Ductile Iron ASTM A536.
    b. Valve trim: Bronze.
    c. Pilot control: Cast bronze with Type 303 stainless steel trim.
    d. Diaphragm: Match the gasket/elastomer material of the corresponding piping system, as specified in the Piping Schedule.

2.02 METAL BODY PRESSURE RELIEF AND BACKPRESSURE SUSTAINING VALVES - WATER SERVICE (PRV20)

A. Metallic pressure relief valves for water service, 1 inches and smaller:
1. Manufacturers: One of the following, or equal:
    a. Cla-Val Model CRL-60.
2. Design:
    a. Direct-acting, spring loaded, diaphragm type relief valve.
    b. Pressure relief adjustment range: 20 to 200 psig.
3. Materials:
    a. Body and spring cover: Bronze or brass alloy meeting the zinc and aluminum requirements of Section 15110 - Common Work Results for Valves.
    b. Valve seat: Type 303 stainless steel.
    c. Diaphragm: Match the gasket/elastomer material of the corresponding piping system, as specified in the Piping Schedule.
    d. Disk: Match the gasket/elastomer material of the corresponding piping system, as specified in the Piping Schedule.

B. Metallic pressure relief valves for water service, 1 1/2 inches and larger:
   1. Manufacturers: One of the following, or equal:
      a. Watts, Ames Fire & Waterworks ACV Series LF920GD.
      b. Cla-Val Model 50-01 KO.
   2. Design:
      a. Pilot controlled, hydraulically operated, diaphragm actuated, globe patterned valve.
      b. Rated for 125 pounds per square inch gauge, minimum, or higher pressure rating if necessary to meet the test pressure of the corresponding piping system, as specified in the Piping Schedule.
      c. Pressure relief adjustment range: 20 to 200 psig.
      d. Pilot line: Equipped with a strainer.
      e. End connections:
         1) 2 1/2 inch and smaller: Screwed.
         2) 3 inch and larger: Class 150 flanges in accordance with ASME B16.42.
      f. Anti-cavitation trim.
   3. Materials:
      a. Body and cover: Ductile Iron ASTM A536.
      b. Valve trim: Bronze.
      c. Pilot control: Cast bronze with Type 303 stainless steel trim.
      d. Diaphragm: Match the gasket/elastomer material of the corresponding piping system, as specified in the Piping Schedule.

2.03 PLASTIC BODY PRESSURE REDUCING VALVES - CHEMICAL OR WATER SERVICE (PRV40)

A. Manufacturers: One of the following or equal:
   1. Plast-O-Matic: Series PRHM.

B. Materials:
   1. Valve body:
      a. PVC piping systems: PVC.
      b. CPVC piping systems: CPVC.
      c. HDPE and PE piping systems: PVC.
   2. U-cups:
      a. Match gasket/elastomer material of corresponding piping system, as indicated on the Piping Schedule.
   3. Non-wetted metallic components: Stainless steel.

C. Design:
   1. Diaphragm type.
   2. Pressure rating: Not less than 150 pounds per square inch.
   3. In-line or angle pattern design, size as indicated on the Drawings.
   4. End connections: Threaded.
   5. Downstream pressure set point:
      a. Externally adjustable without removing valve from piping system.
      b. Adjustable from 5 to 125 psig.

2.04 PLASTIC BODY PRESSURE RELIEF VALVES FOR CHEMICAL OR WATER SERVICE (PRV24)

A. Manufacturers: One of the following or equal:
   1. Plast-O-Matic, Series RVT, RVDT or TRVDT.
   2. Asahi/America.
   3. Georg Fischer Piping Systems.

B. Materials:
   1. Valve body:
      a. PVC piping systems: PVC.
      b. CPVC piping systems: CPVC.
      c. HDPE and PE piping systems: PVC.
   2. U-cup seals:
      a. Match gasket/elastomer material of corresponding piping system, as specified in the Piping Schedule.
   3. Adjusting bolt, locknut, control spring and fasteners: stainless steel.

C. Design:
   1. Pressure rating: Not less than 150 pounds per square inch.
   2. In-line or angle pattern design, size as indicated on the Drawings.
   3. End connections:
      a. 1 inch and smaller: Threaded.
      b. Larger than 1 inch: Flanged.
   4. Relief set point:
      a. Externally adjustable without removing valve from piping system.
      b. Adjustment range:
         1) Valve sizes 2 inches and smaller: 5 to 125 psig.
         2) Valve sizes 3 inches and larger: 5 to 100 psig.
      c. For chemical pump discharge applications, set valve to open at 10 pounds per square inch more than pump discharge pressure at maximum operating point, or as indicated on the Drawings.

2.05 METAL BODY AIR PRESSURE REGULATING VALVES (PRV30 AND PRV35)

A. Air pressure regulating valves for instrument air systems (PRV35):
   1. Manufacturers: One of the following, or equal:
      a. Emerson, Fisher Series 67CFR.
      b. Rotork, Fairchild Industrial Products Company Model 65A.
   2. Design:
      a. Inlet pressure rating: Not less than 250 pounds per square inch gauge.
      b. Inlet and outlet ports: Tapped, 1/4-inch diameter.
      c. Internal pressure relief capability for minor seat leakage.
      d. Integral 40 micron filter.
      e. Drain valve at low point of body.
      f. Provide pressure gauge integrally mounted on the valve:
         1) Gauge units: Pounds per square inch gauge.
         2) Gauge range: Upper end of range approximately 150 percent of output pressure.

3. Materials:
    a. Body: Aluminum.
    b. Diaphragm and o-rings: Nitrile.
    c. Filter element: Stainless steel.
4. Output pressure:
    a. As required for the application as determined by the manufacturer of the instrument receiving the regulated air.
    b. Pressure range: As follows for the required output pressure:
        1) Output pressure 20 pounds per square inch gauge, range 1 to 30.
        2) Output pressure 30 pounds per square inch gauge, range 1 to 60.
        3) Output pressure 40 pounds per square inch gauge, range 1 to 60.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install as specified in Section 15110 - Common Work Results for Valves.

3.02 COMMISSIONING

A. As specified in Section 01756 - Commissioning and this Section.

B. Manufacturer services:
    1. Provide certificates:
        a. Manufacturer's Certificate of Installation and Functionality Compliance.

C. Functional testing:
    1. Valves:
        a. Test witnessing: Witnessed.
        b. Conduct pressure and leak test as specified in Section 15110 - Common Work Results for Valves.

END OF SECTION

SECTION 15119

AIR AND VACUUM RELIEF VALVES

PART 1 GENERAL

1.01 SUMMARY

A. Section includes: Air release valves, air and vacuum valves, and air vents.

B. As specified in Section 15110 - Common Work Results for Valves.

1.02 REFERENCES

A. American Society of Mechanical Engineers (ASME):
   1. B16.1 - Gray Iron Pipe Flanges and Flanged Fittings: Classes 25, 125, and 250.
   2. B16.5 Pipe Flanges and Flanged Fittings: NPS 1/2 through 24.

B. American Water Works Association (AWWA).

C. ASTM International (ASTM):
   1. A126 - Standard Specification for Gray Iron Castings for Valves, Flanges, and Pipe Fittings.
   2. A240 - Standard Specification for Chromium and Chromium-Nickel Stainless Steel Plate, Sheet, and Strip for Pressure Vessels and for General Applications.
   3. A270 - Standard Specification for Seamless and Welded Austenitic Stainless Steel Sanitary Tubing.
   4. B584 - Standard Specification for Copper Alloy Sand Castings for General Applications.

1.03 SUBMITTALS

A. Submit as specified in Section 01330 - Submittal Procedures.

B. Product data: As specified in Section 15110 - Common Work Results for Valves.

C. Commissioning submittals:
   1. Provide Manufacturer’s Certificate of Installation and Functionality Compliance as specified in Section 01756 - Commissioning.

1.04 WARRANTY

A. Provide warranty as specified in Section 01783 - Warranties and Bond.

PART 2 PRODUCTS

2.01 METAL BODY AIR RELEASE VALVES - WATER SERVICE (ARV00)

A. Manufacturers: One of the following or equal:
   1. Valve and Primer Corp., DeZURIK/APCO Series 200.
   2. Multiplex Manufacturing Co., Crispin PL Series.

B. Design:
   1. Pressure rating: Suitable for service under operating pressures equal to and a minimum ANSI Class 150 unless differently indicated on the Drawing.
   2. Inlet: Screwed, 2-inch.
   3. Orifice size: 1/4-inch diameter.

C. Materials:
   1. Valve body: Cast iron.
   2. Float and internal trim: Type 316 stainless steel.
   3. Seat or valve plunger: Buna-N.

2.02 METAL BODY AIR AND VACUUM VALVES - WATER SERVICE (AVV00)

A. Manufacturers: One of the following or equal:
   1. Valve and Primer Corp., DeZURIK/APCO Series 140.
   2. Multiplex Manufacturing Co., Crispin A Series.

B. Design:
   1. Minimum performance requirements:
      a. Air in-flow through valve: Not less than 2 standard cubic feet per second.
      b. Air exhaust through valve: Not less than 5 standard cubic feet per second.
   2. Pressure rating: Suitable for service under operating pressures equal to and a minimum ANSI Class 150.
   3. Inlet: Screwed, size as indicated on Drawings.

C. Materials:
   1. Body: Ductile iron.
   2. Float: Type 304 stainless steel.
   3. Plug and Seat: Brass bushing.

2.03 METAL BODY COMBINATION AIR VALVES - WATER SERVICE (CAV00)

A. Manufacturers: One of the following or equal:
   1. Valve and Primer Corp., DeZURIK/APCO, Series 140C.
   2. Multiplex Manufacturing Co., Crispin UL Series.

B. Design:
   1. Operation: Automatic exhaust of large quantities of air from pipelines during filling and draining and release of accumulated air while pipeline is under pressure.
   2. Utilize compound lever system in conjunction with large and small orifices.
   3. Internal parts removable through top cover without removing valve from pipeline.

4. Pressure rating: ANSI Class 150
5. Inlet: Screwed, size as indicated on Drawings.

C. Materials:
1. Body: Ductile iron.
2. Float: Type 316 stainless steel.
3. Needle: Buna-N.
4. Lever frame: Cast iron or Delrin.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install as specified in Section 15110 - Common Work Results for Valves and manufacturer’s instructions.

B. Install air release valves and air and vacuum valves with suitable discharge lines to nearest drainage system.

3.02 COMMISSIONING

A. As specified in Section 01756 - Commissioning and this Section.

B. Manufacturer services:
1. Provide certificates:
a. Manufacturer's Certificate of Installation and Functionality Compliance.

C. Functional testing:
1. Valves:
a. Test witnessing: Witnessed.
b. Conduct pressure and leak test as specified in Section 15110 - Common Work Results for Valves.

END OF SECTION

SECTION 15120

PIPING SPECIALTIES

PART 1 GENERAL

1.01 SUMMARY

A. Section includes: Piping specialties including:
   1. Flexible rubber connections.
   2. Bellows type expansion joints.
   3. Rubber expansion joints.
   4. Transition fittings.
   5. Pipe couplings for stainless steel piping.
   6. Pipe saddles.
   7. Chemical Injector/Diffuser.

1.02 REFERENCES

A. American Society of Mechanical Engineers (ASME):
   1. B16.5 - Pipe Flanges and Flanged Fittings: NPS 1/2 through NPS 24.

B. American Water Works Association (AWWA):
   1. C110 - Standard for Ductile-Iron and Gray-Iron Fittings.
   2. C151 - Standard for Ductile-Iron Pipe, Centrifugally Cast.

C. ASTM International (ASTM):
   1. A148 - Standard Specification for Steel Castings, High-Strength, for Structural Purposes.
   2. A193 - Standard Specification for Alloy-Steel and Stainless Steel Bolting for High Temperature or High Pressure Service and Other Special Purpose Applications.
   3. A194 - Standard Specification for Carbon Steel, Alloy Steel, and Stainless Steel Nuts for Bolts for High Pressure or High Temperature Service, or Both.
   4. A536 - Standard Specification for Ductile Iron Castings.

D. NSF International (NSF):
   1. 61 - Drinking Water System Components - Health Effects, Includes Errata.
   2. 372 - Drinking Water System Components - Lead Content.

1.03 SUBMITTALS

A. Submit as specified in Section 01330 - Submittal Procedures.

B. Product data:
   1. For each piping product in this Section as applicable:
      a. Design features.
      b. Load capacities.

c. Material designations by UNS alloy number or ASTM Specification and Grade.
d. Data needed to verify compliance with the Specifications.
e. Catalog data.
f. Clearly mark submittal information to show specific items, materials, and accessories or options being furnished.

C. Calculations:
1. Provide calculations in accordance with NSF 372 for materials in contact with drinking water.

D. Manufacturer's Certificate of Installation and Functionality Compliance as specified in Section 01756 - Commissioning:
1. Provide as specified in this Section.

1.04 WARRANTY

A. Provide warranty as specified in Section 01783 - Warranties and Bonds.

PART 2 PRODUCTS

2.01 GENERAL

A. As specified in Section 01600 - Product Requirements.

B. Materials in contact with drinking waters: In accordance with NSF 61 and NSF 372.

2.02 FLEXIBLE RUBBER CONNECTIONS

A. Manufacturers: One of the following or equal:
1. Mercer Rubber Co., Type 150 Vibraflex.
2. Red Valve Co., Inc., Part Number P-5.

B. Provide flexible rubber connections with 3/8 inch thick Viton™ rubber tube with full-faced flanged ends suitable to withstand a pressure of 150 pounds per square inch gauge.

C. Provide complete flexible rubber connections, including galvanized retaining rings and control rods.

2.03 BELLOWS TYPE EXPANSION JOINTS

A. Expansion joints for general service:
1. Expansion joints: Flexible bellows type, or as otherwise specified or indicated on the Drawings.
2. Manufacturers:
a. Expansion joints: One of the following or equal:
1) Senior Flexonics Pathway, Inc., Controlled Flexing Expansion Joint.
2) Flex-Weld, Inc., Keflex, Series 308.
3) Victaulic, Depend-o-Lok, Omniflex stainless bellows expansion joint.

b. Pipe alignment guides: One of the following or equal:
   1) Senior Flexonics Pathway, Inc.
   2) Flex-Weld, Inc.
c. Intermediate supports: Provide with protective saddles. One of the following or equal:
   1) Unistrut Corporation, Roller-type.
   2) Bergen-Paterson Pipe Support Corp.

3. Design:
   a. Expansion joint rating: 150 pounds per square inch gauge, at 300 degrees Fahrenheit.
   b. Bellows: Multi-ply (3 ply minimum) stainless steel, equipped with a self-draining liner guide.
   c. Axial travel of expansion joints: Not less than 1.50 inches.
   d. Ends: 150 pound ASME flanges, Victaulic, Depend-o-Lok Airmaster/Fluidmaster coupled ends, or plain suitable for welding connections, as required for piping in which installed.

B. Expansion joints for steam and hot water:
1. Manufacturers: One of the following or equal:
   a. Flex-Weld, Inc., Keflex, Series 308-1215.
   b. Senior Flexonics Pathway, Inc., Controlled Flexing Expansion Joint.
   c. Victaulic, Depend-o-Lok Omniflex Expansion Joint.
2. Design:
   a. Single reinforced bellows type or Victaulic mechanical couplings.
   b. Pressure and temperature ratings: 150 pounds per square inch gauge, and 500 degrees Fahrenheit service.
   c. Bellows: Multi-ply (3 ply minimum) Type 321 stainless steel, equipped with a Type 321 stainless steel liner.
   d. Axial travel of expansion joints: 3 inches minimum.
   e. Ends: 150 pound ASME flanges.

C. Copper piping expansion joints:
1. Expansion joints for copper pipe: As specified before, except externally guided, and provide for 3-1/4 inch expansion per 100 feet of piping.

D. Roof drain expansion joints:
1. Neoprene bellows between roof drain fitting and drain piping.
2. Up to 12-inch static head.
3. Complete with Type 316 stainless steel clamps.
4. Manufacturers: One of the following or equal:
   a. Watts, Model RD-900.
   b. Flexicraft Industries, DWV.

2.04 RUBBER EXPANSION JOINTS

A. Manufacturers: One of the following or equal:
1. Mercer Rubber Co., Style 500 or 700.
2. Red Valve Co., Inc., Type J-1.
3. Proco Products, Inc., Series 230 or 240.

B. Provide rubber expansion joints complete with control units and split retaining rings.

C. Design:
   1. Material: Neoprene rubber, reinforced with embedded steel rings, and a strong synthetic fabric.
   2. Expansion rings, suitable for pressures of at least 125 pounds per square inch gauge, except as follows:
      a. Expansion joints in pump suction piping and where indicated on the Drawings suitable for minimum 90 pounds per square inch gauge pressure, and minimum 30 inches mercury vacuum.
      b. Ends of expansion joints, 150 pound ASME flanges with drilling to match that of the piping.
   3. Bolts, nuts, control rods/plates, and retaining rings shall be galvanized steel unless otherwise specified.
   4. Bolts, nuts, control rods/plates, and retaining rings for low pressure air systems provide materials matching the piping system.
   5. Bolts, nuts, control rods/plates, and retaining rings submerged in water or wastewater, buried, in wet vaults or structures, adjacent to wet walls, or above open water-containing structures shall be Type 316 stainless steel in accordance with ASTM A193, Grade B8M for bolts and in accordance with ASTM A194, Grade 8M for nuts.

D. Rubber expansion joints for blowers: Butyl type rubber formulated for service application and for maximum temperature of 250 degrees Fahrenheit, suitable for minimum 40 pounds per square inch gauge pressure, and minimum 15 inches mercury vacuum.

2.05 TRANSITION FITTINGS

A. Manufacturers: One of the following or equal:
   1. Spears.

B. Materials:
   1. Slip socket: Schedule 80 PVC.
   2. Collar: Type 316 stainless steel.
   3. Threaded insert: Brass.

2.06 FLANGES: CARBON STEEL PIPE SADDLES

A. For ductile iron pipe:
   1. Double strap brass type.
   2. Manufacturers: One of the following or equal:
      a. A.Y. McDonald, Style 3825.
      b. The Ford Meter Box Company, Style 202B.
      c. Mueller Company, Style BR2B.
   3. Materials:
      a. Pipe saddle body, straps, and nuts: Brass or silicon bronze.
      b. Gaskets: Rubber.

B. For PVC C900 or C905 pipe:
   1. Manufacturers: One of the following or equal:
      a. Smith-Blair, Inc., Style 317.
      b. Romac Industries, Inc., Style 202S.
   2. Materials:
      a. Pipe saddles: Ductile iron with fusion bonded epoxy finish.
      b. Straps, bolts, and nuts: Type 304 stainless steel with Teflon™ coating on nuts.
      c. Gaskets: Rubber TAPPING SLEEVES.

C. Manufacturers: One of the following or equal:
   1. Smith-Blair, Inc., Style 622.
   2. Romac Industries, Inc., Style FTS 420.

D. Materials:
   1. Tapping sleeves: Steel construction.
   2. Bolts and nuts: Type 304 stainless steel.
   3. Nuts: Teflon™ coated.
   4. Gaskets: Rubber.
   5. Size of tapped boss: As indicated on the Drawings.

2.07 CHEMICAL INJECTOR/DIFFUSER

A. Design:
   1. Chemical Injector/Diffuser:
      a. Injector configuration: Single feed point into center of water main.
   2. Heavy duty brass corporation stop or stainless steel ball valve:
      a. Thread connection shall be NPT or AWWA inlet.
      b. Corporation stop must include a safety device to prevent accidental withdrawal of Injection/Diffuser solution tube.
   3. Injector/Diffuser solution tube sized to match pump discharge line or injection flow rate:
      a. Tube shall extend 1/3 to 1/2 diameter of water main into center of main.
      b. Able to safely withdraw or insert injector/diffuser tube into center of water main while under pressure and without having to shut down the main.
      c. Ball check valve located on injector/diffuser solution tube.
      d. Stainless steel safety chain located on injector/diffuser solution tube.

B. Materials:
   1. Injector/Diffuser: Compatible with chemical solution.

C. Manufacturers: The following or equal:
   1. Saf-T-Flo.

2.08 SHIPPING

A. As specified in Section 01600 - Product Requirements.

PART 3 EXECUTION

3.01 GENERAL

A. As specified in Section 01600 - Product Requirements.

B. Drawings supersede conflicts with this Section.

C. Bellows type expansion joints and vibration control joints:
   1. Protect joints against damage during pressure test.

3.02 INSTALLATION

A. Transition couplings:
   1. Application:
      a. Use transition couplings with function and design similar to flexible couplings and flanged coupling adapters for connecting piping having different outside diameters.
   2. Install transition-coupling products specifically designed and manufactured for that application.

B. Pipe saddles:
   1. Coat threads on bolts with anti-gall coating prior to installation.

C. Tapping sleeves:
   1. Verify existing pipe material and outer diameter prior to ordering materials.
   2. Large diameter pipe:
      a. Verify the existence of lining material.
      b. Verify lining material type.
      c. Repair lining after hot tap operations are complete with similar lining or equal.
      d. Demonstrate ability to accomplish hot tap by staging a dry run simulation of the procedure prior to the initiation of the hot tap procedure:
         1) Walk through each step of the hot tap installation, and show the Engineer every component needed to install the hot tap, including but not limited to, tools and materials, to ensure that all the required components are on-site and in place prior to beginning the procedure.
   3. Coat threads on bolts with anti-gall coating prior to installation.

D. Spray nozzles:
   1. Install spray nozzles so that elevation of the nozzles is 18 inches above the water surface.

3.03 COMMISSIONING

A. As specified in Section 01756 - Commissioning and this Section.

B. Manufacturer services:
   1. Required only for:
      a. Transition couplings.
      b. Tapping sleeves for large diameter pipe.
   2. Provide Manufacturer's Certificate of Installation and Functionality Compliance.
   3. Provide Manufacturer's Representative Onsite:
      a. Installation: 2 trip/1 day each:
         1) Installation consultation and advice.
         2) Installation inspection.

C. Field testing:
   1. As specified in Section 15052 - Common Work Results for General Piping.
   2. Protect bellows type expansion joints and vibration control joints.

END OF SECTION

SECTION 15121

PIPE COUPLINGS

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Pipe couplings for ductile iron piping.
   2. Pipe couplings for carbon steel piping.
   3. Pipe couplings for stainless steel piping.

1.02 REFERENCES

A. American National Standards Institute (ANSI).

18. F594 - Standard Specification for Stainless Steel Nuts.

E. NSF International (NSF):
1. 61 - Drinking Water System Components - Health Effects.
2. 372 - Drinking Water System Components - Lead Content.

1.03 SUBMITTALS

A. Submit as specified in Section 01330 - Submittal Procedures.

B. Product data:
1. For each product in this Section as applicable:
a. Design features.
b. Load capacities.
c. Material designations by UNS alloy number or ASTM Specification and Grade.
d. Data needed to verify compliance with the Specifications.
e. Catalog data.
f. Clearly mark submittal information to show specific items, materials, and accessories or options being furnished.

C. Calculations:
1. Provide calculations in accordance with NSF 372 for materials in contact with drinking water.

1.04 WARRANTY

A. Provide warranty as specified in Section 01783 - Warranties and Bonds.

PART 2 PRODUCTS

2.01 GENERAL

A. As specified in Section 01600 - Product Requirements:
   1. Materials in contact with drinking waters: In accordance with NSF 61 and NSF 372.

B. Known acceptable manufacturers are listed by specific products.

C. Provide references as specified in this Section by specific product.

D. Manufacturer's representatives' requirements as specified in Section 01756 - Commissioning and this Section by specific product.

E. Gaskets for flexible couplings and flanged coupling adapters:
   1. Provide gasket materials for piping applications as follows:
      a. Low-pressure and high-pressure air, steam, hot water: EPDM.
      b. All other piping applications: Neoprene rubber or Buna-N.

F. Exterior coatings for underground and submerged applications:
   1. Manufacturers: One of the following or equal:
      a. Tapecoat Co., Inc., T.C. Mastic.
      b. Kop-Coat Co., Inc., Bitumastic Number 50.
   2. Thickness: Minimum 0.040 inch.

2.02 PIPE COUPLINGS FOR DUCTILE IRON PIPING

A. Dismantling joints:
   1. Manufacturers: One of the following or equal:
      a. Romac Ind., Inc., Style DJ400.
      b. Smith-Blair, Inc., Series 975.
   2. Materials:
      a. Flanged spool: AWWA C207 steel pipe:
         1) ASTM A53 for sizes 3 inches to 12 inches.
         2) ASTM A36 for sizes 14 inches to 72 inches.
      b. End ring and body:
         1) For sizes 3 inches to 12 inches, ductile iron in accordance with ASTM A536.
         2) For sizes 14 inches to 72 inches, steel in accordance with ASTM A36 or A53.
      c. Follower ring: Ductile iron in accordance with ASTM A536.
      d. Bolts and hex nuts:
         1) Aboveground: High strength, low alloy steel in accordance with AWWA C111.
         2) Buried and underwater: Type 316 stainless steel bolts in accordance with ASTM F593.
      e. Tie rods: High tensile steel in accordance with ASTM A193 Grade B7.

3. Flange design: Class D steel ring flange in accordance with AWWA C207, compatible with ANSI Class 125 and 150 bolt circles.
4. Coating and lining: Manufacturer's standard fusion bonded epoxy, NSF 61 certified.

B. Flanged coupling adapters: 12-inch size and smaller:
1. Manufacturers: One of the following or equal:
   a. Dresser, Inc., Style 227.
   b. Romac Ind., Inc., Style FCA501.
   c. Smith-Blair, Inc., Series 912.
2. Materials:
   a. Flanged body: Ductile iron in accordance with ASTM A536.
   b. Follower ring: Ductile iron in accordance with ASTM A536.
   c. Bolts and hex nuts:
      1) Aboveground: High strength, low alloy steel in accordance with AWWA C111.
      2) Buried and underwater: Type 316 stainless steel bolts in accordance with ASTM F593.
3. Flange design: Class D steel ring flange in accordance with AWWA C207 compatible with ANSI Class 125 and 150 bolt circles.
4. Coating and lining: Manufacturer's standard fusion bonded epoxy, NSF 61 certified.

C. Flanged coupling adapters: Greater than 12-inch size:
1. Manufacturers: One of the following or equal:
   a. Dresser, Inc., Style 128-W.
   b. Romac Ind., Inc., Style FC400.
   c. Smith-Blair, Inc., Series 913.
2. Materials:
   a. Flange and flanged body: Ductile iron or low carbon steel having a minimum yield strength of 30,000 pounds per square inch.
   b. Follower ring: Low carbon steel having a minimum yield strength of 30,000 pounds per square inch.
   c. Bolts and hex nuts:
      1) Aboveground: High strength, low alloy steel in accordance with AWWA C111.
      2) Buried and underwater: Type 316 stainless steel bolts in accordance with ASTM F593.
3. Flange design: Class D steel ring flange in accordance with AWWA C207 compatible with ANSI Class 125 and 150 bolt circles.
4. Coating and lining: Manufacturer's standard fusion bonded epoxy, NSF 61 certified.

D. Flexible couplings:
1. Manufacturers: One of the following or equal:
   a. Dresser, Inc., Style 253.
   b. Romac Ind., Inc., Style 501.
   c. Smith-Blair, Inc., Series 441.
2. Materials:
   a. Center rings: Ductile iron in accordance with ASTM A536.
   b. Follower rings: Ductile iron in accordance with ASTM A536.

c. Bolts and hex nuts:
    1) Aboveground: High strength, low alloy steel in accordance with AWWA C111.
    2) Buried and underwater: Type 316 stainless steel in accordance with ASTM F593.
3. Coating and lining: Manufacturer's standard fusion bonded epoxy, NSF 61 certified.
4. Center sleeve dimensions: Provide center sleeves with lengths in accordance with following table:

Nominal Pipe Size	Sleeve Length
3 inch and smaller	Manufacturer's standard
4 inch through 8 inch	7 inches
10 inch through 14 inch	12 inches
Greater than 16 inch	Use steel flexible coupling per Pipe Couplings for Steel Piping

E. Restrained flange coupling adapter:
1. Manufacturers: One of the following or equal:
    a. Romac Ind., Inc., Style RFCA.
    b. Star Pipe Products, 3200 StarFlange™.
2. Materials:
    a. Flange and flanged body: Ductile iron in accordance with ASTM A536.
    b. Follower ring: Lug type restraint system.
        1) Follower ring: Ductile iron in accordance with ASTM A536.
        2) Restraining lugs: Ductile iron in accordance with ASTM A536.
            a) Designed to contact the pipe and apply forces evenly.
        3) Restraining bolts:
            a) Ductile iron in accordance with ASTM A536.
            b) Bolt heads shall be designed to twist off when the proper torque has been applied.
    c. Bolts and hex nuts:
        1) Aboveground: High strength, low alloy steel in accordance with AWWA C111.
        2) Buried and underwater: Type 316 stainless steel bolts in accordance with ASTM F593.
3. Flange design: Class D steel ring flange in accordance with AWWA C207 compatible with ANSI Class 125 and 150 bolt circles.
4. Coating and lining: Manufacturer's standard fusion bonded epoxy, NSF 61 certified.
5. Angular deflection: Restrained flange coupling adapter must allow angular deflection after assembly.

F. Grooved joint couplings:
1. Manufacturers: The following or equal:
    a. Victaulic Co., Series 31 or equal.

2. Materials:
    a. Housings: Ductile iron in accordance with ASTM A536.
    b. Gasket:
        1) FlushSeal® type, or equal. Elastomer in accordance with ASTM D2000.
        2) Neoprene or BUNA-N.
    c. Bolts and nuts: Electroplated steel in accordance with ASTM A449.
    d. Coating: As specified in Section 09960 - High-Performance Coatings.
3. For use with rigid or flexible radius grooved components in accordance with AWWA C606.
4. For connection to IPS steel pipe sizes, Victaulic Style 307.

2.03 PIPE COUPLINGS FOR STAINLESS STEEL PIPING

A. Flexible couplings:
    1. Manufacturers: The following or equal:
        a. Dresser, Inc., Style 38.

PART 3 EXECUTION

3.01 INSTALLATION

A. In underground and underwater installations, coat the exterior of coupling with a protective coating in accordance with manufacturer's instructions.

B. Joints and flexible connections shall be installed centered with no angular deflection unless otherwise indicated on the Drawings.

C. Flexible couplings and flange coupling adapters: Install with gap between pipe ends in accordance with the following table unless a greater gap is indicated on the Drawings. Maximum gap tolerance shall be within 1/8 inch.
    1. Install flexible coupling with pipe gap located in middle of center sleeve.
    2. Install flanged coupling adapter with end of plain end pipe in middle of flanged coupling body.

Center Ring Length	Gap Dimension and Tolerance
4 inch through 6 inch	3/8 inch
7 inch	5/8 inch
10 inch and greater	7/8 inch

D. Provide harnesses (tie-downs) for flexible couplings unless otherwise indicated on the Drawings with a written note.
    1. Design harnesses (tie-downs) for the test pressures as specified in the Piping Schedule in Section 15052 - Common Work Results for General Piping.

E. Grooved joint couplings:
   1. Grooved ends: Clean and free from indentations, projections, and roll marks in the area from pipe end to groove.
   2. Gaskets: Elastomer grade suitable for the intended service, and molded and produced by the coupling manufacturer.

F. Bolted, split-sleeve couplings:
   1. Inspect each coupling to ensure that there are no damaged portions of the coupling.
      a. Pay particular attention to the sealing pad/sealing plate area.
      b. Before installation, thoroughly clean each coupling of any foreign substance which may have collected thereon and shall be kept clean at all times.
   2. Wrenches:
      a. Conform to manufacturer instructions.
      b. Bolts and studs shall be tightened so as to secure a uniform gasket compression between the coupling and the body of the pipe with all bolts or studs tightened approximately the same amount.
      c. Final tightening shall be done by hand (no air impact wrenches) and is complete when the coupling is in uniform contact with the outside surface of the pipe all around the circumference of the pipe.
   3. No joint shall be misfit in any plane.
   4. On the fixed ends of bolted, split-sleeve couplings, the shoulders shall bear on the restraint rings all around with no visible gap.
   5. Ends of piping where coupler are installed shall be smooth and free of defects.
      a. Remove weld splatter and grind smooth.
      b. Grind pipe seam welds flush with pipe wall and smooth.

SECTION 15127

DUCTILE IRON BALL-TYPE FLEXIBLE EXPANSION JOINTS

PART 1 GENERAL

1.01 SUMMARY

A. Section includes: Ductile iron ball-type flexible expansion joints.

1.02 REFERENCES

A. American Water Works Association (AWWA):
   1. C110 - Ductile-Iron and Gray-Iron Fittings.
   2. C111 - Rubber-Gasket Joints for Ductile-Iron Pressure Pipe and Fittings.
   3. C153 - Ductile-Iron Compact Fittings for Water Service.
   4. C210 - Liquid-Epoxy Coating Systems for the Interior and Exterior of Steel Water Pipelines.
   5. C213 - Fusion Bonded Epoxy Coating for the Interior and Exterior of Steel Water Pipelines.

B. ASTM International (ASTM):
   1. A536 - Standard Specification for Ductile Iron Castings.

C. NSF International:
   1. 14 - Plastics Plumbing System Components and Related Materials.
   2. 61 - Drinking Water System Components - Health Effects.

1.03 SUBMITTALS

A. Submit as specified in Section 01330 - Submittal Procedures.

B. Product data: As specified in Section 15052 - Common Work Results for General Piping.

C. Source quality test reports:
   1. Holiday test of lining.
   2. Pressure test.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. The following or equal:
   1. EBAA Iron, Inc., Flex-Tend.

2.02 DESIGN AND PERFORMANCE CRITERIA

A. Design requirement:
   1. Performance requirements:
      a. Joints capable of angular deflecting and expanding or contracting simultaneously without leakage.
      b. Angular deflection: Capable of providing a minimum angular deflection from centerline at each ball joint as follows:
         1) 14 to 36-inch pipe: 15 degrees.
      c. Axial movement capacity: Unless otherwise indicated on the Drawings, factory pre-set axial movement to reserve 50 percent of the total axial movement capacity for expansion and 50 percent of the total axial movement capacity for compression. Provide one or more expansion sleeves to provide a total axial movement:
         1) 3 inch through 12 inch: 8 inches minimum expansion or compression.
      d. Working pressure rating:
         1) Sizes 3 inch through 24 inch: 350 pounds per square inch.

2.03 MATERIALS

A. Ductile iron: Material properties in accordance with ASTM A536 with wall thickness meeting requirements of AWWA C153.

B. Gaskets:
   1. At ball joints and sleeves: EPDM.
   2. At flanged end connections: As specified in Section 15052 - Common Work Results for General Piping.
   3. At mechanical joint end connections: As specified in Section 15211 - Ductile Iron Pipe: AWWA C151.

C. Bolts and nuts:
   1. At flanged end connections: As specified in Section 15052 - Common Work Results for General Piping.

2.04 MANUFACTURED UNITS

A. Consist of 2 ball and socket type joints with one or more expansion sleeves located between the 2 ball joints. The ball and socket ends shall be integrally cast with the expansion sleeve.

B. End connections: Provide end connections indicated on the Drawings:
   1. Mechanical joint end connections in accordance with the dimensional requirements of either AWWA C111 or AWWA C153.
   2. Flange end connections in accordance with the dimensional requirements of AWWA C110 with the addition of an o-ring groove.

2.05 FINISHES

A. Coat external surfaces as follows:
   1. Aboveground installations: Field apply coating system as specified in Section 15052 - Common Work Results for General Piping for the piping system.

B. Line all internal wetted surfaces and seal contact surfaces with a minimum of 15 mils of fusion-bonded epoxy in accordance with AWWA C213.
   1. Holiday test epoxy lining with a 1,500-volt spark test in accordance with AWWA C213.

2.06 SOURCE QUALITY CONTROL

A. Pressure test to rated working water pressure before shipment.

2.07 PACKING AND SHIPPING

A. Protect sliding and rotating surfaces against damage during packing and shipping.

PART 3 EXECUTION

3.01 INSTALLATION

A. Protect sliding and rotating surfaces against damage during installation.

B. Install ball-type flexible expansion joints in accordance with manufacturer's published instructions to meet minimum expansion and contraction values as specified or as indicated on the Drawings.

C. Isolate ball-type flexible expansion joints from piping system test pressure, or provide temporary restraint on joint during the pressure test.

END OF SECTION

SECTION 15200

METERED SERVICES

PART 1 GENERAL

1.01 SUMMARY

A. Section includes: Metered service lines.

1.02 REFERENCES

A. American Society of Mechanical Engineers (ASME):
   1. B16.1 - Gray Iron Pipe Flanges and Flanged Fittings: Classes 24, 125, and 250.
   2. B16.24 - Cast Copper Alloy Pipe Flanges and Flanged Fittings: Classes 150, 300, 600, 900, 1500 and 2500.

B. American Water Works Association (AWWA):
   1. C600 - Installation of Ductile Iron Water Mains and Their Appurtenances.
   2. C700 - Standard for Cold-Water Meters -- Displacement Type, Metal Alloy Main Case.
   3. C702 - Cold Water Meters - Compound Type.
   4. C800 - Underground Service Line Valves and Fittings.

C. ASTM International (ASTM):
   1. B88 - Standard Specification for Seamless Copper Water Tube.

D. Federal Communications Commission (FCC).

E. National Sanitation Foundation (NSF).

1.03 SUBMITTALS

A. Shop Drawings and manufacturer's literature for all materials.

B. Contact Owner representative to arrange for pick-up of Owner furnished materials.

PART 2 PRODUCTS

2.01 GENERAL

A. Furnish metered service lines in accordance with the Metered Service Installation Details as indicated on the Drawings.

2.02 WATER METERS

A. 5/8 thru 2-inch meters.
   1. Type:
      a. Only Magnetic Drive, Sealed Register, Positive Displacement, Oscillating Piston type meters are acceptable.
   2. Size:
      a. In accordance with AWWA C700.
   3. Length:
      a. In accordance with AWWA C700.
   4. Cases:
      a. Outer case made of a non-corrosive Water Works Bronze (minimum 75 percent copper content) with a separate measuring chamber that can easily be removed from the case.
         1) Provide raised characters cast on the outer case indicating the size and direction of water flow through the meter.
         2) Provide plastic polymer or cast iron frost bottoms on 5/8 inch, 3/4 inch, and 1 inch size meters.
         3) The manufacturer's serial number must be permanently affixed to the maincase to aid in identification and must be visible so that it can be read from directly above the water meter.
      b. Guarantee cases to be free from defects for 25 years from date of shipment.
      c. Meter of 1-1/2 inch and 2 inch size: Provide 2-bolt oval flanges, faced and drilled. No threaded body meters are required.
   5. External bolts and washers:
      a. Corrosion resistant material.
      b. Easily removed from the maincase.
      c. Cover all threaded maincase bolt holes to aid in removal of the bolts for repair.
   6. Measuring chamber:
      a. Suitable synthetic polymer.
      b. Not be cast as part of the maincase.
      c. All piston assemblies interchangeable in all measuring chamber assemblies of the same size.
   7. Magnetic coupling:
      a. The motion of the piston will be transmitted to the sealed register through the use of a magnetic coupling.
   8. Strainers:
      a. All meters, 2 inch or greater, must be provided with a corrosion resistant strainer, with an effective straining area at least twice the bore diameter which can be easily removed from the meter without the meter itself being disconnected from the pipeline.
   9. Change gears:
      a. Change gears will not be allowed to calibrate the meter.
   10. Provide identical and completely interchangeable registers of a particular registration and meter size. Accuracy and head loss tests:
      a. Meters meet or exceed current AWWA C700, current revision, test flows, head loss and accuracy standards.

11. Pressure capability:
    a. Meters operate up to a working pressure of 150 pounds per square inch, without leakage or damage to any parts.
    b. Meter accuracy not affected when operating at 150 pounds per square inch due to possible distortion.
12. Meter accuracy not affected by variations in pressure up to 150 pounds per square inch. Register and remotes:
    a. Permanently and hermetically sealed register and firmly attached to meter case.
        1) Provide a security seal to prevent easy removal and tampering.
        2) The register must be an encoder type and must be readily adaptable to an outside wall or pit mount inductive reading pad, a walk-by or drive-by short range radio or an automatic fixed network radio meter reading system.

B. 2 inch thru 6 inch compound meters:
1. Scope:
    a. The meters in accordance with AWWA C702, as most recently revised, except as modified in this Section.
2. Type:
    a. Single or dual register type meters.
        1) Single register type:
            a) Totalize the output from 2 interacting measuring chambers.
                (1) One turbine type for measuring high flows.
                (2) One displacement chamber of the oscillating piston type for measuring low flows.
            b) Direct flows through the chambers using an automatic valve mechanism so as to have them function within their normal designed limits.
                (1) Flows first pass through the turbine chamber prior to passing through the oscillating piston measuring chamber so as to ensure continuous registration during low flow to high flow measurement.
3. Size:
    a. Determine size of meter by the nominal size of the opening of the inlet and outlet flanges of the meter.
4. Length:
    a. Maximum overall length of the unit is the face-to-face dimension as listed below:

Size of Meter	Length
2 inch	17 inches
3 inch	17 inches
4 inch	20 inches
6 inch	24 inches

5. Cases:
    a. Construct maincases of Water Works Bronze.
    b. Repaired casings are not acceptable.
        1) Construct the turbine and oscillating piston measuring chambers as separate units.
        2) Operation of an external valve cannot inhibit the oscillating piston measuring chamber operation.
        3) Access both measuring chambers without disturbing the maincase as set in the pipeline.
        4) All sizes of meters include flanged ends.
    c. Provide drain plugs for ease of removing water or other debris from the bottom of the maincase.
    d. Provide a test port of adequate size must be accessible from the top so as to allow testing in pit settings and confined areas.
    e. Provide a threaded port outlet with a bronze plug.
    f. Provide raised characters cast on the outer case indicating the size and direction of water flow through the meter.
6. Strainers:
    a. External body strainers may be specified as part of the meter assembly package.
        1) When specified, construct external body strainers of Water Works Bronze similar to that of the compound meter body.
        2) Provide strainer with a removable cover plate for inspection and debris removal.
        3) Provide strainer screen that is externally accessible and easily removable without disturbing the pipeline setting of the meter assembly package.
7. External fasteners:
    a. Provide external fasteners on the meter made of stainless steel or nonferrous material.
8. Connections:
    a. Flanges on 2 inch size meters:
    b. Oval faced and drilled on the horizontal axis with a bolt circle diameter of 4-1/2 inches.
        1) Thickness conforming to Class 150 bronze round flange requirements.
    c. Flanges for 3 inch, 4 inch, and 6 inch size meters: Class 150 bronze round type, flat faced, in accordance with ASME B16.24 for specified diameter.
    d. Companion flanges, if required with the meters:
    e. Consist of 1 standard cast iron flange, tapped with American Standard internal taper pipe threads, of the same nominal size as the meter, and 1 flanged coupling adaptor.
        1) Provide type and outside diameter of connecting pipe for appropriate gasket sizing.
9. Provide stainless steel or non-corrosive bolts, nuts, and gaskets for connection to the meter assembly.
10. Register box:
    a. Construct register box of the same material as the maincase.
    b. Mount and orient the register box, which encloses the register, to allow reading in any position.

11. Register box sealing:
    a. Seal register box to the meter in such a manner that unauthorized removal is apparent.
    b. Recess seal screws and prohibit their removal by properly affixing seal wire through appropriate holes provided in the register box casting body.
12. Encoder register and remotes:
    a. All Compound meters must be supplied with registers as specified in Class II Turbine Type Meters in this Section.
13. Displacement measuring chamber:
    a. Provide self-contained unit measuring chamber including a strainer, which can be firmly seated and removed as a unit.
        1) Do not cast any part of this chamber as part of the maincase.
    b. Oscillating piston type composed of Water Works Bronze or a suitable synthetic polymer.
        1) Piston, piston roller, and division plate: rubber composition or an approved synthetic polymer as well.
        2) All other components of the measuring chamber: corrosion-resistant materials such as stainless steel.
14. Turbine measuring chamber:
    a. Chamber: Water Works Bronze or suitable synthetic polymer construction.
    b. Secured by 2 stainless steel bolts. Positioned so that water must essentially travel in a straight line path from the meter inlet to the meter outlet during high flow operation.
    c. Polypropylene, mounted on a replaceable Type 316 stainless steel shaft and rotate on roller bearings.
        1) Offset the entire propeller assembly weight, while in operation, by magnetic suspension so that the rotating turbine components are essentially weightless in water.
15. Adjustable tungsten carbide bearing provided to take up the turbine shaft end-play tolerance.
    a. Automatic valve:
        1) Weighted, link-mounted, swing type:
        2) All moving shafts and linkage made of hard rubber bearings and sleeves.
        3) Valve and linkage made of Water Works Bronze.
        4) All shafts made of Type 316 stainless steel.
        5) Position valve in the meter so that water passing through it will follow a straight line path in passing from inlet to outlet. The valve will open at a pressure differential of 2-1/2 pounds per square inch or less.
        6) Access to the valve requires only the upper portion of the meter's maincase be removed.
        7) Displacement and turbine chambers need not be disturbed.
        8) Oscillating piston nor the turbine chamber need to be disturbed.
16. Valve seat:
    a. Consists of a trapezoidal shaped rubber gasket, retained by a bronze or synthetic polymer seat.
    b. Secure valve seat assembly by Type 316 stainless steel screws that are accessible from the maincase opening so as to facilitate easy access for inspection and ease of maintenance.

17. Registration:
    a. Record registration through the normal test flow limits at not less than 98.5 percent nor more than 101.5 percent of actual throughput. At crossover, that point when measurement transfers from 1 measuring chamber to the other, accuracy must exceed 95 percent.
    b. Accuracy at minimum test flow: minimum 95 percent at rate of flow specified in table below:

Size	Normal Flows	Limits Minimum Flows
2 inch	1/2 - 160	1/4
3 inch	1/2 - 350	1/4
4 inch	3/4 - 1,000	3/8
6 inch	3/4 - 2,500	3/8

18. Pressure test:
    a. Guarantee meters will operate successfully at a working pressure of 150 pounds per square inch, without leakage or damage to any component.
19. Guarantee and maintenance program:
    a. Guarantee meters against defects in material and workmanship for a period of 1 year from the date of shipment.
    b. Provide a price schedule of manufacturer factory maintenance program offering as a printed brochure available nationally. Include offerings for both the complete meter and individual meter component assemblies on an exchange basis.
20. Intent:
    a. Specifications are designed to create guidelines for selecting an extremely critical metering device.
    b. Ease of installation, operational features, readability, and maintenance are of prime concern.
    c. A design that best reflects longevity of operation of all elements and a high degree of sustained accuracy through the entire range of the meter is to be considered mandatory.

C. Turbine type meters, 1-1/2 inch thru 10 inch sizes:
1. Type:
    a. Provide horizontal axis, multi-vane design meters suited for moderately low to sustained high flow demands.
2. Size:
    a. Meter assembly size will be determined by the nominal size of the opening of the inlet and outlet flanges of the meter.
3. Length:
    a. Provide meters at maximum overall length unless otherwise noted.
    b. Maximum overall length of the unit is the face-to-face dimension, including external strainer and test port apparatus as listed below. Supplemental

spools or spacers may be provided to achieve the noted dimension; these components will be considered a part of the meter.

Size of Meter	Minimum Length	Maximum Length
1-1/2 inch	10 inch	17 inch
2 inch	10 inch	17 inch
3 inch	12 inch	24 inch
4 inch	14 inch	29 inch
6 inch	18 inch	36-1/2 inch
8 inch	20 inch	42 inch
10 inch	26 inch	45 inch

4. Maincases:
    a. Cast Water Works Bronze, epoxy coated steel or some other non-corrosive material that can withstand minimum water pressures of not less than 150 pounds per square inch.
    b. Repaired casings are not acceptable.
    c. Provide flanged ends.
    d. Provide tapped test port:
        1) 1-1/2 inch through 3 inch size turbines: not less than 1 1/2 inches.
        2) 4 inch and larger size turbines: not less than 2 inch.
        3) Plugged female iron pipe thread (F-IPT).
    e. Provide raised characters cast on the outer case indicating the size and direction of water flow through the meter.
5. Strainers:
    a. External body strainers may be specified as part of the meter assembly package. When specified, construct external body strainers of Water Works Bronze, epoxy coated steel or some other non-corrosive material that can withstand water pressures of not less than 150 pounds per square inch.
6. Provide strainer with a removable cover plate for inspection and debris removal. External fasteners:
    a. Provide external fasteners on the meter made of stainless steel or nonferrous material.
7. Connections:
    a. Flanges for 1-1/2 inch and 2 inch turbine meters: 2-bolt oval type.
    b. Flanges for meters 3 inch through 10 inch size meters: Class 150 bronze round type or Class 125 Steel Epoxy Coated, flat faced in accordance with ASME B16.1 for specified diameter.
    c. No companion flanges are required.
8. Register and remotes:
    a. Permanently and hermetically sealed register and firmly attached to meter case.
    b. If applicable, a security seal must be provided to prevent easy removal and tampering.
    c. Register may be direct read, absolute encoder, digital encoder, or high resolution pulse output and must be readily adaptable to an outside wall

or pit mount inductive reading pad; a walk-by, drive-by short range radio; or a fixed network radio meter reading system.

9. Turbine measuring chamber: Multiple connectivity is not required:
   a. Chamber: Water Works Bronze or suitable synthetic polymer construction.
   b. Secured by 2 stainless steel bolts or other nonferrous fasteners.
   c. Position chamber so that water must essentially travel in a straight line path from the meter inlet to the meter outlet during high flow operation.
10. Registration:
   a. Record registration through the normal test flow limits at not less than 97 percent nor more than 103 percent of actual throughput at all normal test flows.
   b. Meter capable of continuous operation up to the rated maximum flows as listed below without affecting long-term meter accuracy caused by undue wear.

Meter Size	Low Flow (95 percent minimum)	Normal Range (GPM) (100.0 + 1.5 percent)
1-1/2 inch	3	4 to 120
2 inch	3	4 to 160
3 inch	4	5 to 350
4 inch	10	15 to 1,000
6 inch	20	30 to 2,000
8 inch	30	35 to 3,500
10 inch	55	55 to 5,500

   c. Pipeline size applications of 12 inch, can be accomplished by using 10 inch size meters with the appropriate tapered, concentric reducers.
11. Maximum operating pressure:
   a. Operate without leakage, damage or malfunction up to a maximum operating pressure of 150 pounds per square inch.
12. Guarantee:
   a. Guarantee meters against defects in material and workmanship for a period of 1 year from date of shipment.

2.03 SERVICE SADDLES

A. Saddles for 1-inch, 1-1/2-inch and 2-inch taps: Made of bronze.

B. Made to specially fit the contour of the pipe they are to be installed on.
   1. Saddles for ductile-iron, cast-iron, and asbestos-cement pipe:
      a. Made of brass body with double bronze straps, female iron pipe threads in accordance with AWWA C800.
      b. Manufacturers: One of the following or equal:
         1) Ford Model S91.
         2) Mueller Series H-13000.DSfa.
   2. Saddles for PVC C900 pipe:
      a. Made of brass body, single wide bolted brass band, female iron pipe thread outlet.

b. Manufacturers: One of the following or equal:
   1) A.Y. McDonald Model 3826.
   2) Mueller BR 2B.
   3) Ford 202B.

C. Reducer bushings: Made of bronze.

2.04 STOPS

A. Corporation stops:
   1. Install corporation stops with approved saddles as specified in this Section.
   2. Copper service:
      a. Compression coupling outlets and male iron pipe (I.P.) thread inlets in accordance with AWWA C800.
   3. Manufacturers: One of the following or equal:
      a. Mueller Model H-15028 up to 1-inch size.
      b. Mueller Model Ori-Corp H-15013 for 1-1/2-inch to 2-inch size.

B. Angle stops:
   1. Service valves up to 2-inch:
      a. Install angle stops. Copper services up to 1-inch diameter:
      b. Install 1-inch compression coupling inlet angle stops with 1 inch meter nut outlets.
   2. 1-1/2-inch through 2-inch curb stops:
      a. Install compression fitting inlets and meter flange outlets.
   3. All stops: include "Lock Off" holes.
   4. Manufacturers: One of the following or equal:
      a. Mueller B-24258 for up to 1-inch size.
      b. Mueller B-24276 for 1-1/2-inch to 2-inch size.

2.05 WATER SERVICE LINE

A. Size service lines to meet the requirements of the California Uniform Plumbing Code, Public Utilities Commission General Order No. 103, and Tariff Rule No. 16.

B. Standard domestic service lines: 1-inch minimum, Type K, copper tubing in accordance with the requirements of ASTM B88.

2.06 WATER METER COUPLING

A. Made of "no-lead" (less than .1 percent).
   1. All parts listed by NSF for use in potable water service.

B. Provide long straight meter coupling, swivel nut and neoprene meter gasket.

C. Manufacturers: The following or equal:
   1. Cambridge Brass.

2.07 WATER METER BOX BODY

A. Cal American Water shall furnish the Water Meter Box for installation by the Contractor.

2.08 WATER METERS

A. Manufactures and models:
   1. Turbo Meters:
   2. Badger Meter, Turbo Series.
   3. Master Meter, MMT Turbine.
   4. Sensus, OMNI Compound or Turbo.
   5. Approved Equal.

PART 3 EXECUTION

3.01 INSTALLATION

A. Confirm the location of all service lines with the Owner's representative in the field prior to tapping the main.
   1. The Contractor will field mark the proposed location for the corporation stop (pavement) and meters for inspection, confirmation, or adjustment.

B. Experienced craftsmen familiar with installation of water service lines will perform tapping of all water mains.

C. A suitable tapping machine (Mueller, Ford, Hays or Dresser type) using the proper combined drill and tap is required for all taps.
   1. Hand held drilling equipment is not acceptable.

D. Inspect corporation stops for damaged threads and proper operation prior to installation.

E. Tap the main as indicated on the service tap detail.

F. Make taps to polyethylene encased water main in accordance with AWWA C600.

G. Pressure test metered service lines when installed with new mains from the corporation stop to the angle stop.

H. Flush each metered service prior to installation of the meter and connection to the customer service line.

END OF SECTION

SECTION 15209

HIGH-SILICON CAST IRON PIPE FOR DIGESTER GAS

PART 1 GENERAL

1.01 SUMMARY

A. Section includes: High-silicon cast iron pipe.

1.02 REFERENCES

A. ASTM International (ASTM):
   1. A518 - Standard Specification for Corrosion-Resistant High-Silicon Iron Castings iron castings.
   2. A861 - Standard Specification for High-Silicon Iron Pipe and Fittings.

1.03 SUBMITTALS

A. Submit as specified in Section 01330 - Submittal Procedures.

B. Product data: As specified in Section 15052 - Common Work Results for General Process Piping.

PART 2 PRODUCTS

2.01 MATERIALS

A. High-silicon cast iron pipe:
   1. Manufacturers: The following or equal:
      a. The Duriron Co., Inc.
      b. Taiyuan Water Industrial.
   2. Pipe and fitting material:
      a. In accordance with ASTM A518 and A861.
   3. Joints:
      a. Acid-resistant.

PART 3 EXECUTION

3.01 FIELD QUALITY CONTROL

A. Test as specified in Section 15052 - Common Work Results for General Process Piping and Section 15956 - Piping Systems Testing.

END OF SECTION

SECTION 15211

DUCTILE IRON PIPE: AWWA C151

PART 1 GENERAL

1.01 SUMMARY

A. Section includes: Ductile iron pipe, joints, connections, fittings, and pipe linings and coatings.

B. As specified in Section 15052 - Common Work Results for General Piping.

1.02 REFERENCES

A. American Society of Mechanical Engineers (ASME):
   1. B16.1 - Gray Iron Pipe Flanges and Flanged Fittings: Classes 25, 125, and 250.

B. American Water Works Association (AWWA):
   1. C104 - Standard for Cement-Mortar Lining for Ductile-Iron Pipe and Fittings.
   2. C105 - Polyethylene Encasement for Ductile-Iron Pipe Systems.
   3. C110 - Standard for Ductile-Iron and Gray-Iron Fittings.
   4. C111 - Standard for Rubber-Gasket Joints for Ductile-Iron Pressure Pipe and Fittings.
   5. C150 - Standard for Thickness Design of Ductile-Iron Pipe.
   6. C151 - Standard for Ductile-Iron Pipe, Centrifugally Cast.
   7. C153 - Standard for Ductile-Iron Compact Fittings for Water Service.
   8. C210 - Liquid-Epoxy Coatings and Linings for Steel Water Pipe and Fittings.
   9. C222 - Polyurethane Coatings and Linings for Steel Water Pipe and Fittings.
   10. C600 - Installation of Ductile Iron Water Mains and Their Appurtenances.

C. American Welding Society (AWS):
   1. D11.2 - Guide for Welding Iron Castings.

D. ASTM International (ASTM):
   1. A536 - Standard Specifications for Ductile Iron Castings.
   2. B1000 - Standard Practices for Casting Preparation and Test Procedure of Porcelain Enamel-Lined Pipe, Fittings, and Valves for Use in the Municipal Wastewater, Sewage, and Water Treatment Industry.
   3. C33 - Standard Specification for Concrete Aggregates.
   4. C150 - Standard Specification for Portland Cement.
   5. C283 - Standard Test Methods for Resistance of Porcelain Enameled Utensils to Boiling Acid.
   6. D792 - Standard Test Methods for Density and Specific Gravity (Relative Density) of Plastics by Displacement.
   7. D4541 - Standard Test Method for Pull-Off Strength of Coatings Using Portable Adhesion Testers.

E. Ductile Iron Pipe Research Association (DIPRA):
   1. Thrust Restraint Design Manual.

F. International Organization for Standardization (ISO):
   1. 8179 - Ductile iron pipe, fittings, accessories, and their joints - External zinc-based coating – Part 1: Metallic zinc with finishing layer.

G. National Association of Pipe Fabricators, Inc. (NAPF):
   1. 500-03 - Surface Preparation Standard for Ductile Iron Pipe and Fittings in Exposed Locations Receiving Special External Coatings and/or Special Internal Linings.

H. Society for Protective Coatings (SSPC):
   1. SP 5 - White Metal Blast Cleaning.
   2. PA-2 - Measurement of Dry Coating Thickness With Magnetic Gages.

1.03 SUBMITTALS

A. Submit as specified in Section 01330 - Submittal Procedures.

B. Product data.

C. Manufacturer's qualifications:
   1. Manufacturer qualifications and list of projects using the specified material: 5 years minimum.

D. Manufacturer's Quality Assurance Manual:
   1. Submit manufacturer's coating and lining application quality assurance manual to Engineer prior to beginning coating application.
      a. Strict conformance to the requirements of the manual will be required.
      b. Deviation from the requirements of the manual will be grounds for the Engineer to reject the applied coating.

E. Shop drawings:
   1. Detailed layout drawings showing alignment of pipes, location of valves, fittings, and appurtenances, types of joints, and connections to pipelines or structures.
   2. Thrust restraint systems.
   3. Photographs, drawings, and descriptions of fittings, gaskets, couplings, grooving of pipe and fittings.

F. Calculations:
   1. Calculations for thrust restraint system design.

G. Manufacturer's Certificate of Source Testing for ceramic epoxy, glass lined, plural component polyurethane, and zinc materials:
   1. Certify successful performance of holiday detection tests on 100 percent of lining in accordance with ASTM B1000.
   2. Identify each test piece by mark designation and show the actual test results during the final inspection by manufacturer prior to shipment.

3. Zinc coating: Regular measurements in accordance with ISO 8179 Part 4.4.
4. Include Coating Manufacturer's Technical Representative's reports.

1.04 QUALITY ASSURANCE

A. Ductile iron pipe shall be supplied by a single manufacturer.

B. Hydrostatically test each joint of ductile iron pipe in accordance with AWWA C151.

1.05 DELIVERY, STORAGE, AND HANDLING

A. Block piping and associated fittings for shipment to prevent damage to coatings and linings.

B. Carefully handle piping and associated fittings during loading, unloading, and installation:
   1. Do not drop piping material from cars or trucks.
   2. Lower piping by mechanical means.
   3. Do not drop or pound pipe to fit grade.

C. Handle pipe from the outside if lined with ceramic epoxy, glass or plural component polyurethane.
   1. No forks, chains, straps, hooks, or other lifting device shall be placed inside the pipe or fittings for lifting, positioning, or laying.

D. Protect gaskets and polyethylene encasement from long-term exposure to sunlight.

E. Store piping, fittings, and other accessories such that they do not accumulate and hold rainwater, dirt, and debris.

PART 2 PRODUCTS

2.01 MANUFACTURED UNITS

A. Ductile iron piping:
   1. Manufacturers: One of the following or equal:
      a. American Cast Iron Pipe Co.
      b. McWane Ductile.
      c. SIP Industries.
      d. U.S. Pipe.

2.02 THRUST RESTRAINT SYSTEM DESIGN

A. The length of pipe that must be restrained on each side of the focus of a thrust load as specified in the Pipe Schedule.

B. Design pressure: Test pressure.

C. Laying condition: Type 5 in accordance with AWWA C150.

D. Soil type: Silt 1.

E. Unit friction resistance for polyethylene encasement of pipe: DIPRA factor multiplied by a safety factor of 1.5.

2.03 CONCRETE THRUST BLOCK RESTRAINT

A. Joint thrust restraint system designed by Contractor.
   1. Concrete thrust blocks will not be permitted for DIP restraint.

2.04 DUCTILE IRON JOINTS AND CONNECTIONS

A. General:
   1. Pressure class or special thickness class as indicated in the Piping Schedule provided in Section 15052 - Common Work Results for General Piping.
   2. In accordance with AWWA C150 and AWWA C151.
   3. Joints:
      a. Flanged.
      b. Mechanical.
      c. Push-on Rubber Gasket.
      d. Integrally Restrained Mechanical.
      e. Mechanical Wedge Action.
      f. Integrally Restrained Push-On.
      g. Push-On Joint Restraint Harness.
   4. Connections:
      a. Tapping saddle.
      b. Tapping sleeve.
      c. Welded outlet.
   5. Fittings.

B. Joints:
   1. Flanged joints:
      a. Screw-on flanges:
         1) Comply with the diameter, thickness, drilling, and other characteristics in accordance with ASME B16.1.
         2) Ductile iron.
         3) Long hub, threaded, and specially designed for ductile iron pipe.
         4) After attaching to pipe, machine flange face to make pipe end and flange even and perpendicular to the axis of the pipe.
      b. Bolt holes on flanges: 2-holed and aligned at both ends of pipe.
      c. Cap screw or stud bolt holes: Tapped.
      d. Bolts and nuts:
         1) As specified in Section 15052 - Common Work Results for General Piping.
      e. Gaskets:
         1) Standard styrene butadiene copolymer (SBR) unless specified otherwise in Section 15052 - Common Work Results for General Piping.
      f. Couplings:
         1) Rigid type, cast from ductile iron in accordance with ASTM A536, Grade 65-45-12.

g. Bolts and nuts:
    1) As specified in Section 15052 - Common Work Results for General Piping.
h. Gaskets:
    1) As specified in Section 15052 - Common Work Results for General Piping.
i. Fittings:
    1) In accordance with AWWA C606, rigid radius-cut groove:
    2) Center-to-center dimensions: In accordance with AWWA C110.
    3) Wall thickness and other characteristics: In accordance with AWWA C606.
j. Flanged unit connections:
    1) Flanged to grooved joint adapters or a long enough spool with one end flanged and the other end grooved to prevent interference with the operation of adjacent valves, pumps, or other items.

2. Mechanical joints:
    a. In accordance with AWWA C111.
    b. Gaskets:
        1) As specified in Section 15052 - Common Work Results for General Piping.
    c. Bolts and nuts, including T-bolts:
        1) As specified in Section 15052 - Common Work Results for General Piping.
3. Push-on rubber gasket joints:
    a. In accordance with AWWA C111.
    b. Gaskets:
        1) As specified in Section 15052 - Common Work Results for General Piping.
4. Mechanical wedge action joint restraints:
    a. Manufacturers: One of the following or equal:
        1) EBAA Iron, Inc., Megalug® Series 1100.
        2) Star Pipe Products, Split Stargrip Series 3000.
        3) Sigma Corp., One-Lok Model SLDE.
    b. Materials:
        1) Gland body:
            a) Ductile iron in accordance with ASTM A536.
        2) Wedges and wedge actuating components:
            a) Ductile iron in accordance with ASTM A536.
            b) Wedges shall be heat treated to a minimum of 370 BHN.
        3) Actuating bolts and nuts:
            a) Ductile iron in accordance with ASTM A536.
            b) Provide torque-limiting twist off components to ensure proper installation.
        4) Gaskets:
            a) As specified in Section 15052 - Common Work Results for General Piping.

c. Coatings:
    1) Provide manufacturer applied coating system.
    2) Manufacturers: One of the following or equal:
        a) EBAA Iron Inc., Mega-Bond.
        b) Star Pipe Products, Star-Bond.
        c) Sigma Corp., Corrsafe™ Electro-deposition coating.
d. Working pressure:
    1) Shall include a minimum safety factor of 2:1.
    2) For sizes 3- through 16-inch: 350 pounds per square inch.
    3) For sizes 18- through 48-inch: 250 pounds per square inch.
e. Restraint shall consist of multiple gripping wedges incorporated into a follower gland meeting the requirements of AWWA C111.
f. Restraint shall allow post assembly angular deflection that is a minimum of 50 percent of the angular deflection allowed by the mechanical joint.
g. Restraint must be in accordance with applicable requirements of AWWA C110 and AWWA C111 for mechanical joints.

5. Push-on joint restraint harnesses:
    a. Manufacturers: One of the following or equal:
        1) EBAA Iron, Inc., Megalug® Series 1700.
        2) Star Pipe Products, Split Stargrip Series 3100S.
        3) Sigma Corp., One-Lok Model SLDEH.
    b. Materials:
        1) Restraint and backup ring: Ductile iron in accordance with ASTM A536.
        2) Wedges and wedge actuating components: Ductile iron in accordance with ASTM A536.
            a) Wedges shall be heat treated to a minimum of 370 BHN.
        3) Actuating bolts and nuts:
            a) Ductile iron in accordance with ASTM A536.
            b) Provide torque-limiting twist off components to ensure proper installation.
        4) Tie rods:
            a) Low alloy steel in accordance with AWWA C111.
        5) Bolts and nuts, including T-bolts:
            a) As specified in 15052 - Common Work Results for General Piping.
    c. Coatings:
        1) Provide manufacturer applied coating system.
        2) Manufacturers: One of the following or equal:
            a) EBAA Iron Inc., Mega-Bond.
            b) Star Pipe Products, Star-Bond.
            c) Sigma Corp., Corrsafe™ Electro-deposition coating.
    d. Working pressure:
        1) Shall include a minimum safety factor of 2:1.
        2) For sizes 3- through 16-inch: 350 pounds per square inch.
        3) For sizes 18- through 48-inch: 250 pounds per square inch.
    e. Restraint shall consist of a backup ring behind the ductile iron bell and a restraint ring consisting of multiple gripping wedges connected with number and type of tie rods as recommended by the manufacturer.
    f. Restraint shall allow post assembly deflection of a minimum of 50 percent of the deflection capability of the push-on joint.

C. Connections:
    1. Tapping saddle as specified in Owner standard specification.
        a. If Owner does not have a standard specification, provide tapping saddles as specified in Section 15120 - Piping Specialties.
    2. Tapping sleeve as specified in Owner standard specification.
        a. If Owner does not have a standard specification, provide tapping sleeves as specified in Section 15120 - Piping Specialties.
    3. Welded outlet:
        a. Fabrication:
            1) Welded outlets shall be fabricated by the pipe manufacturer at the same facility where the pipe is produced.
            2) The pipe manufacturer shall have a minimum of 5 years of experience in the fabrication and testing of outlets of similar size and configuration as those used on the Project.
            3) Application is limited to branch outlets having a nominal diameter not greater than 70 percent of the nominal diameter of the main line pipe or 36 inches.
            4) Parent pipe and branch outlet candidate pipe shall be centrifugally cast ductile iron pipe designed in accordance with AWWA C150 and manufactured in accordance with AWWA C151. Minimum classes for parent and outlet pipe:
                a) Sizes 4- through 54-inch: Special Thickness Class 53.
                b) Sizes 60- through 64-inch: Pressure Class 350.
            5) Electrodes for reinforcing welds:
                a) Manufacturers: One of the following or equal:
                    (1) NCO Alloys, Ni-Rod 55-0 flux cored wire.
                    (2) INCO Alloys, Ni-Rod 55 welding electrode.
                    (3) Stoody Castweld, Ni 55-0 flux cored wire.
                    (4) INCO Alloys, Ni-Rod 44 Filler Metal.
                b) Carbon steel electrodes are not acceptable.
        b. Pressure rating:
            1) Welded outlets 6- through 30-inch:
                a) Rated for a working pressure of 250 pounds per square inch.
            2) Welded outlets 36-inch and larger:
                a) Rated for a working pressure of 200 pounds per square inch.
            3) Welded outlets of all diameters and configurations:
                a) Have a minimum safety factor of 2.0 based on proof of design hydrostatic test results.
                b) Contractor shall, at the request of Engineer, provide the manufacturer’s representative proof test data confirming the design, hydrostatic test results, and safety factors.
        c. Source quality control:
            1) Branch outlets shall be subjected to an air pressure test of at least 15 pounds per square inch.
                a) Air leakage is not acceptable.
                b) Any leakage shall be detected by applying an appropriate foaming solution to the entire exterior surface of the weldment and adjoining pipe edges or by immersing the entire area in a vessel of water and visually inspecting the weld surface for the presence of air bubbles.

c) Hydrostatic testing to 500 pounds per square inch on each branch outlet can be used in lieu of air testing.
d) Any weldment that shows any signs of leakage shall be repaired and retested in accordance with the manufacturer's written procedures.

2) Pipe manufacturer shall have a fully documented welding quality assurance system and maintain resident quality assurance records in accordance with AWS D11.2.

3) Pipe manufacturer shall maintain appropriate welding procedure specification, procedure qualification, and welder performance qualification test records as well as appropriate air-test logs documenting air-leakage tests on all welded-on outlet pipes furnished to the Project.

D. Fittings:
1. Ductile iron in accordance with AWWA C110.
2. Joint type:
a. Same as that of the associated piping as specified in Section 15052 - Common Work Results for General Piping.
3. Plain end-to-flanged joint connectors using setscrews are not acceptable.

2.05 CEMENT MORTAR

A. Line pipe with cement mortar in accordance with AWWA C104 and as specified in this Section.

B. Cement:
1. Cement: In accordance with ASTM C150, Type II.

C. Water:
1. In accordance with AWWA C104 and as specified in this Section.

D. Sand and aggregate:
1. In accordance with AWWA C104.
2. Provide silica sand or other aggregate that is not subject to leaching in accordance with ASTM C33.

E. Lining:
1. Minimum lining thickness: Standard in accordance with AWWA C104.
2. Apply cement mortar on clean bare metal surfaces.
3. Extend to faces of flanges, ends of spigots, and shoulders of hubs.
4. Line special pieces or fittings by mechanical, pneumatic, or hand placement.
a. Extend to faces of flanges and ends of spigots.
b. Less than 12 inches in width: Coat with epoxy bonding agent prior to applying cement mortar.
c. Larger than 12 inches in width: Reinforced with 2-inch by 4-inch No. 13 gauge welded steel wire mesh prior to applying cement mortar.
5. Provide plastic end caps of sufficient thickness and strength to resist shipping, handling, and storage stresses.

6. Repair damage to the cement mortar lining, including disbondment, or cracking caused by improper curing, shipping, handling, or installation in accordance with AWWA C104 and approved by the Engineer.
    a. Reinforce coating with 2 layers spirally-wound steel wire positioned approximately in center of mortar coating positioned approximately at the third points of mortar coating:
        1) No. 12 gage spaced at maximum 1-inch centers.
        2) No. 14 gage steel wire at maximum 1/2-inch centers.

2.06 CERAMIC EPOXY

A. Line pipe with ceramic epoxy.

B. Manufacturers: One of the following or equal:
1. PROTECTO 401.
2. SP-2000W.

C. Material:
1. Amine cured Novolac epoxy containing at least 20 percent by volume of ceramic quartz pigment.

D. Application:
1. The lining shall only be applied by a manufacturer-authorized representative with no less than 5 years of experience in applying the specified material.
2. The application of the lining shall be performed in accordance with manufacturer's published specifications.
3. Pipe and fittings shall be delivered to application facility with no interior lining.
4. Interior of pipe shall be abrasive blasted in accordance with manufacturer instructions.
5. Apply lining in accordance with manufacturer instructions.
6. Minimum dry film thickness (DFT): 40 mills.

E. Coverage:
1. Gasket and spigot ends on joints:
    a. Minimum coverage using joint compound: 6 mils.
    b. Maximum coverage using joint compound: 10 mils.
2. Mechanical joints:
    a. Extend lining from spigot end to edge of gauging ring.
3. Number of coats:
    a. In accordance with manufacturer instructions.

F. Source quality control:
1. Test pipe and fitting lining with a magnetic film thickness gauge in accordance with SSPC PA-2 Film Thickness Rating.
2. Test lining integrity of pipes in accordance with coating manufacturer instructions using a holiday detection testing instrument set at the specified voltage.
3. Discard pipe or reline pipe when pinholes or discontinuities are found.
4. Repair holidays with joint compound in accordance with coating manufacturer instructions and re-test.

2.07 COATINGS

A. As specified in Section 15052 - Common Work Results for General Piping and Section 09960 - High-Performance Coatings.

2.08 POLYETHYLENE ENCASEMENT

A. General:
   1. Polyethylene encasement shall be supplied by the pipe manufacturer.

B. Materials: Supply one of the following polyethylene encasements:
   1. Single layer of V-Bio® enhanced polyethylene encasement (3 layers of coextruded LLDPE film with anti-microbial additive and volatile corrosion inhibitor infused on the inside surface), meeting all requirements of AWWA C105.

PART 3 EXECUTION

3.01 INSTALLATION

A. General:
   1. Install ductile iron piping in accordance with AWWA C600, or as modified in Section 15052 - Common Work Results for General Piping.
   2. For underground piping, the trenching, backfill, and compaction:
      a. Inspect coating prior to backfill.
      b. As specified in Section 02318 - Trenching.

B. Joints:
   1. Install types of joints as specified in the piping schedule provided in Section 15052 - Common Work Results for General Piping.
   2. Mechanical joints are not acceptable in above ground applications.
   3. Field closure for restrained push-on pipe:
      a. Locate field closures in areas where thrust calculations demonstrate restraint is not required.

C. Connection:
1. Tapping ductile iron pipe:
a. Direct tapping of ductile iron pipe may be performed but is limited to the following conditions:
1) Maximum allowable tap diameter by pipe diameter and pressure class:

Pipe Size (inches)	Pressure Class				
	150	200	250	300	350
	Maximum Allowable Direct Tap Size (inches)				
3	-	-	-	-	3/4
4	-	-	-	-	3/4
6	-	-	-	-	1
8	-	-	-	-	1
10	-	-	-	-	1
12	-	-	-	-	1-1/4
14	-	-	1-1/4	1-1/2	1-1/2
16	-	-	1-1/2	2	2
18	-	-	2	2	2
20	-	-	2	2	2
24	-	2	2	2	2

b. The maximum allowable tap diameter for pipelines greater than 24 inches is 2 inches.
c. 2 layers of 3-mil thread sealant are required to minimize the torque required to effect a watertight connection.
2. Direct tapping of glass lined ductile iron pipe may be performed only when approved in writing by the Engineer. Direct tapping of glass lined pipe shall be performed in accordance with the above conditions for tapping ductile iron pipe in addition to the following conditions:
a. Drilling and tapping shall be performed using a hole saw:
1) Use of a large drill bit is not acceptable.
b. As the hole saw approaches the glass lining, lessen the inward pressure to avoid excess chipping or cracking of the lining.
c. Minor chipping or spalling of the glass lining shall be repaired using an epoxy resin “glass repair kit” provided by the fabricator.
1) Manufacturers: One of the following or equal:
a) Devoe - Devran 224 HS.
b) Sherwin-Williams Co. - Sher-Tile High Solids Epoxy.
2) Repair kit use is only allowed for areas of damage less than 1/2 inch in diameter.
a) Larger areas of damage will require replacement.
3) Surface shall be prepared and repair kit shall be applied in accordance with manufacturer and/or fabricator’s instructions.

3.02 DEFECTS IN COATINGS EXCEPT TAPE WRAP AND CEMENT MORTAR COATING

A. Engineer will identify defective coating to be field repaired in accordance with the applicable AWWA standard.
   1. Pipe joints exceeding the following defect maximum will be rejected.
      a. Minor defects:
         1) No more than 1.5 per 100 square feet of surface area.
         2) 2 or more minor repairs within an 8-inches diameter circle will be considered a single repair.
         3) Repairs for adhesion testing will not be included in the total number of repairs.
         4) Repair in accordance with manufacturer's requirements.
      b. Major defects:
         1) No more than 3 major repairs on each pipe joint.
         2) No more than 30 percent repairs on the pipe surface area with defects.
   2. Minor repairs:
      a. Repairs less than 8-inches in the greatest dimension.
      b. Repair in accordance with manufacturer's requirements.
   3. Major repairs:
      a. Repairs that exceed 8-inches in the greatest dimension.
      b. Repair in accordance with manufacturer's requirements.

3.03 PLURAL COMPONENT EPOXY

A. Joints:
   1. Field applied coating shall be of the same density, smoothness, and thickness as shop applied coating.
   2. Comply with same application requirements as shop applied coating or lining.
      a. Provide heating and/or dehumidification equipment as required to meet the environmental conditions necessary for proper coating application.

3.04 PLURAL COMPONENT POLYURETHANE

A. Joints:
   1. Field applied coating or lining shall be of the same density, smoothness, and thickness as shop applied coating or lining.
   2. Comply with same application requirements as shop applied coating or lining.
      a. Provide heating and/or dehumidification equipment as required to meet the environmental conditions necessary for proper coating application.

3.05 POLYETHYLENE ENCASEMENT

A. Wrap buried ductile iron pipe and fittings in 2 layers of loose low-density polyethylene wrap or a single layer of high-density polyethylene wrap in accordance with AWWA C105 and as specified in this Section.

B. Wrap polyethylene encasement to be continuous and terminated neatly at connections to below grade equipment or structures.

C. At wall penetrations, extend encasement to the wall and neatly terminate.

D. At slab penetrations, extend encasement to 2 inches below the top of slab and neatly terminate.

E. When rising vertically in unimproved areas, extend encasement on pipe 6 inches above existing grade and neatly terminate.

F. Repair tears and make joints with 2 layers of plastic tape.

G. Work shall be inspected prior to backfilling of pipe and associated items.

3.06 FIELD QUALITY CONTROL

A. Testing ductile iron piping:
   1. Test as specified in Section 15052 - Common Work Results for General Piping and Section 15956 - Piping Systems Testing.

B. Repair damaged cement mortar lining to match quality, thickness, and bonding of original lining in accordance with AWWA C104.
   1. When lining cannot be repaired or repairs are defective, replace defective piping with undamaged piping.

C. Verify that interior surfaces of ceramic epoxy and glass lined pipe and fittings have continuous coverage:
   1. Test random samples, as directed by Engineer, in accordance with ASTM B1000.
   2. Discard lined piping and fittings found to have pinholes, crazing, or fish scales, which expose the metal substrate.

END OF SECTION

SECTION 15230

PLASTIC PIPING AND TUBING

PART 1 GENERAL

1.01 SUMMARY

A. Section includes: Plastic pipe, tubing, and fittings for systems that are not plumbing systems.

1.02 REFERENCES

A. American Society of Mechanical Engineers (ASME):

18. F679 - Standard Specification for Poly(Vinyl Chloride) (PVC) Large-Diameter Plastic Gravity Sewer Pipe and Fittings.

1.03 ABBREVIATIONS

A. ABS: Acrylonitrile-butadiene-styrene.

B. CPVC: Chlorinated polyvinyl chloride.

C. ID: Inside diameter of piping or tubing.

D. NPS: Nominal pipe size followed by the size designation.

E. NS: Nominal size of piping or tubing.

F. PVC: Polyvinyl chloride.

1.04 SUBMITTALS

A. Submit as specified in Section 01330 - Submittal Procedures.

B. Product data: As specified in Section 15052 - Common Work Results for General Piping.

C. Shop Drawings:
1. Describe materials, pipe, fittings, gaskets, and solvent cement.
2. Installation instructions.

1.05 QUALITY ASSURANCE

A. Mark plastic pipe with nominal size, type, class, schedule, or pressure rating, manufacturer and all markings required in accordance with ASTM and AWWA standards.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Protect piping materials from sunlight, scoring, and distortion.

B. Do not allow surface temperatures on pipe and fittings to exceed 120 degrees Fahrenheit.

PART 2 PRODUCTS

2.01 MATERIALS

A. Extruding and molding material: Virgin material containing no scrap, regrind, or rework material except where permitted in the referenced standards.

B. Fittings: Same material as the pipe and of equal or greater pressure rating.

C. Unions 2-1/2 inches and smaller: Socket end screwed unions. Make unions 3 inches and larger of socket flanges with 1/8-inch full-face soft Viton™ gasket.

2.02 PVC PIPING, SCHEDULE TYPE

A. The requirements for PVC piping used in plumbing systems are found in Section 15400 - Plumbing Systems.

B. Materials:
   1. PVC Pipe: Designation PVC 1120 in accordance with ASTM D1785 and appendices:
      a. Pipe and fittings: Extruded from Type I, Grade 1, Class 12454 material in accordance with ASTM D1784.
      b. PVC Pipe: Schedule 80 unless otherwise indicated on the Drawings.
   2. Fittings:
      a. Supplied by pipe manufacturer.
      b. Pressure fittings: In accordance with ASTM D2466 or ASTM D2467.
      c. DWV fittings: In accordance with ASTM D2665.
   3. Solvent cement: In accordance with ASTM D2564:
      a. Chemical service: For CPVC or PVC pipe in chemical service, provide the following primer and cement, or equal:
         1) Primer: IPS Corp., Type P70.
         2) Cement: IPS Corp., Type 724 cement or another cement certified by the manufacturer for chemical service.

2.03 CPVC PIPING

A. Materials:
   1. CPVC pipe: Schedule 40 or Schedule 80, as specified, in accordance with ASTM F441 and Appendix, CPVC 4120:
      a. Pipe: Extruded from Type IV, Grade 1, Class 23447 material in accordance with ASTM D1784.
      b. Manufacturers: One of the following or equal:
         1) Charlotte Pipe and Foundry Co.
         2) Eslon Thermoplastics, Inc.
         3) GF Harvel.
   2. Fittings: In accordance with ASTM F438 or ASTM F439 for pressure fittings, as appropriate to the service and pressure requirement:
      a. Fittings: Supplied by the pipe manufacturer.
      b. Manufacturers: One of the following or equal:
         1) Colonial Engineering.
         2) Eslon Thermoplastics, Inc.
         3) Chemtrol.
         4) Spears Manufacturing Co.
   3. Solvent cement: In accordance with ASTM F493:
      a. For CPVC pipe in chemical service, utilize IPS Corp., Type 724 cement or another cement certified by the manufacturer for high strength hypochlorite service.

2.04 SOURCE QUALITY CONTROL

A. The requirements for PVC piping used in plumbing systems are found in Section 15400 - Plumbing Systems.

B. PVC piping, Schedule Type:
   1. Mark pipe and fittings in accordance with ASTM D1785.

C. CPVC piping:
   1. Mark pipe and fittings in accordance with ASTM F441.

PART 3 EXECUTION

3.01 INSTALLATION

A. General:
   1. Where not otherwise specified, install piping in accordance with ASTM F645, or manufacturer's published instructions for installation of piping, as applicable to the particular type of piping.
   2. Provide molded transition fittings for transitions from plastic to metal or IPS pipe. Do not thread plastic pipe.
   3. Locate unions where indicated on the Drawings, and elsewhere where required for adequate access and assembly of the piping system.
   4. Provide serrated nipples for transition from plastic pipe to rubber hose.

B. Installation of PVC piping, Schedule Type:
   1. The requirements for PVC piping used in plumbing systems are found in Section 15400 - Plumbing Systems.
   2. Solvent weld joints in accordance with ASTM D2855:
      a. For PVC pipe in chemical service use IPS Corp., Type 724 cement in accordance with manufacturer's instructions.
   3. Install piping in accordance with manufacturer's published instructions.

C. Installation of CPVC piping:
   1. Clean dirt and moisture from pipe and fittings.
   2. Bevel pipe ends in accordance with manufacturer's instructions with chamfering tool or file. Remove burrs.
   3. Use solvent cement and primer formulated for CPVC:
      a. For CPVC pipe in chemical service use IPS Corp., Type 724 cement in accordance with manufacturer's instructions.
   4. Use primer on pressure and non-pressure joints.
   5. Do not solvent weld joints when ambient temperatures are below 40 degrees Fahrenheit or above 90 degrees Fahrenheit unless solvent cements specially formulated for these conditions are utilized.

END OF SECTION

SECTION 15244

POLYVINYL CHLORIDE (PVC) PIPE: PRESSURE

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. AWWA C900 PVC pipe and fittings.

1.02 REFERENCES

A. American Water Works Association (AWWA):
   1. C111 - Rubber-Gasket Joints for Ductile-Iron Pressure Pipe and Fittings.
   2. C605 - Underground Installation of Polyvinyl Chloride (PVC) and Molecularly Oriented Polyvinyl Chloride (PVCO) Pressure Pipe and Fittings.
   3. C900 - Polyvinyl Chloride (PVC) Pressure Pipe and Fabricated Fittings, 4 In. Through 60 In.
   4. C905 - Polyvinyl Chloride (PVC) Pressure Pipe and Fabricated Fittings, 14 In. through 48 In., for Water Transmission and Distribution.
   5. M23 - PVC Pipe - Design and Installation Manual.

B. ASTM International (ASTM):
   1. A536 - Standard Specification for Ductile Iron Castings.
   2. D1784 - Standard Specification for Rigid PolyVinyl Chloride) (PVC) Compounds and Chlorinated Poly(Vinyl Chloride) (CPVC) Compounds.
   3. D3139 - Standard Specification for Joints for Plastic Pressure Pipes Using Flexible Elastomeric Seals.
   4. F477 - Standard Specification for Elastomeric Seals (Gaskets) for Joining Plastic Pipe.
   5. F645 - Standard Guide for Selection, Design, and Installation of Thermoplastic Water-Pressure Piping Systems.

C. NSF International (NSF):
   1. 61 - Drinking Water System Components - Health Effects.

1.03 ABBREVIATIONS

A. DR: Dimension Ratio = OD/t (OD is pipe outer diameter, t is pipe wall thickness).

B. NPS: Nominal pipe size followed by the size designation.

1.04 SUBMITTALS

A. Submit as specified in Section 01330 - Submittal Procedures.

B. As specified in Section 15052 - Common Work Results for General Piping.

C. Shop drawings.

1.05 QUALITY ASSURANCE

A. Pipe in potable water applications: Provide pipe bearing NSF 61 seal.

B. Mark plastic pipe with date of extrusion, nominal size, class, manufacturer, and markings required in accordance with ASTM and AWWA standards.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Protect from sunlight, scoring, and distortion.

B. Do not allow surface temperatures to exceed 120 degrees Fahrenheit.

C. Deliver, offload, handle, and store pipe in accordance with manufacturer's or pipe supplier's recommendations and best practices provided by AWWA M23 and AWWA C605, including compliance with minimum recommended bending radius and maximum safe pulling forces for each specific pipe.

PART 2 PRODUCTS

2.01 PIPE

A. General:
   1. As specified in Section 15052 - Common Work Results for General Piping.
   2. Extruding and molding material: Virgin material containing no scrap, regrind, or rework material except where permitted in the referenced standards.
   3. In accordance with AWWA C900.
   4. Made from a PVC compound conforming to cell classification 12454 in accordance with ASTM D1784.

B. Pipe:
   1. Bell and spigot:
      a. Pipe with integral bell.
      b. Pressure Class as scheduled in Section 15052 - Common Work Results for General Piping with a maximum DR of 18.
      c. Manufacturers: One of the following or equal.
         1) Diamond Plastics Corp.
         2) CertainTeed.
         3) North American Pipe Corp.

2.02 FITTINGS

A. Material:
   1. Cast or ductile iron fittings as specified in Section 15211 - Ductile Iron Pipe: AWWA C151 sized for the dimensions of the pipe being used.

B. Equal to or greater pressure rating than the pipe.

2.03 JOINTS

A. Bell and spigot joints:
   1. Push-on or mechanical joint type as identified in the Piping Schedule in Section 15052 - Common Work Results for General Piping.
   2. Gasketed joint assembly: Meet or exceed the requirements in accordance with ASTM D3139.
   3. Factory installed gaskets: Neoprene in accordance with ASTM F477.
   4. Joint restraint at fittings:
      a. Concrete thrust blocks:
         1) Install thrust blocks at changes in pipe diameter and at fittings.
         2) Design thrust blocks using a safety factor of at least 1.5:1 for both the test and peak operating pressures.
      b. Mechanical wedge action joint restraints:
         1) Manufacturers: One of the following or approved equal:
            a) EBAA Iron, Inc.:
               (1) For pipes 3 to 36-inch: Series 2000PV.
               (2) For pipes 42 and 48-inch: Series 2200.
            b) Star Pipe Products, Series 4000.
            c) Sigma Corp.*:*
               (1) For pipes 3 to 36-inch: One-Lok Model SLCE.
               (2) For pipes 42 and 48-inch: PV-Lok Model PWM.
         2) Materials:
            a) Mechanical joints bolts and nuts as Specified in Section 15052 - Common Work Results for General Piping.
            b) Gland body: Ductile iron in accordance with ASTM A536.
            c) Wedge and wedge actuating components: Ductile iron in accordance with ASTM A536.
               (1) Wedges: Heat-treated to a minimum of 370 BHN.
            d) Actuating bolts and nuts: Ductile iron in accordance with ASTM A536.
               (1) Provide torque-limiting twist off components to ensure proper installation.
         3) Coatings:
            a) Provide a manufacturer applied coating system.
            b) Manufacturers: One of the following or equal:
               (1) EBAA Iron Inc., Mega-Bond.
               (2) Star Pipe Products, Star-Bond.
               (3) Sigma Corp., Corrsafe™ Electro-Deposition Coating.
         4) Consist of multiple gripping wedges incorporated into a follower gland meeting the requirements in accordance with AWWA C111.
         5) Allow post assembly angular deflection that is a minimum of 50 percent of the angular deflection allowed by the mechanical joint.
         6) Pressure rating equal to or greater than that of the pipe on which it is being used and a minimum safety factor of 2:1 for all sizes.
      c. Push-on joint restraint harnesses:
         1) Manufacturers: One of the following or approved equal:
            a) EBAA Iron, Inc.:
               (1) For pipes 4 to 12-inch: Series 1500.
               (2) For pipes 14 to 48-inch: Series 2800.

b) Star Pipe Products, Series 4100P.
c) Sigma Corp., PV-Lok Model PWP.

2) Materials:
   a) Restraint and backup rings: Ductile iron in accordance with ASTM A536.
   b) Wedge and wedge actuating components: Ductile iron in accordance with ASTM A536.
   c) Tie rods: Low alloy steel in accordance with AWWA C111.
3) Coatings:
   a) Provide manufacturer applied coating system.
   b) Manufacturers: One of the following or equal:
      (1) EBAA Iron Inc., Mega-Bond.
      (2) Star Pipe Products, Star-Bond.
      (3) Sigma Corp., Corrsafe ™ Electro-deposition coating.
4) Consist of a backup ring behind the PVC bell and a restraint ring consisting of multiple gripping wedges connected with number and type of tie rods as recommended by the manufacturer.
5) Allow post assembly angular deflection that is a minimum of 50 percent of the angular deflection allowed by the push-on joint.
6) Pressure rating equal to or greater than that of the pipe on which it is being used and a minimum safety factor of 2:1 for all sizes.

2.04 SOURCE QUALITY CONTROL

A. Bell and spigot piping:
   1. Hydrostatic proof testing in accordance with AWWA C900: Test pipe and integral bell to withstand, without failure, 2 times the pressure class of the pipe for a minimum of 5 seconds.

PART 3 EXECUTION

3.01 INSTALLATION

A. General:
   1. Install PVC piping in accordance with ASTM F645, AWWA C605, and manufacturer's or pipe supplier’s published installation instructions.
   2. Trenching and backfill as specified in Section 02318 - Trenching.
   3. Install pipe with tracer wire as specified in Section 15076 - Pipe Identification.

B. Tapping FPVC:
   1. Direct tapping of FPVC is not allowed.
   2. Saddle tapping:
      a. Saddle taps are allowable on all sizes and classes of AWWA C900 FPCVP.
      b. As specified in Section 15120 - Piping Specialties for allowable service saddles.

3. Tapping sleeves:
    a. Tapping sleeves are allowable on all sizes and classes of AWWA C900 FPVC.
    b. As specified in Section 15120 - Piping Specialties for allowable tapping sleeves.
4. Use only allowable tap sizing and recommended tapping procedures provided by the pipe supplier for all tapping operations on FPVC.

3.02 FIELD QUALITY CONTROL

A. Leakage test for piping:
    1. Subject to visible leak test and pressure test with maximum leakage allowance, as specified in Section 15956 - Piping Systems Testing.
    2. Pressure test with maximum leakage allowance:
        a. Perform test after placing sufficient backfill.
        b. In areas requiring immediate backfill, test prior to placement of permanent surfacing.
        c. Test pressure: As specified in the Piping Schedule in Section 15052 - Common Work Results for General Piping.
        d. Maximum leakage allowance for bell and spigot pipe is as listed in the table below:

Test Pressure (psi)	**Bell and Spigot Pipe Allowable Leakage (Gallons per 50 joints per hour)**									
	Nominal Pipe Size (inches)									
	4	**6**	**8**	**10**	**12**	**14**	**16**	**18**	**20**	**24**
50	0.19	0.29	0.38	0.48	0.57	0.67	0.76	0.86	0.96	1.15
75	0.23	0.35	0.47	0.59	0.70	0.82	0.94	1.05	1.17	1.40
100	0.27	0.41	0.54	0.68	0.81	0.95	1.08	1.22	1.35	1.62
125	0.3	0.45	0.6	0.76	0.91	1.06	1.21	1.36	1.51	1.81
150	0.33	0.50	0.66	0.83	0.99	1.16	1.32	1.49	1.66	1.99
175	0.36	0.54	0.72	0.89	1.07	1.25	1.43	1.61	1.79	2.15
200	0.38	0.57	0.76	0.96	1.15	1.34	1.53	1.72	1.91	2.29
225	0.41	0.61	0.81	1.01	1.22	1.42	1.62	1.82	2.03	2.43

END OF SECTION

SECTION 15249

POLYVINYL CHLORIDE (PVC) PIPE: SCHEDULE TYPE

PART 1 GENERAL

1.01 SUMMARY

A. Section includes: Schedule type PVC pipe and fittings.

1.02 REFERENCES

A. ASTM International (ASTM):
   1. D1784 - Standard Specification for Rigid Poly(Vinyl Chloride) (PVC) Compounds and Chlorinated Poly(Vinyl Chloride) (CPVC) Compounds.
   2. D1785 - Standard Specification for Poly(Vinyl Chloride) (PVC) Plastic Pipe, Schedules 40, 80 and 120.
   3. D2466 - Standard Specification for Poly(Vinyl Chloride) (PVC) Plastic Pipe Fittings, Schedule 40.
   4. D2467 - Standard Specification for Poly(Vinyl Chloride) (PVC) Plastic Pipe Fittings, Schedule 80.
   5. D2564 - Standard Specification for Solvent Cements for Poly(Vinyl Chloride) (PVC) Plastic Piping Systems.
   6. D2855 - Standard Practice for the Two-Step (Primer and Solvent Cement) Method of Joining Poly (Vinyl Chloride) (PVC) or Chlorinated Poly (Vinyl Chloride) (CPVC) Pipe and Piping Components with Tapered Sockets.
   7. F645 - Standard Guide for Selection, Design and Installation of Thermoplastic Water-Pressure Piping Systems.

1.03 SUBMITTALS

A. Submit as specified in Section 01330 - Submittal Procedures.

B. Product data: As specified in Section 15052 - Common Work Results for General Piping.

1.04 DELIVERY, STORAGE, AND HANDLING

A. Protect from sunlight, scoring, and distortion.

B. Do not allow surface temperatures to exceed 120 degrees Fahrenheit.

C. Store and handle as recommended by manufacturer in published instructions.

PART 2 PRODUCTS

2.01 MATERIALS

A. Extruding and molding material: Virgin material containing no scrap, regrind, or rework material except where permitted in the referenced standards.
   1. Pipe: Designation PVC 1120 in accordance with ASTM D1785 and appendices:
      a. Extruded from Type I, Grade 1, Class 12454 material in accordance with ASTM D1784.
      b. Schedule 80 unless otherwise indicated on the Drawings or specified in the Piping Schedule in Section 15052 - Common Work Results for General Piping.
   2. Fittings: In accordance with ASTM D2467.
      a. Same material as the pipe and of equal or greater pressure rating.
      b. Supplied by pipe manufacturer.
      c. Unions 4 inches and smaller:
         1) Use socket end screwed unions.
      d. Unions 6 inches and larger:
         1) Use socket flanges with 1/8-inch full-face soft gasket.
            a) Gasket material: As indicated on the Piping Schedule.
   3. Solvent cement:
      a. In accordance with ASTM D2564.
      b. Manufacturers: The following or equal:
         1) IPS Corp.
            a) Primer: Type P70.
            b) Cement: Type 724.
      c. Certified by the manufacturer for the service of the pipe.
      d. In potable water applications: Provide solvent cement listed by NSF for potable water applications.

2.02 SOURCE QUALITY CONTROL

A. Meets or exceeds all quality assurance test requirements stated in ASTM D1785.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install piping in accordance with ASTM F645, or manufacturer's published instructions for installation of piping, as applicable.

B. Provide molded transition fittings for transitions from plastic to metal pipe.
   1. Do not thread pipe.
   2. Do not use flanged transition fittings unless specifically indicated on the Drawings.

C. Locate unions where indicated on the Drawings, and elsewhere where required for adequate access and assembly of the piping system.

D. Provide serrated nipples for transition from pipe to rubber hose.

E. Solvent weld joints in accordance with ASTM D2855.

3.02 FIELD QUALITY CONTROL

A. Test pipe as specified in Section 15052 - Common Work Results for General Piping and Section 15956 - Piping Systems Testing.

END OF SECTION

SECTION 15286

STAINLESS STEEL PIPE AND TUBING

PART 1 GENERAL

1.01 SUMMARY

A. Section includes: Stainless steel piping and tubing.

1.02 REFERENCES

A. American Society of Mechanical Engineers (ASME):
   1. B16.1 - Gray Iron Pipe Flanges and Flanged Fittings: Classes 25, 125, and 250.
   2. B16.5 - Pipe Flanges and Flanged Fittings: NPS 1/2 through 24.
   3. B16.11 - Forged Fittings, Socket-Welded and Threaded.
   4. B31.3 - Process Piping.
   5. B36.19 - Stainless Steel Pipe.

B. American Welding Society (AWS):
   1. D1.6 - Structural Welding Code - Stainless Steel.

C. ASTM International (ASTM):
   1. A182 - Standard Specification for Forged or Rolled Alloy and Stainless Steel Pipe Flanges, Forged Fittings, and Valves and Parts for High-Temperature Service.
   2. A193 - Standard Specification for Alloy-Steel and Stainless Steel Bolting for High Temperature or High Pressure Service and Other Special Purpose Applications.
   3. A194 - Standard Specification for Carbon and Alloy Steel Nuts and Bolts for High Pressure or High Temperature Service, or Both.
   4. A240 - Standard Specification for Chromium and Chromium-Nickel Stainless Steel Plate, Sheet, and Strip for Pressure Vessels and for General Applications.
   5. A269 - Standard Specification for Seamless and Welded Austenitic Stainless Steel Tubing for General Service.
   6. A276 - Standard Specification for Stainless Steel Bars and Shapes.
   7. A312 - Standard Specification for Seamless, Welded, and Heavily Cold Worked Austenitic Stainless Steel Pipes.
   8. A351 - Standard Specification for Castings, Austenitic, for Pressure-Containing Parts.
   9. A380 - Standard Practice for Cleaning, Descaling, and Passivation of Stainless Steel Parts, Equipment, and Systems.
   10. A403 - Standard Specification for Wrought Austenitic Stainless Steel Piping Fittings.
   11. A743 - Standard Specification for Castings, Iron-Chromium, Iron-Chromium-Nickel, Corrosion Resistant, for General Application.

12. A744 - Standard Specification for Castings, Iron-Chromium-Nickel, Corrosion Resistant, for Severe Service.
13. A774 - Standard Specification for As-Welded Wrought Austenitic Stainless Steel Fittings for General Corrosive Services at Low and Moderate Temperatures.
14. A778 - Standard Specification for Welded, Unannealed Austenitic Stainless Steel Tubular Products.
15. A789 - Standard Specification for Seamless and Welded Ferritic/Austenitic Stainless Steel Tubing for General Service.
16. A790 - Standard Specification for Seamless and Welded Ferritic/Austenitic Stainless Steel Pipe.
17. A928 - Standard Specification for Ferritic/Austenitic (Duplex) Stainless Steel Pipe Electric Fusion Welded with Addition of Filler Metal.
18. A967 - Standard Specification for Chemical Passivation Treatments for Stainless Steel Parts.
19. B622 - Standard Specification for Seamless Nickel and Nickel-Cobalt Alloy Pipe and Tube.
20. B912 - Standard Specification for Passivation of Stainless Steels Using Electropolishing.
21. F593 - Standard Specification for Stainless Steel Bolts, Hex Cap Screws, and Studs.

1.03 SUBMITTALS

A. Submit as specified in Section 01330 - Submittal Procedures.

B. Product data: As specified in Section 15052 - Common Work Results for General Piping.

C. Shop drawings:
   1. Detailed layout drawings:
      a. Dimensions and alignment of pipes.
      b. Location of valves, fittings, and appurtenances.
      c. Location of field joints.
      d. Location of pipe hangars and supports.
      e. Connections to equipment and structures.
      f. Location and details of shop welds.
   2. Thickness and dimensions of fittings and gaskets.
   3. Photographs, drawings, and descriptions of pipe, fittings, welding procedures, and pickling and passivating procedures.
   4. Material specifications for pipe, gaskets, fittings, and couplings.
   5. Data on joint types and components used in the system including stub ends, backing flanges, flanged joints, grooved joint couplings and screwed joints.
   6. Location of material fabrication.
   7. Chemical analysis certificates.

PART 2 PRODUCTS

2.01 DESIGN AND PERFORMANCE CRITERIA

A. Add joints and flexible couplings in a manner that achieves intent of maximizing size of individual piping sections.

B. Shop fabrication: Fabricate piping sections in the shop and pickle and passivate at point of manufacture.

C. Field assembly:
   1. Field welding is prohibited.
   2. Assemble shop-fabricated piping in the field using the joints designed into the piping layout or by using flexible couplings.

2.02 STAINLESS STEEL PIPE

A. General:
   1. Pipe sizes specified in the Specifications and indicated on the Drawings are nominal.

B. Wall thickness:
   1. As specified in Section 15052 - Common Work Results for General Piping.

C. Piping material and manufacturing:
   1. Comply with the requirements outlined in the following table:

Service	Stainless Steel Grade	Pipe Manufacturing Process
For low chloride water service with chloride concentrates below 200 parts per million and/or free chlorine less than 2 parts per million at ambient temperatures.		
Piping 3 inches in nominal diameter and larger	Type 304L stainless steel in accordance with ASTM A240	In accordance with ASTM A778
Piping less than 3 inches in nominal diameter	Type 304L stainless steel in accordance with ASTM A240	In accordance with ASTM A312
PREN: Pitting Resistance Equivalency Number PREN = Cr% + (3.3 x Mo%) + (16 x N%)		

UNS #	ALLOY	Cr%	Mo%	N%	Other	PREN
N10276	C-276	14.5-16	15-17	-	W 3-4.5	64

D. Fittings for piping 3 inches in nominal diameter and greater:
   1. Material: In accordance with ASTM A240 stainless steel, grade to match the pipe.
   2. Manufacturing standard: In accordance with ASTM A774.
   3. Wall thickness of fitting: In accordance with ASME B36.19 for the schedule of pipe specified.
   4. End configuration: As needed to comply with specified type of joint.
   5. Dimensional standards:
      a. Fittings with weld ends: In accordance with ASME B16.11.
      b. Fittings with flanged ends: In accordance with ASME B16.5, Class 150.

E. Fittings for piping less than 3 inches in diameter:
   1. Material: In accordance with ASTM A240 stainless steel, grade to match the pipe.
   2. Manufacturing standard: In accordance with ASTM A403, Class WP.
   3. Wall thickness and dimensions of fitting: In accordance with ASME B16.11 and as required for the schedule of pipe specified.
   4. End configuration: As needed to comply with specified type of joint.
   5. Forgings in accordance with ASTM A182, or barstock in accordance with ASTM A276. Match forging or barstock material to the piping materials.

F. Piping joints:
   1. Joint types, piping greater than 2 inches in diameter, general:
      a. Where type of joint is specifically indicated on the Drawings or specified, design and shop-fabricate piping sections utilizing type of joint illustrated or scheduled.
      b. Where type of joint is not specifically indicated on the Drawings or as specified in Section 15052 - Common Work Results for General Piping, Piping Schedule, design and shop-fabricate piping sections utilizing any of the following joint types:
         1) Welded joints.
         2) Flanged joints.
      c. Joints at valves and pipe appurtenances:
         1) Provide flanged valves and flanged pipe appurtenances in stainless steel piping systems with flanged ends.

2) Design and fabricate piping sections to make connections with flanged valves and pipe appurtenances using flanged coupling adapters or flanged joints.
a) Flexible couplings and flanged coupling adapters: Provide stainless steel construction with materials matching the piping system, and conforming to requirements as specified in Section 15121 - Pipe Couplings.

2. Welded joints:
   a. Pipe 12 inches and larger in diameter: Automatically weld joints using gas tungsten-arc procedures.
   b. Piping 4 inches through 12 inches in diameter: Double butt welded joints.
   c. Piping less than 4 inches in diameter: Single butt-welded joints.
   d. Mark each weld with a symbol that identifies the welder.
3. Flanged joints: Conforming to the requirements in accordance with ASME B16.5, Class 150 , 300, or 600, as scheduled.
4. Flanges for Schedule 40S and Schedule 80S pipe:
   a. Provide forged stainless steel (type matching piping system) welding neck flanges or slip-on flanges in accordance with ASME B16.5 Class 150.
   b. Material: In accordance with ASTM A182.

G. Gaskets:
1. Aeration air service: As specified in Section 15052 - Common Work Results for General Piping.
2. All other service applications: EPDM, nitrile, or other materials compatible with the process fluid.

H. Bolts for flanges :
1. Bolts and nuts: Type 316 stainless steel in accordance with ASTM A193 heavy hex head.
   a. Bolt length such that after installation, end of bolt projects 1/8-inch to 3/8-inch beyond outer face of nut.
   b. Nuts: In accordance with ASTM A194 heavy hex pattern.

I. Fabrication of pipe sections:
1. Welding: Weld in accordance with ASME B31.3.
2. Weld seams:
   a. Full penetration welds, free of oxidation, crevices, pits and cracks, and without undercuts.
   b. Provide weld crowns of 1/16 inch with tolerance of plus 1/16 inch and minus 1/32 inch.
   c. Where internal weld seams are not accessible, use gas tungsten-arc procedures with internal gas purge.
   d. Where internal weld seams are accessible, weld seams inside and outside using manual shielded metal-arc procedures.

J. Cleaning (pickling) and passivation:
1. Following shop fabrication of pipe sections, straight spools, fittings, and other piping components, clean (pickle) and passivate fabricated pieces.

2. Clean (pickle) and passivate in accordance with ASTM A380 or A967.
    a. If degreasing is required before cleaning to remove scale or iron oxide, cleaning (pickling) treatments with citric acid are permissible.
        1) However, these treatments must be followed by inorganic cleaners such as nitric acid/hydrofluoric acid.
    b. Passivation treatments with citric acid are not allowed.
3. Finish requirements: Remove free iron, heat tint oxides, weld scale, and other impurities, and obtain a passive finished surface.

K. Electropolishing:
1. Required for the following stainless steel piping:
    a. Pipe interior: All piping.
    b. Pipe exterior: All piping except concrete encased piping.
2. For piping greater than 2-inches in diameter:
    a. Electropolish stainless steel pipe inside and out in accordance with ASTM B912.
        1) Electropolish process: Remove no more than 5 micrometers from the surface.
    b. Following shop fabrication of pipe sections, straight spools, fittings, and other components, prepare surface using preparatory and cleaning procedures in accordance with ASTM A380.
        1) Wipe all items with appropriate solvent to remove any marks, sugar, markers, or crayon.
    c. A post dip in room temperature 10 to 30 percent nitric acid solution is required to remove residuals from the electropolishing process and to provide a shine to the metal surface.
        1) Follow the post dip procedure by final rinsing with water to remove residual acid or any other materials that may affect the appearance or performance of the passivated part.
    d. Finished surfaces: Free of imperfections such as pitting, etches, burn marks or stains.

2.03 STAINLESS STEEL TUBING

A. Stainless steel tubing:
1. Seamless tubing made of Type 316L stainless steel and in accordance with ASTM A269, wall thickness not less than 0.035 inch.

B. Fittings: Swage ferrule design:
1. Components made of:
    a. Type 316 stainless steel.
2. Double acting ferrule design, providing both a primary seal and a secondary bearing force.
3. Flare type fittings are not acceptable.
4. Manufacturers: One of the following or equal:
    a. Crawford Fitting Co., Swagelok.
    b. Hoke, Gyrolok.
    c. Parker, CPI.

C. Valves for use with stainless steel tubing:
   1. Ball type valves with swage ends to match tubing diameter.
   2. Constructed from:
      a. Type 316 stainless steel with TFE seats.
   3. Manufacturers: The following or equal:
      a. Crawford Fitting Co., Swagelok.

2.04 SOURCE QUALITY CONTROL

A. Visually inspect pipe for welding defects such as crevices, pits, cracks, protrusions, and oxidation deposits.

B. Provide written certification that the pipe as supplied are in accordance with ASTM A778. Supplemental testing is not required.

C. Provide written certification that the fittings as supplied are in accordance with ASTM A774.
   1. Supplementary testing is not required.

D. Thoroughly clean any equipment before use in cleaning or fabrication of stainless steel.

E. Storage: Segregate location of stainless steel piping from fabrication of any other piping materials.

F. Shipment to site:
   1. Protect all flanges and pipe ends by encapsulating in dense foam.
   2. Securely strap all elements to pallets with nylon straps. Use of metallic straps is prohibited.
   3. Cap ends of tube, piping, pipe spools, fittings, and valves with non-metallic plugs.
   4. Load pallets so no tube, piping, pipe spools, fittings, or valves bear the weight of pallets above.
   5. Notify Engineer when deliveries arrive so Engineer may inspect the shipping conditions.
   6. Engineer may reject material due to improper shipping methods or damage during shipment.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install piping in such a manner as not to impart strain to connected equipment.

B. Slope horizontal lines so that they can be drained completely.

C. Provide valve drains at low points in piping systems.

D. Install eccentric reducers where necessary to facilitate draining of piping system.

E. Provide access for inspection and flushing of piping systems to remove sediment, deposits, and debris.

3.02 FIELD ASSEMBLY OF SHOP-FABRICATED PIPING SECTIONS

A. Join shop-fabricated piping sections together using backing flanges, flexible couplings, flanged coupling adapters, grooved couplings, or flanges.

3.03 FIELD QUALITY CONTROL

A. Test piping to pressure and by method as specified in Section 15052 - Common Work Results for General Piping.
   1. If pressure testing is accomplished with water:
      a. Use only potable quality water.
      b. Piping: Thoroughly drained and dried or place immediately into service.

B. Visually inspect pipe for welding defects such as crevices, pits, cracks, protrusions, and oxidation deposits.

3.04 PROTECTION

A. Preserve appearance and finish of stainless steel piping by providing suitable protection during handling and installation and until final acceptance of the Work.
   1. Use handling methods and equipment to prevent damage to the coating, include the use of wide canvas slings and wide padded skids.
   2. Do not use bare cables, chains, hooks, metal bars, or narrow skids.
   3. Store stainless steel piping and fittings away from any other piping or metals. Storage in contact with ground or outside without projection from bad weather is prohibited.
   4. Protect stainless steel piping and fittings from carbon steel projections (when grinding carbon steel assemblies in proximity) and carbon steel contamination (do not contact stainless steel with carbon steel wire brush or other carbon steel tool).
   5. Electropolished stainless steel:
      a. Do not handle with bare hands or gloves contaminated with oils, metals, or other materials. Use disposable latex gloves or equivalent with handling.
      b. Clean, repair, or replace damaged, stained, scarred or dirty electropolished stainless steel to restore shop-finish quality.

END OF SECTION

SECTION 15400

PLUMBING SYSTEMS

PART 1 GENERAL

1.01 SUMMARY

A. Section includes: Requirements for materials and installation of plumbing systems.

1.02 REFERENCES

A. Abbreviations:
   1. gpf - gallons per flush.
   2. gph - gallons per hour.
   3. gpm - gallons per minute.
   4. psig - pounds per square inch, gauge.

B. Definitions:
   1. Buried: Piping that is installed below buildings, foundations, or finish grade, either in soil or encased in concrete in soil.
   2. Exterior: Piping that is installed outside a building or within a pipe trench or tunnel.
   3. Flame Spread and Smoke Density: Burning characteristics determined in accordance with ASTM E84.
   4. Interior: Piping that is installed inside a building.
   5. K Factor: Thermal conductivity determined in accordance with ASTM C177 or C518.
   6. Mineral Fiber: Fibers manufactured of glass, rock, or slag processed from a molten state, with or without a binder.
   7. Water Vapor Permeance: Water vapor transmission determined in accordance with ASTM E96 and expressed in units of perm-inch.

C. Standards:
   1. American Concrete Institute (ACI).
   2. American Gas Association (AGA).
   3. American Society of Mechanical Engineers (ASME).
      a. B16.3 - Malleable Iron Threaded Fittings: Classes 150 and 300.
      b. B16.12 - Cast Iron Threaded Drainage Fittings.
   4. American Society of Sanitary Engineering (ASSE):
      a. 1070 - Performance Requirements for Water Temperature Limiting Devices.
   5. American Water Works Association (AWWA):
      a. C511 - Reduced-Pressure Principle Backflow Prevention.
      b. C700 - Standard for Cold-Water Meters -- Displacement Type, Bronze Main Case.
      c. C702 - Standard for Cold-Water Meters -- Compound Type.
   6. Americans with Disabilities Act (ADA).

7. ASTM International (ASTM):
    a. A48 - Standard Specification for Gray Iron Castings.
    b. A53 - Standard Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless.
    c. A74 - Standard Specification for Cast Iron Soil Pipe and Fittings.
    d. A153 - Standard Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware.
    e. A615 - Standard Specification for Deformed and Plain Carbon-Steel Bars for Concrete Reinforcement.
    f. A888 - Standard Specification for Hubless Cast Iron Soil Pipe and Fittings for Sanitary and Storm Drain, Waste, and Vent Piping Applications.
    g. B32 - Standard Specification for Solder Metal.
    h. B88 - Standard Specification for Seamless Copper Water Tube.
    i. B813 - Standard Specification for Liquid and Paste Fluxes for Soldering of Copper and Copper Alloy Tube.
    j. B828 - Standard Specification for Making Capillary Joints by Soldering of Copper and Copper Alloy Tube and Fittings.
    k. C117 - Standard Test Method for Materials Finer than 75-µm (No. 200) Sieve in Mineral Aggregates by Washing.
    l. C518 - Standard Test Method for Steady-State Thermal Transmission Properties by Means of the Heat Flow Meter Apparatus.
    m. C547 - Standard Specification for Mineral Fiber Pipe Insulation.
    n. C552 - Standard Specification for Cellular Glass Thermal Insulation.
    o. C564 - Standard Specification for Rubber Gaskets for Cast Iron Soil Pipe and Fittings.
    p. C1136 - Standard Specification for Flexible, Low Permeance Vapor Retarders for Thermal Insulation.
    q. D256 - Standard Test Methods for Determining the Izod Pendulum Impact Resistance of Plastics.
    r. D297 - Standard Test Methods for Rubber Products-Chemical Analysis.
    s. D395 - Standard Test Methods for Rubber Property-Compression Set.
    t. D412 - Standard Test Methods for Vulcanized Rubber and Thermoplastic Elastomers-Tension.
    u. D635 - Standard Test Method for Rate of Burning and/or Extent and Time of Burning of Plastics in a Horizontal Position.
    v. D638 - Standard Test Method for Tensile Properties of Plastics
    w. D790 - Standard Test Methods for Flexural Properties of Unreinforced and Reinforced Plastics and Electrical Insulating Materials.
    x. D792 - Standard Test Methods for Density and Specific Gravity (Relative Density) of Plastics by Displacement.
    y. D1784 - Standard Specification for Rigid Poly (Vinyl Chloride) (PVC) Compounds and Chlorinated Poly(Vinyl Chloride (CPVC) Compounds.
    z. D1785 - Standard Specification for Poly(Vinyl Chloride (PVC) Plastic Pipe, Schedules 40, 80, and 120.
    aa. D2240 - Standard Test Method for Rubber Property-Durometer Hardness.
    bb. D2466 - Standard Specification for Poly(Vinyl Chloride) (PVC) Plastic Pipe Fittings, Schedule 40.
    cc. D2467 - Standard Specification for Poly(Vinyl Chloride) (PVC) Plastic Pipe Fittings, Schedule 80.
    dd. D2564 - Standard Specification for Solvent Cements for Poly(Vinyl Chloride) (PVC) Plastic Piping Systems.

ee. D2665 - Standard Specification for Poly(Vinyl Chloride) (PVC) Plastic Drain, Waste, and Vent Pipe and Fittings.
ff. D2843 - Standard Test Method for Density of Smoke from the Burning or Decomposition of Plastics.
gg. D2863 - Standard Test Method for Measuring the Minimum Oxygen Concentration to Support Candle-Like Combustion of Plastics (Oxygen Index).
hh. D4101 - Standard Classification System and Basis for Specification for Polypropylene Injection and Extrusion Materials.
ii. E84 - Standard Test Method for Surface Burning Characteristics of Building Materials.
jj. E96 - Standard Test Methods for Gravimetric Determination of Water Vapor Transmission Rate of Materials.
kk. F438 - Standard Specification for Socket-Type Chlorinated Poly(Vinyl Chloride) (CPVC) Plastic Pipe Fittings, Schedule 40.
ll. F439 - Standard Specification for Chlorinated Poly (Vinyl Chloride) (CPVC) Plastic Pipe Fittings, Schedule 80.
mm. F441 - Standard Specification for Chlorinated Poly(Vinyl Chloride) (CPVC) Plastic Pipe, Schedules 40 and 80.
nn. F493 - Standard Specification for Solvent Cements for Chlorinated Poly(Vinyl Chloride) (CPVC) Plastic Pipe and Fittings.
oo. F593 - Standard Specification for Stainless Steel Bolts, Hex Cap Screws, and Studs.
pp. F594 - Standard Specification for Stainless Steel Nuts.
qq. F645 - Standard Guide for Selection, Design, and Installation of Thermoplastic Water- Pressure Piping Systems.

8. California Code of Regulations (CCR):
   a. Title 24 - Building Standard Code.
9. International Association of Plumbing and Mechanical Officials (IAPMO):
   a. IS 03 - Copper plumbing Tube Pipe and Fittings.
10. National Electrical Manufacturers Association (NEMA):
   a. 250 - Enclosures for Electrical Equipment (1000 V Maximum).
11. Plumbing and Drainage Institute (PDI):
   a. WH 201 - Water Hammer Arresters Standard.
12. Underwriters Laboratories, Inc. (UL):
   a. 94 - Standard for Tests for Flammability of Plastic Materials for Parts in Devices and Appliances.
13. United States Environment Protection Agency (EPA): Water Sense.

1.03 ADMINISTRATIVE REQUIREMENTS

A. Roof coordination:
   1. Provide plumbing equipment roof penetrations information required in the preparation of roofing drawings including, but not limited to:
      a. Location.
      b. Diameter.
      c. Configuration of penetration and the surround.

2. Provide roof mounted plumbing equipment information required in the preparation of roofing drawings including, but not limited to:
    a. Location.
    b. Size.
    c. Weight.
    d. Anchoring and support details.

1.04 SUBMITTALS

A. Submit as specified in Section 01330 - Submittal Procedures.

B. Manufacturer's instructions.

C. Shop drawings: and as applicable:
1. System layout, mechanical, electrical power, and control diagrams.
2. Nameplate information.
3. Materials.
4. Coatings and linings.
5. Rough-in drawings.
6. Supports, vibration isolators, and details.
7. Primary and ancillary equipment.
8. Proposed cutting and patching.
9. Maximum recommended equipment vibration levels and field-testing method.
10. Copy of factory test results.

D. Certificates: As specified in Section 01600 - Product Requirements:
1. American Backflow Prevention Association for backflow prevention assembly.
2. National Science Foundation for products when specified.

E. Field testing documentation.

F. Warranties.

1.05 WARRANTY

A. Provide warranty as specified in Section 01783 - Warranties and Bonds.

PART 2 PRODUCTS

2.01 GENERAL

A. All devices and fixtures shall be in accordance with CCR Title 24.

2.02 PIPE INSULATION

A. General:
1. Insulation thicknesses: Provide insulation thickness in inches in accordance with Table 1 per 2021 International Energy Conservation Code (IECC). Insulation thickness shown is nominal. Manufacturing tolerance of 15 percent variation is permissible.

2. Insulation conductivity and nominal pipe size as specified in Table 1.

Table 1 - Insulation Thickness Requirements							
	CONDUCTIVITY Btu x in./(h x ft^2 x $^\circ$F)[b]	**MEAN RATING TEMPERATURE Degree Fahrenheit**	**<1**	**1 to <1 1/2**	**1 1/2 to < 4**	**4 to < 8**	**>8**
105-140	0.21-0.28	100	1.0	1.5	1.5	1.5	1.5
40-60	0.21-0.27	75	0.5	1.0	1.0	1.0	1.0

3. Service designation and location requirements as specified in Table 2 including the following requirements.
   a. Insulation type.
   b. Jacket type.
   c. Vapor barrier requirements.

Table 2 - Insulation Schedule					
Service Designation[(1)]	**Location[(2)]**	**Insulation Type[(3)]**	**Jacket Type[(3)]**	**Service Temp. °F[(4)]**	**Vapor Barrier**
Hot Water	Interior or Exterior	1 or 2	Type 1 on Exterior installations, none required on Interior installations	100-200	Install on Type 2 insulation
Hot Water Supply and Return	Interior or Exterior	2 or 3	1 or 2	100-200	Required
Tepid Water	Interior or Exterior	1 or 2	Type 1 on Exterior installations, none required on Interior installations	60-100	Install on Type 2 insulation
Tepid Water Supply and Return	Interior or Exterior	2 or 3	1 or 2	60-100	Required
Steam Condensate	Interior or Exterior	3	2	Above 200	Required

Table 2 - Insulation Schedule					
Service Designation[1]	**Location[2]**	**Insulation Type[3]**	**Jacket Type[3]**	**Service Temp. °F[4]**	**Vapor Barrier**
Chilled Water	Interior or Exterior	1	1	Below 40	Required
Heat Traced Pipes[5]	Exterior	1 or 2	2	N/A	Install on Type 2 insulation

Notes:
1. Refer to Plumbing Piping Schedule as indicated on the Drawings for service designations.
2. Insulation jackets are not required for concealed interior installations in accordance with appliable plumbing code.
3. Contractor may select from options listed.
4. Unless noted otherwise, use service temperature range provided in this table to establish insulation thickness as required by Table 1.
5. Insulate all piping systems that are heat traced as indicated on the Drawings.

B. Type 1: Pipe insulation, closed cell elastomeric insulation:
   1. Manufacturers: One of the following or equal:
      a. Aeroflex USA Inc., Aerocel® AC.
      b. Armacell®, AP Armaflex.
   2. Insulation material: Closed cell elastomeric insulation.
   3. Minimum temperature range: Minus 40 degrees Fahrenheit to plus 220 degrees Fahrenheit.
   4. K factor at 75 degrees Fahrenheit: Not more than 0.27 BTU-inch/hour-square feet-degrees Fahrenheit.
   5. Fire ratings:
      a. Flame spread: 25 or less.
      b. Smoke density: 50 or less for insulation thicknesses up to 1.5 inches.
   6. Joints: Seal with manufacturer's recommended contact adhesive to form continuous water barrier.

C. Type 2: Pipe insulation, preformed mineral fiberglass:
   1. Manufacturers: One of the following or equal:
      a. Johns Manville, Micro-Lok® HP.
      b. Knauf Insulation.
      c. Owens-Corning.
   2. Insulation material: Preformed mineral fiberglass insulation made from glass fibers bonded with a thermosetting resin.
      a. In accordance with ASTM C547, Class 1.
      b. Provide with factory installed vapor barrier.
         1) Material: White Kraft paper bound to aluminum foil in accordance with ASTM C1136, Type I.
         2) Longitudinal lap seals: Pressure-sensitive, self-sealing longitudinal lap strip with factory applied adhesive.
         3) Circumferential butt seals: 4-inch wide tape or similar properties or 4 inch wide overlap with adhesive seal.

4) Vapor barrier permeability: 0.02 perms or lower.
5) Vapor barrier flame spread rating: 25 or less.

3. Minimum temperature range: Minus 0 degrees Fahrenheit to plus 850 degrees Fahrenheit.
4. K factor at 75 degrees Fahrenheit: Not more than 0.23 BTU-inch/hour-square feet-degrees Fahrenheit.
5. Maximum moisture absorption, volume percent: 5.

D. Type 3: Pipe insulation, rigid cellular glass:
1. Manufacturers: One of the following or equal:
a. Owens- Corning, Foamglas® One™.
2. Insulation material: Rigid cellular glass in accordance with ASTM C552, Type II.
3. Temperature range: Minus 450 degrees Fahrenheit to plus 900 degrees Fahrenheit.
4. K factor at 75 degrees Fahrenheit: Not more than 0.32 BTU-inch/hour-square feet-degrees Fahrenheit.
5. Minimum average density: 7.5 pounds per cubic foot.
6. Maximum moisture absorption, volume percent: 5.
7. Minimum compressive strength: 87 pounds per square inch.
8. Moisture permeability: 0.00 perm-inch.

E. Insulation jackets:
1. Type 1: Pipe insulation jacket, ultraviolet-resistant polyvinyl chloride:
a. Manufacturers: One of the following or equal:
1) Johns Manville, Zeston® 2000 PVC.
2) Proto Corp., LoSMOKE PVC.
3) Speedline® Corp., Smoke-Safe™ PVC.
b. Material: Ultraviolet-resistant polyvinyl chloride jacketing, 20 mil minimum thickness.
c. Fire rating: 25 maximum flame spread, smoke developed 50 or less.
d. Color: White.
e. Overlap: 1-inch minimum at joints and fittings.
f. Joint seal: PVC solvent welded or adhesive as recommended by the manufacturer.
g. Fittings: Factory made with full thickness insulation.
2. Type 2: Pipe insulation jacket, aluminum:
a. Manufacturers: One of the following or equal:
1) Childers Products.
2) Premetco International.
b. Material: Aluminum, Alloy 5005; 0.016-inch (26-gauge) minimum thickness.
c. Overlap: Overlap circumferential joints 4 inches minimum; overlap longitudinal joints 1-inch minimum; longitudinal joints oriented to minimize water entry.
d. Bands: 0.5-inch wide, 0.0508-inch (16-gauge) thick aluminum, same alloy as jacket or 0.0179-inch thick Type 304 stainless steel; install on 18-inch centers, uniformly spaced and at all fitting joints.
e. Joint seal: Apply waterproof adhesive at joints and overlaps.
f. Fittings: Custom fit of same materials.

F. Vapor barriers:
    1. Type 1: Pipe insulation vapor barrier, white Kraft paper bound to aluminum foil:
        a. Material: White Kraft paper bound to aluminum foil in accordance with ASTM C1136, Type 1.
        b. Permeability: 0.02 perms or lower.
        c. Maximum flame spread rating: 25.
        d. Edge seal: Pressure-sensitive tape lap seal.
        e. Circumferential joints: 4-inch wide tape or 4-inch overlap with adhesive seal.
    2. Type 2: Pipe insulation vapor barrier, mastic:
        a. Manufacturers: One of the following or equal:
            1) Benjamin Foster, No. 30-76.
            2) Childers Products.
            3) Foster Products.
            4) Insul-Coustic.
        b. Material: Mastic.

PART 3 EXECUTION

3.01 GENERAL

A. Furnish and install vents required in drainage piping as part of the plumbing system, in accordance with Laws and Regulations.

B. Use anti-seize lubricant for stainless steel treads on fittings and fasteners.

3.02 INSTALLATION

A. Fixtures:
    1. Rough-in fixtures and accessories in accordance with the dimensions supplied by the manufacturers of the fixtures.
    2. Mount fixtures and accessories without cutting of finish surface.

B. Plumbing and drainage products:
    1. Traps:
        a. Install traps as near the fixtures as possible.
    2. Sizes of equipment drains and of floor drains shall be as indicated on the Drawings.

C. Plumbing piping systems:
    1. Cast iron soil pipe, PVC, polypropylene piping systems:
        a. Where not specified otherwise, install horizontal piping with a grade of 1/4 inch per foot.
        b. Provide vents, roof drains, and pipes flashed and made watertight at the roof with lead sheet flashings.
            1) Minimum 4-pound lead sheet.
        c. Extend flashing not less than 6 inches up the pipes, and counter flash with standard cast iron or malleable iron recessed roof couplings.

d. Extend flashing for vents up to the top of the vent and turn down into the pipe.
e. Extend flashing shields not less than 8 inches from vent and pipe in all directions.

2. Copper tube piping system:
   a. Install in accordance with ASTM B828 and IAPMO IS 03.
   b. Install in straight runs, supported at intervals close enough to avoid sagging.
   c. Make cuts square with a tubing cutter or with a 32-tooth hacksaw.
      1) Provide a sizing tool to correct distortions.
   d. Insulate piping as specified.
3. Black steel piping system:
   a. Install per applicable codes and regulations.
4. CPVC piping system:
   a. Install piping in accordance with ASTM F645, or manufacturer's published instructions for installation of piping, as applicable to the particular type of piping.
   b. Provide molded transition fittings for transitions from plastic to metal or IPS pipe.
      1) Do not thread pipe.
      2) Do not use flanged transition fittings unless specifically indicated on the Drawings.
   c. Locate unions where indicated on the Drawings, and elsewhere where required for adequate access and assembly of the piping system.
   d. Provide serrated nipples for transition from plastic pipe to rubber hose.
   e. Clean dirt and moisture from pipe and fittings.
   f. Bevel pipe ends in accordance with manufacturer's instructions with chamfering tool or file.
      1) Remove burrs.
   g. Use solvent cement and primer formulated for CPVC.
   h. Use primer on pressure and non-pressure joints.
   i. Do not solvent weld joints when ambient temperatures are below 40 degrees Fahrenheit or above 90 degrees Fahrenheit unless solvent cements specially formulated for these conditions are utilized.

D. Wall and floor seals:
   1. Provide seals at rated walls.
   2. Provide seals between floors.
   3. Use specified barrier seals for concrete/masonry wall and floor penetrations.

E. Anti-seize lubricant:
   1. Use with assembly of stainless steel nuts and bolts.

F. Pipe insulation:
   1. Install insulation and jacket materials in accordance with manufacturer's written instructions.
   2. Fittings:
      a. Insulate fittings by covering with mitered sections of insulation or utilize factory-made prefabricated fitting shapes.

b. Terminate preformed pipe jackets or covering at sufficient distance from flanges to permit removal of bolts.
c. Overlap flange and flanged fitting insulation on adjacent pipe covering by at least 2 inches.

3. Valves:
a. Insulate valves 3 inches in nominal size and larger with removable insulating blankets.
b. Size blanket to extend up to packing gland only so that replacement of packing does not require removal of insulating blanket.

4. Provide continuous insulation through and over pipe supports and provide protection saddles at supports.

5. Provide continuous pipe insulation and covering through sleeves or openings in walls and floors.
a. When buried pipe enters a building through a below grade wall or slab penetration, begin insulation system on interior side of penetration.

6. Apply pre-molded pipe insulation with extended legs when used on pipe traced with either tubing or electric cable type.

7. Thermally isolate insulation closure locations (end caps, transitions, etc.).
a. Type 1 or 2 jacket installation on piping with potential reach temperatures greater than 150 degrees Fahrenheit.

8. Apply piping identification on jackets as specified in Section 15076 - Pipe Identification.

G. Backflow preventers:
1. Include shutoff valves at each end of backflow preventer with properly located test cocks.

3.03 FIELD QUALITY CONTROL

A. Test water piping in accordance with the plumbing code as specified in Section 01410 - Regulatory Requirements.

B. Test drain, waste, and vent lines as specified and in accordance with the plumbing code as specified in Section 01410 - Regulatory Requirements.

C. Backflow preventer:
1. Test witnessing: Witnessed.
2. Conduct pressure and leak test as specified in Section 15110 - Common Work Results for Valves.
3. Certificate of backflow prevention from a tester listed by the American Backflow Prevention Association.

3.04 CLEANING

A. Upon completion of installation, clean piping interior of foreign matter and debris.

3.05 SCHEDULES

A. As indicated on the Drawings.

END OF SECTION

SECTION 15500

COMMON WORK RESULTS FOR HVAC

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. General prescriptive, design, and performance requirements for products and mechanical equipment used to heat, ventilate, cool, or otherwise condition or distribute indoor air.
   2. Specific requirements for ductwork accessories:
      a. Dampers and damper operators.
      b. Diffusers, grills, and registers.
   3. Specific requirements for refrigerant piping.

   1. 555 - Standard for Fire Dampers.
   2. 555S - Standard for Smoke Dampers.
   3. 900 - Standard for Air Filter Units.

1.03 ADMINISTRATIVE REQUIREMENTS

A. Coordination.
   1. Provide roof mounted HVAC equipment information required in the preparation of roofing drawings including, but not limited to:
      a. Location.
      b. Size.
      c. Weight.
      d. Anchoring and support details.

1.04 SUBMITTALS

A. Where items in this Section are components of equipment or systems specified in other sections, include data for this Section's components with the equipment or system submittal.

B. When products are specified in this Section but are not referenced in other Technical Sections, submit:
   1. As specified in Section 01330 - Submittal Procedures.
   2. Product data:
      a. Sufficient to substantiate specified requirements.
   3. Description of coating system and instructions for field touch up and re-coating.

C. Projects subject to CEC Title 24:
   1. Damper operators:
      a. Electric: Wiring diagrams.
   2. Manufacturer's recommendation for testing and/or maintenance of product.

PART 2 PRODUCTS

2.01 GENERAL

A. Technical Sections product requirements supersede conflicting requirements in this Section.

B. As specified in Section 01600 - Product Requirements.

C. Electrical:
   1. Components and assemblies.
   2. Carry UL Listing Marking.
   3. In accordance with NEC requirements.

D. Fans:
   1. Rated and labeled in accordance with AMCA 210 and AMCA 211.
   2. Belt drive systems:
      a. Adjustable for minimum within 5 percent speed change.
      b. Rated for 150 percent of maximum motor horsepower.

E. Unitary air conditioners and heat pumps:
   1. Rated in accordance with AHRI Standards 210/240 or 340/360, AHRI 270, and AHRI 430.
   2. In accordance with ASHRAE Standard 15.
   3. Heating: Certified in accordance with ANSI Z21-47.
   4. Refrigerant: HFC R-410A.

F. Filters:
   1. Media: UL 900 listed.

G. Insulation and adhesives: In accordance with NFPA 90A requirements for flame spread and smoke generation.

H. Roof curbs: Supplied by manufacturer of product requiring the curb.

I. Factory coating: For equipment with factory coatings, manufacturer to supply 2 containers (each about a pint) of the paint for Contractor/Owner touch up.

2.02 DESIGN AND PERFORMANCE CRITERIA

A. General:
   1. Environmental conditions as specified in Section 01850 - Design Criteria.
   2. Provide instrumentation and controls to meet the equipment operating requirements as specified in Section 15936 - Instrumentation and Control Devices for HVAC.

B. Fans
   1. Sharply rising pressure characteristics throughout the operating range and beyond the efficiency peak.
   2. Peak operating points to be as close as possible to the maximum efficiency and whose operating range is within the normal fan selection range.
   3. Bearings rated per ABMA 9 or 11 for a L10 life rating of not less than 50,000 hours.
   4. Total sound power levels in the 8 octave band range in accordance with, AMCA 301, not to exceed the lesser of the following or the sones level indicated on the Drawings.

Sound Power Level, decibels levels referenced to 10-12 watts								
Frequency, Hz	63	125	250	500	1,000	2,000	4,000	8,000
General	100	98	94	88	84	84	78	75

   5. Shall comply with AMCA Publication 11 and bear the AMCA Certified Ratings Program seal for air performance and sound performance according to AMCA Publication 211 and AMCA Publication 311.

C. Unitary air conditioners and heat pumps:
   1. Outdoor noise levels: Outdoor noise levels in the 8 octave band ranges, as measured in accordance with AHRI 270 shall not exceed the following:

OCTAVE BANDS								
Unit Nominal Capacity (Tons)	**63**	**125**	**250**	**500**	**1,000**	**2,000**	**4,000**	**8,000**
0 to 5	64	70	71	74	74	71	67	67
6	79	85	78	74	71	73	66	59
7-1/2 to 10	64	70	73	79	82	78	74	67
12 and larger	84	88	84	83	84	78	72	68

   2. Capable of starting and cooling from 45 to 125 degrees Fahrenheit ambient outdoor air temperature and exceeding the maximum load criteria of AHRI Standard 210/240 or 340/360.
   3. Heat pumps capable of starting and heating at or above 0 degrees Fahrenheit outdoor ambient air temperature.
   4. Minimum cooling, Energy Efficiency Ratio (EER) and Integrated Energy Efficiency Ratio (IEER), as rated in accordance with AHRI 210/240 or 340/360 for split systems and packaged units is as follows:

Equipment Type	**Net Cooling Cap (British Thermal Units per hour)**	**EER[(1)]**	**IEER[(2)]**
Space Constrained, Air Cooled	<30,000	11.7	N/A
Small Duct, High Velocity, Air Cooled	<65,000	12.1	N/A
Air Cooled	<65,000	13.4	N/A
Air Cooled	>65,000 and <135,000	11.2	14.8
Air Cooled	>135,000 and <240,000	11.0	14.2
Air Cooled	>240,000 and <760,000	10.0	13.2
Air Cooled	>760,000	9.7	12.5
Water Cooled	<65,000	12.1	12.3
Water Cooled	>65,000 and <135,000	12.1	13.9
Water Cooled	>135,000 and <240,000	12.5	13.9
Water Cooled	>240,000 and <760,000	12.4	13.6
Water Cooled	>760,000	12.2	13.5

Equipment Type	Net Cooling Cap (British Thermal Units per hour)	EER(1)	IEER(2)
Evaporatively Cooled	<65,000	12.1	12.3
Evaporatively Cooled	>65,000 and <135,000	12.1	12.3
Evaporatively Cooled	>135,000 and <240,000	12.0	12.2
Evaporatively Cooled	>240,000 and <760,000	11.9	12.0
Evaporatively Cooled	>760,000	11.7	11.9

(1) Deduct 0.2° from the required EER for units with a heating section other than electric resistance heat.

(2) IEER is only applicable to equipment with capacity control in accordance with AHRI 340/360

5. Units with heating capabilities: Meet or exceed the following:
   a. Annual fuel utilization efficiency: 80 percent.
   b. Steady state efficiency: 80 percent.
   c. Comply with CEC Title 24: Seasonal Energy Efficiency Ratio (SEER) minimum: 76.9 percent.
6. Energy efficiency requirements:
   a. Comply with CEC Title 24
7. Unit air flows for cooling:
   a. Minimum of 300 cubic feet per minute (cfm) per ton.
   b. Maximum 500 cfm per ton.

D. Filters:
   1. Efficiency: 45 to 50 percent dust spot efficiency when rated in accordance with ASHRAE Test Standard 52.2.

E. Smoke detector requirements:
   1. Provide all supply, exhaust, and odor control fans greater than or equal to 2,000 cubic feet per minute with smoke detectors:
      a. Duct or fan mounted smoke detector as specified in Section 15936 - Instrumentation and Control Devices for HVAC.

2.03 REFRIGERANT PIPING

A. Seamless copper tube:
   1. Type:
      a. Straight lengths: ASTM B75, USN Alloy C12200, H55 Temper.
      b. Coiled lengths: ASTM B280, USN Alloy C12200, O60.
      c. Outside diameter sized, minimum wall thickness in accordance with ASTM B280 and B75.
   2. VRF-System Refrigerant Piping:
      a. Entire refrigerant piping system shall be brazed connections and fittings and meet test pressures required by VRF manufacturer.
   3. Non-VRF System Refrigerant Piping:
      a. Solder: ASTM B32, Alloy Grade Sb5.
      b. Flux: ASTM B813.

2.04 CONDENSATE DRAIN PIPING

A. PVC:
   1. PVC Pipe: Designation PVC 1120 in accordance with ASTM D1785 and appendices:
      a. Pipe and fittings: Extruded from Type I, Grade 1, Class 12454 B material in accordance with ASTM D1784.
      b. PVC Pipe: Schedule 80 unless otherwise indicated on the Drawings.
   2. Fittings:
      a. Supplied by pipe manufacturer.
      b. Pressure fittings: In accordance with ASTM D2466 or ASTM D2467.
      c. DWV fittings: In accordance with ASTM D2665.
   3. Solvent cement: In accordance with ASTM D2564:
      a. Manufacturers: The following or equal:
         1) Primer: IPS Corp Type P-70™.
         2) Cement: IPS Corp Type 724™ cement or cement certified by the manufacturer for chemical service.

2.05 PIPE INSULATION

A. General:
   1. As specified in Section 01600 - Product Requirements.
   2. Insulation thicknesses: Provide insulation thickness in inches in accordance with the following table. Insulation thickness shown is nominal. Manufacturing tolerance of 15 percent variation is permissible.

Table 1 - Required Insulation Thicknesses (inches)		
Service Temperature Range as Designated in Insulation Schedule at End of this Section	**Nominal Pipe Diameters**	
	1 inch and Less	**1.25 to 2 inches**
100 to 200 degrees Fahrenheit	1.5	1.5
40 to 100 degrees Fahrenheit	0.5	1.0

B. Insulation, Type 1:
   1. Manufacturers: One of the following or equal:
      a. Aeroflex USA Inc., Aerocel® AC.
      b. Armacell®, AP Armaflex.
   2. Insulation material: Closed cell elastomeric insulation.
   3. Minimum temperature range: Minus 40 degrees Fahrenheit to plus 220 degrees Fahrenheit.
   4. K factor at 75 degrees Fahrenheit: Not more than 0.27 BTU-inch/hour-square feet-degrees Fahrenheit.
   5. Fire ratings:
      a. Flame spread: 25 or less.
      b. Smoke density: 50 or less for insulation thicknesses up to 1.5 inches.
   6. Joints: Seal with manufacturer’s recommended contact adhesive to form continuous water barrier.

C. Insulation jackets:
   1. Type 1:
      a. Manufacturers: One of the following or equal:
         1) Johns Manville, Zeston® 2000 PVC.
         2) Proto Corp., LoSMOKE PVC.
         3) Speedline® Corp., Smoke-Safe™ PVC.
      b. Material: Ultraviolet-resistant polyvinyl chloride jacketing, 20 mil minimum thickness.
      c. Fire rating: 25 maximum flame spread, smoke developed 50 or less.
      d. Color: White.
      e. Overlap: 1-inch minimum at joints and fittings.
      f. Joint seal: PVC solvent welded or adhesive as recommended by the manufacturer.
      g. Fittings: Factory made with full thickness insulation.

D. Vapor barriers:
   1. Vapor barrier, Type 1:
      a. Material: White Kraft paper bound to aluminum foil in accordance with ASTM C1136, Type 1.
      b. Permeability: 0.02 perms or lower.
      c. Maximum flame spread rating: 25.
      d. Edge seal: Pressure-sensitive tape lap seal.
      e. Circumferential joints: 4-inch wide tape or 4-inch overlap with adhesive seal.
   2. Vapor barrier, Type 2:
      a. Manufacturers: One of the following or equal:
         1) Benjamin Foster, No. 30-76.
         2) Childers Products CP10/11 Vi-Acryl.
         3) Foster Products, 36-10/46-10 Weatherite.
         4) Insul-Coustic, No. I.C.-580.
      b. Material: Mastic.

E. Insulation schedule:

Table 2 - Insulation Schedule

Service Designation[1]	Location[2]	Insulation Type	Jacket Type	Service Temp. °F[3]	Vapor Barrier
HVAC Refrigerant	Interior or Exterior	1	1	40 - 200	Required
HVAC Condensate	Interior or Exterior	1	1	Below 60	Required

Notes:
1. Refer to Piping Schedule in Section 15052 - Common Work Results for General Piping for service designations.
2. Insulation jackets are not required for interior installations that are concealed. See definitions for description of concealed locations.
3. Unless noted otherwise, use service temperature range provided in this table to establish insulation thickness as required by Table 1.

2.06 EQUIPMENT NAMEPLATES

A. Provide a nameplate with the following markings that is plainly visible after installation:
   1. Manufacturer's name, trademark, or other descriptive marking to identify specific equipment.
   2. Where equipment is electrically powered:
      a. Supply voltage, phase, frequency, and full-load current.
      b. Power source or circuit ID.
      c. Short-circuit current rating based on one of the following:
         1) Short-circuit current rating of a listed and labeled assembly.
         2) Short-circuit current rating established utilizing an approved method.

2.07 SHIPPING, SPARE PARTS, MAINTENANCE PRODUCTS, AND SPECIAL TOOLS

A. As specified in Section 01600 - Product Requirements.

B. Inspect fasteners for proper tightness.

C. Ship units in 1 piece (or modular, if required), factory assembled, piped, internally wired, and factory tested.

D. Provide:
   1. Filters: 2 extra (3 total) sets per each unit with filters.
   2. Sheaves and belts: 1 set for change-out for final balance per unit installed.
   3. Belts: 1 extra set for each unit installed as determined by final balance.

E. Provide a 2-year supply of maintenance products as indicated in manufacturer's maintenance literature.

PART 3 EXECUTION

3.01 GENERAL

A. Technical Sections execution requirements supersede conflicting requirements in this Section.

B. As specified in Section 01600 - Product Requirements.

C. Inspect fasteners for proper tightness.

D. Provide temporary closures for openings designed for airflow.

3.02 INSTALLATION

A. Examine and verify details and sections as indicated on the Drawings, ascertain adequacy, and determine conflicts in dimensions and clearances.
   1. Take measurements and verify dimensions to ascertain fit of installation.
   2. Ascertain structural sufficiency to support installation.

3. Ascertain that supports and openings are correctly located; otherwise cut new openings where required.
4. Confirm specified thermostat or other controls are compatible with specified equipment.

B. Install in accordance with manufacturer instructions.
   1. Electrical products installation in accordance with NFPA 70 NEC.
   2. If there are conflicts, NEC supersedes manufacturer's instruction.
      a. Notify Engineer of conflicts.

C. Equipment and ducts:
   1. Remove dust and debris before installation.
   2. Protect from dust and debris by covering openings with tape or plastic during installation and until equipment is operated.
   3. Install and wire unitary air conditioners, controls, and thermostats in accordance with manufacturer's recommendations.
   4. Lubrication lines and fittings:
      a. Support and protect lines from source to point of use.
      b. Fittings:
         1) Bring to outside of equipment in manner such that fittings are readily accessible from outside without necessity of removing covers, plates, housings, or guards.
         2) Mount together wherever possible using factory-mounted multiple fitting assemblies securely mounted, parallel with equipment lines, and protected from damage.
   5. Remove dust and debris from ductwork and equipment at completion of installation.
   6. Set equipment to achieve flows and flow patterns indicated on the Drawings.

D. Refrigerant piping:
   1. Support copper tubing as specified in Sections 15061 - Pipe Supports and 15062 - Preformed Channel Pipe Support System.
   2. Clean copper lines with high-pressure air after first disconnecting piping at instruments, filters, pressure reducers, valve operators, and other special devices.
   3. Installation of copper tubing:
      a. Install copper tubing in accordance with ASTM B828 and IAPMO IS 3.
      b. Install copper tubing in straight runs, supported at intervals close enough to avoid sagging.
      c. Make cuts square with a tubing cutter or with a 32-tooth hacksaw.
         1) Provide a sizing tool to correct distortions.
   4. Ream the inside of the tubing and remove burrs from the outside, holding the end of the tubing downward and preventing chips and fillings from entering the tubing.
   5. Perform flaring with a flare block and yoke type screw feed flaring tool:
      a. After removing the tubing from the flare block, inspect both surfaces of the flare for splits, cracks, or other imperfections.
      b. Where there are imperfections, cut off the imperfect flare and prepare a new flare.
   6. Insulate piping as specified in Sections 15400 - Plumbing systems.

E. Gas, water piping, drains, and venting in accordance with the authority having jurisdiction and applicable codes.

F. Completed equipment installations must have confirmation that:
   1. The equipment is properly assembled.
   2. The equipment moves or rotates in the proper direction.
   3. Shafting, drive elements, and bearings are installed and lubricated in accordance with proper tolerances.
   4. No unusual power consumption, lubrication temperatures, bearing temperatures, or other conditions are observed.
   5. The installation meets the requirements for intended use as well as the specified vibration and noise tolerances.

END OF SECTION

SECTION 15732

AIR CONDITIONING UNITS

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Packaged units.
   2. Split system units.
   3. Wall mounted units.
   4. Accessories.

1.02 REFERENCES

A. American Society of Heating, Refrigerating, and Air Conditioning Engineers (ASHRAE):

D. Delegated Design Submittals:
   1. Anchoring and bracing: Provide project-specific calculations based on support conditions and requirements to resist loads specified in Section 01850 - Design Criteria.
      a. To structures for equipment installed in structures designated as seismic design category C, D, E, or F.
      b. For equipment installed outdoors.

E. Engineering data:
   1. Manufacturer's published data for compressor, evaporator coil, condenser, evaporator fan, refrigerant, filter, etc.
   2. Maximum equipment vibration levels and field-testing method.
   3. Sound power level in each of 8 octave bands and overall Sones.
   4. Fan performance curves showing specified operating condition.
   5. Bearing life.

F. Manufacturer's recommendations for handling, storage, and installation.

G. Nameplate data.

H. Vendor operation and maintenance manuals: Manufacturer's standard instruction manual for operation and maintenance.

1.07 WARRANTY

A. Provide warranty as specified in Section 01783 - Warranties and Bonds.

B. Special warranty:
   1. Refrigerant compressors and closed or sealed refrigerant systems warranty duration: Provide 5-year warranty.
   2. Evaporator and condensing coils warranty duration: Provide 10-year warranty.

PART 2 PRODUCTS

2.01 GENERAL

A. As specified in Section 15500 - Common Work Results for HVAC.

B. Supplied components of the unit shall be furnished and fully integrated by the unit system supplier:
   1. Provide piping, valves, dampers, sensors and wiring within the unit package.
   2. Provide a unit mounted control panel prewired on the unit to dampers and sensors within the unit.

C. Motors:
   1. Totally enclosed.
   2. Voltage and phases as scheduled.
   3. Compressor motors:
      a. Cooled by refrigerant gas passing through windings.
      b. Provided with line break thermal and current overload protection.
   4. Fan and blower motors:
      a. Permanently lubricated ball bearings.
      b. Integral automatic reset thermal overload protection.
   5. Other requirements as specified.

D. Electrical:
   1. Provide a single conduit connection in the unit for both power and control wiring.

2.02 DESIGN AND PERFORMANCE CRITERIA

A. As specified in Section 15500 - Common Work Results for HVAC.

B. Provide instrumentation and controls to meet the equipment operating requirements as specified in Section 15936 - Instrumentation and Control Devices for HVAC.

2.03 MINI-SPLIT SYSTEMS

A. Manufacturers: One of the following or equal:
   1. Condenser:
      a. Mitsubishi, Series PUY.
      b. Daikin, Similar series.
      c. Trane, similar series.
      d. Lennox, similar series.

2. Indoor air handling unit:
    a. Mitsubishi, Series PLA (ceiling recessed cassette).
3. Daikin, similar series.
4. Trane, similar series.
5. Lennox, similar series.

B. Compressors:
1. Fully hermetically sealed, high efficiency, reciprocating or rotary or scroll type, with rubber grommet vibration isolation.

C. Fans:
1. Indoor air fan:
    a. Direct driven with capacitor start motor; turbo fan propeller, steel with corrosion resistant finish, statically and dynamically balanced.
    b. Bearings: Permanently sealed ball bearing type and permanently lubricated.
2. Outdoor condenser fan:
    a. Propeller type, direct drive, aluminum blades, dynamically balanced.
    b. Bearings: Permanently sealed ball bearing type and permanently lubricated.

D. Coils:
1. Evaporator and condenser coils: Seamless copper tubes with mechanically bonded aluminum plate fins.
2. Provide corrosion resistant finish, suitable for marine environment.

E. Refrigerant components: Refrigerant circuit including:
1. Accumulator and filter/drier.
2. Expansion device.
3. Flow control valves.
4. Service and gauge connections on compressor suction and discharge, and liquid lines to charge, evacuate, and contain refrigerant.

F. Controls and equipment safety features:
1. Provide system controls for a complete functioning system:
    a. High and low evaporator fan speed control for cooling and heating modes.
    b. Fan only operation.
    c. Space temperature condition setting.
    d. Vapor bellows thermostat to cycle unit to maintain space condition.
2. Equipment safety features:
    a. Thermostatic base pan drain to prevent freeze up of the fan in collected condensate.
3. Provide with a low ambient cooling option.

G. Unit casing:
1. Space-saving ceiling-recessed cassette formed of galvanized steel and outdoor casing shall be constructed from galvanized steel plate, finished with an electrostatically applied, polyester powder coating for corrosion protection.
2. Weatherproof design, reinforced and braced for maximum rigidity.

3. Provided with:
    a. Filter rack for filters accessible through the bottom of the unit.
    b. Non-corrosive drain pan in accordance with ASHRAE Standard 62.1.
    c. Horizontal drain connection.
    d. Provide mini condensate pump suitable to be powered from indoor/outdoor unit.
    e. Knockouts for power connections.
    f. Provide wall sleeve of galvanized steel coated similar to unit casing.

2.04 ACCESSORIES

A. Required accessories:
    1. Sensors: As specified in Section 15936 - Instrumentation and Control Devices for HVAC.
    2. Hail guard.
    3. Dirty filter switch with contacts.
    4. Coil guard.

PART 3 EXECUTION

3.01 GENERAL

A. As specified in Section 15500 - Common Work Results for HVAC.

3.02 PREPARATION

A. Anchoring and bracing to structures:
    1. Prepare equipment anchor setting template(s) and use to position anchors during construction of supporting structure(s).
    2. Install anchors of type and material indicated on approved anchoring designs.
    3. Install anchors with embedment indicated on approved anchoring designs.

3.03 INSTALLATION

A. Install the equipment in accordance with the accepted installation instructions and anchorage details.

B. Insulate refrigerant and condensate piping as specified in Section 15500 - Common Work Results for HVAC.

3.04 TESTING

A. Test equipment performance and balance equipment as specified in Section 15954 - Testing, Adjusting, and Balancing for HVAC.

3.05 SCHEDULES

A. As indicated on the Drawings.

END OF SECTION

SECTION 15936

INSTRUMENTATION AND CONTROL DEVICES FOR HVAC

PART 1 GENERAL

1.01 SUMMARY

A. Section includes: Controls for Heating, Ventilating, and Air Conditioning (HVAC) Systems.

1.02 REFERENCES

A. CSA International (CSA).

B. National Electrical Code (NEC).

C. Restriction of Certain Hazardous Substances (RoHS).

D. National Electrical Manufacturers Association (NEMA):
   1. 250 - Enclosures for Electrical Equipment (1,000 Volts Maximum).

E. National Fire Protection Association (NFPA):
   1. 90A - Standard for the Installation of Air-Conditioning and Ventilating Systems.

F. Underwriters' Laboratories, Inc. (UL):
   1. 13 - Standard for Safety Power-Limited Circuit Cables.
   2. 268A - Standard for Smoke Detectors for Duct Application.
   3. 508 - Standard for Industrial Control Equipment.
   4. 1479 - Fire Tests of Through-Penetration Firestops.
   5. 1685 - Standard for Safety Vertical-Tray Fire-Propagation and Smoke-Release Test for Electrical and Optical-Fiber Cables

G. California Code of Regulations (CCR):
   1. Title 24 - Building Standard Code.

1.03 SUBMITTALS

A. Submit as specified in Section 01330 - Submittal Procedures.

B. Product data: As specified in Section 15050 - Common Work Results for Mechanical Equipment.

C. Shop drawings:
   1. Manufacturer's information including:
      a. Catalog information clearly marked to show specific products, models, and sizes being furnished.
      b. Component cut sheets.
   2. Provide certification that components and systems meet CCR Title 24 and are approved by the California Energy Commission.

D. Provide vendor operation and maintenance manual as specified in Section 01782 - Operation and Maintenance Manuals:
   1. VVVT control systems only.

E. Provide Manufacturer’s Certificate of Installation and Functionality Compliance as specified in Section 01756 - Commissioning:
   1. VVVT control systems only.

1.04 QUALITY ASSURANCE

A. The control system shall be designed in accordance with UL and CSA standards.

B. Regulatory requirements: In accordance with CCR Title 24.

1.05 DELIVERY, STORAGE, AND HANDLING

A. The system control products shall be stored and handled per manufacturer's recommendations.

1.06 SITE CONDITIONS

A. Elevation and ambient conditions as specified in Section 01850 - Design Criteria.

1.07 WARRANTY

A. Special warranties: Warranty period begins at date of Project Acceptance or first date of Beneficial Use by the Owner:
   1. 1 year: Parts and on-site labor for components, systems, and programming.

PART 2 PRODUCTS

2.01 DESIGN AND PERFORMANCE CRITERIA

A. General requirements:
   1. All electrical components shall be UL-listed and meet the design and installation requirements of the NEC.
   2. Complete, functional system: Provide all necessary electrical power and control systems, components, and wiring to make a complete functioning system.
   3. Comply with electrical Sections for electrical power and control systems.
   4. System control functions to perform as described in Products.
   5. Materials: New, free from defects, and of the quality specified.
   6. Common manufacturer: Provide components, component accessories, and devices, as much as possible, by the same manufacturer throughout the work.
   7. Mounting: Mount control components and devices in accessible locations for maintenance and as recommended by the manufacturer; provide necessary

manufacturer-approved mounting and configuration hardware for mounting and operation of control components and devices.

8. Components and systems must in accordance with CCR Title 24 energy conservation regulations and be listed with the California Energy Commission as approved for sale in California.

B. Fire detection system design requirements:
   1. Provide all supply and exhaust fans greater than 2,000 cubic feet per minute with a smoke control system including the following minimum components.
      a. Fan and air handling unit interlocks interlock to shut down upon smoke detection signal from fire alarm control panel.
      b. Field wiring terminal blocks for connection of shut down signals from local fire alarm control panel.

2.02 HVAC CONTROL DESCRIPTIONS

A. General: Provide control systems that will maintain room or area comfort under changing ambient conditions and varying use; descriptions in this Section are general in nature and do not cover every mode of operation.

B. Hypo Feed Building Control Sequences:
   1. Fan coil unit/Condenser unit mini-split systems, FCU/CU-99421 and FCU/CU-99422 will each be controlled by manufacturer provided wired thermostats with adjustable set points. The cooling set-point will be 90 degrees Fahrenheit. When the temperature rises 3 degrees above the set point, the unit will energize. When the temperature falls 3 degrees below the set point, the unit will de-energize.

PART 3 EXECUTION

3.01 PREPARATION

A. Before installation remove dust and debris from equipment and accessories.

B. During installation and until equipment is operated, protect equipment and accessories from dust and debris.

3.02 INSTALLATION

A. Install as indicated on the Drawings, in accordance with NFPA 90A, and per the manufacturer’s written instructions.

B. Coordinate installation of HVAC control systems with other trades.
   1. Prior to installation, coordinate wiring and conduit requirements with electrical subcontractor.

3.03 COMMISSIONING

A. As specified in Section 01756 - Commissioning and this Section.

B. Functional testing:
   1. HVAC Instrumentation and Controls:
      a. Test witnessing: Witnessed.
      b. Test each control component and system as part of HVAC system testing, adjusting, and balancing as specified in Section 15954 - Testing, Adjusting, and Balancing for HVAC.

END OF SECTION

SECTION 15954

TESTING, ADJUSTING, AND BALANCING FOR HVAC

PART 1 GENERAL

1.01 SUMMARY

A. Section includes: Requirements for testing air systems installed as part of this contract and existing air systems affected by the installation of new equipment.

1.02 REFERENCES

A. Associated Air Balance Council (AABC):
   1. National Standards Total System Balance.

B. National Environmental Balancing Bureau (NEBB):
   1. Procedural Standards for Testing, Adjusting, and Balancing Environmental Systems.

C. Sheet Metal and Air Conditioning Contractors' National Association (SMACNA):
   1. HVAC Systems - Testing, Adjusting, & Balancing.

D. Testing, Adjusting, and Balancing Bureau (TABB):
   1. TAB Procedural Guide.

1.03 SUBMITTALS

A. Resumes of proposed supervisor and personnel showing training and qualifications.
   1. Include courses, exams, or tests relating to HVAC testing - taken and passed.

B. Testing plan:
   1. At least 30 days prior to starting field work:
   2. Set of report forms completed with design flow values and installed equipment pressure drops, and required cubic feet per minute for air terminals.
   3. Heating, ventilating, and air conditioning system schematic similar to Figure 6-1 in SMACNA HVAC Testing, Adjusting, & Balancing.
   4. Complete list of instruments proposed to be used, organized in appropriate categories, with data sheets for each showing:
      a. Manufacturer and model number.
      b. Description and use when needed to further identify instrument.
      c. Size or capacity range.
      d. Latest calibration date.
   5. Proposed schedule for testing and balancing.

C. Report:
   1. Not more than 45 days prior to Contractor's request for final inspection, submit draft report on applicable reporting forms.
   2. At least 15 days prior to Contractor's request for final inspection, submit 3 copies of final reports incorporating Engineer's comments on draft report.
   3. List of instruments used and last date of calibration of each.
   4. Procedures followed for testing, adjusting, and balancing.
   5. Identification and succinct description of systems included in report.
   6. Initial balance test results made with all dampers and air control devices in full open positions.
   7. Description of final locations and sizes, including opening area and dimensioned configuration of orifices and other restrictions used to achieve final balanced flows.
   8. Description of final location and opening positions of dampers, registers, louvers, and valves.
   9. Schematics of systems included in report; use schematics as part of testing, adjusting, and balancing report to summarize design and final balanced flows.
   10. Testing, adjusting, and balancing report forms.
   11. Final field results established for system balancing including airflow, fan speeds, and fan static pressures at the fan inlet and outlet.
   12. Appendices:
      a. Raw field data taken during testing.
      b. Sample calculation sheet for each type of calculation made to convert raw field data to final results.
      c. Initial air balance results with dampers and registers in full open position; include airflow at all inlets and outlet, initial fan speed and fan suction and discharge pressures.

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION

3.01 GENERAL

A. Work of testing, adjusting, and balancing of heating, ventilation, and air conditioning systems to be by an independent testing agency and a certified member in good standing with AABC, NEBB, or TABB.

B. Field testing to be performed or directly supervised by personal who have passed a Test and Balance course or exam and is a AABC, NEBB, or TABB certified supervisor

C. Prior to start of testing, adjusting, and balancing, verify that:
   1. System installation is complete in accordance with the requirements for completed equipment installations in Section 15500 - Common Work Results for HVAC and capable of full operation
   2. Outside conditions are within reasonable range relative to design conditions.
   3. Lighting fixtures are energized.

4. Special equipment such as computers, laboratory equipment, and electronic equipment are in full operation.
5. Requirements for preparation for testing and balancing have been met for elements of each system which require testing.

3.02 TESTING, ADJUSTING, AND BALANCING

A. Test, adjust, and balance each separate complete heating, ventilating, and air conditioning systems.
   1. Include existing heating, ventilating, and air conditioning components when effected by the Work.

B. Perform testing, adjusting, and balancing cycles until airflows meet acceptance criteria.
   1. Ascertain airflow balance between overall requirements and flow in individual supply and exhaust grilles.

C. Initial testing, adjusting, and balancing:
   1. Test each system with dampers, grilles, orifices, and other variable airflow devices in their full open position; measure and report initial airflows, fan speed, and fan static pressures at fan inlet and outlet.
   2. Adjust total system flow downward or upward by adjusting fan speed until one inlet or outlet is at indicated flow and all other flows exceed indicated flows.
   3. Adjust fan speed by changing fan drives or sheaves as necessary.

D. Subsequent testing, adjusting, and balancing:
   1. Perform adjustments by adjusting dampers, louvers, or size of orifices or plates.
   2. Measure and record air volume discharged at each inlet and outlet and adjust air inlets and outlets to design air volumes within 0 to 5 percent over design rates.
   3. Adjust fan speeds and motor drives within drive limitations, for required air volume.
   4. Measure air flow and static pressures and adjust air supply and exhaust fan units to deliver at least 100 to 105 percent of the design air volume.
   5. Measure and record static air pressure conditions on fans, including filter and coil pressure drops, and total pressure across the fan.
   6. Evaluate building and room pressure conditions to determine adequate supply and return air conditions.
   7. Evaluate space and zone temperature of conditions to determine adequate performance of the systems to maintain temperatures without draft.
   8. Permanently mark final balance positions of balancing dampers.

E. Develop heating, ventilating, and air conditioning system schematics similar to Figure 6-1 in SMACNA Testing, Adjusting, and Balancing.

F. Accurately record the required data on AABC, NEBB, or TABB test and balance report forms.

G. Measure amperage draw of fan and pump motors at final balance.

H. Following completion of balancing procedures for air systems, test, adjust, and balance hydronic systems.
   1. Measure flow and adjust circuit setter valves so pumps deliver at least 100 percent of the design water flow.
   2. Measure and adjust water flow at coils for design conditions, within 5 percent. Check conditions at cooling and heating coils for required performance at design conditions.
   3. Lock balance valves in the adjusted position and permanently mark the design set point.
      a. Record valve settings in the design report.

I. Test primary source equipment in accordance with AABC, NEBB, or TABB procedures.
   1. Primary source equipment includes items listed in this Section not previously tested as part of this testing, adjusting, and balancing work.
   2. Complete appropriate AABC, NEBB, or TABB equipment test forms for each piece of equipment.
   3. Calculate cooling and heating capacities to show conformance with specified capacities.
   4. Adjust equipment as needed to deliver specified cooling and heating loads.
   5. Record final equipment performing characteristics and adjustment settings in the final design report.

J. Testing, adjusting, and balancing acceptance criteria:
   1. Procedures successful and complete when heating, ventilating, and air conditioning systems and components are functioning properly and system air flows are within specified tolerances of design flows.

END OF SECTION

SECTION 15956

PIPING SYSTEMS TESTING

PART 1 GENERAL

1.01 SUMMARY

A. Section includes: Test requirements for piping systems.

1.02 REFERENCES

A. National Fuel Gas Code (NFGC).

B. American Society of Mechanical Engineers (ASME):
   1. B31.1 - Power Piping.
   2. B31.3 - Process Piping.
   3. B31.8 - Gas Transmission and Distribution Piping Systems.

C. Underwriters Laboratories Inc. (UL).

1.03 TESTING REQUIREMENTS

A. General requirements:
   1. Testing requirements are stipulated in Laws and Regulations; are included in the Piping Schedule in Section 15052 - Common Work Results for General Piping; are specified in the specifications covering the various types of piping; and are specified in this Section.
   2. Requirements in Laws and Regulations supersede other requirements of Contract Documents, except where requirements of Contract Documents are more stringent, including higher test pressures, longer test times, and lower leakage allowances.
   3. Test plumbing piping in accordance with Laws and Regulations, the plumbing code, as specified in Section 01410 - Regulatory Requirements, and UL requirements.
   4. Test natural gas or digester gas piping:
      a. For less than 125 pounds per square inch gauge working pressure, test in accordance with mechanical code, as specified in Section 01410 - Regulatory Requirements, or the National Fuel Gas Code, whichever is more stringent.
      b. For 125 pounds per square inch gauge or greater working pressure, test per ASME B31.3 or ASME B31.8, whichever is more stringent.
   5. When testing with water, the specified test pressure is considered to be the pressure at the lowest point of the piping section under test.
      a. Lower test pressure as necessary (based on elevation) if testing is performed at higher point of the pipe section.

B. Furnish necessary personnel, materials, and equipment, including bulkheads, restraints, anchors, temporary connections, pumps, water, pressure gauges, and other means and facilities required to perform tests.

C. Water for testing, cleaning, and disinfecting:
   1. Water for testing, cleaning, and disinfecting will be provided as specified in Section 01500 - Temporary Facilities and Controls.

D. Pipes to be tested: Test only those portions of pipes that have been installed as part of this Contract. Test new pipe sections prior to making final connections to existing piping. Furnish and install test plugs, bulkheads, and restraints required to isolate new pipe sections. Do not use existing valves as test plug or bulkhead.

E. Unsuccessful tests:
   1. Where tests are not successful, correct defects or remove defective piping and appurtenances and install piping and appurtenances that comply with the specified requirements.
   2. Repeat testing until tests are successful.

F. Test completion: Drain and leave piping clean after successful testing.

G. Test water disposal: Dispose of testing water at the designated location in accordance with requirements of federal, state, county, and city regulations governing disposal of wastes in the location of the Project and disposal site. All requirements and costs associated with notifications and obtaining any discharge permit or approvals shall be responsibility of Contractor.

1.04 SUBMITTALS

A. Submit as specified in Section 01330 - Submittal Procedures.

B. Schedule and notification of tests:
   1. Submit a list of scheduled piping tests by noon of the working day preceding the date of the scheduled tests.
   2. Notification of readiness to test: Immediately before testing, notify Engineer in writing of readiness, not just intention, to test piping.
   3. Have personnel, materials, and equipment specified in place before submitting notification of readiness.

1.05 SEQUENCE

A. Clean piping before pressure or leak tests.

B. Test gravity piping underground, including sanitary sewers, for visible leaks before backfilling and compacting.

C. Underground pressure piping may be tested before or after backfilling when not indicated or specified otherwise.

D. Backfill and compact trench, or provide blocking that prevents pipe movement before testing underground piping with a maximum leakage allowance.

E. Test underground piping before encasing piping in concrete or covering piping with slab, structure, or permanent improvement.

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION

3.01 AIR TESTING METHOD FOR PRESSURE PIPING

A. Air test piping, indicated with "AM" in the Piping Schedule, with air or another nonflammable or inert gas.

B. Test gas, air, liquefied petroleum gas, liquid chlorine, and chlorine gas piping by the air test method:
   1. Test chlorine piping with dry air or nitrogen having a dew point of minus 40 degrees Fahrenheit or less. Supply temporary air dryers as necessary.

C. Test at pressure as specified in Piping Schedule in Section 15052 - Common Work Results for General Piping:
   1. Provide temporary pressure relief valve for piping under test:
      a. Set at the lesser of 110 percent of the test pressure or 50 pounds per square inch gauge over the test pressure.
   2. Air method test pressures shall not exceed 110 percent of the piping maximum allowable working pressure calculated in accordance with the most stringent of ASME B31.1, ASME B31.3, ASME B31.8, or the pipe manufacturer's stated maximum working pressure.
   3. Gradually increase test pressure to an initial test pressure equal to the lesser of 1/2 the test pressure or 25 pounds per square inch gauge.
   4. Perform initial check of joints and fittings for leakage.
   5. Gradually increase test pressure in steps no larger than the initial pressure. Check for leakage; at each step increase until test pressure reached.
   6. At each step in the pressure, examine and test piping being air tested for leaks with soap solution.
   7. Consider examination complete when piping section under test holds the test pressure for 15 minutes without losses.

3.02 TESTING HIGH-HEAD PRESSURE PIPING

A. Test piping for which the specified test pressure in the Piping Schedule is 20 pounds per square inch gauge or greater, by the high head pressure test method, indicated "HH" in the Piping Schedule.

B. General:
   1. Test connections, hydrants, valves, blowoffs, and closure pieces with the piping.
   2. Do not use installed valves for shutoff when the specified test pressure exceeds the valve's maximum allowable seat differential pressure. Provide blinds or other means to isolate test sections.
   3. Do not include valves, equipment, or piping specialties in test sections if test pressure exceeds the valve, equipment, or piping specialty safe test pressure allowed by the item's manufacturer.
   4. During the performance of the tests, test pressure shall not vary more than plus or minus 5 pounds per square inch gauge with respect to the specified test pressure.
   5. Select the limits of testing to sections of piping. Select sections that have the same piping material and test pressure.
   6. When test results indicate failure of selected sections, limit tests to piping:
      a. Between valves.
      b. Between a valve and the end of the piping.
      c. Less than 500 feet long.
   7. Test piping for minimum 2 hours for visible leaks test and minimum 2 hours for the pressure test with maximum leakage allowance.

C. Testing procedures:
   1. Fill piping section under test slowly with water while venting air:
      a. Use potable water for all potable waterlines and where noted on the Piping Schedule.
   2. Before pressurizing for the tests, retain water in piping under slight pressure for a water absorption period of minimum 24 hours.
   3. Raise pressure to the specified test pressure and inspect piping visually for leaks:
      a. Consider visible leakage testing complete when no visible leaks are observed.

D. Pressure test with maximum leakage allowance:
   1. Leakage allowance is zero for piping systems using flanged, National Pipe Thread threaded and welded joints.
   2. Pressure test piping after completion of visible leaks test.
   3. For piping systems using joint designs other than flanged, threaded, or welded joints, accurately measure the makeup water necessary to maintain the pressure in the piping section under test during the pressure test period:
      a. Consider the pressure test to be complete when makeup water added is less than the allowable leakage and no damage to piping and appurtenances has occurred.
      b. Successful completion of the pressure test with maximum leakage allowance shall be achieved when the observed leakage during the test

period is equal or less than the allowable leakage and no damage to piping and appurtenances has occurred.

c. When leakage is allowed, calculate the allowable leakage by the following formula:

$L = S \times D \times P^{1/2} \times 148{,}000^{-1}$

wherein the terms shall mean:

L = Allowable leakage in gallons per hour.

S = Length of the test section in feet.

D = Nominal diameter of the piping in inches.

P = Average observed test pressure in pounds per square inches gauge, at the lowest point of the test section, corrected for elevation of the pressure gauge.

x = The multiplication symbol.

3.03 TESTING LOW-HEAD PRESSURE PIPING

A. Test piping for which the specified test pressure is less than 20 pounds per square inch gauge, by the low head pressure test method, indicated "LH" in the Piping Schedule.

B. General:
   1. Test pressures shall be as scheduled in Section 15052 - Common Work Results for General Piping.
   2. During the performance of the tests, test pressure shall not vary more than plus or minus 2 pounds per square inch gauge with respect to the specified test pressure.
   3. Test connections, blowoffs, vents, closure pieces, and joints into structures, including existing bell rings and other appurtenances, with the piping.
   4. Test piping for minimum 2 hours for visible leaks test and minimum 2 hours for the pressure test with maximum leakage allowance.

C. Visible leaks test:
   1. Subject piping under test to specified pressure measured at the lowest end.
   2. Fill piping section under test slowly with water while venting air:
      a. Use potable water for all potable waterlines and where noted on the Piping Schedule.
   3. Before pressurizing for the tests, retain water in piping under slight pressure for the water absorption period of minimum 24 hours.
   4. Raise pressure to the specified test pressure and inspect piping visually for leaks. Consider testing complete when no visible leaks are observed.

D. Pressure test with maximum leakage allowance:
   1. Pressure test piping after completion of visible leaks test.
   2. Accurately measure the makeup water necessary to maintain the pressure in the piping section under test during the pressure test period:
      a. Consider the pressure test to be complete when makeup water added is less than the allowable leakage of 80 gallons per inch of nominal diameter, per mile of piping section under test after 24 hours, and no damage to piping and appurtenances has occurred.
      b. Successful completion of the leakage test shall have been achieved when the observed leakage is equal or less than the allowable leakage and no damage to piping and appurtenances has occurred.

E. Optional joint test:
   1. When joint testing is allowed by note in the Piping Schedule, the procedure shall be as follows:
      a. Joint testing will be allowed only for low head pressure piping.
      b. Joint testing does not replace and is not in lieu of any testing of the piping system or trust restraints.
   2. Joint testing may be performed with water or air.
   3. Joint test piping after completion of backfill and compaction to the top of the trench.
   4. Joint testing with water:
      a. Measure test pressure at the invert of the pipe. Apply pressure of 4 feet plus the inside diameter of the pipe in water column within 0.20 feet in water column.
      b. Maintain test pressure for 1 minute.
      c. Base the allowable leakage per joint on 80 gallons per inch nominal diameter, per mile of piping, per 24 hours equally distributed to the actual number of joints per mile for the type of piping.
      d. Consider the pressure test to be complete when makeup water added is less than the allowable leakage.
      e. Successful completion of the joint test with water shall have been achieved when the observed leakage is equal or less than the allowable leakage.
   5. Joint testing with air:
      a. Apply test pressure of 3 pounds per square inch gauge with a maximum variation of plus 0.20 and minus 0.00 pounds per square inch.
      b. Maintain test pressure for 2 minutes.
      c. Consider the pressure test to be complete when the test pressure does not drop below 2.7 pounds per square inch for the duration of the test.

END OF SECTION

SECTION 15958

MECHANICAL EQUIPMENT TESTING

PART 1 GENERAL

1.01 SUMMARY

A. Section includes: Testing of mechanical equipment and systems.

1.02 REFERENCES

A. American National Standards Institute (ANSI):
   1. S1.4 Specification for Sound Level Meters.

B. Hydraulic Institute (HI).

C. National Institute of Standards and Technology (NIST).

1.03 SUBMITTALS

A. Provide Source Test Plans as specified in Section 01756 - Commissioning.

B. Provide Installation and Functional Testing Plans as specified in Section 01756 - Commissioning.

C. Provide vendor operation and maintenance manual as specified in Section 01782 - Operation and Maintenance Manuals.
   1. Include motor rotor bar pass frequencies for motors larger than 500 horsepower.

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION

3.01 GENERAL

A. Commissioning of equipment as specified in:
   1. This Section.
   2. Section 01756 - Commissioning.
   3. Equipment sections:
      a. If testing requirements are not specified, provide Level 1 Tests.

B. Test and prepare piping as specified in Section 15956 - Piping Systems Testing.

C. Operation of related existing equipment:
   1. Owner will operate related existing equipment or facilities necessary to accomplish the testing.
   2. Schedule and coordinate testing as required by Section 01756 - Commissioning.

D. Provide necessary test instrumentation that has been calibrated within 1 year from date of test to recognized test standards traceable to the NIST or approved source.
   1. Properly calibrated field instrumentation permanently installed as a part of the Work may be utilized for tests.
   2. Prior to testing, provide signed and dated certificates of calibration for test instrumentation and equipment.

E. Test measurement and result accuracy:
   1. Use test instruments with accuracies as recommended in the appropriate referenced standards. When no accuracy is recommended in the referenced standard, use 1 percent or better accuracy test instruments.
      a. Improved (lower error tolerance) accuracies specified elsewhere prevail over this general requirement.
   2. Do not adjust results of tests for instrumentation accuracy.
      a. Measured values and values directly calculated from measured values shall be the basis for comparing actual equipment performance to specified requirements.

3.02 VARIABLE SPEED EQUIPMENT TESTS

A. Establish performance over the entire speed range and at the average operating condition.

B. Establish performance curves for the following speeds:
   1. The speed corresponding to the rated maximum capacity.
   2. The speed corresponding to the minimum capacity.
   3. The speed corresponding to the average operating conditions.

3.03 PUMP TESTS, ALL LEVELS OF TESTING

A. Test in accordance with the following:
   1. Applicable HI Standards.
   2. This Section.
   3. Equipment sections.

B. Test tolerances: In accordance with appropriate HI Standards, except the following modified tolerances apply:
   1. From 0 to plus 5 percent of head at the rated design point flow.
   2. From 0 to plus 5 percent of flow at the rated design point head.
   3. No tolerance for head and flow when ranges are specified.
   4. No negative tolerance for the efficiency at the rated design point, and other specified conditions.

5. Use of specified test tolerances shall not result in motor overload while operating at any point on the supplied pump operating head-flow curve, including runout.
6. No positive tolerance for vibration limits. Vibration limits and test methods in HI Standards do not apply, use limits and methods specified in this or other Sections of the Specifications.

3.04 DRIVERS TESTS

A. Test motors as specified in Section 16222 - Low Voltage Motors up to 500 Horsepower.

B. Test other drivers as specified in the equipment section.

3.05 NOISE REQUIREMENTS AND CONTROL

A. Perform noise tests in conjunction with vibration test analysis.

B. Make measurements in relation to reference pressure of 0.0002 microbar.

C. Make measurements of emitted noise levels on sound level meter meeting or exceeding ANSI S1.4, Type II.

D. Set sound level meter to slow response.

E. Unless otherwise specified, maximum free field noise level not to exceed 85 dBA measured as sound pressure level at 3 feet from the equipment.

3.06 PRESSURE TESTING

A. Hydrostatically pressure test pressure containing parts at the appropriate standard or code required level above the equipment component specified design pressure or operating pressure, whichever is higher.

3.07 INSPECTION AND BALANCING

A. Statically and dynamically balance each of the individual rotating parts as required to achieve the required field vibration limits.

B. Statically and dynamically balance the completed equipment rotating assembly and drive shaft components.

C. Furnish copies of material and component inspection reports including balancing reports for equipment system components and for the completed rotating assembly.

D. Critical speed of rotating equipment:
   1. Satisfy the following:
      a. The first lateral and torsional critical speed of all constant, variable, and 2-speed driven equipment that is considered rigid such as horizontal pumps, all non-clog pumps, blowers, air compressors, and engines shall be at least 25 percent above the equipment's maximum operating speed.

b. The first lateral and torsional critical speed of all constant, variable, and 2-speed driven equipment that is considered flexible or flexibly mounted such as vertical pumps (vertical in-line and vertical non-clog pumps excluded) and fans shall at least 25 percent below the equipment's lowest operating speed.
c. The second lateral and torsional critical speed of all constant, variable, and 2-speed equipment that is considered flexible or flexibly mounted shall be at least 25 percent above the maximum operating speed.

E. Vibration tests:
1. Definitions:
a. Root mean square: for pumps operating at speeds greater than 600 rpm, the vibration measurement shall be measured as the overall velocity in inches per second root mean square (RMS).
b. Peak-to-peak displacement: The root means squared average of the peak-to-peak displacement multiplied by the square root of 2.
c. Peak velocity: The root mean squared average of the peak velocity multiplied by the square root of 2.
d. Peak acceleration: The root mean squared average of the peak acceleration multiplied by the square root of 2.
e. High frequency enveloping: A process to extract very low amplitude time domain signals associated with impact or impulse events such as bearing or gear tooth defects and display them in a frequency spectrum of acceleration versus frequency.
1) Manufacturers: One of the following or equal:
a) Rockwell Automation, Entek Group, "Spike Energy" analysis.
b) CSI, "PeakVue."
f. Rotor bar pass frequency (RBF), for detecting loose rotor bars.
g. Low speed equipment: Equipment or components of equipment rotating at less than 600 revolutions per minute.
h. High speed equipment: Equipment and equipment components operating at or above 600 revolutions per minute.
i. Preferred operating range: Manufacturer's defined preferred operating range (POR) for the equipment.
j. Allowable operating range: Manufacturer's defined allowable operating range (AOR) for the equipment.
2. Vibration instrumentation requirements:
a. Analyzers: Use digital type analyzers or data collectors with anti-aliasing filter, 12-bit A/D converter, fast fourier transform circuitry, phase measurement capability, time wave form data storage, high-frequency enveloping capabilities, 35 frequency ranges from 21 to 1,500,000 cycles per minute, adjustable fast fourier transform resolution from 400 to 6,400 lines, storage for up to one hundred 3,200 line frequency spectra, data output port, circuitry for integration of acceleration data to velocity or double integration to displacement.
1) Manufacturers: One of the following or equal:
a) Computational Systems Inc., (CSI) Division of Emerson Process Management, Model 2120A, Data Collector/analyzer with applicable analysis software.
b) Pruftechnik, VIBXPERT II.

b. Analyzer settings:
    1) Units: English, inches/second, mils, and gravitational forces.
    2) Fast fourier transform lines: Most equipment 1,600 minimum; for motors, enough lines as required to distinguish motor current frequencies from rotational frequencies, use 3,200 lines for motors with a nominal speed of 3,600 revolutions per minute; 3,200 lines minimum for High Frequency Enveloping; 1,600 lines minimum for low speed equipment.
    3) Sample averages: 4 minimum.
    4) Maximum frequency (Fmax): 40 times rotational frequency for rolling element bearings, 10 times rotational frequency for sleeve bearings.
    5) Amplitude range: Auto select but full scale not more than twice the acceptance criteria or the highest peak, whichever is lower.
    6) Fast fourier transform windowing: Hanning Window.
    7) High pass filter: Minus 3 dB at 120 cycles per minute for high speed equipment. Minus 3 dB at 21 cycles per minute for low speed equipment.
c. Accelerometers:
    1) For low speed equipment: Low frequency, shear mode accelerometer, 500 millivolts per gravitational force sensitivity, 10 gravitational force range, plus/minus 5 percent frequency response from 0.5 hertz to 850 hertz, magnetic mount.
        a) Manufacturers: One of the following or equal:
            (1) Wilcoxon Research, Model 797L.
            (2) PCB, Model 393C.
    2) For high speed equipment: General purpose accelerometer, 100 millivolts per gravitational force sensitivity, 50 gravitational force range, plus/minus 3dB frequency response range from 2 hertz to 12,000 hertz when stud mounted, with magnetic mount holder.
        a) Manufacturers: One of the following or equal:
            (1) Wilcoxon Research, Model 793.
            (2) Entek-IRD Model 943.

3. Accelerometer mounting:
    a. Use magnetic mounting or stud mounting.
    b. Mount on bearing housing in location with best available direct path to bearing and shaft vibration.
    c. Remove paint and mount transducer on flat metal surface or epoxy mount for High Frequency Enveloping measurements.
4. Vibration acceptance criteria:
    a. Testing of rotating mechanical equipment: Tests are to be performed by an experienced, factory trained, and independent authorized vibration analysis expert.

b. Vibration displacement limits: Unless otherwise specified, equipment operating at speeds 600 revolutions per minute or less is not to exhibit unfiltered readings in excess of following:

Operating Conditions and Application Data	Overall Peak-to-Peak Displacement	
	Field, mils	Factory, mils
Operation within the POR	3.0	4.0
Operation within the AOR	4.0	5.0
Additive value when measurement location is greater than 5 feet above foundation.	2.0	2.0
Additive value for solids-handling pumps	2.0	N/A
Additive value for slurry pumps	2.0	N/A

c. Vibration velocity limits: Unless otherwise specified, equipment operating at speeds greater than 600 revolutions per minute is not to exceed the following peak velocity limits:

HI Pump Type	Horsepower	Field Test	Factory Test
		Overall RMS	Overall RMS
Horizontal Solids Handling Centrifugal Pumps	Below 33 hp	0.25	0.28
Horizontal and Vertical In-Line Centrifugal Pumps (other than Non-Clog type)	Between 33 and 100 hp	0.28	0.31
	100 hp and above	0.31	0.34
Vertical Solids Handling Centrifugal Pumps	Below 33 hp	0.30	0.33
Vertical Turbine, Mixed Flow, and Propeller Pumps (solids-handling type pumps)	Between 33 and 100 hp	0.32	0.35
	100 hp and above	0.34	0.35
Non-Solids Handling Centrifugal Pumps HI Types BB1, BB2, BB3, BB4, BB5, OH1, OH2, OH3, OH4, OH5, and OH7	Below 268 hp	0.15	0.19
	268 hp and above	0.19	0.22
Vertical Turbine, Mixed Flow, and Propeller Pumps HI Types VS1, VS2, VS3, VS4, VS5, VS6, VS7, and VS8	Below 268 hp	0.13	
	268 hp and above	0.17	
Slurry Pumps		0.25	0.30

HI Pump Type	Horsepower	Field Test	Factory Test
		Overall RMS	Overall RMS
Motors		See Applicable Motor Specification	See Applicable Motor Specification
Gear Reducers, Radial		Not to exceed AGMA 6000-B96 limits	Not to exceed AGMA 6000-B96 limits
Other Reducers, Axial		0.1	N/A

d. Equipment operation: Measurements are to be obtained with equipment installed and operating within capacity ranges specified and without duplicate equipment running.
e. Additional criteria:
    1) No narrow band spectral vibration amplitude components, whether sub-rotational, higher harmonic, or synchronous multiple of running speed, are to exceed 40 percent of synchronous vibration amplitude component without manufacturer's detailed verification of origin and ultimate effect of such excitation.
    2) The presence of discernable vibration amplitude peaks in Test Level 2 or 3 vibration spectra at bearing inner or outer race frequencies shall be cause for rejection of the equipment.
    3) For motors, the following shall be cause for rejection:
        a) Stator eccentricity evidenced by a spectral peak at 2 times electrical line frequency that is more than 40 percent of the peak at rotational frequency.
        b) Rotor eccentricity evidenced by a spectral peak at 2 times electrical line frequency with spectra side bands at the pole pass frequency around the 2 times line frequency peak.
        c) Other rotor problems evidenced by pole pass frequency side bands around operating speed harmonic peaks or 2 times line frequency side bands around rotor bar pass frequency or around 2 times the rotor bar pass frequency.
        d) Phasing problems evidenced by 1/3 line frequency side band spectral peaks around the 2 times electrical line frequency peak.
    4) The presence of peaks in a High Frequency Enveloping spectra plot corresponding to bearing, gear or motor rotor bar frequencies or harmonics of these frequencies shall be cause for rejection of the equipment; since inadequate lubrication of some equipment may be a cause of these peaks, lubrication shall be checked, corrected as necessary and the high frequency envelope analysis repeated.

5. Vibration testing results presentation:
    a. Provide equipment drawing with location and orientation of measurement points indicated.
    b. For each vibration measurement take and include appropriate data on equipment operating conditions at the time vibration data is taken; for pumps, compressors, and blowers record suction pressure, discharge pressure, and flow.

c. When Vibration Spectra Data required:
    1) Plot peak vibration velocity versus frequency in cycles per minute.
    2) Label plots showing actual shaft or part rotation frequency, bearing inner and outer race ball pass frequencies, gear mesh frequencies and relevant equipment excitation frequencies on the plot; label probable cause of vibration peaks whether in excess of specification limits or not.
    3) Label plots with equipment identification and operating conditions such as tag number, capacity, pressure, driver horsepower, and point of vibration measurement.
    4) Plot motor spectra on a log amplitude scale versus frequency.
d. For low speed equipment, plot peak vibration displacement versus frequency as well as velocity versus frequency.
e. Provide name of manufacturer and model number of the vibration instrumentation used, including analyzer and accelerometer used together with mounting type.

3.08 TESTING LEVELS

A. Level 1 Tests:
    1. Level 1 Performance Test:
        a. General:
            1) For equipment, operate, rotate, or otherwise functionally test for 15 minutes minimum after components reach normal operating temperatures.
            2) Operate at rated design load conditions.
            3) Confirm that equipment is properly assembled.
            4) Confirm the equipment moves or rotates in the proper direction.
            5) Confirm shafting, drive elements, and bearings are installed and lubricated in accordance with proper tolerances.
            6) Confirm that no unusual power consumption, lubrication temperatures, bearing temperatures, or other conditions are observed.
        b. Pumps:
            1) Comply with general performance test requirements as specified in this Section.
            2) Measure flow and head while operating at or near the rated condition; for factory testing, testing may be at reduced speeds with flow and head corresponding to the rated condition when adjusted for speed using the appropriate affinity laws.
                a) Use of a test driver is permitted for factory tests when actual driver is given a separate test at its point of manufacture as specified in Section 16222 - Low Voltage Motors up to 500 Horsepower or the applicable equipment section.
                b) Use actual driver for field tests.
            3) Record measured flow, suction pressure, discharge pressure, and make observations on bearing temperatures and noise levels.
    2. Level 1 Vibration Test:
        a. Test requirement:
            1) Measure filtered vibration spectra versus frequency in 3 perpendicular planes at each normally accessible bearing housing

on the driven equipment, any gears and on the driver; 1 plane of measurement to be parallel to the axis of rotation of the component.
2) Vibration spectra versus frequency shall be in accordance with Vibration Acceptance Criteria.

b. Equipment operating condition: Test at specified maximum speed.

3. Level 1 Noise Test:
   a. Measure unfiltered overall A-weighted sound pressure level in dBA at 3 feet horizontally from the surface of the equipment and at a mid-point of the equipment height.

B. Level 2 Tests:
   1. Level 2 Performance Test:
      a. General:
         1) For equipment, operate, rotate, or otherwise functionally test for at least 2 hours after components reach normal operating temperatures.
         2) Operate at rated design load conditions.
         3) Confirm that equipment is properly assembled.
         4) Confirm the equipment moves or rotates in the proper direction.
         5) Confirm shafting, drive elements, and bearings are installed and lubricated in accordance with proper tolerances.
         6) Confirm that no unusual power consumption, lubrication temperatures, bearing temperatures, or other conditions are observed.
      b. Pumps:
         1) Comply with general performance test requirements as specified in this Section.
         2) Test 2 hours minimum for flow and head at the rated condition; for factory testing, testing may be at a reduced speeds with flow and head corresponding to the rated condition when adjusted for speed using the appropriate affinity laws.
            a) Use of a test driver is permitted for factory tests when actual driver is given a separate test at its point of manufacture as specified in Section 16222 - Low Voltage Motors up to 500 Horsepower.
            b) Use actual driver for field tests.
         3) Test for flow and head at 2 additional conditions; 1 at 25 percent below the rated flow and 1 at 10 percent above the rated flow.
         4) Record measured flow, suction pressure, discharge pressure, and observations on bearing temperatures and noise levels at each condition.
   2. Level 2 Vibration Test:
      a. Test requirement:
         1) Measure filtered vibration spectra versus frequency and measure vibration phase in 3 perpendicular planes at each normally accessible bearing housing on the driven equipment, any gears and on the driver; 1 plane of measurement to be parallel to the axis of rotation of the component; measure actual rotational speeds for each

vibration spectra measured using photometric or other tachometer input connected directly to the vibration data collector.
2) Vibration spectra versus frequency shall be in accordance with Vibration Acceptance Criteria.

b. Equipment operating condition: Repeat test requirements at design specified maximum speed and at minimum speed for variable speed equipment.

c. Natural frequency test of field installed equipment:
1) Excite the installed equipment and support system in 3 perpendicular planes, use same planes as operating vibration measurement planes, and determine the as-installed natural resonant frequency of the driven equipment, the driver, gears, and supports.
2) Perform test at each bearing housing, at each support pedestal, and for pumps on the suction and discharge piping.
3) Perform with equipment and attached piping full of intended service or process fluid.

3. Level 2 Noise Test:
a. Measure filtered A-weighted overall sound pressure level in dBA for each of 8 octave band mid-points beginning at 63 hertz measured at 3 feet horizontally from the surface of the equipment at mid-point height of the noise source.

C. Level 3 Tests:
1. Level 3 Performance Tests:
a. General:
1) For equipment, operate, rotate, or otherwise functionally test for at least 4 hours after components reach normal operating temperatures.
2) Operate at rated design load conditions for 1/2 the specified time; operate at each of any other specified conditions for a proportionate share of the remaining test time.
3) Confirm that equipment is properly assembled.
4) Confirm the equipment moves or rotates in the proper direction.
5) Confirm shafting, drive elements, and bearings are installed and lubricated in accordance with proper tolerances.
6) Confirm that no unusual power consumption, lubrication temperatures, bearing temperatures, or other conditions are observed.
7) Take appropriate capacity, power or fuel consumption, torque, revolutions per minute, pressure, and temperature readings using appropriate test instrumentation to confirm equipment meets specified performance requirements at the design rated condition.
8) Bearing temperatures: During maximum speed or capacity performance testing, measure and record the exterior surface temperature of each bearing versus time.

b. Pumps:
1) Comply with general performance test requirements as specified in this Section.

2) Test 4 hours minimum for flow and head; begin tests at or near the rated condition; for factory and field-testing, test at full speed.
    a) Use of a test driver is permitted for factory tests when actual driver is given a separate test at its point of manufacture as specified in Section 16222 - Low Voltage Motors up to 500 Horsepower.
    b) Use actual driver for field tests.
3) Test each specified flow and head condition at the rated speed and test at minimum as well as maximum specified speeds; operate at each test condition for a minimum of 15 minutes or longer as necessary to measure required performance, vibration, and noise data at each test condition.
4) Record measured shaft revolutions per minute, flow, suction pressure, discharge pressure; record measured bearing temperatures (bearing housing exterior surface temperatures may be recorded when bearing temperature devices are not required by the equipment section) and record observations on noise levels.
5) Perform efficiency and/or Net Positive Suction Head Required (NPSHr) and/or priming time tests when specified in the equipment section in accordance with the appropriate HI standard and as follows:
    a) Perform NPSHr testing at maximum rated design speed, head and flow with test fluids at ambient conditions; at maximum rated speed, test at 15 percent above rated design flow, and 25 percent below rated design flow.
    b) Perform efficiency testing with test fluids at maximum rated speed.
    c) Perform priming time testing with test fluids at maximum rated speed.

2. Level 3 Vibration Test:
    a. Requirements: Same as Level 2 vibration test except data taken at each operating condition tested and with additional requirements below.
    b. Perform High Frequency Enveloping Analysis for gears and bearings.
        1) Measure bearing element vibration directly on each bearing cap in a location close as possible to the bearing load zone that provides a smooth surface and direct path to the bearing to detect bearing defects.
        2) Report results in units of acceleration versus frequency in cycles per minute.
    c. Perform Time Wave Form analysis for gears, low speed equipment and reciprocating equipment; plot true peak amplitude velocity and displacement versus time and label the period between peaks with the likely cause of the periodic peaks (relate the period to a cause).
    d. Plot vibration spectra on 3 different plots; peak displacement versus frequency, peak acceleration versus frequency and peak velocity versus frequency.
3. Level 3 Noise Test: Measure filtered, un-weighted overall sound pressure level in dB at 3 feet horizontally from the surface of the equipment at mid-point height and at 4 locations approximately 90 degrees apart in plain view; report results for each of 8 octave band mid-points beginning at 63 hertz.

D. Level 4 Tests:
   1. Level 4 Performance Test:
      a. General:
         1) For equipment, operate, rotate, or otherwise functionally test for at least 8 hours after components reach normal operating temperatures.
         2) Operate at rated design load conditions for 1/2 the specified time; operate at each of any other specified conditions for a proportionate share of the remaining test time.
         3) Confirm that equipment is properly assembled.
         4) Confirm the equipment moves or rotates in the proper direction.
         5) Confirm shafting, drive elements, and bearings are installed and lubricated in accordance with proper tolerances.
         6) Confirm that no unusual power consumption, lubrication temperatures, bearing temperatures, or other conditions are observed.
         7) Take appropriate capacity, power or fuel consumption, torque, revolutions per minute, pressure and temperature readings, using appropriate test instrumentation to confirm equipment meets specified performance requirements at the design rated condition.
         8) Bearing temperatures: During maximum speed or capacity testing, measure and record the exterior surface temperature of each bearing versus time.
      b. Pumps:
         1) Comply with general performance test requirements as specified in this Section.
         2) Test 8 hours minimum for flow and head; begin tests at or near the rated condition; for factory and field-testing, test with furnished motor at full speed.
         3) Test each specified flow and head condition at the rated speed and test at minimum as well as maximum specified speeds; operate at each test condition for a minimum of 20 minutes or longer as necessary to measure required performance, vibration, and noise data at each test condition.
         4) Record measured shaft revolutions per minute, flow, suction pressure, discharge pressure; record measured bearing temperatures (bearing housing exterior surface temperatures may be recorded when bearing temperature devices not required by the equipment section) and record observations on noise levels.
         5) Bearing temperatures: During maximum speed or capacity testing, measure and record the exterior surface temperature of each bearing versus time.
         6) Perform efficiency and/or Net Positive Suction Head Required (NPSHr) and/or priming time tests when specified in the equipment section in accordance with the appropriate HI standard and as follows:
            a) Perform NPSHr testing at maximum rated design speed, head and flow with test fluids at ambient conditions; at maximum rated speed, test at 15 percent above rated design flow, and 25 percent below rated design flow.

b) Perform efficiency testing with test fluids at maximum rated speed.
c) Perform priming time testing with test fluids at maximum rated speed.

2. Level 4 Vibration Test: Same as Level 3 vibration test.
3. Level 4 Noise Test: Same as Level 3 Noise Test except with data taken at each operating condition tested.

END OF SECTION

SECTION 16050

COMMON WORK RESULTS FOR ELECTRICAL

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Requirements for electrical:
      a. Basic design and performance criteria.
      b. Prescriptive requirements for common components.
      c. Installation.

B. Contract Drawings:
   1. Plan drawings:
      a. The Electrical Drawings show desired locations, arrangements, and components of the electrical work in a diagrammatic manner.
      b. Locations and sizes of equipment are approximate only.
   2. Installation details:
      a. The Contract Drawings include typical installation details the Contractor is to use to complete the Electrical Work. For cases where a typical detail does not apply, develop installation details that may be necessary for completing the Work, and submit these details for review by the Engineer.
      b. Not all typical installation details are referenced within the Drawing set. Apply and use typical details where appropriate.

1.02 REFERENCES

A. National Electrical Manufacturers Association (NEMA):
   1. 250 - Enclosures for Electrical Equipment (1000 V Maximum).

B. National Fire Protection Association (NFPA):
   1. 70 - National Electrical Code (NEC).

C. Underwriters' Laboratories, Inc. (UL).

1.03 DEFINITIONS

A. FAT: Factory acceptance test that is also referred to as source test.

B. ICSC: Instrumentation and controls subcontractor.

C. LCP: Local control panel: Operator interface panel that may contain an HMI, pilot type control devices, operator interface devices, control relays, etc. and does not contain a PLC or RIO.

D. PCM: Process control module: An enclosure containing any of the following devices: PLC, RTU, or RIO.

E. PCIS: Process control and instrumentation system:
   1. RS-232: RS-232 is also known as TIA-232 or EIA-232, is a standard for serial communication transmission of data.
   2. RS-485: RS-485 is also known as TIA-485 or EIA-485, is a standard defining the electrical characteristics of drivers and receivers for use in serial communications system.
   3. RTU: Remote telemetry unit: A controller typically consisting of a PLC, and a means for remote communications.

F. Space: That portion of the switchgear, motor control center, panelboard, switchboard, or control panel that does not physically contain a device but is capable of accepting a device with no modifications to the equipment, i.e., provide standoffs, bus, and hardware, as part of the space.

G. Spare: That portion of the switchgear, motor control center, panelboard, switchboard, or control panel that physically contains a device with no load connections to be made.

H. Unequipped space: That portion of the switchgear, motor control center, panelboard, switchboard, or control panel that does not physically contain a device, standoff, bus, hardware, or other equipment.

I. USB: Universal Serial Bus is an industry standard that establishes specifications for cables, connectors, and protocols for connection, communication, and power supply interfacing between computer, peripherals, and other computers.

J. Vendor control panel (VCP): Control panels that are furnished with particular equipment by a vendor other than the ICSC. These panels may contain PLCs, RIO, OIT, HMI, etc.

1.04 SUBMITTALS (NOT USED)

1.05 QUALITY ASSURANCE

A. General:
   1. Furnish equipment listed by and bearing the label of UL or of an independent testing laboratory acceptable to the Engineer and the Authority Having Jurisdiction.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Shipping precautions:
   1. After completion of shop assembly and successful factory testing, pack all equipment in protective crates, and enclose in heavy duty polyethylene envelopes or secured sheeting to provide complete protection from damage, dust, and moisture.
   2. Place dehumidifiers, when required, inside the polyethylene coverings.
   3. Skid-mount the equipment for final transport.
   4. Provide lifting rings for moving without removing protective covering.
   5. Display boxed weight on shipping tags together with instructions for unloading, transporting, storing, and handling at the job site.

1.07 PROJECT OR SITE CONDITIONS

A. Non-conditioned spaces:
   1. Provide additional temperature conditioning equipment to maintain all equipment in non-conditioned spaces subject to these ambient temperatures, with a band of 10 degrees Fahrenheit above the minimum operating temperature and 10 degrees Fahrenheit below maximum operating temperature, as determined by the equipment manufacturer's guidelines.

B. Outdoor installations:
   1. Provide electrical, instrumentation and control equipment suitable for operation in the ambient conditions where the equipment is located.
   2. Provide heating, cooling, and dehumidifying devices incorporated into and included with electrical equipment, instrumentation and control panels to maintain the enclosures within the rated environmental operating ranges as specified in the Sections for the equipment.

1.08 ADMINISTRATIVE REQUIREMENTS (NOT USED)

1.09 SEQUENCING (NOT USED)

1.10 SCHEDULING (NOT USED)

1.11 WARRANTY (NOT USED)

1.12 SYSTEM START-UP (NOT USED)

1.13 OWNER'S INSTRUCTIONS (NOT USED)

1.14 MAINTENANCE (NOT USED)

PART 2 PRODUCTS

2.01 DESIGN AND PERFORMANCE CRITERIA

A. General:
   1. Equipment manufacturer's responsibility extends to selection and mounting of gear drive units, motors or other prime movers, accessories, and auxiliaries to provide a complete, operable unit.

B. Equipment mounting and anchoring:
   1. Mount equipment on cast-iron or welded-steel bases with structural steel support frames:
      a. Utilize continuous welds to seal seams and contact edges between steel members.
      b. Grind welds smooth.
   2. Provide bases and supports with machined support pads, dowels for alignment of mating of adjacent items, adequate openings to facilitate grouting, and openings for electrical conduits.

3. Provide jacking screws in bases and supports for equipment weighing over 1,000 pounds.
4. Design equipment anchorage, supports, and connections for dead load, running loads, loads during start-up, seismic load specified in Section 01850 - Design Criteria, and other loads as required for proper operation of equipment:
    a. For equipment with an operating weight of 400 pounds or greater and all equipment that is supported higher than 4 feet above the floor, provide calculations for:
        1) The operating weight and location of the centroid of mass for the equipment.
        2) Forces and overturning moments.
        3) Shear and tension forces in equipment anchorages, supports, and connections.
        4) The design of equipment anchorage, supports, and connections based on calculated shear and tension forces.
5. Anchorage of equipment to concrete or masonry:
    a. Perform calculations and determine number, size, type, strength, and location of anchor bolts or other connections.
    b. Unless otherwise indicated on the Drawings, select and provide anchors from the types specified in Section 05190 - Mechanical Anchoring and Fastening to Concrete and Masonry.
    c. Provide bolt sleeves around cast-in anchor bolts for 400 pounds or greater equipment:
        1) Adjust bolts to final location and secure the sleeve.
6. Anchorage of equipment to metal supports:
    a. Perform calculations and determine number, size, type, strength, and location of bolts used to connect equipment to metal supports.
7. Unless otherwise indicated on the Drawings, install equipment supported on concrete over non-shrink grout pads as specified in this Section.

2.02 MANUFACTURERS (NOT USED)

2.03 EXISTING PRODUCTS (NOT USED)

2.04 MATERIALS

A. Enclosures:
    1. Provide enclosures for electrical, instrumentation and control equipment, regardless of supplier or subcontractor furnishing the equipment, that meet the requirements of NEMA Standard 250.

B. Plant area electrical Work requirements:
   1. Provide electrical materials in accordance with the following table, unless otherwise specifically indicated on the Drawings:
      a. Conduit installation requirements: As specified in Section 16130 - Conduits.

Table 1. Electrical Material Requirements				
PLANT AREA	**ENVIRONMENT W = WET D = DAMP C = CLEAN/DRY X = CORROSIVE H = HAZARDOUS**	**NEMA ENCLOSURE TYPE**	**EXPOSED CONDUIT TYPE (as specified in Section 16130 - Conduits)**	**SUPPORT MATERIALS**
Recycled Water PS - Outdoor	W	4	GRC	GALV STEEL
Recycled Water PS Electrical Building - Indoor	C	1, 12	GRC	GALV STEEL
WWTP Electrical Buildings/Rooms - Indoor	C	1, 12	GRC	GALV STEEL
WWTP Electrical Buildings/Rooms - Outdoor	W	4X	PCS	STAINLESS STEEL
Carousel, PAU, and Backwash PS - Outdoor	W	4X	PCS	STAINLESS STEEL
AWT Blower Room	C	1, 12	GRC	GALV STEEL
AWT Chemical Room	X	4X	PCS	STAINLESS STEEL

2.05 MANUFACTURED UNITS (NOT USED)

2.06 EQUIPMENT (NOT USED)

2.07 COMPONENTS (NOT USED)

2.08 ACCESSORIES (NOT USED)

2.09 MIXES (NOT USED)

2.10 FABRICATION (NOT USED)

2.11 FINISHES (NOT USED) SOURCE QUALITY CONTROL (NOT USED)

PART 3 EXECUTION

3.01 EXAMINATION (NOT USED)

3.02 PREPARATION

A. Sequencing and scheduling:
   1. Equipment anchoring: Project construction schedule must include an event for obtaining the anchor layout drawings from equipment manufacturers in adequate time for templates to be constructed and anchors to be cast in place.

3.03 INSTALLATION

A. Demolition:
   1. As specified in Technical Sections or as indicated on the Drawings.
   2. Disconnect utilities:
      a. Disconnect electrical equipment.
      b. Disconnect other utilities as specified in Section 16210 - Utility Coordination.
   3. Remove and dispose of conduit, wire, electrical equipment, controls, etc., associated with the items and/or areas to be demolished as indicated on the Drawings unless otherwise indicated.
   4. Salvage electrical equipment as specified in Section 01738 - Selective Alterations and Demolition.
   5. For each piece of equipment to be removed, remove all ancillary components (e.g., instruments, solenoid valves, disconnect switches, etc.).
   6. Conduit:
      a. Where conduit removal, other than associated with equipment to be removed, is indicated on the Drawings:
         1) Remove exposed conduit to the point of encasement or burial.
         2) Cut conduit flush and plug or cap encased or buried conduit.
      b. Where conduits are to remain in place and removal is not indicated on the Drawings:
         1) Cap conduit open ends.
         2) Re-label empty conduits as spare.
   7. Remove all wire back to the source for all conduits to be removed or abandoned in place.
   8. Provide new nameplates for modified electrical distribution equipment, motor control centers etc. to identify equipment and circuits that are no longer used as spares.
   9. Provide new typewritten schedules for all modified panelboards.

B. Portions of this Project involve installation in existing facilities and interfaces to existing circuits, power systems, controls, and equipment:
   1. Perform and document comprehensive and detailed field investigations of existing conditions (circuits, power systems, controls, equipment, etc.) before starting any Work.
   2. Determine information necessary to document, interface with, modify, upgrade, or replace existing circuits, power systems, controls, and equipment.
   3. Provide and document interface with, modifications to, upgrades, or replacement of existing circuits, power systems, controls, and equipment.

C. Equipment:
   1. Where the Drawings do not show dimensions for locating equipment, install equipment in the approximate locations indicated on the Drawings.

D. Provide NEC required working space in front of all electrical equipment as if it could be worked on energized.

E. Circuits of different service voltage:
   1. Voltage and service levels:
      a. Medium voltage: greater than 1.0 kV.
      b. Low voltage: 120 V to 480 V.
      c. Instrumentation: Less than 50 VDC.
   2. Install different service voltage circuits in separate raceways, junction boxes, manholes, hand holes, and pullboxes.
   3. In manholes, install all cables operating at less than 50 VDC in PVC coated flexible metallic conduit, with corrosion resistant fittings.

F. Conductors shall not pass through equipment they are not terminating in unless indicated on the Drawings or approved by the engineer.

3.04 ERECTION, INSTALLATION, APPLICATION, CONSTRUCTION (NOT USED)

3.05 REPAIR/RESTORATION

A. When touchup or repair required, apply primer and coating systems as recommended by the equipment manufacturer.

3.06 RE-INSTALLATION (NOT USED)

3.07 COMMISSIONING – GENERAL

A. As specified in Section 01756 - Commissioning and Technical Sections.

B. Provide on-site assistance for troubleshooting and correcting electrical issues discovered during commissioning.

3.08 COMMISSIONING – SOURCE TESTING (NOT USED)

A. As specified in Attachment A. Source Testing and Owner Training Requirements.

3.09 COMMISSIONING – INSTALLATION VERIFICATION (NOT USED)

A. Inspection activities conducted during construction do not satisfy inspection or testing requirements as specified in Section 16950 - Field Electrical Acceptance Tests.

3.10 COMMISSIONING – FUNCTIONAL TESTING (NOT USED)

3.11 COMMISSIONING – SYSTEM TESTING (NOT USED)

3.12 COMMISSIONING – OWNER TRAINING

A. As specified in Attachment A - Source Testing and Owner Training Requirements.

3.13 COMMISSIONING – DOCUMENTATION (NOT USED)

3.14 FIELD QUALITY CONTROL

A. Workmanship:
   1. Leave wiring in panels, manholes, boxes, and other locations neat, clean, and organized:
      a. Neatly coil and label spare wiring lengths.
      b. Shorten, re-terminate, and re-label excessive used, as well as spare, wire, and cable lengths, as directed by the Engineer.

3.15 ADJUSTING (NOT USED)

3.16 CLEANING

A. General:
   1. Clean and vacuum all enclosures to remove all metal filings, surplus insulation and any visible dirt, dust, or other matter before energization of the equipment or system start-up:
      a. Use of compressors or air blowers for cleaning is not acceptable.
   2. Clean luminaries that were used in the areas affected by the construction.

3.17 PROTECTION (NOT USED)

3.18 SCHEDULES (NOT USED)

END OF SECTION

ATTACHMENT A - SOURCE TESTING AND OWNER TRAINING REQUIREMENTS

SOURCE TESTING AND OWNER TRAINING REQUIREMENTS

Section Number	Section Title	Source Testing	Owner Training Requirements	
		(Witnessed or Non-witnessed)	Maintenance (hrs per session)	Operation (hrs per session)

SECTION 16060

GROUNDING AND BONDING

PART 1 GENERAL

1.01 SUMMARY

A. Section includes: Grounding materials and requirements.

1.02 REFERENCES

A. As specified in Section 16050 - Common Work Results for Electrical.

B. ASTM International (ASTM):
   1. B3 - Standard Specification for Soft or Annealed Copper Wire.
   2. B8 - Standard Specification for Concentric-Lay-Stranded Copper Conductors, Hard, Medium-Hard, or Soft.

C. Institute of Electrical and Electronics Engineers (IEEE):
   1. 81 - IEEE Guide for Measuring Earth Resistivity, Ground Impedance, and Earth Surface Potentials of a Grounding System.

D. Underwriters Laboratories, Inc. (UL):
   1. 467 - Ground and Bonding Equipment.

1.03 DEFINITIONS

A. As specified in Section 16050 - Common Work Results for Electrical.

1.04 SUBMITTALS

A. Furnish submittals as specified in Sections 01330 - Submittal Procedures and 16050 - Common Work Results for Electrical.

B. Product data:
   1. Catalog cutsheets.

1.05 QUALITY ASSURANCE

A. All grounding components and materials shall be UL listed and labeled.

1.06 DELIVERY, STORAGE, AND HANDLING (NOT USED)

1.07 PROJECT/SITE CONDITIONS (NOT USED)

1.08 SEQUENCING (NOT USED)

1.09 SCHEDULING (NOT USED)

1.10 WARRANTY

A. As specified in Section 01783 - Warranties and Bonds.

1.11 SYSTEM START-UP (NOT USED)

1.12 OWNER'S INSTRUCTIONS (NOT USED)

1.13 MAINTENANCE (NOT USED)

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Compression connectors: One of the following or equal:
   1. Erico.
   2. Harger.
   3. Burndy.
   4. Thomas & Betts.
   5. Panduit.

B. Ground rods: One of the following or equal:
   1. Erico.
   2. Harger.
   3. Nehring
   4. Thomas & Betts.

C. Ground cable: One of the following or equal:
   1. Erico.
   2. Harger
   3. Nehring.
   4. Southwire.

D. Precast ground well boxes: One of the following or equal:
   1. Brooks Products, 3-RT Valve Box.
   2. Christy Concrete Products, G12 Valve Box.

2.02 SYSTEM DESCRIPTION

A. Ground equipment and raceway systems so that the completed installation conforms to all applicable code requirements.

B. Provide a complete electrical grounding system as indicated on the Drawings and as specified including but not limited to:
   1. Grounding electrodes.
   2. Bonding jumpers.
   3. Ground connections.

C. Provide bonding jumpers and wire, grounding bushings, clamps and appurtenances required for complete grounding system to bond equipment and raceways to equipment grounding conductors.

D. The ground system resistance (electrode to ground) of the completed installation, as determined by tests specified in Section 16950 - Field Electrical Acceptance Tests, shall be:
   1. 5 ohms or less for industrial systems.
   2. 1 ohm or less for electrical buildings.

2.03 EXISTING PRODUCTS (NOT USED)

2.04 MATERIALS

A. Ground rod:
   1. Minimum: 3/4-inch diameter, 10 feet long.
   2. Uniform 10 mil covering of electrolytic copper metallically bonded to a rigid steel core:
      a. The copper-to-steel bond shall be corrosion resistant.
   3. In accordance with UL 467.
   4. Sectional type joined by threaded copper alloy couplings.
   5. Fit the top of the rod with a threaded coupling and steel-driving stud.

B. Ground cable:
   1. Requirements:
      a. Soft drawn (annealed).
      b. Concentric lay, coarse stranded in accordance with ASTM B8.
      c. Bare copper in accordance with ASTM B3.
   2. Size is as indicated on the Drawings, but not less than required by the NEC. Use the following type of wire unless otherwise indicated on the Drawings:
      a. Size No. 6 AWG and smaller; solid conductor.
      b. Size No. 4 AWG and larger; stranded conductor.

C. Compression connectors:
   1. Manufactured of high copper alloy specifically for the particular grounding application.
   2. Suitable for direct burial in earth and concrete.
   3. Identifying compression die number inscription to be impressed on compression fitting.
   4. Barrels prefilled and sealed with oxide-inhibiting and anti-seizing compound.

D. Grounding electrode conductors:
   1. Minimum size in accordance with the NEC.

E. Main bonding jumpers and bonding jumpers:
   1. Minimum size in accordance with the NEC.

2.05 MANUFACTURED UNITS (NOT USED)

2.06 EQUIPMENT (NOT USED)

2.07 COMPONENTS (NOT USED)

2.08 ACCESSORIES

A. Precast ground well boxes:
   1. Minimum 10-inch interior diameter.
   2. Traffic-rated cast iron cover.
   3. Permanent “GROUND” marking on cover.

2.09 MIXES (NOT USED)

2.10 FABRICATION (NOT USED)

2.11 FINISHES (NOT USED)

2.12 SOURCE QUALITY CONTROL (NOT USED)

PART 3 EXECUTION

3.01 EXAMINATION (NOT USED)

3.02 PREPARATION (NOT USED)

3.03 INSTALLATION

A. Provide a separate grounding conductor for each motor and connect at motor terminal box. Do not use bolts securing motor box to frame or cover for grounding connectors:
   1. When grounding motors driven by variable frequency drives (VFD) comply with the requirements of the VFD manufacturer.

B. Provide a grounding type bushing with lug for connection of grounding conductor for conduits that originate from each motor control center section, switchboard, or panelboard:
   1. Individually bond these raceways to the ground bus in the equipment.

C. Provide grounding type bushings with lugs for connection of grounding conductor at both ends of metallic conduit runs. Bond ground bushings to the grounding system.

D. Provide a green insulated wire-grounding jumper from the ground screw to a box grounding screw and, for grounding type devices, to equipment grounding conductor.

E. Interconnect the secondary switchgear, switchboard, or panelboard neutral bus to the ground bus in the secondary switchgear, switchboard, or panelboard compartment, only at service entrance point or after a transformer.

F. Duct bank ground system:
   1. Provide a bare copper grounding conductor the entire length of each duct bank, embedded in the concrete of the duct bank as indicated on the Drawings and specified in the Specifications.
   2. Bond duct bank ground conductors together where duct banks join, merge, intersect, or split.

G. Grounding at service (600 V or Less):
   1. Connect the neutral to ground only at one point within the enclosure of the first disconnecting means on the load side of the service transformer.

H. Ground connections:
   1. All connections to the ground grid system, the duct bank grounding system, equipment, ground rods, etc., shall be made using compression type grounding connectors as indicated on the Drawings, UL listed, and labeled for the application.
   2. Make ground connections in accordance with the manufacturer's instructions.
   3. Do not conceal or cover any ground connections until the Engineer or authorized representative has established and provided written confirmation that every grounding connection is as indicated on the Drawings and specified in the Specifications.

I. Grounding electrode system:
   1. Ground ring:
      a. Provide all trenching and materials necessary to install the ground ring as indicated on the Drawings.
      b. Ground ring conductor shall be in direct contact with the earth, or where embedded, concrete, of the size as indicated on the Drawings.
      c. Minimum burial depth 36 inches or as indicated on the Drawings.
      d. Re-compact disturbed soils to original density in 6-inch lifts.
   2. Ground rods:
      a. Locations as indicated on the Drawings.
      b. Length of rods forming an individual ground array shall be equal in length.
      c. Drive ground rods and install grounding conductors before construction of concrete slabs and duct banks.
      d. Pre-crimp all ground rods, as recommended by the manufacturer, before crimping connector to ground rod.
   3. Metal underground water pipe:
      a. Bond metal underground domestic water pipe to grounding electrode system.
   4. Metal frame of building or structure:
      a. Bond metal frame of building or structure to grounding electrode system.
   5. Extend grounding conductors through concrete to accessible points for grounding equipment and electrical enclosures.
   6. Where grounding conductors are exposed and subject to physical damage, install in Schedule 80 PVC conduit for protection.
   7. Install grounding system at each structure where switchgear, motor control centers, switchboards, panelboards, panels, or other electrical equipment are installed.

J. Shield grounding:
   1. Analog signal cables shields shall only be grounded at a single point in the loop. Unless otherwise noted, ground signal cable shields at control panel.
   2. For communication and data line signal cable shields and drain wires should be grounded at both ends of the cable run.
   3. Insulate the shielding and exposed drain wire for each signal cable with heat-shrink tubing.
   4. Terminate the signal cable shield on a dedicated grounding terminal block.

K. Antenna ground:
   1. Install individual ground rod or ground system for communication system antenna:
      a. Install a dedicated grounding electrode conductor from the antenna ground to the grounding electrode system.
      b. Do not connect any other grounds to the antenna grounding electrode conductor.
   2. Install ground rod or ground system in accordance with the radio manufacturer's requirements.

L. Where indicated on the Drawings, install ground rods in precast ground wells.

3.04 ERECTION, INSTALLATION, APPLICATION, CONSTRUCTION (NOT USED)

3.05 REPAIR/RESTORATION (NOT USED)

3.06 RE-INSTALLATION (NOT USED)

3.07 COMMISSIONING

A. As specified in Section 01756 - Commissioning.

3.08 FIELD QUALITY CONTROL

A. Measure grounding electrode system resistance to ground in accordance with IEEE 81.

3.09 ADJUSTING

A. Under the direction of the Engineer, add additional parallel connected ground rods and/or deeper driven rods until the ground resistance measurement meets the specified resistance requirements:
   1. Use of salts, water, or compounds to attain the specified ground resistance is not acceptable.

3.10 CLEANING (NOT USED)

3.11 PROTECTION (NOT USED)

3.12 SCHEDULES (NOT USED)

END OF SECTION

SECTION 16070

HANGERS AND SUPPORTS

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Mounting and supporting electrical equipment and components.

1.02 REFERENCES

A. As specified in Section 16050 - Common Work Results for Electrical.

B. ASTM International (ASTM):
   1. A123 - Standard Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products.
   2. A153 - Standard Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware.

1.03 DEFINITIONS

A. As specified in Section 16050 - Common Work Results for Electrical.

1.04 SYSTEM DESCRIPTION

A. Design requirements:
   1. Conform to the requirements of the Building Code as specified in Section 01410 - Regulatory Requirements.
   2. Demonstrate the following using generally accepted engineering methods:
      a. That the anchors to the structure are adequate to resist the loads generated in accordance with the Building Code and equipment requirements.
      b. That the required load capacity of the anchors can be fully developed in the structural materials to which they are attached.
   3. Design loading and anchoring requirements:
      a. As indicated in the Building Code unless otherwise specified.
      b. Seismic loading requirements:
         1) Freestanding, suspended, or wall-hung equipment shall be anchored in place by methods that will satisfy the requirements for the seismic design specified in Section 01850 - Design Criteria.
      c. Wind loading requirements:
         1) All exterior equipment shall be anchored in place by methods that will satisfy the requirements for wind design specified in Section 01850 - Design Criteria.
      d. Minimum safety factor against overturning: 1.5.
      e. The foundation and structures to which hangers and supports are attached shall be capable of withstanding all anchor loads.

B. Performance requirements:
   1. Hangers and supports individually and as a system shall resist all weights and code-required forces without deflections and deformations that would damage the supporting elements, the equipment supported, or the surrounding construction.

1.05 SUBMITTALS

A. Furnish submittals as specified in Section 01330 - Submittal Procedures.

B. Product data:
   1. Supports:
      a. Materials.
      b. Geometry.
      c. Manufacturer.
   2. Hardware:
      a. Materials.
      b. Manufacturer.

C. Shop drawings:
   1. Complete dimensioned and scalable shop drawings of all supporting structures, trapezes, wall supports, etc.
   2. Complete anchoring details for equipment, lighting and raceway, supporting structures, trapezes, and wall supports for all equipment:
      a. For free standing supports and wall supports supporting equipment weight in excess of 200 pounds:
         1) Stamped by a professional engineer licensed in the state where the Project is being constructed.
      b. Said submittals, by virtue of the fact that they bear the stamp of a registered engineer, will be reviewed for general consistency with the requirements specified in the Contract Documents, but not for context, accuracy, or method of calculation.
   3. Include data on attachment hardware and construction methods that will satisfy the design loading and anchoring criteria.

D. Installation instructions:
   1. Furnish anchorage instructions and requirements based on the seismic and wind conditions of the Site:
      a. Stamped by a professional engineer licensed in the state where the Project is being constructed.

1.06 QUALITY ASSURANCE

1.07 DELIVERY, STORAGE, AND HANDLING

1.08 PROJECT OR SITE CONDITIONS

A. As specified in Section 01850 - Design Criteria.

1.09 SEQUENCING (NOT USED)

1.10 SCHEDULING (NOT USED)

1.11 WARRANTY

A. As specified in Section 01783 - Warranties and Bonds.

1.12 SYSTEM STARTUP (NOT USED)

1.13 OWNER'S INSTRUCTIONS (NOT USED)

1.14 MAINTENANCE (NOT USED)

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. One of the following or equal:
   1. Preformed channel:
      a. Thomas & Betts.
      b. Power-Strut.
      c. Unistrut.
      d. Cooper B-Line.
      e. Robroy.
      f. Tyco.

2.02 EXISTING PRODUCTS (NOT USED)

2.03 MATERIALS

A. Use materials appropriate for the area as specified in Section 16050 - Common Work Results for Electrical.

B. Preformed channel:
   1. Hot dip galvanized steel:
      a. Supports:
         1) In accordance with ASTM A123 or A153.
         2) Minimum zinc coating thickness of 2.5 mils.
      b. Hardware:
         1) Electro-galvanized.
         2) In accordance with ASTM A153.
   2. Stainless steel:
      a. Supports:
         1) In accordance with ASTM A240.
         2) ANSI Type 316 material.
      b. Hardware:
         1) ANSI Type 316 material.

2.04 MANUFACTURED UNITS (NOT USED)

2.05 EQUIPMENT (NOT USED)

2.06 COMPONENTS (NOT USED)

2.07 ACCESSORIES

A. Anchor bolts:
   1. As specified in Section 05190 - Mechanical Anchoring and Fastening to Concrete and Masonry.

2.08 MIXES (NOT USED)

2.09 FABRICATION (NOT USED)

2.10 FINISHES

A. Paint and finish all supporting structures as specified in Section 09960 - High-Performance Coatings.

2.11 SOURCE QUALITY CONTROL (NOT USED)

PART 3 EXECUTION

3.01 EXAMINATION (NOT USED)

3.02 PREPARATION (NOT USED)

3.03 INSTALLATION

A. Preformed Channel:
   1. Mount all raceways, cabinets, boxes, fixtures, instruments, and devices on Contractor-fabricated racks unless otherwise indicated on the Drawings:
      a. Provide the necessary sway bracing to keep trapeze type structures from swaying under seismic events or wind loading.
   2. Brace and anchor freestanding equipment supports using methods that provide structural support based on the seismic loads and wind loads:
      a. Lateral deflection at top of supports not to exceed support height divided by 240 unless otherwise approved by the Engineer.
   3. Provide fabricated steel support pedestals for wall mounted panels that weigh more than 200 pounds:
      a. Fabricate pedestals out of welded angle, tube sections, or preformed channel.
      b. If the supported equipment is a panel or cabinet, match the supported equipment in physical appearance and dimensions.
      c. Provide auxiliary floor supports for transformers hung from stud walls and weighing more than 200 pounds.
   4. Mount all equipment, cabinets, boxes, instruments, and devices in damp or wet locations on minimum of 7/8-inch preformed mounting channel:
      a. Mount channel vertically along the length of the device so that water or moisture may run freely behind the device.

5. Corrosion protection:
    a. Isolate dissimilar metals, except where required for electrical continuity:
        1) Use neoprene washers, 9-mil polyethylene tape, or gaskets for isolation.
6. Raceway:
    a. Furnish all racks and trapeze structures needed to support the raceway from the structure:
        1) Group raceway and position on racks to minimize crossovers.
        2) Provide the necessary bracing to keep trapeze type structures from swaying under loads from cable installation, seismic forces, or wind forces.
7. Anchoring methods:
    a. Solid concrete: Anchor bolts, anchor rods or post-installed anchors as specified in Section 05190 - Mechanical Anchoring and Fastening to Concrete and Masonry.
    b. Metal surfaces: Machine screws or bolts.
    c. Hollow masonry units: Post installed anchors as specified in Section 05190 - Mechanical Anchoring and Fastening to Concrete and Masonry.
8. When supporting devices on metal or wood stud construction, bridge studs with preformed channel, and mount the devices to the channel.
9. Recoat or seal all drilled holes, cut or scratched surfaces or with products recommended by the manufacturer.

3.04 ERECTION, INSTALLATION, APPLICATION, CONSTRUCTION (NOT USED)

3.05 REPAIR/RESTORATION (NOT USED)

3.06 RE-INSTALLATION (NOT USED)

SECTION 16075

IDENTIFICATION FOR ELECTRICAL SYSTEMS

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Identification of electrical equipment, devices, and components.
   2. Material, manufacturing, and installation requirements for identification devices.

1.02 REFERENCES

A. As specified in Section 16050 - Common Work Results for Electrical.

B. Occupational Safety and Health Administration (OSHA).

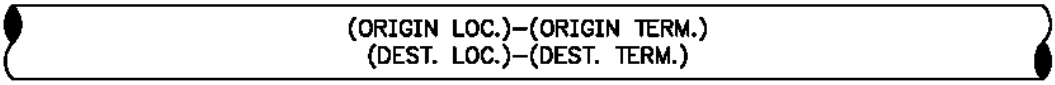
1.03 DEFINITIONS

A. As specified in Section 16050 - Common Work Results for Electrical.

1.04 SYSTEM DESCRIPTION

A. Nameplates:
   1. Provide a nameplate for each piece of electrical equipment and devices, control panel and control panel components.
   2. Provide all nameplates of identical style, color, and material throughout the facility.
   3. Device nameplates information:
      a. Designations as indicated on the Drawings and identified on the Process and Instrumentation Drawings.

B. Wire numbers:
   1. Coordinate the wire numbering system with all vendors of equipment so that every field wire has a unique number associated with it for the entire system:
      a. Wire numbers shall correspond to the wire numbers on the control drawings or the panel and circuit numbers for receptacles and lighting.
      b. Wire numbers shall correspond to the terminal block number to which they are attached in the control panel.
      c. Internal panel wires on a common terminal shall have the same wire number.
      d. Multi-conductor cables shall be assigned a cable number that shall be attached to the cable at intermediate pull boxes and stub-up locations



beneath freestanding equipment. All multi-conductor and instrumentation cables shall be identified at pull points as described above:

1) Label armored multi-conductor cable using the conduit number as indicated on the Drawings, following the requirements for conduit markers in Section 16130 - Conduits.

2. Provide the following wiring numbering schemes throughout the project for field wires between process control module, (PCM), vendor control panels, (VCP), motor control centers, (MCC), field starters, field instruments, etc.

OR

Where:

ORIGIN LOC .= Designation for originating panel or device
ORIGIN TERM. = Terminal designation at originating panel or device
DEST. LOC. = Designation for destination panel or device
DEST. TERM. = Terminal designation at destination panel or device or PLC I/O address at destination panel:

a. Identify equipment and field instruments as the origin.
b. PCMs are always identified as the destination.
c. Location is the panel designation for VCP, LCP, or PCM. For connections to MCCs, location is the specific starter tag and loop number. Location is the tag and loop number for motor starters, field instruments and equipment. Any hyphen in the panel designation or tag and loop number shall be omitted.
d. Terminal designation is the actual number on the terminal block where the conductor terminates at field devices and vendor control panels. For multi-conductor cables, all terminal numbers shall be shown, separated by commas.
e. Terminal designations at motor leads shall be the motor manufacturer's standard terminal designation (e.g., T1, T2, T3, etc.).
f. Terminal designations at PCMs where the field conductor connects to field terminal blocks for a PLC input or output shall be the PLC address (Note: the following PLC I/O numbering scheme is typical for Allen-Bradley, the

numbering scheme should be modified to match that of the actual PLC manufacturer used for the project):

1) Discrete Point: W:X:Y/Z.
   Analog Point: W:X:Y.Z.
   Where:
   W= I for input, O for output
   X= PLC number (1, 2, 3…)
   Y= Slot number (01, 02, 03…)
   Z= Terminal number (00, 01, 02…) for a discrete point or a word number for an analog point (1, 2, 3…)

g. Terminal designations at PCMs where the conductor does not connect to a PLC I/O point shall be the terminal number with a “C” prefix (e.g., C0010). For common power after a fuse or neutrals after a switch, the subsequent points shall have and capital letter suffix starting with “A” (e.g., C0010A).

3. **Case 1**: Vendor control panel (VCP) to process control module (PCM):
   Field wire number/label: A-B/C-D
   A = Vendor control panel number without hyphen (VCP#)
   B = Terminal number within VCP (manufacturer’s or vendor’s standard terminal number)
   C = Process control module number without hyphen (PCM#)
   D = Either the PLC address if the field terminal is connected directly to a PLC input or output point or the terminal number with a “C” prefix if not connected directly to a PLC I/O point (C0010)

   Examples: VCP#-10/PCM#-I: 1:01/01
   VCP#-10/PCM#-O: 1:10/07
   VCP#-10/PCM#-C0100

4. **Case 2**: Field instrument to process control module (PCM):
   Field wire number/label: E-F/C-D
   C = Process control module number without hyphen (PCM#)
   D = Either the PLC address if the field terminal is connected directly to a PLC input or output point or the terminal number with a “C” prefix if not connected directly to a PLC I/O point (C0010)
   E = Field mounted instrument tag and loop numbers without hyphen (EDV#)
   F = Manufacturer’s standard terminal number within instrument. Use both terminal numbers for analog points separated by a comma

   Examples: TIT#-2,3/PCM#-I: 1:01.1
   TSH#-1/PCM#-I: 2:01/00

5. **Case 3**: Motor control center (MCC) to process control module (PCM):
   Field wire number/label: G-B/C-D
   B =Terminal number within Motor Control Center (manufacturer's or vendor's standard terminal number)
   C = Process control module without hyphen (PCM#)
   D = Either the PLC address if the field terminal is connected directly to a PLC input or output point or the terminal number with a "C" prefix if not connected directly to a PLC I/O point (C0010)
   G = Actual starter designation in the motor control center without hyphen (MMS#)

   Examples:MMS#-10/PCM#-I: 1:01/01
   MMS#-10/PCM#-O: 1:10/07
   MMS#-10/PCM#-C0100

6. **Case 4**: Motor control center (MCC) to vendor control panel (VCP):
   Field wire number/label: G-B/A-B
   A = Vendor control panel number without hyphen (VCP#)
   B = Terminal number within motor control center or vendor control panel (manufacturer's or vendors standard terminal number)
   G = Actual starter designation in the motor control center without hyphen (MMS#)

   Example: MMS#-X2/VCP#-10

7. **Case 5**: Motor leads to a motor control center (MCC):
   Field wire number/label: H-I/G-B
   B = Terminal number within motor control center (manufacturer's standard terminal number)
   G = Actual starter designation in the motor control center without hyphen (MMS#)
   H = Equipment tag and loop number without hyphen (PMP#)
   I = Motor manufacturer's standard motor lead identification (e.g., T1, T2, T3, etc.)

   Example: PMP-#-T3/MMS#-T3

8. **Case 6**: Remote or separately mounted starter or variable frequency drive (VFD) to process control module (PCM):
   Field wire number/label: J-B/C-D
   B = Terminal number within starter or variable frequency drive (manufacturer's standard terminal number)
   C = Process control module number without hyphen (VCP#)
   D = Either the PLC address if the field terminal is connected directly to a PLC input or output point or the terminal number with a "C" prefix if not connected directly to a PLC I/O point (C0010)
   J = Starter or variable frequency drive tag and loop number without hyphen (MMS#)

   Examples: MMS#-10/PCM#-I: 1:01/01
   MMS#-10/PCM#-O: 2: 10/07
   MMS#-10/PCM#-C0010

9. Identify all spare conductors as required for other field wires with an "S" prefix:

   Example: S MMS#-10/PCM#-C011

1.05 SUBMITTALS

A. Furnish submittals as specified in Section 01330 - Submittal Procedures.

B. Product data:
   1. Nameplates:
      a. Color.
      b. Size:
         1) Outside dimensions.
         2) Lettering.
      c. Material.
      d. Mounting means.
   2. Nameplate schedule:
      a. Show exact wording for each nameplate.
      b. Include nameplate and letter sizes.
   3. Wire numbers:
      a. Manufacturer's catalog data for wire labels and label printer.

C. Record documents:
   1. Update the conduit schedule to reflect the exact quantity of wire numbers including spares and destination points for all wires.

1.06 QUALITY ASSURANCE (NOT USED)

1.07 DELIVERY, STORAGE, AND HANDLING (NOT USED)

1.08 PROJECT SITE CONDITIONS (NOT USED)

1.09 SEQUENCING (NOT USED)

1.10 SCHEDULING (NOT USED)

1.11 WARRANTY

A. As specified in Section 01783 - Warranties and Bonds.

1.12 SYSTEM START-UP (NOT USED)

1.13 OWNER'S INSTRUCTIONS (NOT USED)

1.14 MAINTENANCE (NOT USED)

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Nameplates and signs:
   1. One of the following or equal:
      a. Brady.
      b. Seton.

B. Conductor and cable markers:
   1. Heat-shrinkable tubing:
      a. One of the following or equal:
         1) Raychem.
         2) Brady.
         3) Thomas & Betts.
         4) Kroy.
         5) Panduit.

C. Conduit and raceway markers:
   1. Stainless Steel, one of the following or equal:
      a. Panduit
   2. Brass, one of the following or equal:
      a. Panduit.

2.02 EXISTING PRODUCTS (NOT USED)

2.03 MATERIALS

A. Nameplates:
   1. Colors:
      a. Warning nameplates: White-center, red face.
      b. Other nameplates: Black-center, white face.
   2. Laminated plastic engraving stock:
      a. 3/32-inch-thick material.
      b. 2-ply.
   3. With chamfered edges.
   4. Lettering:
      a. Block style engraved characters of adequate size to be read easily from a distance of 6 feet:
      b. Minimum letter height: 1/8-inch.

B. Signs:
    1. Automatic equipment and high voltage signs:
        a. Suitable for exterior use.
        b. In accordance with OSHA regulations.

C. Conductor and cable markers:
    1. Lettering:
        a. Machine printed black characters on white tubing.
        b. Minimum letter height: 10-point type or larger.

D. Conduit and raceway markers:
    1. Stainless steel:
        a. Type 304 or 316.
        b. Minimum letter height: 3/16-inch
    2. Solid brass:
        a. Minimum thickness: 0.036 inches.
        b. Letter characters stamped.
        c. Minimum letter height: 3/16-inch.

2.04 MANUFACTURED UNITS (NOT USED)

2.05 EQUIPMENT (NOT USED)

2.06 COMPONENTS (NOT USED)

2.07 ACCESSORIES (NOT USED)

2.08 MIXES (NOT USED)

2.09 FABRICATION (NOT USED)

2.10 FINISHES (NOT USED)

2.11 SOURCE QUALITY CONTROL

A. Nameplates:
    1. Provide all nameplates for control panel operator devices (e.g., pushbuttons, selector switches, pilot lights, etc.):
        a. Same material and same color and appearance as the device nameplates, in order to achieve an aesthetically consistent and coordinated system.

PART 3 EXECUTION

3.01 EXAMINATION (NOT USED)

3.02 PREPARATION (NOT USED)

3.03 INSTALLATION

A. Nameplates:
   1. Attach nameplates to equipment with rivets, bolts or sheet metal screws, approved waterproof epoxy-based cement or install in metal holders welded to the equipment.
   2. Provide a nameplate for each disconnecting means with the following:
      a. Equipment served, voltage, and fuse size as required.
      b. Identification of the circuit source that supplies the disconnecting means.
   3. On NEMA Type 4, NEMA Type 4X, or NEMA Type 7 enclosures, use epoxy-based cement to attach nameplates.
   4. Nameplates shall be aligned and level or plumb to within 1/64 inch over the entire length:
      a. Misaligned or crooked nameplates shall be remounted or provide new enclosures at the discretion of the Engineer.

B. Conductor and cable markers:
   1. Apply all conductor and cable markers before termination.
   2. Heat-shrinkable tubing:
      a. Tubing shall be shrunk using a heat gun that produces low temperature heated air.
      b. Tubing shall be tight on the wire after it has been heated.
      c. Characters shall face the open panel and shall read from left to right or top to bottom.
      d. Marker shall start within 1/32 inch of the end of the stripped insulation point.

C. Conduit markers:
   1. Furnish and install conduit markers for every conduit in the electrical system that is identified in the conduit schedule or part of the process system:
      a. Conduit markings shall match the conduit schedule.
   2. Mark conduits at the following locations:
      a. Each end of conduits that are greater than 10 feet in length.
      b. The middle of conduits that are 10 feet or less in length.
      c. Where the conduit penetrates a wall or structure.
      d. Where the conduit emerges from the ground, slab, etc.
   3. Mark conduits after the conduits have been fully painted.
   4. Position conduit markers so that they are easily read from the floor.
   5. Attach stainless steel tags with stainless steel cable ties.
   6. Attach brass tags with Type 316 stainless steel wires.
   7. Mark conduits before construction review by Engineer for punch list purposes.
   8. Label intrinsically safe conduits in accordance with the requirements of the NEC.

D. Signs and labeling:
   1. Furnish and install permanent warning signs at mechanical equipment that may be started automatically or from remote locations:
      a. Fasten warning signs with round head stainless steel screws or bolts.
      b. Locate and mount in a manner to be clearly legible to operations personnel.

2. Furnish and install permanent and conspicuous warning signs on equipment (front and back), doorways to equipment rooms, pull boxes, manholes, etc. where the voltage exceeds 600 volts.
3. Furnish and install warning signs on equipment that has more than one source of power:
    a. Warning signs to identify every panel and circuit number of the disconnecting means of all external power sources.
4. Place warning signs on equipment that has 120 VAC control voltage source used for interlocking:
    a. Identify panel and circuit number or conductor tag for control voltage source disconnecting means.

3.04 ERECTION, INSTALLATION, APPLICATION, CONSTRUCTION (NOT USED)

3.05 REPAIR/RESTORATION (NOT USED)

3.06 RE-INSTALLATION (NOT USED)

3.07 COMMISSIONING

A. As specified in Section 01756 - Commissioning.

3.08 FIELD QUALITY CONTROL

A. Replace any nameplates, signs, conductor markers, cable markers or raceway labels that in the sole opinion of the Engineer do not meet the Engineer’s aesthetic requirements.

3.09 ADJUSTING (NOT USED)

3.10 CLEANING (NOT USED)

3.11 PROTECTION (NOT USED)

3.12 SCHEDULES (NOT USED)

END OF SECTION

SECTION 16123

600-VOLT OR LESS WIRES AND CABLES

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. 600-volt class or less wire and cable.

1.02 REFERENCES

A. As specified in Section 16050 - Common Work Results for Electrical.

B. ASTM International (ASTM):
   1. B3 - Standard Specification for Soft or Annealed Copper Wire.
   2. B8 - Standard Specification for Concentric-Lay-Stranded Copper Conductors, Hard, Medium-Hard, or Soft.

C. CSA International (CSA).

D. National Electrical Code (NEC).

E. National Electrical Manufacturers Association /Insulated Cable Engineers Association (NEMA/ICEA):
   1. NEMA WC 57/ICEA S-73-532 - Standard for Control, Thermocouple Extension, and Instrumentation Cables.
   2. NEMA WC 66/ICEA S-116-732 - Standard for Category 6 and 6A, 100 Ohm, Individually Unshielded Twisted Pairs, Indoor Cables (With or Without an Overall Shield) for Use in LAN Communication Wiring Systems.
   3. NEMA WC 70/ICEA S-95-658-1999 - Standard for Power Cables Rated 2,000 Volts or Less for the Distribution of Electrical Energy.

F. Telecommunications Industry Association (TIA):
   1. 568.2-D - Balanced Twisted-Pair Telecommunications Cabling and Components Standard.
   2. 569-B - Commercial Building Standards for Telecommunications Pathways and Spaces.

G. Underwriter's Laboratories Inc., (UL):
   1. 44 - Standard for Thermoset-Insulated Wires and Cables.

1.03 DEFINITIONS

A. As specified in Section 16050 - Common Work Results for Electrical.

B. Specific definitions and abbreviations:
   1. AWG: American wire gauge.
   2. BCCS: Bare copper-covered steel.

3. CPE: Chlorinated polyethylene.
4. FEP: Fluorinated ethylene propylene.
5. FHDPE: Foam high-density polyethylene.
6. FPE: Foam polyethylene.
7. OD: Outside diameter.
8. PVC: Polyvinyl chloride.
9. XHHW: Cross-linked high heat water resistant insulated wire.

C. Definitions of terms and other electrical considerations as set forth in the:
1. ASTM.
2. ICEA.

1.04 SYSTEM DESCRIPTION

A. Furnish and install the complete wire and cable system.

1.05 SUBMITTALS

A. Furnish submittals as specified in Section 01330 - Submittal Procedures.

B. Product data:
1. Manufacturer of wire and cable.
2. Insulation:
   a. Type.
   b. Voltage class.
3. AWG size.
4. Conductor material.
5. Pulling compounds.

C. Shop drawings:
1. Show splice locations.
   a. For each proposed splice location provide written justification describing why the splice is necessary.

D. Test reports:
1. Submit test reports for meg-ohm tests.

E. Calculations:
1. Submit cable pulling calculations to the Engineer for review and comment for all cables that will be installed using mechanical pulling equipment. Show that the maximum cable tension and sidewall pressure will not exceed manufacturer recommended values:
   a. Provide a table showing the manufacturer's recommended maximum cable tension and sidewall pressure for each cable type and size included in the calculations.
   b. Submit the calculations to the Engineer a minimum of 2 weeks before conduit installation.

F. Cable lengths:
   1. Submit installed cable lengths using a conduit measuring tape for all 3-phase circuits including, but not limited to:
      a. 480 V circuits.
      b. 208 V circuits.
   2. Submit installed lengths of cable for the following single-phase circuits:
      a. Circuits feeding single-phase transformers.
      b. Circuits feeding single-phase panelboards.

1.06 QUALITY ASSURANCE

A. All wires and cables shall be UL listed and labeled.

1.07 DELIVERY, STORAGE, AND HANDLING (NOT USED)

1.08 PROJECT OR SITE CONDITIONS (NOT USED)

1.09 SEQUENCING (NOT USED)

1.10 SCHEDULING (NOT USED)

1.11 WARRANTY

A. As specified in Section 01783 - Warranties and Bonds.

1.12 SYSTEM START-UP (NOT USED)

1.13 OWNER`S INSTRUCTIONS (NOT USED)

1.14 MAINTENANCE (NOT USED)

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. One of the following or equal:
   1. 600-volt class wire and cable:
      a. General Cable.
      b. Okonite Co.
      c. Southwire Co.
      d. Service Wire.
   2. 600-volt VFD cable:
      a. General Cable.
      b. Southwire Co.
      c. Service Wire.
   3. Instrumentation class wire and cable:
      a. Alpha Wire Co.
      b. Belden CDT.
      c. General Cable.

d. Okonite Co.
e. Rockbestos Surprenant Cable Corp.

4. Network cables:
   a. General Cable.
   b. Belden.
   c. CommScope.

2.02 EXISTING PRODUCTS (NOT USED)

2.03 MATERIALS

A. Conductors:
   1. Copper in accordance with ASTM B3.

2.04 MANUFACTURED UNITS

A. General:
   1. Provide new wires and cables manufactured within 1 year of the date of delivery to the Site.
   2. Permanently mark each wire and cable with the following at 24-inch intervals:
      a. AWG size.
      b. Voltage rating.
      c. Insulation type.
      d. UL symbol.
      e. Month and year of manufacture.
      f. Manufacturer's name.
   3. Identify and mark wire and cable as specified in Section 16075 - Identification for Electrical Systems:
      a. Use integral color insulation for No. 2 AWG and smaller wire.
      b. Wrap colored tape around cable larger than No. 2 AWG.

B. 600-volt class wire and cable:
   1. Provide AWG or kcmil sizes as indicated on the Drawings or in the Conduit Schedules:
      a. When not indicated on the Drawings, size wire as follows:
         1) In accordance with the NEC:
            a) Use 75 degree Celsius ampacity ratings.
            b) Ampacity rating after all derating factors, equal to or greater than rating of the overcurrent device.
         2) Provide No. 12 AWG minimum for power conductors.
         3) Provide No. 14 AWG minimum for control conductors.
   2. Provide Class B stranding in accordance with ASTM B8:
      a. Provide Class C stranding where extra flexibility is required.
   3. Insulation:
      a. XHHW-2.
      b. 90 degree Celsius rating.

C. 600-volt VFD cables:
   1. Conductor:
      a. Provide Class B stranding in accordance with ASTM B3 and B8.
      b. Copper conductor.

2. Insulation:
    a. Cross-linked Polyethylene, XLPE.
    b. 90 degree Celsius rating.
    c. UL 44 Type RHH/RHW-2 or XHHW-2.
    d. 2,000 volts.
3. Ground:
    a. Provide Class B compressed stranded bare copper in accordance with ASTM B3 and B8.
    b. 3 symmetrically placed bare copper conductors in direct contact with shield.
    c. Equivalent ground size 50 percent of the phase conductor size.
4. Filler:
    a. Cable sizes 8 and 6 use polypropylene filler.
    b. Other cable sizes use paper filler.
5. Metallic shield:
    a. Overall 5 mil bare copper tape shield with 50 percent overlap.
6. Outer jacket:
    a. UL 1277 Type PVC.
7. Cable tray rated, UL Type TC-ER.

D. Instrumentation class cable:
1. Type TC.
2. Suitable for use in wet locations.
3. Voltage rating: 600 volts.
4. Temperature rating:
    a. 90 degree Celsius rating in dry locations.
    b. 75 degree Celsius rating in wet locations.
5. Conductors:
    a. Insulation:
        1) Flame-retardant PVC, 15 mils nominal thickness, with nylon jacket 4 mils nominal thickness.
    b. No. 16 AWG stranded and tinned.
    c. Color code: ICEA Method 1:
        1) Pair: Black and white.
        2) Triad: Black, white and red.
        3) Multiple pairs or triads:
            a) Color-coded and numbered.
6. Drain wire:
    a. No. 18 AWG.
    b. Stranded, tinned.
7. Jacket:
    a. Flame retardant, moisture and sunlight resistant PVC.
    b. Ripcord laid longitudinally under jacket to facilitate removal.
8. Shielding:
    a. Individual pair/triad:
        1) Minimum 1.35-mil double-faced aluminum foil-polyester tape overlapped to provide 100 percent coverage.
    b. Multiple pair or triad shielding:
        1) Group shield: Minimum 1.35-mil double-faced aluminum foil-polyester tape overlapped to provide 100 percent coverage.

2) Completely isolate group shields from each other.
3) Cable shield: 2.35 mils double-faced aluminum and synthetic polymer backed tape overlapped to provide 100 percent coverage.

c. All shielding to be in contact with the drain wire.

E. Network cables:
1. Copper Ethernet cable:
a. Provide copper Ethernet cable types as indicated in the Drawings and Specifications.
b. General requirements:
1) All cables shall meet the standards set by TIA-568.2-D and verified by third-party testing laboratory.
2) Conductors:
a) Four balanced twisted pairs.
(1) No. 22 to No. 24 AWG thermoplastic insulated solid copper conducts enclosed by a thermoplastic jacket. Copper clad aluminum is not allowed.
3) Insulation:
a) Non-Plenum: Polyolefin.
b) Plenum: Fluoropolymer.
4) Color coded per T568B.
5) Outer jacket with ripcord.
6) Shielding:
a) Provide F/UTP cables with drain wire for cables inside any equipment, enclosures, or raceway that also contains circuits exceeding 480 VAC and as indicated on the Drawings.
7) Electrical rating:
a) Equipment cables: 600 VAC.
b) Horizontal cables: 300 VAC.
8) Approvals and listings:
a) Meets any necessary NEC and NFPA requirements for each application.
b) Riser applications: CMR in accordance with UL 1666.
c) Plenum applications: CMP in accordance with NFPA 262.
9) Certification:
a) Provide Category 6 cables with NEMA WC 66/ICEA S-116-732 certification.

2.05 EQUIPMENT (NOT USED)

2.06 COMPONENTS (NOT USED)

2.07 ACCESSORIES

A. Wire ties:
1. One of the following or equal:
a. T&B, "Ty-Rap" cable ties.
b. Panduit, cable ties.

B. Wire markers:
1. As specified in Section 16075 - Identification for Electrical Systems.

2.08 MIXES (NOT USED)

2.09 FABRICATION (NOT USED)

2.10 FINISHES (NOT USED)

2.11 SOURCE QUALITY CONTROL

A. Assembly and testing of cable shall comply with the applicable requirements of NEMA WC 70/ICEA S-95-658-1999.

B. Test Type XHHW-2 in accordance with the requirements of UL 44.

PART 3 EXECUTION

3.01 EXAMINATION (NOT USED)

3.02 PREPARATION (NOT USED)

3.03 INSTALLATION

A. As specified in Section 16050 - Common Work Results for Electrical.

B. Color-coding:
   1. Color-coding shall be consistent throughout the facility.
   2. The following color code shall be followed for all 240/120 volt and 208/120 volt systems:
      a. Phase A: Black.
      b. Phase B: Red.
      c. Phase C: Blue.
      d. Single phase system: Black for 1 hot leg, red for the other.
      e. Neutral: White.
      f. High phase or wild leg: Orange.
      g. Equipment ground: Green.
   3. The following color code shall be followed for all 480/277 volt systems:
      a. Phase A: Brown.
      b. Phase B: Orange.
      c. Phase C: Yellow.
      d. Neutral: Gray.
      e. Equipment ground: Green.
   4. The following color code shall be followed for all 120 VAC control wiring:
      a. Power: Red.
      b. Neutral: White.
   5. The following color code shall be followed for all general purpose DC control circuits:
      a. Grounded conductors: White with blue stripe.
      b. Ungrounded conductors: Blue.
   6. Switch legs shall be violet. 3-way switch runners shall be pink.
   7. Wires in intrinsically safe circuits shall be light blue.

8. Wire colors shall be implemented in the following methods:
    a. Wires manufactured of the desired color.
    b. Continuously spiral wrap the first 6 inches of the wire from the termination point with colored tape:
        1) Colored tape shall be wrapped to overlap 1/2 of the width of the tape.

C. Install conductors only after the conduit installation is complete, and all enclosures have been vacuumed clean, and the affected conduits have been swabbed clean and dry:
    1. Install wires only in approved raceways.
    2. Do not install wire:
        a. In incomplete conduit runs.
        b. Until after the concrete work and plastering is completed.

D. Properly coat wires and cables with pulling compound before pulling into conduits:
    1. For all No. 4 AWG and larger, use an approved wire-pulling lubricant while cable is being installed in conduit:
        a. Ideal Products.
        b. Polywater Products.
        c. 3M Products.
        d. Greenlee Products.
        e. Or equal as recommended by cable manufacturer.
        f. Do not use oil, grease, or similar substances.

E. Cable pulling:
    1. Prevent mechanical damage to conductors during installation.
    2. For cables No. 1 AWG and smaller, install cables by hand.
    3. For cables larger than No. 1 AWG, power pulling winches may be used if they have cable tension monitoring equipment.
    4. Provide documentation that maximum cable pulling tension was no more than 75 percent of the maximum recommended level as published by the cable manufacturer. If exceeded, the Engineer may, at his discretion, require replacement of the cable.
    5. Ensure cable pulling crews have all calculations and cable pulling limitations while pulling cable.
    6. Make splices or add a junction box or pullbox where required to prevent cable pulling tension or sidewall pressure from exceeding 75 percent of manufacturer’s recommendation for the specified cable size:
        a. Make splices in manholes or pull boxes only.
        b. Leave sufficient slack to make proper connections.

F. Use smooth-rolling sheaves and rollers when pulling cable into cable tray to keep pulling tension and bending radius within manufacturer’s recommendations.

G. Install and terminate all wire in accordance with manufacturer's recommendations.

H. Neatly arrange and lace conductors in all switchboards, panelboards, pull boxes, and terminal cabinets by means of wire ties:
    1. Do not lace wires in gutter or panel channel.

2. Install all wire ties with a flush cutting wire tie installation tool:
    a. Use a tool with an adjustable tension setting.
3. Do not leave sharp edges on wire ties.

I. Terminate stranded conductors on equipment box lugs such that all conductor strands are confined within the lug:
    1. Use ring type lugs if box lugs are not available on the equipment.

J. Lighting circuits:
    1. Each circuit shall have a dedicated neutral.

K. Splices:
    1. Provide continuous circuits from origin to termination whenever possible:
        a. Obtain Engineer's approval prior to making any splices.
    2. Lighting and receptacle circuit conductors may be spliced without prior approval from the Engineer.
    3. Where splices are necessary because of extremely long wire or cable lengths that exceed standard manufactured lengths:
        a. Splice box NEMA rating requirements as specified in Section 16050 - Common Work Results for Electrical.
        b. Make splices in labeled junction boxes for power conductors.
        c. Make splices for control and instrument conductors in terminal boxes:
            1) Provide terminal boards with setscrew pressure connectors, with spade or ring lug connectors.
    4. Power and control conductors routed in common raceways may be spliced in common junction boxes.
    5. Clearly label junction and terminal boxes containing splices with the word "SPLICE LOCATED WITHIN".
    6. Leave sufficient slack at junction boxes and termination boxes to make proper splices and connections. Do not pull splices into conduits.
    7. Install splices with compression type butt splices and insulate using a heat-shrink sleeve:
        a. In NEMA Type 4 or NEMA Type 4X areas, provide heat-shrink sleeves that are listed for submersible applications.
    8. Splices in below grade pull boxes, in any box subject to flooding, and in wet areas shall be made waterproof using:
        a. A heat shrink insulating system listed for submersible applications.
        b. Or an epoxy resin splicing kit.

L. Apply wire markers to all wires at each end after being installed in the conduit and before meg-ohm testing and termination.

M. Instrumentation class cable:
    1. Install instrumentation class cables in separate raceway systems from power cables:
        a. Install instrument cable in metallic conduit within non-dedicated manholes or pull boxes.
        b. Install cable without splices between instruments or between field devices and instrument enclosures or panels.

2. Do not make intermediate terminations, except in designated terminal boxes as indicated on the Drawings.
3. Shield grounding requirements as specified in Section 16060 - Grounding and Bonding.

N. Copper Ethernet cables:
   1. In accordance with TIA-568.2-D.
   2. Pathways:
      a. For initial installation, the maximum fill capacity for pathways (i.e., conduit, raceways, trays, baskets) is 40 percent. The maximum fill capacity of 60 percent is allowed to accommodate future additions after initial installation.
      b. Conduit should be run in the most direct route possible with no more than two 90 degree bends between pull boxes and serve no more than 3 outlet boxes.
   3. Cable bend radius:
      a. Proper cable bend radius control must be maintained throughout the pathways. The bend radius needs to be at a minimum 10 times the cable diameter.
   4. Cable pulling:
      a. Provide cable pulling swivel system to prevent winding and tangling of rope and cables during pull.
      b. The maximum pulling tension is not to exceed manufacturer recommendations. Cable installation should not in any way deform the cable jacket.
      c. Do not install bruised, kinked, scored, deformed, or abraded cable. Do not splice cable between termination, tap, or junction points. Remove and discard cable if damaged during installation and replace it with new cable.
   5. Cable management:
      a. Organize and manage cables for quick and easy moves, adds and changes.
   6. Cable termination:
      a. Install equipment outlet connector hardware (e.g., RJ45, M12, etc.), and connect to field equipment outlet (e.g., instrument, VFD, actuator, etc.).
      b. Use shielded connectors as required by the installation.
      c. Coordinate cable termination at copper patch panels with ICSC and General Contractor.
   7. Testing:
      a. Copper Ethernet cable testing requirements as specified in Section 16950 - Field Electrical Acceptance Tests.
   8. Separation from EMI sources:
      a. Comply with TIA-569-B recommendations for separating unshielded copper voice and data communication cable from potential EMI sources, including electrical power lines and equipment.
      b. Separation between open communications cables or cables in nonmetallic raceways and unshielded power conductors and electrical equipment shall be as follows:
         1) Electrical Equipment Rating Less Than 2 kVA: A minimum of 5 inches.

2) Electrical Equipment Rating between 2 and 5 kVA: A minimum of 12 inches.
3) Electrical Equipment Rating More Than 5 kVA: A minimum of 24 inches.

c. Separation between communications cables in grounded metallic raceways and unshielded power lines or electrical equipment shall be as follows:
1) Electrical Equipment Rating Less Than 2 kVA: A minimum of 2-1/2 inches.
2) Electrical Equipment Rating between 2 and 5 kVA: A minimum of 6 inches.
3) Electrical Equipment Rating More Than 5 kVA: A minimum of 12 inches.

d. Separation between communications cables in grounded metallic raceways and power lines and electrical equipment located in grounded metallic conduits or enclosures shall be as follows:
1) Electrical Equipment Rating Less Than 2 kVA: No requirement.
2) Electrical Equipment Rating between 2 and 5 kVA: A minimum of 3 inches.
3) Electrical Equipment Rating More Than 5 kVA: A minimum of 6 inches.

e. Separation between Communications Cables and Electrical Motors and Transformers, 5 kVA or HP and Larger: A minimum of 48 inches.

O. Signal cable:
1. Separate and isolate electrical signal cables from sources of electrical noise and power cables by minimum 12 inches.

P. Wiring allowances:
1. Equipment locations may vary slightly from the drawings. Include an allowance for necessary conductors and terminations for motorized equipment, electrical outlets, fixtures, communication outlets, instruments, and devices within 10 linear feet of locations indicated on the Drawings.
2. Locations for pull boxes, manholes, and duct banks may vary slightly from the drawings. Include an allowance for necessary conductors and related materials to provide conductors to all pull boxes, manholes and duct banks within 20 linear feet of locations indicated on the Drawings.

3.04 ERECTION, INSTALLATION, APPLICATION, CONSTRUCTION (NOT USED)

3.05 REPAIR/RESTORATION (NOT USED)

3.06 RE-INSTALLATION (NOT USED)

3.07 COMMISSIONING

A. As specified in Section 01756 - Commissioning.

3.08 FIELD QUALITY CONTROL (NOT USED)

3.09 ADJUSTING (NOT USED)

3.10 CLEANING (NOT USED)

3.11 PROTECTION (NOT USED)

3.12 SCHEDULES (NOT USED)

END OF SECTION

SECTION 16125

FIBER OPTIC CABLE AND APPURTENANCES

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Fiber optic cable.
   2. Fiber splices and terminations.
   3. Accessories.

1.02 REFERENCES

A. Abbreviations:
   1. N/Cm: Newtons per centimeter.
   2. OTLS: Optical Loss Test Set (Tier 1 test).
   3. OTDR: Optical Time Domain Reflectometer (Tier 2 test).

B. Definitions:
   1. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

C. Standards:
   1. Bellcore Standards:
      a. GR-409 - Generic Requirements for Indoor Fiber.
   2. Electronic Industry Association (EIA):
      a. FOTP-25 - Impact testing of Fiber Optic Cables and Cable Assemblies.
      b. FOTP-33 - Fiber Optic Cable Tensile Loading and Bending Test.
      c. FOTP-41 - Compressive Loading Resistance of Fiber Optic Cables.
      d. FOTP-81 - Compound Flow (Drip) Test for Filled Fiber Optic Cable.
      e. FOTP-104 - Fiber Optic Cable Cyclic Flexing Test.
      f. FOTP-181 - Lightning Damage Susceptibility Test for Fiber Optic Cables with Metallic Components.
   3. Insulated Cable Engineer's Association (ICEA):
      a. S-83-596 - Optic Fiber Premises Distribution Cables.
      b. S-87-640 - Optic Fiber Outside Plant Communications Cable.
      c. S-104-696 - Indoor-Outdoor Optic Fiber Cable.
   4. TIA/EIA Standards:
      a. 598 - Optical Fiber Cable Color Coding.
      b. 11801 - Information technology - Generic cabling for customer premises.
   5. Underwriters Laboratories, Inc. (UL):
      a. 1666 - Test for Flame Propagation Height of Electrical and Optical-Fiber Cables Installed Vertically in Shafts.
      b. 1685 - Vertical-Tray Fire-Propagation and Smoke-Release Test for Electrical and Optical-Fiber Cables.

1.03 DELEGATED DESIGN (NOT USED)

1.04 SUBMITTALS

A. Furnish submittals as specified in Section 01330 - Submittal Procedures.

B. Product data:
   1. Complete manufacturer's brochures that identify materials and options.
   2. Completed data sheets, including catalog number and source for determining catalog number.
   3. Manufacturer's installation instructions.
   4. Include the following:
      a. Manufacturer's data on testing equipment used on this project.
      b. Manufacturer's specifications and data sheets for all fiber types.
      c. Manufacturer's specifications and data sheets for all connectors, bulkheads, splicing kits, breakout devices, and appurtenances used in connecting and terminating the fiber spans.
   5. Catalog data on all testing devices proposed for use plus certifications of accuracy, calibration, and traceability to standards of the NIST.
   6. Manufacturer's test procedures and quality assurance procedures:
      a. After review, the Engineer may require that additional tests be performed before installation.

C. Shop drawings:
   1. Interconnection cabling diagrams for the complete system including every fiber in each cable.
   2. Drawings indicating the locations of all pull boxes including pull box identifiers and lengths.
   3. Submit optical power budget calculations for all fiber segments. Include the following:
      a. Minimum transmit power of active devices.
      b. Minimum receive sensitivity.
      c. Available power, in dBm.
      d. Loss for each segment in dBm, including cable attenuation and connector losses. Use manufacturer's data for cable attenuation, at the wavelength to be used. Assume 0.5 dB per connector.
      e. Demonstrate that remaining power budget at each receiver is equal to or greater than 3.0 dBm.

D. Installation instructions:
   1. Submit a cable pulling and splicing work plan that includes the following:
      a. Pull tension calculations.
      b. Detailed description of pull operation methods for all conduit runs.
      c. Tools and equipment to be used for cable installation and testing.
      d. Physical location of equipment setup and type.
      e. Exact locations of splice points.
      f. Safety and manual assist cable-pulling operations.
      g. Detailed schedule for pulling and testing cables.
      h. The name and qualifications of the supervisory personnel directly responsible for the installation of the conduit system.
      i. Sample fiber optic cable test sheets.
      j. All signed test sheet results.

E. Commissioning submittals:
   1. As specified in Section 01756 - Commissioning, including the following:
      a. Manufacturer's representative qualifications.
      b. Certificates:
         1) Requirements as specified in this Section.
      c. Test Plans:
         1) Test requirements as specified in this Section.
      d. Test Reports.
      e. Manufacturer's representatives field notes and data.

F. Operation and maintenance manuals:
   1. Compile completed test reports, instruction manuals, and manufacturer's information into the operating manuals and submitted in accordance with Section 01782 - Operation and Maintenance Manuals.

G. Test reports:
   1. Submit the results of all specified tests to the Engineer.
   2. Submit 3 copies of all test reports showing the results of all tests specified herein or in Section 16950 - Field Electrical Acceptance Tests:
      a. Test forms shall include the following information at a minimum:
         1) Test type.
         2) Test location.
         3) Test date.
         4) Wavelength.
         5) Index of refraction.
         6) Cable identification.
         7) Fiber type.
         8) Fiber number.
         9) Fiber color.
         10) Result of the value of the tested parameter.
   3. Furnish hard copy and electronic copy for all OTDR traces.
   4. Submit certification that the fiber optic cable has passed each testing stage:
      a. Submit separate documentation for each testing stage result.

H. Record documents:
   1. Furnish updated electrical drawings, network diagrams, and fiber cable block diagrams at the end of construction and submit as Record Drawings.

I. Calculations:
   1. Cable pulling calculations for all conduit runs:
      a. Indicate on the submittal any additional pull boxes that are required, including pull box identifiers and a written description of the location.

1.05 QUALITY ASSURANCE

A. Furnish all cable and appurtenances manufactured within 1 year of installation.

B. Proof test all optical fibers by the fiber manufacturer at a minimum load of 50 kpsi.

C. Provide 100 percent attenuation testing for all optical fibers:
   1. Include with each cable reel the attenuation of each fiber.

D. Provide information on at least 5 successful fiber optic cable installations of comparable size and complexity in the past 3 years with name, address, and telephone number of facility owner, name of project with completion date, and type of conduit system and length of cable pulled.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Package the cable for shipment on wooden reels:
   1. Seal both ends of the cable to prevent the ingress of moisture.
   2. Place fiber cable assemblies on reels such that both cable ends are available for testing.
   3. Weatherproof cable reel markings shall include the following:
      a. Manufacturer.
      b. Date of manufacture.
      c. Shipping date.
      d. Cable identification.
      e. Cable configuration/fiber count.
      f. Cable length.
      g. Gross weight.
      h. Cable test date.
      i. Handling instructions.
      j. Direction to unreel.

1.07 PROJECT OR SITE CONDITIONS

A. As specified in Section 01850 - Design Criteria.

1.08 ADMINISTRATIVE REQUIREMENTS

A. Sequencing:
   1. Submit a cable pulling and splicing work plan a minimum of 45 days before the planned initiation of cable pulling. The cable pulling and splicing work plan must be approved a minimum of 15 days before pulling cable.
   2. Testing sequence:
      a. Perform testing of each fiber in each cable as follows:
         1) At the factory before shipment.
         2) At the project site upon delivery.
         3) Submit copies of the test results to the Engineer within 5 days after the delivery to the site.
         4) After installation, before breakout and terminations.
         5) After installation is complete.
      b. Submit test reports following each set of tests as specified in this Section.

B. Scheduling:
   1. Schedule Engineer, 5 days before installation, to witness all cable installations.
   2. Notify the Engineer and Owner a minimum of 15 days before post-installation testing.

1.09 WARRANTY

A. As specified in Section 01783 - Warranties and Bonds.

PART 2 PRODUCTS

2.01 GENERAL (NOT USED)

A. Furnish a complete fiber optic network as indicated on the Drawings.

2.02 DESIGN AND PERFORMANCE CRITERIA

A. Install all fiber optic system components in accordance with the recommendations of the manufacturer.

2.03 MANUFACTURERS

A. Acceptable manufacturers are indicated with each component type as listed in the remainder of this specification.

2.04 MATERIALS (NOT USED)

2.05 MANUFACTURED UNITS

A. General fiber cable requirements:
   1. Suitable for the installed environment.
   2. Color-coded fibers according to EIA/TIA-598.
   3. Color-coded buffer tubes according to EIA/TIA-598.
   4. Furnish buffer tubes of a single layer nylon construction or of a material with similar mechanical performance.
   5. Fillers may be included in the cable core to lend symmetry to the cable cross-section where needed.
   6. Apply binders with sufficient tension to secure the buffer tubes to the central member without crushing the buffer tubes:
      a. Provide binders that are:
         1) Non-hygroscopic.
         2) Non-wicking (or rendered so by the flooding compound).
         3) Dielectric with low shrinkage.
   7. Provide a minimum of 1 ripcord under the cable sheath.
   8. Provide the high tensile strength Aramid yarns, Kevlar, and/or fiberglass helically stranded evenly around the cable core:
      a. No metallic elements whatsoever are allowed in non-armored cable.
   9. The jacket or sheath shall be free of holes, splits, and blisters.
   10. Mark the jacket or sheath with:
      a. Manufacturer's name.
      b. The words “Optical Cable”.
      c. Year of manufacture.
      d. Sequential meter marks.
      e. Repeat markings every 1-meter.
      f. The actual length of the cable to be within 1 percent of the length marking.

g. The marking must be in a contrasting color to the cable jacket.
h. The height of the marking:
1) Approximately 2.5 millimeters.

11. The shipping, storage, and operating temperature range of the cable shall be -40 degrees Celsius to +70 degrees Celsius.
12. General performance characteristics:
a. The rated tensile load of the cables:
1) Indoor/outdoor:
a) Short term: 1,330 N.
b) Long term: 400 N.
b. Non-armored fiber optic cables: Compressive load withstand of 220 N/cm applied uniformly over the length of the cable.
c. Armored fiber optic cables: Compressive load withstand of 440 N/cm applied uniformly over the length of the cable.
d. The average increase in attenuation for the fibers: Less than or equal to 0.10 dB at 1,550 nm for a cable subjected to this load:
1) With no measurable increase in attenuation after load removal.
e. Test in accordance with EIA FOTP-41 except that the load must be applied at the rate of 3 millimeters to 20 millimeters per minute and maintained for 10 minutes.
f. Capable of withstanding 25 cycles of mechanical flexing at a rate of 30 within 1 cycles/minute.
g. The average increase in attenuation for the fibers: Less than or equal to 0.10 dB at 1,550 nm at the completion of the test.
h. For armored cables, any visible cracks causing separation of the armor and propagating more than 5 millimeters constitutes failure.
i. Outer cable jacket cracking or splitting observed under 10X times magnification, constitutes failure.

B. Indoor/outdoor cable:
1. Cable construction:
a. General:
1) Cable type: Indoor/Outdoor - Flame retardant, low smoke, zero halogen, UV resistant.
2) Fiber count: As indicated on the Drawings.
3) Fiber type: As indicated on the Drawings.
4) Buffer tube: Loose tube.
5) Armoring: None.
6) Waterproofing: Water blocking layer.
7) Approvals and listings: UL 1666 and UL 1685.
8) Design and test criteria: In accordance with ICEA S-104-696.
b. Testing:
1) All fibers in the cable:
a) Proof test of 100 kpsi.
b) Each optical fiber: Bellcore GR-409 strip force testing.
c) No gaps are allowed between the coating material and the buffer material visible under a 50-power microscope.
c. Outer jacket material:
1) Linear low-density polyethylene.
2) Meet all requirements of the NEC for use in all indoor/outdoor areas (excluding plenums) without being enclosed in conduit.

3) Flame retardant OFNR riser rated conforming to UL 1666.
4) Printed with all necessary UL marks and manufacturer identification.
5) Sequential printing of footage in 2-foot increments.
6) With a ripcord incorporated under the cable jacket.

C. Multimode fibers:
1. All fibers in the cable must be usable fibers and meet required specifications.
2. Each optical fiber shall consist of a doped silica core surrounded by a concentric silica cladding.
3. Multimode fiber characteristics:
a. Category: OM4 compliant with ISO/IEC 11801.
b. Jacket color: Aqua.

D. Indoor/outdoor:
1. Tight buffer:
a. Corning Cable Systems, Freedm® One.
b. Optical Cable Corporation, DX-Series.
c. CommScope, LazrSPEED/TerraSPEED.

2.06 EQUIPMENT (NOT USED)

2.07 COMPONENTS (NOT USED)

2.08 ACCESSORIES

A. Patch cords:
1. General:
a. Connector types to match supplied equipment and the patch panel terminations.
b. Maximum length of patch cords: 25 feet.
c. Provide 2 spare patch cords (or 1 duplex patch cord) of each type used at each PLC or network cabinet.
d. Factory assembled and optically tested.
e. Provide mode-conditioning cords for multimode fibers operating at 1,310 nm.
2. Manufacturers: One of the following or equal:
a. CommScope.
b. Corning Cable Systems.

B. Fiber connectors:
1. As specified in Section 17733 - Control Systems: Network Materials and Equipment.

C. Fiber optic identification/warning tags:
1. Black letters on orange or yellow background.
2. UV resistant polyethylene or other suitable material:
a. Manufacturers: The following or equal:
1) Almetek.

PART 3 EXECUTION

3.01 EXAMINATION

A. Verify the condition of the conduit system before installation of the fiber optic cable or inner duct.

B. Pass a test mandrel through all fiber optic conduits prior to pulling fiber or installing inner duct.
   1. Run the mandrel in both directions.

C. Examine all materials and equipment before installation and verify they are free from physical damage and defects.

3.02 PREPARATION

A. Equipment support and anchoring to structures:
   1. Prepare anchor setting template(s) and use to position anchors during construction of supporting structures.
   2. Install anchors of type and material indicated on approved anchoring designs.
   3. Install anchors with embedment indicated on approved anchoring designs.

B. Before fiber splicing terminating or testing activities, verify sufficient workspace is available to perform the activity without interferences from other trades.

C. Pre-installation test:
   1. Upon arrival at the site:
      a. Inspect the cable and reel for damage.
      b. Test all fibers with an optical time domain reflectometer (OTDR) for fiber integrity.
      c. Verify that the fiber lengths are consistent with the cable manufacture.
      d. Verify that all traces yield no point discontinuities.
   2. Complete test sequence and obtain approval from the Engineer of submitted test results before cable installation.

3.03 INSTALLATION

A. Install fiber optic patch cords in open network trays or in dedicated conduits no longer than 25 feet in length.

B. Install fiber optic cable in continuous lengths without intermediate splices, except where approved by the Engineer.

C. Cable installation:
   1. Properly attach the fiber optic cable’s strength elements to a 600-pound breakaway swivel containing tension or shear pins using Kellums pulling grips that are a minimum of 18 inches long.
   2. Certify that cable tensile limits do not exceed cable pull tension and bend limits using tension monitoring devices.
   3. Leave an extra loop of fiber optic cable in each pull box.

4. Conform with the cable manufacturer's specifications, practices, and the following requirements:
    a. When power equipment is used to install fiber optic cables, use low speeds and do not exceed a rate of 30 meters per minute.
    b. Do not exceed the tensile and bending limitation for fiber optic cables under any circumstances.
    c. Use large diameter wheels, pulling sheaves, and cable guides to maintain the specified bending radius.
    d. Use commercial dynamometers or load cells to monitor pulling tension.
    e. A nonfreezing type of swivel inserted between the pulling line and cable pulling grip to prevent twisting under strain.
    f. All cable to be installed using a breakaway swivel.
5. Apply to all conduits a lubricant at each conduit ingress and egress location during the pull operation:
    a. Pour or pump lubricant into the end of the conduit at the feed location at a nominal application rate of 3 gallons per 1,000 feet of cable.
    b. If the conduit is open at intermediate locations, then apply the appropriate proportion of lubricant at each opening.
    c. Continuously lubricate the cable as it is being pulled by pouring or pumping the lubricant into the conduit at the feed location and at each intermediate location.
    d. Station workers at each intermediate location as required.
    e. Remove all excess lubricant that has collected.
    f. Remove and clean the surrounding area after cable installation.
6. Install using a hydraulic capstan or winch equipped with a recording running line dynamometer graph which measures and records pulling tensions:
    a. Use pulling equipment with slip-load capability to allow the winch to maintain a constant pulling force without taking up the winch line.
    b. Use pulling equipment equipped with a hydraulic bypass set so that a maximum tension of 600 pounds is not exceeded.
    c. Use only equipment designed to prevent a preset pulling tension from being exceeded.
    d. Fiber optic cable manufacturer to provide the pulling tension setpoint.
    e. If during the pulling operation excessive tension is detected, cease all operations and notify the Engineer.
7. Position the cable reel at the feed point in alignment with the raceway and in such a position that the cable can be passed from the top of the reel in a long, smooth bend into the raceway system:
    a. The use of a cable feeder is required, unless the cable is hand-pulled.
8. Supply all bull wheels, blocks, split wheels, cable feeders, and necessary equipment required to provide a clean and safe operation:
    a. The cable shall not be allowed to travel over any wheel or block that has a radius less than the minimum radius allowed by the cable manufacturer.
9. Minimize the use of snatch blocks and rollers to guide the cable into the conduit at the feed point:
    a. Slack feed by hand the cable into the feed point and raceway without the use of rollers.
10. Tend the cable reel at all times and turn by hand to provide the required cable slack:
    a. Under no circumstances shall the cable tension be allowed to turn the cable reel.

11. Use a rim roller, with a wheel radius greater than the minimum cable bending radius placed at the manhole or vault opening to prevent the cable from dragging on the manhole rim or steps.
12. Perform a continuous thorough visual inspection for flaws, breaks, and abrasions in the cable sheath as the cable leaves the reel, and maintain a slow pulling speed to permit this inspection.
13. Damage to the sheath or finish of the cable is cause for rejecting the cable:
    a. Replace any cable damaged in any way during installation.
14. If the cable becomes damaged during installation, stop operations and notify the Engineer immediately:
    a. Engineer to determine whether to replace the entire reel of cable or to install a termination panel to eliminate the damaged section.
15. Document all pulls by a graph which is annotated with the following information:
    a. Reel number.
    b. Pull point ID.
    c. Date and time.
    d. Explanations for abnormalities in readings or interruptions.
    e. Sign-off by Contractor and Engineer.
16. Under no conditions shall the fiber optic cable be left exposed or unattended.

D. Provide inner duct in fiber optic conduits as indicated on the Drawings, cable schedule, and as specified in Section 16130 - Conduits:
    1. Provide a pull rope in each unused inner duct.

E. After the cables are installed and spliced:
    1. Rack the cables:
        a. Loosely secure in racked position with wire ties.
        b. Attach imprinted plastic-coated cloth identification/warning tags to each cable in at least 2 locations in each handhole/manhole.

F. Splices:
    1. Provide field splices in a splice tray located in a waterproof splice enclosure:
        a. Manufacturers: The following or equal:
            1) Tyco/Raychem, FOSC style splice enclosure.
    2. Loop the individual fibers a minimum of 1 full turn within the splice tray to avoid macro/micro bending.
    3. After completion of cable terminations, neatly dress all cables.
    4. Protect all splices with a thermal shrink sleeve.
    5. Provide fusion type fiber optic cable splicing meeting the following requirements:
        a. Joins multimode fibers.
        b. Establishes a permanent fusion splice.
        c. Waterproof.
        d. Re-enterable, rearrangable, and reusable.
        e. Splice loss less than 0.10 dB.
        f. Protected by a splice enclosure.
    6. Requirement for outdoor fiber splice enclosures:
        a. Seal.
        b. Bond.
        c. Anchor.

d. Protect fiber optic cable splices.
e. Stand-alone unit that does not require an outer enclosure.
f. Provide for a maximum of 6 cable entries in a butt-end configuration.
g. Used in aerial, underground, and direct buried applications.

7. Requirement for indoor fiber splice enclosures:
   a. Anchor.
   b. Protect fiber optic cable splices.
   c. Stand-alone unit that does not require an outer enclosure.
   d. Suitable for the minimum number of splices at that location plus additional capacity for reconfigurations.
8. Re-splice any splice that has a loss greater than 0.10 dB.
9. Leave a minimum of 20 feet of fiber optic cable at each end of splice.

G. Terminations:
1. Terminate all fiber inside a patch panel:
   a. Direct landing to a switch, router hub, or PLC will not be allowed.
2. Terminate outdoor cables using a breakout kit that seals the cable and provides physical protection for the fiber strands.
3. Terminate indoor cables using breakout kits with field installed terminators.
4. Labeling:
   a. Permanently label all cable terminations. Use labels produced by a wire printer using pressure sensitive polyester labels.
   b. Label patch panels as specified in Section 16075 - Identification for Electrical Systems.

3.04 COMMISSIONING

A. As specified in Section 01756 - Commissioning.

B. Source testing:
1. Before shipment and while on the shipping reel, test 100 percent of all fibers for attenuation:
   a. Copies of the results shall be:
      1) Maintained on file.
      2) Attached to the cable reel in a waterproof pouch.
      3) Submitted before the delivery of the cable to the job site to Engineer for approval.
2. Conduct the flex test in accordance with EIA FOTP-104 test condition I and III with a maximum sheave diameter of 20 times the cable OD.
3. Verify that the cable withstands 25 impact cycles with:
   a. The average increase in attenuation for the fibers less than 0.20 dB at 1,550 nm.
   b. No evidence of cracking or splitting.
   c. Conduct the test in accordance with EIA FOTP-25.
4. Certify that the cable withstands a tensile load of 2,700 N (600 pounds):
   a. Without exhibiting an average increase in attenuation of greater than 0.10 dB.
   b. Test in accordance with EIA FOTP-33 using a maximum mandrel and sheave diameter of 560 millimeters.
   c. Apply the load for 1 hour in Test Condition II.

5. Certify that the cable withstands a simulated lightning strike:
    a. Peak value of the current pulse greater than 105kA.
    b. Use a test current with a damped oscillatory maximum time-to-peak value of 15 µs (which corresponds to a minimum frequency of 16.7 kHz) and a maximum frequency of 30 kHz.
    c. The time to half-value of the waveform envelope 40 to 70 µs.
    d. Conduct the test in accordance with the EIA FOTP-181.
    e. In addition to the analysis criterion set forth in EIA FOTP-181, the integrity of the buffer tubes (or analogous loose tube, i.e., core tube) and strength members must be intact after removal of the cable specimens from the test box.
6. Furnish test reports and Manufacturer's Certificate of Source Testing.

C. Installation Verification:
1. Furnish Manufacturer's Certificate of Installation Verification.

D. Functional Testing:
1. Conduct post-installation tests of the fiber optic system as specified in Section 16950 - Field Electrical Acceptance Tests.

3.05 FIELD QUALITY CONTROL

A. Utilize personnel certified by the manufacturer with specific knowledge of the cable manufacturer's recommended installation procedures.

B. General:
1. All test results shall meet or exceed manufacturer specifications:
    a. Test each fiber of each cable for breaks, abnormalities, and overall attenuation characteristics.
2. Pre-installation tests and post-installation tests to be witnessed and signed off by Engineer and Owner.
3. Perform OLTS test with equipment capable and calibrated to show anomalies of 0.1 dB as a minimum:
    a. Test multimode fibers at 850 nm and 1,300 nm.
4. Perform OTDR tests on fiber cables less than 100 meters with the aid of a launch cable:
    a. Adjust OTDR pulse width settings to a maximum setting of 1/1,000th of the cable length or 10 nanoseconds.

C. Manufacturer's field service:
1. Provide the services of a certified manufacturer's engineering representative for the equipment specified in this Section at the jobsite for the frequency and minimum duration (travel time excluded) as specified below to perform the following services:
    a. One 8-hour day for inspection, assistance during installation and alignment, and certification of proper installation:
        1) Submit a certificate of installation.
    b. One 8-hour-day for assistance and witnessing of system testing and any required troubleshooting.

3.06 ADJUSTING (NOT USED)

3.07 CLEANING

A. Clean all fiber optic connectors after termination and before testing. After cleaning, cover all un-terminated connectors with a protective boot.

B. At the completion of construction, touch up the finish on all fiber patch panels and enclosures.

3.08 PROTECTION

A. Protect the fiber system from physical damage and the encroachment of dust, before, during, and after installation.

3.09 SCHEDULES (NOT USED)

END OF SECTION

SECTION 16130

CONDUITS

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Metallic conduits.
   2. Nonmetallic conduits.
   3. Conduit bodies.
   4. Conduit fittings and accessories.
   5. Conduit installation.

1.02 REFERENCES

A. As specified in Section 16050 - Common Work Results for Electrical.

B. American National Standards Institute (ANSI):
   1. C80.1 - Electrical Rigid Steel Conduit.

C. National Electrical Manufacturer's Association (NEMA):
   1. RN-1 - Polyvinyl Chloride (PVC) Externally Coated Galvanized Rigid Steel Conduit and Intermediate Steel Conduit.
   2. TC2 - Electrical Polyvinyl Chloride (PVC) Conduit.
   3. TC3 - Polyvinyl Chloride (PVC) Fittings for Use with Rigid PVC Conduit and Tubing.

D. Underwriters Laboratories (UL):
   1. 1 - Standard for Flexible Metal Conduit.
   2. 6 - Standard for Electrical Rigid Metal Conduit - Steel.
   3. 360 - Standard for Liquidtight Flexible Steel Conduit.
   4. 651 - Standard for Schedule 40, 80, Type EB and A Rigid PVC Conduit and Fittings.
   5. 1203 –Standard for Explosion-Proof and Dust-Ignition-Proof Electrical Equipment for Use in Hazardous (Classified) Locations.
   6. 1660 - Standard for Liquidtight Flexible Nonmetallic Conduit.

1.03 DEFINITIONS

A. As specified in Section 16050 - Common Work Results for Electrical.

B. Specific definitions and abbreviations:
   1. Conduit bodies: A separate portion of a conduit system that provides access through a removable cover to the interior of the system at a junction of 2 or more conduit sections. Includes, but not limited to, Shapes C, E, LB, T, X, etc.
   2. Conduit fitting: An accessory that primarily serves a mechanical purpose. Includes, but not limited to, bushings, locknuts, hubs, couplings, reducers, etc.

3. GRC: Galvanized rigid steel conduit.
4. PCS: Polyvinyl chloride (PVC) coated rigid steel conduit.
5. PVC: Polyvinyl chloride rigid nonmetallic conduit.
6. SLT: Sealtight-liquidtight flexible conduit.
7. NPT: National pipe thread.

1.04 SUBMITTALS

A. Furnish submittals as specified in Section 01330 - Submittal Procedures.

B. Product data:
   1. Furnish complete manufacturer's catalog sheets for every type and size of conduit, fitting, conduit body, and accessories to be used on the Project.
   2. Furnish complete manufacturer's recommended special tools to be used for installation if required.
   3. Certified test results for PVC-coated metallic conduit showing the adhesive bond is stronger than the tensile strength of the PVC.

C. Shop drawings:
   1. Furnish conduit routing plans for conduits before the installation of any conduit.
   2. Detail the intended routing of each conduit, conduit material and include supporting methods.
   3. Number conduits in accordance with the Contract Documents.
      a. Provide conduit labels as specified in Section 16075 - Identification for Electrical Systems.

D. Certifications:
   1. Furnish PVC-coated conduit manufacturer's valid, unexpired certification for each installer.

E. Record Documents:
   1. Incorporate all changes in conduit routing on electrical plan drawings.
   2. Dimension underground and concealed conduits from building lines.
   3. Furnish hard copy drawings.

1.05 QUALITY ASSURANCE

A. All conduits, conduit bodies, and fittings shall be UL listed and labeled.

B. Every installer of PVC-coated metallic conduit shall be certified by the manufacturer for installation of the conduit, and be able to present a valid, unexpired installer certification card prior to installation beginning.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Do not expose non-metallic conduit to direct sunlight.

B. Do not store conduit in direct contact with the ground.

1.07 PROJECT OR SITE CONDITIONS

A. As specified in Section 01850 - Design Criteria.

1.08 SEQUENCING

A. Before installing any conduit or locating any device box:
   1. Examine the complete set of Drawings and Specifications, and all applicable shop drawings.
   2. Verify all dimensions and space requirements and make any minor adjustments to the conduit system as required to avoid conflicts with the building structure, other equipment, or the work of other trades.

B. Duct bank construction and direct buried conduit installation have a prerequisite of fulfilling all aspects of Section 02280 - Subsurface Utility Engineering.

C. Before performing any trenching, the following prerequisites must be met for each underground conduit routing:
   1. Review of existing civil record drawings for recorded underground utilities.
   2. Existing underground utility horizontal and vertical location by at least 1 of the following methods:
      a. Soft excavation.
      b. Local utility location service, CALL BEFORE YOU DIG or equal.
   3. Protection of any discovered existing underground utility shall remain intact until the nearby duct bank installation is complete.

1.09 SCHEDULING (NOT USED)

1.10 WARRANTY

A. As specified in Section 01783 - Warranties and Bonds.

1.11 SYSTEM START-UP (NOT USED)

1.12 OWNER'S INSTRUCTIONS (NOT USED)

1.13 MAINTENANCE (NOT USED)

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Galvanized rigid steel conduit:
   1. One of the following or equal:
      a. Western Tube and Conduit.
      b. Allied Tube and Conduit.
      c. Wheatland Tube Co.

B. PVC-coated rigid steel conduit:
   1. One of the following or equal:
      a. Robroy Ind.
      b. Ocal, Inc.
      c. Calbond.
      d. Allied.
      e. NEC, Inc. BlackGuard.

C. Sealtight-liquidtight flexible conduit:
   1. One of the following or equal:
      a. Southwire.
      b. AFC Cable Systems.
      c. Electri-Flex Co.
      d. Anaconda.

D. Rigid nonmetallic PVC conduit:
   1. One of the following or equal:
      a. Carlon.
      b. Cantex.
      c. Triangle Conduit and Cable.

E. Conduit bodies:
   1. One of the following or equal:
      a. Crouse-Hinds.
      b. Appleton.
      c. O-Z/Gedney.
      d. Ocal, Inc.
      e. Robroy Ind.
      f. Calbond.
      g. Carlon.

F. Joint compound:
   1. The following or equal:
      a. Thomas & Betts.

G. Galvanized rigid steel conduit expansion fittings:
   1. One of the following or equal:
      a. Crouse-Hinds.
      b. Appleton.
      c. O-Z/Gedney.

H. PVC-coated rigid steel conduit expansion fittings:
   1. One of the following or equal:
      a. Ocal, Inc.
      b. Robroy Ind.
      c. NEC, Inc. BlackGuard.

I. Conduit sleeve:
   1. One of the following or equal:
      a. Crouse-Hinds.
      b. Appleton.
      c. O-Z/Gedney.

J. Conduit seals:
   1. One of the following or equal:
      a. Appleton.
      b. Crouse-Hinds.
      c. O-Z/Gedney.

K. Conduit hangers and supports:
   1. As specified in Section 16070 - Hangers and Supports.

L. Conduit through wall and floor seals:
   1. The following or equal:
      a. O-Z/Gedney:
         1) Type "WSK."
         2) Type “CSM.”

2.02 SYSTEM DESCRIPTION

A. Provide conduits, conduit bodies, fittings, junction boxes, and all necessary components, whether or not indicated on the Drawings, as required, to install a complete electrical raceway system.

B. Provide location and protection of existing underground utilities, underground conduit trenching, conduit and backfill necessary for the complete installation of underground conduits.

2.03 EXISTING PRODUCTS (NOT USED)

2.04 MATERIALS (NOT USED)

2.05 MANUFACTURED UNITS (NOT USED)

2.06 EQUIPMENT (NOT USED)

2.07 COMPONENTS

A. GRC:
   1. All threads: NPT standard conduit threads with a 3/4-inch taper per foot:
      a. Running conduit threads are not acceptable.
   2. Hot-dip galvanized inside and out:
      a. Ensures complete coverage and heats the zinc and steel to a temperature that ensures the zinc alloys with the steel over the entire surface.
      b. Electro-galvanizing is not acceptable.
   3. Manufactured in accordance with:
      a. UL-6.
      b. ANSI C80.1.

B. PCS:
   1. The steel conduit, before PVC coating, shall be new, unused, hot-dip galvanized material, conforming to the requirements for Type GRC.
   2. Coated conduit NEMA Standard RN-1:
      a. The galvanized coating may not be disturbed or reduced in thickness during the cleaning and preparatory process.
   3. Factory-bonded PVC jacket:
      a. The exterior galvanized surfaces shall be coated with primer before PVC coating to ensure a bond between the zinc substrate and the PVC coating.
      b. Nominal thickness of the exterior PVC coating shall be 0.040 inch except where part configuration or application of the piece dictates otherwise.
      c. PVC coating on conduits and associated fittings shall have no sags, blisters, lumps, or other surface defects and shall be free of holes and holidays.
      d. The PVC adhesive bond on conduits and fittings shall be greater than the tensile strength of the PVC plastic coating:
         1) Confirm bond with certified test results.
   4. A urethane coating shall be uniformly and consistently applied to the interior of all conduits and fittings:
      a. Nominal thickness of 0.002 inch.
      b. Conduits having areas with thin or no coating are not acceptable.
      c. All threads shall be coated with urethane.
   5. The PVC exterior and urethane interior coatings applied to the conduits shall afford sufficient flexibility to permit field bending without cracking or flaking at temperature above 30 degrees Fahrenheit (-1 degree Celsius).
   6. PCS conduit bodies and fittings:
      a. Malleable iron.
      b. The conduit body, before PVC coating, shall be new, unused material and shall conform to appropriate UL standards.
      c. The PVC coating on the outside of conduit bodies shall be 0.040-inch thick and have a series of ribs to protect the coating from tool damage during installation.
      d. 0.002-inch interior urethane coating.
      e. Utilize the PVC coating as an integral part of the gasket design.
      f. Stainless steel cover screw heads shall be encapsulated with plastic to ensure corrosion protection.
      g. A PVC sleeve extending 1 conduit diameter or 2 inches, whichever is less, shall be formed at each female conduit opening.
         1) The inside diameter of the sleeve shall be the same as the outside diameter of the conduit to be used.
         2) The sleeve shall provide a vapor- and moisture resistant seal at every connection.
         3) Fittings shall be Form 8 and supplied with plastic encapsulated stainless steel cover screws. Fittings shall be UL Type 4X. Fittings shall be from the same manufacturer as the conduit in order to maintain system continuity and warranty.

C. SLT:
1. Temperature rated for use in the ambient temperature at the installed location but not less than the following:
a. General purpose:
1) Temperature range: -20 degrees Celsius to +80 degrees Celsius.
b. Oil-resistant:
1) Temperature range: -20 degrees Celsius to +60 degrees Celsius.
2. Sunlight-resistant, weatherproof, and watertight.
3. Manufactured from single strip steel, hot-dip galvanized on all 4 sides before conduit fabrication.
4. Strip steel spiral wound resulting in an interior that is smooth and clean for easy wire pulling.
5. Overall PVC jacket.
6. With integral copper ground wire, built in the core, in conduit trade sizes 1/2 inch through 1-1/4 inch.

D. PVC:
1. Extruded from virgin PVC compound:
a. Schedule 40 unless otherwise specified.
b. Schedule 80 extra-heavy wall where specified.
2. Rated for 90 degrees Celsius conductors or cable.
3. Rated for use in direct sunlight.

E. Conduit bodies:
1. Material consistent with conduit type:
a. Malleable iron bodies and covers when used with Type GRC.
b. PVC bodies and covers when used with Type PVC.
c. PVC-coated malleable iron bodies and covers when used with Type PCS.
2. Conduit bodies to conform to Form 8, Mark 9, or Mogul design:
a. Mogul design conforming to NEC requirements for bending space for large conductors for conduit trade sizes of 1 inch and larger with conductors No. 4 AWG and larger, or where required for wire-bending space.
3. Gasketed covers attached to bodies with stainless steel screws secured to threaded holes in conduit body.

2.08 ACCESSORIES

A. Connectors and fittings:
1. Manufactured with compatible materials to the corresponding conduit.

B. Insulated throat metallic bushings:
1. Construction:
a. Malleable iron or zinc-plated steel when used with steel conduit.
b. Positive metallic conduit end stop.
c. Integrally molded non-combustible phenolic-insulated surfaces rated at 150 degrees Celsius.
d. Use fully insulated bushings on nonmetallic conduit system made of high-impact 150 degrees Celsius rated non-combustible thermosetting phenolic.

C. Insulated grounding bushings:
   1. Construction:
      a. Malleable iron or steel, zinc-plated, with a positive metallic end stop.
      b. Integrally molded non-combustible phenolic-insulated surfaces rated at 150 degrees Celsius.
      c. Tin-plated copper grounding saddle for use with copper or aluminum conductors.

D. Electrical unions (Erickson Couplings):
   1. Construction:
      a. Malleable iron for use with steel conduit.
      b. PVC-coated malleable iron for use with PCS conduit.
      c. Concrete tight, 3-piece construction.
      d. Rated for Class I Division 1 Group D in hazardous areas.

E. SLT fittings:
   1. Construction:
      a. Malleable iron.
      b. Furnished with locknut and sealing ring.
      c. Liquidtight, raintight, oiltight.
      d. Insulated throat.
      e. Furnish as straight, 45-degree elbows, and 90-degree elbows.
      f. Designed to prevent sleeving:
         1) Verify complete bonding of the raceway jacket to the plastic gasket seal.
      g. Equipped with grounding device to provide ground continuity irrespective of raceway core construction. Grounding device, if inserted into raceway and directly in contact with conductors, shall have rolled-over edges for sizes under 5 inches.
      h. Where terminated into a threadless opening using a threaded hub fitting, a suitable moisture-resistant/oil-resistant synthetic rubber gasket shall be provided between the outside of the box or enclosure and the fitting shoulder. Gasket shall be adequately protected by and permanently bonded to a metallic retainer.
   2. Corrosion-resistant and outdoor SLT fittings:
      a. Construction:
         1) PVC-coated liquidtight fittings with a bonded 0.040-inch-thick PVC coating on the metal connector to form a seal around the SLT conduit.
         2) Insulated throat and an integral sealing ring.

F. Hubs for threaded attachment of steel conduit to sheet metal enclosures:
   1. Construction:
      a. Insulated throat.
      b. PVC-coated when used in corrosive areas.
      c. Bonding locknut.
      d. Recessed neoprene O-ring to ensure watertight and dusttight connector.
      e. 1/2-inch through 1-1/4-inch steel zinc electroplated.
      f. 1-1/2-inch through 6-inch malleable iron zinc plated.

2. Usage:
    a. All conduits in damp, wet, outdoor, and corrosive areas shall use threaded hubs for connections to sheet metal enclosures.

G. Sealing fittings:
1. Construction:
    a. 40-percent wire fill capacity.
    b. PVC-coated when used in corrosive areas.
    c. PVC Coated Hazardous (Classified) Location fittings must be UL 1203 listed after the coating is applied and have a red metal tag attached to the fitting to signify compliance.
    d. Malleable ductile iron with steel conduit.
    e. Aluminum with aluminum conduit.
    f. Type EYDX where drains are required.
    g. Type EYSX where drains are not required.
    h. UL 1203 listed for use in Class I, Division 1, Groups A, B, C, D; Class I, Division 2, Groups A, B, C, D; and Class II, Divisions 1 and 2, Groups E, F, and G.
2. Sealing compound:
    a. Fiber filler and cement as recommended by the sealing fitting manufacturer.
    b. Approved for the conditions and use.
        1) Not affected by surrounding atmosphere or liquids.
    c. Melting point shall be 200 degrees Fahrenheit minimum.

H. PVC fittings:
1. Materials:
    a. All devices shall be made of PVC, using the same materials as used for Type PVC conduit.
    b. All metal hardware shall be stainless steel.

I. Through wall and floor seals:
1. Materials:
    a. Body: Casting of malleable or ductile iron with a hot-dip galvanized finish.
    a. Grommet: Neoprene.
    b. Pressure rings: PVC-coated steel.
    c. Disc material: PVC-coated steel.

J. Expansion/deflection couplings:
1. Use to compensate for movement in any directions between 2 conduit ends where they connect.
2. Shall allow movement of 3/4 inch from the normal in all directions.
3. Shall allow angular movement for a deflection of 30 degrees from normal in any direction.
4. Constructed to maintain electrical continuity of the conduit system.
5. Materials:
    a. End couplings: Bronze or galvanized ductile iron.
    b. Sleeve: Neoprene.
    c. Bands: Stainless steel.
    d. Bonding jumper: Tinned copper braid.

K. Expansion couplings:
    1. Shall allow for expansion and contraction of conduit:
        a. Permitting 8-inch movement, 4 inches in either direction.
    2. Constructed to maintain electrical continuity of the conduit system.
    3. Materials:
        a. Head: Malleable or ductile iron.
        b. Sleeve: Steel.
        c. Insulating bushing: Phenolic.
        d. Finish: Hot-dip galvanized.
        e. PVC-coated steel when used with Type PCS.

L. Conduit markers:
    1. As specified in Section 16075 - Identification for Electrical Systems.

2.09 MIXES (NOT USED)

2.10 FABRICATION (NOT USED)

2.11 FINISHES (NOT USED)

2.12 SOURCE QUALITY CONTROL (NOT USED)

PART 3 EXECUTION

3.01 EXAMINATION (NOT USED)

3.02 PREPARATION (NOT USED)

3.03 INSTALLATION

A. General:
    1. Conduit routing:
        a. The electrical drawings are diagrammatic in nature:
            1) Install conduit runs as specified with schematic representation indicated on the Drawings and as specified.
            2) Modify conduit runs to suit field conditions, as accepted by the Engineer:
                a) Make changes in conduit locations that are consistent with the design intent but are dimensionally different, or routing to bypass obstructions.
                b) Make changes in conduit routing due to the relocation of equipment.
                c) Install conduits and equipment in such a manner as to avoid obstructions and to preserve headroom and keep openings and passageways clear.
            3) Where the Drawings do not indicate the exact mounting and/or supporting method to be used, use materials and methods similar to the mounting details indicated on the Drawings.

4) The electrical drawings do not indicate all required junction boxes and pull boxes:
a) Provide junction boxes and pull boxes to facilitate wire pulling as required:
(1) To meet cable manufacturer's pulling tension requirements.
(2) To limit total conduit bends between pull locations.
b) Install junction boxes and pull boxes at locations acceptable to the Engineer.

b. The Contractor is responsible for any deviations in general location, conduit size, routing, or changes to the conduit schedule without the express written approval or direction by the Engineer:
1) The Engineer is the sole source in determining whether the change is constituted as a deviation:
2) Perform any changes resulting in additional conduits, or extra work from such deviations.
3) Incorporate any deviations on the Record Documents.

2. Use only tools recommended by the conduit manufacturer for assembling the conduit system.
3. Provide adequate clearances from high-temperature surfaces for all conduit runs. Provide minimum clearances as follows:
a. Clearance of 6 inches from surfaces 113 degrees Fahrenheit to 149 degrees Fahrenheit.
b. Clearance of 12 inches from surfaces greater than 149 degrees Fahrenheit.
c. Keep conduits at least 6 inches from the coverings on hot water and steam pipes, 18 inches from the coverings on flues and breechings, and 12 inches from fuel lines and gas lines.
d. Where it is necessary to route conduits close to high-temperature surfaces, provide a high-reflectance thermal barrier between the conduit and the surface.
4. Support conduit runs on water-bearing walls a minimum of 7/8-inch away from wall on an accepted preformed channel:
a. Do not run conduits within water-bearing walls unless otherwise indicated on the Drawings.
5. Do not install 1-inch or larger conduits in or through structural members unless approved by the Engineer.
6. Run conduits exposed to view parallel with or at right angles to structural members, walls, or lines of the building:
a. Install straight and true conduit runs with uniform and symmetrical elbows, offsets, and bends.
b. Make changes in direction with long radius bends or with conduit bodies.
7. Install conduits with total conduit bends between pull locations less than or equal to 270 degrees.
8. Route all exposed conduits to preserve headroom, access space and workspace, and to prevent tripping hazards and clearance problems:
a. Install conduit runs so that runs do not interfere with proper and safe operation of equipment and do not block or interfere with ingress or egress, including equipment-removal hatches.
b. Route conduits to avoid drains or other gravity lines. Where conflicts occur, relocate the conduit as required.

9. Conduits may be run in concrete members or slabs with permission of the Engineer or as indicated on the Drawings:
    a. Refer to the typical details for conduit spacing and size requirements.
10. When installing conduits through existing slabs or walls, make provisions for locating any possible conflicting items where the conduit is to penetrate. Use tone signal or X-ray methods to make certain that no penetrations will be made into the existing conduits, piping, cables, post-tensioning cables, etc.
11. Plug conduits brought into pull boxes, manholes, handholes, and other openings until used to prevent entrance of moisture.
12. Install conduits through wall and floor seals where indicated on the Drawings.
13. For existing and new 2-inch and larger conduit runs, snake conduits with a conduit cleaner equipped with a cylindrical mandrel of a diameter not less than 85 percent of nominal diameter of the conduit:
    a. Remove and replace conduits through which mandrel will not pass.
14. Provide all sleeves and openings required for the passage of electrical raceways or cables even when these openings or sleeves are not specifically indicated on the Drawings.
15. Install complete conduit systems before conductors are installed.
16. Provide metallic conduits terminating in transformer, switchgear, motor control center, or other equipment conduit windows with grounding bushings and ground with a minimum No. 6 AWG ground wire.
17. Underground conduits:
    a. Install underground conduits, including conduit runs below slabs-on-grade in concrete-reinforced duct bank construction:
        1) As specified in Section 16133 - Duct Banks.
    b. Make underground conduit size transitions at handholes and manholes.
    c. Install spare conduits in underground duct banks towards top center of runs to allow for ease of installation of future cables as conduits enter underground manholes and handholes.
    d. Seal around conduit penetrations of below grade walls with a mechanical seal.
18. Underground conduit trenching:
    a. Perform trenching as specified in Section 02318 - Trenching.
    b. Trench must be uniformly graded with the bottom, rock free and covered with select material.
    c. Damage occurring to existing ducts, conduits, cables, and other utilities during underground conduit installation shall be remediated to the satisfaction of the Owner.
    d. Whenever possible, use the walls of the trench as forms for concrete encasement:
        1) Forms are required where the soil is not self-supporting.

B. Equipment grounding conductors:
    1. Provide a separate, green insulated, grounding conductor in each raceway independent of raceway material:
        a. Multi-conductor power and control cables shall include an integral green insulated grounding conductor.
        b. Provide a separate grounding conductor in each individual raceway for parallel feeders.

2. Conductors shall be the same type and insulation as the circuit conductors:
   a. Use 600-volt insulation for the equipment grounding conductors for medium voltage systems.
3. Minimum size in accordance with the NEC.

C. Lighting and receptacle conduits:
1. Provide conduit runs for lighting and receptacle circuits, whether or not indicated on the Drawings:
2. Install conduits in accordance with the requirements of this Section unless otherwise indicated.
3. Minimum conduit size:
   a. 3/4-inch for exposed conduits.
   b. 1-inch for underground or in-slab conduits.
4. Provide conduit materials for the installed location as specified in Section 16050 - Common Work Results for Electrical.

D. Conduit usage:
1. Exposed conduits:
   a. Rigid conduit:
      1) Install the rigid conduit type for each location as specified in Section 16050 - Common Work Results for Electrical.
      2) Minimum size: 3/4-inch.
   b. Flexible conduit:
      1) Use flexible conduit for final connections between rigid conduit and motors, vibrating equipment, instruments, control equipment, or where required for equipment servicing:
         a) Use Type SLT with rigid metallic conduit.
      2) Minimum size: 3/4-inch:
         a) 1/2 when required for connection to instruments.
      3) Maximum length:
         a) Fixed equipment:

Conduit Trade Size	Flexible Conduit Length (inch)
3/4	18
1	18
1-1/4	18
1-1/2	18
2	36
2-1/2	36
3	36
3-1/2	38
4	40

         b) Removable instruments or hinged equipment:
            (1) As required to allow complete removal or full movement without disconnecting or stressing the conduit.

2. Concrete-encased and embedded conduits:
    a. Straight runs and bends less than 45 degrees:
        1) Type PVC Schedule 40.
    b. Bends with total deflection greater than 45 degrees:
        1) PCS.
    c. Entering and exiting duct bank, underground or embedded conduit runs a minimum 12 inches above and below grade, finished floor, or entering equipment:
        1) PCS.
    d. Minimum size:
        1) 2-inch in duct banks.
        2) 1-inch for in-slab conduits.
        3) Provide conduit fittings to enlarge the conduit from the exposed size in the conduit schedule as required.
3. Direct-buried and sand-bedded duct bank conduits:
    a. Type PCS.
    b. Minimum size: 1-inch.
4. Below-slab conduits:
    a. Type PCS.
    b. Minimum size: 1-inch.
5. PVC-coated rigid metallic conduit:
    a. Use specifically manufactured or machined threading dies to manufacturer's specifications to accommodate the PVC jacket.
    b. Repair damage to PVC coatings with manufacturer supplied touchup compound or PVC Coating Repair Kit for PVC Coated Raceway Systems.
6. GRC:
    a. Conduit shall be cut square and reamed before threading.

E. Conduit joints and bends:
1. General:
    a. Where conduit is underground, under slabs on grade, exposed to the weather, or in NEMA Type 4 or NEMA Type 4X locations, make joints liquidtight.
    b. Keep bends and offsets in conduit runs to an absolute minimum.
    c. All bends shall be symmetrical.
    d. The following conduit systems shall use large-radius sweep elbows:
        1) Underground conduits.
    e. Provide large-radius factory-made bends for 1-1/4-inch trade size or larger.
    f. Make field bends with a radius of not less than the requirements found in the NEC:
        1) The minimum bending radius of the cable must be less than the radius of the conduit bend.
        2) Make all field bends with power bending equipment or manual benders specifically intended for the purpose:
            a) Make bends so that the conduit is not damaged and the internal diameter is not effectively reduced.
            b) For the serving utilities, make bends to meet their requirements.
    g. Replace all deformed, flattened, or kinked conduit.

2. Threaded conduit:
    a. Cut threads on rigid metallic conduit with a standard conduit-cutting die that provides a 3/4-inch per foot taper and to a length such that all bare metal exposed by the threading operation is completely covered by the couplings or fittings used. In addition, cut the lengths of the thread such that all joints become secure and wrench-tight just preceding the point where the conduit ends would butt together in couplings or where conduit ends would butt into the ends or shoulders of other fittings.
    b. Thoroughly ream conduit after threads have been cut to remove burrs.
    c. Use bushings or conduit fittings at conduit terminations.
    d. On exposed conduits, repair scratches and other defects with galvanizing repair stick, Enterprise Galvanizing “Galvabar™,” or CRC “Zinc It.”
    e. Coat conduit threads with an approved electrically conductive sealant and corrosion inhibitor that is not harmful to the conductor insulation:
        1) Apply to the male threads and tighten joints securely.
        2) Clean excess sealant from exposed threads after assembly.
    f. Securely tighten all threaded connections.
    g. Any exposed threaded surfaces must be cleaned and coated with a galvanizing solution so that all exposed surfaces have a galvanized protective coating.
3. PVC:
    a. Use approved solvent-weld cement specifically manufactured for the purpose. Spray-type cement is not allowed.
    b. Apply heat for bends so that conduit does not distort or discolor. Use a spring mandrel as required to ensure full inside diameter at all bends:
        1) Utilize a heater specifically for PVC conduit as recommended by the conduit manufacturer.

F. Conduit sealing and drainage:
1. Conduit drainage and sealing other than required for hazardous and classified areas:
    a. Provide sealing and drainage in vertical drops of long (in excess of 20 feet), exterior, above-grade conduit runs at the points at which the conduit enters buildings, switchgear, control panels, lighting panelboards, and other similar enclosures.
    b. Provide seal fittings with drains in vertical drops directly above grade for exterior and above-grade conduit runs that are extended below grade.
    c. Provide conduit seals with drains in areas of high humidity and rapidly changing temperatures:
        1) Where portions of an interior raceway pass through walls, ceilings, or floors that separate adjacent areas having widely different temperatures.
    d. Provide conduit seals similar to O-Z/Gedney (Type CSM) on all conduits between corrosive and non-corrosive areas.
    e. Seal one end only of all underground conduits at highest point with O-Z/Gedney sealing (non-hazardous) filling, or equal.
2. Install seals with drains at any location along conduit runs where moisture may condense or accumulate. This requirement includes, but is not limited to, the following locations: control panels, junction boxes, pullboxes, or low points of the conduit.

G. Conduit supports:
   1. General:
      a. Provide appropriate hangers, supports, fasteners, and seismic restraints to suit applications:
         1) As specified in Section 16070 - Hangers and Supports.
         2) Provide support materials consistent with the type of conduit being installed as specified in Section 16050 - Common Work Results for Electrical.
      b. Support conduit at the intervals required by the NEC.
      c. Perforated strap and plumbers' tape are not acceptable for conduit supports.
   2. Conduit on concrete or masonry:
      a. Use 1-hole malleable iron straps with metallic or plastic expansion anchors and screws or support from preset inserts.
      b. Use preset inserts in concrete when possible.
      c. Use pipe spacers (clamp backs) in wet locations.
   3. Suspended conduit:
      a. Use malleable-iron factory-made split-hinged pipe rings with threaded suspension rods sized for the weight to be carried (minimum 3/8-inch diameter), Kindorf, or equal.
      b. For grouped conduits, construct racks with threaded rods and tiered angle iron or preformed channel cross members. Clamp each conduit individually to a cross member. Where rods are more than 2-feet long, provide rigid sway bracing.
   4. Supports at structural steel members:
      a. Use beam clamps.
      b. Drilling or welding may be used only as specified or with approval of the Engineer.
   5. PVC-coated rigid metal systems:
      a. Provide right-angle beam clamps and "U" bolts specially formed and sized to snugly fit the outside diameter of the coated conduit. Provide "U" bolts with PVC-encapsulated nuts that cover the exposed portions of the threads.
      b. Securely fasten exposed conduits with Type 316 stainless steel clamps or straps.

H. Expansion or expansion/deflection fittings:
   1. General:
      a. Align expansion coupling with the conduit run to prevent binding.
      b. Follow manufacturer's instructions to set the piston opening.
      c. Install expansion fittings across concrete expansion joints and at other locations where necessary to compensate for thermal or mechanical expansion and contraction.
      d. Furnish fittings of the same material as the conduit system.
   2. For metallic conduit, provide expansion or expansion/deflection couplings, as appropriate, where:
      a. Install expansion fittings a minimum of every 200 feet in straight conduit runs.

I. Empty conduits:
   1. Provide a pull tape in each empty conduit more than 10 feet in length.
   2. Seal ends of all conduits with approved, manufactured conduit seals, caps, or plugs immediately after installation:
      a. Keep ends sealed until immediately before pulling conductors.

J. Miscellaneous:
   1. Seal roof penetrations for raceways and other items that penetrate the roof in accordance with roofing manufacturer's instructions and as indicated on the Drawings.
   2. Provide electrical unions at all points of union between ends of rigid conduit systems that cannot otherwise be coupled:
      a. Running threads and threadless couplings are not allowed.
   3. Replace any conduits installed that the Engineer determines do not meet the requirements of this Specification.
   4. Provide conduit housekeeping curb around all embedded or below-grade conduits exiting or entering the slab, per the Typical Details.

3.04 ERECTION, INSTALLATION, APPLICATIONS, CONSTRUCTION (NOT USED)

3.05 REPAIR/RESTORATION (NOT USED)

3.06 RE-INSTALLATION (NOT USED)

3.07 COMMISSIONING

A. As specified in Section 01756 - Commissioning.

3.08 FIELD QUALITY CONTROL (NOT USED)

3.09 ADJUSTING (NOT USED)

3.10 CLEANING (NOT USED)

3.11 PROTECTION (NOT USED)

3.12 SCHEDULES (NOT USED)

END OF SECTION

SECTION 16133

DUCT BANKS

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Electrical underground duct banks.
   2. Duct bank installation requirements.

1.02 REFERENCES

A. As specified in Section 16050 - Common Work Results for Electrical.

1.03 DEFINITIONS

A. As specified in Section 16050 - Common Work Results for Electrical.

1.04 SYSTEM DESCRIPTION

A. Provide location and protection of existing underground utilities, duct bank, trenching, forming, rebar, spacers, conduit, concrete, backfill, and compaction necessary for the complete installation of the duct banks.

B. Provide reinforced concrete duct banks for all conduits installed below grade, on the site, below structures, or in contact with the earth, unless otherwise indicated on the Drawings.

1.05 SUBMITTALS

A. Furnish submittals as specified in Section 01330 - Submittal Procedures.

B. Product data:
   1. PVC conduit spacers.
   2. Detectable underground marking tape.
   3. Pull line.

C. Shop drawings:
   1. Submit site plan drawings of duct banks including underground profiles indicating all underground utilities.
   2. Submit cross section of each duct bank with dimensions.
   3. For duct bank routings crossing under building footers or foundations alternative to designed routings indicated on the Drawings:
      a. Submit shop drawings detailing the new building footer crossing locations and plan drawings labeling all equipment to be installed on top of the new routing for approval by the project Structural Engineer.

1.06 QUALITY ASSURANCE (NOT USED)

1.07 DELIVERY, STORAGE, AND HANDLING (NOT USED)

1.08 PROJECT OR SITE CONDITIONS

A. As specified in Section 01850 - Design Criteria.

B. Duct bank sections indicated on the Drawings are an initial arrangement and may need to be modified due to existing site conditions, existing underground utilities, and infrastructure.
   1. Reorganize duct bank section with approval of Engineer.

1.09 SEQUENCING

A. Duct bank construction has a prerequisite of fulfilling all aspects of Section 02280 - Subsurface Utility Engineering.

B. Before performing any excavation, the following prerequisites must be met for each duct bank routing:
   1. Review of existing civil record drawings for recorded underground utilities.
   2. Existing underground utility horizontal and vertical location by minimum 2 of the following methods:
      a. Ground-penetrating radar.
      b. Soft excavation.
      c. Local utility location service, CALL BEFORE YOU DIG or equal.
   3. Protection of any discovered existing underground utility shall remain intact until the nearby duct bank installation is complete.

C. Make changes required to accommodate duct bank configuration and routing changes due to field conditions.
   1. Where changes in a duct bank configuration extend to a manhole or handhole, coordinate manhole/handhole blockouts and size with the new configuration.

1.10 SCHEDULING

A. Schedule a coordination meeting to adjust duct bank configurations and routing for each duct bank section after trenching and exposure of any underground utilities within the vicinity of the duct bank route. The meeting shall determine the final configuration of the duct bank before installation.

1.11 WARRANTY

A. As specified in Section 01783 - Warranties and Bonds.

1.12 SYSTEM START-UP (NOT USED)

1.13 OWNER'S INSTRUCTIONS (NOT USED)

1.14 MAINTENANCE (NOT USED)

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Conduit spacers:
   1. One of the following or equal:
      a. Carlon Snap-Loc.
      b. Cantex.
      c. Osburn Associates, Inc.

B. Detectable underground marking tape:
   1. One of the following or equal:
      a. Blackburn Manufacturing Co.
      b. Pro-Line Safety Products.
      c. Panduit.

C. Pull line:
   1. One of the following or equal:
      a. Arnco.
      b. Greenlee.
      c. Osburn Associates, Inc.

D. Duct seal:
   1. The following or equal:
      a. O-Z/Gedney type DUX.

2.02 EXISTING PRODUCTS (NOT USED)

2.03 MATERIALS

A. Provide conduit as specified in Section 16130 - Conduits.

B. Provide reinforcing steel as specified in Section 03200 - Concrete Reinforcing:
   1. Provide minimum Number 4 reinforcing steel.

2.04 MANUFACTURED UNITS

A. Conduit spacers:
   1. Provide conduit spacers recommended by the conduit manufacturer or specified above.
   2. Saddle type.
   3. Non-metallic, non-corrosive, non-conductive.
   4. Interlocking type:
      a. Vertical interlocking.
      b. Horizontal interlocking.
   5. Suitable for concrete encasement.

6. Molded-in rebar holder.
7. Accommodates 2-inch through 6-inch conduit sizes.
8. Relieves the conduit from both horizontal and vertical stresses.

B. Pull line:
1. Minimum 1/4-inch wide, flat design.
2. Polyester.
3. Minimum pulling strength 1,200 pounds.

C. Detectable marking tape:
1. Provide a detectable tape, locatable by a cable or metal detector from above the undisturbed grade.
2. Aluminum core laminated between polyethylene film.
3. 6-inch-wide red tape imprinted with black lettering stating "CAUTION - BURIED ELECTRIC LINE BELOW" or equivalent.

D. Duct seal:
1. Non-hardening sealing compound.
2. Flexible, can be applied by hand.
3. UL Listed for use with installed conductors.

2.05 EQUIPMENT (NOT USED)

2.06 COMPONENTS (NOT USED)

2.07 ACCESSORIES (NOT USED)

2.08 MIXES

A. Concrete mix requirements as specified in Section 03300 - Cast-in-Place Concrete.

B. Provide a red-oxide conduit encasement coloring agent as specified in Section 03300 - Cast-in-Place Concrete.

2.09 FABRICATION (NOT USED)

2.10 FINISHES (NOT USED)

2.11 SOURCE QUALITY CONTROL (NOT USED)

PART 3 EXECUTION

3.01 EXAMINATION (NOT USED)

3.02 PREPARATION (NOT USED)

3.03 INSTALLATION

A. Duct banks:
1. Install duct banks encased in concrete at least 24 inches below finish grade, unless otherwise indicated on the Drawings.

2. Damage minimization:
    a. Conduit should not be left exposed in an open trench longer than is necessary.
    b. Protect all underground duct banks against damage during pouring of concrete or backfilling.
3. All plastic conduit fittings to be joined should be exposed to the same temperature conditions for a reasonable length of time before assembly.
4. Provide No. 4/0 American Wire Gauge bare copper ground wire the entire length of duct bank and bond to the grounding system at each end of the duct bank and every 20 feet to steel reinforcing bar.
5. Install underground ducts to be self-draining:
    a. Slope duct banks away from buildings to manholes, handholes, or pullboxes.
    b. Slope duct banks uniformly from manholes, handholes, or pullboxes to manholes, handholes, or pullboxes or both ways from high points between manholes, handholes, or pullboxes.
    c. Slope a minimum of 1/4 inch per 10 feet.
6. Where new duct banks join to existing manholes, handholes, or pullboxes, make the proper fittings and fabricate the concrete envelopes to ensure smooth durable transitions, as indicated on the Drawings.
7. Install pull line in spare conduits:
    a. Provide adequate pull line at both ends of conduits to facilitate conductor pulling.
    b. Cap above ground spare conduit risers at each end with screw-on conduit caps.

B. Trenching:
1. Perform trenching as specified in Section 02318 - Trenching.
2. Trench must be uniformly graded with the bottom, rock free and covered with select material.
3. Whenever possible, use the walls of the trench as forms for concrete encasement:
    a. Forms are required where the soil is not self-supporting.
4. Damage occurring to existing ducts, conduits, cables, and other utilities during duct bank installation shall be remediated to the satisfaction of the Owner.

C. Duct spacing:
1. Separate conduits with manufactured plastic spacers using a minimum space between the outside surfaces of adjacent conduits of 2 inches, unless otherwise indicated on the Drawings:
    a. Separate medium voltage ducts a minimum of 7.5 inches on center.
2. Install spacers to maintain uniform spacing of duct assembly a minimum of 4 inches above the bottom of the trench during concrete pour. Install spacers on 8-foot maximum intervals:
    a. Due to some distortion of conduit from heat, and other means, it may be necessary to install extra spacers within the duct bank:
        1) Install the intermediate set of spacers within normal required spacing to maintain the proper horizontal clearance:
            a) Clearance is required to allow the proper amount of concrete to infiltrate vertically among the duct to ensure proper protection.

3. Spacers shall not be located at the center of a bend:
    a. Locate spacer in the tangent, free of the coupling on fabricated bends.
    b. Locate spacers midway between the tangent and the center bend on trench formed sweeps.

D. Terminating:
1. Use bell ends in duct at entrances into cable vaults.
2. Make conduit entrances into cable vaults tangential to walls of cable vault.
3. Form trapezoidal transitions between duct bank and cable vaults as needed in order to ensure adequate cable bending radius for the duct bank-to-vault transition.
4. Install duct seal in all conduits including spare conduits, at both ends, entrance to manholes/handholes, and building/equipment stub-ups. Form by hand to conduit and around cables to develop moisture barrier.
5. New manhole or handhole applications, provide a single opening or "window" per duct bank, sized to accommodate the duct bank envelope.

E. Concrete:
1. Install concrete as specified in Section 03300 - Cast-in-Place Concrete.
2. Provide tie wires in accordance with Section 03200 - Concrete Reinforcing to prevent displacement of the conduits during pouring of concrete:
    a. Tie wire shall not act as a substitute for spacers.
3. Install minimum 3-inch cover around conduit and rebar.
4. Consolidation of encasement concrete around duct banks shall be by hand puddling. Mechanical vibrators are acceptable for use outside of the rebar cage.
5. Conduit is subject to temperature rise. As concrete cures, allow the free end to expand by pouring the concrete from the center of the run or from one tie in point.

F. Marking tape:
1. Install a detectable marking tape 12 inches above the duct bank the entire length of the duct bank.

G. For conduit installations beneath building slabs:
1. Duct banks shall be continued under building slabs to the final destination of the conduits.
    a. Construct separate duct banks as required.
    b. Concrete for encasement under building slabs need not be colored red.
    c. For duct banks crossing under building foundation, install the top of the duct bank a minimum of 6 inches below the footer.
    d. Where duct banks enter through building walls, foundation walls, stem walls, etc. make connections as indicated on the Drawings.
    e. Where duct banks terminate with conduit risers entering building walls, install an expansion/deflection fitting or a flat-wise elbow (elbow parallel to building wall) in order to accommodate differential movement between the conduits and structure.

H. Restore all surfaces to their original condition as specified in Section 02952 - Pavement Restoration and Rehabilitation, unless otherwise specified.

3.04 ERECTION, INSTALLATION, APPLICATION, CONSTRUCTION (NOT USED)

3.05 REPAIR/RESTORATION (NOT USED)

3.06 RE-INSTALLATION (NOT USED)

3.07 COMMISSIONING

A. As specified in Section 01756 - Commissioning.

3.08 FIELD QUALITY CONTROL (NOT USED)

3.09 ADJUSTING (NOT USED)

3.10 CLEANING

A. Clean conduits of dirt and debris by use of an appropriately sized steel mandrel no less than 1/2 inch smaller than the inside diameter of the conduit.

3.11 PROTECTION

A. Provide shoring and pumping to protect the excavation and safety of workers.

B. Protect excavations with barricades as required by applicable safety regulations.

3.12 SCHEDULES (NOT USED)

END OF SECTION

SECTION 16134

BOXES

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Device boxes.
   2. Raceway system boxes.

1.02 REFERENCES

A. As specified in Section 16050 - Common Work Results for Electrical.

B. American Association of State Highway and Transportation Officials (AASHTO):
   1. Standard Specifications for Highway Bridges.

C. ASTM International (ASTM):
   1. A47 - Standard Specification for Ferritic Malleable Iron Castings.
   2. D149 - Standard Test Method for Dielectric Breakdown Voltage and Dielectric Strength of Solid Electrical Insulating Materials at Commercial Power Frequencies.
   3. D495 - Standard Test Method for High-Voltage, Low-Current, Dry Arc Resistance of Solid Electrical Insulation.
   4. D570 - Standard Test Method for Water Absorption of Plastics.
   5. D648 - Standard Test Method for Deflection Temperature of Plastics Under Flexural Load in the Edgewise Position.
   6. D790 - Standard Test Methods for Flexural Properties of Unreinforced and Reinforced Plastics and Electrical Insulating Materials.
   7. D792 - Standard Test Methods for Density and Specific Gravity (Relative Density) of Plastics by Displacement.

D. Joint Industry Conference (JIC).

E. Underwriters Laboratories, Inc. (UL):
   1. 94 - Standard for Tests for Flammability of Plastic Materials for Parts in Devices and Appliances.

1.03 DEFINITIONS

A. As specified in Section 16050 - Common Work Results for Electrical.

B. Specific definitions:
   1. Arcing parts: Circuit breakers, motor controllers, switches, fuses, or any device intended to interrupt current during its operation.
   2. Raceway system boxes: Boxes that are used for wire and cable pullboxes, conduit junction boxes, or terminal boxes.

1.04 SYSTEM DESCRIPTION

A. Provide outlet boxes for wiring devices, junction, and pullboxes for use in the raceway systems, etc.

B. Provide boxes as indicated on the Drawings or as needed to complete the raceway installation.

1.05 SUBMITTALS

A. Furnish submittals as specified in Section 01330 - Submittal Procedures.

B. Product data:
   1. Manufacturer.
   2. Materials.
   3. Dimensions:
      a. Height.
      b. Width.
      c. Depth.
      d. Weight.
      e. NEMA rating.
   4. Conduit entry locations.
   5. Catalog cutsheets.
   6. Installation instructions.

C. Shop drawings:
   1. Include identification and sizes of pullboxes.

1.06 QUALITY ASSURANCE

A. Regulatory requirements:
   1. Outlet boxes shall comply with all applicable standards of:
      a. JIC.
      b. NEC.
      c. NEMA.
      d. UL.

1.07 DELIVERY, STORAGE, AND HANDLING (NOT USED)

1.08 PROJECT OR SITE CONDITIONS

A. As specified in Section 01850 - Design Criteria.

1.09 SEQUENCING (NOT USED)

1.10 SCHEDULING (NOT USED)

1.11 WARRANTY

A. As specified in Section 01783 - Warranties and Bonds.

1.12 SYSTEM START-UP (NOT USED)

1.13 OWNER'S INSTRUCTIONS (NOT USED)

1.14 MAINTENANCE (NOT USED)

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. One of the following or equal:
   1. Pressed steel boxes and concrete boxes:
      a. Steel City.
      b. Appleton.
      c. Crouse - Hinds.
      d. Thomas & Betts.
   2. Plastic and/or fiberglass boxes:
      a. Hoffman.
      b. Carlon.
      c. Stahlin.
   3. Cast device boxes:
      a. Appleton.
      b. Crouse - Hinds.
      c. OZ/Gedney.
   4. Formed steel enclosures:
      a. Hoffman.
      b. Thomas and Betts.
      c. Stahlin.
      d. Rittal.
   5. Stainless steel enclosures:
      a. Hoffman.
      b. Stahlin.
      c. Rittal.

2.02 EXISTING PRODUCTS (NOT USED)

2.03 MATERIALS (NOT USED)

2.04 MANUFACTURED UNITS

A. Pressed steel boxes:
   1. 1-piece galvanized pressed steel.
   2. Knockout type boxes.
   3. Minimum size 4-inch square by 2-1/8-inch deep.

B. Concrete boxes:
   1. For outlets and pullboxes in concrete construction.
   2. Pressed steel or cast construction, concrete tight.
   3. Knockout sizes range from 1/2 inch to 1 inch.

4. Depth as needed.
5. Types:
    a. Four-inch octagon.
    b. Four-inch octagon ceiling boxes with hanging bars.
    c. Gangable masonry boxes:
        1) 3-1/2-inch deep, 3-3/4-inch high, length as required:
            a) 2-1/2-inch deep boxes may be used where wall thickness precludes the use of the deeper boxes.
        2) With partitions as needed.

C. Cast device boxes:
1. Construction:
    a. With internal green ground screw.
    b. Furnished with a suitable gasketed cover.
    c. With integral cast mounting lugs when surface mounted.
    d. Conduit sizes range from 3/4 inch to 1 inch.
    e. Tapered threaded hubs with integral bushing.
2. Aluminum (copper free) boxes:
    a. High strength copper free 4/10 of 1 percent maximum alloy for use with aluminum rigid conduit.
3. Malleable iron boxes:
    a. Conforming to ASTM A47 Grade 32510.

D. Fiberglass boxes:
1. NEMA Type 4X.
2. Constructed of molded fiberglass reinforced polyester.
3. Integral neoprene gasket on cover attached with an oil-resistant adhesive.
4. Enclosures to have internal pads for mounting optional panels and terminal kits.
5. Covers:
    a. Screw cover enclosures:
        1) Covers held in place with captive, stainless steel, or Monel® screws.
        2) Covers attached to body with internal zinc-plated steel hinges.
    b. Quick release latches covers:
        1) Corrosion resistant fiberglass hinges.
        2) Spring loaded fiberglass latches with a Monel® or stainless steel bail attached with Monel® or stainless steel screws.
        3) With a Type 316 stainless steel padlock hasp.
6. With external mounting feet.
7. Meeting the following minimum standards and tests:

Physical Property	Value	ASTM Method
Flexural strength	12,000 psi	D790
Heat distortion	400° Fahrenheit	D648
Water absorption (24 hrs)	0.5 percent	D570
Tensile strength	5000 psi	D651
Specific gravity	1.8	D792
Flammability	94V-0	UL94
Dielectric strength	4000 V.P.M.	D149
Arc resistance	180 second	D495

E. Formed steel enclosures:
    1. Steel:
        a. NEMA Type 12.
        b. Fabricated from 14-gauge steel, minimum.
        c. All seams continuously welded ground smooth.
        d. Door:
            1) Rolled lip around 3 sides.
            2) Attached to enclosure by means of a continuous stainless steel hinge and pin.
        e. Neoprene door gasket to provide a watertight, dusttight, oiltight seal:
            1) Attached with an adhesive.
            2) Retained by a retaining strip.
        f. Fabricate all external removable hardware for clamping the door to the enclosure body from zinc-plated heavy gauge steel:
            1) With a hasp and staple for padlocking.
        g. Provide large enclosures with door and body stiffeners for extra rigidity.
        h. No holes or knockouts.
        i. Finish:
            1) ANSI-61 gray electrostatically applied polyester powder inside and out over cleaned and primed surfaces.
            2) White electrostatically applied polyester powder mounting plate.
        j. Heavy gauge steel external mounting brackets when surface mounted.
    2. Stainless steel:
        a. NEMA Type 4X:
            1) Boxes in locations subject to flooding or temporary submersion:
                a) NEMA Type 6.
        b. Fabricated from 14-gauge Type 316 stainless steel.
        c. All seams continuously welded.
        d. Door:
            1) Rolled lip around 3 sides.
            2) Attached to enclosure by means of a continuous stainless steel hinge and pin.
        e. Neoprene door gasket to provide a watertight seal:
            1) Attached with an adhesive.
            2) Retained by a retaining strip.
        f. Fabricate all external removable hardware for clamping the door to the enclosure body from heavy gauge stainless steel:
            1) With a hasp and staple for padlocking.
        g. Provide large enclosures with door and body stiffeners for extra rigidity.
        h. No holes or knockouts.
        i. Finish:
            1) Brushed.
        j. Stainless steel external mounting brackets when surface mounted.

F. Cast iron junction boxes:
    1. NEMA Type 4.
    2. Recessed cover boxes.
    3. Suitable for use outdoors where subject to rain, dripping, or splashing water.
    4. Designed for flush mounting in walls or floors:
        a. Can be surface mounted using mounting lugs.

5. Construction:
    a. Cast iron box.
    b. Covers:
        1) Checkered plate covers suitable for foot traffic.
        2) When used in areas subject to vehicular traffic, design to support an AASHTO Standard Specifications for Highway Bridges, H-20 vehicle loading.
    c. Hot dip galvanized.
    d. Neoprene gasket.
    e. Stainless steel screw covers.

2.05 EQUIPMENT (NOT USED)

2.06 COMPONENTS (NOT USED)

2.07 ACCESSORIES

A. Fasteners:
    1. Electroplated or stainless steel in boxes with wiring devices.
    2. Screws, nuts, bolts, and other threaded fasteners:
        a. Stainless steel.

B. Provide breather and drain fittings where appropriate.

C. Internal panels:
    1. Provide internal panels where required for mounting of terminal strips or other equipment.
    2. With plated steel shoulder studs.
    3. Steel with white polyester powder finish.

2.08 MIXES (NOT USED)

2.09 FABRICATION (NOT USED)

2.10 FINISHES (NOT USED)

2.11 SOURCE QUALITY CONTROL (NOT USED)

PART 3 EXECUTION

3.01 EXAMINATION (NOT USED)

3.02 PREPARATION (NOT USED)

3.03 INSTALLATION

A. General:
    1. Provide materials and construction suitable for environmental conditions at the location of the box as specified in Section 16050 - Common Work Results for Electrical.

2. Provide outlet box materials to match the conduit system:
    a. GRC - Cast ferrous boxes.
    b. PCS - PVC coated cast ferrous boxes.
    c. PVC - PVC boxes.
3. Solid type gang boxes:
    a. For more than 2 wiring devices.
    b. For barriered outlets.
4. Support all wall mounted NEMA Type 4 or NEMA Type 4X boxes to maintain a minimum of 7/8-inch free air space between the back of the enclosure and the wall:
    a. Use machined spacers to maintain air space; built-up washers are not acceptable.
    b. Use stainless steel or nylon materials for spacers.
5. Use cast malleable iron boxes when box must support other devices.
6. Boxes serving luminaires or wiring devices:
    a. Use as pullboxes wherever possible.
7. Fit all cast boxes and pressed steel boxes for flush mounting in concrete with cast, malleable box covers and gaskets.
8. In terminal boxes, furnish terminals as indicated on the Drawings, with a minimum of 50 percent spare terminals:
    a. Furnish wireways for discrete and analog/DC wiring.
    b. Separate analog wiring from 120 V discrete or power wiring.
9. Size boxes in accordance with NEC requirements and to provide sufficient room for the future components and cables indicated on the Drawings.
10. For fire-rated construction, provide materials and installation for use in accordance with the listing requirements of the classified construction.

B. Outlet boxes:
1. Locate outlet boxes as indicated on the Drawings:
    a. Adjust locations so as not to conflict with structural requirements or other trades.
2. Use deep threaded-hub stainless steel:
    a. I
    b. Where exposed to the weather.
    c. In unheated areas.
    d. Where subject to mechanical damage:
        1) Defined as exposed boxes less than 10 feet above the floor.
    e. To act as a pullbox for conductors in a conduit system.
    f. Accommodate wiring devices.
3. Use deep threaded-hub plastic coated malleable iron boxes in corrosive and NEMA Type 4X area and when the exposed conduit system is PVC coated steel.
4. Outlet boxes may be used as junction boxes wherever possible.

C. Pullboxes and junction boxes:
1. Size pullboxes in accordance with NEC requirements and to provide sufficient room for any future conduits and cables as indicated on the Drawings.
2. Install pullboxes such that access to them is not restricted.

D. For boxes not indicated:
   1. Provide types and mountings as required to suit the equipment and that will be consistent with the conduit system and environmental conditions as indicated in Section 16050 - Common Work Results for Electrical.
   2. Outlet, switch, and junction boxes for flush-mounting in general purpose locations:
      a. One-piece, galvanized, pressed steel.
   3. Outlet, switch, and junction boxes where surface mounted in exposed locations:
      a. Cast ferrous boxes with mounting lugs, zinc or cadmium plating finish.
   4. Outlet, control station, and junction boxes for installation in corrosive locations:
      a. Fiberglass reinforced polyester, stainless steel, or plastic-coated steel to match the conduit system.
      b. Furnished with mounting lugs.
   5. Fire rated construction: Use materials and methods to comply with the listing requirements for the classified construction.

3.04 ERECTION, INSTALLATION, APPLICATION, CONSTRUCTION (NOT USED)

3.05 REPAIR/RESTORATION (NOT USED)

3.06 REINSTALLATION (NOT USED)

3.07 COMMISSIONING

A. As specified in Section 01756 - Commissioning.

3.08 FIELD QUALITY CONTROL

A. As specified in Section 16050 - Common Work Results for Electrical.

3.09 ADJUSTING (NOT USED)

3.10 CLEANING

A. As specified in Section 16050 - Common Work Results for Electrical.

3.11 PROTECTION (NOT USED)

3.12 SCHEDULES (NOT USED)

SECTION 16140

WIRING DEVICES

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Switches.
   2. Receptacles.
   3. Plates.

1.02 REFERENCES

A. As specified in Section 16050 - Common Work Results for Electrical.

B. Federal Specifications (FS):
   1. W-C 596 - Connector, Electrical, Power, General Specification for.
   2. W-S 896/2 - Switches, Toggle (Toggle and Lock), Flush Mounted (General Specification).

C. National Electrical Manufacturers Association (NEMA):
   1. WD1 - General Color Requirements for Wiring Devices.
   2. ICS 5 - Industrial Control and Systems, Control Circuit and Pilot Devices.
   3. OS1 - Sheet-Steel Outlet Boxes, Device Boxes, Covers and Box Supports.
   4. WD6 - Wiring Devices Dimensional Specifications.

D. Underwriters Laboratories, Inc. (UL):
   1. 20 - General Use Snap Switches.
   2. 498 - Standard for Attachment Plugs and Receptacles.
   3. 514D - Cover Plates for Flush-Mounted Wiring Devices.
   4. 943 - Ground-Fault Circuit-Interrupters.

1.03 DEFINITIONS

A. As specified in Section 16050 - Common Work Results for Electrical.

B. Specific definitions:
   1. GFCI: Ground fault circuit interrupter.

1.04 SYSTEM DESCRIPTION

A. Switches, receptacles, and plates as indicated on the Drawings wired and operable to form a complete system.

1.05 SUBMITTALS

A. Furnish submittals as specified in Section 01330 - Submittal Procedures.

B. Product data:
   1. Catalog cutsheets.

C. Shop drawings:
   1. Engraving schedule:
      a. Furnish complete engraving schedule for engraved nameplates.

1.06 QUALITY ASSURANCE

A. Wiring devices shall be UL listed and labeled.

1.07 DELIVERY, STORAGE, AND HANDLING (NOT USED)

1.08 PROJECT OR SITE CONDITIONS

A. As specified in Section 01850 - Design Criteria.

1.09 SEQUENCING (NOT USED)

1.10 SCHEDULING (NOT USED)

1.11 WARRANTY

A. As specified in Section 01783 - Warranties and Bonds.

1.13 OWNER'S INSTRUCTIONS (NOT USED)

1.14 MAINTENANCE (NOT USED)

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Switches:
   1. One of the following or equal:
      a. Hubbell.
      b. Leviton.
      c. Cooper Wiring Devices.

B. Receptacles:
   1. General purpose receptacles:
      a. One of the following or equal:
         1) Hubbell.
         2) Leviton.
         3) Cooper Wiring Devices.

C. Plates:
1. General location:
a. One of the following or equal:
1) Legrand.
2) Cooper Wiring Devices.
2. Wet or corrosive areas:
a. One of the following or equal:
1) Hubbell.
2) Cooper Wiring Devices.
3) Thomas & Betts.
4) Pass and Seymour.
3. In-use covers:
a. One of the following or equal:
1) TayMac.
2) Cooper Wiring Devices.
3) Pass and Seymour.
4) Thomas & Betts.

2.02 EXISTING PRODUCTS (NOT USED)

2.03 MATERIALS (NOT USED)

2.04 MANUFACTURED UNITS

A. Switches:
1. General:
a. 120-277 VAC.
b. 20 ampere.
c. Listed in accordance with UL 20.
d. Designed and constructed in accordance with FS W-S-896/2.
e. Back and side wired unless otherwise indicated.
f. Integral grounding terminal.
g. Totally enclosed:
1) Color-coded body with color corresponding to ampere rating.
h. Provide switches with the operator style and contact arrangement as indicated on the Drawings and as required for proper operation.
i. Color:
1) Ivory in finished areas.
2) Brown in all other areas.
2. General purpose switches:
a. Toggle type.

B. Receptacles:
1. General purpose receptacles:
a. Single or duplex as indicated on the Drawings.
b. 125 VAC.
c. 20 ampere or as indicated on the Drawings.
d. NEMA Type 5-20R configuration for 20 ampere receptacles.
e. Other NEMA configurations as indicated on the Drawings.
f. Listed in accordance with UL 498.
g. Designed and constructed in accordance with FS W-C-596.

h. Back and side wired.
i. 1-piece, rivet-less mounting strap.
j. Color:
1) Ivory in finished areas.
2) Brown in all other areas.
3) Orange when powered by a UPS.

2. Ground fault interrupter receptacles (GFCI):
a. 125 VAC.
b. 20 ampere.
c. Trip level 4-6 milliamperes.
d. Individual and feed through protection.
e. UL 943 and UL 498 listed.
f. NEMA Type 5-20R configuration.
g. For damp or wet locations:
1) Weather resistant, in accordance with UL 498.

C. Plates:
1. General location:
a. Type 302 or 304 stainless steel.
b. Brushed satin finish.
c. Minimum thickness: 0.032 inches.
d. Rectangular or square shape.
e. Engraving:
1) Engrave each switch plate with the following:
a) Area served.
b) Panelboard and Circuit.
2) Engrave each receptacle plate with the following:
a) Panelboard and Circuit.
3) Treat engraving to improve visibility.
4) Characters shall be block letter pantograph engraved with a minimum character height of 1/8-inch.
f. Coordinate the number of gangs, number, and type of openings with the specific location.

2. Outdoor and wet areas requiring NEMA Type 4 or NEMA Type 4X enclosures:
a. General:
1) UL listed for wet locations.
2) Gasketed.
3) Die cast metal:
a) Match material to box material.
b. Switches:
1) Lever operated:
a) Provide toggle switch.
c. Receptacles:
1) Weatherproof in-use cover:
a) Die cast metal construction with electrostatic powder coating for corrosion resistance.
b) Gasketed.
c) Lockable.
d) UL listed and in accordance with NEC.

3. Corrosive areas:
    a. Neoprene.
    b. Gasketed.
    c. Weatherproof.

2.05 EQUIPMENT (NOT USED)

2.06 COMPONENTS (NOT USED)

2.07 ACCESSORIES (NOT USED)

2.08 MIXES (NOT USED)

2.09 FABRICATION (NOT USED)

2.10 FINISHES (NOT USED)

2.11 SOURCE QUALITY CONTROL (NOT USED)

PART 3 EXECUTION

3.01 EXAMINATION (NOT USED)

3.02 PREPARATION (NOT USED)

3.03 INSTALLATION

A. Mounting heights:
    1. Process and production areas:
        a. Switches and receptacles 48 inches from finished floor to top of plate.
    2. Offices and finished areas:
        a. Switches: 48 inches from finished floor to top of plate.
        b. Receptacles: 18 inches from finished floor to center of plate.

B. Switches:
    1. Over 300 Volts:
        a. Where switches used in systems of more than 300 volts between conductors, are to be ganged in outlet boxes, provide switches having no exposed live parts or use barriers between the individual switches.

C. Receptacles:
    1. Provide GFCI receptacles as indicated on the Drawings.
        a. Provide weather resistant GFCI receptacles in all wet or damp areas.
            1) As specified in Section 16050 - Common Work Results for Electrical.
    2. Mount non-weatherproof receptacles vertically:
        a. Ground slot down.

3. Mount weatherproof receptacles horizontally:
   a. Neutral slot up.
4. 3-phase receptacles shall be consistent with respect to phase connection at the receptacle terminals. Correct errors in phasing at the source and not the receptacle.

D. Ensure all plates make a firm seal with wall for recessed mounted devices:
   1. Outside edges of plates parallel with building lines.

3.04 ERECTION, INSTALLATION, APPLICATION, CONSTRUCTION (NOT USED)

3.05 REPAIR/RESTORATION (NOT USED)

3.06 REINSTALLATION (NOT USED)

SECTION 16150

LOW VOLTAGE WIRE CONNECTIONS

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Wire connecting devices.
   2. Terminations.
   3. Splices.
   4. Power Distribution Blocks

1.02 REFERENCES

A. As specified in Section 16050 - Common Work Results for Electrical.

B. ASTM International (ASTM):
   1. D3005 - Standard Specification for Low-Temperature Resistant Vinyl Chloride Plastic Pressure-Sensitive Electrical Insulating Tape.

C. CSA International (CSA):
   1. C22.2 - No. 197-M1983 (R2208) - PVC Insulating Tape.

D. Underwriters Laboratories, Inc. (UL):
   1. 510 - Standard for Polyvinyl Chloride, Polyethylene, and Rubber Insulating Tape.
   2. 1953 - Outline of Investigation for Power Distribution Blocks.

1.03 DEFINITIONS

A. As specified in Section 16050 - Common Work Results for Electrical.

1.04 SYSTEM DESCRIPTION

A. Provide a complete system of wiring connectors, terminators, fittings, etc. for a complete wiring system suitable for the cables and conductors used.

1.05 SUBMITTALS

A. Furnish submittals as specified in Section 01330 - Submittal Procedures.

B. Product data:
   1. Catalog cutsheets.
   2. Installation instructions.

1.06 QUALITY ASSURANCE

A. All materials shall be UL listed.

1.07 DELIVERY, STORAGE, AND HANDLING (NOT USED)

1.08 PROJECT OR SITE CONDITIONS

A. As specified in Section 01850 - Design Criteria.

1.09 SEQUENCING

A. Conduct the initial fault current study as specified in Section 16305 - Electrical System Studies and submit results for Engineer's review.

B. After successful review of the initial fault current study, submit complete equipment submittal.

1.10 SCHEDULING (NOT USED)

1.11 WARRANTY

A. As specified in Section 01783 - Warranties and Bonds.

1.12 SYSTEM START-UP (NOT USED)

1.13 OWNER'S INSTRUCTIONS (NOT USED)

1.14 MAINTENANCE (NOT USED)

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Manufacturers for each type of technology are specified with the equipment in this Section.

2.02 EXISTING PRODUCTS (NOT USED)

2.03 MATERIALS (NOT USED)

2.04 MANUFACTURED UNITS (NOT USED)

2.05 EQUIPMENT

A. Control connections:
   1. Use insulated ring type wire terminators for connections to all screw terminals:
      a. With chamfered/funneled terminal barrel entry.
      b. Deep internal serrations.
      c. Long barrel design to reduce electrical resistance and increased insulator-barrel surface area to ensure that the insulator remains in contact with the barrel.

d. Electroplated-tin copper conductor.
e. Manufacturers: The following or equal:
1) Thomas & Betts, Sta-Kon.

2. For process equipment connections work from manufacturer's drawings.

B. Joints, splices, taps, and connections:
1. 600-volt conductors:
a. Use solderless connectors.
b. Use only plated copper alloy connectors or lugs:
1) Aluminum connectors or lugs are not acceptable for copper conductors.
c. Under those specific conditions where aluminum conductors have been allowed or are specified then the connectors for aluminum conductors shall be specifically designed for that purpose.
d. For wire No. 10 AWG and smaller use compression splice caps, with insulating caps:
1) Manufacturers: The following or equal:
a) Buchanan, 2006S or 2011S, with 2007 or 2014 insulating caps.
e. For wire No. 8 AWG and larger, use heavy duty copper compression connectors:
1) Manufacturers: One of the following or equal:
a) Burndy.
b) Thomas & Betts.
f. Heat shrink tubing:
1) Suitable for indoors, outdoors, overhead, direct burial or submerged applications.
2) Minimum shrink ratio: 4 to 1.
3) Continuous operating temperature: -55 degrees Celsius to 110 degrees Celsius.
4) Internally applied adhesive sealant.
5) Cross-linked polyolefin:
a) Manufacturers: One of the following or equal:
(1) 3M, ITCSN.
(2) Thomas & Betts, Shrink-Kon.

2. Instrumentation class cable splices:
a. Suitable for indoor, outdoors, weather exposed, direct buried, or submersed applications.
b. Utilizing an epoxy, polyurethane, and re-enterable compounds.
c. For use with shielded or unshielded plastic- and rubber-jacketed, signal, control, and power cables rated up to 1 kilovolt.
d. Two-part mold body with tongue and groove seams and built in spacer webbing.
e. Manufacturers: The following or equal:
1) 3M, Scotchcast 72-N.

C. Insulating tape:
1. General purpose insulating tape:
a. Minimum 7 mil vinyl tape.
b. Suitable for application in an ambient of -18 degrees Celsius (0 degrees Fahrenheit).
c. Operating range up to 105 degrees Celsius (220 degrees Fahrenheit).

d. Flame retardant, hot- and cold- weather resistant, UV resistant.
e. For use as a primary insulation for wire cable splices up to 600 VAC.
f. Meeting and complying with:
1) ASTM D3005 Type I.
2) UL 510.
3) CSA C22.2.
g. Manufacturers: The following or equal:
1) 3M, Scotch Number Super 33+.

2. General-purpose color-coding tape:
a. Minimum 7 mil vinyl tape.
b. Suitable for application on PVC and polyethylene jacketed cables.
c. For use indoors and outdoors in weather protected enclosures.
d. Available with the following colors:
1) Red.
2) Yellow.
3) Blue.
4) Brown.
5) Gray.
6) White.
7) Green.
8) Orange.
9) Violet.
e. For use as phase identification, marking, insulating, and harnessing.
f. Meeting and complying with:
1) UL 510.
2) CSA C22.2.
g. Manufacturers: The following or equal:
1) 3M, Scotch Number 35.

D. Power distribution blocks:
1. UL 1953 listed.
2. Interrupting ratings: Not less than the system maximum available fault current at the point of application.
3. Provide fuses or circuit breakers in enclosure as required to meet the fault current requirements.
4. Voltage rating: 600 VAC.
5. IP 20 finger safe enclosure.
6. Tin-plated aluminum or copper terminals suitable for copper conductors.
7. Manufacturers: One of the following or equal:
a. Eaton CHDB series.
b. Rockwell Automation 1492 PD series
c. Square D by Schneider Electric.

2.11 SOURCE QUALITY CONTROL (NOT USED)

PART 3 EXECUTION

3.01 EXAMINATION (NOT USED)

3.02 PREPARATION (NOT USED)

3.03 INSTALLATION

A. Load connections:
   1. Connect loads to the circuits as indicated. Color-code all branch circuits as specified in Section 16123 - 600-Volt or Less Wires and Cables.

B. Zero to 600-volt systems:
   1. Make all connections with the proper tool and die as specified by the device manufacturer.
   2. Use only tooling and dies manufactured by the device manufacturer.
   3. Insulate all connections and splices with Scotch 33+ tape and Scotchfill, or pre-molded plastic covers, or heat shrink tubing and caps.
   4. Number all power and control wires before termination.

C. Motor connections (600 volts and below):
   1. Terminate all leads and wires with compression type ring lugs.
   2. Terminations on all motor leads, including leads that are connected together to accommodate the motor voltage, and the machine wires entering the motor terminal box from the power source, shall have ring type compression lugs.
   3. Cover bolted connectors with a heat shrinkable, cross-linked polyolefin material formed as a single opening boot:
      a. In damp and wet locations, use a complete kit containing mastic that shall seal out moisture and contamination.
      b. Shrink cap with low heat as recommended by manufacturer.
   4. Wire markers shall be readable after boot installation.
   5. Manufacturers: The following or equal:
      a. Raychem, MCK.

D. Power distribution terminal blocks:
   1. Connect circuit breakers on line side of power distribution terminal blocks as required to meet short circuit requirements.

3.04 ERECTION, INSTALLATION, APPLICATION, CONSTRUCTION (NOT USED)

3.05 REPAIR/RESTORATION (NOT USED)

3.06 RE-INSTALLATION (NOT USED)

3.07 COMMISSIONING

A. As specified in Section 01756 - Commissioning.

3.08 FIELD QUALITY CONTROL (NOT USED)

3.09 ADJUSTING (NOT USED)

3.10 CLEANING (NOT USED)

3.11 PROTECTION (NOT USED)

3.12 SCHEDULES (NOT USED)

END OF SECTION

SECTION 16210

UTILITY COORDINATION

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Coordination with the utility companies to provide service.
   2. Contractor's responsibilities for connecting to utilities and providing utility service to the facilities.
   3. Descriptions of utility services required.

B. Utility contacts:
   1. Electric utility:
      a. Name: Scott Bozzoli.
      b. Utility: City of Ukiah - Electric Utility.
      c. Address: 1350 Hastings Rd, Ukiah CA 95482.
      d. Phone number: 707-467-5775.
      e. Fax number: N/A.
      f. E-mail: sbozzoli@cityofukiah.com.

1.02 REFERENCES

A. Underwriters' Laboratories, Inc. (UL).

1.03 DELEGATED DESIGN (NOT USED)

1.04 SUBMITTALS

A. Furnish submittals as specified in Section 01330 - Submittal Procedures.

B. Certification:
   1. Submit certification that the intended installation has been coordinated with the utility companies.
   2. Include a narrative description of the utility's requirements and points of connection, names and telephone numbers for contacts at the utilities.

C. Additional Requirements:
   1. Submit the following after utility coordination and before construction for engineering review:
      a. 12 kV underground conduit routing.
      b. MV vault location and dimensions.

1.05 QUALITY ASSURANCE

A. Materials and equipment used in performance of Electrical Work shall be listed or labeled by UL, or other equivalent recognized independent testing laboratory, for the class of service intended.

1.06 DELIVERY, STORAGE, AND HANDLING (NOT USED)

1.07 PROJECT OR SITE CONDITIONS

A. As specified in Section 01850 - Design Criteria.

1.08 ADMINISTRATIVE REQUIREMENTS

A. Scheduling:
   1. General:
      a. Before start of Site Work, make arrangements for temporary electrical service as required.
   2. Electrical systems:
      a. Before bidding, Contact the utilities to determine the Work and materials that will be required from the Contractor, and all fees and permits that will be required, so that all utility systems furnished by the Contractor will be included in the bid.
      b. Coordinate Work with Engineer to minimize downtime of existing operating equipment and electrical distribution systems and to preclude unsafe operation:
         1) Notify Owner 10 days before power interruptions.
         2) Coordinate downtime with Owner and local electric utility.
      c. During the construction of the Project, the existing electrical service must remain fully functional in order to supply uninterrupted electrical power to the facility and its ancillary buildings and structures.
   3. Before commencing Site Work, coordinate underground conduit installations with other Work to eliminate conflicts and avoid interferences with other underground systems.

1.09 WARRANTY

A. As specified in Section 01783 - Warranties and Bonds.

PART 2 PRODUCTS

2.01 GENERAL (NOT USED)

2.02 DESIGN AND PERFORMANCE CRITERIA

A. Electrical service:
   1. Provide all Work and materials and bear all costs for providing temporary construction power and the permanent electrical service, including but not limited to:
      a. All Work and materials to complete the 12 kV system shown in drawings.

b. Contractor to cover cost of the following work to be performed by Ukiah Electric Utility (cost of work to be performed by Utility to be provided by City of Ukiah Electric Department):
    1) Installation of 12 kV conductors upon completion of conduit installation by Contractor.
    2) 12 kV switching procedures and loop configuration.
c. All permits and fees required by the electric utility.

B. General:
    1. Coordinate and obtain inspections and final installation approval from the serving utilities and other authorities having jurisdiction.

2.03 MANUFACTURERS (NOT USED)

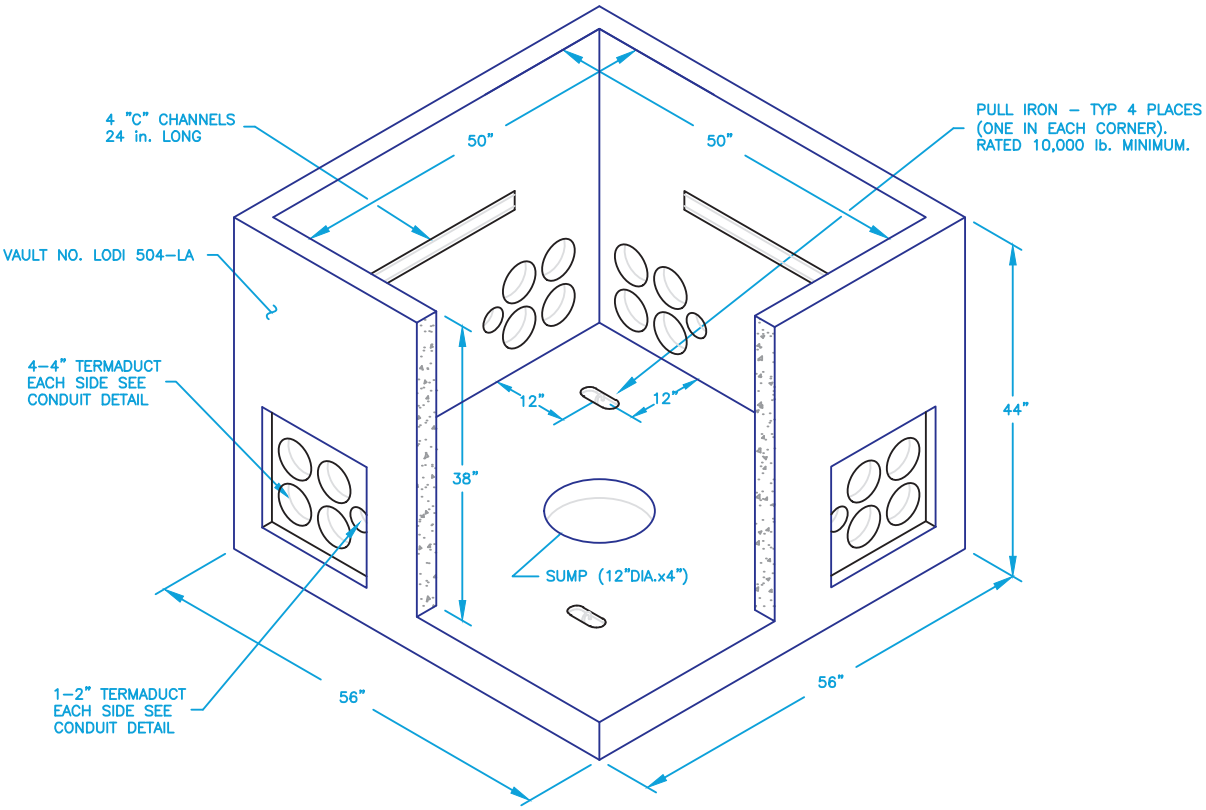
2.04 MATERIALS

A. Provide materials in accordance with the applicable requirements of the utilities and as specified in these Specifications.

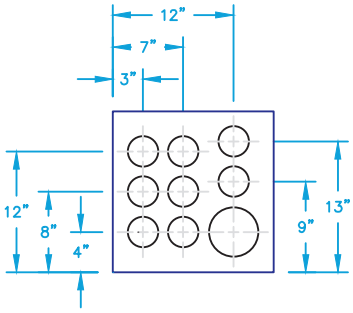
2.05 MANUFACTURED UNITS (NOT USED)

2.06 EQUIPMENT

A. Provide equipment in accordance with the applicable requirements of the utilities and as specified in these Specifications.



PART 3 EXECUTION



3.01 INSTALLATION

A. Reference Ukiah Electric Utility typical detail drawings provided at the end of this specification section for work on 12 kV cables and conduits.

LOW VOLTAGE MOTORS UP TO 500 HORSEPOWER

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Low voltage motors up to 500 horsepower (hp).

1.02 REFERENCES

A. As specified in Section 16050 - Common Work Results for Electrical.

B. American Bearing Manufacturers Association (ABMA):
   1. 9 - Load Ratings and Fatigue Life for Ball Bearings.
   2. 11 - Load Ratings and Fatigue Life for Roller Bearings.

C. American Petroleum Institute (API):
   1. 670 - Machinery Protection Systems.

D. ASTM International (ASTM).
   1. B117 - Standard Practice for Operating Salt Spray (Fog) Apparatus.

E. Institute of Electrical and Electronic Engineers (IEEE):
   1. 43 - IEEE Recommended Practice for Testing Insulation Resistance of Rotating Machinery.
   2. 112 - IEEE Standard Test Procedure for Polyphase Induction Motors and Generators.
   3. 303 - Recommended Practice for Auxiliary Devices for Rotating Electrical Machines in Class I, Division 2 and Zone 2 Locations.
   4. 841 - IEEE Standard for Petroleum and Chemical Industry-Premium-Efficiency, Severe Duty, Totally Enclosed Fan-Cooled (TEFC) Squirrel Cage Induction Motors - Up to and Including 370 kW (500 hp).
   5. 1349 - Guide for Application of Electric Motors in Class I, Division 2 and Class I, Zone 2 Hazardous (Classified) Locations.

F. National Electrical Manufacturers' Association (NEMA):
   1. MG-1 - Motors and Generators.
   2. MG-2 - Safety Standard for Construction and Guide for Selection, Installation, and Use of Electric Motors and Generators.

G. Underwriters Laboratories Inc. (UL):
   1. 674 - Electric Motors and Generators for Use in Division 1 Hazardous (Classified) Locations.

1.03 DEFINITIONS

A. As specified in Section 16050 - Common Work Results for Electrical.

1.04 SYSTEM DESCRIPTION

A. Furnish and install electric motors and accessories as specified in this Section and the Sections specifying driven equipment to provide a complete and operable installation.

1.05 SUBMITTALS

A. Furnish submittals as specified in Section 01330 - Submittal Procedures.

B. Submit completed motor data sheets for each motor supplied:
   1. As specified in Attachment A - Motor Data Sheet.
   2. Manufacturer's or other data sheets are not acceptable.

C. Product data:
   1. Descriptive bulletins.
   2. Machine tag and loop number as indicated on the Drawings and in the specification section number of the driven machine.
   3. Complete electrical data.
   4. Manufacturer's storage recommendations.
   5. Torque, current, and power factor versus speed curves:
      a. At 100 percent rated voltage for all full voltage started and VFD-driven motors.
      b. For motors on reduced voltage start at 70, 80, 90, and 100 percent rated voltage.
   6. Accessories data:
      a. Power factor correction capacitors:
         1) Size in KVAR, for all motors not connected to variable frequency drives.
      b. Motor winding heaters:
         1) Voltage.
         2) Watts.
      c. Winding temperature detectors:
         1) Type.
         2) Rating.
      d. Moisture detectors.
   7. Mechanical data:
      a. Bearing design and bearing life calculations.
      b. Resonant frequencies for all VFD-driven motors 50 hp or greater.

D. Shop drawings:
   1. Motor weight.
   2. Frame size.
   3. Conduit box(es), size(s), and location(s).
   4. Outline drawings with dimensions.
   5. Installation details for the project seismic criteria.

E. Test reports:
   1. Factory test reports with test reference standard identified.

F. Certification:
   1. When motors are driven by variable speed drive systems, submit certification that selected motor:
      a. Is capable of satisfactory performance under the intended load.
      b. Meets the requirements of the latest edition of NEMA MG-1 Part 31.

G. Calculations:
   1. Where site conditions specified in Section 01850 - Design Criteria exceed manufacturer's ratings, provide derating calculations for each motor.

1.06 QUALITY ASSURANCE (NOT USED)

1.07 DELIVERY, STORAGE, AND HANDLING

A. Store motors in accordance with the manufacturer's recommendations.

1.08 PROJECT OR SITE CONDITIONS

A. As specified in Section 01850 - Design Criteria.

1.09 SEQUENCING (NOT USED)

1.10 SCHEDULING (NOT USED)

1.11 WARRANTY

A. As specified in Section 01783 - Warranties and Bonds.

1.12 SYSTEM START-UP (NOT USED)

1.13 OWNER'S INSTRUCTION (NOT USED)

1.14 MAINTENANCE (NOT USED)

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. One of the following or equal:
   1. US Motors.
   2. General Electric.
   3. Reliance.
   4. Toshiba.
   5. Baldor.

2.02 EXISTING PRODUCTS (NOT USED)

2.03 MATERIALS (NOT USED)

2.04 MANUFACTURED UNITS (NOT USED)

2.05 EQUIPMENT

A. 3-phase induction motors - general:
   1. Voltage:
      a. All motors 1/2 hp and larger shall be rated 460 V, 3-phase unless otherwise indicated on the Drawings.
      b. Dual voltage motors rated 230/460 V, 3-phase are acceptable provided all leads are brought to the conduit box.
   2. Motors driving identical machines shall be identical.
   3. All motors greater than 1 hp and up to 500 hp shall meet the "NEMA Premium Efficiency" percent listed in NEMA MG-1.
   4. Horsepower as indicated on the Drawings:
      a. Horsepower ratings indicated on the Drawings are based on vendor's estimates. Provide motors sized for the load of the actual equipment furnished without operating in the service factor.
   5. Service factor:
      a. 1.15 service factor on sine wave power.
      b. 1.0 when driven by VFD.
   6. Torque:
      a. Provide motors that develop sufficient torque for acceleration to full speed at voltage 10 percent less than motor nameplate rating.
      b. When started using reduced voltage starters:
         1) Provide motors that develop sufficient torque for acceleration to full speed.
      c. NEMA Design B except where driven load characteristics require other than normal starting torque:
         1) In no case shall starting torque or breakdown torque be less than the values specified in NEMA MG-1.
   7. Enclosures:
      a. As specified in the individual equipment Specifications or in this Section.
      b. Totally enclosed fan cooled:
         1) Cast iron conduit box.
         2) Tapped drain holes with Type 304 stainless steel plugs for frames 286 and smaller, and automatic breather and drain devices for frames 324 and larger.
      c. Explosion-proof:
         1) Tapped drain holes with corrosion resistant plugs for frames 286 and smaller and automatic breather and drain devices for frames 324 and larger.
      d. Lifting devices: All motors weighing 265 pounds (120 kilograms) or more shall have suitable lifting devices for installation and removal.
   8. Manufactured with cast iron frames in accordance with NEMA MG-1 or manufacturer's standard material for the specified rating.
   9. Nameplates:
      a. Provide all motors with a permanent, stainless steel nameplate indelibly stamped or engraved with:
         1) NEMA standard motor data.
            a) Indicate compliance with NEMA MG-1 Part 31 for inverter duty motors.
         2) AFBMA bearing numbers and lubrication instructions.

10. Hardware:
    a. Type 304 stainless steel.
11. Conduit boxes:
    a. Cast iron or stamped steel.
    b. Split from top to bottom.
    c. Provide gaskets at the following interfaces:
        1) Frames and conduit boxes.
        2) Conduit boxes and box covers.
    d. Rotatable through 360 degrees in 90-degree increments.
        1) Where available based on the size of the conduit box.
    e. Exceeding the dimensions defined in NEMA MG-1.
    f. Provide grounding lugs inside conduit boxes for motor frame grounding.
12. Motor bearings:
    a. Antifriction.
    b. Regreasable and initially filled with grease for horizontal motors and vertical motors per manufacturer's standard design.
    c. Bearings and lubrication suitable for ambient temperature and temperature rise.
    d. Suitable for intended application and have ABMA L-10 rating life of 60,000 hours or more.
    e. Fit bearings with easily accessible grease supply, flush, drain, and relief fittings using extension tubes where necessary.
    f. Where specified in the equipment Specifications, provide split-sleeve type hydrodynamic radial bearings. Provide a bearing isolator to protect bearings from contaminants.
13. Insulation systems:
    a. Motors installed in ambient temperatures between 40 degrees Celsius and 50 degrees Celsius:
        1) Provide Class F insulation.
        2) Design temperature rise consistent with Class B insulation.
        3) Rated to operate at an ambient temperature of 50 degrees Celsius at the altitude where the motor will be installed.
14. Motor leads:
    a. Insulated leads with non-wicking, non-hydroscopic material. Class F insulation.
15. Noise:
    a. Maximum operating noise level in accordance with NEMA MG-1.

B. Vertical motors:
    1. Enclosures:
        a. Totally enclosed fan cooled (TEFC) for motors 200 hp and less installed outdoors.
    2. Thrust bearings:
        a. Selected for combined rotor and driven equipment loads.
        b. Coordinate with driven equipment supplier for maximum vertical thrust of driven equipment.
    3. Anti-reverse ratchet.

C. Motors driven by variable frequency drives:
    1. Compatible with the variable frequency drives specified.
    2. Inverter duty rated and labeled.

3. Meet the requirements of NEMA MG-1 Part 31.
4. Winding insulation meets the requirements of NEMA MG-1 Part 31.4.4.2.
5. Capable of running continuously at 1/10th of full speed, with no harmful effects or overheating.
6. Shaft grounding ring:
    a. Provide a shaft grounding ring for each VFD-driven motor.
    b. Aluminum frame and internal components.
    c. Conductive microfiber brushes.
    d. Maintenance free design.
    e. Aegis Bearing Protection ring as manufactured by Electro Static Technology or equal.

D. Motors installed in corrosive environments:
1. Nameplate indicating conformance to IEEE 841.
2. Stator double dipped in varnish and baked.
3. Stator and rotor coated with corrosion resistant epoxy.
4. Frame, brackets, fan guard and conduit box coated with minimum of 2 coats of epoxy paint.
5. Withstand salt spray tests in accordance with ASTM B117.

E. Single-phase motors:
1. Capacitor start type rated for operation at 115 volts, 60 hertz, unless otherwise specified or as indicated on the Drawings.
2. Totally enclosed fan cooled (TEFC) motors manufactured in accordance with NEMA MG 1.
3. Ball bearings: Sealed.
4. 1/2 hp or less fan motors:
    a. Split-phase or shaded pole type when standard for the equipment.
    b. Open type when suitably protected from moisture, dripping water, and lint accumulation.
5. Wound rotor or commutator type single-phase motors only when their specific characteristics are necessary for application and their use is acceptable to the Engineer.
6. Integral overload protection.

2.06 COMPONENTS (NOT USED)

2.07 ACCESSORIES

A. Motor winding heaters:
1. Provide all 3-phase motors with belted or cartridge space heaters mounted within the motor enclosure.
2. Space heater rating shall be 120 volts, single-phase, unless otherwise indicated on the Drawings.
3. Power leads for heaters wired into conduit box.
4. Installed within motor enclosure adjacent to core iron.

B. Winding temperature detectors:
   1. Provide factory installed winding temperature detector with leads terminating in the conduit box:
   2. Temperature switches with normally closed contacts as indicated on the Drawings.

2.08 MIXES (NOT USED)

2.09 FABRICATION (NOT USED)

2.10 FINISHES (NOT USED)

PART 3 EXECUTION

3.01 EXAMINATION (NOT USED)

3.02 PREPARATION (NOT USED)

3.03 INSTALLATION

A. Install motors in accordance with manufacturer's instructions.

B. Install shaft grounding ring on VFD-driven motors in accordance with the manufacturer’s instructions.

3.04 ERECTION, INSTALLATION, APPLICATION, CONSTRUCTION (NOT USED)

3.05 REPAIR/RESTORATION (NOT USED)

3.06 RE-INSTALLATION (NOT USED)

3.07 COMMISSIONING AND PROCESS START-UP

A. As specified in Section 01756 - Commissioning.

B. Factory testing:
   1. Motors less than 250 hp:
      a. Perform manufacturer’s standard production tests including but not limited to:
         1) No load current.
         2) High potential test.
         3) Winding resistance.
      b. Furnish copies of standard test reports on prototype or identical units.

3.08 FIELD QUALITY CONTROL

A. Before start-up, perform insulation resistance test on each motor furnished or installed on this project:
   1. Windings energized to 1,000 volts DC for 1 minute.

2. Resistance measured at the end of the test, recorded, and submitted to the Engineer for review.
3. Inform the Engineer of any unusual or unacceptable test results.
4. This test is in addition to the acceptance tests in Section 16950 - Field Electrical Acceptance Tests.

3.09 ADJUSTING (NOT USED)

3.10 CLEANING (NOT USED)

3.11 PROTECTION (NOT USED)

SECTION 16262

VARIABLE FREQUENCY DRIVES 0.50 - 50 HORSEPOWER

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Variable frequency drives (VFD) 0.5 to 50 horsepower for control of NEMA Design B squirrel cage induction motors.

1.02 REFERENCES

A. As specified in Section 16050 - Common Work Results for Electrical.

B. International Organization for Standardization (ISO):
   1. 9001 - Quality Management Systems - Requirements.

C. National Electrical Manufacturers Association (NEMA):
   1. MGI, Part 31 – Motors with higher peak voltage capability.

D. Underwriters' Laboratories (UL):
   1. 508A - Standard for Safety for Industrial Control Panels.
   2. 508C - Standard for Power Conversion Equipment.

1.03 DEFINITIONS

A. As specified in Section 16050 - Common Work Results for Electrical.

B. Specific definitions:
   1. Point of common coupling: the point of common coupling for all harmonic calculation and field measurements for both voltage and current distortions is defined as the closest directly connected bus supplying power to the VFD.

1.04 SYSTEM DESCRIPTION

A. Design requirements:
   1. Each VFD system consists of all components required to meet the performance, protection, safety, testing, and certification criteria of this Section.
   2. The VFD system:
      a. Is a fully integrated package.
      b. Includes all material necessary to interconnect all VFD system elements, even if shipped separately.
   3. Coordinate bearing protection methods with the supplier of the driven equipment.

B. Any modifications to a standard product necessary to meet this Section shall be made only by the VFD manufacturer:
   1. Each VFD shall be completely factory pre-wired, assembled, and then tested as a complete system by the VFD manufacturer to ensure a properly coordinated, fully integrated drive system.
   2. The VFD shall be capable of operating standard NEMA Design B motors. It is the responsibility of the VFD manufacturer to ensure that the drive will not damage motor insulation due to high carrier frequency, reflected wave, dv/dt or other drive electrical characteristics based upon the installed conditions:
      a. Provide equipment necessary to mitigate potential damage to motor insulation.
      b. Motors as specified in Section 16222 - Low Voltage Motors up to 500 Horsepower.

C. Performance:
   1. Operating envelope:
      a. Speed and torque requirements:
         1) Provide a variable torque or constant torque VFD as required by the driven load.
         2) The VFD shall be capable of producing a variable alternating voltage/frequency output to provide continuous operation over the 40 to 200 percent (25 to 120 hertz) speed range.
      b. Current requirements:
         1) Full rated current output on a continuous basis.
         2) Variable torque VFD:
            a) Minimum 110 percent current overload for 1 minute.
         3) Constant torque VFD:
            a) Minimum 150 percent current overload for 1 minute.
   2. Minimum VFD system efficiency:
      a. 96 percent when operating at the rated kW output.
      a. VFD system efficiency shall be calculated as follows:

$$\text{Efficiency (\%)} = \frac{\text{Power (Load)}}{\text{Power (Supply)}} \text{ x } 100$$

      Power (Load) is the total power measured at the output terminals of the drive system, including VFD, output filters, or transformers. Power (Supply) is the total power measured at the input terminals of the VFD including input filters, line reactors, isolation transformers, harmonic distortion attenuation equipment and auxiliary equipment (e.g., controls, fans) for complete system operation.

   3. Total power factor:
      a. Minimum of 0.96 lagging across the entire speed range.
      b. At no speed shall the VFD have a leading power factor.
   4. Frequency accuracy:
      a. Minimum of within 0.01 percent.
   5. Speed regulation:
      a. Minimum of within 0.5 percent across the entire speed range.

1.05 SUBMITTALS

A. Furnish submittals as specified in Section 01330 - Submittal Procedures:
   1. Custom prepared by the VFD manufacturer and specific for the equipment furnished.

B. Product data:
   1. Manufacturer of the VFD.
   2. Manufacturer of all components of the VFD.
   3. Dimensions:
      a. Height.
      b. Width.
      c. Depth.
      d. Weight.
   4. Nameplate schedule.
   5. Bill of material.
   6. Ratings:
      a. Voltage.
      b. Phase.
      c. Input current.
      d. Output current.
      e. Interrupting rating.
      f. Momentary current rating.
   7. List of recommended spare parts.
   8. Catalog cutsheets for major components.
   9. Design data:
      a. Efficiency and power factor values.
      b. Certification that the drive is sized for the full nameplate motor horsepower and current of the driven load at the installed altitude and ambient temperature.
      c. Certification that based upon VFD design, cable length to motor, and motor dielectric insulation level that the VFD will not damage motor insulation due to carrier frequency, reflected wave, dv/dt, or other VFD produced characteristics.
      d. Certification that all electronic circuits and printed circuit boards are conformally coated.
   10. For equipment installed in structures designated as seismic design category C, D, E, or F submit the following as specified in Section 01850 - Design Criteria:
      a. Manufacturer’s statement of seismic qualification with substantiating test data.
      b. Manufacturer’s special seismic certification with substantiating test data.

C. Shop drawings:
   1. Complete plan and elevation drawings showing:
      a. All dimensions.
      b. Panel, sub-panel, and component layout indexed to the bill of material.
      c. Conduit connections.
   2. Block diagram showing the basic control and protection systems specifying the protection, control, trip and alarm functions, the reference signals and commands and the auxiliary devices.

3. Complete schematic, wiring and interconnection diagrams showing connections to both internal and external devices:
    a. Include terminal number and wire numbers.
4. Complete single-line and 3-line diagrams including, but not limited to, circuit breakers, motor circuit protectors, contactors, instrument transformers, meters, relays, timers, control devices, and other equipment comprising the complete system:
    a. Clearly indicate device electrical ratings on the drawings.

D. Control descriptions and control logic program:
1. Provide control descriptions describing the full control functionality to be incorporated into the programming of the drive including the following:
    a. Functionality in local and remote.
    b. Software and hardware interlocks.
    c. Control response upon loss and restoration of power.
2. Provide complete register list of all IO available to the Plant PCS.
3. Submit the completed control logic program for each and every device supplied.
4. Submit a list of all networking address tables.
5. Submit configuration settings in accordance with actual motor and field equipment being supplied.

E. Installation instructions:
1. Detail the complete installation of the equipment including rigging, moving, and setting into place.
2. For equipment installed in structures designated as seismic design category A or B:
    a. Provide manufacturer’s installation instructions and anchoring details for connecting equipment to supports and structures.
3. For equipment installed in structures designated as seismic design category C, D, E, or F:
    a. Provide project-specific installation instructions and anchoring details based on support conditions and requirements to resist seismic and wind loads as specified in Section 01850 - Design Criteria.
    b. Submit anchoring drawings with supporting calculations.
    c. Drawings and calculations shall be stamped by a professional engineer registered in the state where the Project is being constructed.

F. Operation and maintenance manuals:
1. Spare parts list with supplier names and part numbers.
2. Startup and commissioning instructions and data.
3. Operating manuals:
    a. Submit operating instructions and a maintenance manual presenting full details for care and maintenance of each model of VFD provided under this Contract.
4. Operating instructions:
    a. Written descriptions detailing the operational functions of all controls on the front panel.

5. Maintenance manual:
    a. Furnish maintenance manuals with instructions covering all details pertaining to care and maintenance of all equipment as well as identifying all parts.
    b. Manuals shall include, but are not limited to the following:
        1) Adjustment and test instructions covering the steps involved in the initial test, adjustment, and start-up procedures.
        2) Detailed control instructions which outline the purpose and operation of every control device used in normal operation.
        3) All schematic wiring and external diagrams:
            a) Furnish drawings in a reduced 11-inch by 17-inch format that are fully legible at that size.

G. Test forms and reports.
    1. Submit complete factory acceptance test procedures and all forms used during the test.
    2. Submit complete control description checklist and IO checklist organized by VFD for use during the control logic portion of the witnessed factory acceptance testing as well as the witnessed field acceptance testing.

H. Manufacturer's Certificate of Installation and Functionality Compliance.

I. Manufacturer's field reports:
    1. Report listing the setting of all VFD adjustable parameters and their values after start-up.

J. Record Documents:
    1. Certified Record Documents of equipment with information listed above.

1.06 QUALITY ASSURANCE

A. Qualifications:
    1. Any third-party certification, safety or protection requirements shall be applied to the VFD system as a whole. Certification or protection of system elements or individual components by themselves is not acceptable.
    2. VFDs shall be UL 508C listed and labeled:
        a. UL 508C for individual units.
        b. UL 508A for VFD systems in control panels.
    3. Variable frequency drives shall be manufactured by the VFD manufacturer at its own facility which shall have a quality assurance program that is certified in conformance with ISO 9001.

1.07 DELIVERY, STORAGE, AND HANDLING

A. Ship the VFDs and associated equipment to the job site on a dedicated air ride vehicle that will allow the Contractor to utilize onsite offloading equipment:
    1. VFDs shall be delivered to the site preassembled and wired.

B. Furnish temporary equipment heaters within the VFD to prevent condensation from forming.

1.08 PROJECT OR SITE CONDITIONS

A. As specified in Section 01850 - Design Criteria.

1.09 SEQUENCING

A. Conduct Programming and Data Exchange Coordination Meeting.

B. Conduct factory acceptance test and submit certified test results for Engineer's review.

C. Ship equipment to project site after successful completion of factory acceptance test.

D. Assemble equipment in the field.

E. Conduct field acceptance test and submit results for Engineer's review.

F. Submit Manufacturers Certificate of Installation and Functionality Compliance.

G. Conduct Owner's training sessions.

H. Commissioning and process start-up as specified in Section 01756 - Commissioning.

1.10 SCHEDULING (NOT USED)

1.11 WARRANTY

A. As specified in Section 01783 - Warranties and Bonds.

1.12 SYSTEM START-UP

A. The VFD manufacturer shall be responsible for start-up of the VFDs in the presence of the equipment suppliers, Contractor, Engineer, and Owner.

1.13 OWNERS INSTRUCTIONS (NOT USED)

1.14 MAINTENANCE

A. Spare parts:
   1. The following spare parts shall be furnished:
      a. 1 set of all power and control fuses for each VFD.
      b. One complete main control key pad for each type and rated size of VFD.
      c. 1 spare fan for each VFD unit.
      d. 2 sets of ventilation filters for each VFD unit (if applicable in VFD cabinet louvers).
      e. 1 set of thyristors or power electronics for each type and rated size of VFD.
      f. Any special dedicated tools for emergency service and troubleshooting.
      g. All hardware and software required for configuration, maintenance, troubleshooting, and inquiry of all drive parameters.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. One of the following or equal:
   1. ABB ACS-880.

2.02 EXISTING PRODUCTS (NOT USED)

2.03 MATERIALS (NOT USED)

2.04 MANUFACTURED UNITS (NOT USED)

2.05 EQUIPMENT

A. General:
   1. Sinusoidal pulse width modulated (PWM) type drive.
      a. 6-pulse insulated gate bipolar transistor (IGBT) power section.
      b. Microprocessor based controls.
      c. Line reactors.
      d. Load reactor or dv/dt filter as required by motor cable length.

B. Ratings:
   1. Voltage:
      a. Input voltage as indicated on the Drawings.

C. Operational features:
   1. Protective features:
      a. Provide the following minimum protective features:
         1) Motor overload protection.
         2) Instantaneous overcurrent.
         3) Instantaneous overvoltage.
         4) Undervoltage.
         5) Power unit overtemperature.
         6) Phase loss.
         7) VFD output short circuit.
   2. Control mode:
      a. Operation in either a constant volts/hertz or sensorless vector mode:
         1) The control mode selectable using the programming keypad.
   3. Frequency control:
      a. Minimum of 3 selectable skip frequencies with adjustable bandwidths.
      b. Programmable minimum frequency.
      c. Programmable maximum frequency.
   4. Acceleration/deceleration:
      a. Separately adjustable acceleration and deceleration rates:
         1) Each rate adjustable from 0.01 to 1,800 seconds.
   5. Spinning load:
      a. The VFD shall be capable of determining the speed and direction of a spinning load, “catch” the load and accelerate or decelerate it without damage to the load.

6. Programmable loss of signal:
    a. Upon loss of speed reference the VFD shall be programmable to either:
        1) Stop.
        2) Maintain current speed.
        3) Default to pre-selected speed.
7. Power interrupt ride-through:
    a. The VFD shall be capable of continuous operation in the event of a power loss of 5 cycles or less.
8. Inputs/Outputs:
    a. Manufacturer's standard number the following:
        1) Analog inputs:
            a) Configurable as either 0 to 10 volts or 4 to 20 milliamperes.
        2) Analog outputs:
            a) Programmable 4 to 20 milliamperes isolated.
        3) Discrete inputs:
            a) Programmable.
        4) Discrete outputs:
            a) Programmable.
            b) Form C relay contacts.
        5) Potentiometer 3-wire input.
    b. Provide additional inputs/outputs as required to meet the control functions indicated on the Drawings.
9. Communications:
    a. Provide each VFD with a EtherNet I/P communications interface module.
10. Automatic control:
    a. PID capability utilizing an internal or external setpoint:
        1) Selectable setpoint source.
11. Diagnostics:
    a. Store a minimum of 4 fault conditions in non-volatile memory on a first in-first out basis.
    b. Operational parameters stored at the time of the fault:
        1) Operating frequency.
        2) Drive status.
        3) Power mode.
    c. Fault memory accessible via RS-232, RS-422, or RS-485.
12. Automatic restart:
    a. User selectable automatic restart feature allowing the VFD to restart following a momentary power failure or other VFD fault:
        1) Programmable for up to 9 restart attempts.
        2) Adjustable time delay between restart attempts.

2.06 COMPONENTS

A. Enclosure:
    1. NEMA Type 12 free-standing or floor mounted.
    2. Provide cooling devices required to maintain the VFD within the manufacturer's specified temperature limits for the Project conditions:
        a. Provide cooling device failure alarm.

B. Power disconnect:
   1. Flange-mounted thermal magnetic circuit breaker.
   2. Lockable in the OFF position.

C. Input Reactor:
   1. 3 percent input line reactor.

D. Output Device:
   1. 3 percent output load reactor.
   2. dV/dt filter:
      a. Common mode reduction: 30 percent minimum.
      b. Motor terminal peak voltage limit: 150 percent of dc bus voltage with a motor lead length up to 1,000 feet.
      c. Carrier frequency range: up to 12 khz.
      d. Efficiency: 98 percent minimum.
      e. Class H insulation minimum.

E. Keypad:
   1. Provide each VFD with a keypad for programming and control.
   2. Keypad requirements:
      a. Password security to protect drive parameters.
      b. Mounted on the door of the VFD enclosure.
      c. Back-lit LCD:
         1) Minimum of 2 lines with a minimum of 16 characters per line.
      d. Programming and display features language: English.
      e. Capable of displaying the following parameters:
         1) Speed (percent).
         2) Output current (amperes).
         3) Output frequency (hertz).
         4) Input voltage.
         5) Output voltage.
         6) Total 3-phase kilowatt.
         7) Kilowatt-hour meter.
         8) Elapsed run time meter.
         9) Revolutions per minute.
         10) Direct current bus voltage.
   3. In addition to all keys required for programming, provide the following controls on the keypad:
      a. Auto/manual selector.
      b. Start pushbutton.
      c. Stop pushbutton.
      d. Jog pushbutton.
      e. Speed increment.
      f. Speed decrement.
      g. Forward/reverse selector.
      h. Run LED indicator.
      i. Program LED indicator.
      j. Fault LED indicator.
   4. Provide the VFD with the hardwired controls as indicated on the Drawings.

F. Control power transformer:
   1. Furnish a control power transformer mounted and wired inside the VFD enclosure.
   2. With primary and secondary fusing.
   3. Sized to power all VFD controls and options as well as any external devices indicated on the Drawings including the motor winding heater.

2.07 ACCESSORIES

A. Metal oxide varistors:
   1. Provide protection for the VFD against:
      a. Line transients: 5,000 volt peak minimum.
      b. Line to ground transients: 7,000 peak minimum.

B. Conformal coating:
   1. Provide conformal coating material applied to electronic circuitry and printed circuit boards to act as a protection against moisture, dust, temperature extremes, and chemicals such as H_2S and chlorine.

2.08 MIXES (NOT USED)

2.09 FABRICATION (NOT USED)

2.10 FINISHES

A. Enclosure finish shall be manufacturer's standard gray.

2.11 SOURCE QUALITY CONTROL (NOT USED)

PART 3 EXECUTION

3.01 EXAMINATION (NOT USED)

3.02 PREPARATION (NOT USED)

3.03 INSTALLATION

A. Install the equipment in accordance with the accepted installation instructions and anchorage details to meet the seismic and wind load requirements at the Project site.

B. General:
   1. Furnish all cables, conduit, lugs, bolts, expansion anchors, sealants, and other accessories needed to complete the installation of the VFD (free-standing or within motor control center).
   2. Assemble and install the VFD in the locations and with the layouts indicated on the Drawings.
   3. Perform work in accordance with manufacturer's instructions and shop drawings.
   4. Furnish components and equipment as required to complete the installation.

5. Replace any hardware lost or damaged during the installation or handling to provide a complete installation.
6. Install free-standing enclosures on a raised concrete housekeeping pad:
    a. Provide structural leveling channels in accordance with the manufacturer's recommendations to provide proper alignment of the units.
    b. Weld and/or bolt the VFD frame to the leveling channels.
7. Provide openings in top or bottom of the VFD (free-standing or within motor control center) enclosure for conduit only, no additional openings will be allowed:
    a. Improperly cut holes will require that the entire panel be replaced:
        1) No hole closers or patches will be allowed.
8. Bundle circuits together and terminate in each unit:
    a. Tie with nylon wire ties.
    b. Label all wires at each end with wire numbers shown on the approved control drawings.
    c. All connections to and from the VFD (free-standing or within motor control center) enclosure must be made via terminal blocks.

3.04 ERECTION, INSTALLATION, APPLICATION, CONSTRUCTION (NOT USED)

3.05 REPAIR/RESTORATION (NOT USED)

3.06 RE-INSTALLATION (NOT USED)

3.07 COMMISSIONING

A. As specified in Section 01756 - Commissioning.

B. Source testing (Factory Acceptance Tests):
    1. Owner and Engineer will witness the Factory Acceptance Test as specified in Section 16050 - Common Work Results for Electrical.
    2. General:
        a. Incoming inspection of components and raw materials based on strategic supplier base and experience.
        b. All VFDs furnished under this Section shall be tested and inspected as specified below. Testing of VFDs based on sampling plans is not allowed.
        c. The testing procedures specified are the minimum acceptable requirements. The manufacturer may perform additional tests at its discretion.
    3. Failure of any component during testing requires repair of the faulted component and complete retest.
    4. Tests:
        a. Perform manufacturer's standard factory acceptance tests.

C. Provide Manufacturer's Certificate of Installation and Functionality Compliance as specified in Section 01756 - Commissioning.

D. Owner training:
    1. As specified in Sections 01756 - Commissioning and 16050 - Common Work Results for Electrical.

3.08 FIELD QUALITY CONTROL

A. As specified in Section 16050 - Common Work Results for Electrical.

B. Provide the services of a VFD manufacturer representative for startup assistance and training:
   1. Inspection and field adjustment:
      a. Supervise the following and submit written certification that the equipment and controls have been properly installed, aligned, adjusted, and readied for operation.
   2. Startup field testing:
      a. Provide technical direction for testing, checkout, and startup of the VFD equipment in the field.
      b. Under no circumstances are any portions of the drive system to be energized without authorization from the manufacturer's representative.

3.09 ADJUSTING

A. Make all adjustments as necessary and recommended by the manufacturer, Engineer, or testing firm.

B. Provide the services of a VFD manufacturer factory technician to make all drive parameters and protective device settings:
   1. Protective device settings provided by the VFD manufacturer in accordance with the manufacturer of the driven equipment requirements.
   2. Provide documentation of VFD settings included but not limited to:
      a. Minimum speed.
      b. Maximum speed.
      c. Skip speeds.
      d. Current limit.
      e. Acceleration time.
      f. Deceleration time.

C. Programming:
   1. Manufacturer/supplier may contract with the project Programmer for portions of the tasks below.
   2. Provide all gateway communications between the drive to the Owner's control system as required.
   3. Provide all control logic as indicated in the control descriptions.
   4. Configure all network communications with applicable security settings, IP addresses and any other addressing tables required to provide a fully functioning system.
   5. Coordinate all IP addresses with the Owner.
   6. Coordinate data exchange approach for efficient communications to the Owner's control and maintenance systems. This effort will include a coordination meeting to discuss the data exchange approach including formatting and mapping.
   7. Provide witnessed source testing to prove out all Overload control logic as well as interaction with Owner’s control and maintenance systems at the supplier's facility. ICSC/Programmer shall attend witnessed testing.

3.10 CLEANING

A. As specified in Section 16050 - Common Work Results for Electrical.

3.11 PROTECTION (NOT USED)

3.12 SCHEDULES (NOT USED)

END OF SECTION

SECTION 16265

REDUCED HARMONIC VARIABLE FREQUENCY DRIVES

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Reduced harmonic 18 pulse or active front end, variable frequency drives (VFD), 60 to 500 hp for control of standard NEMA Design B squirrel cage induction motors.

1.02 REFERENCES

A. Definitions:
   1. AFE: Active Front End.
   2. ULH: Ultra-Low Harmonics
   3. IGBT: Insulated Gate Bipolar Transistor.
   4. VFD: Variable Frequency Drive.

B. Standards:
   1. National Electrical Manufacturers Association (NEMA):
      a. 250 - Enclosures for Electrical Equipment (1,000 V Maximum).
   2. Underwriters' Laboratories, Inc. (UL):
      a. 508A - Standard for Safety for Industrial Control Panels.

1.03 DELEGATED DESIGN

A. As specified in Section 01357 - Delegated Design Procedures.

B. Anchoring and bracing.

1.04 SUBMITTALS

A. Furnish submittals as specified in Section 01330 - Submittal Procedures:
   1. Custom prepared by the VFD manufacturer and specific for the equipment furnished.

B. Product data:
   1. Manufacturer of the VFD.
   2. Manufacturer of all components of the VFD.
   3. Dimensions:
      a. Height.
      b. Width.
      c. Depth.
   4. Weight.
   5. Nameplate schedule.
   6. Bill of material.

7. Ratings:
    a. Voltage.
    b. Phase.
    c. Input current.
    d. Output current.
    e. Interrupting rating.
    f. Momentary current rating.
8. Catalog cutsheets for major components.
9. Surge protection data.
10. Design data:
    a. Efficiency and power factor values.
    b. Certification that the drive is sized for the full nameplate motor hp and current (at rated RPM) of the driven load at the installed altitude.
    c. Certification that based upon VFD design, cable length to motor, and motor dielectric insulation level that the VFD will not damage motor insulation due to carrier frequency, reflected wave, dv/dt, or other VFD produced characteristics.
    d. Certification that all electronic circuits and printed circuit boards are conformably coated.
    e. Certification that the VFD will operate with all power sources (including alternate utilities and on-site generation when applicable).
11. List of recommended spare parts.
12. For equipment installed in structures designated as seismic design category C, D, E, or F submit the following as specified in Section 01850 - Design Criteria:
    a. Manufacturer’s statement of seismic qualification with substantiating test data.
    b. Manufacturer’s special seismic certification with substantiating test data.

C. Shop drawings:
1. Complete plan and elevation drawings showing:
    a. All dimensions.
    b. Panel, sub-panel and component layout indexed to the bill of material.
    c. Conduit connections.
    d. Required clearance around equipment.
2. Block diagram showing the basic control and protection systems identifying the protection, control, trip and alarm functions, the reference signals and commands and the auxiliary devices.
3. Complete schematic, wiring and interconnection diagrams showing connections to both internal and external devices:
    a. Wiring diagrams shall include terminal number and wire numbers.
4. Complete 1-line and 3-line diagrams including, but not limited to, circuit breakers, motor circuit protectors, contactors, instrument transformers, meters, relays, timers, control devices, and other equipment comprising the complete system:
    a. Device electrical ratings shall be clearly indicated on the Drawings.

D. Delegated design submittals:
   1. Anchoring and bracing: Provide project-specific calculations based on support conditions and requirements to resist loads specified in Section 01850 - Design Criteria:
      a. To structures for equipment installed in structures designated as seismic design category C, D, E, or F.
      b. For equipment installed outdoors.

E. Installation instructions:
   1. Detail the complete installation of the equipment including rigging, moving, and setting into place.
   2. Provide manufacturer's installation instructions.

F. Commissioning submittals:
   1. As specified in Section 01756 - Commissioning, including the following:
      a. Manufacturer's representative qualifications.
      b. Certificates:
         1) Requirements as specified in this Section.
      c. Test Plans:
         1) Test requirements as specified in this Section.
      d. Test Reports.
      e. Manufacturer's representatives field notes and data.
      f. Owner training.

G. Certifications:
   1. Certification letter from the VFD manufacturer stating that the VFD(s) are capable of operating with all new and existing sources (utility sources and on-site generation in possible operating configurations).
   2. Certification letter from the VFD manufacturer stating that the VFD(s) are capable of operating with all new and existing VFDs in the existing and new distribution system.

H. Control descriptions and control logic program:
   1. Provide control descriptions describing the full control functionality to be incorporated into the programming of the drive including the following:
      a. Functionality in local and remote.
      b. Software and hardware interlocks.
      c. Control response upon loss and restoration of power.
   2. Provide complete register list of all IO available to the Plant PCS.
   3. Submit the completed control logic program for each and every device supplied.
   4. Submit a list of all networking address tables.
   5. Submit configuration settings in accordance with actual motor and field equipment being supplied.

I. Installation instructions:
   1. Detail the complete installation of the equipment including rigging, moving, and setting into place.
   2. Provide manufacturer's installation instructions.

J. Calculations:
    1. Harmonic study:
        a. A preliminary harmonic analysis shall be performed:
            1) A power system short circuit ratio of 20 shall be used.
            2) All VFDs shall be assumed to be operating at maximum speed and maximum load.
            3) The short circuit current (ISC) utilized for the harmonic analysis calculations is defined as:
                a) ISC = 20 * (Sum Total Full Load Amps of all VFDs).
        b. A separate harmonic analysis shall be performed based on the standby generator system. Coordinate with the generator manufacturer and the VFD manufacturer so the actual characteristics for the generator supplied, or existing, for this Project are used in the harmonic analysis.
    2. Detailed calculations or details of the actual physical testing performed on the VFD to prove the VFD is suitable for the seismic conditions at the Project Site.

K. Test forms and reports:
    1. Submit complete field acceptance test procedures and all forms used during the test:
        a. Testing performed by independent organization as specified in Section 16950 - Field Electrical Acceptance Tests.
    2. Submit complete control description checklist and IO checklist organized by VFD for use during the control logic portion of the witnessed field acceptance testing.

L. Record documents:
    1. Certified record documents of all equipment with information listed above.

M. Manufacturer's field reports:
    1. Certification letter from the VFD manufacturer that the VFD(s) has been inspected and installed in accordance with the manufacturer's requirements.
    2. Report listing the setting of all VFD adjustable parameters and their values after start-up.
    3. Certification letter from the VFD manufacturer stating that the VFD(s) are programmed to avoid system resonances when connected to the standby generator and will not conflict with generator system voltage regulator.

N. Operation and maintenance manuals:
    1. Spare parts list with supplier names and part numbers.
    2. Start-up and commissioning instructions and data.
    3. Complete bill of material indexed to the drawings, identifying the catalog or part numbers, manufacturer, and quantities of components of the VFD system.
    4. Operating manuals:
        a. Submit operating instructions and a maintenance manual presenting full details for care and maintenance of each model of VFD provided under this Contract.
    5. Operating instructions:
        a. The written descriptions shall detail the operational functions of all controls on the front panel including keypad functions and parameters.

6. Maintenance manual:
    a. Furnish maintenance manuals with instructions covering all details pertaining to care and maintenance of all equipment as well as identifying all parts.
    b. Manuals shall include but are not limited to the following:
        1) Adjustment and test instructions covering the steps involved in the initial test, adjustment and start-up procedures.
        2) Detailed control instructions that outline the purpose and operation of every control device used in normal operation.
        3) All schematic wiring and external diagrams:
            a) Furnish drawings in a fully legible reduced 11-inch by 17-inch format.

1.05 QUALITY ASSURANCE

A. Qualifications:
    1. Any third-party certification, safety or protection requirements shall be applied to the VFD system as a whole. Certification or protection of system elements or individual components by themselves is not acceptable.
    2. VFDs shall be UL 508C listed and labeled.
    3. VFD systems (packaged VFD panels) shall be UL 508A listed and labeled.
    4. VFDs shall be manufactured by the VFD manufacturer at its own facility, which shall have a quality assurance program that is certified in accordance with ISO 9001.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Ship VFDs to the job site on a dedicated air ride vehicle that will allow the Contractor to utilize on site off-loading equipment:
    1. VFDs shall be delivered to the site pre-assembled and wired.
    2. Ship each VFD with 2 tamperproof accelerometers that record the maximum shock and vibration experienced by the VFD during shipping and handling.

B. Furnish temporary equipment heaters within the VFD to prevent condensation from forming.

1.07 PROJECT OR SITE CONDITIONS

A. As specified in Section 01850 - Design Criteria.

1.08 ADMINISTRATIVE REQUIREMENTS

A. Sequencing:
    1. Conduct Programming and Data Exchange Coordination Meeting.
    2. Assemble equipment in the field.
    3. Conduct field acceptance tests including harmonic testing and submit results for Engineer’s review:
        a. All utility power sources and on-site generation shall be installed and operable for field test.
    4. Submit manufacturer’s certification that equipment has been properly installed and is fully functional for Engineer’s review.

5. Conduct Owner's training sessions.
6. Commissioning and process start-up as specified in Section 01756 - Commissioning.

1.09 WARRANTY

A. As specified in Section 01783 - Warranties and Bonds.

B. Extended warranty:
   1. Provide an additional 2 years manufacturer's warranty from date of startup for all equipment provided under this Section.

1.10 SYSTEM START-UP

A. The VFD manufacturer shall be responsible for start-up of the VFDs in the presence of the equipment suppliers, Contractor, Engineer, and Owner.

1.11 MAINTENANCE

A. Maintenance service: Manufacturer shall describe the field service system available to support the proposed VFD system. As a minimum describe:
   1. Type of technical support available (e.g., system engineering and technician).
   2. Location of field service personnel.
   3. Field service daily rates in dollars per hour and dollars per day.
   4. Guaranteed response times to service requests.

B. Spare parts:
   1. The following spare parts shall be furnished:
      a. 1 complete VFD of each size furnished.
      b. 1 set of all power and control fuses for each VFD.
      c. 1 spare fan for each VFD unit.
      d. 2 sets of ventilation filters for each VFD unit (if applicable in VFD cabinet louvers).
      e. Any special dedicated tools for emergency service and troubleshooting.
      f. All hardware and software required for configuration, maintenance, troubleshooting and inquiry of all drive parameters.

PART 2 PRODUCTS

2.01 GENERAL (NOT USED)

2.02 DESIGN AND PERFORMANCE CRITERIA

A. Provide equipment and components that are fully rated for the site elevation and operating environment where the equipment will be installed as specified in Section 01850 - Design Criteria and as indicated on the Drawings.

B. Non-conditioned spaces:
   1. For equipment located in non-conditioned spaces, provide additional temperature conditioning equipment to maintain the equipment temperature

within a band of 10 degrees Fahrenheit above the minimum operating temperature and 10 degrees Fahrenheit below maximum operating temperature.

C. Outdoor installations:
   1. Provide conditioning equipment incorporated into the equipment to maintain the enclosures within the equipment manufacturer's specified operating ranges.

D. Design requirements:
   1. Each VFD system shall consist of all components required to meet the performance, protection, safety, testing and certification criteria of this Section.
   2. The VFD system:
      a. Is a fully integrated package.
      b. Includes all material necessary to interconnect VFD system elements, even if shipped separately.
   3. Any modifications to a standard product necessary to meet this Section shall be made only by the VFD manufacturer.
   4. Each VFD shall be completely factory pre-wired, assembled and then tested as a complete package by the VFD manufacturer to ensure a properly coordinated, fully integrated drive system.
   5. The VFD shall be capable of operating standard NEMA Design B motors. It is the responsibility of the VFD manufacturer to ensure that the drive will not damage motor insulation due to high carrier frequency, reflected wave, dv/dt or other drive electrical characteristics:
      a. The VFD manufacturer shall furnish equipment necessary to mitigate potential damage to motor insulation.
      b. Coordinate bearing protection methods with the supplier of the driven equipment.
      c. Motors as specified in Section 16222 - Low Voltage Motors up to 500 hp.

E. Performance:
   1. Operating envelope:
      a. Speed and torque requirements:
         1) Provide a variable torque or constant torque VFD as required by the driven load.
         2) The VFD shall be capable of producing a variable alternating voltage/frequency output to provide continuous operation over the 40 to 110 percent (25 to 66 hertz) speed range.
      b. Current requirements:
         1) Provide 100 percent of rated output current on a continuous basis.
         2) Variable torque VFD:
            a) Minimum 110 percent current overload for 1 minute.
         3) Constant torque VFD:
            a) Minimum 150 percent current overload for 1 minute.

2. Harmonics:
    a. The VFD shall meet the following distortion limits at 2 percent line voltage unbalance measured at the input terminals of the VFD:
        1) Voltage harmonics: The maximum allowable total harmonic distortion, THD, for each VFD shall not exceed 5 percent.
        2) Current harmonics: The maximum allowable total harmonic current distortion limit, TDD, for each VFD shall not exceed 5 percent as measured at the input terminals of the VFD system.
3. Efficiency:
    a. VFD system minimum efficiency shall be 93 percent at rated kilowatt output of the VFD. VFD system efficiency shall be calculated as follows:

$$Efficiency\ (\%) = \frac{Power\ (Load)}{\text{Power (Supply)}}\ X\ 100$$

    b. Power:
        1) Load power is the total 3-phase power measured at the output terminals of the drive system, including the output filter.
        2) Supply power is the total power measured at the input terminals of the VFD including phase shifting transformer or active front end components and auxiliary equipment (e.g., controls, fans) for complete system operation.
4. Total power factor:
    a. Minimum of 0.96 lagging across the entire speed range.
    b. Under no operating conditions shall the VFD have a leading power factor.
5. Frequency accuracy:
    a. Minimum of within 0.01 percent.
6. Speed regulation:
    a. Minimum of within 0.5 percent across the entire speed range.
7. Capable of working with all available power sources (utility and on-site generation) and with all new and existing VFDs.

2.03 MANUFACTURERS

A. One of the following or equal:
    1. ABB ACS880-3x (ULH Drive)

2.04 MATERIALS (NOT USED)

2.05 MANUFACTURED UNITS (NOT USED)

2.06 EQUIPMENT

A. General:
    1. Sinusoidal pulse width modulated, (PWM), voltage source type drive shall consist of the following:
        a. Rectifier section.
        b. Direct current link with capacitors.
        c. Insulated gate bipolar transistor (IGBT), inverter section.
        d. Microprocessor based controls.
        e. Output filter.

2. Rectifier section:
    a. Active front end rectifier (non-regenerative) – Ultra-low Harmonics:
        1) IGBT based converter module:
            a) Six IGBTs minimum.
        2) Inductor/capacitor/inductor, LCL, harmonic filter:
            a) Low pass filter.
            b) Installed within same enclosure as VFD.

B. Ratings:
1. Voltage:
    a. Input voltage: 480 Volts plus or minus 10 percent, 3-phase, 3-wire, 60 hertz.
    b. Solidly grounded.
2. Short-circuit rating:
    a. 65 kA RMS symmetrical.

C. Operational features:
1. Protective features:
    a. Annunciated at the keypad and available via network connection.
    b. Include the following protective features:
        1) Motor overload protection.
        2) Instantaneous overcurrent.
        3) Instantaneous overvoltage.
        4) Undervoltage.
        5) Power unit overtemperature.
        6) Phase loss.
        7) VFD output short circuit.
        8) VFD output ground fault.
        9) Blown fuse with blown fuse indication.
        10) IGBT protection.
        11) Cooling fan failure.
        12) Component failure.
        13) Motor overtemperature protection:
            a) Winding and bearing temperature:
                (1) From 100 ohm, platinum RTDS.
                (2) Quantity as specified in Section 16222 - Low Voltage Motors up to 500 hp and the driven equipment specification or as indicated on the Drawings.
2. Control mode:
    a. The VFD shall operate in either a constant volts/hertz or sensorless vector mode. Selectable using the programming keypad.
3. Frequency control:
    a. Minimum of 3 selectable skip frequencies with adjustable bandwidths.
    b. Programmable minimum frequency.
    c. Programmable maximum frequency.
4. Acceleration/Deceleration:
    a. Separately adjustable acceleration and deceleration rates.
    b. Each rate shall be adjustable from 0.01 to 1,800 seconds.
5. Spinning load:
    a. Capable of determining the speed and direction of a spinning load, “catch” the load and accelerate or decelerate it without damage to the load.

6. Programmable loss of signal:
    a. Upon loss of reference speed signal the VFD shall be programmable to either stop, maintain current speed, or default to preselected speed.
7. Power interrupt ride through:
    a. Capable of continuous operation in the event of a power loss of 5 cycles or less.
8. Hardwired inputs and outputs:
    a. Manufacturer's standard number the following:
        1) Analog inputs:
            a) Configurable as either 0 to 10 volts or 4 to 20 milliamperes.
        2) Analog outputs:
            a) Programmable 4 to 20 milliamperes isolated.
        3) Discrete inputs:
            a) Programmable.
        4) Discrete outputs:
            a) Programmable.
            b) Form C relay contacts.
        5) Potentiometer 3-wire input.
    b. Provide additional inputs and outputs as required to meet the control functions indicated on the Drawings.
9. Communications:
    a. Provide each VFD with a EtherNet/IP communications interface module.
    b. The use of gateways is not acceptable.
10. Real-time clock:
    a. Capable of providing time-stamped events.
    b. Set locally or via a remote controller.
    c. Programmable for day, month, year, local time zones in hours, minutes and seconds.
11. Diagnostics:
    a. Minimum of 4 fault conditions in memory on a first in-first out basis.
    b. Time stamped.
    c. Operating frequency, drive status and power mode shall also be stored at the time of the fault.
    d. Fault memory shall be maintained in the event of a power outage.
    e. The fault memory shall be accessible via Ethernet/IP.
12. Automatic restart:
    a. User selectable, automatic restart feature allowing the VFD to restart following a momentary power failure or other VFD fault:
        1) Programmable for up to 9 automatic restart attempts with an adjustable time delay between restart attempts.

2.07 COMPONENTS

A. Enclosure:
    1. NEMA Type 12.
    2. Provide cooling devices required to maintain the VFD within the manufacturer's specified temperature limits for the Project conditions:
        a. Provide cooling device alarm.

B. Power disconnect:
   1. Flange mounted thermal magnetic circuit breaker:
      a. Lockable in the OFF position.

C. Output filter:
   1. 3 percent load reactor.

D. Keypad:
   1. Furnished with a keypad for programming and control.
   2. Password security to protect drive parameters.
   3. Mounted on the door of the VFD.
   4. Back-lit LCD with a minimum of 2 lines of a minimum of 16 characters each.
   5. Programming and display features language: English.
   6. Capable of displaying the following parameters:
      a. Speed (percent).
      b. Input current (amperes).
      c. Output current (amperes).
      d. Output frequency (hertz).
      e. Input voltage.
      f. Output voltage.
      g. Total 3-phase kilowatt.
      h. Kilowatt hour meter.
      i. Elapsed run time meter.
      j. Revolutions per minute.
      k. Direct current bus voltage.
   7. In addition to all keys required for programming, the keypad shall have the following:
      a. Automatic/Manual selector.
      b. Start pushbutton.
      c. Stop pushbutton.
      d. Jog pushbutton.
      e. Speed increment.
      f. Speed decrement.
      g. Forward/Reverse selector.
      h. RUN indicator.
      i. PROGRAM indicator.
      j. FAULT indicator.
      k. DRIVE READY indicator.
      l. Diagnostics.
   8. Provide the VFD with the hardwired controls indicated on the Drawings.

E. Control power transformer:
   1. Furnish a control power transformer mounted and wired inside the drive enclosure:
      a. Primary and secondary fusing.
   2. Size the transformer to supply power to all VFD controls and options as well as any external devices indicated on the Drawings including the motor winding heater.

2.08 ACCESSORIES

A. Surge protection:
   1. Metal oxide varistors:
      a. Provide protection for the VFD against:
         1) Line transients: 5,000-volt peak minimum.
         2) Line to ground transients: 7,000-volt peak minimum.

B. Conformal coating:
   1. Provide conformal coating material applied to electronic circuitry and printed circuit boards to act as protection against moisture, dust, temperature extremes, and chemicals such as H_2S and chlorine.

C. Air filters:
   1. Mounted on the outside of the VFD enclosure:
      a. Replaceable without requiring that the VFD be turned off or the door opened.
   2. Located on the front or top of the VFD enclosure:
      a. Side or rear mounted air filters are not acceptable.

2.09 FABRICATION (NOT USED)

2.10 FINISHES

A. Enclosure finish shall be manufacturer's standard gray.

PART 3 EXECUTION

3.01 EXAMINATION (NOT USED)

3.02 PREPARATION

A. Anchoring and bracing to structures:
   1. Prepare equipment anchor setting template(s) and use to position anchors during construction of supporting structure(s).
   2. Install anchors of type and material indicated on approved anchoring designs.
   3. Install anchors with embedment indicated on approved anchoring designs.

3.03 INSTALLATION

A. Install the equipment in accordance with the accepted installation instructions and anchorage details.

B. General:
   1. Furnish all cables, conduit, lugs, bolts, and other accessories needed to complete installation of the VFD (free-standing or within motor control center).
   2. Assemble and install the VFD in the locations and with the layouts indicated on the Drawings.
   3. Perform Work in accordance with the manufacturer's instructions and shop drawings.

4. Furnish components, and equipment as required to complete the installation.
5. Replace any hardware lost or damaged during the installation or handling to provide a complete installation.
6. Install free-standing enclosures on a raised concrete housekeeping pad:
    a. Provide structural leveling channels in accordance with the manufacturer's recommendations to provide proper alignment of the units.
    b. Weld and/or bolt the VFD frame to the leveling channels.
7. Provide openings in top or bottom of the VFD (free-standing or within motor control center) enclosure for conduit only, no additional openings will be allowed:
    a. Improperly cut holes will require that the entire panel be replaced:
        1) No hole closers or patches will be allowed.
8. Bundle circuits together and terminate in each unit:
    a. Tie with nylon wire ties. As specified in Section 16123 - 600-Volt or Less Wires and Cables.
    b. Label all wires at each end with wire numbers shown on the approved Control Drawings.
    c. All connections to and from the VFD (free-standing or within motor control center) enclosure must be made via terminal blocks.

3.04 COMMISSIONING

A. As specified in Section 01756 - Commissioning.

B. Installation Verification:
    1. Furnish Manufacturer's Certificate of Installation Verification.

C. Functional Testing:
    1. As specified in Section 16950 - Field Electrical Acceptance Tests.

D. Owner Training:
    1. Perform Owner training as specified in Section 01756 - Commissioning.
    2. Topics:
        a. Operation topics limited to:
            1) Auto/Manual Control of VFD's.
        b. Maintenance topics limited to:
            1) Auto/Manual Control of VFD's.
            2) Troubleshooting VFD's.
    3. Number of sessions:
        a. Operations: 1 Session – 1 Hour.
        b. Maintenance: 1 Session – 2 Hours.

3.05 FIELD QUALITY CONTROL

A. As specified in Section 16050 - Common Work Results for Electrical.

B. Provide the services of a VFD manufacturer representative for start-up assistance and training:
    1. Inspection and field adjustment:
        a. Supervise the equipment installation and confirm controls have been properly installed, aligned, adjusted, and readied for operation.
        b. Configure AFE drives for all new and existing sources (utility sources and on-site generation in possible operating configurations).
    2. Start-up field testing:
        a. Provide technical direction for testing, checkout, and startup of the VFD equipment in the field.
        b. Under no circumstances are any portions of the drive system to be energized without authorization from the manufacturer's representative.
        c. Compliance with the following specified parameters shall be verified by the VFD manufacturer:
            1) Motor terminal voltage:
                a) Make field measurements at the motor connection box.
                b) Make measurements of the full speed range of the VFD.
                c) Make measurements with a recording type oscilloscope.
            2) Harmonics:
                a) Make field measurements at the input terminals of the VFD with and without the VFD in operation.
                b) Harmonic testing shall include utility power as well as generator standby power.
                c) Make measurements with a recording type harmonic analyzer displaying individual and total harmonic currents and voltages:
                    (1) Record currents and voltages for a minimum of 10 minutes.
                    (2) Analyzers using snapshots are not acceptable.
        d. All utility sources and on-site generation shall be operational for start-up field testing.

3.06 ADJUSTING

A. Make all adjustments as necessary and recommended by the manufacturer, Engineer, or testing firm.

B. Provide the services of a VFD manufacturer factory technician to make all drive parameter and protective device settings:
    1. Protective device settings provided by the VFD manufacturer in accordance with the manufacturer of the driven equipment requirements.
    2. Provide documentation of VFD settings included but not limited to:
        a. Minimum speed.
        b. Maximum speed.
        c. Skip speeds.
        d. Current limit.
        e. Acceleration time.
        f. Deceleration time.
        g. Carrier frequency.

C. Programming:
   1. Manufacturer/supplier may contract with the project Programmer for portions of the tasks below.
   2. Provide network communication card between the drive to the Owner's control system as required.
   3. Provide all control logic as indicated in the control descriptions.
   4. Configure all network communications with applicable security settings, IP addresses and any other addressing tables required to provide a fully functioning system.
   5. Coordinate all IP addresses with the Owner.
   6. Coordinate data exchange approach for efficient communications to the Owner's control and maintenance systems. This effort will include a coordination meeting to discuss the data exchange approach including formatting and mapping.

END OF SECTION

SECTION 16272

DRY-TYPE TRANSFORMERS

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Enclosed dry-type transformers:
      a. Rated 1 to 1,000 kilovolt-amperes, single and 3-phase.
      b. Primary voltage 600 volts and below.

1.02 REFERENCES

A. As specified in Section 16050 - Common Work Results for Electrical.

B. Institute of Electrical and Electronics Engineers (IEEE):
   1. 389 - IEEE Recommended Practice for Testing Electronics Transformers and Inductors.
   2. C57.12.01 - IEEE Standard General Requirements for Dry-Type Distribution and Power Transformers Including Those with Solid Cast and/or Resin Encapsulated Windings.
   3. C57.96 - IEEE Guide for Loading Dry-Type Distribution and Power Transformers.

C. Underwriters Laboratory (UL):
   1. 1561 - Standard for Dry-Type General Purpose and Power Transformers.

D. U.S. Department of Energy (DOE):
   1. 10 CFR Part 431 - Energy Efficiency Program for Certain Commercial and Industrial Equipment.

1.03 DEFINITIONS

A. As specified in Section 16050 - Common Work Results for Electrical.

1.04 SYSTEM DESCRIPTIONS

A. Provide 3-phase or 1-phase, 60 hertz dry-type with voltage ratings, kilovolt-ampere capacities, and connections as indicated on the Drawings:
   1. Transformers shall provide full capacity at the Project elevation and environmental conditions as specified in Section 01850 - Design Criteria after all derating factors have been applied.
   2. Suitable for continuous operation at full rating with normal life expectancy in accordance with IEEE C57.96.

1.05 SUBMITTALS

A. Furnish submittals as specified in Section 01330 - Submittal Procedures.

B. Product data:
   1. Catalog cutsheets.
   2. Nameplate data.
   3. Dimensions:
      a. Height.
      b. Width.
      c. Depth.
   4. Inrush current.
   5. Insulation system and temperature constraints.
   6. Number and rating of taps.
   7. Sound levels.
   8. Connection diagrams:
      a. Primary.
      b. Secondary.
   9. BIL rating.
   10. Required clearances.
   11. Percent impedance.
   12. Efficiency.
   13. Certification of full capacity capability at the Project elevation and ambient conditions.
   14. For equipment installed in structures designated as seismic design category C, D, E, or F submit the following as specified in Section01610 - Design Criteria:
      a. Manufacturer's statement of seismic qualification with substantiating test data.
      b. Manufacturer's special seismic certification with substantiating test data.

C. Installation instructions:
   1. Detail the complete installation of the equipment including rigging, moving, and setting into place.
   2. For equipment installed in structures designated as seismic design category A or B:
      a. Provide manufacturer's installation instructions and anchoring details for connecting equipment to supports and structures.
   3. For equipment installed in structures designated as seismic design category C, D, E, or F:
      a. Provide project-specific installation instructions and anchoring details based on support conditions and requirements to resist seismic and wind loads as specified in Section 01850 - Design Criteria.
      b. Submit anchoring drawings with supporting calculations.
      c. Drawings and calculations shall be stamped by a professional engineer registered in the state where the Project is being constructed.

1.06 QUALITY ASSURANCE (NOT USED)

1.07 DELIVERY, STORAGE, AND HANDLING (NOT USED)

1.08 PROJECT OR SITE CONDITIONS

A. As specified in Section 01850 - Design Criteria.

1.09 SEQUENCING (NOT USED)

1.10 SCHEDULING (NOT USED)

1.11 WARRANTY

A. As specified in Section 01783 - Warranties and Bonds.

1.12 SYSTEM START-UP (NOT USED)

1.13 OWNER'S INSTRUCTIONS (NOT USED)

1.14 MAINTENANCE (NOT USED)

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. One of the following or equal:
   1. GE by ABB.
   2. Jefferson.
   3. Schneider Electric.
   4. Eaton.
   5. ABB.

2.02 EXISTING PRODUCTS (NOT USED)

2.03 MATERIALS

A. Cores:
   1. Non-aging, grain-oriented silicon steel.
   2. Magnetic flux densities below the saturation point.

B. Windings:
   1. High-grade magnet wire.
   2. Impregnated assembly with non-hydroscopic, thermo-setting varnish:
      a. Cured to reduce hot-spots and seal out moisture.
   3. Material electrical grade:
      a. Copper.

2.04 MANUFACTURED UNITS (NOT USED)

2.05 EQUIPMENT

A. General:
   1. 10 kilovolts BIL for 600-volt class windings.

2. Sound levels, in accordance with IEEE 389 test conditions, not to exceed:

Kilovolt-Amperes Range	Audible Sound Level (db)
1-9	40
10-50	45
51-150	50
151-300	55
301-500	60
501-700	62
701-1000	64

3. Taps:
   a. 15 kilovolt-amperes and less:
      1) Two 5 percent full capacity primary taps below rated voltage.
   b. 25 kilovolt-amperes and larger:
      1) Four 2.5 percent full capacity primary taps below rated voltage.
      2) Two 2.5 percent full capacity primary taps above rated voltage.
   c. Operated by a tap changer handle or tap jumpers accessible through a panel.
4. Terminals:
   a. UL listed for either copper or aluminum conductors.
   b. Rated for 75 degrees Celsius.
5. Daily overload capacities, at rated voltage and without reduction in life, in accordance with IEEE C57.96.

B. Transformers less than 15 kilovolt-amperes:
   1. Insulation class: 185 degrees Celsius.
   2. Temperature rise: 115 degrees Celsius.

C. Energy efficient transformers 15 kilovolt-amperes and larger:
   1. Insulation class: 220 degrees Celsius.
   2. Temperature rise: 80 degrees Celsius, except as noted below:
      a. 150-degree Celsius rise for dry-type transformers located in motor control centers.
   3. Efficiency:
      a. In accordance with DOE 10 CFR Part 431.

D. Enclosures:
   1. Heavy gauge steel:
      a. Outdoor: Moisture and water resistant with rodent screens over all openings and in a weather-protected enclosure, NEMA Type 3R.
      b. Indoor: NEMA Type 2.
   2. Louvers to limit coil temperature rise to the value stated above, and case temperature rise to 50 degrees Celsius.
   3. Built-in vibration dampeners to isolate the core and coils from the enclosure:
      a. Neoprene vibration pads and sleeves.

2.06 COMPONENTS (NOT USED)

2.07 ACCESSORIES

A. Nameplates:
   1. Non-corrosive metal or UL listed non-metallic:
      a. Stamped, engraved or printed with the following information:
         1) Phases.
         2) Frequency.
         3) Kilovolt-ampere rating.
         4) Voltage ratings.
         5) Temperature rise.
         6) Impedance.
         7) Insulation class.
         8) BIL rating.
         9) Connection diagram.
         10) Weight.
         11) Manufacturer.
         12) The identification “transformer”.
         13) Classes of cooling.
         14) Tap voltage(s).
         15) Vector diagram.

2.08 MIXES (NOT USED)

2.09 FABRICATION (NOT USED)

2.10 FINISHES

A. Finish to consist of de-greasing, phosphate cleaning, and an electrodeposited manufacturer’s standard gray enamel rust-inhibiting paint.

2.11 SOURCE QUALITY CONTROL (NOT USED)

PART 3 EXECUTION

3.01 EXAMINATION (NOT USED)

3.02 PREPARATION (NOT USED)

3.03 INSTALLATION

A. Install the equipment in accordance with the accepted installation instructions and anchorage details to meet the seismic and wind load requirements at the Project site.

B. General:
   1. Mounted as indicated on the Drawings.
   2. Install where not in direct contact with building structure.
   3. Install on single layer vibration pad under the entire mounting surface.
      a. Manufacturers: The following or equal:
         1) Korfund.

4. Make any necessary connections to the enclosure with liquidtight flexible conduit having neoprene gaskets and insulated ground bushings.
5. Ground the enclosure:
    a. To an equipment ground conductor in the conduit.
    b. To the facility grounding electrode system.
6. Floor mounted transformers:
    a. Install transformers on a housekeeping pads.
    b. Install transformers with adequate space from walls or other enclosures for proper ventilation in accordance with the manufacturer's recommendations.

3.04 ERECTION, INSTALLATION, APPLICATIONS, CONSTRUCTION (NOT USED)

3.05 REPAIR/RESTORATION (NOT USED)

3.06 RE-INSTALLATION (NOT USED)

3.07 COMMISSIONING

A. As specified in Section 01756 - Commissioning.

B. Factory tests:
1. Applied voltage test to each winding and from each winding to the core:
    a. 600-volt class winding 4.5 kilovolt.
2. Induced voltage test at 2 times normal voltage and 400 hertz for 1,080 cycles.
3. Voltage ratio and polarity.
4. Sound level, performed in a test room with ambient sound level not exceeding 24 db.
5. Perform all tests in accordance with UL 1561.

3.08 FIELD QUALITY CONTROL (NOT USED)

3.09 ADJUSTING

A. Set the transformer taps as required to obtain nominal output voltage on the secondary terminals.

3.10 CLEANING

A. As specified in Section 16050 - Common Work Results for Electrical.

3.11 PROTECTION (NOT USED)

3.12 SCHEDULES (NOT USED)

END OF SECTION

SECTION 16285

SURGE PROTECTIVE DEVICES

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. High-energy surge protective devices.

1.02 REFERENCES

A. As specified in Section 16050 - Common Work Results for Electrical.

B. Institute of Electrical and Electronics Engineers (IEEE):
   1. C62.41.1 - Guide on the Surge Environment in Low-Voltage (1000 V and less) AC Power Circuits.
   2. C62.41.2 - Recommended Practice on Characterization of Surges in Low-Voltage (1000 V and Less) AC Power Circuits.
   3. C62.45 - Recommended Practice on Surge Testing for Equipment Connected to Low-Voltage (1000 V and Less) AC Power Circuits.
   4. C62.62- Standard Test Specifications for Surge Protective Devices (SPDs) for Use on the Load Side of the Service Equipment in Low Voltage (1000 V and less) AC Power Circuits.

C. National Fire Protection Agency (NFPA):
   1. 20 - Standard for the Installation of Stationary Pumps for Fire Protection.
   2. 75 - Standard for the Fire Protection of Information Technology Equipment.
   3. 780 - Standard for the Installation of Lightning Protection Systems.

D. Underwriters Laboratory (UL):
   1. 1283 - Standard for Electromagnetic Interference Filters.
   2. 1449 - Standard for Surge Protective Devices.

1.03 DEFINITIONS

A. As specified in Section 16050 - Common Work Results for Electrical.

B. Specific definitions:
   1. SPD: Surge protective device.
   2. SAD: Silicon avalanche diode.
   3. MOV: Metal oxide varistor.
   4. MCOV: Maximum continuous operating voltage.
   5. I_n: Nominal discharge current.
   6. VPR: Voltage protection rating.
   7. SCCR: Short circuit current rating.

1.04 SYSTEM DESCRIPTION

A. Surge protection as indicated on the Drawings.

1.05 SUBMITTALS

A. Furnish submittals as specified in Section 01330 - Submittal Procedures.

B. Product data:
   1. Furnish complete product data confirming detailed compliance or exception statements to all provisions of this Section.
   2. Manufacturer's catalog cutsheets indicating:
      a. Manufacturer and model numbers.
      b. Ratings of each SPD including but not limited to:
         1) Short circuit current rating.
         2) Nominal discharge current.
         3) Maximum continuous operating voltage.
         4) Voltage protection rating.
         5) System voltage.
         6) System frequency.
         7) Surge current capacity.
   3. Submit independent test data from a nationally recognized testing laboratory verifying the following:
      a. Overcurrent protection.
      b. UL 1449.

C. Shop drawings:
   1. Provide electrical and mechanical drawings by the manufacturer that detail:
      a. Unit dimensions.
      b. Weights.
      c. Components.
      d. Field connection locations.
      e. Mounting provisions.
      f. Connection details.
      g. Wiring diagram.

D. Operation and maintenance manuals:
   1. Provide the manufacturer's manual with installation, start-up, spare parts lists, and operating instructions for the specified system.

1.06 QUALITY ASSURANCE

A. Provide SPD units that are designed, manufactured, tested and installed in compliance with the following codes and standards:
   1. Institute of Electrical and Electronics Engineers (IEEE C62.41.1, C62.41.2, C62.45, C62.62).
   2. Federal Information Processing Standards Publication 94 (FIBS PUB 94).
   3. National Electrical Manufacturers Association (NEMA).
   4. National Fire Protection Association (NFPA 20, 75 and 780).
   5. National Electric Code (NFPA 70).

6. Underwriters Laboratories (UL 1449 4th Edition and UL 1283).
7. International Electrotechnical Commission (IEC 801).

1.07 DELIVERY, STORAGE, AND HANDLING (NOT USED)

1.08 PROJECT OR SITE CONDITIONS

A. As specified in Section 01850 - Design Criteria.

1.09 SEQUENCING

A. Coordinate with and provide SPD equipment to the electrical equipment manufacturer before final assembly and factory testing.

1.10 SCHEDULING (NOT USED)

1.11 WARRANTY

A. As specified in Section 01783 - Warranties and Bonds.

B. Extended warranty:
   1. Furnish a manufacturer’s full 5-year parts and labor warranty from date of shipment against any part failure when installed in compliance with manufacturer's written instructions, UL listing requirements, and any applicable national, state, or local electrical codes.
   2. Warranty shall include:
      a. Direct, factory trained employees must be available within 48 hours for assessment of the problem.
      b. A 24-hour toll-free 800-number for warranty support.

1.12 SYSTEM START-UP (NOT USED)

1.13 OWNER'S INSTRUCTIONS (NOT USED)

1.14 MAINTENANCE (NOT USED)

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. One of the following or equal:
   1. Southern Tier Technologies.
   2. Eaton.
   3. Schneider Electric.
   4. GE by ABB.

2.02 EXISTING PRODUCTS (NOT USED)

2.03 MATERIALS (NOT USED)

2.04 MANUFACTURED UNITS (NOT USED)

2.05 EQUIPMENT

A. Provide Type 1 or Type 2 SPD units as required for the locations indicated on the Drawings.

B. Electrical requirements:
   1. SPD ratings are to be consistent with the nominal system operating voltage, phase, and configuration as indicated on the Drawings.
   2. MCOV:
      a. For the SPD and all components in the suppression path (including all MOVs, SADs, and selenium cells): Greater than 115 percent of the nominal system operating voltage.
   3. Operating frequency:
      a. 47 to 63 hertz.
   4. SCCR:
      a. 65 kAIC minimum, but not less than the equipment it is connected to as indicated on the Drawings.
      b. The SCCR shall be marked on the SPD in accordance with UL 1449 and the NEC.
   5. Nominal discharge current I_n:
      a. 20 kA.
   6. Maximum VPR:

Modes	240/120 3W	208Y/120	480Y/277	480V
L-N, L-G, N-G	700	700	1,200	1,800
L-L	1,200	1,200	1,800	1,800

   7. Peak surge current:
      a. Service entrance locations:
         1) 240 kA per phase minimum.
         2) 120 kA per mode minimum.
      b. Branch locations:
         1) 120 kA per phase, minimum.
         2) 60 kA per mode minimum.

C. Protection modes:
   1. Provide SPD protection modes as follows:
      a. Line to Neutral (L-N) where applicable.
      b. Line to Ground (L-G).
      c. Neutral to Ground (N-G), where applicable.

D. Environmental requirements:
   1. Storage temperature:
      a. -40 degrees to 122 degrees Fahrenheit.
   2. Operating temperature:
      a. 32 degrees to 140 Fahrenheit.
   3. Relative humidity:
      a. 5 percent to 95 percent.

4. Audible noise:
    a. Less than 45 dBa at 5 feet (1.5 m).
5. Operating altitude:
    a. Zero to 12,000 feet above sea level.

E. Provide surge protective devices that are suitable for application in IEEE C62.41.1, C62.41.2 Category A, B and C3 environments, as tested to IEEE C62.45.

2.06 COMPONENTS

A. Enclosure:
1. Located in electrical equipment as indicated on the Drawings.

B. Internal connections:
1. Provide low impedance copper plates for intra-unit connections:
    a. Attach surge modules using bolted connections to the plates for low impedance connections.
2. Size all connections, conductors, and terminals for the specified surge current capacity.

C. Surge diversion modules:
1. MOV:
    a. Where multiple MOVs are used in parallel, utilize computer matched MOVs to within 1 volt variance and tested for manufacturer's defects.

D. Overcurrent protection:
1. Individually fuse all components, including suppression, filtering, and monitoring components:
    a. Rated to allow maximum specified nominal discharge current capacity.
    b. Overcurrent protection that limits specified surge currents is not acceptable.

E. Connections:
1. Provide terminals to accommodate wire sizes up to No. 2 AWG.

2.07 ACCESSORIES

A. Unit status indicators:
1. Provide red and green solid-state indicators, with printed labels, on the front cover to redundantly indicate on-line unit status:
    a. The absence of the green light and the presence of the red light indicate that surge protection is reduced and service is needed to restore full operation.
    b. Indicates the status of protection on each mode or phase.

B. Dry contacts for remote monitoring:
1. Electrically isolated Form C dry contacts (1 A/125 VAC) for remote monitoring of system integrity, and indication of under voltage, phase and/or power loss.

C. Provide an audible alarm which activates under any fault condition.
   1. Provide an alarm On/Off switch to silence the alarm.
   2. A visible LED will confirm whether alarm is On or Disabled.
   3. Locate both switches and the audible alarm on the unit's front cover.

2.08 MIXES (NOT USED)

2.09 MIXES (NOT USED)

2.10 FABRICATION (NOT USED)

2.11 FINISHES (NOT USED)

2.12 SOURCE QUALITY CONTROL

A. Permanently affix surge rating to the SPD.

B. Perform manufacturer's standard factory test:
   1. Perform testing in accordance with UL 1449.

PART 3 EXECUTION

3.01 EXAMINATION (NOT USED)

3.02 PREPARATION (NOT USED)

3.03 INSTALLATION

A. Follow the manufacturer's recommended installation practices and comply with all applicable codes.

B. Special techniques:
   1. Install SPDs internal to equipment with as short and straight conductors including ground conductor as practically possible:
      a. Twist the input conductors together to reduce input conductor inductance.
   2. Do not subject SPD to insulation resistance testing.

3.04 ERECTION, INSTALLATION, APPLICATION, CONSTRUCTION (NOT USED)

3.05 REPAIR/RESTORATION (NOT USED)

3.06 RE-INSTALLATION (NOT USED)

3.07 COMMISSIONING

A. As specified in Section 01756 - Commissioning.

3.08 FIELD QUALITY CONTROL

A. As specified in Section 16950 - Field Electrical Acceptance Tests.

3.09 ADJUSTING (NOT USED)

3.10 CLEANING (NOT USED)

3.11 PROTECTION (NOT USED)

3.12 SCHEDULES (NOT USED)

END OF SECTION

SECTION 16290

ELECTRICAL POWER MONITORING

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Power meters and accessories.

1.02 REFERENCES

A. As specified in Section 16050 - Common Work Results for Electrical.

B. American National Standard Institute (ANSI):
   1. C12.20 - Electricity Meters - 0.2 and 0.5 Accuracy Classes.

C. Institute of Electrical and Electronics Engineers (IEEE):
   1. C57.13.6 - Standard for High Accuracy Instrument Transformers.

1.03 DEFINITIONS

A. As specified in Section 16050 - Common Work Results for Electrical.

B. Specific definitions:
   1. FS - Full Scale.
   2. RDG - Of Reading.
   3. SSM - Solid State Multifunction Power Meter.
   4. THD - Total Harmonic Distortion.

1.04 SYSTEM DESCRIPTION (NOT USED)

1.05 SUBMITTALS

A. Furnish submittals as specified in Section 01330 - Submittal Procedures.

B. Product data:
   1. Power meter data including but not limited to:
      a. Power requirements.
      b. Communications protocols.
      c. Input/outputs.
      d. Dimensions.
      e. Measurement functions.
      f. Front panel controls.
      g. Display characteristics.
   2. Accessory data:
      a. Test switch dimensions and wiring diagrams.

C. Operation and maintenance manuals:
   1. Descriptive and technical bulletins and sales aids edited to reflect only the equipment to be provided and covering each of the components in the system.
   2. A maintenance section including all instruction leaflets and technical data necessary to setup, change setup and maintain the power meters.
   3. Original licensed copies of all software and software manuals.

D. Configuration files and reports:
   1. Settings including but not limited to:
      a. Device tag name.
      b. IP addresses.
      c. Alarm settings.
      d. Time synchronization settings.
      e. Security settings.
   2. Configuration files are to be provided in the selected manufacturer's native format.
   3. Configuration reports are to be submitted in .PDF format, listing each configured parameter setting and description of each parameter.

1.06 QUALITY ASSURANCE (NOT USED)

1.07 DELIVERY, STORAGE, AND HANDLING (NOT USED)

1.08 PROJECT OR SITE CONDITIONS

A. As specified in Section 01850 - Design Criteria.

1.09 SEQUENCING (NOT USED)

1.10 SCHEDULING (NOT USED)

1.11 WARRANTY

A. As specified in Section 01783 - Warranties and Bonds.

1.14 MAINTENANCE (NOT USED)

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. One of the following or equal:
   1. Allen-Bradley.
   2. Eaton.
   3. ABB.
   4. Schneider Electric.
   5. GE Multilin.

2.02 EXISTING PRODUCTS (NOT USED)

2.03 MATERIALS (NOT USED)

2.04 MANUFACTURED UNITS (NOT USED)

2.05 EQUIPMENT (NOT USED)

2.06 COMPONENTS

A. Power meters:
   1. Power meter type 2 (SSM2) device which shall include at a minimum:
      a. Individual phase currents, plus or minus 0.3 percent FS.
      b. Phase-to-phase and phase-to-neutral voltages, plus or minus 3 percent FS.
      c. Watts, VARs, VA, plus or minus 6 percent FS.
      d. Watt-hours 0.6 percent FS; VAR-hours 0.6 percent FS; VA-hours 0.6 percent FS.
      e. PF apparent 1 percent FS; PF displacement 1 percent FS.
      f. Frequency 0.17 percent FS.
      g. THD:
         1) Voltage - 31st harmonic.
         2) Current - 31st harmonic.
      h. Demand:
         1) Ampere, plus or minus 0.3 percent FS.
         2) Watt, VAR, VA, plus or minus 0.6 percent FS.
      i. Minimum and maximum values:
         1) Volts (L-L), volts (L-N), current (L), watts, VARs, VA.
         2) PF (apparent and displacement).
         3) Frequency.
         4) THD-amps, THD-volts.
         5) Demand:
            a) Ampere, watt, VAR, VA.
      j. Trend analysis:
         1) 2 selectable parameters.
      k. Other features:
         1) 3 form C relays, rated 10 amps.
      l. Synch-input kilowatt utility.
      m. Graphic LCD with LED backlight:
         1) Seven lines, 147 characters.
      n. Ethernet connection:
         1) Provide EtherNet/IP communication.

2.07 ACCESSORIES

A. Current transformers:
   1. Ring type current transformers:
      a. Suitable for service within low or medium voltage equipment as indicated on the Drawings.
      b. Designed to have a mechanical and thermal rating to withstand short-circuit current, stresses, and heating effects equal to the rating of the equipment of the application.
   2. Current ratio: As indicated on the Drawings.
   3. Rated in accordance with IEEE C57.13.6 with accuracy of the current transformers suitable for relay accuracy class and rated for 200 percent burden for the required connected devices.
   4. Identify polarity with standard marking or symbols.
   5. Capable of carrying rated primary current continuously without damage.
   6. Install secondary wiring from current transformers in a suitable wiring trough, or conduit to proper short-circuiting type terminal blocks for connection to relays, instruments, and other devices.

B. Test switches:
   1. Ten pole.
      a. 3 potential poles, for phase voltage.
         1) 600V rated.
      b. Four 30A, non-shorting current poles, for neutral current and let-thru phase currents.
      c. Three 30A, shorting current poles, for shorting phase currents.
   2. Base to be made of electrical grade plastic.
   3. Barriers between poles for pole isolation and separation.
   4. Clear cover encapsulating the test switch to enable visual verification of each switch position.
   5. Knife-blade type switches, accepting a horizontal gang interlocking bar.
   6. Screw type terminals on each switch.

ELECTRICAL SYSTEM STUDIES

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Short-circuit fault analysis study.
   2. Protective device coordination study.
   3. Arc-flash hazard study.

1.02 REFERENCES

A. As specified in Section 16050 - Common Work Results for Electrical.

B. Institute of Electrical and Electronics Engineers (IEEE):
   1. 1584 - IEEE Guide for Specification of Scope and Deliverable Requirements for an Arc-Flash Hazard Calculations Study in Accordance with IEEE Std 1584 (TM).

C. National Fire Protection Association (NFPA).

1.03 DEFINITIONS

A. As specified in Section 16050 - Common Work Results for Electrical.

1.04 SYSTEM DESCRIPTION

A. General study requirements:
   1. Scope:
      a. The short-circuit fault analysis, protective device coordination, and arc-flash hazard studies shall include all new and existing equipment in the power distribution system including, but not limited to:
         1) Utility equipment.
         2) All electrical equipment including:
            a) Dry-type transformers.
            b) Switchgears.
            c) Switchboards.
            d) MCCs.
            e) 480-volt panelboards.
            f) 240 and 208 volt panelboards.
         3) Generators.
         4) Motors.
         5) Vendor control panels.
         6) HVAC equipment.

b. Study scenarios:
    1) The studies shall include all possible electrical system configurations, for example:
        a) Operation on normal (utility) source.
        b) Operation on generator source.
        c) Parallel operation on normal and generator sources.
        d) A side feeder breaker close, and B side feeder breaker open for gears with A and B feeder configuration (only for WWTP).
        e) A side feeder breaker open, and B side feeder breaker close for gears with A and B feeder configuration (only for WWTP).
        f) Obtain, for all equipment, the required data for preparation of the study including, but not limited to:
    c. Transformer kilovolt-ampere (kVA) and impedances.
    d. Generator impedances.
    e. Generator decrement curves.
    f. Bus withstand ratings.
    g. Cable and bus data.
    h. Protective device taps, time dials, instantaneous pickups, and time-delay settings.
    i. As-built lengths for all new wire and cable installations covered by the studies.
2. Obtain the Electric Utility information on the minimum and maximum available fault current, minimum and maximum utility impedances, utility protective device settings including manufacturer and model number, interrupting ratings, X/R ratios, and model information one level above the point of connection:
    a. Utility tolerances and voltage variations.
3. The individual performing the studies shall visit the site and collect all necessary field data in order to perform and complete comprehensive electrical system studies.
4. Obtain equipment layouts and configurations from the manufacturer’s final submittal requirements and project layout drawings as required.
5. Bus and conductor data:
    a. Use impedances of the actual installed or specified conductors, unless otherwise indicated.
    b. Use cable and bus impedances calculated at 25 degrees Celsius, unless otherwise indicated.
    c. Use 600-volt cable reactance based on typical dimensions of actual installed or specified conductors, unless otherwise indicated.
    d. Use bus withstand values for all equipment having buses.
    e. Use medium-voltage cable reactance based on typical dimensions of shielded cables with 133-percent insulation levels, unless otherwise indicated.
6. Motors:
    a. Each motor shall be individually modeled:
        1) Grouping of motors for fault contribution current is not acceptable.
    b. Motors with variable frequency drives (VFDs) may be assumed to have no contribution to fault current, unless VFDs are equipped with Bypass Contactors.
        1) If VFDs are equipped with bypass contactors, perform the fault current and arc flash study assuming all of bypass contactors are in the closed position.

7. Use the equipment, bus, and device designations as indicated on the Drawings for all studies.
8. Studies shall include, but not be limited to, all equipment and connections shown on Contract Drawing:
    a. 03E01: WTP MODIFIED OVERALL ONE-LINE DIAGRAM.
    b. 03E06: SWBD70281 AND SWBD70282 ONE-LINE DIAGRAM.

B. Short-circuit fault analysis study additional requirements:
1. The short-circuit fault analysis shall be performed and submitted in 2 phases:
    a. Initial short-circuit fault analysis:
        1) Based on the Contract Documents and Electric Utility information.
        2) The initial short-circuit fault analysis study shall indicate the estimated available short-circuit current at the line side terminals of each piece of equipment covered by the scope of the study.
            a) Measure conductor lengths from the Drawings. Use of arbitrary short conductor lengths is not allowed.
        3) Provide a list of assumptions used in the initial study.
    b. Final short-circuit fault analysis:
        1) The final short-circuit fault analysis shall modify the initial analysis as follows:
            a) Utilize the actual equipment provided on the project.
            b) Utilize conductor lengths based on installation.
2. Calculate 3-phase bolted fault, line-to-line fault, line-to-ground fault, double line-to-ground fault, short-circuit 1/2 cycle momentary symmetrical and asymmetrical RMS, 1-1/2 to 4 cycle interrupting symmetrical RMS, and 30-cycle steady-state short-circuit current values at each piece of equipment in the distribution system.
3. Evaluate bus bracing, short-circuit ratings, fuse interrupting capacity and circuit-breaker-adjusted interrupting capacities against the fault currents, and calculate X/R values:
    a. Identify and document all devices and equipment as either inadequate or acceptable.
4. Calculate line-to-ground and double line-to-ground momentary short-circuit values at all buses having ground-fault devices.
5. Provide calculation methods, assumptions, one-line diagrams, and source impedance data, including utility X/R ratios, typical values, recommendations, and areas of concern.

C. Protective device coordination study additional requirements:
1. Furnish protective device settings for all functions indicated on the Drawings including, but not limited to:
    a. Current.
    b. Voltage:
        1) Provide settings for all voltage relays based upon actual utility and generator tolerances and specifications.
    c. Frequency:
        1) Provide settings for all frequency relays based upon actual utility and generator tolerances and specifications.
    d. Negative sequence.
    e. Reverse power.

f. Machine protection functions:
1) Provide settings for all motor and generator protective relays based on the manufacturer's recommended protection requirements.

2. Provide log-log form time-current curves (TCCs) graphically indicating the coordination proposed for the system:
a. Include with each TCC a complete title and one-line diagram with legend identifying the specific portion of the system covered by the particular TCC:
1) Typical TCCs for identical portions of the system, such as motor circuits, are acceptable as allowed by the Engineer.
b. Include a detailed description of each protective device identifying its type, function, manufacturer, and time-current characteristics:
1) These details can be included on the TCC.
c. Include a detailed description of each protective device tap, time dial, pickup, instantaneous, and time delay settings:
1) These details can be included on the TCC.

3. TCCs shall include all equipment in the power distribution system where required to demonstrate coordination. Include utility relay and fuse characteristics, medium-voltage equipment protective relay and fuse characteristics, low-voltage equipment circuit breaker trip device characteristics, transformer characteristics, motor and generator characteristics, and characteristics of other system load protective devices:
a. Include all devices down to the largest branch circuit and largest feeder circuit breaker in each motor control center, main breaker in branch panelboards, and fused disconnect switches.
b. Provide ground fault TCCs with all adjustable settings for ground fault protective devices.
c. Include manufacturing tolerances and damage bands in plotted fuse and circuit breaker characteristics.
d. On the TCCs, show transformer full load currents, transformer magnetizing inrush, ANSI transformer withstand parameters, and transformer damage curves.
e. Cable damage curves.
f. Terminate device characteristic curves at a point reflecting the maximum symmetrical or asymmetrical fault current to which the device is exposed based on the short-circuit fault analysis study.
g. Coordinate time interval medium-voltage relay characteristics with upstream and downstream devices to avoid nuisance tripping.

4. Site generation: When site generation (including cogeneration, standby, and emergency generators) is part of the electrical system, include phase and ground coordination of the generator protective devices:
a. Show the generator decrement curve and damage curve along with the operating characteristic of the protective devices.

5. Suggest modifications or additions to equipment rating or settings in a tabulated form.

D. Arc-flash hazard study additional requirements:
1. Include the calculated arc-flash boundary and incident energy (calories/square centimeter) at each piece of equipment in the distribution system:
a. Perform study with 15 percent arcing fault variation as defined by IEEE 1584.

b. Perform arc-flash calculations at minimum and maximum utility and generator fault contributions.
c. Perform arc-flash calculations for both the line side and load side of the switchgear, switchboard, motor control center, and panelboard main breakers.
d. Perform arc-flash calculations for all short-circuit scenarios with all motors on for 3 to 5 cycles and with all motors off.

2. Provide executive summary of the study results:
   a. Provide summary based upon worst case results.
3. Provide a detailed written discussion and explanation of the tabulated outputs:
   a. Include all scenarios.
4. Provide alternative device settings to allow the Owner to select the desired functionality of the system:
   a. Minimize the arc-flash energy by selective trip and time settings for equipment maintenance purposes.
   b. Identify the arc-flash energy based upon the criteria of maintaining coordination and selectivity of the protective devices.

E. Electrical system study meetings:
1. The individual conducting the short-circuit fault analysis, protective device coordination, and the arc-flash hazard studies shall meet with the Owner and Engineer 3 times.
2. The purpose of the 3 meetings is as follows:
   a. Initial meeting:
      1) Meet with the Owner and Engineer to discuss the scope of the studies.
         a) Confirm assumptions to be used in the electrical system study with the Owner including but not limited to:
            (1) Maximum protective device fault clearing time.
      2) Discuss the Owner's operational requirements for both normal operation and maintenance.
   b. Preliminary results meeting:
      1) This meeting will be held after the studies have been completed, reviewed, and accepted by the Engineer.
      2) The purpose of this meeting is to inform the Owner of the results of the study and impacts on normal operation and maintenance including:
         a) Protective device coordination problems and recommended solutions.
         b) Explanation of the arc-flash hazard study results and its potential impact on operations.
         c) Recommendations for reduction of arc-flash category levels including reduction of protective device settings or changes in operational practices.
   c. Final meeting:
      1) Discuss changes to the studies based on the previous meeting.
      2) Discuss with the Owner how changes to the electrical system may change the arc-flash hazard category.
   d. Deliver the final report after substantial completion.

3. The meetings will be at the Owner's facility:
    a. Provide a minimum of 3-weeks' notice to the Owner and Engineer in advance of the projected meeting date.
    b. Submit a draft of the meeting agenda when each meeting is requested.
4. Meeting materials:
    a. Prepare and provide the following materials:
        1) Meeting agenda. Include, at a minimum, the scope of the meeting, estimated time length for the meeting, and meeting goals.
        2) 6 copies of the project one-line diagrams for the initial meeting.
        3) 6 copies of the submitted studies.

F. Owner training:
1. Training shall include, but is not limited to:
    a. Introduction and basics of NFPA 70E: At least 1 hour.
    b. Detailed review of the electrical system study for at least 2 hours.
    c. Questions and Answers period: 0.5 hours.

G. By virtue of the fact that this is a professional study, the Owner reserves the right to modify the requirements of the study to comply with its operational requirements. The protective device coordination study and the arc-flash hazard study shall be modified based on the results of the meetings with the Owner.

1.05 SUBMITTALS

A. Furnish submittals as specified in Section 01330 - Submittal Procedures.

B. Initial studies and reports:
1. Include the following in the initial short-circuit current report:
    a. List of all devices included in the studies.
    b. A description of all operating scenarios.
    c. Form and format of arc-flash labels.

C. Final studies and reports:
1. Format and quantity:
    a. Provide 6 bound copies of all final reports.
    b. Provide 3 complete sets of electronic files on CD or DVD media, including the electrical system model(s), configuration files, custom libraries, and any other files used to perform the studies and produce the reports. Also provide an electronic version of the bound reports in PDF format.
    c. Provide the number of copies specified in Section 01330 - Submittal Procedures.
2. Include the sections below in the final report:
    a. Copies of correspondence and data obtained from the electric utility company.
    b. Letter certifying the inspection and verification of existing equipment.
    c. One-line diagrams:
        1) The following information shall be included at a minimum:
            a) Motor horsepower.
            b) Transformer data:
                (1) kVA.
                (2) Configuration.

c) Cable data:
(1) Insulation.
(2) Size.
(3) Length.
2) One-line diagrams shall be fully legible at 11-inch by 17-inch size.

d. Include in the short-circuit fault analysis study:
1) Descriptions, purpose, basis, assumptions, recommendations, and scope of the study.
2) Normal system connections and those that result in maximum fault conditions.
3) Tabulation of circuit breaker, fuse, and other protective device ratings compared to maximum calculated short-circuit duties.
4) Fault current calculations for the cases run including a definition of terms and guide for interpretation of computer software printouts.

e. Protective device coordination study shall include:
1) Descriptions, purpose, basis, assumptions, recommendations, and scope of the study.
2) List all requirements used in the selection and setting criteria for any protective devices.
3) Manufacturer's time-current curves for circuit breakers, fuses, motor circuit protectors, and other protective devices for all new equipment.
4) TCCs graphically indicating the coordination proposed for the system on log-log graphs:
a) All TCCs shall be in color.
5) Tabulation of relay, fuse, circuit breaker, and other protective devices in graphical form with a one-line diagram to display area coordination.
6) Where coordination could not be achieved, an explanation shall be included in the report to support the statement along with recommendations to improve coordination. Recommended equipment modifications or settings shall be in a tabulated form.

f. Include in the arc-flash hazard study:
1) Descriptions, purpose, basis, assumptions, recommendations, and scope of the study.
2) Normal system connections and those that result in maximum arc-flash conditions.
3) Arc-flash raw data, calculations, and assumptions.
4) Arc-flash label data:
a) Identifying the content of each label.
b) Identifying the location of each label.

D. Certification:
1. Submit written certification, sealed and signed by the professional engineer conducting the study, equipment supplier, and electrical subcontractor stating that the data used in the study is correct.

E. Submit the credentials of the individual(s) performing the study and the individual in responsible charge of the study.

F. The Engineer will review all studies and reports. After review, the Engineer will make recommendations and/or require changes to be made to the short-circuit fault

analysis, protective device coordination, or arc-flash hazard studies. These changes shall be provided as part of the scope of work.

G. Submit course outline for Owner's training.

1.06 QUALITY ASSURANCE

A. Qualifications of the entity responsible for electrical system studies:
   1. The studies shall be performed, stamped, and signed by a professional engineer registered in the state where the project is located.
   2. A minimum of 5 years of experience in power system analysis is required for the individual in responsible charge of the studies.
   3. The short-circuit fault analysis, protective device coordination, and arc-flash hazard studies shall be performed with the aid of a digital computer program:
      a. Point-to-point calculations are not acceptable.

B. The study shall be performed by an independent firm

1.07 DELIVERY, STORAGE, AND HANDLING (NOT USED)

1.08 PROJECT/SITE CONDITIONS (NOT USED)

1.09 SEQUENCING

A. Below is an outline of the typical work sequence. Proposed changes to the work sequence may be reviewed and approved by the Engineer.
   1. Site visit to gather data on the existing facility systems for all studies:
      a. Make multiple trips as required to obtain all data for the short-circuit fault analysis, protection device coordination, and arc flash hazard studies.
   2. Initial electrical system study meeting.
   3. Submit the initial short-circuit fault analysis study before submittal of any electrical equipment.
      a. Only the initial short-circuit results will be reviewed.
   4. Submit the preliminary short-circuit fault analysis, protective device coordination, and arc-flash hazard studies after the approval of all electrical equipment.
   5. Second electrical system study meeting for preliminary results.
   6. Update the model with all changes to the electrical system made during start-up and commissioning.
   7. Final arc-flash meeting and final short-circuit fault analysis, protective device coordination, and arc-flash hazard studies.
   8. Submit the final electrical system studies.
   9. Label equipment with approved arc-flash labels.
   10. Owner's training.

1.10 SCHEDULING (NOT USED)

1.12 SYSTEM START-UP (NOT USED)

1.13 OWNER'S INSTRUCTIONS (NOT USED)

1.14 MAINTENANCE (NOT USED)

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Electrical system study software: One of the following or equal:
   1. Operation Technology, Inc., ETAP.
   2. SKM Systems Analysis, Powertools.

2.02 EXISTING PRODUCTS (NOT USED)

2.03 MATERIALS (NOT USED)

2.04 MANUFACTURED UNITS (NOT USED)

2.05 EQUIPMENT (NOT USED)

2.06 COMPONENTS

A. Arc-flash hazard labels:
   1. Dimensions:
      a. Minimum 5 inches by 3.5 inches.
   2. Materials:
      a. Polyester with polyvinyl polymer over-laminate.
      b. Self-adhesive.
      c. Resistant to:
         1) UV.
         2) Chemicals and common cleaning solvents.
         3) Scuffing.
         4) Wide temperature changes.
   3. Contents:
      a. Short-circuit bus identification.
      b. Calculated incident energy (calories/square centimeter) range:
         1) Based on worst-case study results.
      c. Site specific personnel protective equipment level number.
      d. Arc-flash protection boundary.
      e. Shock hazard boundary:
         1) The Contractor may provide separate labels for indication of the shock hazard boundary.
      f. Fed from:
         1) Identify the tag number of the upstream equipment providing power.
   4. Color scheme:
      a. For locations above 40 calories/square centimeter:
         1) White label with red "DANGER" strip across the top.
         2) Black lettering.

b. For locations below 40 calories/square centimeter:
    1) White label with orange “WARNING” strip across the top.
    2) Black lettering.

2.11 SOURCE QUALITY CONTROL (NOT USED)

PART 3 EXECUTION

3.01 EXAMINATION (NOT USED)

3.02 PREPARATION (NOT USED)

3.03 INSTALLATION

A. After review and acceptance of the arc-flash hazard study by the Engineer, install all arc-flash hazard labels:
    1. Install labels at all locations required by NFPA, ANSI, or IEEE standards.
    2. At a minimum, install labels in the following locations:
        a. The front of each main or incoming service compartment.
        b. The front of each low-voltage switchgear section.
        c. The front of each accessible auxiliary or conductor compartment.
        d. Each accessible rear or side vertical section.
        e. Each motor control center vertical section.
        f. Each panelboard covered by the study.
        g. Each control panel, individual starter or VFD, or other equipment covered by the scope of the study.

B. After review and acceptance of the draft arc-flash hazard study and protective device coordination study by the Engineer, adjust protective device settings per final study prior to equipment energization.
    1. Devices that require power for configuration may be set during energization, but before any subfed loads are energized.
    2. Ensure that settings for upstream equipment are set prior to energizing downstream devices.

3.04 ERECTION, INSTALLATION, APPLICATION, AND CONSTRUCTION (NOT USED)

3.05 REPAIR/RESTORATION (NOT USED)

3.06 RE-INSTALLATION (NOT USED)

3.07 COMMISSIONING

A. As specified in Section 01756 - Commissioning.

3.08 FIELD QUALITY CONTROL

A. The individual performing the arc-flash hazard study shall direct the installation of the arc-flash hazard labels:
   1. Remove and replace any improperly applied labels.
   2. Repair the equipment finish damaged by removal of any label.
   3. Install labels level or plumb across the entire dimension of the label.

SECTION 16411

DISCONNECT SWITCHES

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Fusible and non-fusible disconnect switches.

1.02 REFERENCES

A. As specified in Section 16050 - Common Work Results for Electrical.

B. National Electric Manufacturer’s Association (NEMA):
   1. KS 1-2001 - Enclosed and Miscellaneous Distribution Equipment Switches (600 Volts Maximum).

C. Underwriters Laboratories Inc. (UL):
   1. 20 - General-Use Snap Switches.
   2. 98 - Enclosed and Dead-Front Switches.
   3. 508 - Standard for Industrial Control Equipment.

1.03 DEFINITIONS

A. As specified in Section 16050 - Common Work Results for Electrical.

B. Specific definitions:
   1. Safety switches and disconnect switches are to be considered synonymous.

1.04 SYSTEM DESCRIPTION

A. Provide heavy-duty type disconnect switches as indicated on the Drawings and specified in the Contract Documents.

B. Provide disconnect switches with the number of poles, voltage, current, short circuit, and horsepower ratings as required by the load and the power system.

1.05 SUBMITTALS

A. Furnish submittals as specified in Section 01330 - Submittal Procedures.

B. Product data:
   1. Manufacturer.
   2. Manufacturer's specifications and description.
   3. Ratings:
      a. Voltage.
      b. Current.

c. Horsepower.
d. Short circuit rating.
4. Fused or non-fused.
5. NEMA enclosure type.
6. Dimensions:
a. Height.
b. Width.
c. Depth.
7. Weight.
8. Cross-referenced to the disconnect schedule indicated on the Drawings.

C. Shop drawings:
1. Manufacturer's installation instructions:
a. Indicate application conditions and limitations of use stipulated by product testing agency specified under Quality Assurance, Regulatory Requirements below.
b. Include instructions for storage, handling, protection, examination, preparation, installation, and operation of product.
2. For each switch, indicate nameplate inscription, including voltage, circuit, fuse size (if applicable), and equipment served.

D. Installation instructions:
1. Provide anchorage instructions and requirement based on the seismic requirements at the Project Site as specified in Section 01850 - Design Criteria and calculations:
a. Stamped by a professional engineer registered in the state where the Project is being constructed.

1.06 QUALITY ASSURANCE

A. Regulatory requirements:
1. NEMA Type KS1 - Enclosed and Miscellaneous Distribution Switches (600 V Maximum).
2. UL 98 - Enclosed and Dead-Front Switches.

B. Disconnect switches shall be UL listed and labeled.

1.07 DELIVERY, STORAGE, AND HANDLING (NOT USED)

1.08 PROJECT OR SITE CONDITIONS

A. As specified in Section 01850 - Design Criteria.

1.09 SEQUENCING

A. Conduct the initial fault current study as specified in Section 16305 - Electrical System Studies and submit results for Engineer’s review.

B. After successful review of the initial fault current study, submit complete equipment submittal.

1.10 SCHEDULING (NOT USED)

1.11 WARRANTY

A. As specified in Section 01783 - Warranties and Bonds.

1.12 SYSTEM START-UP (NOT USED)

1.13 OWNER'S INSTRUCTIONS (NOT USED)

1.14 MAINTENANCE (NOT USED)

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. One of the following or equal:
   1. Schneider Electric.
   2. Eaton.
   3. GE by ABB.
   4. Siemens.
   5. Appleton.
   6. Crouse-Hinds.

2.02 EXISTING PRODUCTS (NOT USED)

2.03 MATERIALS (NOT USED)

2.04 MANUFACTURED UNITS (NOT USED)

2.05 EQUIPMENT

A. Switch mechanism:
   1. Quick-make, quick-break heavy-duty operating mechanisms:
      a. Provisions for padlocking the switch in the Off position.
      b. A minimum of 90-degree handle travel position between Off and On positions:
         1) Provide handle position indicators to identify the handle position.
      c. Full cover interlock to prevent opening of the switch door in the On position and to prevent closing the switch mechanism with the door open:
         1) With an externally operated override.

B. Switch interior:
   1. Switch blades visible when the switch is Off and the cover is open.
   2. Lugs:
      a. Front accessible.
      b. Removable.
      c. UL listed for 60/75-degree Celsius copper conductors.
   3. Current carrying parts completely plated to resist corrosion.

4. Removable arc suppressors to facilitate easy access to line side lugs.
5. Furnish equipment ground kits for every switch.

C. Fused switches:
   1. Furnish with fuses as indicated on the Drawings:
      a. Provide fuses as specified in Section 16494 - Low Voltage Fuses.
   2. UL approved for field conversion from standard Class H fuse spacing to Class J fuse spacing:
      a. Ratings 100 amperes through 600 amperes at 240 volts.
      b. Ratings 30 amperes through 600 amperes at 600 volts.
      c. Provide spring reinforced and plated fuse clips.

D. Ratings:
   1. UL horsepower rated for AC or DC with the rating not less than the load served.
   2. Current:
      a. 30 to 1,200 amperes.
   3. Voltage:
      a. 250 volts AC, DC.
      b. 600 volts (30 A to 200 A, 600 volts DC).
   4. Poles:
      a. 2, 3, 4, and 6 poles.
   5. UL listed short circuit ratings:
   6. Where not indicated on the Drawings, provide switches with the NEMA ratings specified in Section 16050 - Common Work Results for Electrical for the installed location.

E. Size, fusing and number poles as indicated on the Drawings or as required:
   1. Provide solid neutral where indicated on the Drawings.

2.06 COMPONENTS (NOT USED)

2.07 ACCESSORIES

A. Disconnect switches to have provisions for a field installable “B” type electrical interlock for position indication as indicated on the Drawings.

2.08 MIXES (NOT USED)

2.09 FABRICATION (NOT USED)

2.10 FINISHES (NOT USED)

2.11 SOURCE QUALITY CONTROL (NOT USED)

PART 3 EXECUTION

3.01 EXAMINATION (NOT USED)

3.02 PREPARATION (NOT USED)

3.03 INSTALLATION

A. Install the equipment in accordance with the accepted installation instructions and anchorage details to meet the seismic and wind load requirements at the Project site.

B. General:
   1. Use Myers hubs or bolt-on hubs for all conduit penetrations on NEMA Type 12, Type 4, and Type 4X enclosures.
   2. Provide all mounting brackets, stands, supports and hardware as required:
      a. Match finish and materials for all brackets, stands, and hardware with the switch installed.
      b. Provide adequate supporting pillar(s) for disconnect switches in accordance with the approved seismic calculations, and locate aboveground or above decks, where there is no structural wall or surface for box.
   3. When possible, mount switches rigidly to exposed building structure or equipment structural members:
      a. For NEMA Type 4 and Type 4X locations, maintain a minimum of 7/8 inch air space between the enclosure and supporting surface.
      b. When mounting on preformed channel, position channel vertically so that water may freely run behind the enclosure.
   4. Provide a nameplate for each disconnect switch:
      a. Provide per requirements specified in Section 16075 - Identification for Electrical Systems.

3.04 ERECTION, INSTALLATION, APPLICATION, CONSTRUCTION (NOT USED)

3.05 REPAIR/RESTORATION (NOT USED)

3.06 RE-INSTALLATION (NOT USED)

3.07 COMMISSIONING

A. As specified in Section 01756 - Commissioning.

3.08 FIELD QUALITY CONTROL

A. As specified in Section 16050 - Common Work Results for Electrical.

3.09 ADJUSTING (NOT USED)

3.10 CLEANING

A. As specified in Section 16050 - Common Work Results for Electrical.

3.11 PROTECTION (NOT USED)

3.12 SCHEDULES (NOT USED)

LOW VOLTAGE MOLDED CASE CIRCUIT BREAKERS

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Low voltage molded case circuit breakers.

1.02 REFERENCES

A. As specified in Section 16050 - Common Work Results for Electrical.

B. Underwriter's Laboratories (UL):
   1. 489 - Molded-Case Circuit Breakers, Molded-Case Switches, and Circuit-Breaker Enclosures.

1.03 DEFINITIONS

A. As specified in Section 16050 - Common Work Results for Electrical.

B. In accordance with UL 489.

1.04 SYSTEM DESCRIPTION

A. Molded case thermal magnetic, solid-state, or motor circuit protector type circuit breakers as indicated on the Drawings and connected to form a completed system.

1.05 SUBMITTALS

A. Furnish submittals as specified in Section 01330 - Submittal Procedures.

B. Product data:
   1. Catalog cutsheets.
   2. Manufacturer's time-current curves for all molded case circuit breakers furnished.

1.06 QUALITY ASSURANCE

A. Low voltage molded case circuit breakers shall be UL listed and labeled.

1.07 DELIVERY, STORAGE AND HANDLING (NOT USED)

1.08 PROJECT OR SITE CONDITIONS

A. As specified in Section 01850 - Design Criteria.

1.09 SEQUENCING (NOT USED)

1.10 SCHEDULING (NOT USED)

1.11 WARRANTY

A. As specified in Section 01783 - Warranties and Bonds.

1.12 SYSTEM START-UP (NOT USED)

1.13 OWNER'S INSTRUCTIONS (NOT USED)

1.14 MAINTENANCE (NOT USED)

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. One of the following or equal:
   1. Eaton.
   2. GE by ABB.
   3. Schneider Electric.
   4. ABB.

2.02 EXISTING PRODUCTS (NOT USED)

2.03 MATERIALS (NOT USED)

2.04 MANUFACTURED UNITS

A. General:
   1. Conforming to UL 489.
   2. Operating mechanism:
      a. Quick-make, quick-break, non-welding silver alloy contacts.
      b. Common Trip, Open and Close for multi-pole breakers such that all poles open and close simultaneously.
      c. Mechanically trip free from the handle.
      d. Trip indicating handle - automatically assumes a position midway between the manual ON and OFF positions to clearly indicate the circuit breaker has tripped.
      e. Lockable in the "OFF" position.
   3. Arc extinction:
      a. In arc chutes.
   4. Voltage and current ratings:
      a. Minimum ratings as indicated on the Drawings.
      b. Minimum frame size 100A.

5. Interrupting ratings:
    a. Minimum ratings as indicated on the Drawings.
    b. Modify as required to meet requirements of the short circuit fault analysis - as specified in Section 16305 - Electrical System Studies.
    c. Not less than the rating of the assembly (panelboard, switchboard, motor control center, etc.).

B. Motor circuit protectors:
    1. Instantaneous only circuit breaker as part of a listed combination motor controller.
    2. Each pole continuously adjustable in a linear scale with 'LO' and 'HI' settings factory calibrated.

2.05 EQUIPMENT (NOT USED)

2.06 COMPONENTS

A. Terminals:
    1. Line and load terminals suitable for the conductor type, size, and number of conductors in accordance with UL 489.

B. Case:
    1. Molded polyester glass reinforced.
    2. Ratings clearly marked.

C. Trip units:
    1. Provide thermal magnetic or solid-state trip units as indicated on the Drawings.
    2. Thermal magnetic:
        a. Instantaneous short circuit protection.
        b. Inverse time delay overload.
        c. Ambient or enclosure compensated by means of a bimetallic element.
    3. Solid state:
        a. With the following settings as indicated on the Drawings.
            1) Adjustable long time current setting.
            2) Adjustable long time delay.
            3) Adjustable short time pickup.
            4) Adjustable short time delay.
            5) Adjustable instantaneous pickup.
            6) Adjustable ground fault pickup as indicated on the Drawings.
            7) Adjustable ground fault delay as indicated on the Drawings.

D. Provide ground fault trip devices as indicated on the Drawings.

E. Molded case circuit breakers for use in panelboards:
    1. Bolt-on type:
        a. Plug-in type breakers are not acceptable.
    2. Ground fault trip devices as indicated on the Drawings.

2.07 ACCESSORIES

A. Lockable handle:
   1. Provide assembly to lock operating handle in 'OPEN' position.
   2. Where a molded case circuit breaker is located in a dedicated enclosure, provide a lockable handle. Reference the Electrical Specifications for additional locking requirements associated with other mounting installations.

2.08 MIXES (NOT USED)

2.09 FABRICATION (NOT USED)

2.10 FINISHES (NOT USED)

2.11 SOURCE QUALITY CONTROL

A. Test breakers in accordance with:
   1. UL 489.
   2. Manufacturer's standard testing procedures.

PART 3 EXECUTION

3.01 EXAMINATION (NOT USED)

3.02 PREPARATION (NOT USED)

3.03 INSTALLATION

A. Install breakers to correspond to the accepted shop drawings.

3.04 ERECTION, INSTALLATION, APPLICATION, CONSTRUCTION (NOT USED)

3.05 REPAIR/RESTORATION (NOT USED)

3.06 RE-INSTALLATION (NOT USED)

3.07 COMMISSIONING

A. As specified in Section 01756 - Commissioning.

3.08 FIELD QUALITY CONTROL (NOT USED)

3.09 ADJUSTING

A. Adjust trip settings in accordance with Protective Device Coordination Study as accepted by the Engineer and in accordance with manufacturer's recommendations.

B. Adjust motor circuit protectors in accordance with NEC and the manufacturer's recommendation based on the nameplate values of the installed motor.

3.10 CLEANING (NOT USED)

3.11 PROTECTION (NOT USED)

3.12 SCHEDULES (NOT USED)

END OF SECTION

SECTION 16422

MOTOR STARTERS

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Motor starters and contactors.

1.02 REFERENCES

A. Abbreviations:
   1. FVNR: Full voltage non-reversing.
   2. FVR: Full voltage reversing.
   3. PWS: Part winding start.
   4. RVAT: Reduced voltage auto transformer.
   5. RVSS: Reduced voltage solid state.
   6. TS1W: 2 speed 1 winding (consequent pole).
   7. TS2W: 2 speed 2 winding.

B. Definitions:
   1. Overload relay class: A classification of an overload relay time current characteristic by means of a number which designates the maximum time in seconds at which it will operate when carrying a current equal to 600 percent of its current rating.

C. Standards:
   1. Institute of Electrical and Electronics Engineers (IEEE).
   2. International Electrotechnical Commission (IEC):
      a. 801-1 - Electromagnetic Compatibility for Industrial-Process Measurement and Control Equipment - Part 1: General Information.
      b. 947-4 - Low-Voltage Switchgear and Control Gear.
   3. National Electrical Manufacturer's Association (NEMA):
      a. 250 - Enclosures for Electrical Equipment (1000 V Maximum). ICS 2-230 - Industrial Control and Systems: Controllers, Contactors, and Overload Relays Rated 600 V.
   4. Underwriters Laboratories, Inc. (UL):
      a. 508 - Standard for Industrial Control Equipment.
      b. 508A - Standard for Industrial Control Panels.

1.03 DELEGATED DESIGN

A. As specified in Section 01357 - Delegated Design Procedures.

B. Anchoring and bracing.

1.04 SUBMITTALS

A. Furnish submittals as specified in Section 01330 - Submittal Procedures:
   1. Submit motor starter data with equipment submittal.

B. Product data:
   1. Manufacturer.
   2. Catalog cutsheets.
   3. Technical information.
   4. Complete nameplate schedule.
   5. Complete bill of material.
   6. List of recommended spare parts.
   7. Confirmation that the overload relay class for each starter meets the requirements of the equipment and motor supplier.
   8. Electrical ratings:
      a. Phase.
      b. Wire.
      c. Voltage.
      d. Ampacity.
      e. Horsepower.
   9. Furnish circuit breaker submittals as specified in Section 16412 - Low Voltage Molded Case Circuit Breakers.

C. Shop drawings:
   1. Elementary and schematic diagrams:
      a. Provide 1 diagram for every starter and contactor.
      b. Indicate wire numbers for all control wires on the diagrams:
         1) Wire numbering as specified in Section 16075 - Identification for Electrical Systems.
      c. Indicate interfaces with other equipment on the drawings.

D. Delegated design submittals:
   1. Anchoring and bracing: Provide project-specific calculations based on support conditions and requirements to resist loads specified in Section 01850 - Design Criteria:
      a. To structures for equipment installed in structures designated as seismic design category C, D, E, or F.
      b. For equipment installed outdoors.
      c. For wall mounted equipment weighing 125 pounds or more.

E. Commissioning submittals:
   1. As specified in Section 01756 - Commissioning, including the following:
      a. Manufacturer’s representative qualifications.
      b. Certificates:
         1) Requirements as specified in this Section.
      c. Test Plans:
         1) Test requirements as specified in this Section.
      d. Test Reports.
      e. Manufacturer’s representatives field notes and data.
      f. Owner training.

F. Operation and maintenance manuals:
    1. Submit complete operating and maintenance instructions presenting full details for care and maintenance of equipment furnished or installed under this Section. Including but not limited to:
        a. Electrical ratings:
            1) Phase.
            2) Wire.
            3) Voltage.
            4) Ampacity.
        b. Complete bill of material.
        c. Manufacturer's operating and maintenance instructions starter and/or contactor component parts, including:
            1) Protective devices (fuses, breakers, overload relays, heater elements, etc.).
            2) Pilot devices.
        d. Complete renewal parts list.
        e. As-built drawings:
            1) Furnish as-built drawings for each starter and contactor indicating final:
                a) Wire numbers.
                b) Interfaces with other equipment.
            2) 11-inch by 17-inch format.

1.05 QUALITY ASSURANCE

A. Regulatory requirements:
    1. All starters and components shall be UL listed and labeled:
        a. UL 508 - Industrial Control Equipment.
        b. UL 508A - Industrial Control Panels.
    2. NEMA ICS 2 - Industrial Control and System Controllers; Contactors and Overload Relays Rated: 600 Volts.
    3. Combination starters shall be UL listed and labeled.

1.06 DELIVERY, STORAGE, AND HANDLING (NOT USED)

1.07 PROJECT OR SITE CONDITIONS

A. As specified in Section 01850 - Design Criteria.

1.08 ADMINISTRATIVE REQUIREMENTS (NOT USED)

1.09 WARRANTY

A. As specified in Section 01783 - Warranties and Bonds.

1.10 MAINTENANCE

A. Spare parts:
    1. Provide the following spare parts, suitably packaged and labeled with the corresponding equipment number:
        a. 1 spare fuse of each size and type per starter.

PART 2 PRODUCTS

2.01 GENERAL

A. Starters for motor control centers, individual enclosed starters, or control panels.

2.02 DESIGN AND PERFORMANCE CRITERIA

A. Provide equipment and components that are fully rated for the site elevation and operating environment where the equipment will be installed as specified in Section 01850 - Design Criteria and as indicated on the Drawings.

2.03 MANUFACTURERS

A. One of the following or equal:
   1. NEMA starters and contactors:
      a. ABB.
      b. Allen-Bradley.
      c. Eaton.
      d. Schneider Electric.
   2. Manual motor starters:
      a. ABB.
      b. Cutler-Hammer.
      c. Schneider Electric.
   3. Reduced voltage solid state starters:
      a. Eaton (Westinghouse Series 2100).

2.04 MATERIALS (NOT USED)

2.05 MANUFACTURED UNITS

A. General:
   1. Provide combination type starters with motor circuit protector or thermal-magnetic circuit breaker and control power transformer with ratings as indicated on the Drawings.
   2. NEMA size, design, and rated:
      a. NEMA Size 1 minimum.
   3. Coordinate motor circuit protector, thermal magnetic circuit breaker, or fusible disconnect, and overload trip ratings with nameplate horsepower and current ratings of the installed motor:
      a. If motors provided are different in horsepower rating than those specified or indicated on the Drawings, provide starters coordinated to the actual motors furnished.
   4. Provide starters NEMA Size 2 and larger with arc quenchers on load breaking contacts.
   5. Mount extended overload reset buttons to be accessible for operation without opening starter enclosure door.

B. Full voltage starters:
   1. Across-the-line full voltage magnetic starters.
   2. Rated for 600 volts.

3. Electrical characteristics as indicated on the Drawings.
4. Provide positive, quick-make, quick-break mechanisms, pad lockable enclosure doors.
5. Furnish starter with bi-metallic overload relays.
6. Double-break silver alloy contacts.
7. Remote indicators:
    a. Provide Form C dry contacts for remote indication of:
        1) Internal fault error.
        2) Undervoltage.
        3) Overvoltage.
        4) Phase reversal.
        5) Phase loss.
        6) Overload.
        7) Frequency out of range.
        8) Excessive starts per hour.
        9) Drive electronics over temperature.
        10) Stall.
        11) Jam.
        12) System failure.
        13) Starter failure.
        14) Run status.
        15) Full speed.

C. Manual motor starters:
1. General:
    a. Provide with number of poles as indicated on the Drawings or as required by the connected load.
    b. Provide handles that clearly indicate the On and Off (with lockout), positions.
    c. Switch shall have positive, quick-make, quick-break mechanisms.
2. Thermal overload switches:
    a. Provide thermal overloads in manual motor starters where integral overloads are not furnished with the motor.
    b. Size heater elements for approximately 115 percent of the nameplate full load current, for motors with a 1.15 service factor.
    c. Thermal overload units in all phase legs.
    d. Overload conditions interrupts all ungrounded conductors.
3. Enclosure:
    a. Provide the NEMA enclosure type specified in Section 16050 - Common Work Results for Electrical for the starter location.

D. RVSS:
1. Manufactured and tested in accordance with the applicable requirements of IEEE, UL, and NEMA, including the following:
    a. Dielectric withstand per UL 508.
    b. Noise and RF immunity per NEMA ICS-2.
2. Furnish with a motor circuit protector or thermal magnetic circuit breaker as indicated on the Drawings.
3. Provide protection against internal faults and high SCR temperature during operation of the motor including starting, running (except when bypassed), and stopping modes.

4. Capable of continuously delivering full rated current of the motor plus the motor service factor in ambient temperatures from 0 degrees Celsius to 40 degrees Celsius at the installed altitude.
5. Provide a magnetically operated bypass contactor in parallel with the solid state starter:
    a. The bypass contactor to energize when the motor has reached full speed:
        1) The electronic overload protection circuits must be fully functional with the bypass contactor closed.
6. RVSS control module requirements:
    a. Microcomputer based, and contains the required circuitry to drive the power semiconductors in the power section of the starter.
    b. Integrally mounted on the power section and requires no additional panel space or wiring.
    c. Mounted for easy wiring, testing, service, and replacement.
    d. Provide 3-phase current sensing.
    e. Quick disconnect plug-in connectors for current transformer inputs, line and load voltage inputs, and SCR gate firing output circuits.
    f. Operates on power supplied from a control power transformer.
    g. Phase insensitive or with phase rotation protection.
    h. Control modes:
        1) Soft start with adjustable linear ramp time and a “kick start” or “boost” feature to provide a short time (typically 0.1 seconds) application of approximately full voltage.
        2) Soft start with adjustable linear ramp time, with a current limit:
            a) The current limit shall be adjustable over the range of 2 to 4 times normal full load current.
        3) Reverse voltage ramp (line voltage to zero voltage):
            a) Adjustable from 2 to 30 seconds to provide smooth stop.
            b) Automatic shutdown at end of voltage ramp.
    i. Protective functions:
        1) Single phase protection.
        2) Under voltage protection.
        3) Short circuit electronic trip overcurrent protection. Time not to exceed 3 cycles.
        4) Inverse time running overcurrent protection.
        5) Auxiliary trip circuitry.
        6) Gate firing circuit lockout protection on trip.
        7) Jam and stall detection.
        8) Fault relay lockout protection.
        9) 100 percent to 130 percent full load running current trip adjustment.
        10) 100 percent to 450 percent of starting current limit adjustment.
        11) Dwell time at current limit with ramp continuation after acceleration.
        12) Individual light emitting diodes (LEDs) for trip and phase loss.
        13) Minimum and maximum initial starting voltage adjustments.
        14) Initial torque adjustment.
7. RVSS power section requirements:
    a. 3 sets of back-to-back phase-controlled power semiconductors:
        1) Minimum repetitive peak inverse voltage of 1,500 volts at 480 VAC.
        2) Resistor/capacitor snubber networks to prevent false firing of the SCRs.

3) Equipped with individual heat sink assemblies.
4) Provide high-speed fuses for protection of the SCR stacks against short circuit conditions.

b. Provide metal oxide varistors for surge protection on the line and load side power terminal connections:
1) Rated for a minimum of 120 joules.

c. Capable of supplying the following current levels:
1) 600 percent of full load current for a minimum of 10 seconds.
2) 450 percent of full load for a minimum of 30 seconds.

d. Furnish ground lugs, one for incoming and one for outgoing ground connections.

e. Furnish pressure type terminals for top or bottom entry power terminations.

8. Remote indicators:
a. Provide Form C dry contacts for remote indication of:
1) Internal fault error.
2) Undervoltage.
3) Overvoltage.
4) Phase reversal.
5) Phase loss.
6) Overload.
7) Frequency out of range.
8) Excessive starts per hour.
9) Drive electronics over temperature.
10) Stall.
11) Jam.
12) System failure.
13) Starter failure.
14) Run status.
15) Full speed.

2.06 EQUIPMENT (NOT USED)

2.07 COMPONENTS

A. Molded case circuit breakers:
1. Circuit breaker type and ratings as indicated on the Drawings.
2. Provide as specified in Section 16412 - Low Voltage Molded Case Circuit Breakers.

B. Contactors:
1. NEMA size as indicated on the Drawings.
2. Electrically held:
a. For lighting loads designed to withstand the initial inrush currents of ballast and lamp loads.
3. Factory adjusted and chatter free.
4. Auxiliary contacts:
a. Contact ratings as per NEMA A 600 rating:
1) Auxiliary contacts rated 10 amps at 600 volts.

b. Provide all contacts indicated on the Drawings, and any additional contacts required for proper operation.
c. Provide at least 1 normally open and 1 normally closed spare auxiliary contact.

5. Constructed in accordance with the following standards:
   a. UL 508.
   b. IEC 947-4:
      1) Type 1 coordination when protected by a circuit breaker.
      2) Type 2 coordination when protected by a suitable UL listed fuse.
   c. IEC 801-1 parts 2 through 6.

C. Overloads:
1. Bi-metallic overload relay:
   a. Class 20 protection.
   b. Ambient compensated.
   c. Interchangeable heater pack:
      1) 1 heater per phase.
      2) Coordinate with installed motor full load amps and service factor.
   d. Visible trip indicator.
   e. Push-to-trip test.
   f. Isolated normally open alarm contact.
   g. Normally closed trip contacts.
   h. Manual reset.

D. Control power transformer:
1. Furnish integral control power transformer capacity to power:
   a. All motor controls: Motor and starter accessories indicated on the Drawings or specified.
2. Primary and secondary fusing as indicated on the Drawings:
   a. Fusing sized by the manufacturer for the rating of the transformer furnished.
3. Control power transformer secondary voltage:
   a. As indicated on the Drawings.

2.08 ACCESSORIES

A. Lugs and terminals:
1. For all external connections of No. 6 AWG and larger.
2. UL listed for either copper or aluminum conductors.

B. Surge protective devices:
1. Furnish surge protection devices across the coil of each starter, contactor, and relay.

C. Pilot devices:
1. Provide pilot lights, switches, elapsed time meters, and other devices as specified or as indicated on the Drawings.
2. As specified in Section 17710 - Control Systems: Panels, Enclosures, and Panel Components.

D. Nameplates and wire markers:
   1. As specified in Section 16075 - Identification for Electrical Systems.

E. Conformal coating:
   1. Provide conformal coating material applied to electronic circuitry and printed circuit boards to act as protection against moisture, dust, temperature extremes, and chemicals such as H_2S and chlorine.

2.09 FABRICATION (NOT USED)

2.10 FINISHES (NOT USED)

2.11 SOURCE QUALITY CONTROL (NOT USED)

PART 3 EXECUTION

3.01 EXAMINATION (NOT USED)

3.02 PREPARATION

A. Anchoring and bracing to structures:
   1. Prepare equipment anchor setting template(s) and use to position anchors during construction of supporting structure(s).
   2. Install anchors of type and material indicated on approved anchoring designs.
   3. Install anchors with embedment indicated on approved anchoring designs.

3.03 INSTALLATION

A. Install the equipment in accordance with the accepted installation instructions and anchorage details.

B. Starters in motor control centers:
   1. Install as specified in Section 16444 - Low Voltage Motor Control Centers.

C. Starters in control panels:
   1. Install as specified in Section 17710 - Control Systems: Panels, Enclosures, and Panel Components.

D. Manual motor starters:
   1. Provide complete mounting brackets and hardware as necessary for complete support of manual motor starter at locations indicated on the Drawings.
   2. Mount manual motor starter rigidly to exposed building or equipment structural members.

3.04 COMMISSIONING

A. As specified in Section 01756 - Commissioning.

B. Source Testing (NOT USED).

C. Owner Training:
   1. Perform Owner training as specified in Section 01756 - Commissioning.
   2. Topics:
      a. Operation topics limited to:
         1) Soft Starter Operation and Control
      b. Maintenance topics limited to:
         1) Soft Starter Operation and Control
   3. Number of sessions:
      a. Operations 1.
      b. Maintenance 1.

3.05 FIELD QUALITY CONTROL

3.06 ADJUSTING

A. Make all adjustments as necessary and recommended by the manufacturer, Engineer, or testing firm.

B. Set all overloads and motor circuit protectors based on the nameplate values of the installed motor.

END OF SECTION

SECTION 16441

GROUP-MOUNTED CIRCUIT BREAKER SWITCHBOARDS

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Free standing, dead-front type metal-enclosed distribution, low voltage switchboards, utilizing group mounted circuit protective devices.

1.02 REFERENCES

A. As specified in Section 16050 - Common Work Results for Electrical.

B. National Electrical Manufacturers' Association (NEMA):
   1. PB-2 - Dead-front Distribution Switchboards.

C. Underwriters' Laboratories, Inc. (UL):
   1. 50 - Standard for Enclosures for Electrical Equipment.
   2. 891 - Switchboards.

1.03 DEFINITIONS

A. As specified in Section 16050 - Common Work Results for Electrical.

1.04 SYSTEM DESCRIPTION

A. Factory assembled, wired, and tested switchboards, with major components being products of a single manufacturer, including but not limited to, circuit breakers, bus and enclosure with accessories and features specified in this Section and indicated on the Drawings.

B. Description of sections:
   1. Space for future devices:
      a. Where indicated on the Drawings, space for future devices shall include:
         1) All necessary bus.
         2) Device supports.
         3) Device mounting equipment.
         4) Device connections to bus work.
         5) Wire troughs or raceway space.
         6) Unused device space shall be covered with blank code gauge steel covers or doors.

1.05 SUBMITTALS

A. Furnish submittals as specified in Section 01330 - Submittal Procedures.

B. Product data:
   1. Manufacturer of switchboard.
   2. Manufacturer of all component parts of switchboard.
   3. Weight of switchboard.
   4. Dimensions:
      a. Height.
      b. Length.
      c. Width.
   5. Nameplate schedule.
   6. Bill of material.
   7. Ratings:
      a. Voltage.
      b. Phase.
      c. Current.
      d. Interrupting rating (circuit breakers and fuses).
      e. Momentary current rating.
   8. List of recommended spare parts.
   9. Name and telephone number of manufacturer's authorized parts and repair provider.
   10. Furnish circuit breaker submittals as specified in:
      a. Section 16412 - Low Voltage Molded Case Circuit Breakers.
   11. For equipment installed in structures designated as seismic design category C, D, E, or F submit the following as specified in Section 01850 - Design Criteria:
      a. Manufacturer's statement of seismic qualification with substantiating test data.
      b. Manufacturer's special seismic certification with substantiating test data.

C. Shop drawings:
   1. Layout drawings:
      a. Complete, detailed, and scaled switchboard layout:
         1) Front panel.
         2) Sub-panels.
         3) Interior panels.
         4) Top and bottom conduit windows.

D. Installation instructions:
   1. Detail the complete installation of the equipment including rigging, moving, and setting into place.
   2. For equipment installed in structures designated as seismic design category A or B:
      a. Provide manufacturer's installation instructions and anchoring details for connecting equipment to supports and structures.
   3. For equipment installed in structures designated as seismic design category C, D, E, or F:
      a. Provide project-specific installation instructions and anchoring details based on support conditions and requirements to resist seismic and wind loads as specified in Section 01850 - Design Criteria.

b. Submit anchoring drawings with supporting calculations.
c. Drawings and calculations shall be stamped by a professional engineer registered in the state where the Project is being constructed.

E. Operating and maintenance manuals:
1. Submit operating instructions and a maintenance manual for the switchboard(s) furnished and/or installed under this Contract.
2. Operating instructions:
3. Maintenance manual:
a. Furnish maintenance manuals with instructions covering all details pertaining to care and maintenance of all equipment as well as data identifying all parts.
b. Manuals to include but are not limited to the following:
1) Adjustment and test instructions covering the steps involved in the initial test, adjustment, and start-up procedures.

F. Test forms and reports:
1. Submit complete factory acceptance test procedures and all forms used during the test.
2. Manufacturer to furnish a certified report after the shop tests.
3. Manufacturer to furnish a certified report after the start-up:
a. Report must state that the installation is complete and satisfactory, or list items requiring additional work and a proposal for the corrective actions.

G. Certification letters:
1. Provide a letter from the switchboard manufacturer that lists every paragraph, subparagraph etc. of this Section and states compliance or non-compliance with said paragraph. If non-compliance is indicated, provide an explanation for the deviation and alternative method to address the non-compliance.

H. Calculations:
1. Detailed calculations or details of the actual physical testing performed on the switchboard to prove the switchboard is suitable for the seismic requirements at the Project Site.

1.06 QUALITY ASSURANCE

A. Sections and devices shall be UL listed and labeled.

B. The manufacturer of this equipment shall have produced similar electrical equipment for a minimum period of 5 years. When requested by the Engineer, an acceptable list of installations with similar equipment shall be provided demonstrating compliance with this requirement.

1.07 DELIVERY STORAGE AND HANDLING

A. Ship the switchboard to the job site on a dedicated air ride vehicle that will allow the Contractor to utilize onsite off-loading equipment:

B. Furnish temporary equipment heaters within the switchboard to prevent condensation from forming.

1.08 PROJECT OR SITE CONDITIONS

A. As specified in Section 01850 - Design Criteria.

1.09 SEQUENCING

A. Conduct the initial fault current study as specified in Section 16305 - Electrical System Studies and submit results for Engineer's review.

B. After successful review of the initial fault current study, submit complete equipment submittal.

C. Conduct factory acceptance test and submit certified test results for Engineer's review.

D. Ship equipment to Project Site after successful completion of factory acceptance test.

E. Assemble equipment in the field.

F. Conduct field acceptance test and submit results for Engineer's review.

G. Submit manufacturer's certification that equipment has been properly installed and is fully functional for Engineer's review.

H. Conduct Owner's training sessions.

I. Commissioning as specified in Section 01756 - Commissioning.

1.10 SCHEDULING (NOT USED)

1.11 WARRANTY

A. As specified in Section 01783 - Warranties and Bonds.

1.12 SYSTEM START-UP (NOT USED)

1.13 OWNER'S INSTRUCTIONS (NOT USED)

1.14 MAINTENANCE (NOT USED)

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. The following, no equal, to match owner standard:
   1. GE by ABB.

B. Circuit breakers: Same manufacturer as the switchboard.

2.02 EXISTING PRODUCTS (NOT USED)

2.03 MATERIALS (NOT USED)

2.04 MANUFACTURED UNITS (NOT USED)

2.05 EQUIPMENT

A. Switchboard:
   1. Furnish low voltage Class 2 switchboards as specified and indicated on the Drawings.
   2. Provide complete and functional switchboards with required controls.
   3. Furnish and install devices or accessories not described in this Section but necessary for the proper installation and operation of the equipment.

B. Voltage ratings:
   1. Voltage level and configuration: As indicated on the Drawings.
   2. Frequency: 60 hertz.

C. Bus:
   1. General:
      a. Tin-plated copper.
      b. Bus cross-section in accordance with UL heat rise requirements.
      c. Current density of 1,000 amperes per square inch.
      d. Mounted on supports of high-impact, non-tracking insulators.
      e. Phase A-B-C bus arrangement:
         1) Top-to-bottom, left-to-right, front-to-back throughout the switchboard.
      f. Symmetrical short circuit current bracing of as indicated on the Drawings.
      g. Continuous current rating as indicated on the Drawings.
   2. Horizontal bus:
      a. Provisions for future connections to additional switchboard sections.
   3. Ground bus:
      a. Sized per UL 891.

D. Enclosure:
   1. General:
      a. Self-supporting structures bolted together to form the required line-up.
      b. All sections rear aligned.
      c. Dead-front.
      d. Conduit entry:
         1) Open-bottom.
         2) Removable top cover.
   2. Frame:
      a. Die-formed 12 gauge steel.
   3. Covers:
      a. Bolt-on.
      b. Code gauge steel.
      c. Removable front covers.
         1) Held in place by captive screws.
   4. Rating:
      a. NEMA Type 1.

2.06 COMPONENTS

A. Circuit breakers:
   1. General:
      a. Molded case circuit breakers as specified in Section 16412 - Low Voltage Molded Case Circuit Breakers.
   2. Main circuit breaker:
      a. Frame, trip and short circuit ratings as indicated on the Drawings.
      b. 100 percent rated.
   3. Feeder breakers:
      a. Frame, trip and short circuit ratings as indicated on the Drawings.

B. Wiring:
   1. Provide all necessary internal wiring, fuse blocks, and terminal blocks as required.
   2. Number all wires at each end and indicate wire numbers on shop drawings.
   3. Type SIS switchboard wire with at least 26 strands.
   4. Minimum wire size:
      a. No. 14 for control circuits.
      b. No. 12 for potential and current transformer circuits.
   5. Numbered and labeled in accordance with Section 16075 - Identification for Electrical Systems.

2.07 ACCESSORIES

A. Metering system:
   1. Include metering as indicated on the Drawings.
   2. Provide microprocessor based power meters as specified in Section 16290 - Electrical Power Monitoring.

B. Surge protective devices:
   1. Provide surge protective devices as indicated on the Drawings and as specified in Section 16285 - Surge Protective Devices.

C. Nameplates:
   1. Provide engraved plastic nameplates to identify:
      a. Switchboard units.
      b. Door mounted components.
      c. Interior mounted devices.
   2. As specified in Section 16075 - Identification for Electrical Systems.
   3. Engraved with the circuit number and circuit name as indicated on the Drawings.
   4. Manufacturers labels:
      a. Each vertical section shall have a label identifying:
         1) Serial number.
         2) Shop order number.
         3) Bus rating.
         4) Vertical section reference number.
         5) Date of manufacture.

D. Warning signs:
   1. Voltage:
      a. Provide a minimum of 2 warning signs on the front of the switchboard lineup and 2 on the back.
      b. Red laminated plastic engraved with white letters approximately 1/2 inch high.
      c. Signs shall read:
         1) "WARNING-HIGH VOLTAGE-KEEP OUT".
   2. Arc flash:
      a. Provide one warning sign for each switchboard compartment.
      b. Signs shall have read a minimum of:
         1) “DANGER ELECTRIC ARC FLASH HAZARD.”
         2) Signs shall meet the requirements of NFPA 70E and NEC Article 110.16.

E. Lugs:
   1. For all external connections of No. 6 AWG or larger.
   2. UL listed for copper or aluminum conductors.
   3. Rated for 75-degree Celsius conductors.
   4. Lugs shall be of the compression type in design requiring a hydraulic press and die for installation.

2.08 MIXES (NOT USED)

2.09 FABRICATION (NOT USED)

2.10 FINISHES

A. Chemically clean all steel surfaces before painting.

B. Exterior color manufacturer’s standard gray over phosphate-type rust inhibitor.

2.11 SOURCE QUALITY CONTROL (NOT USED)

PART 3 EXECUTION

3.01 EXAMINATION (NOT USED)

3.02 PREPARATION (NOT USED)

3.03 INSTALLATION

A. Install the equipment in accordance with the accepted installation instructions and anchorage details to meet the seismic and wind load requirements at the Project site.

B. General:
   1. Furnish all cables, conduit, lugs, bolts, expansion anchors, sealants, and other accessories needed to complete the installation of the switchboard.
   2. Assemble and install the switchboard in the location and layout indicated on the Drawings.
   3. Perform work in accordance with manufacturer's instructions and shop drawings.
   4. Furnish components and equipment as required to complete the installation.
   5. Replace any hardware lost or damaged during the installation or handling to provide a complete installation.
   6. Install the switchboard on a raised concrete housekeeping pad:
      a. Provide structural leveling channels in accordance with the manufacturer's recommendations to provide proper alignment of the units.
      b. Weld and/or bolt the switchboard frame to be to the leveling channels.

3.04 ERECTION, INSTALLATION, APPLICATION, CONSTRUCTION (NOT USED)

3.05 REPAIR/RESTORATION (NOT USED)

3.06 REINSTALLATION (NOT USED)

3.07 COMMISSIONING

A. As specified in Section 01756 - Commissioning.

B. Factory tests:
   1. Owner and Engineer will witness the factory acceptance test as specified in Section 16050 - Common Work Results for Electrical.
   2. Completely assemble, wire, and test the switchboard:
      a. Provide groups of wires leaving the shipping-assembled equipment with terminal blocks with suitable numbering strips.

3.08 FIELD QUALITY CONTROL

A. As specified in Section 16050 - Common Work Results for Electrical.

3.09 ADJUSTING

A. Make all adjustments as necessary and recommended by the manufacturer, Engineer, or testing firm.

3.10 CLEANING

A. As specified in Section 16050 - Common Work Results for Electrical.

3.11 PROTECTION (NOT USED)

3.12 SCHEDULES (NOT USED)

END OF SECTION

SECTION 16445

PANELBOARDS

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Panelboards serving feeder circuits and branch circuits.

1.02 REFERENCES

A. As specified in Section 16050 - Common Work Results for Electrical.

B. Underwriter's Laboratories, Inc. (UL):
   1. 67 - Standard for Panelboards.

1.03 DEFINITIONS

A. As specified in Section 16050 - Common Work Results for Electrical.

1.04 SYSTEM DESCRIPTION

A. Circuit breaker panelboards as indicated in the panelboard schedules, one-lines, and where indicated on the Drawings:
   1. Service voltage and configuration as indicated on the panel schedules.

1.05 SUBMITTALS

A. Furnish submittals as specified in Section 01330 - Submittal Procedures.

B. Product data:
   1. Manufacturer of panelboard.
   2. Bill of material.
   3. Assembly ratings including:
      a. Voltage.
      b. Phase.
      c. Continuous current.
      d. Short circuit interrupting rating.
   4. NEMA enclosure type.
   5. Cable terminal sizes based upon actual feeder and sub-feeder conductors used.
   6. Furnish circuit breaker submittals as specified in Section 16412 - Low Voltage Molded Case Circuit Breakers.
   7. For equipment installed in structures designated as seismic design category C, D, E, or F submit the following as specified in Section 01850 - Design Criteria:
      a. Manufacturer’s statement of seismic qualification with substantiating test data.
      b. Manufacturer’s special seismic certification with substantiating test data.

C. Shop drawings:
    1. Drawings to contain:
        a. Overall panelboard dimensions, interior panel dimensions, and wiring gutter dimensions:
            1) Height.
            2) Length.
            3) Width.
        b. Weight.
        c. Anchoring locations.
        d. Breaker layout drawing with dimensions:
            1) Location of the main, branches, solid neutral, and ground.
        e. Conduit entry/exit locations:
            1) Identify all conduit entry/exit locations and restrictions.
        f. Individual panel schedules identifying breaker locations, ratings, and nameplate designations within the panelboard, for every panelboard.

D. Installation instructions:
    1. Detail the complete installation of the equipment including rigging, moving, and setting into place.
    2. For equipment installed in structures designated as seismic design category A or B:
        a. Provide manufacturer's installation instructions and anchoring details for connecting equipment to supports and structures.
    3. For equipment installed in structures designated as seismic design category C, D, E, or F:
        a. Provide project-specific installation instructions and anchoring details based on support conditions and requirements to resist seismic and wind loads as specified in Section 01850 - Design Criteria.
        b. Submit anchoring drawings with supporting calculations.
        c. Drawings and calculations shall be stamped by a professional engineer registered in the state where the Project is being constructed.

E. Operations and maintenance manual:
    1. Provide a complete manual for the operation and maintenance of the panelboard, circuit breakers, devices, and accessories:
        a. Including but not limited to:
            1) Instruction narratives and bulletins.
            2) Renewal parts lists.
            3) Time-current curves for all devices.

F. Calculations:
    1. Detailed calculations or details of the actual physical testing performed on the panelboard to prove the panelboard is suitable for the seismic requirements at the Project Site.

1.06 QUALITY ASSURANCE

A. Panelboards shall be UL listed and labeled.
    1. Where indicated as service entrance equipment, panelboards shall be UL labeled and listed "Suitable for Service Entrance."

1.07 DELIVERY, STORAGE, AND HANDLING (NOT USED)

1.08 PROJECT OR SITE CONDITIONS

A. As specified in Section 01850 - Design Criteria.

1.09 SEQUENCING (NOT USED)

1.10 SCHEDULING (NOT USED)

1.11 WARRANTY

A. As specified in Section 01783 - Warranties and Bonds.

1.12 SYSTEM START-UP (NOT USED)

1.13 OWNER'S INSTRUCTIONS (NOT USED)

1.14 MAINTENANCE (NOT USED)

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. One of the following or equal:
   1. Eaton.
   2. GE by ABB.
   3. Schneider Electric.

B. Circuit breakers:
   1. Same manufacturer as the panelboard.

2.02 EXISTING PRODUCTS (NOT USED)

2.03 MATERIALS (NOT USED)

2.04 MANUFACTURED UNITS (NOT USED)

2.05 EQUIPMENT

A. Provide panelboards with:
   1. Molded-case circuit breakers with trip ratings as shown on the panel schedules.
   2. Spares and spaces for future circuit breakers in panels as shown on the panel schedules.

B. Short circuit rating:
   1. Provide panelboards with short-circuit ratings as indicated on the Drawings:
   2. Testing method in accordance with UL 67.
   3. Mark each panelboard with its maximum short circuit rating at the supply voltage.
   4. Panelboards shall be fully rated.

2.06 COMPONENTS

A. Enclosure:
   1. NEMA enclosure type as indicated on the Drawings.
      a. Where not indicated on the Drawings, as specified in Section 16050 - Common Work Results for Electrical for the installed location.
   2. Minimum width: 20 inches.
   3. Gutter space in accordance with the NEC:
      a. Minimum of 4 inches of gutter space.
   4. Dead-front, no live parts when the panelboard is in service.
   5. Enclose entire panelboard bus assembly in a corrosion resistant galvanized steel cabinet.
   6. 4-piece front to provide ease of wiring access.
   7. Lockable, hinged door over the protective devices with a flush, cylinder tumbler-type lock with catch and door pull.
      a. Minimum 2 keys per panelboard.
      b. Key all panelboard locks alike.
         1) Match locks on existing panelboards to the extent possible.
   8. Circuit directory frame and card on the inside of the door.
   9. Door-in-door construction consists of a one-piece front with 2 doors:
      a. The smaller door provides access to all device handles and rating labels and shall be lockable.
      b. The larger door provides access to all conductors and wiring terminals.
   10. Interior design such that replacement of circuit breakers does not require disturbing adjacent units or removal of the main bus connectors.
   11. Outdoor locations: Provide NEMA Type 4X enclosures with a NEMA Type 4X stainless steel outer enclosure (with a hinged door) and a NEMA Type 1 interior panelboard, unless otherwise indicated.

B. Bus:
   1. General:
      a. Tin-plated copper.
   2. Phase bus:
      a. Full size and height without reduction.
      b. Dimensions and temperature rise in accordance with UL 67:
         1) Limit current density to less than 1,000 amps per square inch.
      c. Insulate all current carrying parts from ground and phase-to-phase with a high dielectric strength insulator.
   3. Ground bus:
      a. Copper, solidly bonded.

4. Neutral bus:
    a. Provide where indicated on the Drawings.
    b. 100 percent rated.
    c. Provide lugs for each outgoing feeder requiring a neutral connection.
5. Provide insulation barriers over the vertical bus behind the dead front shield to provide increased safety during field service.

C. Lugs:
1. UL listed for copper and aluminum wire:
    a. Provide lugs rated for 75-degree Celsius terminations.
    b. Provide bolted or compression main lug terminations as required for the incoming cable size.

D. Circuit breakers: As specified in Section 16412 - Low Voltage Molded Case Circuit Breakers and as indicated on the Drawings:
1. Provide all circuit breakers with bolt-on connections:
    a. Plug-in circuit breakers are not allowed.

2.07 ACCESSORIES

A. Surge protective devices:
1. Furnish panelboards with surge protective devices as indicated on the Drawings.
2. As specified in Section 16285 - Surge Protective Devices.

B. Nameplates:
1. As specified in Section 16075 - Identification for Electrical Systems.
2. Install on outside of door.
3. Indicating:
    a. Panel designation.
    b. Voltage.
    c. Number of phases and configuration.

C. Circuit identification labels:
1. Provide index cards behind heavy clear plastic in cardholders on the inside of the doors.
2. Type all information on the cards using designations in the panel schedules.
3. Laminated on both sides.

D. Pad locking mechanism:
1. Provide a pad locking attachment to allow circuit breakers to be locked in the off position.
2. At a minimum, provide 1 mechanism per panelboard:
    a. Provide multiple mechanisms if required to accommodate all circuit breaker frame sizes in the panelboard.

2.08 MIXES (NOT USED)

2.09 FABRICATION (NOT USED)

2.10 FINISHES

A. Finish stand-alone panelboards with a primer, rust-resistant phosphate undercoat, and 2 coats of oven-baked enamel with manufacturer's standard gray.

B. Finish panelboards mounted in motor control centers to match the motor control center finish and color.

2.11 SOURCE QUALITY CONTROL (NOT USED)

PART 3 EXECUTION

3.01 EXAMINATION (NOT USED)

3.02 PREPARATION (NOT USED)

3.03 INSTALLATION

A. Install the equipment in accordance with the accepted installation instructions and anchorage details to meet the seismic and wind load requirements at the Project site.

B. General:
   1. Mounted as indicated on the Drawings.
   2. Mount rigidly to structural members with exposed surfaces plumb and level to within 1/32 inch.
   3. Perform work in accordance with the manufacturer's instructions and shop drawings.
   4. Provide all brackets, hangers, supports, and hardware for mounting as required.
   5. In all NEMA Type 4 and NEMA Type 4X locations, mount panelboards on 7/8-inch deep stainless steel preformed channel, with channel running vertically from top to bottom of panelboard:
      a. Use only stainless steel mounting hardware.
   6. Mount panelboard so that top operating handle is not more than 6 feet-7 inches above the operating floor.

3.04 ERECTION, INSTALLATION, APPLICATION, CONSTRUCTION (NOT USED)

3.05 REPAIR/RESTORATION (NOT USED)

3.06 RE-INSTALLATION (NOT USED)

3.07 COMMISSIONING

A. As specified in Section 01756 - Commissioning.

B. Factory testing:
   1. Perform standard factory tests on the panelboards:
   2. Test in accordance with the latest version of NEMA and UL standards.

3.08 FIELD QUALITY CONTROL

A. As specified in Section 16050 - Common Work Results for Electrical.

3.09 ADJUSTING (NOT USED)

3.10 CLEANING

A. As specified in Section 16050 - Common Work Results for Electrical.

3.11 PROTECTION (NOT USED)

3.12 SCHEDULES

A. Circuiting within the panelboard shall match the panel schedules as indicated on the Drawings.

B. Provide typewritten schedule in each panelboard.

END OF SECTION

SECTION 16494

LOW VOLTAGE FUSES

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Fuses: 600-volt class and lower.

1.02 REFERENCES

A. As specified in Section 16050 - Common Work Results for Electrical.

1.03 DELEGATED DESIGN (NOT USED)

1.04 SUBMITTALS

A. Furnish submittals as specified in Sections 01330 - Submittal Procedures.

B. Product data:
   1. Catalog cut sheets.
   2. Complete fuse schedule.
   3. Manufacturer original 11-inch by 17-inch, time current curves for all fuses furnished.

C. Shop drawings:
   1. Include drawings of spare fuse cabinets.

1.05 QUALITY ASSURANCE

A. All low voltage fuses shall be UL listed and labeled.

1.06 DELIVERY, STORAGE, AND HANDLING (NOT USED)

1.07 PROJECT OR SITE CONDITIONS

A. As specified in Section 01850 - Design Criteria.

1.08 ADMINISTRATIVE REQUIREMENTS (NOT USED)

1.09 WARRANTY

A. As specified in Section 01783 - Warranties and Bonds.

1.10 MAINTENANCE

A. Spare parts:
   1. Provide 3 spare fuses for each size and type used or supplied under any Section of the Contract Documents.
   2. Provide spare fuse cabinet(s):
      a. Metal cabinet with hinged door and shelves or fuse holders.
      b. Gray enamel finish.
      c. Mount near equipment and label "Spare Fuses" on face of cabinet.
      d. Suitable pocket inside door of each cabinet with typewritten spare fuse inventory in clear plastic protective insert.
      e. Provide as many cabinets as required to hold entire spare fuse inventory.

PART 2 PRODUCTS

2.01 GENERAL

A. Fuses for overcurrent protection and/or current limiting applications as indicated on the Drawings.

2.02 DESIGN AND PERFORMANCE CRITERIA (NOT USED)

2.03 MANUFACTURERS

A. One of the following or equal:
   1. Bussmann.
   2. Ferraz Shawmut.
   3. Littelfuse.

2.04 MATERIALS (NOT USED)

2.05 MANUFACTURED UNITS

A. General:
   1. Provide durable, readily visible label inside each fuse enclosure, clearly indicating the correct type, size, and ratings of replacement fuse:
      a. Label shall not cover or interfere with equipment manufacturer's instructions.
   2. Affix a label indicating recommended torque for fuse mounting bolts or studs to the inside of fuse access doors.
   3. To ensure selective coordination of protective devices:
      a. Provide fuses for new facilities by the same manufacturer.
      b. Provide fuses for renovations of the same manufacturer as existing fuses.
   4. Provide fuses rated for the voltage and available short circuit current at which they are applied.

B. Fuses for services, switchboard mains, feeders, and branch circuits:
   1. 600 amperes and less:
      a. Provide UL listed RK1 dual-element, time-delay fuses with ampere ratings as indicated on the Drawings except as may be modified by the Contract Documents.
   2. 601 to 6,000 amperes:
      a. Provide UL listed Class L fuses.

C. Fuses for motor branch circuits:
   1. Ampere ratings shall not exceed motor controller manufacturer's recommended values:
      a. If manufacturer does not have such standards, provide fuses as specified in this Section.
   2. Provide Class RK1 fuses or fuses as indicated on the Drawings and as specified in the Contract Documents, rated in accordance with the fuse manufacturer's recommendations for backup running protection of motor circuits containing overload relays.
   3. Determine fuse ratings for overload protection of motor branch circuits by actual full-load currents of motors provided.
   4. Fuses in motor control centers may be time-delay Class J or Class CC fuses, if MCC manufacturer's standard designs use these fuse types:
      a. Time-delay Class J fuse ratings shall not exceed 150 percent of motor full load current except as permitted.
      b. Follow fuse manufacturer's recommendations for Class CC fuses.
      c. A motor having starting duty or other special characteristics requiring larger fuses than specified above, may have branch circuit fuse ratings increased as necessary to meet motor's requirements, but no larger than maximum permitted by the NEC.
         1) Increased requirements for an individual motor shall not be cause for increasing size of all fuses.
   5. Provide Class L fuses for motor branch circuits requiring fuses over 600 amperes, sized at 150 percent of motor full load current except as permitted below:
      a. A motor having starting duty or other special characteristics requiring larger fuses than specified above, may have branch circuit fuse ratings increased as necessary to meet motor's requirements, but no larger than maximum permitted by the NEC.
         1) Increased requirements for an individual motor shall not be cause for increasing size of all fuses.

D. Fusing of control circuits:
   1. Provide:
      a. RK1 fuses installed in UL listed Class CC fuse blocks as specified in the Contract Documents.
   2. Provide minimum protection for control circuits in accordance with the latest revision of UL Standard 508 for Industrial Control.
   3. Fuse both the primary and secondary circuit of control power transformers:
      a. Fuse ratings shall be in accordance with NEC requirements.

PART 3 EXECUTION

3.01 EXAMINATION (NOT USED)

3.02 PREPARATION (NOT USED)

3.03 INSTALLATION

A. General:
   1. Install fuses properly aligned, electrically and mechanically secure.
   2. Evenly torque mounting bolts and nuts to ASTM recommendations for type and diameter of mounting bolts or studs provided.
   3. Paralleling of fuses is not permitted.
   4. Install fuses so that the fuse nameplate and rating are easily readable in the equipment.

B. Replace fuses, on all phases, for any fuses that opened during start-up and testing.

C. After completion of testing, deliver spare fuses in quantities specified:
   1. Fuses shall be new, in manufacturer's original packaging, and stored in a clean, dry location.

D. Install spare fuse cabinets where instructed by the Owner.

3.04 COMMISSIONING

A. As specified in Section 01756 - Commissioning.

END OF SECTION

SECTION 16510

LIGHTING: LED LUMINAIRES

PART 1 GENERAL

1.01 SUMMARY

A. Section includes: LED luminaires, drivers, poles, and accessories.

1.02 REFERENCES

A. As specified in Section 16050 - Common Work Results for Electrical.

B. Illuminating Engineering Society (IES):
   1. LM-79 - Approved Method: Optical and Electrical Measurements of Solid-State Lighting Products.
   2. LM-80 - Measuring Luminous Flux and Color Maintenance of LED Packages, Arrays and Modules.
   3. TM-21 - Projecting Long Term Lumen, Photon, and Radiant Flux Maintenance of LED Light Sources.
   4. RP-7 - Recommended Practice for Lighting Industrial Facilities.

C. Institute of Electrical and Electronics Engineers (IEEE):
   1. C62.41 - IEEE Recommended Practice for Surge Voltages in Low-Voltage AC Power Circuits.

D. National Electrical Manufacturers Association (NEMA):
   1. 410 - Performance Testing for Lighting Controls and Switching Devices with Electronic Drivers and Discharge Ballasts.

E. Underwriters Laboratories (UL):
   1. 1598 - Luminaires.
   2. 8750 - Light Emitting Diode (LED) Equipment For Use In Lighting Products.

1.03 DEFINITIONS

A. As specified in Section 16050 - Common Work Results for Electrical.

B. Specific definitions and abbreviations:
   1. CCT: Correlated color temperature - Scientific scale to describe how “warm” or how “cool” the light source is, measured in Kelvin. The lower the Kelvin temperature, the warmer the light feels, or appears.
   2. CRI: Color Rendering Index - A quantitative measure of the ability of a light source to reveal the colors of various objects faithfully in comparison with an ideal or natural light source.
   3. Driver - Device that manages power and controls the current flow from AC to DC for an LED lighting product.

4. Efficacy - Lumen output of a light source per unit of power supplied to that source (lumens per watt).
5. EMI: Electromagnetic Interference - Electrical interference (noise) generated by electrical and electronic devices.
6. FC: Foot Candles - Measure of light level on a surface being illuminated.
7. L70 - The extrapolated life in hours of the luminaire when the luminous output depreciates 30 percent from initial values.
8. LED: Light emitting diode - A solid-state semiconductor device that produces light when electrical current flows through it.
9. LED light source - See LED luminaire.
10. LED luminaire - A complete lighting unit consisting of LED-based light emitting elements and a matched driver together with parts to distribute light, to position and protect the light emitting elements, and to connect the unit to a branch circuit.
11. Lumen - The international (SI) unit of luminous flux or quantity of light. The amount of light that is spread over a square foot of surface by one candle power when all parts of the surface are exactly one foot from the light source.
12. Lumen ambient temperature multiplier - LED light source relative lumen output when compared to a standard ambient temperature.
13. Lumen maintenance factor - How well an LED light source is able to retain its intensity when compared to new.
14. Luminaire - Lighting unit.
15. THD: Total harmonic distortion - The combined effect of harmonic Distortion on the AC waveform produced by a driver or other device.

1.04 SUBMITTALS

A. Furnish submittals as specified in Section 01330 - Submittal Procedures.

B. Product data:
   1. LED Luminaires:
      a. Catalog literature for each luminaire specified, cross-referenced to the luminaire type on the Luminaire Schedule in the Drawings.
      b. Provide for each luminaire type:
         1) Materials.
         2) Type of diffuser.
         3) Hardware.
         4) Gasketing.
         5) Reflector.
         6) Chassis.
         7) Finish and color.
         8) Driver type and protection.
         9) LED luminaire:
            a) Initial lumen output at 40 degrees Celsius ambient.
            b) Correlated color temperature.
            c) Lumen maintenance factors.
            d) Lumen ambient temperature multipliers.
            e) Drive current.
            f) Efficacy.
         10) Picture of luminaire.
         11) IES optical distributions.

12) Dimensioned drawings:
    a) Effective projected area rating for pole mounted luminaires.
13) Weight.
14) Photometric data:
    a) Coefficient of utilization tables based on the IES zonal cavity system by an approved testing laboratory.
    b) Luminaire dirt depreciation factor.
    c) Candlepower distribution curves.
    d) Average luminaire brightness.
    e) Lumen output charts.
15) Furnish support method for interior luminaires weighing more than 30 pounds and all wall-mounted luminaires:
    a) Support methods shall be based on seismic requirements at the project site as specified in Section 01850 - Design Criteria.

c. Luminaire substitutions:
    1) Provide complete literature for each luminaire substitution:
    2) Submittals for substituted luminaires shall be sufficient for competent comparison of the proposed luminaire to the originally specified luminaire:
        a) Photometric data:
            (1) IES file in standard IES format.
            (2) Coefficient of utilization tables based on the IES zonal cavity system by an approved testing laboratory.
            (3) Candlepower distribution curves.
            (4) Average luminaire brightness.
            (5) Lumen output charts.
            (6) Power requirements in watts and volt-amperes.
        b) Calculations:
            (1) Provide software generated calculations showing illuminance levels in footcandles and power usage in watts per square foot for each of the areas in which substitutions are proposed:
                (a) Use surface reflectance values in accordance with IES RP-7.
                (b) Use manufacturer Projected Lumen Maintenance factor for minimum of 60,000 hours to perform all calculations.
        c) Specification sheets:
            (1) If lacking sufficient detail to indicate compliance with contract documents, standard specification sheets will not be accepted. This includes, but is not limited to, luminaire type designation, manufacturer's complete catalog number, voltage, LED type, CCT, CRI, specific driver information, system efficacy, L70 life rating, and any modifications necessary to meet the requirements of the contract documents.
    3) Substitutions for specified luminaires will be evaluated upon quality of construction, light distribution, energy use, appearance, and maintenance.
    4) Substitutions shall comply with all applicable building and energy codes.

2. Driver: Provide for each driver type:
    a. Catalog number.
    b. Type of driver.
    c. Output wattage.
    d. Input voltage.
    e. Operating voltage range.
    f. Maximum input power.
    g. Efficiency.
    h. Operating line current.
    i. Power factor.
    j. Operating temperature range.
    k. Current output range in ambient temperatures of 30 to 55 degrees Celsius.
    l. Surge suppression data.
3. Photocell:
    a. Provide for each photocell type:
        1) Switching capacity.
        2) Life expectancy when used on LED sources.
        3) The means of adjusting the lighting pickup level.
        4) Enclosure type.
        5) Mounting method.
4. Luminaire poles:
    a. Submit complete data for each pole type including but not limited to:
        1) Material.
        2) Finish and color.
        3) Handholes.
        4) Anchoring.
        5) Luminaire attachment methods and fittings.
        6) Pole height.
        7) Pole dimensions.
        8) Bolt hole circle layout and hardware.
        9) Accessories.
        10) Provide the EPA wind load rating.

C. Calculations:
1. Provide complete design calculations and installation documents for pole mounting piers and poles mounted from structures:
    a. Include in the calculations the wind and seismic requirements at the project site.
    b. Calculations and design shall be performed by and signed by a Professional Engineer registered in the state where the project is being constructed:

D. Record documents:
1. Update the Luminaire Schedule in the Drawings to reflect the acceptable substitutions, after the substitution has been reviewed and accepted by the Engineer.

1.05 QUALITY ASSURANCE

A. Luminaires shall be UL listed and labeled.

1.06 DELIVERY, STORAGE, AND HANDLING (NOT USED)

1.07 PROJECT OR SITE CONDITIONS

A. As specified in Section 01850 - Design Criteria.

1.08 SEQUENCING (NOT USED)

1.09 SCHEDULING

A. Exterior and outdoor lighting system operation shall be demonstrated during the hours of darkness.

B. Lighting demonstration shall occur within 2 weeks before substantial completion.

1.10 WARRANTY

A. As specified in Section 01783 - Warranties and Bonds.

B. LED luminaire:
   1. 5-year warranty from the date of installation including material, workmanship, photometrics, driver, and LED modules.

1.11 SYSTEM START-UP

1.12 OWNER'S INSTRUCTIONS (NOT USED)

1.13 MAINTENANCE

A. Furnish 1 complete spare LED luminaire, with driver, of each type used.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Luminaires:
   1. The following or equal:
      a. As noted on the Luminaire Schedule.

B. Drivers:
   1. One of the following or equal:
      a. Philips Advance.
      b. Thomas Research.
      c. eldoLED.

C. Substitutions:
   1. The lighting design and luminaire selection has been based upon the photometric data of the identified luminaire. It is the Contractor's responsibility to ensure and prove to the Engineer at time of submittal the substitutions meet the quality and photometric requirements of the original design.

2.02 SYSTEM DESCRIPTION

A. Provide luminaires, and accessories for all lighting systems, complete and operable, in accordance with the requirements of the Contract Documents.

B. Individual luminaire types are indicated on the Drawings and on the Luminaire Schedule.

2.03 EXISTING PRODUCTS (NOT USED)

2.04 MATERIALS (NOT USED)

2.05 MANUFACTURED UNITS (NOT USED)

2.06 EQUIPMENT

A. LED Luminaires:
   1. General:
      a. Pre-wired with leads of 18-AWG, minimum, for connection to building circuits.
      b. Provide the luminaires furnished per the Luminaire Schedule in the Drawings:
         1) The Specifications noted in this Section are an addition or supplement to the Luminaire Schedule.
      c. Individual LEDs connected such that a catastrophic loss or the failure of 1 LED will not result in the loss of the entire luminaire.
   2. Minimum ambient temperature range of 0 degrees Celsius to 40 degrees Celsius.
   3. Minimum rated life:
      a. Process Areas: 100,000 hours when operated at 40 degrees Celsius.
   4. Minimum efficacy of 70 lumens/watt.
   5. Minimum Color Rendering Index of 70.
   6. Tested according to IES LM-79 and LM-80.
   7. Lumen maintenance projection in accordance with IES TM-21.
   8. RoHS compliant.
   9. Integral driver.
   10. Suitable for dry, damp, or wet locations as indicated on the Drawings or on the Luminaire Schedule.
      a. Wet or damp locations: UL 1598 listed.
   11. Designed as a complete LED assembly. Retrofit LED lamps in luminaires not designed specifically for LED light sources shall not be used.
   12. Exterior/outdoor luminaires:
      a. Luminaires in combination with their mounting pole and bracket shall be capable of withstanding:
         1) Wind levels at the project site without damage.
         2) Seismic levels at the project site.
      b. Corrosion-resistant hardware and hinged doors or lens retainer.
      c. Luminaires furnished with integral photoelectrical control shall be of the luminaire manufacturer's standard design.

d. California Energy Code Light Pollution Reduction Compliance:
    1) Provide all exterior luminaires with cutoff photometrics.
        a) Luminaire design shall allow no more than 0.01 horizontal footcandles to escape beyond the site boundary.
    2) Provide exterior luminaires with photocells to automatically control exterior lighting dusk to dawn to turn off or lower the lighting levels during inactive periods. Reference the Drawings for specific luminaires to be controlled.

B. Photo-electric cells:
    1. Photoelectric cell for control of a single luminaire:
        a. Integral to the luminaire.

C. Drivers:
    1. Dimmable, with dimming signal protocol of 0-10 VDC or DALI.
    2. Input power source:
        a. As indicated on the Drawings.
    3. Drive current:
        a. As indicated in the Luminaire Schedule.
    4. Power factor: greater than 0.90.
    5. Efficiency: greater than 80 percent.
    6. Total harmonic distortion (THD) of the input current less than 20 percent.
    7. Rated life of 60,000 hours in an LED luminaire operated at an ambient temperature of 40 degrees Celsius.
    8. Minimum operating temperature of 0 degrees Celsius.
    9. Sound rating: Class A+ or quieter.
    10. UL listed Class 2 Outdoor in accordance with UL 8750.
    11. In accordance with IEEE C62.41 Category A for transient protection.
    12. Driver must limit inrush current:
        a. Meet or exceed NEMA 410 driver inrush standard:
            1) 230 Amps per 10 Amp load with a maximum of 106 Amps squared-seconds at 120V.
            2) 430 Amps per 10 Amp load with a maximum of 370 Amps squared-seconds at 277V.

2.07 COMPONENTS

A. Luminaire poles:
    1. As indicated on the Luminaire Schedule.
    2. Anchor bolts:
        a. Use anchor bolts, bolts, or welded studs for anchors for resisting seismic and wind forces.
            1) Standard hex bolt head.
            2) Do not use anchor bolts fabricated from rod stock with an L or J-shape.
        b. Complete with leveling shims.
    3. Anchor base:
        a. Fabricated from the same type of material as the pole shaft.
        b. Base plate to telescope the pole shaft.
        c. Welded top and bottom along the entire perimeter.
        d. With slotted bolt holes on the bolt circles as submitted.

4. Pole shaft:
    a. As indicated on the Luminaire Schedule.
5. Handhole:
    a. Reinforced handhole located approximately 18 inches above the base.
    b. Complete with cover fabricated from the same material as the pole shaft and stainless steel attachment screws.
    c. With an integral ground connection nut, 1/2 inch by 13 inch UNC welded to the pole for connection to the grounding system.
6. Shroud:
    a. Fabricated from the same type of material as the pole shaft.
    b. 1-piece formed channel section that shall conform to the pole shaft taper.
    c. Secured by a locking device with provisions for a padlock to prevent accidental lowering.
7. Fastening hardware:
    a. All fasteners shall be stainless steel.
8. Finish:
    a. As indicated on the Luminaire Schedule.

2.08 ACCESSORIES

A. Pole mounted convenience outlet:
    1. Where indicated, furnish a 120 Volt, GFCI protected receptacle:
        a. Integrally mounted in the pole shaft at 24 inches above the base.
    2. Complete with corrosion resistant and weatherproof cover.

2.09 MIXES (NOT USED)

2.10 FABRICATION (NOT USED)

2.11 FINISHES (NOT USED)

2.12 SOURCE QUALITY CONTROL (NOT USED)

PART 3 EXECUTION

3.01 EXAMINATION (NOT USED)

3.02 PREPARATION (NOT USED)

3.03 INSTALLATION

A. Install luminaires per the manufacturer’s guidelines and submitted installation calculations to meet seismic and wind requirements at the project site.

B. Special techniques:
    1. Support luminaires from structural elements capable of carrying the total weight.

2. Install luminaires plumb and square with building and wall intersections:
    a. Suspend pendant-mounted luminaries that are mounted from sloping ceilings with ball hangers, unless otherwise indicated on the Drawings.
    b. Install luminaires in machinery rooms after machines have been installed, so as to ensure no conflict with machinery, piping, or ductwork.
3. In all cases, coordinate luminaire locations with work of other trades to prevent obstruction of light from the fixtures:
    a. Locate bottom of luminaire approximately at the bottom of ductwork, unless otherwise specified or indicated on the Drawings.
4. Support luminaires weighing more than 25 pounds independently of the outlet box and the conduit.
5. Provide ceiling or pendent mounted luminaires with a safety chain connecting the lens, driver, and other components to the building structure.
6. Provide recessed luminaires with auxiliary safety supports attached directly to the building structure:
    a. The safety supports shall consist of number 12 AWG soft drawn galvanized wires.
7. Install luminaires in accordance with the architectural reflected ceiling Drawings:
    a. Center luminaires on ceiling tiles unless otherwise indicated.
8. Support luminaires installed in suspended grid ceilings, independently of the grid:
    a. Provide seismic restraint clips for all luminaires installed in suspended grid ceilings.

C. Luminaire poles:
1. Set poles on anchor bolts and secured with double nuts on each bolt.
2. Dry-pack the pole base, after the luminaire and pole has been leveled and plumbed.
3. Bond metal poles to the plant grounding system, utilizing a ground lug connection within the pole:
    a. Route ground conductor through pier and pole base sleeve using Schedule 40 PVC conduit.

3.04 ERECTION, INSTALLATION, APPLICATION, CONSTRUCTION (NOT USED)

3.05 REPAIR/RESTORATION (NOT USED)

3.06 RE-INSTALLATION (NOT USED)

3.07 COMMISSIONING

A. As specified in Section 01756 - Commissioning.

3.08 FIELD QUALITY CONTROL

3.09 ADJUSTING

A. Aim and verify all exterior and outdoor luminaires alignment, during dark evening hours, as directed by Owner or the Engineer.

3.10 CLEANING

A. Clean all lenses, diffusers, and reflectors.

B. Refinish all luminaires' trim, poles, and support brackets, where finish has been damaged.

C. Clean all LED luminaires (new and old), used during construction for construction lighting, before substantial completion.

D. Clean and re-lamp all existing fluorescent and HID luminaires used during construction for construction lighting, before substantial completion.

3.11 PROTECTION (NOT USED)

3.12 SCHEDULES

A. Refer to the Luminaire Schedule in the Drawings.

1.03 DEFINITIONS

A. Project definitions:
   1. As specified in Sections 01756 - Commissioning and 16050 - Common Work Results for Electrical.

B. Specific definitions:
   1. Testing laboratory: The organization performing acceptance tests.

1.04 SYSTEM DESCRIPTION

A. General requirements:
   1. Testing of all electrical equipment installed under this Contract in accordance with the manufacturer's requirements and as specified in this Section.
   2. Conduct all tests in the presence of the Engineer or the Engineer's representative:
      a. Engineer will witness all visual, mechanical, and electrical tests, and inspections.
   3. The testing and inspections shall verify that the equipment is operational within the tolerances required and expected by the manufacturer, and these Specifications.

B. Responsibilities:
   1. Contractor responsibilities:
      a. Ensure that all resources are made available for testing, and that all testing requirements are met.
   2. Electrical subcontractor responsibilities:
      a. Perform routine tests during installation.
      b. Demonstrate operation of electrical equipment.
      c. Commission the electrical installation.
      d. Provide the necessary services during testing, and provide these services to the testing laboratory, Contractor, and other subcontractors, including but not limited to:
         1) Providing electrical power as required.
         2) Operating of electrical equipment in conjunction with testing of other equipment.
         3) Activating and shutting down electrical circuits.
         4) Making and recording electrical measurements.
         5) Replacing blown fuses.
         6) Installing temporary jumpers.
   3. Testing laboratory responsibilities:
      a. Perform all acceptance tests specified in this Section.
      b. Provide all required equipment, materials, labor, and technical support during acceptance tests.

1.05 SUBMITTALS

A. General submittal requirements:
   1. Furnish submittals as specified in Section 01330 - Submittal Procedures.

B. Copper Ethernet test form:
   1. Cable test reports:
      a. Submit 3 copies of test reports showing the results of all tests specified in this Section:
         1) Test type.
         2) Test location.
         3) Test date.

4) Cable number.
5) Cable length.
6) Certification that the cable meets or exceeds the specified standard.

b. Furnish hard copy and electronic copy for all traces.

C. Manufacturers' testing procedures:
1. Submit manufacturers' recommended testing procedures and acceptable test results for review by the Engineer prior to beginning testing.

D. Test report:
1. Include the following:
a. Summary of Project.
b. Description of equipment tested.
c. Description of tests performed.
d. Test results.
e. Conclusions and recommendations.
f. Completed test forms.
g. List of test equipment used and calibration dates.
h. LAN cable test reports.

E. Test data records:
1. Include the following:
a. Identification of the testing organization.
b. Equipment identification.
c. Nameplate data.
d. Humidity, temperature and or other conditions that may affect the results of the tests and or calibrations.
e. Dates of inspections, tests, maintenance and or calibrations.
f. Indication of the inspections, tests, maintenance, and or calibrations to be performed and recorded.
g. Expected results when calibrations are to be performed.
h. Indication of as-found and as-left results as applicable.
i. Indication of all test results outside specified tolerances.

F. Testing laboratory qualifications:
1. Submit a complete resume and statement of qualifications from the proposed testing laboratory detailing their experiences in performing the tests specified:
a. This statement will be used to determine whether the laboratory is acceptable, and shall include:
1) Corporate history and references.
2) Resume of individual performing test.
3) Equipment list and test calibration data.

G. Division of responsibilities:
1. Submit a list identifying who is responsible for performing each portion of the testing.

1.06 QUALITY ASSURANCE

A. Testing laboratory qualifications:
   1. The testing laboratory may be qualified testing personnel from the electrical subcontractor's staff or an independent testing company.
   2. NETA certification required.
   3. Selection of the testing laboratory and testing personnel is subject to approval by the Engineer based on testing experience and certifications of the individuals and testing capabilities of the organization.

1.07 DELIVERY, STORAGE, AND PROTECTION (NOT USED)

1.08 PROJECT OR SITE CONDITIONS

A. General site and project conditions:
   1. As specified in Section 01850 - Design Criteria.

1.09 SEQUENCING

A. Prior to testing:
   1. At least 30 days before commencement of the acceptance tests, submit the manufacturer's complete field testing procedures to the Engineer and to the testing laboratory, complete with expected test results and tolerances for all equipment to be tested.

B. Perform testing in the following sequence:
   1. Perform routine tests as the equipment is installed including:
      a. Insulation-resistance tests.
      b. Continuity tests.
      c. Rotational tests.
   2. Adjusting and preliminary calibration.
   3. Acceptance tests.
   4. Demonstration.
   5. Commissioning and plant start-up.

1.10 SCHEDULING (NOT USED)

1.11 WARRANTY

A. As specified in Section 01783 - Warranties and Bonds.

1.12 SYSTEM START-UP (NOT USED)

1.13 OWNER'S INSTRUCTIONS (NOT USED)

1.14 MAINTENANCE (NOT USED)

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION

3.01 EXAMINATION (NOT USED)

3.02 PREPARATION

A. Test instrument calibration:
   1. Utilize a testing laboratory with a calibration program which maintains all applicable test instrumentation within rated accuracy.
      a. The calibrating standard shall be of better accuracy than that of the equipment tested.
   2. The accuracy shall be traceable to the NIST in an unbroken chain.
   3. Calibrate instruments in accordance with the following frequency schedule:
      a. Field instruments: 6 months maximum.
      b. Laboratory instruments: 12 months maximum.
      c. Leased specialty equipment where the accuracy is guaranteed by the lessor (such as Doble): 12 months maximum.
   4. Dated calibration labels shall be visible on all test equipment.
   5. Maintain an up-to-date instrument calibration record for each test instrument:
      a. The records shall show the date and results of each calibration or test.
   6. Maintain an up-to-date instrument calibration instruction and procedure for each test instrument.

B. Requirements prior to testing:
   1. Do not begin testing until the following conditions have been met:
      a. All instruments required are available and in proper operating condition.
      b. All required dispensable materials such as solvents, rags, and brushes are available.
      c. All equipment handling devices such as cranes, vehicles, chain falls and other lifting equipment are available or scheduled.
      d. All instruction books, calibration curves, or other printed material to cover the electrical devices are available.
      e. Data sheets to record all test results are available.

3.03 INSTALLATION

A. Test decal:
   1. The testing laboratory shall affix a test decal on the exterior of equipment or equipment enclosure of protective devices after performing electrical tests.

2. The test decal shall be color coded to communicate the condition of maintenance of the protective. The color scheme for condition of maintenance of overcurrent protective devices shall be:
    a. White: electrically and mechanically acceptable.
    b. Yellow; minor deficiency not affecting fault detection and operation, but minor electrical or mechanical condition exists.
3. The decal shall include the following information at a minimum:
    a. Testing organization.
    b. Project identifier.
    c. Test date.
    d. Technician identifier.

3.04 ERECTION, INSTALLATION, APPLICATION, CONSTRUCTION (NOT USED)

3.05 REPAIR/RESTORATION (NOT USED)

3.06 RE-INSTALLATION (NOT USED)

3.07 COMMISSIONING

A. General commissioning requirements:
    1. As specified in Section 01756 - Commissioning.

B. Testing and Training Phase: Installation Testing:
    1. Also called "Field Acceptance Testing".

C. Panelboards:
    1. Cleaning:
        a. Visually inspect panelboard for evidence of discoloration, abnormal dust accumulation, metal shards, or any other indication of overheating, wear, or other abnormal conditions prior to cleaning.
        b. Clean cabinet with a brush, vacuum cleaner, or clean, dry, lint-free rags to remove any accumulation of dust, dirt, or other foreign matter. Do not use liquids, solvents or detergents when cleaning panelboards or components.
        c. Avoid blowing dust into panelboards. Do not use a blower or compressed air.
        d. Clean Supports, terminals, and other major insulating surfaces with clean, dry, lint-free rags or soft bristled brushes.
        e. Remove dust, soot, grease, moisture, and foreign material from surface of circuit breakers.
    2. General:
        a. Compare equipment nameplate data with the Contract Documents.
        b. Check panelboard circuit schedule for accuracy.
        c. Verify appropriate anchorage, required area clearances, and correct alignment.
        d. Inspect overall general condition for physical damage. Check for broken studs and loose or damaged wires, connector, terminations, etc. Check all bolts, nuts, washer, and pins for tightness. Tighten or use manufacture’s replacement parts as required.

e. Inspect cabinets for signs of rust, corrosion, or deteriorating paint. Inspect cabinets for evidence of localized heat damage to the paint. Investigate sources of heat. Repair painted surfaces.
f. Check that covers are in place and fastened. Plug any open unused knockouts.
g. Inspect panelboard for moisture. Seal off any cracks or openings which have allowed moisture to enter the cabinet. Inspect all component devices. Replace any components that show evidence of damage from moisture.
h. Look for any recent changes in sprinklers or other plumbing that might expose indoor panelboards to a source of liquids. Eliminate sources of water, moisture, or liquids, or provide adequate barriers to protect panelboards from sources of water, moisture, or liquids.
i. Inspect panelboards and internal components for evidence of overheating, arc spatter, sooty deposits, and tracking. Investigate and correct sources of arcing or overheating. Consult the panelboard manufacturer for recommendations.
j. Verify that fuse and/or circuit breaker sizes and types correspond to record drawings, if available, as well as to the circuit breaker's address for microprocessor communications packages, if equipped.
k. Set adjustable circuit breakers in accordance with engineering coordination study supplied by Contractor.

3. Terminations, Connections, and Lugs:
   a. Inspect bolted electrical connections for high resistance using one of the following methods:
      1) Use of low-resistance ohmmeter.
         a) Compare bolted connection resistance values to values of similar connections:
            (1) Investigate values which deviate from those of similar bolted connections by more than 50 percent of the lowest value.
      2) Verify tightness of accessible bolted electrical connections by the calibrated torque wrench method:
         a) Refer to manufacturer's instructions for proper foot-pound levels or NETA ATS tables.
   b. Inspect terminations, connection, and lugs for alignment, physical damage, burns, corrosion, discoloration, flaking, heat damage, arcing, pitting, melting, deterioration, carbonization, cracks, chips, breaks, partial discharge, or moisture. Investigate and eliminate sources of any damage.
   c. Follow manufacturer recommendations for cleaning, repairing, and replacing damaged parts.
   d. Replace overheated connections. Tighten connections to proper torque levels as specified above.
4. Conductors and raceways:
   a. Inspect supply conductors and terminations for overheating, discoloration, and oxidation. Investigate and correct any deficiencies.
   b. Ensure the conductors are protected within their ampacities.
   c. Visually check panelboard, cables, and raceways for proper bonding and grounding. Correct improper bonding and grounding.

d. Inspect conductors for discoloration, arcing, pitting, melting, flaking of insulation and/or metal parts. Repair or replace damaged components in accordance with manufacturer's recommendations.
e. Inspect for frayed or broken wires. Replace or repair damaged components in accordance with manufacturer recommendations.
f. Inspect for frayed or broken wires. Replace or repair conductors as necessary.
g. Inspect conduits for moisture. Seal conduits which are a source of moisture and provide means to drain moisture away from the panelboard.

5. Circuit breakers:
   a. Breakers rated less than 100 A:
      1) Operate circuit breakers several times in order to exercise the mechanisms and the contacts, and to ensure smooth operation. Do not oil or grease parts of molded case circuit breakers.
      2) Visually check circuit breakers for evidence of overheating and thermal damage. Investigate and eliminate sources of overheating.
      3) Check circuit breakers for visual defects, chipping, cracks, breaks, burns, and deterioration. Replace damaged circuit breakers.
      4) Verify correct operation of any auxiliary features such as trip and pickup indicators, zone interlocking, electrical close and trip operation, trip-free, and antipump function.
      5) Inspect interchangeable trip-unit circuit breakers for tightness of trip units.
      6) Check circuit breaker terminals and connections for tightness as specified above.
   b. Breakers rated 100 A and higher:
      1) Perform visual and mechanical inspection as specified in this Section.
      2) Perform electrical tests as specified in this Section.

D. Switchgear and switchboard:
   1. Visual and mechanical inspection:
      a. Compare equipment nameplate data with the Contract Documents.
      b. Inspect physical and mechanical condition.
      c. Inspect anchorage, alignment, grounding and required area clearances.
      d. Verify the unit is clean and all shipping bracing, loose parts, and documentation shipped inside cubicles have been removed.
      e. Verify that circuit breaker/fuse sizes and types correspond to the approved submittals and the coordination study as well as to the circuit breakers address for microprocessor-communication packages.
      f. Verify that current and voltage transformer ratios correspond to those indicated on the Drawings.
      g. Verify that wiring connections are tight and that wiring is secure to prevent damage during routine operation of moving parts.
      h. Inspect bolted electrical connections for high resistance using one of the following methods:
         1) Use of low-resistance ohmmeter.
         2) Verify tightness of accessible bolted electrical connections by the calibrated torque wrench method:
            a) Refer to manufacturer's instructions for proper foot-pound levels or NETA ATS tables.

i. Verify operation and sequencing of interlocking systems:
   1) Attempt closure on locked-open devices.
   2) Attempt to open locked-closed devices.
   3) Make/attempt key-exchanges in all positions.
j. Verify appropriate lubrication on moving current-carrying parts and on moving and sliding surfaces.
k. Inspect insulators for evidence of physical damage or contaminated surfaces.
l. Verify correct barrier and shutter installation and operation.
m. Exercise all active components.
n. Inspect mechanical indicating devices for correct operation.
o. Verify that filters are in place and/or vents are clear.
p. Perform visual and mechanical inspection of instrument transformers as specified in this Section.
q. Perform visual and mechanical inspection of surge arresters as specified in this Section.
r. Inspect control power transformers:
   1) Inspect for physical damage, cracked insulation, broken leads, tightness of connections, defective wiring, and overall general condition.
   2) Verify that primary and secondary fuse/circuit breaker ratings match the submittal drawings.
   3) Verify correct functioning of drawout disconnecting contacts, grounding contacts, and interlocks.

2. Electrical tests:
   a. Perform resistance measurements through bolted connections with a low-resistance ohmmeter.
   b. Perform insulation-resistance tests on each bus section, phase-to-phase and phase-to-ground for 1 minute.
      1) Perform test in accordance with NETA ATS tables.
   c. Perform electrical tests on instrument transformers as specified in this Section.
   d. Perform ground-resistance tests:
      1) Perform point-to-point tests to determine the resistance between the main grounding system and all major electrical equipment frames, system neutral and derived neutral points.
   e. Test metering devices as specified in this Section.
   f. Control power transformers:
      1) Perform insulation-resistance tests. Perform measurements from winding-to-winding and each winding-to-ground:
         a) Test voltages shall be in accordance with NETA ATS tables or as specified by the manufacturer.
         b) Perform a turns-ratio test on all tap positions.
      2) Perform secondary wiring integrity test:
         a) Disconnect transformer at secondary terminals and connect secondary wiring to a rated secondary voltage source:
            (1) Verify correct potential at all devices.
      3) Verify correct secondary voltage by energizing primary winding with system voltage:
         a) Measure secondary voltage with the secondary wiring disconnected.

g. Perform current injection tests on the entire current circuit of each switchgear or switchboard:
    1) Perform current tests by secondary injection with magnitudes such that a minimum current of 1.0 ampere flows in the secondary circuit:
        a) Verify the correct magnitude of current at each device in the circuit.
h. Perform system function tests.
i. Verify operation of space heaters.
j. Perform electrical tests of surge arresters as specified in this Section.

3. Test values:
    a. Compare bolted connection resistance values to values of similar connections:
        1) Investigate values which deviate from those of similar bolted connections by more than 50 percent of the lowest value.
    b. Bolt-torque levels shall be in accordance with manufacturer's published data:
        1) Refer to NETA ATS tables in the absence of manufacturer's published data.
    c. Insulation-resistance values of bus insulation shall be in accordance with manufacturer's published data:
        1) Refer to NETA ATS tables in the absence of manufacturer's published data.
        2) Investigate insulation values less than the allowable minimum.
        3) Do not proceed with dielectric withstand voltage tests until insulation-resistance values are above minimum values.
    d. If no evidence of distress or insulation failure is observed by the end of the total time of voltage application during the dielectric withstand test, the test specimen is considered to have passed the test.
    e. Instrument transformer test values shall be as specified in this Section.
    f. Meter test values shall be as specified in this Section.
    g. Investigate grounding system point-to-point resistance values that exceed 0.5 ohm.
    h. Control power transformers:
        1) Insulation-resistance values of control power transformers shall be in accordance with manufacturer's published data:
            a) Refer to NETA ATS tables in the absence of manufacturer's published data.
            b) Investigate insulation values less than the allowable minimum.
        2) Turns-ratio test results shall not deviate by more than 1/2 percent from either the adjacent coils or the calculated ratio.
            a) Do not proceed with dielectric withstand voltage tests until insulation-resistance values are above minimum values.
        3) Secondary wiring shall be as indicated on the Drawings and specified in the Specifications.
        4) Secondary voltage shall be as indicated on the Drawings.
    i. Current-injection tests shall prove current wiring is as indicated on the Drawings and specified in the Specifications.
    j. Results of system function tests shall match the drawings and Specifications.
    k. Heaters shall be operational.

l. Phasing checks shall prove the switchgear or switchboard phasing is correct and in accordance with the system design.
m. Results of electrical tests on surge arresters shall be as specified in this Section.

E. Dry type transformers:
1. Visual and mechanical inspection:
a. Compare equipment nameplate data with the Contract Documents.
b. Inspect physical and mechanical condition.
c. Inspect anchorage, alignment, and grounding.
d. Verify that resilient mounts are free and that any shipping brackets have been removed.
e. Inspect equipment for cleanliness.
f. Inspect bolted electrical connections for high resistance using one of the following methods:
1) Use of low-resistance ohmmeter.
2) Verify tightness of accessible bolted electrical connections by the calibrated torque wrench method:
a) Refer to manufacturer's instructions for proper foot-pound levels or NETA ATS tables.
g. Verify that as-left tap connections are as specified.
2. Electrical tests:
a. Perform resistance measurements through bolted connections with a low-resistance ohmmeter.
b. Perform insulation-resistance tests winding-to-winding and each winding-to-ground:
1) Apply voltage in accordance with manufacturer's published data.
a) Refer to NETA ATS tables in the absence of manufacturer's published data.
c. Calculate dielectric absorption ration or polarization index.
d. Verify correct secondary voltage, phase-to-phase and phase-to-neutral after energization and before loading.
3. Test values:
a. Compare bolted connection resistance values to values of similar connections:
1) Investigate values which deviate from those of similar bolted connections by more than 50 percent of the lowest value.
b. Bolt-torque levels shall be in accordance with manufacturer's published data:
1) Refer to NETA ATS tables in the absence of manufacturer's published data.
c. Tap connections are left as found unless otherwise specified.
d. Minimum insulation-resistance values of transformer insulation shall be in accordance with manufacturer's published data:
1) Refer to NETA ATS tables in the absence of manufacturer's published data.
2) Investigate insulation values less than the allowable minimum.
e. The dielectric absorption ratio or polarization index shall not be less than 1.0.

f. Turns-ratio results should not deviate more than 1/2 percent from either the adjacent coils or calculated ratio.
g. Phase-to-phase and phase-to-neutral secondary voltages shall be in agreement with nameplate data.

F. Low voltage cables, 600 volt maximum:
1. Visual and mechanical inspection:
a. Compare cable data with the Drawings and Specifications.
b. Inspect exposed sections of cable for physical damage and correct connection as indicated on the Drawings.
c. Inspect bolted electrical connections for high resistance by one of the following methods:
1) Use of low-resistance ohmmeter.
2) Verify tightness of accessible bolted electrical connections by the calibrated torque wrench method:
a) Refer to manufacturer's instructions for proper foot-pound levels or NETA ATS tables.
d. Inspect compression applied connectors for correct cable match and indentation.
e. Inspect for correct identification and arrangement.
f. Inspect cable jacket insulation and condition.
2. Electrical tests:
a. Perform resistance measurements through bolted connections with a low-resistance ohmmeter.
b. Perform insulation resistance test on each conductor sized No. 8 AWG or larger with respect to ground and adjacent conductors:
1) Applied potential shall be 500 volts dc for 300 volt rated cable and 1,000 volts dc for 600 volt rated cable.
2) Test duration shall be 1 minute.
c. Perform continuity tests on all power and control conductors to insure correct cable connection.
d. Verify uniform resistance of parallel conductors.
3. Test values:
a. Compare bolted connection resistance values to values of similar connections:
1) Investigate values which deviate from those of similar bolted connections by more than 50 percent of the lowest value.
b. Insulation-resistance values shall be in accordance with manufacturer's published data:
1) Refer to NETA ATS tables in the absence of manufacturer's published data.
2) Investigate values of insulation-resistance less than the allowable minimum.
c. Cable shall exhibit continuity.
d. Deviations in resistance between parallel conductors shall be investigated.

G. Low voltage molded case and insulated case circuit breakers:
1. Visual and mechanical inspection:
a. Compare equipment nameplate data with the Contract Documents.
b. Inspect physical and mechanical condition.

c. Inspect anchorage and alignment.
d. Verify the unit is clean.
e. Operate the circuit breaker to ensure smooth operation.
f. Inspect bolted electrical connections for high resistance by one of the following methods:
    1) Use of low-resistance ohmmeter.
    2) Verify tightness of accessible bolted electrical connections by the calibrated torque wrench method:
        a) Refer to manufacturer's instructions for proper foot-pound levels or NETA ATS tables.
g. Perform adjustments for final protective device settings in accordance with the coordination study.

2. Electrical tests:
    a. Perform resistance measurements through bolted connections with a low-resistance ohmmeter.
    b. Perform insulation-resistance tests for 1 minute on each pole, phase-to-phase and phase-to-ground with the circuit breaker closed and across each open pole:
        1) Apply voltage in accordance with manufacturer's published data.
        2) Refer to NETA ATS tables in the absence of manufacturer's published data.
    c. Perform a contact/pole-resistance test.
    d. Determine long-time pickup and delay by primary current injection.
    e. Determine short-time pickup and delay by primary current injection.
    f. Determine ground-fault pickup and delay by primary current injection.
    g. Determine instantaneous pickup value by primary current injection.
    h. Perform minimum pickup voltage tests on shunt trip and close coils in accordance with manufacturer's published data.
    i. Verify correct operation of any auxiliary features such as trip and pickup indicators, zone interlocking, electrical close and trip operation, trip-free, anti-pump function and trip unit battery condition:
        1) Reset all trip logs and indicators.
    j. Verify operation of charging mechanism.

3. Test values:
    a. Compare bolted connection resistance values to values of similar connections:
        1) Investigate values which deviate from those of similar bolted connections by more than 50 percent of the lowest value.
    b. Bolt-torque levels shall be in accordance with manufacturer's published data:
        1) Refer to NETA ATS tables in the absence of manufacturer's published data.
    c. Insulation-resistance values shall be in accordance with manufacturer's published data:
        1) Refer to NETA ATS tables in the absence of manufacturer's published data.
        2) Investigate values of insulation-resistance less than the allowable minimum.

d. Microhm or dc millivolt drop values shall not exceed the high levels of the normal range as indicated in the manufacturer's published data:
    1) If manufacturer's data is not available, investigate any values which deviate from adjacent poles or similar breakers by more than 50 percent of the lowest value.
e. Long-time pickup values shall be as specified, and the trip characteristic shall not exceed manufacturer's published time-current characteristic tolerance band including adjustment factors:
    1) If manufacturer's curves are not available, trip times shall not exceed the value shown in NETA ATS tables.
f. Short-time pickup values shall be as specified, and the trip characteristic shall not exceed manufacturer's published time-current tolerance band.
g. Ground fault pickup values shall be as specified, and the trip characteristic shall not exceed manufacturer's published time-current tolerance band.
h. Instantaneous pickup values shall be as specified and within manufacturer's published tolerances:
    1) Refer to NETA ATS tables in the absence of manufacturer's published data.
i. Pickup values and trip characteristics shall be within manufacturer's published tolerances.
j. Determine energy reducing maintenance switch pickup value by primary current injection.
k. Breaker open, close, trip, trip-free, anti-pump, and auxiliary features shall function as designed.
l. The charging mechanism shall operate in accordance with manufacturer's published data.

H. Instrument transformers - current transformers:
1. Visual and mechanical inspection:
    a. Compare equipment nameplate data with the Contract Documents.
    b. Inspect physical and mechanical condition.
    c. Verify correct connection of transformers with system requirements.
    d. Verify that adequate clearances exist between primary and secondary circuit wiring.
    e. Verify the unit is clean.
    f. Inspect bolted electrical connections for high resistance using one of the following methods:
        1) Use of low-resistance ohmmeter.
        2) Verify tightness of accessible bolted electrical connections by calibrated torque wrench method:
            a) Refer to manufacturer's instructions for proper foot-pound levels or NETA ATS tables.
    g. Verify that all required grounding and shorting connections provide contact.
    h. Verify appropriate lubrication on moving current-carrying parts and on moving and sliding surfaces.
2. Electrical tests:
    a. Perform resistance measurements through bolted connections with a low-resistance ohmmeter.

b. Perform insulation-resistance test of each current transformer and its secondary wiring with respect to ground at 1,000 VDC for 1 minute:
    1) For solid state devices that cannot tolerate the applied voltage, follow the manufacturer's recommendation.
c. Perform a polarity test of each current transformer in accordance with IEEE C57.13.1.
d. Perform a ratio verification test using the voltage or current method in accordance with IEEE C57.13.1.
e. Perform an excitation test on current transformers used for relaying applications in with accordance with IEEE C57.13.1.
f. Measure current circuit burdens at transformer terminals in accordance with IEEE C57.13.1.
g. When applicable perform insulation-resistance tests on the primary winding with the secondary grounded:
    1) Test voltages shall be in accordance with NETA ATS tables.
h. Perform power-factor or dissipation-factor tests in accordance with test equipment manufacturer's published data.
i. Verify that current transformer secondary circuits are grounded and have only 1 grounding point in accordance with IEEE C57.13.3:
    1) That grounding point should be located as specified by the Engineer in the Contract Documents.

3. Test values:
    a. Compare bolted connection resistance values to values of similar connections:
        1) Investigate values which deviate from those of similar bolted connections by more than 50 percent of the lowest value.
    b. Bolt-torque levels shall be in accordance with manufacturer's published data:
        1) Refer to NETA ATS tables in the absence of manufacturer's published data.
    c. Insulation-resistance values of instrument transformers shall be in accordance with manufacturer's published data:
        1) Refer to NETA ATS tables in the absence of manufacturer's published data.
    d. Polarity results shall agree with transformer markings.
    e. Ratio errors shall be in accordance with IEEE C57.13.
    f. Excitation results for current transformers shall match the curve supplied by the manufacturer or be in accordance with IEEE C57.13.1.
    g. Measured burdens shall be compared to instrument transformer ratings.
    h. If no evidence of distress or insulation failure is observed by the end of the total time of voltage application during the dielectric withstand test, the primary winding is considered to have passed the test.
    i. Power-factor or dissipation-factor values shall be compared to manufacturer's published data:
        1) In the absence manufacturer's published data, use the test equipment manufacturer's published data.
    j. Test results shall indicate that the circuits have only 1 grounding point.

I. Instrument transformers - voltage transformers:
   1. Visual and mechanical inspection:
      a. Compare equipment nameplate data with the Contract Documents.
      b. Inspect physical and mechanical condition.
      c. Verify correct connection of transformers with system requirements.
      d. Verify that adequate clearances exist between primary and secondary circuit wiring.
      e. Verify the unit is clean.
      f. Inspect bolted electrical connections for high resistance using one of the following methods:
         1) Use of low-resistance ohmmeter.
         2) Verify tightness of accessible bolted electrical connections by calibrated torque wrench method:
            a) Refer to manufacturer's instructions for proper foot-pound levels or NETA ATS tables.
      g. Verify that all required grounding and connections provide contact.
      h. Verify correct primary and secondary fuse sizes for voltage transformers.
      i. Verify appropriate lubrication on moving current-carrying parts and on moving and sliding surfaces.
      j. Perform as-left tests.
   2. Electrical tests - voltage transformers:
      a. Perform resistance measurements through bolted connections with a low-resistance ohmmeter.
      b. Perform insulation-resistance tests winding-to-winding and winding-to-ground:
         1) Test voltage shall be applied for 1 minute in accordance with NETA ATS requirements.
         2) For solid state devices that cannot tolerate the applied voltage, follow the manufacturer's recommendation.
      c. Perform a polarity test on each voltage transformer to verify the polarity marks on H_1- X_1 relationship as applicable.
      d. Perform a turns ratio test on all tap positions.
      e. Measure voltage circuit burdens at transformer terminals.
      f. Perform a dielectric withstand test on the primary windings with the secondary windings grounded:
         1) The dielectric voltage shall be in accordance with NETA ATS tables.
         2) Apply the test voltage for 1 minute.
      g. Perform power-factor or dissipation-factor tests in accordance with test equipment manufacturers published data.
      h. Verify that voltage transformer secondary circuits are grounded and have only 1 grounding point in accordance with IEEE C57.13.3:
         1) That grounding point should be located as specified by the Engineer in the Contract Documents.
   3. Test values:
      a. Compare bolted connection resistance values to values of similar connections:
         1) Investigate values which deviate from those of similar bolted connections by more than 50 percent of the lowest value.

b. Bolt-torque levels shall be in accordance with manufacturer’s published data:
    1) Refer to NETA ATS tables in the absence of manufacturer’s published data.
c. Insulation-resistance values of instrument transformers shall be in accordance with manufacturer’s published data:
    1) Refer to NETA ATS tables in the absence of manufacturer’s published data.
d. Polarity results shall agree with transformer markings.
e. Ratio errors shall be in accordance with IEEE C57.13.
f. Measured burdens shall be compared to instrument transformer ratings.
g. If no evidence of distress or insulation failure is observed by the end of the total time of voltage application during the dielectric withstand test, the primary winding is considered to have passed the test.
h. Power-factor or dissipation-factor values shall be compared to manufacturer’s published data:
    1) In the absence manufacturer’s published data, use the test equipment manufacturer's published data.
i. Test results shall indicate that the circuits have only 1 grounding point.

J. Metering devices, microprocessor based:
1. Visual and mechanical inspection:
    a. Compare equipment nameplate data with the Contract Documents.
    b. Inspect meters and cases for physical damage.
    c. Clean front panel.
    d. Verify tightness of electrical connections.
    e. Record the following:
        1) Model number.
        2) Serial number.
        3) Firmware revision.
        4) Software revision.
        5) Rated control voltage.
    f. Verify operation of display and indicating devices.
    g. Record passwords.
    h. Verify the unit is grounded in accordance with the manufacturer's instructions.
    i. Set all required parameters including instrument transformer ratios, system type, frequency, power demand methods/intervals, and communications requirements.
2. Electrical tests:
    a. Apply voltage or current as appropriate to each analog input and verify correct measurement and indication.
    b. Confirm correct operation and setting of each auxiliary input/output feature including mechanical relay, digital and analog.
    c. After initial system energization, confirm measurements and indications are consistent with loads present.
3. Test values:
    a. Nameplate data shall match the Contract Documents.
    b. Tightness of electrical connections shall ensure a low resistance connection.

c. Display and indicating devices shall operate per manufacturer's published data.
d. Measurement and indication of applied voltages and currents shall be within the manufacturer's published tolerances for accuracy.
e. All auxiliary input/output features shall operate per settings and manufacturer's published data.
f. Measure and indications shall be consistent with energized system loads.

K. Metering devices electromechanical and solid state:
1. Visual and mechanical inspection:
a. Compare equipment nameplate data with the Contract Documents.
b. Inspect physical and mechanical condition.
c. Inspect bolted electrical connections for high resistance using one of the following methods:
1) Use of low-resistance ohmmeter.
2) Verify tightness of accessible bolted electrical connections by calibrated torque wrench method:
a) Refer to manufacturer’s instructions for proper foot-pound levels or NETA ATS tables.
d. Record model number, serial number, firmware revision, software revision, and rated control voltage.
e. Verify operation of display and indicating devices.
f. Record passwords.
g. Verify unit is grounded in accordance with manufacturer’s instructions.
h. Set all required parameters including instrument transformer ratios, system type, frequency, power demand methods/intervals, and communications requirements.
i. Inspect cover gasket, cover glass, condition of spiral spring, disk clearance, contacts, and case shorting contacts as applicable.
j. Verify the unit is clean.
2. Electrical tests:
a. Apply voltage or current as appropriate to each analog input and verify correct measurement and indication.
b. Confirm correct operation and setting of each auxiliary input/output feature including mechanical relay, digital, and analog.
c. After initial system energization, confirm measurements and indications are consistent with loads present.
d. Perform resistance measurements through bolted connections with a low-resistance ohmmeter.
e. Verify accuracy of meter at all cardinal points.
f. Calibrate meters in accordance with manufacturer’s published data.
g. Verify that current transformer, and voltage transformer secondary circuits are intact.
3. Test values:
a. Compare bolted connection resistance values to values of similar connections:
1) Investigate values which deviate from those of similar bolted connections by more than 50 percent of the lowest value.

b. Bolt-torque levels shall be in accordance with manufacturer's published data:
    1) Refer to NETA ATS tables in the absence of manufacturer's published data.
c. Meter accuracy shall be in accordance with manufacturer's published data.
d. Calibration results shall be within manufacturer's published tolerances.
e. Instrument multipliers shall be in accordance with system design specifications.
f. Test results shall confirm the integrity of the secondary circuits of current and voltage transformers.

L. Grounding systems:
1. Visual and mechanical inspection:
    a. Inspect ground system for compliance with the Contract Documents, and the NEC.
    b. Inspect physical and mechanical condition.
    c. Inspect bolted electrical connections for high resistance using one of the following methods:
        1) Use of low-resistance ohmmeter.
        2) Verify tightness of accessible bolted electrical connections by calibrated torque wrench method:
            a) Refer to manufacturer's instructions for proper foot-pound levels or NETA ATS tables.
    d. Inspect anchorage.
2. Electrical tests:
    a. Perform resistance measurements through bolted connections with a low-resistance ohmmeter.
    b. Perform fall of potential test or alternative test in accordance with IEEE 81 on the main grounding electrode or system.
    c. Perform point-to-point tests to determine the resistance between the main grounding system and all major electrical equipment frames, the system neutral and any derived neutral points.
3. Test values:
    a. Grounding system electrical and mechanical connections shall be free of corrosion.
    b. Compare bolted connection resistance values to values of similar connections:
        1) Investigate values which deviate from those of similar bolted connections by more than 50 percent of the lowest value.
    c. Bolt-torque levels shall be in accordance with manufacturer's published data:
        1) Refer to NETA ATS tables in the absence of manufacturer's published data.
    d. The resistance between the main grounding electrode and ground shall be as specified in Section 16060 - Grounding and Bonding.
    e. Investigate point-to-point resistance values that exceed 0.5 ohm.

M. Rotating machinery, ac induction motors and generators:
1. Visual and mechanical inspection:
    a. Compare equipment nameplate information with the Contract Documents.

b. Inspect physical and mechanical condition.
c. Inspect anchorage, alignment, and grounding.
d. Inspect air baffles, filter media, cooling fans, slip rings, brushes, and brush rigging.
e. Inspect bolted electrical connections for high resistance using one or more of the following methods:
    1) Use of low-resistance ohmmeter.
    2) Verify tightness of accessible bolted electrical connections by calibrated torque wrench method:
        a) Refer to manufacturer's instructions for proper foot-pound levels or NETA ATS tables.
f. Manually rotate the rotor and check for problems with the bearings or shaft.
g. Rotating equipment:
    1) Operate at rated design load conditions.
    2) Confirm that equipment is properly assembled.
    3) Confirm the equipment moves or rotates in the proper direction.
    4) Confirm shafting, drive elements, and bearings are installed and lubricated in accordance with proper tolerances.
    5) Confirm that no unusual power consumption, lubrication temperatures, bearing temperatures, or other conditions are observed.
h. Verify correct application of appropriate lubrication and lubrication systems.
i. Verify that resistance temperature detector (RTD) circuits conform to that indicated on the Drawings.

2. Electrical tests - AC Induction:
    a. Perform resistance measurements through bolted connections with a low-resistance ohmmeter.
    b. Perform insulation-resistance test in accordance with IEEE 43:
        1) On motors 200 horsepower and smaller, test duration shall be 1 minute. Calculate dielectric absorption ratio for 60/30 second periods.
    c. Perform insulation-resistance test on insulated bearings in accordance with manufacturer's published data.
    d. Test surge protection devices as specified in this Section.
    e. Test motor starter as specified in this Section.
    f. Perform resistance tests on resistance temperature detector (RTD) circuits.
    g. Verify operation of motor space heater, if applicable.
3. Test values:
    a. Inspection:
        1) Air baffles shall be clean and installed in accordance with the manufacturer's published data.
        2) Filter media shall be clean and installed in accordance with the manufacturer's published data.
        3) Cooling fans shall operate.
        4) Slip ring alignment shall be within manufacturer's published tolerances.
        5) Brush alignment shall be within manufacturer's published tolerances.
        6) Brush rigging shall be within manufacturer's published tolerances.

b. Compare bolted connection resistance values to values of similar connections:
    1) Investigate values which deviate from those of similar bolted connections by more than 50 percent of the lowest value.
c. Bolt-torque levels shall be in accordance with manufacturer's published data:
    1) Refer to NETA ATS tables in the absence of manufacturer's published data.
d. Airgap spacing and machine alignment shall be in accordance with manufacturer's published data.
e. The recommended minimum insulation-resistance ($IR_{1\ min}$) test results in megohms shall be in accordance with NETA ATS tables.
    1) The polarization index value shall not be less than 2.0.
    2) The dielectric absorption ratio shall not be less than 1.4.
f. If no evidence of distress or insulation failure is observed by the end of the total time of voltage application during the dielectric withstand test, the test specimen is considered to have passed the test.
g. Investigate phase-to-phase stator resistance values that deviate by more than 5 percent.
h. Power factor or dissipation factor values shall be compared to manufacturer's published data:
    1) In the absence of manufacturer's published data, compare values of similar machines.
i. Tip-up values shall indicate no significant increase in power factor.
j. If no evidence of distress, insulation failure, or waveform nesting is observed by the end of the total time of voltage application during the surge comparison test, the test specimen is considered to have passed the test.
k. Bearing insulation-resistance measurements shall be within manufacturer's published tolerances:
    1) In the absence of manufacturer's published data, compare values of similar machines.
l. Test results of surge protection devices shall be as specified in this Section.
m. Test results of motor starter equipment shall be as specified in this Section.
n. RTD circuits shall conform to the design intent and machine protection device manufacturer's published data.
o. Heaters shall be operational.
p. Vibration amplitudes of the uncoupled and unloaded machine shall be in accordance with manufacturer's published data:
    1) In the absence of manufacturer's published data, vibration amplitudes shall not exceed values in NETA ATS tables.
    2) If values exceed those in the NETA ATS tables, perform a complete vibration analysis.

N. Motor starters, low voltage:
    1. Visual and mechanical inspection:
        a. Compare equipment nameplate information with the Contract Documents.
        b. Inspect physical and mechanical condition.
        c. Inspect anchorage, alignment, and grounding.

d. Verify the unit is clean.
e. Inspect contactors:
    1) Verify mechanical operation.
    2) Verify contact gap, wipe, alignment, and pressure is in accordance with manufacturer's published data.
f. Motor-running protection:
    1) Verify overload element rating/motor protection settings are correct for its application.
    2) If motor running protection is provided by fuses, verify correct fuse rating.
g. Inspect bolted electrical connections for high resistance using one of the following methods:
    1) Use of low-resistance ohmmeter.
    2) Verify tightness of accessible bolted electrical connections by calibrated torque wrench method:
        a) Refer to manufacturer's instructions for proper foot-pound levels or NETA ATS tables.
h. Lubrication requirements:
    1) Verify appropriate lubrication on moving current-carrying parts.
    2) Verify appropriate lubrication on moving and sliding surfaces.

2. Electrical tests:
    a. Perform resistance measurements through bolted connections with a low-resistance ohmmeter.
    b. Perform insulation-resistance tests for 1 minute on each pole, phase-to-phase and phase to ground with the starter closed, and across each open pole for 1 minute:
        1) Test voltage shall be in accordance with manufacturer's published data.
        2) Refer to NETA ATS tables in the absence of manufacturer's published data.
    c. Test motor protection devices in accordance with manufacturer's published data.
    d. Test circuit breakers as specified in this Section.
    e. Perform operational tests by initiating control devices.
3. Test values:
    a. Compare bolted connection resistance values to values of similar connections:
        1) Investigate values which deviate from those of similar bolted connections by more than 50 percent of the lowest value.
    b. Bolt-torque levels shall be in accordance with manufacturer's published data:
        1) Refer to NETA ATS tables in the absence of manufacturer's published data.
    c. Insulation-resistance values shall be in accordance with manufacturer's published data:
        1) Refer to NETA ATS tables in the absence of manufacturer's published data.
        2) Investigate values of insulation-resistance less than the allowable minimum.

d. Motor protection parameters shall be in accordance with manufacturer's published data.
e. Circuit breaker test results shall as be specified in this Section.
f. Control devices shall perform in accordance with system design requirements.

O. Variable frequency drive systems:
1. Visual and mechanical inspection:
a. Compare equipment nameplate data with the Contract Documents.
b. Inspect physical and mechanical condition.
c. Inspect anchorage, alignment, and grounding.
d. Verify the unit is clean.
e. Ensure vent path openings are free from debris and that heat transfer surfaces are clean.
f. Verify correct connections of circuit boards, wiring, disconnects, and ribbon cables.
g. Motor running protection:
1) Verify drive overcurrent setpoints are correct for their application.
2) If drive is used to operate multiple motors, verify individual overload element ratings are correct for their application.
3) Apply minimum and maximum speed setpoints. Verify setpoints are within limitations of the load coupled to the motor.
h. Inspect bolted electrical connections for high resistance using one of the following methods:
1) Use of low-resistance ohmmeter.
2) Verify tightness of accessible bolted electrical connections by the calibrated torque wrench method:
a) Refer to manufacturer's instructions for proper foot-pound levels or NETA ATS tables.
i. Verify correct fuse sizing in accordance with manufacturer's published data.
j. Perform visual and mechanical inspection of input circuit breaker as specified in this Section.
2. Electrical tests:
a. Perform resistance measurements through bolted connections with low resistance ohmmeter.
b. Test the motor overload relay elements by injecting primary current through the overload circuit and monitoring trip time of the overload element.
c. Test for the following parameters in accordance with relay calibration procedures specified in NETA ATS or as recommended by the manufacturer:
1) Input phase loss protection.
2) Input overvoltage protection.
3) Output phase rotation.
4) Overtemperature protection.
5) Direct current overvoltage protection.
6) Overfrequency protection.
7) Drive overload protection.
8) Fault alarm outputs.

d. Harmonic distortion measurements for both voltage and current is within the specification limits at the installed site.
e. Peak voltage at the motor terminations is less than 90 percent of the motor insulation dielectric withstand level.
f. Perform continuity tests on bonding conductors as specified in accordance with NETA ATS.
g. Perform start-up of drive in accordance with manufacturer's published data. Calibrate drive to the system's minimum and maximum speed control signals.
h. Perform operational tests by initiating control devices:
1) Slowly vary drive speed between minimum and maximum. Observe motor and load for unusual noise or vibration.
2) Verify operation of drive from remote start/stop and speed control signals.
i. Perform electrical tests of input circuit breaker as specified in this Section.
j. Measure fuse resistance.

3. Test values:
a. Compare bolted connection resistance values to values of similar connections:
1) Investigate values which deviate from those of similar bolted connections by more than 50 percent of the lowest value.
b. Bolt-torque levels shall be in accordance with manufacturer's published data:
1) Refer to NETA ATS tables in the absence of manufacturer's published data.
c. Overload test trip times at 300 percent of overload element rating shall be in accordance with manufacturer's published time-current curve.
d. Test values for input circuit breaker shall be as specified in this Section.
e. Relay calibration results shall be as specified in this Section.
f. Continuity of bonding conductors shall be in accordance with NETA ATS.
g. Control devices shall perform in accordance with system requirements.
h. Operational tests shall conform to system design requirements.
i. Investigate fuse resistance values that deviate from each other by more than 15 percent.

P. Surge arresters, low-voltage:
1. Visual and mechanical inspection:
a. Compare equipment nameplate data with the Contract Documents.
b. Inspect physical and mechanical condition.
c. Inspect anchorage, alignment, grounding, and clearances.
d. Verify the arresters are clean.
e. Inspect bolted electrical connections for high resistance using one of the following methods:
1) Use of low-resistance ohmmeter.
2) Verify tightness of accessible bolted electrical connections by the calibrated torque wrench method:
a) Refer to manufacturer's instructions for proper foot-pound levels or NETA ATS tables.
f. Verify that the ground lead on each device is individually attached to a ground bus or ground electrode.

g. Verify that stroke counter is correctly mounted and electrically connected, if applicable.
h. Record stroke counter reading.

2. Electrical tests:
   a. Perform resistance measurements through bolted connections with a low-resistance ohmmeter.
   b. Perform an insulation-resistance test on each arrester, phase terminal-to-ground:
      1) Apply voltage in accordance with manufacturers published data.
      2) Refer to NETA ATS tables in the absence of manufacturer's published data.
   c. Test grounding connection as specified in this Section.
3. Test values:
   a. Compare bolted connection resistance values to values of similar connections:
      1) Investigate values which deviate from those of similar bolted connections by more than 50 percent of the lowest value.
   b. Bolt-torque levels shall be in accordance with manufacturer's published data:
      1) Refer to NETA ATS tables in the absence of manufacturer's published data.
   c. Insulation-resistance values shall be in accordance with manufacturer's published data:
      1) Refer to NETA ATS tables in the absence of manufacturer's published data.
      2) Investigate insulation values less than the allowable minimum.
   d. Resistance between the arrester ground terminal and the ground system shall be less than 0.5 ohm.

Q. Switches, air, medium-voltage, metal-enclosed:
1. Visual and mechanical inspection:
   a. Compare equipment nameplate data with the Contract Documents.
   b. Inspect physical and mechanical condition.
   c. Inspect anchorage, alignment, grounding, and required clearances.
   d. Verify the unit is clean.
   e. Verify correct blade alignment, blade penetration, travel stops, arc interrupter operation, and mechanical operation.
   f. Verify that fuse sizes and types are as indicated on the Drawings, short-circuit study, and coordination study.
   g. Verify that expulsion-limiting devices are in place on all holders having expulsion-type elements.
   h. Verify that each fuseholder has adequate mechanical support and contact integrity.
   i. Inspect bolted electrical connections for high resistance using one of the following methods:
      1) Use of a low resistance ohmmeter.
      2) Verify tightness of accessible bolted electrical connections by calibrated torque wrench method:
         a) Refer to manufacturer's instructions for proper foot-pound levels or NETA ATS tables.
   j. Verify operation and sequencing of interlocking systems.

k. Verify correct phase barrier installation.
l. Verify correct operation of all indicating and control devices.
m. Verify appropriate lubrication on moving current-carrying parts and on moving and sliding surfaces.

2. Electrical tests:
   a. Perform resistance measurements through bolted connections with a low-resistance ohmmeter.
   b. Measure contact resistance across each switchblade and fuseholder.
   c. Perform insulation-resistance tests for 1 minute on each pole, phase-to-phase and phase-to ground with switch closed, and across each open pole. Apply voltage in accordance with manufacturer's published data:
      1) In the absence of manufacturer's published data, use NETA ATS requirements.
   d. Perform a dielectric withstand voltage test on each pole with switch closed. Test each pole-to-ground with all other poles grounded. Test voltage shall be in accordance with manufacturer's published data:
      1) In the absence of manufacturer's published data, use NETA ATS requirements.
   e. Measure fuse resistance.
   f. Verify cubicle space heater operation.
3. Test values:
   a. Compare bolted connection resistance values to values of similar connections:
      1) Investigate values which deviate from those of similar bolted connections by more than 50 percent of the lowest value.
   b. Bolt-torque levels shall be in accordance with manufacturer's published data:
      1) Refer to NETA ATS tables in the absence of manufacturer's published data.
4. Test values - electrical:
   a. Compare bolted connection resistance values to values of similar connections:
      1) Investigate values which deviate from those of similar bolted connections by more than 50 percent of the lowest value.
   b. Microhm or dc millivolt drop values shall not exceed the high levels of the normal range as indicated in the manufacturer's published data.
      1) If manufacturer's published data is not available, investigate values which deviate from those of similar bus connections and sections by more than 50 percent of the lowest value.
   c. Insulation-resistance values shall be in accordance with manufacturer's published data:
      1) Refer to NETA ATS tables in the absence of manufacturer's published data.
      2) Investigate insulation values less than the allowable minimum.
      3) Do not proceed with dielectric withstand voltage tests until insulation-resistance values are above minimum values.
   d. If no evidence of distress or insulation failure is observed by the end of the total time of voltage application during the dielectric withstand test, the test specimen is considered to have passed the test.

e. Investigate fuse resistance values that deviate from each other by more than 15 percent.
f. Heaters shall be operational.

R. Fiber-optic cables:
1. Visual and mechanical inspection:
a. Compare cable, connector, and splice data with the Contract Documents.
b. Inspect cable and connections for physical and mechanical damage.
c. Verify that all connectors and splices are correctly installed.
2. Optical tests:
a. Perform cable length measurement, fiber fracture inspection, and construction defect inspection using an optical time domain reflectometer (OTDR):
1) OTDR test performed on fiber cables less than 100 meters shall be performed with the aid of a launch cable.
2) Adjust OTDR pulse width settings to a maximum setting of 1/1,000th of the cable length or 10 nanoseconds.
b. Perform connector and splice integrity test using an optical time domain reflectometer.
c. Perform cable attenuation loss measurement with an optical power loss test set:
1) Perform attenuation tests with an Optical Loss Test Set capable and calibrated to show anomalies of 0.1 dB as a minimum.
2) Test multimode fibers at 850 nanometer and 1,300 nanometer.
3) Test single mode fibers at 1,310 nanometer and 1,550 nanometer.
d. Perform connector and splice attenuation loss measurement from both ends of the optical cable with an optical power loss test set:
1) At the conclusion of all outdoor splices at 1 location, and before they are enclosed and sealed, all splices shall be tested with OTDR at the optimal wavelengths (850 and 1,300 for multimode, 1,310 and 1,550 for single mode), in both directions. The splices shall be tested for integrity as well as attenuation.
e. Perform fiber links integrity and attenuation tests using each link shall be an OTDR and an Optical Loss Test Set:
1) OTDR traces shall be from both directions on each fiber at the 2 optimal wavelengths, 850 nanometer, and 1,300 nanometer for multimode fibers.
2) Optical loss testing shall be done with handheld test sets in 1 direction at the 2 optimal wavelengths for the appropriate fiber type. Test equipment shall equal or exceed the accuracy and resolution of Agilent/HP 8147 high performance OTDR.
3. Test values:
a. Cable and connections shall not have been subjected to physical or mechanical damage.
b. Connectors and splices shall be installed in accordance with industry standards.
c. The optical time domain reflectometer signal should be analyzed for excessive connection, splice, or cable backscatter by viewing the reflected power/distance graph.

d. Attenuation loss measurement shall be expressed in dB/km. Losses shall be within the manufacturer's recommendations when no local site specifications are available.
e. Individual fusion splice losses shall not exceed 0.1 dB. Measurement results shall be recorded, validated by trace, and filed with the records of the respective cable runs.

S. Copper Ethernet cable installation testing:
1. Pre-installation:
a. Immediately prior to installation, verify that cable to be installed matches that which was submitted.
b. Verify that no damage has been done to the cable during shipping or handling.
c. Inspect cable for physical and mechanical damage.
d. Engineer shall be notified if a cable fails to meet inspection and the cable shall not be installed unless otherwise directed by the Engineer.
2. Post-installation:
a. Prior to copper Ethernet cable termination, perform cable end-to-end continuity validation testing on all installed cables, conductor pairs and cable shields using toner and probe kit. Any cable that fails testing shall be removed and replaced.
b. Inspect equipment outlet connectors for damage and ensure connectors hold tightly in field device ports.
3. Test equipment:
a. Certification equipment used for the testing shall be capable of verifying twisted pair cable installation with end-to-end continuity testing.
b. Use only test cords and adapters that are qualified by test equipment manufacturer for channel or link test configuration.
c. Manufacturers: The following or equal:
1) Fluke Networks, IntelliTone Pro 200 Toner and Probe Kit, MT-8200-60-KIT.
d. Refer to Section 17950 - Commissioning for Instrumentation and Controls for Permanent Link testing requirements.

3.08 FIELD QUALITY CONTROL (NOT USED)

3.09 ADJUSTING (NOT USED)

3.10 CLEANING

A. As specified in Section 16050 - Common Work Results for Electrical.

B. After the acceptance tests have been completed, dispose of all testing expendables, vacuum all cabinets, and sweep clean all surrounding areas.

3.11 PROTECTION (NOT USED)

3.12 SCHEDULES (NOT USED)

END OF SECTION

SECTION 16990

CONDUIT SCHEDULE

PART 1 GENERAL

1.01 SUMMARY

A. Specific definitions:

1. Conduits:

a.	ARM:	Armored cable.
b.	GRC:	Galvanized rigid conduit.
c.	PCS:	PVC jacketed rigid steel conduit.
d.	IMC:	Intermediate metallic conduit.
e.	EMT:	Electrical metallic steel tubing.
f.	PVC:	Polyvinyl chloride rigid plastic conduit.
g.	SLT:	Sealtight - liquidtight flexible conduit.
h.	RAC:	Rigid aluminum conduit.
i.	FLX:	Flexible metallic conduit.
j.	NFC:	Non-metallic flexible conduit.

2. Cables:

a.	DN Thick:	DeviceNet “thick” cable.
b.	DN Thin:	DeviceNet “thin” cable.
c.	PBPA:	Profibus PA cable.
d.	PBDP:	Profibus DP cable.
e.	PBDPP:	Profibus DP cable with 24VDC power.
f.	FFBUS:	Foundation Fieldbus cable.
g.	RS-485	RS-485 cable.
h.	CAT5e:	Category 5 enhanced Ethernet cable.
i.	CAT6:	Category 6 Ethernet cable.
j.	CNET:	ControlNet cable.
k.	DH+:	Data Highway Plus cable.
l.	RIO:	Remote I/O cable.
m.	DF1:	Serial cable.
n.	MODB:	Modbus cable.
o.	MODB+:	Modbus Plus cable.
p.	*/FO:	Fiber optic cable (* indicates number of fibers).
q.	2/C#16S:	2 conductor, 16 gauge, twisted shielded pair. (*/2/C#16S * indicates number of pairs).
r.	3/C#16S:	3 conductor, 16 gauge, twisted shielded triplet. (*/3/C#16S * indicates number of triplets).
s.	*/C#Y:	Multiconductor cable (* indicates number of conductors, Y indicates conductor size and insulation).
t.	MFR:	Manufacturer or vendor furnished cable.

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION

3.01 CONDUIT SCHEDULE

A. As specified in Attachment A - Conduit Schedule.

END OF SECTION

ATTACHMENT A - CONDUIT SCHEDULE

SECTION 16990

CONDUIT SCHEDULE
AREA WTP RECYCLED WATER PS

PART 1 GENERAL

1.01 SUMMARY

A. Conduit requirements:
   1. As defined in Section 16050 and Section 16130.

B. Cable requirements and definitions:
   1. As defined in Section 16050 and Section 16123.
   2. 2/CS#16: 2 conductor, 16 gauge, twisted shielded pair.
   3. 3/CS#16: 3 conductor, 16 gauge, twisted shielded triplet.
   4. */C#Y: Multiconductor cable (* indicates number of conductors, Y indicates conductor size and insulation).
   5. CAT6: Category 6 Ethernet cable.
   6. MFR: Manufacturer or vendor furnished cable.
   7. PULL: Pull Rope.
   8. VFD: Shielded VFD cable with integral ground.

END OF CONDUIT SCHEDULE

END OF SECTION

SECTION 16990

CONDUIT SCHEDULE
AREA 85

PART 1 GENERAL

1.01 SUMMARY

A. Conduit requirements:
   1. As defined in Section 16050 and Section 16130.

B. Cable requirements and definitions:
   1. As defined in Section 16050 and Section 16123.
   2. 2/CS#16: 2 conductor, 16 gauge, twisted shielded pair.
   3. CAT6: Category 6 Ethernet cable.
   4. MFR: Manufacturer or vendor furnished cable.

PART 2 PRODUCTS

Not Used.

PART 3 EXECUTION

3.01 CONDUIT SCHEDULE

A. Conduit Schedule is presented on the following pages.

CONDUIT SCHEDULE
AREA WWTP Pump Stations

PART 1 GENERAL

1.01 SUMMARY

A. Conduit requirements:
   1. As defined in Section 16050 and Section 16130.

B. Cable requirements and definitions:
   1. As defined in Section 16050 and Section 16123.
   2. 2/CS#16: 2 conductor, 16 gauge, twisted shielded pair.
   3. 3/CS#16: 3 conductor, 16 gauge, twisted shielded triplet.
   4. */C#Y: Multiconductor cable (* indicates number of conductors, Y indicates conductor size and insulation).
   5. */FO: Fiber optic (* indicates strand count).
   6. CAT6: Category 6 Ethernet cable.
   7. MFR: Manufacturer or vendor furnished cable.
   8. PULL: Pull Rope.
   9. VFD: Shielded VFD cable with integral ground.

PART 2 PRODUCTS

Not Used.

PART 3 EXECUTION

3.01 CONDUIT SCHEDULE

A. Conduit Schedule is presented on the following pages.

SECTION 17050

COMMON WORK RESULTS FOR PROCESS CONTROL AND INSTRUMENTATION SYSTEMS

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Process control and instrumentation systems requirements for common components including installation.
   2. Loop drawings:
      a. Provide complete loop drawings for all systems, including packaged equipment furnished as part of a vendor furnished package, and pre-purchased equipment.
      b. The form, minimum level of detail, and format for the loop drawings must match that of the sample loop drawings included in the Contract Documents.
      c. The Owner and Engineer are not responsible for providing detailed loop diagrams for Contractor furnished equipment.
   3. The requirements of the Instrumentation and Control Specifications apply to all Instrumentation and Control Work specified in Technical Sections, including packaged mechanical systems, LCPs, VCPs, etc.

B. Contract Documents:
   1. Contract drawings:
      a. Schematic diagrams:
         1) Use schematic diagrams in conjunction with the descriptive operating sequence in the Technical Sections to furnish a coordinated and fully functional control system.
         2) Schematic diagrams show control function only.
            a) Incorporate other necessary functions for proper operation and protection of the system.
         3) Controls are indicated on the Drawings as de-energized.
         4) Mount devices shown on motor controller schematic diagrams in the controller compartment enclosure, unless otherwise noted or indicated on the Drawings.

1.02 REFERENCES

A. Code compliance:
   1. As specified in Section 01410 - Regulatory Requirements:
   2. The publications are referenced in this Section by basic designation only without a specified publish date.

B. American Petroleum Institute (API):
   1. RP 550 - Manual on Installation of Refinery Instruments and Control Systems; Part II-Process Stream Analyzers; Section 5-Oxygen Analyzers.
   2. RP 551 - Process Measurement Instrumentation.

C. International Organization for Standardization (ISO):
   1. 9001 - Quality Management Systems - Requirements.

D. International Society of Automation (ISA):
   1. 5.1 - Instrumentation Symbols and Identification.
   2. 5.4 - Instrument Loop Diagrams.

E. National Electrical Code (NEC).

F. National Electrical Manufacturers Association (NEMA).

G. Underwriters Laboratories, Inc. (UL):
   1. 508 - Standard of Safety for Industrial Control Equipment.
   2. 508A - Standard of Safety for Industrial Control Panels.

1.03 DEFINITIONS

A. Control circuit: Any circuit operating at 120 volts alternating current (VAC) or direct current (VDC) or less, whose principal purpose is the conveyance of information (including performing logic) and not the conveyance of energy for the operation of an electrically powered device.

B. Digital bus: A communication network, such as PROFIBUS, Foundation Fieldbus, or DeviceNet, allowing instruments and devices to transmit data, control functions, and diagnostic information.

C. Modifications: Changing, extending, interfacing to, removing, or altering an existing circuit.

D. Panel: An instrument support system that may be a flat surface, a partial enclosure, or a complete enclosure for instruments and other devices used in process control systems.

E. Power circuit: Any circuit operating at 90 volts (AC or DC) or more, whose principal purpose is the conveyance of energy for the operation of an electrically powered device.

F. Powered transmitters: A transmitter that requires a separate power source (120 VAC, 240 VAC, etc.) in order for the transmitter to develop its signal. As used in this Section, the produced signal may be a 4 to 20 mA 24 VDC signal, a digital bus communications signal, or both.

G. RS-232: RS-232 is also known as TIA-232 or EIA-232, is a standard for serial communication transmission of data. When compared to RS-485 it has lower transmission speed, short maximum cable length, large voltage swing, large

standard connectors and no multipoint capability. USB has displaced RS-232 from most of its peripheral interface roles.

H. RS-485: RS-485 is also known as TIA-485 or EIA-485, is a standard defining the electrical characteristics of drivers and receivers for use in serial communications system. Electrical signaling is balanced, and multipoint systems are supported, can be used with data rates up to 10 Mbit/s or at lower speeds distances up to 1,000 meters (4,000 feet).

I. Signal circuit: Any circuit operating at less than 50 VAC or VDC, which conveys analog information or digital communications information.

J. 2-Wire transmitter (loop powered): A transmitter that derives its operating power supply from the signal transmission circuit and requires no separate power supply connections. As used in this Section, 2-wire transmitter refers to a transmitter that provides a signal such as 4 to 20 mA 24 VDC regulation of a signal in a series circuit with an external 24 VDC driving potential:
   1. Fieldbus communications signal or both.

K. USB: Universal Serial Bus is an industry standard that establishes specifications for cables, connectors, and protocols for connection, communication, and power supply interfacing between computer, peripherals, and other computers, it has largely replaced interfaces such as serial and parallel ports.

L. Acronym definitions:
   1. ACB: Automatic current balance.
   2. ATS: Automatic Transfer Switch.
   3. CCS: The PCS central computer system (CCS) consisting of computers and software. The personal computer-based hardware and software system that includes the operator interface, data storage, data retrieval, archiving, alarming, historian, reports, trending, and other higher level control system software and functions.
   4. DPDT: Double-pole, double-throw.
   5. ECP: Electronic circuit protector.
   6. ES: Ethernet Switch.
   7. FAT: Factory acceptance test also known as Source Test.
   8. HART: Highway addressable remote transducer.
   9. HOA: Hand-Off-Auto control function that is totally PLC based. In the Hand mode, equipment is started or stopped, valves are opened or closed through operator direction under the control of the PLC software. In the Auto mode, equipment is started or stopped and valves are opened or closed through a control algorithm within the PLC software. In the Off mode, the equipment is prohibited from responding from the PLC control.
   10. HMI: Human machine interface is a software application that presents information to an operator or user about the state of a process, and to accept and implement the operators control instructions. Typically information is displayed in a graphical format.
   11. ICSC: Instrumentation and control system contractor: Subcontractor who specializes in the design, construction, fabrication, software development, installation, testing, and commissioning of industrial instrumentation and control systems.

12. IJB: Instrument junction boxes: A panel designed with cord sets to easily remove, replace, or relocate instrument signals.
13. I/O: Input/Output.
14. IP: Internet protocol or ingress protection.
15. LCP: Local control panel: Operator interface panel that may contain an HMI, pilot type control devices, operator interface devices, control relays, etc. and does not contain a PLC or RIO.
16. LAN: Local area network: A control or communications network that is limited to the physical boundaries of the facility.
17. LOI: Local Operator Interface is an operator interface device consisting of an alphanumeric or graphic display with operator input functionality. The LOI is typically a flat panel type of display mounted on the front of an enclosure with either a touch screen or tactile button interface.
18. LOR: Local-Off-Remote control function. In the Remote mode, equipment is started or stopped, and valves are opened or closed through the PLC based upon the selection of the HOA. In the Local mode, equipment is started or stopped, valves are opened or closed based upon hardwired control circuits completely independent of the PLC with minimum interlocks and permissive conditions. In the Off mode, the equipment is prohibited from responding to any control commands.
19. NJB: Network junction box. An enclosure that contains multiple access points to various networks within the facility. Networks could be Ethernet, Ethernet/IP, Fieldbus, RIO, etc.
20. P&ID: Process and instrumentation diagram.
21. PC: Personal computer.
22. PCIS: Process control and instrumentation system: Includes the entire instrumentation system, the entire control system, and all of the Work specified in the Instrumentation and Control Specifications and depicted on the Instrumentation Drawings. This includes all the PCS and instruments and networking components as well as the various servers, workstations, thin clients, etc.
23. PCM: Process control module: An enclosure containing any of the following devices: PLC, RTU, or RIO.
24. PCS: Process Control System: A general name for the computerized system that gathers and processes data from equipment and sensors and applies operational controls to the process equipment. It includes the PLCs and/or RIOs, LOIs, HMIs, both LCPs, VCPs and all data management systems accessible to staff.
25. PJB: Power junction box: An enclosure with terminal blocks that distribute power to multiple instruments.
26. PLC: Programmable logic controller.
27. PS: Power supply.
28. RIO: Remote I/O device for the PLC consisting of remote I/O racks, or remote I/O blocks.
29. RTU: Remote telemetry unit: A controller typically consisting of a PLC, and a means for remote communications. The remote communications devices typically are radios, modems, etc.
30. SCADA: Supervisory control and data acquisition system: A general name for the computerized system that gathers and processes data from sensors and equipment located outside of the facility, such as wells, lift stations, metering stations, etc.

31. SELV: Safety extra-low voltage.
32. SFP: Small form-factor pluggable.
33. SPDT: Single-pole, double-throw.
34. SPST: Single-pole, single-throw.
35. UPS: Uninterruptible power supply.
36. VCP: Vendor control panel: Control panels that are furnished with particular equipment by a vendor other than the ICSC. These panels may contain PLCs, RIO, LOI, HMI, etc.
37. WAN: Wide area network: A control or communications network that extends beyond the physical boundaries of the facility.

1.04 SUBMITTALS

A. General:
   1. Adhere to the wiring numbering scheme specified in Section 16075 - Identification for Electrical Systems throughout the Project:
      a. Uniquely number each wire.
      b. Wire numbers must appear on Equipment Drawings.
   2. Some items of Work are represented schematically, and are designated for the most part by numbers, as derived from criteria in ISA-5.1:
      a. Employ the nomenclature and numbers designated in this Section and indicated on the Drawings exclusively throughout shop drawings, data sheets, and similar submittals.
      b. Replace any other symbols, designations, and nomenclature unique to a manufacturer's, suppliers, or subcontractor's standard methods with those identified in this Section and indicated on the Drawings.

B. Specific submittal requirements:
   1. Control Panel Drawings:
      a. General Requirements:
         1) Submit panel, enclosure, console, furniture, and cabinet layout drawings for all items provided.
         2) Use equipment and instrument tags as depicted on the P&IDs for all submittals.
         3) Nameplates and Wire Labeling:
            a) Nameplate legend including text, letter size, materials, and colors.
            b) As specified in Section 16075 - Identification for Electrical Systems or as indicated on the Drawings.
         4) Structural Requirements:
            a) Anchoring method and leveling criteria, including manufacturer's recommendations for the Project site seismic criteria.
            b) Weight.
         5) Clearly show all modifications to existing circuits:
            a) Show all existing unmodified wiring to clearly depict the functionality and electrical characteristics of the complete modified circuits.
      b. Required for materials and equipment listed in this and other Technical Sections.

c. Front, side, rear, internal, external elevations and top and bottom views, showing all dimensions and all to scale.
    1) Locations of conduit entrances and access plates.
    2) Component layout and identification.
    3) Complete and detailed bills of materials:
        a) Including quantity, description, manufacturer, and part number for each assembly or component for each control panel.
        b) Include all items within an enclosure.
    4) Requirements for physical separation between control system components and 120 VAC, 480 VAC, and medium-voltage power cables.
    5) Complete grounding requirements for each system component including any requirements for PLCs, process LANs, and Control System equipment.
    6) PLC rack and card layout:
        a) Provide a count of current I/O allocation.
        b) Future I/O allocation.
        c) Quantity of spares provided.
    7) NEMA rating.
    8) Material and finish.

2. Schematics and Wiring Diagrams:
    a. General Requirements:
        1) Submit panel wiring diagrams for every panel that contains wiring.
        2) Use equipment and instrument tags as depicted on the P&IDs for all submittals.
        3) Nameplates and Wire Labeling:
            a) As specified in Section 16075 - Identification for Electrical Systems or as indicated on the Drawings.
        4) Clearly show all modifications to existing circuits:
            a) Show all existing unmodified wiring to clearly depict the functionality and electrical characteristics of the complete modified circuits.
    b. Include the following information:
        1) Name of panel.
        2) Wiring sizes and types.
        3) Terminal strip numbers.
        4) Terminal identification for device and field connections.
        5) Wire tags and labels.
        6) Functional name and manufacturer's designation for items to which wiring are connected.
        7) Set points for relays and control or alarm contact settings.
    c. Incorporate equipment manufacturer’s shop drawing information into the schematic diagrams in order to document the entire control system.
3. Loop Drawings:
    a. General Requirements:
        1) Submit loop drawings for every analog, discrete, fieldbus signal, vendor supplied equipment packages, and control panels:
            a) Includes all monitoring, alarming, interlocks, and control devices.
        2) Use equipment and instrument tags as depicted on the P&IDs for all submittals.

3) Show and identify each component of each loop or system using requirements and symbols from ISA-5.4.
4) Provide drawings for every instrumentation loop system:
a) Furnish a separate drawing sheet for each system or loop diagram.
5) Nameplates and Wire Labeling:
a) As specified in Section 16075 - Identification for Electrical Systems or as indicated on the Drawings.
6) Clearly show all modifications to existing circuits:
a) Show all existing unmodified wiring to clearly depict the functionality and electrical characteristics of the complete modified circuits.
7) Provide loop drawings in the format indicated in the contract drawings.

b. Provide a complete index in the front of each bound volume:
1) Index the loop drawings by systems or process areas.

c. In addition to the ISA-5.4 requirements, show the following details:
1) Functional name of each loop.
2) Reference name, drawing, and loop diagram numbers for any signal continuing off the loop diagram sheet.
3) Show all terminal numbers, regardless of the entity providing the equipment.
4) MCC panel, circuit, and breaker numbers for all power feeds to the loops and instrumentation.
5) Terminal assignments associated with every manhole, pull-box, junction box, conduit, and panel through which the loop circuits pass.
6) Show vendor control panel, instrument panel, conduit, junction box, equipment and PCS terminations, termination identification, wire numbers and colors, power circuits, and ground identifications.
7) Cables required for communication requirements.

4. PLC I/O List:
a. A complete listing of the PCS system point I/O database:
1) Include for each data point relevant parameters such as range, contact orientation, limits, incremental limits, I/O hardware address, and PLC assignment.
2) Organize on a site-by-site basis and separate by point type.
3) In addition to the active I/O points, list the implemented spare I/O points and the available I/O points remaining on each card, as well as other defined future points specified or shown.
4) Upon completion of the Work, update all I/O lists to indicate the final as-built configuration of the systems:
a) Organize as-built I/O list on a site-by-site basis, separated by equipment and point type.

5. Control Descriptions:
a. For each control loop, provide programming logic in the form of a written functional description of the operation of the equipment, signals, and controls based on the requirements specified in Section 17100 - Control Strategies, and Section 17101 - Specific Control Strategies, and as shown on the P&IDs:
1) Functional descriptions shall be modified to reflect the actual programming to be implemented in the PLCs.

2) Include each function depicted or described in the Contract Documents.
3) Include within the Control Description content:
a) Specific requirements.
b) Common requirements that pertain in general to all loops.
c) Listing ranges, setpoints, timers, values, counter values, etc.
d) Manual keyboard entries.
e) Entry codes.
f) System responses.
g) Modes:
(1) Startup.
(2) Routine and normal operation.
(3) Regulation and control.
(4) Shutdown under specified modes of operation.
(5) Emergency operating shutdown.

6. Instrument Data Sheets:
a. The data sheets provided with the instrument specifications are preliminary and are not complete but are provided to assist with the completion of final instrument data sheets. Additional data sheets may be required.
b. Furnish fully completed data sheets for each instrument and component according to ISA-20 Specification Forms for Process Measurement and Control Instruments, Primary Elements and Control Valves.
c. Format: Provide data sheets in Microsoft Word or Microsoft Excel.
1) Features and options that are furnished.
d. Provide completed data sheet as specified in the Technical Sections and for each control system component.

7. Instrument Installation Drawings:
a. Provide instrument installation, mounting, and anchoring details for all components and assemblies, including access requirements and conduit connection or entry details.
b. Each installation shall be identified by the equipment or instrument by tag number.
c. Provide certification by the instrument manufacturer that the proposed installation is in accordance with the instrument manufacturer's recommendations and is fully warrantable.
d. Provide, at a minimum, the following contents for each detail:
1) Necessary sections and elevation views required to define instrument location by referencing tank, building, or equipment names and numbers, and geographical qualities such as north, south, east, west, basement, first floor, etc.
2) Ambient temperature and humidity where the instrument is to be installed.
3) Corrosive qualities of the environment where the instrument is to be installed.
4) Hazardous rating of the environment where the instrument is to be installed.
5) Process line pipe or tank size, service, and material.
6) Process tap elevation and location.
7) Upstream and downstream straight pipe lengths between instrument installation and pipe fittings and valves.

8) Routing of tubing and identification of supports.
9) Mounting brackets, stands, anchoring devices, and sunshades.
10) Conduit entry size, number, location, and delineation between power and signal.
11) NEMA ratings of enclosures and all components.
12) Clearances required for instrument servicing.
13) List itemizing all manufacturer makes, model numbers, quantities, lengths required, and materials of each item required to support the implementation of the detail.

8. Product data:
   a. Provide a technical brochure or bulletin (“cutsheet”) for each instrument or equipment on the project labeled with equipment and instrument tags as depicted on the P&IDs.
      1) Submit with the corresponding data sheets:
      2) Organization: Index product data in the submittal by systems or loops.
   b. Engineering data:
      1) Test data and performance curves, when applicable.
   c. Manufacturer's technical reference manuals.
9. Commissioning Submittals:
   a. As specified in Section 01756 - Commissioning.
   b. Manufacturer representative qualifications.
   c. Manufacturer certificates.
   d. Test plans.
   e. Test reports.
   f. Owner training submittals.
   g. Operation and maintenance manuals.
      1) Organize the operation and maintenance manuals for each process in the following manner:
         a) Section A - Process and Instrumentation Diagrams.
         b) Section B - Control Panel Drawings.
         c) Section D - Schematics and Wiring Diagrams.
         d) Section E - Loop Drawings.
         e) Section F - Network Diagrams.
         f) Section G - PLC I/O List.
         g) Section H - Control Descriptions.
         h) Section I - Instrument Data Sheets.
         i) Section J - Instrument Installation Drawings.
         j) Section K - Product Data.
         k) Section L - Sizing Calculations.
         l) Section M - Test Results.
         m) Section N - Operational Manual.
         n) Section O - Spare Parts List.
         o) Section P - PLC Programs.
10. Meetings:
    a. As specified in Section 01312 - Project Meetings and in this Section.

1.05 QUALITY ASSURANCE

A. Manufacture instruments at facilities certified to the quality standards of ISO 9001.

B. Provide equipment listed by and bearing the label of UL or of an independent testing laboratory acceptable to the Engineer and the Authority Having Jurisdiction.

C. The ICSC must have their own operating UL listed panel fabrication facility.
   1. Panels must be fabricated at this facility and meet UL 508/508A requirements.

1.06 DELEGATED DESIGN (NOT USED)

1.07 DELIVERY, STORAGE, AND HANDLING

A. Upon receipt of instruments in the field:
   1. Outside of the package: Prominently display tag number identification.
   2. On each instrument: Provide a nameplate as specified in this Section.

1.08 PROJECT OR SITE CONDITIONS

A. Project conditions:
   1. Area classifications:
      a. Furnish enclosures that match the area classifications as specified in Section 16050 - Common Work Results for Electrical.

B. Non-conditioned spaces:
   1. Provide additional temperature conditioning equipment to maintain all equipment in non-conditioned spaces subject to these ambient temperatures, with a band of 10 degrees Fahrenheit above the minimum operating temperature and 10 degrees Fahrenheit below maximum operating temperature, as determined by the equipment manufacturer’s guidelines.

C. Outdoor installations:
   1. Provide electrical, instrumentation and control equipment suitable for operation in the ambient conditions where the equipment is located.
   2. Provide heating, cooling, and dehumidifying devices incorporated into and included with electrical equipment, instrumentation and control panels to maintain the enclosures within the rated environmental operating ranges as specified in the Sections for the equipment.

1.09 SEQUENCING

A. As specified in Section 01312 - Project Meetings.

B. Project PCIS overview conference:
   1. Contractor leads the meeting.
   2. Timing:
      a. Prior to start of ICSC and Programmer Work.
   3. Attendees:
      a. Engineer, Owner, ICSC, and Programmer.
      b. Contractor.

c. Electrical subcontractor.
d. Manufacturers furnishing major pieces of equipment must attend, including but not limited to:
1) Vendor control panels.
2) Chemical feed systems.
3) Motor control centers.
4) Switchgear.
5) Variable frequency drives.
6) Lighting.
7) Engine generators.

4. Agenda:
a. Meeting purpose:
1) Review the entire project, equipment, control philosophy, schedules, and submittal requirements.
b. Review entire project.
c. Review equipment lists.
d. Review control philosophy.
e. Review schedules.
f. Review submittal requirements.
g. Safety and security.
h. Action items.
i. Next meeting.

C. System configuration meetings: Meet on at least the following occasions:
1. Preliminary meeting:
a. Contractor leads the meeting.
b. Timing:
1) Before configuration work is begun.
c. Attendees:
1) Engineer, Owner, ICSC, and Programmer.
d. Agenda:
1) Meeting purpose:
a) Review the system configuration, the HMI system database, control schemes, displays, report formats, etc.
2) Review the ICSC provided examples of displays, display symbols, reports, etc. to show the capabilities of the system software.
3) Safety and security.
4) Action items.
5) Next meeting.

2. Development review meeting:
a. Contractor leads the meeting.
b. Timing:
1) After the initial database is entered and typical screens and reports have been entered.
c. Attendees:
1) Engineer, Owner, ICSC, and Programmer.
d. Agenda:
1) Meeting purpose:
a) Review the system configuration, the HMI system database, control schemes, displays, report formats, etc.
2) Review the system configuration.

3) Review the HMI system database.
4) Review the control schemes.
5) Review the displays.
6) Review the report formats.
7) Safety and security.
8) Action items.
9) Next meeting.

3. Pre-submittal review meeting:
   a. Contractor leads the meeting.
   b. Timing:
      1) Before producing any submittals.
   c. Attendees:
      1) Engineer, Owner, ICSC, and Programmer.
   d. Agenda:
      1) Meeting purpose:
         a) Review the system configuration, the HMI system database, control schemes, displays, report formats, etc.
         b) Review an informal hardcopy of developed HMI screens for review by the Engineer.
      2) Review the system configuration.
      3) Review the HMI system database.
      4) Review the control schemes.
      5) Review the displays.
      6) Review the report formats.
      7) Review an informal hardcopy of developed HMI screens.
      8) Review the submittal schedule.
      9) Safety and security.
      10) Action items.
      11) Next meeting.
4. Final review meeting:
   a. Contractor leads the meeting.
   b. Timing:
      1) After initial completion of configuration work.
      2) Prior to the Source Test.
   c. Attendees:
      1) Engineer, Owner, ICSC, and Programmer.
   d. Agenda:
      1) Meeting Purpose:
         a) Review the system configuration, the HMI system database, control schemes, displays, report formats, etc.
      2) Review the system configuration.
      3) Review the HMI system database.
      4) Review the control schemes.
      5) Review the displays.
      6) Review the report formats.
      7) Safety and security.
      8) Action items.
      9) Next meeting.
   e. Make final format revisions after this review.

5. Additional requirements as specified in the following:
    a. Section 17100 - Control Strategies.
    b. Section 17101 - Specific Control Strategies.
    c. Section 17720 - Control Systems: Programmable Logic Controllers.

D. Control logic meetings: Meet on at least the following occasions:
    1. Preliminary meeting:
        a. Contractor leads the meeting.
        b. Timing:
            1) Before configuration work is begun on any PLCs programmed by the Contractor (including those provided through subcontractors and suppliers).
        c. Attendees:
            1) Owner, Engineer, ICSC, and Programmer.
            2) Individuals responsible for programming PLCs and other programmable devices supplied by Contractor may attend by telephone conference call.
        d. Agenda:
            1) Meeting purpose:
                a) Discuss overall control logic.
            2) Review list of each PLC and other programmable devices that will interface to the rest of the control system, including make, model, and a description of the interface.
            3) Review contact information for each individual responsible for programming each said PLC and other programmable device.
            4) Review schedule of submittals that will contain HMI/LOI interface information.
            5) Safety and security.
            6) Action items.
            7) Next meeting.
    2. Development review meeting:
        a. Contractor leads the meeting.
        b. Timing:
            1) After approximately one-half of the HMI/LOI interface submittals have been submitted.
        c. Attendees:
            1) Owner, Engineer, ICSC, and Programmer.
            2) Individuals responsible for programming PLCs and other programmable devices supplied by Contractor may attend by telephone conference call.
        d. Agenda:
            1) Meeting purpose:
                a) Discuss progress on control logic.
            2) Discuss HMI/LOI interface submittals to date.
            3) Discuss HMI/LOI interface future submittals and their requirements.
            4) Discuss half of the screens "drafted" but not submitted.
            5) Review list of each PLC and other programmable devices that will interface to the rest of the control system, including make, model, and a description of the interface.
            6) Review contact information for each individual responsible for programming each said PLC and other programmable device.

7) Review schedule of submittals that will contain HMI/LOI interface information.
8) Safety and security.
9) Action items.
a) Document Vendor Control Panel programming requirements.
10) Next meeting.

3. Pre-submittal review meeting:
a. Contractor leads the meeting.
b. Timing:
1) Before producing any submittals.
c. Attendees:
1) Engineer, Owner, ICSC, and Programmer.
d. Agenda:
1) Meeting purpose:
a) Coordinate submittals.
2) Review the system configuration, the HMI system database, control schemes, displays, report formats, etc.
3) Review an informal hardcopy of developed HMI screens for review by the Engineer to determine that requirements are being sufficiently met.
4) Review the submittal schedule.
5) Safety and security.
6) Action items.
7) Next meeting.

4. Vendor control panel programming meetings:
a. Contractor leads the meeting.
b. Timing:
1) Prior to start of vendor control panel programming Work.
c. Attendees:
1) Owner, Engineer, ICSC, and Programmer.
2) Individuals responsible for programming PLCs and other programmable devices supplied by Contractor may attend by telephone conference call.
3) Each equipment supplier who is providing equipment with a PLC and/or LOI.
d. Agenda:
1) Meeting purpose:
a) Coordinate control logic requirements for specific equipment.
2) Review minimum Vendor Control Panel programming requirements:
a) PLC to PLC global data mapping.
b) PLCs to HMI tags mapping.
c) Communication methods.
3) Review advanced Vendor Control Panel programming requirements, as applicable:
a) Tag naming conventions.
b) LOI screen colors and navigation.
c) Interlock and permissive definitions.
d) Alarms: Clearing, formats, colors, and status.
e) Standard code blocks for common control functionality.
4) Safety and security.

5) Action items.
6) Next meeting.

5. Final review meeting:
   a. Contractor leads the meeting.
   b. Timing:
      1) After all HMI/LOI interface submittals have been submitted.
   c. Attendees:
      1) Owner, Engineer, and Programmer.
      2) Individuals responsible for programming PLCs and other programmable devices supplied by Contractor may attend by telephone conference call.
   d. Agenda:
      1) Meeting purpose:
         a) Discuss HMI/LOI interface submittals and requirements.
      2) Review minimum programming requirements:
         a) PLC to PLC global data mapping.
         b) PLCs to HMI tags mapping.
         c) Communication methods.
      3) Review advanced requirements, as applicable:
         a) Tag naming conventions.
         b) LOI screen colors and navigation.
         c) Interlock and permissive definitions.
         d) Alarms: Clearing, formats, colors, and status.
         e) Standard code blocks for common control functionality.
      4) Safety and security.
      5) Action items.
      6) Next meeting.
6. Additional requirements as specified in the following:
   a. Section 17100 - Control Strategies.
   b. Section 17101 - Specific Control Strategies.
   c. Section 17720 - Control Systems: Programmable Logic Controllers.

1.10 SCHEDULING (NOT USED)

1.11 WARRANTY (NOT USED)

1.12 SYSTEM PROCESS START-UP (NOT USED)

1.13 OWNER'S INSTRUCTIONS (NOT USED)

1.14 MAINTENANCE (NOT USED)

PART 2 PRODUCTS

2.01 MANUFACTURERS (NOT USED)

2.02 DESIGN AND PERFORMANCE REQUIREMENTS (NOT USED)

2.03 SYSTEM DESCRIPTION (NOT USED)

2.04 EXISTING PRODUCTS (NOT USED)

2.05 MATERIALS (NOT USED)

2.06 MANUFACTURED UNITS (NOT USED)

2.07 EQUIPMENT (NOT USED)

2.08 COMPONENTS

A. Furnish meters, instruments, and other components that are the most recent field proven models marketed by their manufacturers at the time of submittal of the shop drawings unless otherwise specified to match existing equipment.

B. Unless otherwise specified, furnish individual instruments that have a minimum accuracy of within 0.5 percent of full scale and a minimum repeatability of within 0.25 percent of full scale.

C. Signal transmission:
   1. Analog signals:
      a. Furnish analog measurements and control signals that vary in direct linear proportion to the measured variable, unless otherwise indicated.
      b. Furnish electrical analog signals outside control panels that are 4-to-20 milliamperes 24 VDC, except as indicated.
      c. Electrically or optically isolate all analog signals from other signals.
      d. Furnish regulated analog signals that are not affected by changes in supply voltage or load resistance within the unit's rating.
      e. Maintain the total 4-to-20 milliamperes loop impedance to 10 percent below the published value at the loop operating voltage.
      f. Where necessary, reduce loop impedance by providing current-to-current (I/I) isolation amplifiers for signal re-transmission.
   2. Discrete input signals:
      a. As indicated in the controller hardware specification.
   3. Discrete output signals:
      a. Dry contacts or TRIAC outputs (with express written approval by the Engineer) as needed to coordinate with the field device.
      b. Provide external terminal block mounted fuse with blown fuse indication for all discrete outputs.
      c. Provide interposing relays for all discrete outputs for voltage and/or current compatibilities.
      d. Provide interposing relays as required for functionality of the control circuit.
   4. Signal performance and design criteria:
      a. Stability:
         1) After controls have taken corrective action, oscillation of the final control element shall not exceed 2 cycles per minute or a magnitude of motion of 0.5 percent of full travel.

b. Response:
    1) Any change in setpoint or controlled variable shall produce a corrective change in position of the final control element and stabilized within 30 seconds.
c. Agreement:
    1) Setpoint indication of controlled variable and measured indication of controlled variable shall agree within 3 percent of full scale over a 6:1 operating range.
d. Repeatability:
    1) For any repeated magnitude of control signal, from either an increasing or decreasing direction, the final control element shall take a repeated position within 0.5 percent of full travel regardless of force required to position the final element.
e. Sensitivity:
    1) Controls shall respond to a setpoint deviations and measured variable deviations within 1.0 percent of full scale.
f. Performance:
    1) All instruments and control devices shall perform in accordance with the manufacturers' specifications.

D. Discrete circuit configuration:
    1. Configure discrete control circuits to fail safe, on loss of continuity or loss of power.
    2. Alarm contacts: Fail to the alarm condition.
    3. Control contacts fail to the inoperative condition unless otherwise indicated on the Drawings.

E. Grounding:
    1. Analog signal cables shields shall only be grounded at a single point in the loop. Unless otherwise noted, ground signal cable shields at control panel.
    2. For communication and data line signal cable shields and drain wires should be grounded at both ends of the cable.
    3. Insulate the shielding and exposed drain wire for each signal cable with heat-shrink tubing.
    4. Terminate the signal cable shield on a dedicated grounding terminal block.
    5. Provide isolating amplifiers within control panels for field equipment possessing a grounded input or output, except when the panel circuit is galvanically isolated.

2.09 ACCESSORIES

A. Provide flow conditioning devices or other required accessories as needed to meet the accuracy requirements in the Contract Documents.

2.10 MIXES (NOT USED)

2.11 FABRICATION (NOT USED)

2.12 FINISHES (NOT USED)

2.13 SOURCE QUALITY CONTROL (NOT USED)

PART 3 EXECUTION

3.01 EXAMINATION (NOT USED)

3.02 PREPARATION (NOT USED)

3.03 INSTALLATION

A. The PCIS configurations are diagrammatic:
   1. The locations of equipment are approximate unless dimensioned.
   2. Where Project conditions require, make reasonable changes in locations and arrangements.

B. Field instruments installation:
   1. Install field instruments as specified in the Contract Documents, API RP 550 and RP 551, and the manufacturer's instructions.
   2. Mount field instruments so that they can be easily read, readily approached, and easily serviced, and so they do not restrict access to mechanical equipment:
      a. Mount field instruments on a pipe stand or local panel, if they are not directly mounted, unless otherwise indicated on the Drawings.
      b. Provide sun shields for field electronic instruments located outdoors.
   3. Make connections from rigid conduit systems to field instruments with PVC coated flexible conduit:
      a. Type of flexible conduit required for the area classification:
         1) Area classification as specified in Section 16050 - Common Work Results for Electrical.
      b. Maximum length of 18 inches.
   4. Connect field instruments with cable as specified in the Electrical Specifications, except when the manufacturer requires the use of special cable, or otherwise specified in this Section:
      a. Special cable applications shall be in accordance with the NEC.
   5. Verify the correctness of each installation:
      a. Polarity of electric power and signal connections.
   6. Ensure all process connections are free of leaks.

C. Existing instrumentation:
   1. Clean, recondition and re-calibrate each existing instrument to be reused, removed, or reinstalled using an authorized service facility of the instrument manufacturer.
   2. Provide certification of this Work before reinstallation of each instrument.

D. Cable and conductor termination:
   1. Terminate all cables and conductors on terminal blocks.
   2. Terminal block enclosures:
      a. Suitable for the area classification as specified in Section 16050 - Common Work Results for Electrical.

E. Surge protection:
   1. Provide outdoor field instrument loops with voltage surge protection units installed on the instruments and the panel.
   2. Individually fuse each 4 to 20 milliamperes direct current loop with a 1/2-ampere fuse between power supplies and receiver surge protectors.
   3. Provide voltage surge protection for 4 wire transmitters and analyzers:
      a. Protect both power source and signal loop.

3.04 ERECTION, INSTALLATION, APPLICATION, CONSTRUCTION (NOT USED)

3.05 REPAIR/RESTORATION (NOT USED)

3.06 RE-INSTALLATION (NOT USED)

3.07 COMMISSIONING - GENERAL

A. As specified in Section 01756 - Commissioning and Technical Sections.

3.08 COMMISSIONING - SOURCE TESTING (NOT USED)

3.09 COMMISSIONING - INSTALLATION VERIFICATION (NOT USED)

3.10 COMMISSIONING - FUNCTIONAL TESTING

A. Assist with troubleshooting and correcting instrumentation and control issues.

3.11 COMMISSIONING - SYSTEM TESTING (NOT USED)

3.12 COMMISSIONING - OWNER TRAINING (NOT USED)

3.13 COMMISSIONING - DOCUMENTATION (NOT USED)

3.14 FIELD QUALITY CONTROL (NOT USED)

3.15 ADJUSTING

A. Control valves:
   1. Stroke control valves, cylinders, drives and connecting linkages from the control system as well as local control devices and adjust to verify proper control action, hand switch action, limit switch settings, torque settings, remote control actions, and remote feedback of valve status and position.
   2. Check control valve actions and positioner settings with the valves in place to ensure that no changes have occurred since the bench calibration.

B. Make revisions necessary to the control system software, as directed by the Engineer.
   1. It is understood that the Contractor knows and agrees that changes will be required in the control system software during commissioning.

3.16 CLEANING

A. Vacuum clean control panels and enclosures before process start-up and again after final completion of the project.

B. Clean panel surfaces.

C. Return to new condition any scratches and/or defects.

D. Wipe instrument faces and enclosures clean.

E. Leave wiring in panels, manholes, boxes, and other locations in a neat, clean, and organized manner:
   1. Neatly coil and label all spare wiring lengths.
   2. Shorten, re-terminate, and re-label excessive spare wire and cable lengths, as determined by the Engineer.

3.17 PROTECTION (NOT USED)

3.18 SCHEDULES (NOT USED)

END OF SECTION

SECTION 17100

CONTROL STRATEGIES

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Contractor-developed loop description submittal requirements.
   2. General programming requirements.
   3. Common control functions:
      a. General control and monitoring functions to be provided throughout the PCS syste:
         1) These requirements apply to all systems and supplement the specific loop descriptions in Section 17101 - Specific Control Strategies and information indicated on the Drawings.

1.02 REFERENCES

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

1.03 DEFINITIONS

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Clamp: Imposed upper and lower limits on setpoints to eliminate entries outside the allowable control parameters.

C. Hardwired control: Control circuitry that does not utilize software to initiate functionality.

D. Hardwired interlocks: A safety or protective feature that will interrupt operation of the equipment in all operating modes with no required operator intervention.

E. Historize: To store data collected by a Supervisory Control and Data Acquisition system or Distributed Control system in a Historical Server or Historian for later use in trends and reports.

F. Software interlocks: A safety or protective feature that will interrupt operation of the equipment when the PLC has control.

G. Slew rate: Rate of change in respect to time.

H. Watchdog timer: Timers imposed to test components such as discrete I/O to verify the health of the card.

1.04 SYSTEM DESCRIPTION (NOT USED)

1.05 SUBMITTALS

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

1.06 QUALITY ASSURANCE (NOT USED)

1.07 DELIVERY, STORAGE, AND HANDLING (NOT USED)

1.08 PROJECT OR SITE CONDITIONS (NOT USED)

PART 3 EXECUTION

3.01 EXAMINATION (NOT USED)

3.02 PREPARATION (NOT USED)

3.03 INSTALLATION (NOT USED)

3.04 ERECTION, INSTALLATION, APPLICATION, CONSTRUCTION

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. General programming requirements:
   1. Use variable names or aliases derived from tag and loop identification on the P&IDs for all process values.
      a. Submit names for Owner approval.
      b. Unless otherwise noted, utilize floating-point format for all PLC algorithms and calculations.
      c. Provide PLC logic to convert raw input values into engineering units in a floating-point format.
   2. Store all adjustable parameters in the PLC and configure so that an operator with sufficient security access can change the parameters from the LOI or HMI. Update and display the current value at all locations, regardless of where the last change was made.
   3. Reusable PLC code blocks:
      a. Develop and use new standard user defined function blocks (UDFBs) and user defined types (UDTs) where appropriate. One instance of each standard code block shall reside in each PLC and shall be referenced in main routines and subroutines.
      b. New code blocks that the Contractor would like to use as a standard shall be submitted to Owner for review and approval.
      c. Provide complete library of standard code blocks to Owner as part of O&M documentation.
   4. Documentation:
      a. All control logic shall be completely annotated including all rungs, instructions, and tags.
      b. Each routine shall have a title and a detailed description of the control strategy represented by the control logic. Where parameters are passed to the routine, all parameters shall be defined in the routine description.
      c. Analog tag descriptions representing process variables shall include the engineering unit range of the analog variable.
      d. Digital tag descriptions shall include the On and Off state labels.
      e. Complete, grammatically correct sentences and terminology, consistent with water treatment processes, shall be utilized in the development of rung and routine descriptions.
      f. All equations developed in the process logic shall be fully documented in the rung or routine description. A description of each constant and

variable utilized in the equation shall be defined including engineering units.

5. Program slew rates for setpoints as needed to limit the effect of updated setpoints on the process:
    a. Provide for control setpoints and manual speed and position selections.
    b. Store new setpoints in one register, and gradually ramp the actual setpoint register at the slew rate until it reaches the new value.
    c. Provide operator access to change slew rates from the HMI.
6. Saved setpoints:
    a. Provide an operator selection to save all setpoint values.
    b. Furnish 1 or more screens at the HMI that display the initial values for all setpoints defined during start-up and the value for each setpoint the last time they were saved.
    c. Where possible use a DFB or AOI to provide an operator selection to restore all setpoints to the initial start-up value.
    d. Provide an operator selection to restore all setpoints to the last saved value.
7. Store a copy of all adjustable parameters and accumulated and integrated totals in PCS:
    a. Upon re-loading of the PLC program, re-load these values to the PLC from PCS or processor memory card.
    b. PLCs provide a minimum 2-week data storage to provide for data accumulation and later communication to the Historian in the event of a network interruption.
8. Calculated values:
    a. Program calculations such that division by zero errors cannot occur.
    b. Prevent calculations from generating values that exceed the limits of the equipment or data type structures (integers) internal to the PLC.
    c. Configure counting functions (start counts and operation counts) to allow a minimum of 10,000 counts, and to roll-over to zero at an even decimal interval (1 followed by 4 or more zeros).
    d. Configure integrating functions to accurately accumulate the maximum rate from the instrument/equipment (totalizers, run time meters) for 30 years. Utilize manufacturer AOI/DFBs etc. where possible.
9. Timers:
    a. Provide programmable settling and proving timers in control sequences as required for starting and stopping of equipment to allow the process to settle to a steady state before proceeding with any additional control functions.
        1) The settling timers may be overridden by setting the timer to 0 seconds.
10. Control Panel status:
    a. Design the PLC system to function as a stand-alone unit that performs all of the control functions described in this Section completely independent from the functions of the PCS system PC-based operator interfaces:
        1) Failure of the PCS system shall not impact data acquisition, control, scaling, alarm checking, or communication functions of the PLC.
    b. Furnish a minimum of 1 screen that depicts the status of all enclosures containing PLCs, communication equipment, UPS or I/O in the control system, including but not limited to the following:
        1) PLC cabinet over-temperatures from high temperature switch.

2) Intrusion status on all enclosures equipped with intrusion switches.
3) AC power failure:
    a) Monitor ahead of UPS.
4) DC power supply failure:
    a) For redundant power supplies, alarm when either power supply or the diode bridge fails.
5) UPS failure signal.
6) UPS Low Battery signal.
7) Digital bus network Coupler and or Gateway failure signal.
8) Ethernet Switch failure signal.

11. PLC system communication status:
    a. Furnish a minimum of 1 screen to display all communication errors and status within the PCS:
        1) Communication between PCS and PLCs, PLC to PLC, PLC to RIO and PLC and or PCS to VCP.
        2) 4-20 mA HART interface cards.
        3) Digital bus network status:
            a) Profibus scanners.
        4) Modbus Gateway modules.
        5) Display status of each node, and summary of failures over the past 60 minutes.
    b. Generate a communications alarm if any communication fault is detected or there is no response from a node for more than a user specified time.
    c. In the event of communications loss:
        1) Continue normal operation at each PLC.
        2) Where control parameters are received over a communications link:
            a) If a link fails where process elements use the remote value for closed-loop control, hold operating status, speed and position, of the process elements at their last state before the communication alarm, unless other I/O local to that PLC indicates shutdown or over-ride conditions:
                (1) Ensure that the operator can control the process using PCI\S HAND mode at the local LOI.
            b) If a link fails where process elements use the remote value to determine setpoints, continue to operate using the last value received:
                (1) Provide a manual over-ride entry at the local LOI to allow an operator to enter a different value for any such remote signal.
                (2) Generate an alarm whenever an over-ride value is in use.
12. 4-20 mA Hart interface cards:
    a. Provide the following HART protocol information for each populated channel on the card:
        1) Process variable values:
            a) Primary process variable (analog): 4-20 mA current signal.
            b) Primary process variable (digital): Digital value in engineering units.
            c) Percent range: Primary process variable expressed as percent of calibrated range.

d) Loop current: Loop current value in milliamps.
e) Secondary process Variable 1: Digital value in engineering units available from multivariable devices (if applicable).

2) Host commands:
a) Set primary variable units.
b) Set upper range.
c) Set lower range.
d) Set damping value.
e) Set message.
f) Set tag.
g) Set date.
h) Set descriptor.
i) Perform loop test: Force loop current to specific value.
j) Initiate self-test: Start device self-test.
k) Get more status available information.

3) Status and diagnostic alerts:
a) Device malfunction: Indicated device self-diagnostic has detected a problem in device operation.
b) Configuration changed: Indicates device configuration has been changed.
c) Cold start: Indicates device has gone through power cycle.
d) More status available: Indicates additional devices status data available.
e) Primary variable analog output fixed: Indicates device in fixed current mode.
f) Primary variable analog output saturated: Indicates 4-20 mA signal is saturated.
g) Secondary variable out of limits: Indicates secondary variable value outside the sensor limits.
h) Primary variable out of limits: Indicates primary variable value outside the sensor limits.

4) Device identification:
a) Instrument tag: User defined, up to 8 characters.
b) Descriptor: User defined, up to 16 characters.
c) Manufacturer name (code): Code established by HCF and set by manufacturer.
d) Device type and revision: Set by manufacturer.
e) Device serial number: Set by manufacturer.
f) Sensor serial number: Set by manufacturer.

5) Calibration information:
a) Date: Date of last calibration, set by user.
b) Upper range value: Primary variable value in engineering units for 20 mA point, set by user.
c) Lower range value: Primary variable value in engineering units for 4 mA point, set by user.
d) Upper sensor limit: Set by manufacturer.
e) Lower sensor limit: Set by manufacturer.
f) Sensor minimum span: Set by manufacturer.
g) PV damping: Primary process variable damping factor, set by user.

h) Message: Scratch pad message area (32 characters), set by user.
i) Loop current transfer function: Relationship between primary variable digital value and 4-20 mA current signal.
j) Loop current alarm action: Loop current action on device failure (upscale/downscale).
k) Write protect status: Device write-protect indicator.

C. Common control functions:
1. Incorporate common control functions into all control loops and devices and into the control programming, whether or not specifically shown in the specific control descriptions or elsewhere in the Contract Documents.
2. Alarms:
a. Generate alarms within the PLC logic.
b. Indicate alarms at the LOI and HMI. Enable acknowledgement from either the HMI or the LOI.
c. Generate high, high-high, low, and low-low level alarms where indicated:
1) Provide an alarm reset deadband for each analog value to prevent excessive repeated alarms.
2) Provide logic and timers to inhibit analog alarms based on process events. For example, inhibit low flow alarms when a pump is stopped, or has not been running long enough to establish flow.
d. Flash all alarm and fail conditions and their respective indicators on the PCS graphic screens and local indicating lights until the condition is acknowledged by the operator, even if the alarm condition is no longer present.
e. Once the alarm is acknowledged by an operator, display alarm conditions in a steady state (not flashing) while the alarm condition is still present:
1) Flash with a cycle rate of 1/2 second on and 1/2 second off.
f. Once the alarm has been cleared and the operator has acknowledged the alarm or fail condition, turn the graphic alarm indicator off.
g. For all alarms that do not have inherent timers, provide an operator-adjustable proving timer to limit nuisance alarms, continuously adjustable from zero seconds to 100 minutes. The initial setting of proving timers shall be zero seconds:
1) The PLC shall start the timer when it first detects an alarm condition and shall only activate the alarm after the timer has expired.
2) If the alarm condition clears while the timer is running, the timer shall reset, and the alarm shall not be activated.
h. Use interlocks and proving timers to prevent alarms from operating due to power loss, except for loss of power alarms.
i. Furnish an alarm silence pushbutton at each PCM, LOI, or LCP with an audible alarm to signal the PLC to turn off the audible alarm until the next alarm occurs.
j. Lamp test: Furnish lamp test pushbuttons at each control panel with more than 10 pilot lights, that illuminates all pilot lights on the panel:
1) The lamp test may sequence through blocks of lights.
2) Minimum on time for each lamp during lamp test 15 seconds.
k. Horns and Beacons:
1) Activate PCM horn and beacon on all critical alarms and on other alarms as defined by the Facility Alarm Philosophy.

2) Deactivate PCM horn and beacon when PCM reset pushbutton is activated.
3) Silence PCM horn when PCM silence pushbutton is activated.

l. Dual analog instruments:
1) For applications where 2 or more analog instruments are measuring the same process variable:
a) Generate an operator adjustable percent deviation alarm.
b) Allow operator to take each instrument out of service when an instrument is out of service.

3. Where a reset is shown for counts, totals and times maintained in the PLC:
a. Provide a reset selection on the HMI screen that displays the value.
b. Provide a preset function on the HMI to allow an operator-entered value to become the current accumulated total.
c. Limit access to the reset and preset functions to operators with suitable security level.
d. Log the value before reset, operator, time, and date of reset in the PCS archive.
e. Log the value before preset, preset value, operator, time, and date of preset in the PCS archive.

4. Where start counts are indicated on the Drawings, or required in this Section, count starts for each piece of equipment (off to on transitions of running status) in the PLC:
a. Display total starts on PCS screens and provide a reset function.
b. Where indicated, calculate number of starts for each day:
1) Display current day and previous day starts on PCS displays.
2) Do not reset daily start count when overall count is reset.
3) Archive starts for each day through PCS.

5. Where run time accumulation is indicated on the Drawings, or required in this Section, integrate accumulated run time to the nearest 0.1 hour whenever the running status input indicates that the equipment is running:
a. Display total run time in hours on PCS screens.
b. Where indicated, calculate total run time for each day:
1) Display current day and previous day run time on the HMI to the nearest 0.1 hour.
2) Do not reset daily run time when overall time is reset.
3) Archive run time for each day through PCS.

6. For all monitored analog values:
a. Convert all values to engineering units in floating-point format within the PLC.
b. Maintain trends in PCS.
1) Display minima and maxima on the HMI, and archive through PCS.
c. Flows and Weights:
1) Totalize flows in the PLC logic:
2) Where totalized flows are input to a discrete input, count input pulses and multiply by the volume per pulse.
3) Where no totalizer input is shown, integrate the analog input over time.
4) Display totals on the HMI and LOI.
5) Archive totals to the historical database through PCS.
d. Generate an alarm whenever an over-ride value is in use.

e. Calculate hourly, daily, and monthly averages:
    1) Calculations shall be performed by the PLC.
    2) Display averages on the HMI, and archive through PCS.
    3) Display minima and maxima on the HMI, and archive through PCS.
f. Calculate minimum and maximum values each day, and month:
    1) Calculations may be performed by the PLC or PCS.
    2) Display minima and maxima on the HMI, and archive through PCS.

7. Analog data processing:
    a. Engineering units conversion:
        1) Use engineering units for all analog point values. Convert analog inputs to engineering units.
    b. Analog magnitude checking:
        1) Provide upper and lower limits to prevent operator-entered values (setpoints, etc.) from falling outside acceptable limits.
    c. Analog value quality:
        1) Monitor analog values received at each PLC from analog inputs or communications from another PLC or RIO specific to critical analog values, and generate alarms for the following conditions:
            a) Rate of change in excess of acceptable limit:
                (1) Provide a separate rate limit for each value.
            b) Stale value:
                (1) For analog signals that come from analog inputs or calculations using analog inputs, which are expected to have some variation each time the input is read, alarm when there is no change in the value for 10 times the normal expected scan or communication update.

8. Analog device override (LOI and HMI):
    a. Provide the following functions from the HMI and the local LOI all controlling analog input:
        1) An over-ride value to be used in place of the analog input:
            a) Enter in engineering units:
                (1) Display the calibrated range in engineering units.
                (2) Only allow entries within the calibrated range of the instrument.
            b) When the analog input is enabled, track the analog input so that the over-ride matches the analog input value when the input is initially disabled.
            c) Maintain over-ride status and value in the PLC.
            d) Only allow access to over-ride selections and settings to operators with sufficient security.
        2) An enable/disable selection:
            a) When enabled, the value used by the PCS system is equal to the analog input value.
            b) When disabled, the analog input is ignored, and the over-ride value is used for all control and display functions.
            c) Generate an alarm whenever an analog input is disabled.
            d) Enter a value for the analog input from the PCS system to the PLC.
        3) Use the over-ride value for all display and control functions instead of the actual analog input value.

b. Provide the following functions in the PLC, with selections and value entry from the HMI and/or LOI:
    1) An over-ride value to be used in place of the normal output value:
        a) Enter in percent of output span.
        b) When the analog output is enabled, track the analog input so that the over-ride matches the analog output value when the output is initially disabled.
    2) An enable/disable selection:
        a) When enabled, the value sent to the output is the value determined by the PLC based on the control logic or operator-entered value in PCS HAND.
        b) When disabled, the calculated PCS HAND values are ignored, and the over-ride value is sent to the output.
        c) Generate an alarm whenever an analog output is disabled.

9. Tank and vessel levels:
    a. Display all tank and vessel levels as both a level (typically in feet) and a volume (typically in gallons):
        1) Some individual displays may be only level or volume, when agreed to by the Owner and Engineer during screen review meetings.
    b. Monitor rate of change of volume on all tanks and vessels:
        1) Establish the maximum withdraw rate at which the volume should decrease (all pumps or feeders operating at maximum output). Generate an alarm whenever the volume decreases faster than this rate.
        2) Establish the maximum fill rate at which the volume should increase when filling. Generate an alarm whenever the volume increases faster than this rate. Verify tank and vessel level is fluctuating to verify the validity of the IO register. If it is determined the register is not active or failed in a manner that leaves a stagnant value generate an alarm.
10. I/O filtering and processing:
    a. Analog input filtering:
        1) For each analog input provide an adjustable first order filter, for the purpose of smoothing out spikes and other noise for analog transmitter input signals. By default, configure analog inputs with no filtering affect.
        2) Monitor analog input signal quality:
            a) Over range: The input value is above the normal range (typically over 21 mA).
            b) Under range: The input value is below the normal range (typically under 3 mA, indicating a probable broken connection).
            c) Generate alarms for over or under range inputs.
            d) Do not use over or under range values for control or calculation purposes:
                (1) Where a second instrument is provided to monitor the same condition (a redundant instrument, or additional instruments furnished for averaging or different operating modes), and has a valid signal, use that input for control.

3) Digital input filtering (proving timer):
a) Provide an adjustable time delay function (0-10 seconds) on discrete input for the purpose of de-bouncing.
b) By default, discrete inputs shall be configured with de-bounce timers set to zero seconds.

11. Instrument scaling (HMI/LOI):
a. Provide 1 or more maintenance screens to display ranges and trigger points for all field instruments:
1) For analog instruments, use input scaling values in the PLC to determine minimum and maximum calibration points.
2) For discrete instruments, display calibrated pick-up and drop-out values.
12. PCS HAND-OFF-AUTO:
a. Where indicated, provide HAND-OFF-AUTO and START-STOP selections in the PCS, accessed from an LOI or HMI for operators with sufficient security, to provide the following operating modes:
1) PCS AUTO: The normal, automatic control mode of the strategy which allows full PLC control in response to process conditions and programmed sequences.
2) PCS HAND: Enables PCS Manual control where control decisions are made by an operator through the PCS START-STOP, OPEN/CLOSE, or other selections as indicated.
3) PCS OFF: Automated PCS control is disabled, and PLC calls for all associated equipment to stop and valves to close or go to their identified safe state.
4) Program the PLC so that switching a strategy between AUTO and HAND (either direction) occurs with a smooth transition. Keep running or position status unchanged when control is switched to HAND until a change is requested using the operator selections (START, STOP, OPEN, CLOSE). Keep running and position status unchanged when control is switched to AUTO until the control logic determines a change is required.
13. Display the current status of all operator selections (PCS HAND/AUTO, PCS START/STOP, etc.) on LOI and HMI.
14. Interlocks:
a. Implement software interlocks where indicated to place equipment in a safe condition in response to impending hazardous process conditions. Apply software interlocks when equipment is operating in PCS AUTO or PCS HAND:
15. Permissives:
a. Implement software permissives where indicated to prevent equipment from starting in an unsafe condition.
b. Apply software permissives when equipment is operating in PCS AUTO or PCS HAND.
16. Process control algorithms:
a. Jog and hold:
1) When the error between process variable and setpoint is beyond a setpoint deadband:
a) Jog valve or ramp speed in the required direction for a preset “Jog Time” or until the process variable reaches or passes the setpoint.

b) Then hold speed or position through a setpoint “Hold Time.”
c) Continue alternating jog and hold until the error is less than the deadband.

2) Provide operator access to Jog Time and Hold Time setpoints from the HMI.

b. PID algorithms:

1) Provide a PID faceplate with the following displays and functions for each PID control algorithm:
a) Display Output, CV.
b) Display Setpoint, SP.
c) Display Process Variable, PV.
d) Allow for operator selection of Automatic or Manual control of the output.
e) Under Manual control of output allow the operator to enter the desired output value.
f) Allow for input of the 3 Proportional, Integral, and Derivative tuning parameters.
g) Configure PID loops to prevent reset windup when controlled equipment is operating in Manual (local or PCS), or when the equipment has reached a physical limit.
h) When controlled equipment is being operated in remote PCS HAND, configure the PID function to track the process variable to provide a smooth transfer between Manual and Automatic modes.
i) Provide selectable slew rates with adjustable setpoints to allow the PID algorithm to slowly ramp to its final value to minimize system disturbance.

17. Equipment alternating and sequencing:

a. Distribute number of starts and run time equally between identical equipment.

b. Where multiple pieces of equipment are used to control a single process variable, alternating of lead and lag equipment assignments is done as follows:

1) Automatic Lead/Lag equipment selection:
a) The control system automatically selects the lead equipment and next lag equipment based on the lowest run time hours of the equipment.
b) When multiple equipment are running, the control system determines which equipment to stop next based on the running equipment with the highest run time hours.
c) A weighted run time factor can be assigned to each individual piece of equipment.
(1) The weighting factor is a percentage from 1-100 percent that is multiplied by the actual run time hours of the equipment to create a weighted run time hours of the equipment.
(2) The weighted run time hours of each piece of equipment are then used by the algorithms that select the equipment that will start or stop next.

(3) This is to allow for specific equipment to accrue more run time hours so that all pumps do not reach their maximum run time hours at approximately the same time.
(a) Display both the weighted and actual runtime hours on the PCS screen.

2) Manual Lead/Lag selection:
a) The operator will assign the Lead, “Next Lag” equipment through a selection matrix in the HMI.
b) When modifying this matrix, modifications shall not become active until an “ACCEPT ALL” software pushbutton is activated.
c) Provide a “CANCEL ALL” software pushbutton to clear all modification of the selection matrix and revert them to the last accepted changes.

18. Motor control:
a. Monitor the device’s LOCAL-OFF-REMOTE (LOR) switch (the hard-wired switch at the MCC, drive or equipment) to determine when the PLC has control of the associated equipment:
1) Display current REMOTE status on the PCS screens.
b. Monitor the device’s running status from the starter auxiliary or run status input:
1) Display the current status (running or stopped) on the PCS screens.
2) Use status to calculate total run time and daily run time, and to count total starts and daily starts.
3) Provide time stamp for each start.
4) For motors 200 HP and greater, provide software to prevent exceeding the manufacturer’s recommended maximum starts per hour.
c. When equipment control has been given to the PLC as reported by the LOCAL-OFF-REMOTE switch, allow selection of PCS AUTO or PCS HAND control modes based upon operator selection using the PCS screens.
d. Starting, stopping and running when the device LOR is in LOCAL:
1) With the LOR switch in the LOCAL position, the motor is controlled by the START and STOP pushbuttons.
2) With the LOR switch in the OFF position, the motor is prohibited from running.
3) With the LOR switch in the REMOTE position, the motor is controlled remotely.
e. Starting, stopping and running when the device LOR is in REMOTE:
1) When the motor is expected to be running (PLC has issued a START or RUN due to process conditions or operator selection), LOR is in REMOTE, and the device is not reported to be running, start an operator adjustable “Control Activation” timer:
a) Provide “Control Activation” timers for each piece of controlled equipment:
(1) If the LOR and required running status do not change, and the PLC does not receive running status within the “Control Activation” time period:
(a) De-activate the output.
(b) Place the device in a “Failed” state.
(c) Generate a “Failed to Respond” alarm.

2) When the motor is not expected to be running (PLC has issued a STOP or removed the RUN output), LOR is in REMOTE, and the device is reported to be running, start the “Control Activation” timer:
    a) If the LOR and required stopped status do not change, and the PLC does not lose the running status within the “Control Activation” time period:
        (1) Keep the RUN output off or the STOP output on.
        (2) Place the device in a “Failed” state.
        (3) Generate a “Failed to Respond” alarm.
3) Re-establish PLC control of a device in a “Failed” state only after the following:
    a) An operator turns the device’s LOR switch out of REMOTE, and back to REMOTE (i.e., REMOTE input to the PLC cycles off and back on).
    b) An operator acknowledges the fault from PCS.

f. Where motor winding high temperature switches or RTD temperature elements are shown, generate an alarm when high temperature is sensed (contact opens or temperature above the high alarm setpoint), but do not stop the motor unless otherwise indicated.

g. Motor equipped with current detection shall shut down and report a “failed” status on detection of high current.

h. Control two-speed motors similar to other motors, except as listed below:
1) Motor states are RUN-FAST, RUN-SLOW, and STOP.
2) Start all two-speed motors in the RUN-SLOW state. If or when the high speed is required (RUN-FAST operator selection or process conditions), transition to RUN-FAST after a designated time.
3) When transitioning from RUN-FAST to RUN-SLOW, remove the RUN-FAST output or issue a STOP, then wait for a “Fast to Slow” time delay before energizing the RUN-SLOW or START-SLOW output.

i. Simultaneous starts:
1) Prevent more than one motor-driven load 25 HP or larger in the same facility from starting concurrently:
    a) When starting one load, inhibit start logic for all other such equipment until the load being started is up to speed (RVSS or VFD), or after a setpoint time delay (full-voltage starters and miscellaneous equipment).

j. Speed control:
1) Modulate speed on VFD-driven motors using jog and hold, or PID control algorithms to maintain process conditions as described in the specific loop descriptions.
2) Operate speed control within a pre-defined range:
    a) Minimum speed as determined by equipment manufacturer. The higher of:
        (1) Minimum motor speed to maintain adequate cooling for the type of load driven (constant or variable torque).
        (2) Minimum equipment speed, such as minimum speed to deliver flow or to deliver minimum flow for equipment cooling or lubrication.
    b) Maximum speed 100 percent (60 hertz) or as identified by equipment manufacturer.

3) Where multiple equipment may operate together to maintain the same process condition, alternatively referred to as “Lead/Lag”:
    a) Start the first equipment at a preset starting speed.
    b) When 1 or more equipment is running and the speed control algorithm reaches a preset “Start Next” speed value (initially 95 percent of speed range) through a preset time delay:
        (1) Start the next available equipment at the preset starting speed.
        (2) Ramp up the started equipment and ramp down the previously running equipment to the mid operating speed (adjustable in the PLC). Determine preset values for each condition based on equipment and system characteristics to provide approximately the same total flow or process condition with the new load running at the mid speed (for example if one pump is running and the second pump will be added, then the total flow of both pumps running at mid operating speed should be approximately the same as flow of one pump at Start Next speed).
        (3) Once both equipment reach the mid operating speed, resume the speed control algorithm for those equipment.
        (4) Operate all equipment at the same speed following the output of the speed control algorithm.
    c) When two or more pieces of equipment are running, monitor for a “Stop Next” condition:
        (1) Where flow rate is monitored, use a preset “Stop Next” flow rate for each possible number and combination of equipment:
            (a) Determine initial “Stop Next” speed based on the flow that can be provided with one fewer piece of equipment running at a speed slightly below the “Start Next” speed.
        (2) When the “Stop Next” condition exists through a preset time delay:
            (a) Ramp speed of running equipment except for the equipment to be stopped up to a preset value based on the number of items running. Determine preset values for each condition based on equipment and system characteristics to provide approximately the same total flow or process condition with one fewer load running (typically slightly below the preset “Start Next” speed) while ramping speed of equipment to be stopped down to the preset minimum speed.
            (b) Operate all remaining equipment at the same speed following the output of the speed control algorithm. Stop the load once it reaches minimum speed.

19. Gate and valve control:
    a. Monitor the device’s LOCAL-STOP-REMOTE (LSR) switch(es) (the integral switch in the actuator or hard-wired switch at the local control station):
        1) Display current REMOTE status on PCS screens.

b. Start an “Open Activation” timer whenever the device is expected to be open (PLC has issued an OPEN command in PCS AUTO, or OPEN was selected in PCS HAND):
    1) Initially set “Open Activation” time to twice the normal opening time.
    2) If the LSR position and open command do not change, and the PLC does not receive fully open status feedback within the “Open Activation” time period:
        a) De-activate the open output.
        b) Place the device in a “Failed” state.
        c) Generate a “Failed to Open” alarm.
c. Start a “Close Activation” timer whenever the device is expected to be closed (PLC has issued a CLOSE command in PCS AUTO, or CLOSE was selected in PCS HAND):
    1) Initially set “Close Activation” time to twice the normal closing time.
    2) If the LSR position and close command do not change, and the PLC does not receive fully closed status feedback within the “Close Activation” time period:
        a) De-activate the close output.
        b) Place the device in a “Failed” state.
        c) Generate a “Failed to Close” alarm.
d. Limit the number of open/close /commands so that it does not exceed the manufacturer requirements.
e. For modulating valves (valves controlled from either a 4-20 mA signal or digital communications command) with position feedback, start a “Position Error” timer whenever the position feedback differs from the required position command by more than a setpoint error when the LSR is in REMOTE:
    1) For analog modulating devices, error is determined by position feedback differing from position command by more than the setpoint error.
    2) For discrete modulating devices, error is determined by feedback not changing in the correct direction, or changing at less than a setpoint rate, when the OPEN or CLOSE PLC output is active.
    3) Initially set the “Position Error” time to 60 seconds.
    4) If the LSR position does not change, and position error stays outside of the setpoint error through the “Position Error” time period:
        a) Place the device in a “Failed” state.
        b) Generate a “Position Fail” alarm.
f. Provide separate time delay settings for each function and for each device.
g. If the valve position inputs indicate an invalid state (i.e., valve open and closed at the same time), place the device in a “Failed” state and generate an “Invalid State” alarm.
h. Re-establish PLC control of a device in a “Failed” state only after the following:
    1) An operator turns the device’s LSR switch out of REMOTE and back to REMOTE (i.e., REMOTE input to the PLC cycles off and back on).
    2) An operator acknowledges the fault from PCS.
i. For all alarm conditions, control other devices (as stopping pumps, etc.) as stated in the individual loop descriptions to make the system safe.

j. For discrete modulating valves (valves positioned to intermediate positions to control process values through discrete OPEN and CLOSE outputs), count the number of actuations (OPEN or CLOSE commands) per hour in the PLC:
    1) Display count on the HMI.

20. Chemical systems (LOI/HMI):
    a. Provide the following chemical system screens:
        1) Where one LOI manages more than one chemical system, a main menu screen that will allow the operator to access the individual chemical system screens using software keys.
        2) One or more screens for each individual chemical system controlled at that location, containing:
            a) All status displays (running, failed, etc.).
            b) Selections (lead/lag, which process flow to pace to, etc.).
            c) Setpoint entry and display.
            d) Calculated feed requirement (result of flow pacing calculation) in engineering units (typically milligrams of chemical per minute).
            e) Output signal to feeder in percent of full span.
            f) Actual chemical flow rate from flowmeter (where shown).
            g) Process flow rate(s) used to pace each chemical on the individual chemical screens (PROC FLOW):
                (1) Where different process flows can be selected for flow pacing, display and identify the selected source.
    b. Chemical system calculations: Perform calculations as indicated on the Drawings and in the individual loop descriptions. Use the following assumptions, unless otherwise noted:
        1) Where chemical flow feedback is not used, assume feeder output is linear in response to control signal.
        2) Zero signal (typically 4 milliamperes) produces zero flow.
        3) Perform flow-pacing calculations using as indicated on the Drawings or described in the individual loop descriptions.
    c. Provide the setpoints and selections indicated on the Drawings and in the individual loop descriptions. Typical setpoints include:
        1) QMAX: Maximum calibration value:
            a) Chemical flow rate measured from calibration column at maximum feeder output (typically in gallons of solution per hour or milliliters of solution per minute).
        2) CONC: Chemical concentration:
            a) The concentration of the chemical in the solution to be fed, in engineering units (typically milligrams of chemical per liter of chemical solution).
        3) DENSITY:
            a) Density of the chemical solution to be fed in engineering units or as a specific gravity.
            b) Used to calculate the concentration of the chemical in the solution.
        4) DOSE: Desired dosage:
            a) Desired chemical concentration in the process stream in engineering units (typically milligrams of chemical per liter of process fluid).
        5) FLOW SEL: Selection of process stream(s) for flow pacing.

6) OPEN/CLOSED LOOP:
   a) Selection of method of controlling chemical flow-paced feed rate.
   b) OPEN LOOP: Signal to feeder is based on feeder calibration (QMAX) to deliver calculated chemical solution feed rate. Chemical solution flowmeter is not used for control.
   c) CLOSED LOOP: Chemical feed rate is directly controlled using the calculated chemical solution feed rate as the setpoint, and the flow rate from the chemical solution flowmeter as the process variable.
7) TRIM FACTOR: refer to the equations below.

d. Chemical control algorithms:
   1) Flow pacing algorithm: Operator selects a desired dose and the control system adjusts the chemical feed rate to dose based on process flow, chemical concentration, and feeder calibration. The calculation is as follows (units may vary from those shown in the calculation below):

$$Q_C = \frac{D \cdot Q_f \cdot 8.34}{24 \cdot C \cdot p}$$

Where,
Q_C = Chemical Pump flow Rate command (gal/hr)
Q_f = Process Flow (MGD) Measurement
D = Dose setpoint (mg/L) User Adjustable
p = Chemical Density (lbs/gal)
C = Chemical Concentration (ratio in decimal format. For example, use 0.25 for 25 percent chemical solution)
8.34 = conversion factor ([lbs • L]/[MG • day • mg])
24 = conversion factor days to hours

$$S = \frac{Q_C}{Q_{max}}$$

Where,
S = Pump Speed control setpoint (0 to 100 percent)
Q_C = Flow setpoint from equation above (gal/hr)
Q_{max} = Maximum Pump Flow *setpoint* (gal/hr) based on calibration column test.

   2) Flow pacing with closed loop algorithm: Operator selects a desired dose and the control system adjusts the speed of the chemical feeder through a speed control signal to match the measured chemical feed rate to a flow rate setpoint. This flow rate setpoint shall be derived from the process flow and operator setpoints for dosage and concentration. The calculation is as follows (units may vary from those shown in the calculation below):

$$Q_C = \frac{D \cdot Q_f \cdot 8.34}{24 \cdot C \cdot p}$$

Where,
Q_C = Chemical Pump flow Rate command (gal/hr)
Q_f = Process Flow Measurement (MGD)
D = Dose setpoint (mg/L) User Adjustable
p = Chemical Density (lbs/gal)
C = Chemical Concentration (ratio in decimal format. For example, use 0.25 for 25 percent chemical solution)
8.34 = conversion factor ([lbs • L]/[MG • day • mg])
24 = conversion factor days to hours

a) The speed of the chemical feed pump shall be determined by the output of a PID controller. The setpoint of the PID controller shall be the result of the equation in the paragraph above. The process variable (feedback) shall be the chemical flow (not process flow) as measured by a flow meter.

3) Flow pacing with analyzer trim algorithm: Operator selects a desired dose and desired analyzer setpoint band and the control system adjusts the chemical feed rate to dose based on process flow, chemical concentration, process analyzer output, and feeder calibration. The calculation is as follows (units may vary from those shown in the calculation below):

$$Q_C = \left(\frac{D \cdot Q_f \cdot 8.34}{24 \cdot C \cdot p}\right) T$$

Where,
Q_C = Chemical Pump flow Rate command (gal/hr)
Q_f = Process Flow Measurement (MGD)
T = Trim Factor (ratio)
D = Dose setpoint (mg/L) User Adjustable
p = Chemical Density (lbs/gal)
C = Chemical Concentration (ratio in decimal format. For example, use 0.25 for 25 percent chemical solution)
8.34 = conversion factor ([lbs • L]/[MG • day • mg])
24 = conversion factor days to hours

$$S = \frac{Q_{CL2}}{Q_{max}}$$

Where,
S = Pump Speed control setpoint (0 to 100 percent)
Q_{CL2} = Flow setpoint from equation above (gal/hr)
Q_{max} = Maximum Pump Flow (gal/hr) based on calibration column test.

a) The trim multiplier shall be controlled by the output of a PID controller initially scaled between 0.8 and 1.2, adjustable. The setpoint of the PID controller shall be an operator adjustable target residual or desired analytical value. The process variable (feedback) of the PID controller shall be measured residual or analytical value.

4) Flow pacing with closed loop and analyzer trim algorithm: Operator selects a desired dose and desired analyzer setpoint band and the control system adjusts the speed of the chemical feeder through a speed control signal to match the measured chemical feed rate to a flow rate setpoint. An additional control algorithm is used in the calculation to fine-tune the feed based on an analytical measurement as measured by the process analyzer.

$$Q_C = \left(\frac{D \cdot Q_f \cdot 8.34}{24 \cdot C \cdot p}\right) T$$

Where,
Q_C = Chemical Pump flow Rate command (gal/hr)
Q_f = Process Flow Measurement (MGD)
T = Trim Factor (ratio)
D = Dose setpoint (mg/L) User Adjustable
p = Chemical Density (lbs/gal)
C = Chemical Concentration (ratio in decimal format. For example, use 0.25 for 25 percent chemical solution)
8.34 = conversion factor ([lbs • L]/[MG • day • mg])
24 = conversion factor days to hours

a) The trim multiplier shall be controlled by the output of a PID controller initially scaled between 0.8 and 1.2, adjustable. The setpoint of the PID controller shall be an operator adjustable target residual or desired analytical value. The process variable (feedback) of the PID controller shall be measured residual or analytical value.

b) The speed of the chemical feed pump shall be determined by the output of a PID controller. The setpoint of the PID controller shall be the result of the equation in the paragraph above. The process variable (feedback) shall be the chemical flow (not process flow) as measured by a flow meter.

e. Virtual day tanks:

1) Chemical systems without actual day tanks will have their own “virtual” day tank, which will use either a pre-set volume (operator adjustable) or a calculated daily use rate based on the totalized flow (volume) of the chemical magnetic flowmeters over the virtual day tank cycle. The “virtual” day tank will start at the pre-set volume or the calculated volume (operator-selectable) and based on the storage tank level, the volume in the “virtual” day tank will decrease until the total “volume” in the virtual day tank is used. The virtual day tank will automatically compensate for any changes in the system due to the use of the dilution system (revised solution concentration). Once this occurs, the operator will be provided with a “pop-up” screen stating that the “virtual” day tank volume is used. Once this occurs, the operator will be provided with a “pop-up” screen stating that the virtual day tank needs to be refilled. The pop-up screen will contain the following information:

a) Time {hours and minutes} since the last day tank filling.

b) Volume utilized in the “virtual” day tank (based on the level transmitter measuring the chemical storage tank).
c) Dose {mg/L} based on the average flow rate over the “virtual” day tank cycle.
d) Target dose {mg/L} based on operator input.

2) Provide a double check using the actual flowmeter values to compare with the calculated dose. Compared the magnetic flowmeter value with the calculated dose. The magnetic flowmeter value will be based on an hourly average of chemical flow rate over the day tank cycle.
3) As an added level of control any chemical system that has an analyzer used for feedback will be tracked and alarmed if outside the operating parameters.
4) Alarm if any condition falls outside of the flow, or level parameters.

21. Breaker status:
    a. Display the following data to the extent it is available from the specified device:
        1) Open.
        2) Closed.
        3) Tripped.
        4) Ground fault.
        5) Settings.
        6) Racked out.
22. Power Data:
    a. Retrieve data from:
        1) Power Quality Meters (PQMs) at 480V.
        2) Main Breaker Protective Relays on 12.47 kV Switchgear.
        3) Generator Master Control Panel.
        4) Digital bus networks, as indicated.
        5) Where available, use EtherNet IP communications.
    b. Display the following data (to the extent it is available) from the specified device.
        1) Current XXXX.X A:
            a) A-Phase.
            b) B-Phase.
            c) C-Phase.
        2) Volts: XXXX.X V:
            a) A-Phase.
            b) B-Phase.
            c) C-Phase.
        3) Reactive power: XXXX.X kVAR.
        4) Real power: XXXX.X kW.
        5) Apparent power: XXXX.X kVA.
        6) Power factor: 0.XX.
        7) Energy: XXXXXXX kW*hr.
        8) Demand peak: XXXX Amp.
        9) Demand peak: XXXX kW.
    c. For engine/generator system monitoring, also display percent of rated output.

23. Power Supply and Distribution displays Power Quality Meters display:
    a. In addition to the Power Data listed above, display the following (where available) from PQMs, Protective Relays, and Generator Master Control Panel:
        1) Frequency: Hertz.
        2) THD (current and voltage): up to 31st harmonic.
    b. Calculate, indicate, historize, and trend data in a 12.47 kV Meter Table that lists measurements from the following Protection Relays:
        1) Protection Relay on 52-G1.
        2) Protection Relay on 52-G2.
        3) Protection Relay on 52-M1.
        4) Protection Relay on 52-M2.
        5) Protection Relay on 52-M3.
        6) Display calculated values for "Load At 12.47 kV", which sums the current, kW, and kW-hr values for all five Protection Relays.
        7) Display calculated values for "Load At 480V", which sums the current, kW, and kW-hr values for all PQM meters.
        8) Display calculated values for "Transformer and Line Losses", which subtracts "Load at 480V" from "Load At 12.47 kV" for current, kW, and kW-hr values for all PQM meters.
    c. Display the data in a 480V Meter Table that lists measurements from all power quality meters on the plant.
24. Digital bus Starters, RVSS and VFDs equipped with EtherNet IP communications:
    a. Communicate and display all values listed in the equipment specifications, indicated on the Drawings, or listed below.
    b. Communicate start and stop commands and receive running feedback over the fieldbus network.
    c. Provide data entry screen for the cost of electricity in dollars per (kw*hr), which will be used in calculations for display.
    d. Monitor the following additional values, and display on the HMI:
        1) Motor current, phase A, B, and C.
        2) Over current alarm.
        3) Under current alarm.
        4) Running status.
        5) Phase loss.
        6) Stall.
        7) Number of starts.
        8) History of past 5 trips.
    e. Calculate, indicate, historize, and trend, the following additional values:
        1) Full Load Amps (static value, Engineer will provide).
        2) Average Motor Operating Current.
        3) Run Time (Hours).
        4) Operating Hours (Hours/Year).
        5) Average Load Factor (equals Average Motor Current Operating Current/Full Load Amps) - *display as a percentage.*
        6) Annual Energy Use (kW*hr).
        7) Annual Operating Cost (dollars).
        8) Percent of Site Electric Use (equals Annual Energy Use/Sum of Annual Energy (kW*hr) values for all PQM meters).

f. For Variable Frequency Drives:
   1) Speed command.
   2) Speed feedback.

g. For RVSS, Variable Frequency Drives, and where otherwise shown or available, monitor the following over the digital bus network:
   1) Line voltage.
   2) Power.
   3) Power factor.
   4) Over voltage alarm.
   5) Under voltage alarm.
   6) Over current alarm.
   7) Under current alarm.
   8) Indicate, historize, trend, and alarm data as indicated in the ACS I/O Tables on the Drawings.

END OF SECTION

SECTION 17101

SPECIFIC CONTROL STRATEGIES

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Loop descriptions:
      a. Specific control requirements and functional descriptions for individual control loops.

1.02 REFERENCES

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

1.03 DEFINITIONS

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

1.04 SYSTEM DESCRIPTION (NOT USED)

1.05 SUBMITTALS

A. Develop detailed loop descriptions based on the information in the Contract Documents and submit as specified in Sections 01330 - Submittal Procedures and 17050 - Common Work Results for Process Control and Instrumentation Systems.
   1. For each control loop, provide a detailed functional description of the operation of the equipment, signals, and controls shown on the P&IDs:
      a. Include all functions depicted or described in the Contract Documents.
      b. Include the following within each loop description:
         1) All requirements specific to that loop.
         2) Common control requirements applicable to that loop.
         3) List of all ranges, setpoints, timers, values, counters, etc.
   2. Where there are similar loops with identical control, such as multiple loops for individual raw water pumps, only 1 loop description need be developed, and the remaining loops may reference that loop description.
   3. Loop description format: As specified in this Section.

B. Loop number and title:
   1. References:
      a. List P&IDs that are specifically referenced.
   2. Abstract:
      a. General description of how the loop works, what devices are involved, and how the process will be controlled.

b. Process values, setpoints, and limits, including units and ranges:
    1) Show span and range values for analog inputs and outputs, and operating point and deadband for discrete inputs.

3. Hardwired control:
    a. Detailed description of the control functions at the local level.
    b. Function of local operator interfaces.
    c. Operation of hardwired field pilot controls:
        1) Pushbuttons.
        2) Selector switches.
        3) Potentiometers.
        4) Pilot lights, indicators, and other displays.
4. Hardwired interlocks:
    a. Explanation of the operation of system interlocks and hardwired permissive conditions.
5. PCS control:
    a. Detailed description of the control functions that are under control of the PLC and operator controls.
    b. Operator controls and automatic controls.
    c. Setpoints, alarms, etc.:
        1) Include units and ranges for analog values.
        2) Include span and range for analog inputs and outputs.
        3) Include operating point and deadband for discrete inputs, and identify conditions where contacts are open, and when they close.
    d. Control sequences.
    e. Software interlocks:
        1) Operation of system software interlocks.
6. Indicators and alarms:
    a. List any indicators and alarms specific to the loop that are not covered in the common control strategies.
7. Failure modes:
    a. List any failure modes specific to the loop that are not covered in the common control strategies.

1.06 QUALITY ASSURANCE (NOT USED)

1.07 DELIVERY, STORAGE, AND HANDLING (NOT USED)

1.08 PROJECT OR SITE CONDITIONS (NOT USED)

1.09 SEQUENCING (NOT USED)

1.14 COMMISSIONING (NOT USED)

1.15 MAINTENANCE (NOT USED)

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION

3.01 EXAMINATION (NOT USED)

3.02 PREPARATION (NOT USED)

3.03 INSTALLATION (NOT USED)

3.04 ERECTION, INSTALLATION, APPLICATION, CONSTRUCTION

A. Dechlorination Structure Valves:
   1. References:
      a. 60N01.
   2. Abstract:
      a. On-spec water goes through the dechlorination structure and out to the Russian river. If off-spec water is detected during dechlorination mode, the valve within the dechlorination structure will automatically close, and the valve west of the dechlorination structure will automatically open, diverting the off-spec water to the Carousel Pump Station.
   3. Hardwired control:
      a. At the LCP, a LOCAL-STOP-REMOTE switch with OPEN-STOP-CLOSE switch operates as follows:
         1) With the LSR switch in the LOCAL position, an operator may open or close the valve by using the OSC switch. The valve will open when the OSC is in the OPEN position, and the valve will close when the OSC is in the CLOSE position. The OSC is spring-returned to the STOP position.
         2) With the LSR switch in the STOP position, the valve will stop.
         3) With the LSR switch in the REMOTE position, the PCS shall control the valve.
   4. Hardwired interlocks/overload programmed interlocks:
      a. None.
   5. PCS control:
      a. PCS HAND mode:
         1) The dechlorination structure valve is controlled manually by the Operator with the following commands:
            a) Open.
            b) Close.
      b. PCS AUTO mode:
         1) The water quality in the chlorination and dechlorination structures are monitored by the chlorine residual analyzer.

2) Dechlorination Mode:
    a) For 45 minutes out of every hour, the 4-way valve is positioned so that the chlorine residual analyzer samples from the dechlorination structure.
    b) In this mode, when chlorine residual reaches an Operator adjustable setpoint, the PCS shall alarm (initial setpoint 0.02 mg/L), latch out, and the two vales shall switch positions so that DCL Structure Valve 1 will be open and DCL Structure Valve 2 will close. Water will then be diverted to the percolation ponds through the Carousel Pump Station. As discussed below, for the first 5 minutes of this mode, there shall be a hold timer placed on alarms and logic to allow time for the chlorine level to settle.
3) Chlorination Mode:
    a) For 15 minutes out of every hour, the 4-way valve is positioned so that the chlorine residual analyzer samples from the chlorine contact basins.
    b) When this mode begins, start a 20-minute hold timer so that no alarms are displayed and there will be no PCS logic during the hold time. As noted above, this hold timer will be present for the entire 15 minutes of the chlorination mode, as well as the first 5 minutes of dechlorination mode.
4) If the measured chlorine is outside the operator adjustable range, the DCL Structure Valve 2 shall be closed and DCL Structure Valve 1 shall be opened to divert the water to the Carousel pump station.
5) If the measured chlorine exceeds the range by an operator adjustable percentage (default:10 percent), an alarm shall be sent to the PCS to alert the operators of the need to manually divert the water to the Carousel pump station.

6. Indicators and alarms:
    a. As indicated on the Drawings and specified in Section 17100 - Control Strategies.
7. Failure modes:
    a. As indicated on the Drawings and specified in Section 17100 - Control Strategies.

B. Chlorination/dechlorination Chlorine Sample Pumps and Valve:
1. References:
    a. 60N01.
2. Abstract:
    a. A rotary pump draws a chlorinated sample from chlorine contact tank 1 and 2 and a submersible pump draws effluent from the dechlorination wet well for the sample.
    b. The position of a four-position valve allows the chlorine residual analyzer to monitor chlorine contact basin residual 15 minutes out of every hour and to monitor dechlorination structure residual 45 minutes out of every hour.
3. Hardwired control:
    a. None.
4. Hardwired interlocks/overload programmed interlocks:
    a. None.

5. PCS control:
    a. PCS HAND mode:
        1) Retain existing control of chlorinated or dechlorinated sample pumps, if available.
        2) Retain existing control of the four-position valve, if available.
    b. PCS AUTO mode:
        1) For 15 minutes out of every hour, command the four-position valve to allow flow from chlorine contact basin to the analyzer.
        2) For 45 minutes out of every hour, command the four-position valve to allow flow from the dechlorination structure to the analyzer.
6. Indicators and alarms:
    a. As indicated on the Drawings and specified in Section 17100 - Control Strategies.
7. Failure modes:
    a. As indicated on the Drawings and specified in Section 17100 - Control Strategies.

C. Clarifier/Filters:
1. References:
    a. 85N01.
    b. 85N02.
    c. 85N03.
    d. 85N04.
2. Abstract:
    a. Four existing clarifier/filters will be rehabilitated with new media, new valves with new electric motor actuators (replacing existing pneumatic actuators), new air scour piping and valving, and new support instrumentation.
    b. A new vendor control panel (VCP-3) shall be supplied to control the new valves.
3. Hardwired control:
    a. Hardwired control is achieved through VCP-3.
4. Hardwired interlocks/overload programmed interlocks:
    a. All hardwired interlocking is achieved through VCP-3.
5. PCS control:
    a. PCS HAND mode:
        1) None.
    b. PCS AUTO mode:
        1) The Operator may select the desired discharge flow from each filter in MGD.
        2) VCP-3 performs all control functions, including backwashing, for the clarifier/filters to discharge the Operator designated flow.
        3) At the PCS HMI screen, the Operator shall be able to modify all VCP setpoints.
6. Indicators and alarms:
    a. As indicated on the Drawings and specified in Section 17100 - Control Strategies.
7. Failure modes:
    a. As indicated on the Drawings and specified in Section 17100 - Control Strategies.

D. Air Wash Blowers:
    1. References:
        a. 85N05.
    2. Abstract:
        a. There are two existing blowers that will be replaced with new blowers and starters. A third blower will be added with a new starter. All blowers will be controlled by the new VCP-3.
    3. Hardwired control:
        a. At the LCP, a LOCAL-OFF-REMOTE selector switch with START-STOP pushbuttons operates as follows:
            1) With the LOR switch in the LOCAL position, the operator starts and stops the blower with the START or STOP pushbuttons.
            2) With the LOR switch in the OFF position, the pump will stop.
            3) With the LOR switch in the REMOTE position, the PCS shall control the pump.
    4. Hardwired interlocks/overload programmed interlocks:
        a. The blowers are stopped under the following conditions:
            1) High motor temperature.
            2) High inlet filter differential pressure.
            3) High discharge motor pressure.
        b. Permissive signal shall be sent to the turn on the Air wash blower fans in local mode as indicated in the contract drawings.
    5. PCS control:
        a. PCS HAND mode:
            1) None.
        b. PCS AUTO mode:
            1) VCP-3 performs all control functions, including backwashing, for the clarifier/filters to discharge the Operator designated flow.
            2) At the PCS HMI screen, the Operator shall be able to modify all VCP setpoints.
    6. Indicators and alarms:
        a. As indicated on the Drawings and specified in Section 17100 - Control Strategies.
    7. Failure modes:
        a. As indicated on the Drawings and specified in Section 17100 - Control Strategies.

E. Coagulant Feed Pumps:
    1. References:
        a. 85N06.
    2. Abstract:
        a. Two existing feed pumps and one new will provide coagulant to the clarifier/filters.
        b. Automatic control of pump starts/stops and speed will be from VCP-3 via PLC-4.
    3. Hardwired control:
        a. At the VCP, a HAND-OFF-AUTO selector switch and speed potentiometer operates as follows:
            1) With the HOA switch in the HAND position, the pump will start and the operator can adjust the speed using the potentiometer.

2) With the LOR switch in the OFF position, the pump will stop.
3) With the LOR switch in the AUTO position, the PCS shall control the pump.

4. Hardwired interlocks/overload programmed interlocks:
   a. The dilution water solenoid is hardwired to the pump VCP so that when the pump is running the dilution water solenoid valve is opened.
5. PCS control:
   a. PCS HAND mode:
      1) The pump is controlled manually by the Operator with the following commands:
         a) Start.
         b) Stop.
         c) Speed.
   b. PCS AUTO mode:
      1) The PCS shall receive all pump commands for speed from VCP-3. The PCS shall control the speed of each pump to meet the speed setpoint command from VCP-3. The PCS shall report all status points for running and E-STOP to VCP-3.
6. Indicators and alarms:
   a. As indicated on the Drawings and specified in Section 17100 - Control Strategies.
7. Failure modes:
   a. As indicated on the Drawings and specified in Section 17100 - Control Strategies.

F. Rapid Mix Pump:
1. References:
   a. 85N07.
2. Abstract:
   a. The rapid mix pump will ensure coagulant is being dispersed after injection. It will run when any coagulant pump is running and stop when all pumps are stopped.
3. Hardwired control:
   a. At the LCP, a LOCAL-OFF-REMOTE selector switch with START-STOP pushbuttons operates as follows:
      1) With the LOR switch in the LOCAL position, the operator starts and stops the pump with the START or STOP pushbuttons.
      2) With the LOR switch in the OFF position, the pump will stop.
      3) With the LOR switch in the REMOTE position, the PCS shall control the pump.
4. Hardwired interlocks/overload programmed interlocks:
   a. The pump is stopped and prohibited from running when high motor temperature is detected by the temperature switch.
5. PCS control:
   a. PCS HAND mode:
      1) The pump is controlled manually by the Operator with the following commands:
         a) Start.
         b) Stop.

b. PCS AUTO mode:
1) The PCS shall run the rapid mix pump whenever a coagulant pump is running and stop the rapid mix pump when all coagulant pumps are stopped.

6. Indicators and alarms:
a. As indicated on the Drawings and specified in Section 17100 - Control Strategies.

7. Failure modes:
a. As indicated on the Drawings and specified in Section 17100 - Control Strategies.

G. Backwash Pump Station Chlorine Sample Pumps:
1. References:
a. 87N01.

2. Abstract:
a. The backwash pump station chlorine sample pump will supply samples to a new chlorine analyzer.

3. Hardwired control:
a. At the LCP, a LOCAL-OFF-REMOTE selector switch with START-STOP pushbuttons operates as follows:
1) With the LOR switch in the LOCAL position, the operator starts and stops the pump with the START or STOP pushbuttons.
2) With the LOR switch in the OFF position, the pump will stop.
3) With the LOR switch in the REMOTE position, the PCS shall control the pump.

4. Hardwired interlocks/overload programmed interlocks:
a. None.

5. PCS control:
a. PCS HAND mode:
1) The pump is controlled manually by the Operator with the following commands:
a) Start.
b) Stop.

b. PCS AUTO mode:
1) None.

6. Indicators and alarms:
a. As indicated on the Drawings and specified in Section 17100 - Control Strategies.

7. Failure modes:
a. As indicated on the Drawings and specified in Section 17100 - Control Strategies.

H. Carousel Pump Station:
1. References:
a. 89N01.

2. Abstract:
a. Two existing pumps transfer water from the Middle Pond and South Pond to the North Pond.

b. One new pump will convey excess water at the Carousel Pump Station to the PAU.
c. Pumps will operate to meet a level setpoint in the Carousel Pump Station's wet well.

3. Hardwired control:
   a. At the LCP, a LOCAL-OFF-REMOTE selector switch with START-STOP pushbuttons and a speed potentiometer operates as follows:
      1) With the LOR switch in the LOCAL position, the operator starts and stops the pump with the START or STOP pushbuttons and can adjust speed using the potentiometer.
      2) With the LOR switch in the OFF position, the pump will stop.
      3) With the LOR switch in the REMOTE position, the PCS shall control the pump.
4. Hardwired interlocks/overload programmed interlocks:
   a. The pumps are stopped under the following conditions:
      1) Pump discharge low flow switch is activated after timer expires.
      2) Motor high temperature is detected.
   b. Alarm signals shall be sent to the Plant PLC for each hardwired interlock.
5. PCS control:
   a. PCS HAND mode:
      1) The pump is controlled manually by the Operator with the following commands:
         a) Start.
         b) Stop.
         c) Speed.
   b. PCS AUTO mode:
      1) Carousel pumps 1 and 2 will only be operated in PCS HAND mode and will not have PCS AUTO 1 or AUTO 2 control under this project. However, provide a 4-position HMI switch for each pump with: HAND, OFF, AUTO 1, and AUTO 2. Mark AUTO 1 and AUTO 2 as "FOR FUTURE USE".
      2) Carousel pump 3 shall start when an Operator adjustable level setpoint is reached in the carousel pump station wet well and stop when an Operator adjustable low level setpoint is reached.
      3) A low-low level switch shall serve as a backup to stop all pumps when detected.
      4) High-high level detected in the PAU pump station wet well shall shut down pump 3 in the carousel pump station.
      5) The PCS shall operate the carousel pump 3 to meet an Operator adjustable level setpoint in the carousel pump station wet well.
6. Indicators and alarms:
   a. As indicated on the Drawings and specified in Section 17100 - Control Strategies.
7. Failure modes:
   a. As indicated on the Drawings and specified in Section 17100 - Control Strategies.

I. Production Augmentation Unit (PAU) Pump:
1. References:
   a. 80N01.
   b. 91N01.

2. Abstract:
    a. One PAU pump conveys water from the PAU to the wet well in Structure 80 that then feeds the AWT pump station.
    b. The pump will start and stop according to level setpoints in the Structure 80 wet well.
3. Hardwired control:
    a. At the LCP, a LOCAL-OFF-REMOTE selector switch with START-STOP pushbuttons and a speed potentiometer operates as follows:
        1) With the LOR switch in the LOCAL position, the operator starts and stops the pump with the START or STOP pushbuttons and can adjust speed using the potentiometer.
        2) With the LOR switch in the OFF position, the pump will stop.
        3) With the LOR switch in the REMOTE position, the PCS shall control the pump.
4. Hardwired interlocks/overload programmed interlocks:
    a. The pumps are stopped under the following conditions:
        1) Pump discharge low flow switch is activated.
        2) Motor high temperature is detected.
        3) Wet well low level is detected.
5. PCS control:
    a. PCS HAND mode:
        1) The pump is controlled manually by the Operator with the following commands:
            a) Start.
            b) Stop.
            c) Speed.
    b. PCS AUTO mode:
        1) The PCS shall operate the pump to meet an Operator adjustable level setpoint in Structure 80.
        2) The pumps shall start when an Operator adjustable low level setpoint is reached in Structure 80 and stop when an Operator adjustable high level setpoint is reached in Structure 80.
6. Indicators and alarms:
    a. As indicated on the Drawings and specified in Section 17100 - Control Strategies.
7. Failure modes:
    a. As indicated on the Drawings and specified in Section 17100 - Control Strategies.

J. Distribution Tank Fill Valve:
1. References:
    a. 99N01.
2. Abstract:
    a. Influent water from the distribution system goes to the distribution tank through the tank fill valve.
    b. The tank fill valve is designed to hydraulically close when the tank level produces a determined amount of static head pressure.
    c. The valve does have solenoids to allow for manual opening and closing of the valve.
3. Hardwired control:
    a. None.

4. Hardwired interlocks:
    a. None.
5. PCS control:
    a. PCS HAND mode:
        1) The valve is controlled manually by the Operator with the following commands:
            a) Open.
            b) Close.
    b. PCS AUTO mode:
        1) None.
6. Indicators and alarms:
    a. As indicated on the Drawings and specified in Section 17100 - Control Strategies.
7. Failure modes:
    a. As indicated on the Drawings and specified in Section 17100 - Control Strategies.

K. Distribution Tank Level:
1. References:
    a. 99N01.
2. Abstract:
    a. The level in the reservoir is calculated from the static head pressure.
    b. Range for tank level instruments are 0-27 feet.
3. Hardwired control:
    a. None.
4. Hardwired interlocks:
    a. None.
5. PCS control:
    a. None.
        1) LoLo alarm = 1 foot.
        2) Lo indication = 2 feet.
        3) Hi indication = 24 feet 9 inches.
        4) HiHi alarm = 25 feet.
6. Indicators and alarms:
    a. No additional indicators and alarms specific to the loop that are not covered in the common control strategies.
7. Failure modes:
    a. No additional failure modes specific to the loop that are not covered in the common control strategies.

L. Recycled Water Pumps:
1. References:
    a. 99N01.
    b. 99N02.
    c. 99N03.
2. Abstract:
    a. The booster pump station has 4 pumps that operate in a lead, lag1, lag2, standby configuration with a design capacity of 2,700 gpm at a set discharge pressure of 100 psi.
    b. The booster pump station draws water from the water storage tank and will discharge directly into the recycled water system.

c. The booster pump station can be manually controlled at the VFD panel located in the electrical room, or remotely controlled via the PCS.
d. The booster pump motors are all equipped with VFDs.

3. Hardwired control:
   a. At the LCP, a LOCAL-OFF-REMOTE selector switch with START-STOP pushbuttons and a speed potentiometer operates as follows:
      1) With the LOR switch in the LOCAL position, the operator starts and stops the pump with the START or STOP pushbuttons and can adjust speed using the potentiometer.
      2) With the LOR switch in the OFF position, the pump will stop.
      3) With the LOR switch in the REMOTE position, the PCS shall control the pump.
4. Hardwired interlocks:
   a. The booster pumps are stopped under the following conditions:
      1) High motor temperature.
      2) High discharge pressure.
      3) Low discharge flow.
5. PCS control:
   b. PCS HAND mode:
      1) The booster pump is controlled manually by the Operator with the following commands:
         a) Start.
         b) Stop.
         c) Speed.
   c. PCS AUTO mode:
      1) The booster pump will not start when the tank fill valve is closed, or the tank level is less than an Operator adjustable low-low level setpoint (default: 1 ft).
      2) The pumps shall operate in a LEAD, LAG1, LAG2, STANDBY configuration.
      3) The LEAD recycled water pump shall be called to run at an Operator adjustable low-low pressure setpoint.
      4) The LEAD and LAG pumps will change speeds and turn on and off in accordance with the strategy in Section 17100 to maintain an Operator adjustable discharge pressure setpoint.
      5) The STANDBY pump will only come online when a LEAD or LAG pump has failed.
6. Indicators and alarms:
   d. As indicated on the Drawings and specified herein.
7. Failure modes:
   e. As indicated on the Drawings and specified herein.

3.05 REPAIR/RESTORATION (NOT USED)

3.06 RE-INSTALLATION (NOT USED)

3.07 FIELD QUALITY CONTROL (NOT USED)

3.08 ADJUSTING (NOT USED)

3.09 CLEANING (NOT USED)

3.10 DEMONSTRATION AND TRAINING (NOT USED)

3.11 PROTECTION (NOT USED)

3.12 SCHEDULES (NOT USED)

END OF SECTION

SECTION 17201

LEVEL MEASUREMENT: SWITCHES

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Ball float level switch.

B. Provide all instruments identified in the Contract Documents.

1.02 REFERENCES

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

1.03 DEFINITIONS

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

1.04 SUBMITTALS

A. Furnish submittals as specified in Sections 01330 - Submittal Procedures and 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Provide complete documentation covering the traceability of all calibration instruments.

1.05 QUALITY ASSURANCE

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Examine the complete set of Contract Documents and verify that the instruments are compatible with the installed conditions including:
   1. Process conditions: Fluids, pressures, temperatures, flows, materials etc.
   2. Physical conditions:
      a. Installation and mounting requirements.
      b. Location within the process.
      c. Accessories: Verify that all required accessories are provided and are compatible with the process conditions and physical installation.

C. Notify the Engineer if any installation condition does not meet the instrument manufacturer's recommendations or specifications.

D. Manufacture instrument facilities certified to the quality standards of ISO Standard 9001 – Quality Systems – Model for Quality Assurance in Design/Development, Production, Installation and Servicing.

1.06 DELIVERY, STORAGE, AND HANDLING

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

1.07 PROJECT OR SITE CONDITIONS

A. Project environmental conditions as specified in Section 01850 - Design Criteria:
   1. Provide instruments suitable for the installed site conditions including, but not limited to, material compatibility, site altitude, site seismic conditions, humidity, and process and ambient temperatures.

1.08 WARRANTY

A. As specified in Section 01783 - Warranties and Bonds.

1.09 MAINTENANCE

A. Furnish all parts, materials, fluids, etc. necessary for operation, maintenance, and calibration purposes throughout the warranty period. Deliver all of these supplies before project substantial completion.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. One of the following or equal:
   1. Ball float level switch:
      a. E+H, Liquifloat T FTS20.
      b. Evoqua Water Technologies, 9G-EF.
      c. ITT Flygt, Model ENM-10.
      d. Anchor Scientific Inc., Ecofloat/Solofloat.

2.02 MANUFACTURED UNITS

A. As specified in this Section including Attachment A - ISA Data Sheet - Level Measurement: Switches.

B. Ball float level switch:
   1. General:
      a. Encapsulated body with a switch to determine position of float.
   2. Outputs:
      a. Power supply.
      b. Relay outputs.

c. 1 Form C contact.
d. Rated at 6 amperes at 120 VAC.
e. Programmable for adjustable hysteresis.

3. Element:
   a. Mechanical switch encapsulated in waterproof floating ball of nominal diameter, supported by flexible PVC cable and jacket or heavy neoprene.
   b. The length of the PVC cable shall be, at a minimum, equal to sump depth plus 5 feet.
   c. Float: Provide Type 316 stainless steel or polypropylene, maximum 5.5 inches in diameter.
   d. An operating temperature rating: -4 degrees Fahrenheit to +185 degrees Fahrenheit.
   e. Mercury switches are not acceptable.
   f. Suspend ball float and adjust for level setpoint as required.
   g. Lead wires: Mounted in flexible waterproof PVC cable from switch to junction box terminals without splices.
   h. Provide the number of floats per level system as indicated on the Drawings.
4. Switch:
   a. Power supply:
      1) None.
   b. Outputs:
      1) Single pole double throw contacts rated 10 amps resistive at 120 VAC.
   c. Enclosure:
      1) Non-hazardous area:
         a) NEMA Type 4X.
      2) Class I Division 1 area:
         a) Explosion-proof/Class I Division 1 rated.
         b) NEMA 4X with intrinsic safe circuits.
      3) Class I Division 2 area:
         a) Explosion-proof/Class I Division 1 rated.
         b) Class I Division 2 rated.
         c) NEMA 4X with intrinsic safe circuits.
         d) Hermetically sealed contacts.
      4) For more information, see Attachment A - ISA Data Sheet - Level Measurement: Switches.
5. Components:
   a. Floats shall include Type 316 stainless steel clamp and brackets and 1/4-inch cable to allow testing of the float without entering the basin or wet well.
   b. Provide strain relief at both ends of the float cable.
   c. Float anchors:
      1) Furnish PVC coated anchor kit with Type 316 stainless steel chain with sufficient length as needed.
      2) Provide stainless steel shackles and float clamps.
      3) Manufacturers: The following or equal:
         a) Conery Mfg. Inc.

2.03 ACCESSORIES

A. Provide sunshades for outdoor installation.

2.04 SOURCE QUALITY CONTROL

A. FM approval certification or equal when installed in classified areas.

PART 3 EXECUTION

3.01 EXAMINATION

A. Examine the installation location for the instrument and verify that the instrument will work properly when installed:
   1. Notify the Engineer promptly if any installation condition does not meet the instrument manufacturer's recommendations or specifications.

3.02 PREPARATION (NOT USED)

3.03 INSTALLATION

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

3.04 FIELD QUALITY CONTROL (NOT USED)

3.05 ADJUSTING

A. As specified in Section 17950 - Commissioning for Instrumentation and Controls.

3.06 CLEANING

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

3.07 DEMONSTRATION AND TRAINING (NOT USED)

3.08 PROTECTION (NOT USED)

3.09 SCHEDULES

A. The provided information does not necessarily include all required instruments. Provide all instruments identified in the Contract Documents:
   1. Instruments may be as indicated on the Drawings, as specified in the Specifications or both.

SECTION 17206

LEVEL MEASUREMENT: ULTRASONIC

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Ultrasonic level instruments.

B. Provide all instruments identified in the Contract Documents.

1.02 REFERENCES

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

1.03 DEFINITIONS

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Specific definitions:
   1. FDT: Field Device Tool.
   2. DTM: Device Type Manager.

1.04 SUBMITTALS

A. Furnish submittals as specified in Sections 01330 - Submittal Procedures and 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Provide complete documentation covering the traceability of all calibration instruments.

C. For each instrument with Digital Bus communication protocol:
   1. Provide FDT certificate for the instrument's DTM.
   2. FDT certificate to be approved and listed by the FDT Group.

1.05 QUALITY ASSURANCE

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Examine the complete set of Contract Documents and verify that the instruments are compatible with the installed conditions including:
   1. Process conditions: Fluids, pressures, temperatures, flows, materials, etc.
   2. Physical conditions:
      a. Installation and mounting requirements.

b. Location within the process.
c. Accessories: Verify that all required accessories are provided and are compatible with the process conditions and physical installation.

C. Notify the Engineer if any installation condition does not meet the instrument manufacturer's recommendations or specifications.

D. Manufacture instruments facilities certified to the quality standards of ISO Standard 9001 - Quality Systems - Model for Quality Assurance in Design/Development, Production, Installation, and Servicing.

1.06 DELIVERY, STORAGE, AND HANDLING

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

1.07 PROJECT OR SITE CONDITIONS

A. Project environmental conditions as specified in Section 01850 - Design Criteria:
1. Provide instruments suitable for the installed site conditions including, but not limited to, material compatibility, site altitude, site seismic conditions, humidity, and process and ambient temperatures.

1.08 WARRANTY

A. As specified in Section 01783 - Warranties and Bonds.

1.09 MAINTENANCE

A. Furnish all parts, materials, fluids, etc. necessary for operation, maintenance, and calibration purposes throughout the warranty period. Deliver all of these supplies before project substantial completion.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. One of the following or equal:
1. Ultrasonic level sensor with 2-wire integral transmitter:
a. Siemens, SITRANS Probe.
b. Endress+Hauser, Prosonic M FMU Series.
c. Pulsar, dBi HART Intelligent Transducers.

2.02 MANUFACTURED UNITS

A. As specified in this Section including Attachment A - ISA Data Sheet - Level Measurement: Ultrasonic.

B. Ultrasonic level measurement with 2-wire integral transmitter:
   1. General:
      a. Continuous non-contact level measurement device with integral transmitter using ultrasonic echo sensing.
      b. The transducer generates an ultrasonic pulse in the range of 10 to 70 kHz and measures the time required for the pulse to travel to the process surface and return. The level is measured based on constant velocity of sound in air with temperature compensation to adjust for velocity changes relative to temperature.
      c. Each 2- or 3-wire level transmitter system includes, but is not limited to:
         1) Ultrasonic transducer with integral transmitter.
   2. Performance requirements:
      a. Accuracy:
         1) 0.25 percent of range.
      b. Repeatability:
         1) 0.2 percent of range.
   3. Transducer (Integral):
      a. Encapsulated in chemical- and corrosion-resistant material as indicated in Attachment A - ISA Data Sheet - Level Measurement: Ultrasonic or Instrument Index.
      b. Operating temperature range: -5 to 122 degrees Fahrenheit (-20 to 50 degrees Celsius).
      c. Operating relative humidity range: 5 to 95 percent.
   4. Transmitter:
      a. Functions:
         1) Single-level measurement.
         2) Programmable for:
            a) Level.
            b) Tank volume.
      b. Power supply:
         1) 24 VDC, 2-wire loop powered.
         2) Power consumption: 6 VA maximum.
      c. Outputs:
         1) Isolated 4 to 20 milliamperes DC with HART communication protocol.
         2) DTM certified by FDT Group:
            a) Instrument shall be listed in the FDT Group’s certified DTM’s catalog.
      d. Indicator: Liquid crystal display with approximately 0.50-inch display scaled to read in engineering units.
      e. Sensitivity: Able to ignore momentary level spikes or momentary loss of echo and indicate loss of echo condition on indicating transmitter unit.

f. Enclosure:
    1) Non-hazardous area:
        a) NEMA Type 4X.
    2) Class I Division 1 area:
        a) Explosion-proof/Class I Division 1 rated.
        b) NEMA 4X with intrinsic safe circuits.
    3) Class I Division 2 area:
        a) Explosion-proof/Class I Division 1 rated.
        b) Class I Division 2 rated.
        c) NEMA 4X with intrinsic safe circuits.
    4) For more information, see Attachment A - ISA Data Sheet - Level Measurement: Ultrasonic.
g. Mounting: As indicated in the Contract Documents.

2.03 ACCESSORIES

A. Mounting brackets: As indicated on the Drawings.

B. Provide sunshades for outdoor installations.

2.04 SOURCE QUALITY CONTROL

A. Factory calibrate each instrument with a minimum 3-point calibration or according to manufacturer's standard at a facility that is traceable to NIST:
    1. Submit calibration data sheets to the Engineer at least 30 days before shipment of the instruments to the project site.

B. FM approval certification or equal when installed in classified areas.

PART 3 EXECUTION

3.01 EXAMINATION

A. Examine the installation location for the instrument and verify that the instrument will work properly when installed:
    1. Notify the Engineer promptly if any installation condition does not meet the instrument manufacturer's recommendations or specifications.

3.02 PREPARATION (NOT USED)

3.03 INSTALLATION

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Coordinate the installation with all trades to ensure that the mechanical system has all necessary appurtenances including weld-o-lets, valves, etc. for proper installation of instruments.

3.04 FIELD QUALITY CONTROL (NOT USED)

3.05 ADJUSTING

A. As specified in Section 17950 - Commissioning for Instrumentation and Controls.

B. Turn on turbulent surface software feature for all installations measuring surfaces lacking a placid surface. This would include but not be limited to level measurements in mixed media filters and potentially wet wells.

3.06 CLEANING

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

3.07 DEMONSTRATION AND TRAINING (NOT USED)

3.08 PROTECTION (NOT USED)

3.09 SCHEDULES

A. The provided information does not necessarily include all required instruments. Provide all instruments identified in the Contract Documents:
   1. Instruments may be as indicated on the Drawings, specified in the Specifications, or both.

SECTION 17208

LEVEL MEASUREMENT: RADAR PULSE TIME OF FLIGHT (PTOF)

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Non-contact radar (PTOF) level instruments.

B. Provide all instruments identified in the Contract Documents.

1.02 REFERENCES

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

1.03 DEFINITIONS

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Specific definitions:
   1. PTOF: Pulse Time of Flight.
   2. FDT: Field Device Tool.
   3. DTM: Device Type Manager.

1.04 SUBMITTALS

A. Furnish submittals as specified in Sections 01330 - Submittal Procedures and 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. For each instrument with digital bus communication protocol:
   1. Provide FDT certificate for the instrument’s DTM.
   2. FDT certificate to be approved and listed by the FDT Group.

1.05 QUALITY ASSURANCE

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Provide instruments manufactured at facilities certified to the quality standards of ISO 9001.

C. Examine the complete set of Contract Documents and verify that the instruments are compatible with the installed conditions including:
   1. Process conditions: Fluids, pressures, temperatures, flows, materials, etc.
   2. Physical conditions:
      a. Installation and mounting requirements.

b. Location within the process.
c. Accessories: Verify that all required accessories are provided and are compatible with the process conditions and physical installation.

D. Notify the Engineer if any installation condition does not meet the instrument manufacturer's recommendations or specifications.

1.06 DELIVERY, STORAGE, AND HANDLING

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

1.07 PROJECT OR SITE CONDITIONS

A. As specified in Section 01850 - Design Criteria.

1.08 WARRANTY

A. As specified in Section 01783 - Warranties and Bonds.

1.09 MAINTENANCE (NOT USED)

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. One of the following or equal:
1. Emerson, Rosemount 5408.
2. Endress+Hauser, Micropilot M.
3. Siemens/Milltronics, LR250.
4. Ohmart Vega, VegaPuls.
5. Ametek Drexelbrook, DR7000 Series.

2.02 MANUFACTURED UNITS

A. As specified in this Section including Attachment A - ISA Data Sheet - Level Measurement: Radar Pulse Time of Flight (PTOF).

B. Pulse Time of Flight:
1. General:
a. Instrument emits radar pulses via a transmitter, with a frequency range of 6.3 GHz to 26 GHz.
b. The pulses reflect from the surface being measured and are received back at the instrument via a sensor.
c. The instrument measures the pulse travel time between the transmitter, surface, and receiver to calculate the level.
d. Safety:
1) Shall not generate frequency waves with power levels hazardous to humans.

2. Performance requirements:
    a. Accuracy: Level:
        1) 0.25-inch.
3. Element:
    a. Level element must conform to the process material compatibility as indicated in Attachment A - ISA Data Sheet - Level Measurement: Radar Pulse Time of Flight (PTOF) or the Instrument Index.
    b. Connections:
        1) Process: The antenna design shall be suitable for mounting in a nozzle as indicated in Attachment A - ISA Data Sheet - Level Measurement: Radar Pulse Time of Flight (PTOF) or the Instrument Index.
        2) The design shall be such that product condensation on the antenna shall not affect the performance of the gauge. It shall be possible to choose between either parabolic-, cone-, rod-shaped antennas.
4. Transmitter:
    a. Microprocessor-based signal converter/transmitter.
    b. Power supply:
        1) 24 VDC - 2-wire loop powered.
        2) Power consumption: 15 VA maximum.
    c. Outputs:
        1) Isolated 4-20 mA DC with HART communication protocol.
        2) DTM certified by FDT group.
            a) Instrument shall be listed in the FDT group’s certified DTMs catalog.
    d. Backlit digital display for level or volume.
    e. Self-diagnostics and automatic data checking.
    f. Signal integrity:
        1) Immune to radio frequency and electromagnetic interference with field strength of 15 volts/meter or less over a frequency range of 50 Hz to 460 MHz.
        2) Able to ignore momentary level spikes or momentary loss of echo and indicate loss of echo condition on indicating transmitter unit.
    g. Protected terminals and fuses in a separate compartment, which isolates field connection from electronics.
        1) Indication: Local - 5-digit display.
    h. Enclosure:
        1) Non-hazardous area:
            a) NEMA Type 4X.
        2) For more information, see Attachment A - ISA Data Sheet - Level Measurement: Radar Pulse Time of Flight (PTOF).
    i. Electrical connection: 1/2-inch male NPT.

2.03 ACCESSORIES

A. Software: Provide Windows based PC software for configuration and echo mapping.

B. Provide sun shield for outdoor installations.

2.04 SOURCE QUALITY CONTROL

A. Factory calibrate each level transmitter at a facility that is traceable to NIST.

B. Provide complete documentation covering the traceability of all calibration instruments.

C. FM approval certification or equal when installed in classified areas.

PART 3 EXECUTION

3.01 EXAMINATION (NOT USED)

3.02 PREPARATION (NOT USED)

3.03 INSTALLATION

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Coordinate the installation with all trades to ensure that the mechanical system has all necessary appurtenances including weld-o-lets, valves, etc. for proper installation of instruments.

3.04 FIELD QUALITY CONTROL (NOT USED)

3.05 ADJUSTING

A. Verify factory calibration of all instruments in accordance with the manufacturer's instructions:
   1. Return factory calibrated devices to the factory if they do not meet the field verification requirements for calibration.

3.06 CLEANING

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

3.07 DEMONSTRATION AND TRAINING (NOT USED)

3.08 PROTECTION (NOT USED)

3.09 SCHEDULES

A. The provided information does not necessarily include all required instruments. Provide all instruments identified in the Contract Documents:
   1. Instruments may be indicated on the Drawings, specified in the Specifications or both.

SECTION 17301

FLOW MEASUREMENT: SWITCHES

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Thermal dispersion flow switches.

B. Provide all instruments identified in the Contract Drawings.

1.02 REFERENCES

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

1.03 DEFINITIONS

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

1.04 SUBMITTALS

A. Furnish submittals as specified in Sections 01330 - Submittal Procedures and 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Provide complete documentation covering the traceability of all calibration instruments.

1.05 QUALITY ASSURANCE

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Examine the complete set of Contract Documents and verify that the instruments are compatible with the installed conditions including:
   1. Process conditions: Fluids, pressures, temperatures, flows, materials, etc.
   2. Physical conditions:
      a. Installation and mounting requirements.
      b. Location within the process.
      c. Accessories: Verify that all required accessories are provided and are compatible with the process conditions and physical installation.

C. Notify the Engineer if any installation condition does not meet the instrument manufacturer’s recommendations or specifications.

1.06 DELIVERY, STORAGE, AND HANDLING

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

1.07 PROJECT OR SITE CONDITIONS

A. As specified in Section 01850 - Design Criteria:
   1. Provide instruments suitable for the installed site conditions including, but not limited to, material compatibility, site altitude, site seismic conditions, humidity, and process and ambient temperatures.

1.08 WARRANTY

A. As specified in Section 01783 - Warranties and Bonds.

1.09 MAINTENANCE

A. Furnish all parts, materials, fluids, etc. necessary for operation, maintenance, and calibration purposes throughout the warranty period. Deliver all of these supplies before project substantial completion.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. One of the following or equal:
   1. Thermal dispersion type:
      a. Fluid Components International LLC, FLT93.
      b. Kayden.

2.02 MANUFACTURED UNITS

A. As specified in this Section including Attachment A - ISA Data Sheet - Flow Measurement: Switches.

B. Thermal dispersion type:
   1. General:
      a. Instrument uses a heated probe and a reference probe:
         1) Deviation in the amount of heat measured by the reference probe deviates beyond the setpoint an adjustable relay closes.
         2) Switch:
            a) Micro-processor based with continuous self-diagnostics, “Smart Heater” to prevent sensor failure, no mechanical jumpers or trim pots, and a 3-year warranty.
   2. Performance requirements:
      a. Accuracy: Within 2 degrees Fahrenheit.
      b. Repeatability: Within 1 percent of setpoint range.
      c. Response time: 0.5 to 2.5 seconds.

d. Adjustable Bypass Delay Timer.
e. Adjustable range.

3. Switch characteristics:
   a. Exposed parts: Powder coated aluminum housing.
   b. Wetted parts:
      1) Materials as recommended by the manufacturer and approved by the Engineer.
   c. Power supply:
      1) 115 VAC.
      2) Power consumption: 13 VA maximum.
   d. Operating temperature range: -40 degrees Fahrenheit to 140 degrees Fahrenheit.
   e. Enclosure:
      1) Non-hazardous area:
         a) NEMA Type 4X.
      2) For more information, see Attachment A - ISA Data Sheet - Flow Measurement: Switches.

2.03 ACCESSORIES

A. Provide sunshades for outdoor installations.

2.04 SOURCE QUALITY CONTROL

A. Factory calibrate each instrument with a minimum 3-point calibration or according to Manufacturer's standard at a facility that is traceable to the NIST.
   1. Submit calibration data sheets to the Engineer at least 30 days before shipment of the instruments to the project site.

B. FM approval certification or equal when installed in classified areas.

PART 3 EXECUTION

3.01 EXAMINATION

A. Examine the installation location for the instrument and verify that the instrument will work properly when installed.
   1. Notify the Engineer promptly if any installation condition does not meet the instrument manufacturer's recommendations or specifications.

3.02 PREPARATION (NOT USED)

3.03 INSTALLATION

SECTION 17302

FLOW MEASUREMENT: MAGNETIC FLOWMETERS

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Full-body magnetic flowmeters.

1.02 REFERENCES

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Standards:
   1. International Organization for Standardization (ISO):
      a. 9000 - Quality management systems - Fundamentals and vocabulary.
      b. 17025 - General requirements for the competence of testing and calibration laboratories.
   2. National Institute of Standards and Technology (NIST).
   3. NSF International (NSF).

1.03 SUBMITTALS

A. Furnish Submittals as specified in Section 01330 - Submittal Procedures and Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Include sizing information from the manufacturer that includes:
   1. Chart of the measurement error from zero to maximum measured volumetric flow range indicated in datasheets.
   2. Indication of input parameters and their values used in the calculations.

C. Furnish commissioning Submittals listed below and specified in this Section as specified in Section 01756 - Commissioning:
   1. Manufacturer’s representative qualifications.
   2. Owner training.

1.04 QUALITY ASSURANCE

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Examine the complete set of Contract Documents and verify that the instruments are compatible with the installed conditions including:
   1. Process conditions: Fluids, pressures, temperatures, flows, materials, etc.
   2. Physical conditions:
      a. Installation and mounting requirements.

b. Location within the process.
c. Accessories: Verify that required accessories are provided and are compatible with the process conditions and physical installation.

C. Manufacture instrument facilities certified to the quality standards of ISO Standard 9001 - Quality Systems - Model for Quality Assurance in Design/Development, Production, Installation and Servicing.

1.05 DELIVERY, STORAGE, AND HANDLING

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems

1.06 PROJECT OR SITE CONDITIONS

A. As specified in Section 01850 - Design Criteria.

1.07 ADMINISTRATIVE REQUIREMENTS

A. Coordination:
1. Notify the Engineer if any installation condition does not meet the instrument manufacturer's recommendations or specifications.

1.08 WARRANTY

A. As specified in Section 01783 - Warranties and Bonds.

PART 2 PRODUCTS

2.01 GENERAL

A. Provide instruments identified in the Contract Drawings.

2.02 DESIGN AND PERFORMANCE CRITERIA

A. Provide instruments suitable for the installed site conditions including, but not limited to, material compatibility, site altitude, site seismic conditions, humidity, and process and ambient temperatures.

2.03 MANUFACTURERS

A. One of the following or equal:
1. Endress+Hauser:
a. Promag W flowtube with 300/500 series transmitter.
b. Promag H flowtube with 300/500 series transmitter.
2. Emerson, Rosemount 8750W.
3. Krohne, IFC.
4. ABB, Watermaster.

2.04 MANUFACTURED UNITS

A. As specified in this Section including Attachment A - ISA Datasheet - Flow Measurement: Magnetic Flowmeters.

B. Magnetic flowmeter:
   1. General:
      a. Magnetic flowmeters obtain the flow velocity by measuring the changes of induced voltage of the conductive fluid passing across a controlled magnetic field.
      b. Complete zero stability shall be an inherent characteristic of the flowmeter system.
      c. Include for each magnetic flow metering system:
         1) A metering tube with electrodes (sensor).
         2) Fully welded flanges that are rated for the full pressure class of the piping.
         3) Signal cable if remote mounted.
         4) Transmitter integral or remote as indicated on the Drawings.
         5) Flowmeter grounding rings.
   2. Performance requirements:
      a. Accuracy:
         1) 0.25 percent of flow rate from 10 to 100 percent of full-scale for velocities ranging between 1.9 to 10 feet per second.
      b. Repeatability:
         1) 0.25 percent of rate.
   3. Element:
      a. Metering tube:
         1) Constructed of Type 304 or 316 stainless steel (unless specifically noted otherwise in the instrument datasheet) with flanged connections to match with piping material.
            a) Carbon steel cannot be used when coils are on the outside of the metering tube, it will not pass the magnetic field.
            b) Coils which are embedded in the liner are not permitted.
         2) Liner material in conformance with:
            a) Manufacturer’s recommendations for the intended service.
            b) NSF certified for drinking water applications.
         3) Electrodes type and material in conformance with:
            a) Manufacturer’s recommendations for the intended service.
            b) Utilize a minimum of 2**,** self-cleaning electrodes.
         4) As indicated in the datasheets.
         5) Meter terminal housing NEMA Type 4X, unless installed in locations such as vaults that will experience submergence. In those applications NEMA 6P is required.
         6) Meter coating consisting of epoxy painted finish.
         7) Components:
            a) 2 grounding rings:
               (1) Which are in conformance with the manufacturer’s bore and material recommendation for the meter’s intended service.

4. Transmitter:
    a. Power supply:
        1) As indicated in the datasheets.
    b. Outputs:
        1) As indicated in the instrument datasheet.
        2) For instruments with 4 to 20 mA HART or digital bus protocol, provide a Device Type Manager (DTM) certification by FDT group.
    c. Microprocessor-based signal converter/transmitter.
    d. Utilize DC pulse technique to drive flux-producing coils.
    e. Contain a 6-digit display for flow rate, percent of span, and totalizer.
    f. Operator keypad interface.
    g. Integral zero return to provide consistent zero output signals in response to an external dry contact closure.
    h. Integral low flow cut-off zero return.
    i. Programmable parameters including:
        1) Meter size.
        2) Full-scale flow rate.
        3) Magnetic field frequency.
        4) Time constant.
    j. Data retention for a minimum of 5 years without auxiliary main or battery power.
    k. Self-diagnostics and automatic data checking.
    l. Protected terminals and fuses in a separate compartment which isolates field connection from electronics.
    m. Ambient operating temperature limits of -5 to 140 degrees Fahrenheit (-20 to 60 degrees Celsius).
    n. Enclosure:
        1) As indicated in the instrument datasheet.
        2) Non-hazardous area:
            a) NEMA Type 4X.
        3) For more information, see Attachment A - ISA Datasheet - Flow Measurement: Magnetic Flowmeters.
    o. The transmitter should retain all setup parameters and accumulated measurements internally in non-volatile memory in the event of power failure.

2.05 ACCESSORIES

A. Provide stainless steel tags for each instrument. Tags shall be labeled as specified in the Contract Documents.

B. Provide sunshades for transmitters located outdoors.

C. Provide galvanic isolation gaskets, nylon/Teflon™ flange bolt insulation bushings and nylon washers on meters installed on pipes with cathodic protection.

2.06 FINISHES (NOT USED)

2.07 SOURCE QUALITY CONTROL

A. Factory calibrate each flow metering system at a facility that is traceable to the NIST.
   1. ISO-17025 accredited test facility with certified accuracy traceable to NIST.
   2. Suggestion, the calibration facility be traceable to international standards and ILAC, International Laboratory Accreditation Committee MRA, Mutual Recognition Agreement.
   3. This ensures worldwide accreditation of calibration laboratories.

B. Evidence of accreditation shall originate from a national verification agency such as A2LA ILAC.

C. FM approval certification or equal when installed in classified areas.

D. A real-time computer-generated printout of the actual calibration date indication actual velocities and as read values of the flow tube.
   1. Flow calibration report of the manufacturers flow lab calibration procedure shall be shipped with the meter system.
   2. Minimum calibration shall be a 3 point calibration including 1, 3, and 10 feet per second velocities for every meter and transmitter system. 2 points at 15 to 20 percent and 80 to 100 percent are statistically proven to be sufficient calibration points.
   3. Manufacturer shall archive calibration reports for future reference.

PART 3 EXECUTION

3.01 EXAMINATION (NOT USED)

3.02 INSTALLATION

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. For instruments located outdoors or where instrument elements and transmitters are separated by conduit located outside the building envelope, provide surge protection devices at the transmitters.

3.03 COMMISSIONING

A. As specified in Section 01756 - Commissioning.

B. Owner Training:
   1. Perform Owner training as specified in Section 01756 - Commissioning.

3.04 FIELD QUALITY CONTROL

A. Field Verification:
   1. Verify factory calibration of instruments in accordance with the manufacturer’s instructions.

2. The transmitter and sensor to include a method to verify flow meter performance to the original manufacturer specifications.
3. Verification should be traceable to factory calibration using a third party, attested onboard system pursuant to ISO standards.
4. The verification report should be compliant to common quality systems such as ISO 9000 to prove reliability of the meter specified accuracy.
5. Return factory calibrated devices to the factory if they do not meet the field verification requirements for calibration.

3.05 SCHEDULES

A. Instrument datasheets included in this Section.

B. The provided information does not necessarily include all required instruments.

C. Provide all instruments identified in the Contract Documents:
   1. Instruments may be indicated on the Drawings, specified in the Specifications, or both.

SECTION 17316

FLOW MEASUREMENT: ROTAMETERS (VARIABLE AREA FLOWMETERS)

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Rotameters (variable area flowmeters).

B. Provide all instruments identified in the Contract Documents.

1.02 REFERENCES

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

1.03 DEFINITIONS

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

1.04 SUBMITTALS

A. Furnish submittals as specified in Section 01330 - Submittal Procedures and 17050 - Common Work Results for Process Control and Instrumentation Systems.

1.05 QUALITY ASSURANCE

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Examine the complete set of Contract Documents and verify that the instruments are compatible with the installed conditions including:
   1. Process conditions: Fluids, pressures, temperatures, flows, materials, etc.
   2. Physical conditions:
      a. Installation and mounting requirements.
      b. Location within the process.
      c. Accessories: Verify that all required accessories are provided and are compatible with the process conditions and physical installation.

1. Notify the Engineer if any installation condition does not meet the instrument manufacturer's recommendations or specifications.

1.06 DELIVERY, STORAGE, AND HANDLING

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

1.07 PROJECT OR SITE CONDITIONS

A. As specified in Section 01850 - Design Criteria.

1.08 WARRANTY

A. As specified in Section 01783 - Warranties and Bonds.

1.09 MAINTENANCE (NOT USED)

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. One of the following or equal:
   1. ABB.
   2. Brooks.
   3. King Instrument Co.

2.02 MANUFACTURED UNITS

A. As specified in this Section including Attachment A - ISA Data Sheet - Flow Measurement: Rotameters (Variable Area Flowmeters).

B. Rotameters:
   1. General:
      a. Variable area type flowmeters with local flow indication.
      b. Glass tube type.
   2. Performance requirements:
      a. Flow range:
         1) As specified in instrument data sheets or instrument index.
      b. Accuracy:
         1) Glass tube: Within 2.0 percent of range.
         2) Metal tube: Within 5.0 percent of range.
         3) Repeatability: 0.50 percent of range.
   3. Element:
      a. Flow tube:
         1) Glass tube: Borosilicate glass, or as required to be compatible with the process conditions.
      b. Turndown: 10 to 1.
      c. Process temperature:
         1) Glass tube: 32 to 200 degrees Fahrenheit.
         2) Metal tube: -20 to 320 degrees Fahrenheit.
      d. Maximum process pressure:
         1) Glass tube: 100 pounds per square inch gauge.
         2) Metal tube: 450 pounds per square inch gauge.
         3) Size tube for the largest of the following:
            a) 2.0 times the normal flow rate.
            b) 1.2 times the maximum flow rate.
            c) 4.0 times the minimum flow rate.

e. Float:
1) Design to provide the widest possible immunity band change for lowest pressure loss.
2) Metal tube rotameters: Float with encapsulated magnet.

4. Components:
a. Seals: O-rings or packing glands fully compatible with process fluid.
b. Integral needle valve for flow control.

5. Scale:
a. Metal tube: Dial indicator with rotatable magnet coupled to magnet encapsulated in rotameter float.

6. Other:
a. Process connection:
1) As indicated on the Mechanical Drawings.
b. Mounting:
1) As indicated on the Drawings.
2) Provide all necessary hardware for rotameter mounting.

2.03 ACCESSORIES (NOT USED)

2.04 SOURCE QUALITY CONTROL (NOT USED)

PART 3 EXECUTION

3.01 EXAMINATION (NOT USED)

3.02 PREPARATION (NOT USED)

3.03 INSTALLATION

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Coordinate the installation with all trades to ensure that the mechanical system has all necessary appurtenances including weld-o-lets, valves, etc. for proper installation of instruments.

3.04 FIELD QUALITY CONTROL (NOT USED)

3.05 ADJUSTING

A. Verify factory calibration of all instruments in accordance with the manufacturer's instructions:
1. Return factory calibrated devices to the factory if they do not meet the field verification requirements for calibration.

3.06 CLEANING

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

3.07 DEMONSTRATION AND TRAINING (NOT USED)

3.08 PROTECTION (NOT USED)

3.09 SCHEDULES

A. The provided information does not necessarily include all required instruments. Provide all instruments identified in the Contract Documents:
   1. Instruments may be indicated on the Drawings, specified in the Specifications, or both.

SECTION 17317

FLOW MEASUREMENT: OPEN CHANNEL

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Open channel flow measurement instruments.

1.02 REFERENCES

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Standards:
   1. Underwriters Laboratories, Inc. (UL):
      a. 913 - Standard for Intrinsically Safe Apparatus and Associated Apparatus for Use in Class I, II, III, Division 1, Hazardous (Classified) Locations.

1.03 SUBMITTALS

A. Furnish Submittals as specified in Section 01330 - Submittal Procedures and Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Provide complete documentation covering the traceability of calibration instruments.

C. Furnish commissioning Submittals listed below and specified in this Section as specified in Section 01756 - Commissioning:
   1. Manufacturer's representative qualifications.
   2. Owner training.

1.04 QUALITY ASSURANCE

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Examine the complete set of Contract Documents and verify that the instruments are compatible with the installed conditions including:
   1. Process conditions: Fluids, pressures, temperatures, flows, materials etc.
   2. Physical conditions:
      a. Installation and mounting requirements.
      b. Location within the process.
      c. Accessories: Verify that required accessories are provided and are compatible with the process conditions and physical installation.

1.05 DELIVERY, STORAGE, AND HANDLING

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

1.06 PROJECT OR SITE CONDITIONS

A. Project environmental conditions as specified in Section 01850 - Design Criteria.

1.07 ADMINISTRATIVE REQUIREMENTS

A. Coordination:
   1. Notify the Engineer if any installation condition does not meet the instrument manufacturer's recommendations or specifications.

1.08 WARRANTY

A. As specified in Section 01783 - Warranties and Bonds.

1.09 MAINTENANCE

A. Furnish parts, materials, fluids, etc., necessary for operation, maintenance, and calibration purposes throughout the warranty period. Deliver these supplies before project substantial completion.

PART 2 PRODUCTS

2.01 GENERAL

A. Provide instruments identified in the Contract Documents.

2.02 DESIGN AND PERFORMANCE CRITERIA

A. Provide instruments suitable for the installed site conditions including, but not limited to, material compatibility, site altitude, site seismic conditions, humidity, and process and ambient temperatures.

2.03 MANUFACTURERS

A. One of the following or equal:
   1. HACH, FL1500 Transmitter with US9001 sensor.
   2. Siemens, SITRANS LUT400 with EchoMax XRS-5.

2.04 MANUFACTURED UNITS

A. Open channel flow measure instrument:
   1. General:
      a. The flow measurement device shall calculate a flow rate that meets or exceeds the performance guidelines as specified in this Section.

2. Performance requirements:
    a. Accuracy:
        1) The complete system flow accuracy shall not exceed within 5 percent of rate with within 0.5 percent of rate repeatability.
3. Element:
    a. Weir:
        1) Rectangular.
    b. Ultrasonic level transducer:
        1) Operating temperature range: 0 to 140 degrees Fahrenheit (-18 to 60 degrees Celsius).
        2) Operating relative humidity range: 0 to 95 percent, non-condensing.
        3) Functions:
            a) Temperature compensation.
        4) Mounting: As indicated in the Contract Documents.
        5) Sensors shall be rated for NEMA 6P submergence.
            a) Sensors shall have mechanical decoupling between sensor membrane and outer housing.
            b) Sensors shall be provided with automatic build up compensation to provide self-cleaning when condensation may occur.
            c) Sensors shall be provided with internal heating elements and separate power supplies for these elements when freezing condensation may occur.
4. Transmitter:
    a. Field-selectable units of measure:
        1) Level: Inches, feet, centimeters, and meters.
        2) Velocity: Feet/second, centimeters/second, and meters/second.
        3) Flow rate: Gallons per minute, million gallons per day, cubic feet per second, cubic centimeter per second, and cubic meter per second.
    b. Flow indicating transmitter:
        1) Indicator: Liquid crystal display with approximately 0.50-inch display scaled to read in engineering units.
        2) Sensitivity: Able to ignore momentary level spikes or momentary loss of echo and indicate loss of echo condition on indicating transmitter unit.
        3) Ability to allow for signal profiles and echo mapping:
            a) Provide manufacturer’s software for re-mapping the signal.
    c. Memory storage:
        1) Store programmed parameters in non-volatile memory to prevent loss in case of power interruption.
    d. Power supply:
        1) As indicated in the datasheets.
        2) 120 VAC.
    e. Outputs:
        1) As indicated in the datasheets.
        2) Relay outputs:
            a) 1 Form C contact.
            b) Rated 5 amps at 120 VAC.
            c) Programmable.

2.05 ACCESSORIES

A. Provide sunshades for outdoor installations.

2.06 FINISHES (NOT USED)

2.07 SOURCE QUALITY CONTROL

A. Factory calibrate each instrument with a minimum 3-point calibration or according to Manufacturer's standard at a facility that is traceable to the NIST.
   1. Submit calibration datasheets to the Engineer at least 30 days before shipment of the instruments to the project site.

PART 3 EXECUTION

3.01 EXAMINATION

A. Examine the installation location for the instrument and verify that the instrument will work properly when installed.

3.02 INSTALLATION

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Coordinate the installation with trades to ensure that the mechanical system has all necessary appurtenances including weld-o-lets, valves, etc., for proper installation of instruments.

3.03 COMMISSIONING

A. As specified in Section 01756 - Commissioning.

B. Owner Training:
   1. Perform Owner training as specified in Section 01756 - Commissioning.
   2. Number of sessions:
      a. Operations: 1.
      b. Maintenance: 1.

3.04 SCHEDULES

A. The provided information does not necessarily include all required instruments. Provide all instruments identified in the Contract Documents:
   1. Instruments may be indicated on the Drawings, specified in the Specifications, or both.

SECTION 17402

PRESSURE/VACUUM MEASUREMENT: INSTRUMENT VALVES

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Valve manifolds and instrument valves.

B. Provide all valves identified in the Contract Documents.

1.02 REFERENCES

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

1.03 DEFINITIONS

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

1.04 SUBMITTALS

A. Furnish submittals as specified in Sections 01330 - Submittal Procedures and 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Additional requirements:
   1. Product data:
      a. Valve type.
      b. Body material.
      c. Size.
      d. Options.
   2. Shop drawings:
      a. Mounting details for all manifold valves.

1.05 QUALITY ASSURANCE

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Examine the complete set of Contract Documents and verify that the valves are compatible with the installed conditions including:
   1. Process conditions: Fluids, pressures, temperatures, flows, materials, etc.
   2. Physical conditions:
      a. Installation and mounting requirements.
      b. Location within the process.
      c. Accessories: Verify that all required accessories are provided and are compatible with the process conditions and physical installation.

C. Notify the Engineer if any installation condition does not meet the valve manufacturer's recommendations or specifications.

D. Provide valves manufactured at facilities certified to the quality standards of ISO 9001.

1.06 DELIVERY, STORAGE, AND HANDLING

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Protect valve manifolds and protective coatings from damage during handling and installation. Repair coating where damaged.

1.07 PROJECT OR SITE CONDITIONS

A. Project environmental conditions as specified in Section 01850 - Design Criteria.
   1. Provide valves suitable for the installed site conditions including, but not limited to, material compatibility, process, and ambient temperatures.

1.08 WARRANTY

A. As specified in Section 01783 - Warranties and Bonds.

1.09 MAINTENANCE

A. Furnish all parts, materials, fluids, etc. necessary for operation, maintenance, and calibration purposes throughout the warranty period. Deliver all of these supplies before project substantial completion.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Valve manifold:
   1. One of the following or equal:
      a. Anderson Greenwood.
      b. Hex Valve.
      c. Noshok.
      d. Emerson, Rosemount.

B. Block and bleed valve:
   1. One of the following or equal:
      a. Anderson Greenwood.
      b. Hex Valve.

C. Gauge valve:
   1. One of the following or equal:
      a. Anderson Greenwood.
      b. Hex Valve.

D. Level sensor isolation valve:
    1. One of the following or equal:
        a. Indu-Tech, Level Sensor Isolation Valve.
        b. DeZURIK, Level Sensor Isolation Valve.
        c. Tyco, Rovalve Isolation Knife Gate Valve.

2.02 MANUFACTURED UNITS

A. Valve manifolds:
    1. General:
        a. Provide 2-valve, 3-valve, blowdown type 5-valve, or metering type 5-valve manifolds as indicated on the Drawings.
        b. Valve manifolds shall have one piece bonnet with a metal-to-metal seal to the valve body below the bonnet threads.
    2. Requirements:
        a. Bonnet lock pin to prevent accidental loosening.
        b. Gas leak tested metal-to-metal hard seat design for hard seat valves.
        c. Gas leak tested soft seat design with replaceable seat for soft seat valves.
        d. Manifold valves shall have straight through portion for bi-directional flow and easy roddable cleaning.
        e. Manifold valves shall allow for direct or remote instrument mounting.
        f. Shall be able to withstand pressures up to 6,000 psi for soft seat valves and 10,000 psi for hard seat valves at maximum 200 degrees Fahrenheit.
        g. Materials of construction:
            1) Body material: Type 316 stainless steel.
            2) O-Ring: Teflon™.
        h. 2-Valve manifolds:
            1) 1 isolation valve and 1 drain/vent and calibration valve.
        i. 3-Valve manifolds:
            1) 2 isolation valves and 1 equalizing valve for differential pressure applications.
            2) Plugged vent connections used for vent/drain or calibration.
        j. Blowdown 5-valve manifold:
            1) 2 isolation valves, 1 equalizing valve, 2 blowdown valves for differential pressure applications.
        k. Metering 5-valve manifold:
            1) 2 isolation valves, 2 equalizing valves, 1 vent/drain and calibration valve for differential pressure applications.

B. Block and bleed valves:
    1. General:
        a. Valve shall provide process isolation and venting/draining capabilities.
        b. Gas leak tested metal-to-metal hard seat design for hard seat valves.
        c. Gas leak tested soft seat design with replaceable seat for soft seat valves.
        d. Valve shall not be used with fluids with high solids content, such as raw wastewater or sludge.
    2. Requirements:
        a. Materials of construction:
            1) Body material: Type 316 stainless steel.
            2) O-Ring: Teflon™.

C. Gauge valves:
   1. General:
      a. Valve shall provide process isolation from pressure instrument.
      b. Gas leak tested, metal-to-metal hard seat design for hard seat valves.
      c. Gas leak tested soft seat design with replaceable seat for soft seat valves.
   2. Requirements:
      a. Materials of construction:
         1) Body material: Type 316 stainless steel.
         2) O-Ring: Teflon™.

D. Level sensor isolation valves:
   1. General:
      a. Valve shall provide process isolation from level diaphragm.
      b. Gas leak tested, metal-to-metal hard seat design for hard seat valves.
      c. Gas leak tested soft seat design with replaceable seat for soft seat valves.
   2. Requirements:
      a. Materials of construction:
         1) Body material: Type 316 stainless steel.
         2) Flange diameter size: 3 inches.

2.03 ACCESSORIES

A. Provide tube fitting, female NPT, or pipe butt weld connections if necessary.

B. Provide stainless steel concentric or eccentric pipe nipples when necessary.

2.04 SOURCE QUALITY CONTROL (NOT USED)

PART 3 EXECUTION

3.01 EXAMINATION

A. Examine the installation location and verify it will work properly when installed.
   1. Notify the Engineer promptly if any installation condition does not meet the manufacturer's recommendations or specifications.

3.02 PREPARATION (NOT USED)

3.03 INSTALLATION

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Coordinate the installation with all trades to ensure that the mechanical system has all necessary appurtenances including weld-o-lets, valves, etc. for proper installation of all valves.

3.04 FIELD QUALITY CONTROL (NOT USED)

3.05 ADJUSTING

A. As specified in Section 17950 - Commissioning for Instrumentation and Controls.

3.06 CLEANING

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

3.07 DEMONSTRATION AND TRAINING (NOT USED)

3.08 PROTECTION (NOT USED)

3.09 SCHEDULES (NOT USED)

END OF SECTION

SECTION 17404

PRESSURE/VACUUM MEASUREMENT: GAUGES

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Pressure/vacuum gauges.

B. Provide all instruments specified in the Contract Documents.

1.02 REFERENCES

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. American Society of Mechanical Engineers (ASME):
   1. B40.100 - Pressure Gauges and Gauge Attachments.

1.03 DEFINITIONS

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

1.04 SUBMITTALS

A. Furnish submittals as specified in Sections 01330 - Submittal Procedures and 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Additional requirements:
   1. Product data:
      a. Accessories such as diaphragm seals, valve manifold, snubbers, and pulsation dampeners.

1.05 QUALITY ASSURANCE

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Examine the complete set of Contract Documents and verify that the instruments are compatible with the installed conditions including:
   1. Process conditions: Fluids, pressures, temperatures, flows, materials, etc.

2. Physical conditions:
    a. Installation and mounting requirements.
    b. Location within the process.
    c. Accessories: Verify that all required accessories are provided and are compatible with the process conditions and physical installation.

C. Notify the Engineer if any installation condition does not meet the instrument manufacturer's recommendations or specifications.

1.06 DELIVERY, STORAGE, AND HANDLING

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

1.07 PROJECT OR SITE CONDITIONS

A. As specified in Section 01850 - Design Criteria.

1.08 WARRANTY

A. As specified in Section 01783 - Warranties and Bonds.

1.09 MAINTENANCE (NOT USED)

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. One of the following or equal:
    1. Ashcroft:
        a. Maximum pressure less than 10 pounds per square inch: Model 1188.
            1) If a stainless steel dial casing is required:
                a) Model 1009.
        b. Maximum pressure greater than or equal to 10 pounds per square inch: Model 1279.
            1) If a stainless steel dial casing is required:
                a) Model 1009.
        c. Removable Gauges:
            1) Model 1082.
    2. Wika.
        a. Model XSEL type 232.34.
    3. Ametek U.S. Gauge.

2.02 MANUFACTURED UNITS

A. As specified in this Section including Attachment A - ISA Data Sheet - Pressure/Vacuum Measurement: Gauges.

B. General:
   1. Pressure gauge assembly shall include pressure sensing element, gauge case, and dial mechanism.

C. Performance requirements:
   1. Pressure range:
      a. As specified in the Contract Documents.
   2. Accuracy:
      a. Grade 2A, as defined by ASME B40.100.
      b. Within 1.0 percent of span after friction errors are eliminated by tapping or vibration.
      c. Maximum allowable friction inaccuracy: Within 1.0 percent of span.
   3. Element:
      a. Where the maximum pressure is less than 10 pounds per square inch, provide socket and bellows; for all other pressure ranges, employ a Bourdon® tube.
      b. Socket tips for bellows and Bourdon® tube:
         1) Materials: Type 316 stainless steel.
      c. Overpressure: Minimum 130 percent of maximum range pressure without damage to gauge or sensing element.
      d. Wetted materials: Type 316 stainless steel.
   4. Dial gauge:
      a. Dial size: 4-1/2 inches.
      b. Dial case material:
         1) Maximum pressure less than 10 pounds per square inch:
            a) Phenolic.
         2) Maximum pressure greater than or equal to 10 pounds per square inch:
            a) Phenolic.
      c. Provide safety gauge with safety blow out through the back or top of the unit.
      d. Dial face: Gasketed shatterproof glass or polycarbonate.
      e. Provide gauge locks on all pressure gauges directly connected to diaphragm seals.
      f. Provide gauge locks where possible.
      g. Hermetically sealed.
      h. Connection and mounting:
         1) Direct mounted and suitable for outdoor installation.
         2) 1/2-inch NPT.
         3) Connection material: Stainless steel.
      i. Pointer: Externally adjustable.

2.03 ACCESSORIES

A. Pulsation dampeners and snubbers:
   1. Provide pulsation dampener or snubber with each pressure gauge installed on discharge of positive displacement type pump.
   2. Provide piston-type snubber if pressure spikes will exceed 130 percent of gauge maximum range.
   3. Materials: Type 316 stainless steel.

4. Mount pulsation dampener or snubber integrally to the pressure gauge.
5. Connection: 1/2-inch NPT.

B. Provide means for gauge isolation as specified in Section 17402 - Pressure/Vacuum Measurement: Instrument Valves:
   1. Mount valve manifold integrally to the gauge.
   2. Valve manifold and pressure gauge shall be assembled by manufacturer and shipped as an assembly.

C. Provide stainless steel tags for each instrument. Tags shall be labeled as specified in the Contract Documents.

2.04 SOURCE QUALITY CONTROL

A. Factory calibrate each pressure gauge at a facility that is traceable to the NIST.

B. Provide complete documentation covering the traceability of all calibration instruments.

PART 3 EXECUTION

3.01 EXAMINATION (NOT USED)

3.02 PREPARATION (NOT USED)

3.03 INSTALLATION

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Coordinate the installation with all trades to ensure that the mechanical system has all necessary appurtenances including weld-o-lets, valves, etc. for proper installation of instruments.

3.04 FIELD QUALITY CONTROL (NOT USED)

3.05 ADJUSTING

A. Verify factory calibration of all instruments in accordance with the manufacturer's instructions:
   1. Return factory calibrated devices to the factory if they do not meet the field verification requirements for calibration.

3.06 CLEANING

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

3.07 DEMONSTRATION AND TRAINING (NOT USED)

3.08 PROTECTION (NOT USED)

3.09 SCHEDULES

A. The provided information does not necessarily include all required instruments. Provide all instruments identified in the Contract Documents:
   1. Instruments may be indicated on the Drawings, specified in the Specifications or both.

SECTION 17405

PRESSURE/VACUUM MEASUREMENT: DIRECT

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Pressure transmitters and indicators.

1.02 REFERENCES

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

1.03 TERMINOLOGY

A. The words and terms listed below are not defined terms that require initial capital letters, but, when used in this Section, have the indicated meaning.
   1. Calibrated range: The range that the pressure transmitter is configured to measure.
      a. The low end of the calibrated range must be greater than the lower range value (LRV) of the transmitter.
      b. The high end of the calibrated range must be less than or equal to the upper range value (URV).
      c. The calibrated range corresponds to the flow signal sent from the transmitter.
   2. Lower range value (LRV): Lowest pressure that the pressure transmitter is capable of measuring.
   3. Upper range value (URV): Highest pressure that the pressure transmitter is capable of measuring.

1.04 SUBMITTALS

A. Furnish Submittals as specified in Section 01330 - Submittal Procedures and Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Provide complete documentation covering the traceability of calibration instruments.

1.05 QUALITY ASSURANCE

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Examine the complete set of Contract Documents and verify that the instruments are compatible with the installed conditions including:
   1. Process conditions: Fluids, pressures, temperatures, flows, materials etc.

2. Physical conditions:
    a. Installation and mounting requirements.
    b. Location within the process.
    c. Accessories: Verify that required accessories are provided and are compatible with the process conditions and physical installation.

C. Provide instruments manufactured at facilities certified to the quality standards of ISO 9001.

1.06 DELIVERY, STORAGE, AND HANDLING

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

1.07 PROJECT OR SITE CONDITIONS

A. As specified in Section 01850 - Design Criteria.

1.08 ADMINISTRATIVE REQUIREMENTS

A. Coordination:
    1. Notify the Engineer if any installation condition does not meet the instrument manufacturer’s recommendations or specifications.

1.09 WARRANTY

A. As specified in Section 01783 - Warranties and Bonds.

1.10 MAINTENANCE

A. Furnish parts, materials, fluids, etc., necessary for operation, maintenance, and calibration purposes throughout the warranty period. Deliver these supplies before project substantial completion.

PART 2 PRODUCTS

2.01 GENERAL

A. Provide instruments identified in the Contract Documents.

2.02 DESIGN AND PERFORMANCE CRITERIA

A. Provide instruments suitable for the installed site conditions including, but not limited to, material compatibility, site altitude, site seismic conditions, humidity, and process and ambient temperatures.

2.03 MANUFACTURERS

A. One of the following or equal:
    1. Emerson, Rosemount 3051 Series.
    2. Emerson, Rosemount 2051 Series with High performance option.

3. Yokogawa, EJA Series.
4. ABB, 266 Series.
5. Endress & Hauser, Cerabar S Series.

2.04 MANUFACTURED UNITS

A. Pressure transmitters - direct:
   1. General:
      a. Pressure transmitter assembly shall include a diaphragm type pressure transducer and microprocessor-based transmitter for measurement of gauge, vacuum, or absolute pressure.
   2. Performance requirements:
      a. Maximum ratio of total instrument range to calibrated span: 10 to 1.
      b. Accuracy:
         1) Reference accuracy: Plus or minus 0.075 percent of calibrated span, including effects of hysteresis, nonlinearity, and repeatability.
         2) Total performance accuracy: Plus or minus 0.30 percent of calibrated span, including reference accuracy effects, static pressure and ambient temperature effects.
         3) Stability: Plus or minus 0.15 percent of upper range limit over 5 years.
   3. Element:
      a. Diaphragm type transducer integral to pressure transmitter.
      b. Diaphragm material: Stainless steel or ceramic.
      c. Process material compatibility:
         1) Verify material compatibilities with the instrument manufacturer.
      d. Process connection: As specified in Attachment A - ISA Datasheet - Pressure/Vacuum Measurement: Direct.
   4. Transmitter:
      a. Power supply:
         1) As indicated in the datasheets.
         2) 24 VDC - 2 wire loop powered.
      b. Outputs:
         1) As indicated in the datasheets.
         2) Isolated 4-20 mA DC with HART communication protocol.
      c. Provided with electronic microprocessor.
      d. Adjustments: Adjustable electronic zero and span, with elevated or suppressed zero as required by application. Adjustment shall be possible without mechanical fulcrum points or handheld configurator.
      e. Local display:
         1) 5-digit LCD.
         2) Scaled in engineering units.
      f. Enclosure:
         1) As indicated in the datasheets.
         2) Non-hazardous area:
            a) NEMA Type 4X.
      g. Over range protection: To maximum process line pressure.
      h. Conduit: 1/2-inch male NPT.

5. Components:
    a. Transmitter mounting:
        1) As indicated in the datasheets.
        2) Provide necessary hardware for transmitter mounting.

2.05 ACCESSORIES

A. Provide valve manifolds as specified in Section 17402 - Pressure/Vacuum Measurement: Instrument Valves:
    1. Mount valve manifold integrally to the transmitter.
    2. Valve manifold and transmitter shall be assembled by Manufacturer and shipped as an assembly.
    3. Provide remote or integral diaphragm seals as indicated on the Drawings or as indicated in the datasheets.

B. Provide sunshades for outdoor installations.

C. Provide stainless steel tags for each instrument. Tags shall be labeled as specified in the Contract Documents.

2.06 FINISHES (NOT USED)

2.07 SOURCE QUALITY CONTROL

A. Factory calibrate each instrument with a minimum 3-point calibration or according to Manufacturer's standard at a facility that is traceable to the NIST.
    1. Submit calibration datasheets to the Engineer at least 30 days before shipment of the instruments to the project site.

B. FM approval certification or equal when installed in classified areas.

PART 3 EXECUTION

3.01 EXAMINATION

A. Examine the installation location for the instrument and verify that the instrument will work properly when installed.

3.02 INSTALLATION

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Coordinate the installation with trades to ensure that the mechanical system has necessary appurtenances including weld-o-lets, valves, etc., for proper installation of instruments.

3.03 COMMISSIONING

A. As specified in Section 01756 - Commissioning.

3.04 SCHEDULES

A. The provided information does not necessarily include all required instruments. Provide all instruments identified in the Contract Documents:
   1. Instruments may be indicated on the Drawings, specified in the Specifications, or both.

   1. Submersible pressure transmitters.

1.02 REFERENCES

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

1.03 SUBMITTALS

A. Furnish Submittals as specified in Section 01330 - Submittal Procedures, and Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Provide complete documentation covering the traceability of all calibration instruments.

1.04 QUALITY ASSURANCE

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Examine the complete set of Contract Documents and verify that the instruments are compatible with the installed conditions including:
   1. Process conditions: Fluids, pressures, temperatures, flows, materials etc.
   2. Physical conditions:
      a. Installation and mounting requirements.
      b. Location within the process.
      c. Accessories: Verify that all required accessories are provided and are compatible with the process conditions and physical installation.

C. Provide instruments manufactured at facilities certified to the quality standards of ISO 9001.

1.05 DELIVERY, STORAGE, AND HANDLING

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

1.06 PROJECT OR SITE CONDITIONS

A. Project environmental conditions as specified in Section 01850 - Design Criteria.

1.07 ADMINISTRATIVE REQUIREMENTS

A. Coordination:
   1. Notify the Engineer if any installation condition does not meet the instrument manufacturer's recommendations or specifications.

1.08 WARRANTY

A. As specified in Section 01783 - Warranties and Bonds.

1.09 MAINTENANCE

A. Furnish all parts, materials, fluids, etc., necessary for operation, maintenance, and calibration purposes throughout the warranty period. Deliver all of these supplies before project substantial completion.

PART 2 PRODUCTS

2.01 GENERAL

A. Provide all instruments identified in the Contract Documents.

2.02 DESIGN AND PERFORMANCE CRITERIA

A. Provide instruments suitable for the installed site conditions including, but not limited to, material compatibility, site altitude, site seismic conditions, humidity, and process and ambient temperatures.

2.03 MANUFACTURERS

A. Submersible level measurement with 2-wire integral transmitter:
   1. One of the following or equal:
      a. Endress+Hauser, Waterpilot FMX21 .
      b. Druck, PTX-1830.
      c. Siemens, SITRANS LH100.
      d. Measurement Specialties, KPSI 700 Series.

2.04 MANUFACTURED UNITS

A. As specified in this Section including Attachment A - ISA Datasheet - Pressure Measurement: Submersible.

B. Submersible level measurement with 2-wire integral transmitter:
   1. General:
      a. Pressure is measured through a diaphragm-type measuring cell and converted to linear pressure measurement.
      b. Each submersible pressure transmitter system shall include:
         1) Signal cable, including pressure compensation tube.
         2) Transducer probe with integral transmitter.
         3) Transmitter cable termination box.

2. Performance requirements:
    a. Accuracy:
        1) 0.3 percent of range.
    b. Repeatability:
        1) 0.25 percent of full scale.
    c. Rangeability:
        1) 3:1.
    d. Range:
        1) As indicated on the Drawings or in the datasheet.
3. Element:
    a. Sensor housing shall be Type 316L stainless steel or titanium with ceramic, Teflon™-coated, or titanium diaphragm.
    b. Protective cap shall be manufacturer's recommended material, chemically resistant to process fluid.
    c. Pressure reference/compensation:
        1) Slip resistant extension cable with pressure compensation tube with Teflon™ filter.
    d. Enclosure for probe and transmitter assembly shall be NEMA Type 6P.
4. Transmitter:
    a. Power supply:
        1) As indicated in the datasheets.
        2) 24 VDC: 2 wire loop powered.
    b. Outputs:
        1) As indicated in the datasheets.
        2) Isolated 4 to 20 mA DC with HART communication protocol.
    c. Ambient operating temperature limits of -10 to 70 degrees Celsius (14 to 158 degrees Fahrenheit).
5. Transmitter cable termination box:
    a. As indicated in the datasheets.
    b. NEMA Type 4X.
    c. Equipped with filter or desiccant chamber to eliminate moisture from the pressure compensation tube.
    d. Termination for signal wires and/or pressure compensation tube**.**

2.05 ACCESSORIES

A. Type 316L stainless steel mounting clamp with Type 304 stainless steel mounting screws.

B. Provide additional anchor to prevent movement.

C. Provide cable clamp and strain relief.

D. Provide computer cable adapter with Windows® software.

E. Provide sunshade for outdoor installations.

2.06 FINISHES (NOT USED)

2.07 SOURCE QUALITY CONTROL

A. Factory calibrate each instrument with a minimum 3-point calibration or according to Manufacturer's standard at a facility that is traceable to the NIST.
   1. Submit calibration datasheet to the Engineer at least 30 days before shipment of the instruments to the project site.

PART 3 EXECUTION

3.01 EXAMINATION

A. Examine the installation location for the instrument and verify that the instrument will work properly when installed.

3.02 INSTALLATION

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Coordinate the installation with all trades to ensure that the mechanical system has all necessary appurtenances including weld-o-lets, valves, etc., for proper installation of instruments.

3.03 COMMISSIONING

A. As specified in Section 01756 - Commissioning.

3.04 SCHEDULES

A. The provided information does not necessarily include all required instruments. Provide all instruments identified in the Contract Documents:
   1. Instruments may be indicated on the Drawings, specified in the Specifications, or both.

SECTION 17505

ANALYZERS: RESIDUAL CHLORINE

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Residual chlorine analyzers.

B. Provide all instruments identified in the Contract Documents.

1.02 REFERENCES

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

1.03 DEFINITIONS

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

1.04 SUBMITTALS

A. Furnish submittals as specified in Sections 01330 - Submittal Procedures and 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Provide complete documentation covering the traceability of all calibration instruments.

1.05 QUALITY ASSURANCE

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Examine the complete set of Contract Documents and verify that the instruments are compatible with the installed conditions including:
   1. Process conditions: Fluids, pressures, temperatures, flows, materials, etc.
   2. Physical conditions:
      a. Installation and mounting requirements.
      b. Location within the process.
      c. Accessories: Verify that all required accessories are provided and are compatible with the process conditions and physical installation.

C. Notify the Engineer if any installation condition does not meet the instrument manufacturer’s recommendations or specifications.

1.06 DELIVERY, STORAGE, AND HANDLING

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

1.07 PROJECT OR SITE CONDITIONS

A. Project environmental conditions as specified in Section 01850 - Design Criteria.
   1. Provide instruments suitable for the installed site conditions including, but not limited to, material compatibility, site altitude, site seismic conditions, humidity, and process and ambient temperatures.

1.08 WARRANTY

A. As specified in Section 01783 - Warranties and Bonds.

1.09 MAINTENANCE

A. Furnish all parts, materials, fluids, etc. necessary for operation, maintenance, and calibration purposes throughout the warranty period. Deliver all of these supplies before project substantial completion.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Colorimetric residual analyzers:
   1. The following or equal:
      a. HACH, CL17sc.
         1) Transmitter Model sc4500.

2.02 MANUFACTURED UNITS

A. As specified in this Section including Attachment A - ISA Data Sheet - Analyzers: Residual Chlorine.

B. Colorimetric residual analyzers:
   1. General:
      a. Residual chlorine analyzer utilizing the DPD colorimetric method to provide accurate measurements independent of swings in pH or alkalinity levels in the sample source.
      b. Convert from free to total chlorine by changing reagents:
         1) Measure a sample blank before each sample measurement to provide zero reference compensation for sample color and turbidity, changes in light intensity due to voltage fluctuations, or light intensity.
   2. Performance requirements:
      a. Complete analysis every 2.5 minutes for free or total chlorine residual.
      b. Designed for 30 days of unattended operation, with less than 500 milliliters of reagent used per month.

c. Accuracy:
    1) Within 5 percent of reading or within 0.035 milligrams per liters.
d. Range:
    1) 0 to 5 milligrams per liters free or total residual.
e. Repeatability:
    1) Within 5 percent or 0.05 milligrams per liters.

3. Transmitter:
    a. Microprocessor-based signal converter/transmitter:
        1) Self-diagnostic functions available via the alphanumeric, menu-driven keyboard.
    b. Power supply:
        1) 120 VAC.
        2) Power consumption: 95 VA maximum.
    c. Outputs:
        1) Isolated 4 to 20 milliamperes DC.
        2) As indicated on the instrument data sheets.
        3) Relay outputs:
            a) SPST relay contacts: 2.
            b) Selectable to activate on the following conditions:
                (1) High or low sample concentration.
                (2) Analyzer system warning.
                (3) Analyzer system shutdown.
    d. Enclosure:
        1) Rating: NEMA 12 (IP62).
        2) ABS plastic with 2 clear polycarbonate windows.
        3) Wall mounted.
    e. Display:
        1) LCD, 3-digit readout, and 6-character alphanumeric scrolling text line.
    f. Light source:
        1) Class I LED (light emitting diode), with peak wavelength of 520 nanometer; 50,000 hours estimated minimum life.

2.03 ACCESSORIES

A. Provide sunshades for outdoor installations.

B. Provide surge suppression for outdoor installations.

2.04 SOURCE QUALITY CONTROL

A. Factory calibrate each instrument with a minimum 3-point calibration or according to Manufacturer’s standard at a facility that is traceable to the NIST.
    1. Submit calibration data sheets to the Engineer at least 30 days before shipment of the instruments to the project site.

PART 3 EXECUTION

3.01 EXAMINATION

A. Examine the installation location for the instrument and verify that the instrument will work properly when installed.
   1. Notify the Engineer promptly if any installation condition does not meet the instrument manufacturer's recommendations or specifications.

3.02 PREPARATION (NOT USED)

3.03 INSTALLATION

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

3.04 FIELD QUALITY CONTROL (NOT USED)

3.05 ADJUSTING

A. As specified in Section 17950 - Commissioning for Instrumentation and Controls.

3.06 CLEANING

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

3.07 DEMONSTRATION AND TRAINING (NOT USED)

3.08 PROTECTION (NOT USED)

3.09 SCHEDULES

A. The provided information does not necessarily include all required instruments. Provide all instruments identified in the Contract Documents:
   1. Instruments may be indicated on the Drawings, specified in the Specifications, or both.

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Design, fabrication and assembly of all instrumentation enclosures, control panels and components provided under this contract, including but not limited to:
      a. Custom built instrumentation and control panels, including all enclosures for hand stations controllers, low voltage power distribution and marshalling panels.
      b. Control panels furnished as part of equipment systems specified in other Divisions, such as vendor control panels (VCPs) and chemical feed panels.
      c. Control components.
      d. Control panel installation.

B. Provide all control panels identified in Contract Documents.

1.02 REFERENCES

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Institute of Electrical and Electronics Engineers (IEEE):

5. 698A - Standard for Industrial Control Panels Relating to Hazardous (Classified) Locations.
6. 913 - Standard for Intrinsically Safe Apparatus and Associated Apparatus for Use in Class I, II, III, Division 1, Hazardous (Classified) Locations.
7. 1077 - Standard for Supplementary Protectors for Use in Electrical Equipment.
8. 1283 - Standard for Electromagnetic Interference Filters.
9. 1449 - Standard for Surge Protective Devices.

1.03 DEFINITIONS

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Specific definitions:
   1. The term "panel" in this Section is interchangeable with the term "enclosure."

1.04 SUBMITTALS

A. Provide submittals as specified in Section 01330 - Submittal Procedures and Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Provide a control panel hardware submittal for each control panel/enclosure being provided on this project, including but not limited to:
   1. Product data:
      a. Enclosure construction details and NEMA type.
      b. Manufacturer's literature and specification data sheets for each type of equipment to be installed within or on the panel or enclosure.
   2. Shop drawings:
      a. Scaled, detailed exterior panel (front and side views) and interior panel layout showing equipment arrangement and dimensional information:
         1) Provide draft for review and approval by Engineer. The Engineer has the authority to substantially alter initial panel layouts.
      b. Complete nameplate engraving schedule.
      c. Structural details of fabricated panels.
   3. Calculations:
      a. Provide installation details based on calculated shear and tension forces:
         1) Calculations shall be signed and sealed by a Professional Engineer licensed in the state where the cabinets and panels will be installed.
      b. For assembled enclosures and other equipment with a weight of 200 pounds or more, provide calculations for:
         1) Weight including panel internal components.
         2) Seismic forces and overturning moments.
         3) Shear and tension forces in connections.
      c. Cooling calculations, including but not limited to:
         1) Highest expected ambient temperature for the enclosure's location.
         2) Internal heat load.
         3) Exposure to direct sunlight.
         4) Dimensions of the enclosure in inches.
         5) Maximum allowable temperature inside the enclosure, based on the lowest operating temperature limit of the installed components.

C. Seismic design:
    1. Seismic panel construction:
        a. Seismic anchorage: Provide seismic design calculations and installation details for anchorage of all panels, enclosures, consoles, etc. to meet seismic requirements in Section 01850 - Design Criteria:
            1) Stamped by a Professional Engineer registered in the state where the project is being constructed.
        b. For floor-mounted freestanding panels weighing 200 pounds or more (assembled, including contents), submit calculations, data sheets, and other information to substantiate that panel, base, and framing meet minimum design strength requirements and seismic requirements as specified in Section 01850 - Design Criteria. Calculations shall be signed and sealed by a Professional Engineer licensed in the state where the cabinets and panels will be installed.

1.05 QUALITY ASSURANCE

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Assemble panels, enclosures, and rack systems along with all internal and external devices, wiring, equipment, and materials in a facility that is recognized by UL to assemble and certify UL-labeled control panels:
    1. Provide all components and equipment with UL 508 listing.
    2. All control panels shall be UL 508A labeled, unless the equipment in the panel and the design in the contract documents cannot be reasonably modified to meet the requirements for UL 508A labeling:
        a. Non-listed, complex, and unique equipment may be evaluated and approved by a third-party testing agency, with prior approval by the Owner. Provide report documenting the testing standard, specification, method of testing, and that the equipment and materials meet appropriate designated standards or have been tested and found suitable for use in a specified manner.
    3. Provide fuses for all equipment that is not UL or UR listed.
    4. Install all intrinsically safe circuits and equipment in accordance with UL698A.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Project environmental conditions as specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.
    1. Provide instruments suitable for the installed site conditions including, but not limited to, material compatibility, site altitude, site seismic conditions, humidity, and process and ambient temperatures.

1.07 PROJECT OR SITE CONDITIONS

A. As specified in Section 01850 - Design Criteria.

1.08 SEQUENCING (NOT USED)

1.09 SCHEDULING (NOT USED)

1.10 WARRANTY

A. As specified in Section 01783 - Warranties and Bonds.

1.11 SYSTEM START-UP (NOT USED)

1.12 OWNER'S INSTRUCTIONS (NOT USED)

1.13 COMMISSIONING (NOT USED)

1.14 MAINTENANCE (NOT USED)

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. As listed below in the individual component paragraphs.

B. Provide instruments and other components performing similar functions of the same type, model, or class, and from 1 manufacturer.

2.02 SYSTEM DESCRIPTION

A. Panel dimensions:
   1. Minimum dimensions are scalable from or as indicated on the Drawings and are based upon manufacturer's non-certified information. It is the responsibility of the Contractor or manufacturer to design and size all panels:
      a. Size panels to provide space for all equipment, wiring, terminations, and other items in the panel, including space for future build out.
      b. Panel sizes that substantially deviate (within 3 inches in any dimension) from the sizes indicated on the Drawings must be approved by the Engineer.
      c. Maximum panel depth: 32 inches, unless otherwise indicated.

B. Structural design:
   1. Completed and installed panel work shall safely withstand seismic requirements at the project site as specified in Section 16050 - Common Work Results for Electrical. Enclosures and internal equipment shall be braced to prevent damage from specified forces.

2.03 EXISTING PRODUCTS

A. Provide labor and materials for complete modifications to existing panels as required.

B. Field cut and refinish existing panel faces to original condition to accommodate installation of new instruments, removal of existing instruments, and fitting of blanks to suit new layouts. New instrument supports shall be provided as required for complete installation.

2.04 MATERIALS

A. Construct and finish enclosures using materials capable of withstanding the mechanical, electrical, and thermal stresses, as well as the effects of humidity and corrosion that are likely to be encountered in normal service:
   1. Enclosures shall have the following properties:
      a. NEMA Type 1: Steel.
      b. NEMA Type 4: Steel with gasketed door, raintight.
      c. NEMA Type 4X: Type 316 stainless steel (unless Type 304 is indicated on the Drawings).
      d. NEMA Type 4X: Polycarbonate or fiberglass reinforced polyester (FRP) in corrosive areas where stainless steel is incompatible.
      e. NEMA Type 12: Steel with gasketed door, dusttight.
      f. NEMA Type 7: Cast aluminum.

B. Bolting material:
   1. Commercial quality 1/2-inch diameter, stainless steel hex-head Grade 5 bolts, nuts, and washers, with unified coarse (UNC) threads.
   2. Carriage bolts for attaching end plates.
   3. All other bolted joints shall have S.A.E. standard lock washers.

2.05 MANUFACTURED UNITS

A. Panels/enclosures:
   1. Manufacturers: One of the following or equal:
      a. nVent/Hoffman.
      b. Saginaw Control & Engineering.
      c. Rittal.
   2. Panel assembly:
      a. General guidelines for panel fabrication include:
         1) Continuous welds ground smooth.
         2) Exposed surfaces free of burrs and sharp edges.
         3) Base formed of heavy channel iron, either galvanized or powder coated, minimum 1/2-inch holes at 12-inch spacing to accommodate anchoring of freestanding enclosures to floor.

b. Construct enclosure and mounting panel using stretcher-level quality sheet metal having minimum thickness not less than the following sizes (U.S. Standard Gauge):

Enclosure Height (inches)	Minimum Enclosure Steel Thickness (gauge)	Minimum Back Mounting Panel Thickness (gauge)
Wall-mounted up to 48	14	14
Up to 57	12	12
57 - 69	12	10
69 - 82	12, except 10 on back	10
82 or more	10	10

1) Use heavier sheet metal to meet seismic requirements at the project site or when required due to equipment requirements.

c. For Rittal or engineer approved equal free-standing modular enclosure, construct enclosure and mounting panel using stretcher-level quality sheet metal having minimum thickness not less than the following sizes (U.S. Standard Gauge):

Enclosure Height (inches)	Minimum Enclosure Steel Thickness (gauge)	Minimum Back Mounting Panel Thickness (gauge)
Wall-mounted up to 48	16	14
Up to 57	14	13
57 or more	16	11

d. Construct supporting frame structure with angled, channeled, or folded rigid section of sheet metal, rigidly attached to and having essentially the same outer dimensions as the enclosure surface and having sufficient torsional rigidity to resist the bending moments applied via the enclosure surface when it is deflected.

e. Provide stiffeners for back mounting or C folded back panels in enclosures larger than 4 feet. In addition, secure the panels in place by collar studs welded to the enclosure.

f. Door construction:
   1) Turned-back edges suitably braced and supported to maintain alignment and rigidity without sagging.
   2) Sufficient width to permit door opening without interference with rear projection of flush-mounted instruments.
   3) Heavy-gauge stainless steel hinges.
   4) For NEMA Type 12, Type 4, and Type 4X, provide oil-resistant neoprene sealing gasket and adhesive to seal cover to enclosure.
   5) Gasket installed to seal against roll lip on the enclosure opening.

g. Latches:
   1) For panels, provide each door with an oil tight 3-point latching mechanism and locking handle with rollers on the ends of the latch rods. Latch rods shall be connected to a common door handle, hold

doors securely, and form a compressed seal between door and gasket, at the top, side, and bottom.
a) Provide padlock for each enclosure with padlock provisions.
b) Provide 2 keys per panel.
c) All locks keyed alike.
2) For Rittal or engineer approved equal free-standing modular enclosure, provide each door with a 4-point latching mechanism, if available, or a 2-point latching mechanism if a 4-point is not available.
3) For cabinets not available with 3-point latching hardware, provide multiple clips and padlock hasps.

h. Panel cut-outs:
1) Cut, punch, or drill cutouts for instruments, devices, and windows. Smoothly finish with rounded edges.
2) Allow a minimum of 3-inch envelope around all displays, controllers, and monitors.
3) Reinforce around cut-outs with steel angles or flat bars for the following:
a) Large panel cutouts; for example, openings for local operator interfaces.
b) Pilot device groupings, where the removed metal exceeds 50 percent of the available metal.

3. In addition to the requirements specified above, the following requirements for NEMA Type 4X powder coated stainless steel enclosures apply:
a. Minimum 16-gauge, Type 304 stainless steel.
b. Captive stainless steel cover screws threaded into sealed wells.
c. Inside finish: White polyester powder coating.
d. Specifically designed for use with flange-mounted disconnect handles where required or as indicated on the Drawings.
e. NEMA Type 4X powder-coated stainless steel enclosures are not an acceptable substitute for stainless steel unless indicated on the Drawings.

4. Outdoor panels. Supplementary requirements for panels located outdoors are as follows:
a. All enclosures located outdoors shall be explicitly designed and rated for outdoor service by the manufacturer.
b. Door hardware: Stainless steel.
c. Provide factory installed rain canopy and sun shield for all enclosures with operator interface panels.
d. Bases: Heavy channel, gasketed stainless steel bases, flanges up, for anchoring to pad.

B. Arrangement of components:
1. Arrange panel internal components for external conduit and piping to enter into panel either from above or below.
2. Arrange panel instruments and control devices in a logical configuration, associating pushbutton and selector switches with related readout devices, or as indicated on the Drawings.
3. Mount internal control components on an internal back panel. Devices may be mounted on the side panel only by special permission from the Engineer.
4. All control panel mounted operator interface devices shall be mounted between 3 feet and 5 feet above finished floor.

C. Overcurrent protection:
    1. Main overcurrent device:
        a. Where the electrical power supply voltage to the control panel is more than 120 VAC, provide the panel with a flange-mounted disconnect handle operating a molded-case circuit breaker and provide a control power transformer for 120-VAC circuits:
            1) Door-mounted disconnect handles are not acceptable.
            2) Mechanically interlock the disconnect switch with the control enclosure doors so that no door can be opened unless the power is disconnected, and the disconnect switch cannot be closed until all doors are closed.
            3) Provide means to defeat the interlock.
            4) Lockable in the off position.
        b. Control panels supplied with 120 VAC:
            1) Provide an internal breaker with the line side terminals covered by a barrier.
            2) Provide a nameplate prominently positioned on the control panel identifying the location of the power source and a warning statement requiring the source to be disconnected before opening the door to the enclosure.
            3) Provide a nameplate prominently positioned on the control panel stating "CAUTION Risk of Electric Shock – UPS equipment outputs remain energized with main disconnect in off position" for any panel containing a UPS.
    2. Provide circuit breakers as specified in Section 16412 - Low Voltage Molded Case Circuit Breakers.
    3. Selection and ratings of protective devices:
        a. Interrupting ratings: Not less than the system maximum available fault current at the point of application.
        b. Voltage rating: Not less than the voltage of the application.
        c. Select current rating and trip characteristics to be suitable for:
            1) Maximum normal operating current.
            2) Inrush characteristics.
            3) Coordination of the protective devices to each other and to the source breaker feeding the panel.
        d. Circuit breakers, fuses, and motor overcurrent protection devices used for branch circuit protection must be UL 508A compliant.
            1) Circuit breakers listed under UL 1077 Standard for Supplementary Protectors that do not comply with UL 508A requirements are not acceptable.
            2) Miscellaneous, miniature, and micro fuses listed under UL 248 Part 14 that do not comply with UL 508A requirements are not acceptable.
            3) Manual motor controllers provided with an instantaneous-trip overcurrent mechanism listed under UL 508 that do not comply with UL 508A requirements are not acceptable.
    4. Provide a separate protective device for each powered electrical device:
        a. An individual circuit breaker for each 120-VAC instrument installed within its respective control panel and clearly identified for function.

b. An individual fuse for each:
    1) Discrete input:
        a) 0.5-ampere fuse.
    2) Discrete output:
        a) Size external fuse to open before any I/O-card-mounted fuses.
    3) Analog loop powered from the control panel:
        a) 0.25-ampere fuse.
c. Install protective devices on the back mounting panel and identify by a service nameplate in accordance with the wiring diagrams.

5. Fuses for analog and discrete control loops:
    a. Provide durable, readily visible label for each fuse, clearly indicating the correct type, size, and ratings of replacement fuse:
        1) Label shall not cover or interfere with equipment manufacturer's instructions.
    b. Provide fuses rated for the voltage and available short-circuit current at which they are applied.
    c. Manufacturers: One of the following or equal:
        1) Ferraz Shawmut.
        2) Littelfuse.
        3) Bussmann.
6. Fuse holders:
    a. Modular type:
        1) DIN rail mounting on 35-millimeter rail.
        2) Touch-safe design: All connection terminals to be protected against accidental touch.
        3) Incorporates blown-fuse indicator.
        4) Plug-in style fuse terminals and fuse plugs are not acceptable.
    b. Provide nameplate identifying each fuse:
        1) As specified in Section 16075 - Identification for Electrical Systems.
    c. Manufacturers: One of the following or equal:
        1) Phoenix Contact, UT4-HESI Series.
        2) Allen-Bradley, 1492-FB Series B.
7. Control circuit breakers:
    a. DIN rail mounting on 35-millimeter rail.
    b. Manual OPEN-CLOSE toggle switch.
    c. Rated for 250 VAC.
    d. Interrupting rating: 10 kiloampere (kA) or available fault current at the line terminal, whichever is higher.
    e. Current ratings: As required for the application.
    f. Provide nameplate identifying each circuit breaker:
        1) As specified in Section 16075 - Identification for Electrical Systems.
    g. Manufacturers: One of the following or equal:
        1) Phoenix Contact, TMC Series.
        2) ABB.
        3) Allen-Bradley.
        4) Square D.
8. Electronic circuit protectors:
    a. Used where a NEC Class 2 power circuit is required.
    b. Confirms to NEC Class 2 according to UL 1310.
    c. DIN rail mounting on 35-millimeter rail.

d. Power source:
    1) Operating voltage: 24 VDC.
    2) Output current ratings: As required for the application.
    3) Maximum output current: 4 A.
    4) Maximum nameplate rating: 100VA.
e. LED for status indication.
f. Remote status contact.
g. When using multi-channel electronic circuit protectors, distribute devices such that a failure is limited to a single network or segment.
h. Provide nameplate identifying each circuit electronic circuit protector module:
    1) As specified in Section 16075 - Identification for Electrical Systems.
i. Manufacturers: One of the following or equal:
    1) Single-channel:
        a) Phoenix Contact, PTCB E1 series.
        b) Allen-Bradley, 1694 series.
    2) Multi-channel:
        a) Phoenix Contact, CBMC series.
        b) Puls PISA11 series.

D. Conductors and cables:
1. Power and control wiring:
    a. Materials: Stranded, soft annealed copper.
    b. Insulation: 600 VAC type MTW.
    c. Minimum sizes:
        1) Primary power distribution: 12 AWG.
        2) Secondary power distribution: 14 AWG.
        3) Control: 16 AWG.
    d. Color:
        1) AC power (line and load): Black.
        2) AC power (neutral): White.
        3) AC control: Red.
        4) AC control: Orange for foreign voltages.
        5) DC power and control (ungrounded): Blue.
        6) DC power and control (grounded): White with Blue stripe.
        7) Ground: Green.
2. Signal cables:
    a. Materials: Stranded, soft annealed copper.
    b. Insulation: 600 VAC, PVC outer jacket.
    c. Minimum size: 18 AWG paired triad.
    d. Overall aluminum shield (tape).
    e. Copper drain wire.
    f. Color:
        1) 2-Conductor:
            a) Positive (+): Black.
            b) Negative (-): White and red.

2) 3-Conductor:
a) Positive (+): Black.
b) Negative (-): Red.
c) Signal: White.

g. Insulate the foil shielding and exposed drain wire for each signal cable with heat-shrink tubing.

E. Conductor identification:
1. Identify each conductor and cable with unique wire numbers as specified in Section 16075 - Identification for Electrical Systems.
2. Readily identified without twisting the conductor.

F. General wiring requirements:
1. Wiring methods: Wiring methods and materials for panels shall be in accordance with the NEC requirements for General Purpose (no open wiring) unless otherwise specified.
2. Install all components in accordance with the manufacturer's instructions included in the listing and labeling.
3. Provide a nameplate on the cover of the control panel identifying all sources of power supply and foreign voltages within the control panel.
4. Provide transformers, protective devices, and power supplies required to convert the supply voltage to the needed utilization voltage.
5. Provide power surge protection for all control panels.
6. Provide signal surge protection within control panels for each analog I/O, discrete I/O, and data line (Copper Ethernet, Coax, Fieldbus signals) that originates from outdoor devices.
7. Provide non-metallic ducts for routing and organization of conductors and cables:
a. Provide wiring separation plan.
b. Size ducts for ultimate build-out of the panel, or for 20-percent spare, whichever is greater.
c. Provide separate ducts for signal and low-voltage wiring from power and 120 VAC control wiring:
1) 120 VAC: Grey colored ducts.
2) 24 VDC: White colored ducts.
8. Cables shall be fastened with cable-mounting clamps or with cable ties supported by any of the following methods:
a. Screw-on cable tie mounts.
b. Hammer-on cable-tie mounting clips.
c. Fingers of the nonmetallic duct.
9. Wire ties:
a. No wire ties inside wire duct.
b. Use Panduit Cable tie installation tool, with tension control/cutoff.
c. Verify cut ends are cut flush filed smooth after installed.
10. Provide supports at the ends of cables to prevent mechanical stresses at the termination of conductors.
11. Support panel conductors where necessary to keep them in place.
12. Wiring to rear terminals on panel-mount instruments shall be run in nonmetallic duct secured to horizontal brackets run adjacent to the instruments.

13. Conductors and cables shall be run from terminal to terminal without splice or joints. Exceptions:
    a. Factory-applied connectors molded onto cables shall be permitted. Such connectors shall not be considered as splices or joints.
14. The control panel shall be the source of power for all 120 VAC devices interconnected with the control panel including, but not limited to:
    a. Solenoid valves.
    b. Instruments both mounted in the control panel and remotely connected to the control panel.

G. Provide power circuits for all Contractor and Vendor-furnished PLC cabinets in accordance with the PLC and Instrument Power wiring diagrams Indicated on the Drawings or as specified.

2.06 EQUIPMENT (NOT USED)

2.07 COMPONENTS

A. Thermal management:
1. Provide heating, cooling, and dehumidifying devices in order to maintain all instrumentation and control devices to within a range as specified in Section 17050 - Common Work Results for Process Control and Instrumentation.
2. Air conditioner:
    a. Provide solid-state cabinet coolers or air conditioning units on all outdoor panels containing electronic components such as local operator interfaces, panel instruments, programmable logic controllers, or remote I/O.
    b. Provide filters on intake and exhaust openings.
    c. Increase panel sizes as needed to accommodate cooling units.
    d. Enclosure rating: NEMA Type 4X.
    e. Closed-loop design.
    f. Power supply: 120 VAC.
    g. Manufacturers: The following or equal:
        1) Kooltronic, Guardian X DP Series.
        2) ICEqube, Blade series or IECEx/ATEX for Zones 1 and 2.
3. Heating:
    a. Provide all panels located in areas that are not climate controlled with thermostatically controlled strip heaters, except where all of the following conditions apply:
        1) The panel is not supplied with 120 VAC power.
        2) There are no electronics or moisture-sensitive devices in the enclosure.
        3) The panel is smaller than 38 inches high.
4. Enclosure temperature switch:
    a. Provide wall-mounted bimetallic switch transmitter (to measure internal cabinet temperature in all enclosures) containing electrical components such as PLCs, RTUs, RIO, and VFDs.
    b. Sensor and electronic enclosure.
    c. Accuracy: Within 2 degrees Fahrenheit.

d. Single contact:
1) Manufacturers: One of the following or equal:
a) nVent/Hoffman ATEMNC.
b) Pfannenberg FLZ.
c) Rittal.
e. Dual contact:
1) Manufacturers: The following or equal:
a) nVent/Hoffman ADLTEMP.
b) Rittal.
5. Status relays and discrete inputs for switches, power supplies, and fieldbus devices (if applicable):
a. Provide as indicated on the Drawings or as specified.
6. Fan ventilation:
a. Provide nVent/Hoffman or Rittal fan speed control:
1) Provide 2 door/cabinet-mounted vent fans for every 72 inches of cabinet width.
2) Provide finger-guard kit.
3) Filter kit with 2 spare filters for each intake fan.
4) Provide bezel and gasket kit.
5) Provide fan shroud.
6) Automatically adjust fan speed depending on remote temperature sensor input.
7) 120 VAC, 60 hertz.
8) NEMA Type 5-15R cord connections.

B. Pilot devices:
1. General:
a. Provide operator pushbuttons, switches, and pilot lights, from a single manufacturer.
b. Size:
1) 30.5 millimeters.
c. Heavy duty.
d. Pushbuttons:
1) Contacts rated:
a) NEMA Type A600.
2) Furnish 1 spare normally open contact and normally closed contact with each switch.
e. Selector switches:
1) Contacts rated:
a) NEMA Type A600.
b) Knob type.
2) Furnish 1 spare normally open contact and normally closed contact with each switch.
3) Provisions for locking in the OFF position where lockout provisions are indicated on the Drawings.
f. Pilot lights:
1) Type:
a) LED for interior installations.
2) Push to test.
3) Lamp color:
a) On/Running/Start: Green.

b) Off/Stop: Red.
c) Power: White.
d) Alarm: Yellow.
e) Status or normal condition: White.
f) Opened: Green.
g) Closed: Red.
h) Failure: Yellow.

2. Indoor and outdoor areas:
   a. NEMA Type 4/13.
   b. Manufacturers: One of the following or equal:
      1) Allen-Bradley, Type 800T.
      2) Schneider Electric, Class 9001, Type K.
      3) General Electric, Type CR104P.
      4) IDEC, TWTD Series.
3. Corrosive areas:
   a. NEMA Type 4X.
   b. Corrosion resistant.
   c. Exterior parts of high-impact strength fiberglass-reinforced polyester or multiple-layer epoxy-coated zinc.
   d. Manufacturers: One of the following or equal:
      1) Cutler Hammer, Type E34.
      2) Schneider Electric, Class 9001, Type SK.
      3) Allen-Bradley Type 800H.
      4) IDEC, TWTD Series.
4. Hazardous (Classified) Areas:
   a. Manufacturers: One of the following or equal:
      1) Cutler Hammer, Type E34.
      2) Allen-Bradley, Type 800H.
   b. Corrosion resistant.
   c. Exterior parts of high-impact strength fiberglass-reinforced polyester or multiple-layer epoxy-coated zinc:
      1) All contacts contained within a hermetically sealed chamber:
         a) Pushbuttons.
         b) Selector switches.
         c) Push-to-test contacts on pilot lights.
      2) UL listed and labeled for Class I Division 2 areas.

C. Potentiometer and slidewire transmitters:
   1. Provide a DC output in proportion to a potentiometer input.
   2. Potentiometer input:
      a. 100 ohms to 100 K ohms.
      b. Impedance Greater or equal to 1 M ohms.
      c. Zero turn-up: 80 percent of full-scale input.
      d. Span turn-down: 80 percent of full-scale input.
   3. Field-configurable output:
      a. Voltage and current: All conventional current loops and voltage control signals.
   4. Accuracy including linearity and hysteresis within 0.1 percent maximum at 77 degrees Fahrenheit.
   5. Operating temperature: 32 degrees to 131 degrees Fahrenheit.
   6. Supply power: 9 to 30 VDC.

7. Manufacturers: The following or equal:
    a. Phoenix Contact, Mini Analog Pro.
    b. Allen Bradley Type 800T-U29.

D. Signal isolators and converters:
1. Furnish signal isolators that provide complete isolation of input, output, and power input:
    a. Minimum isolation level: 1.0 kilovolts AC/50 hertz for at least 1 minute.
    b. Adjustable span and zero.
    c. Accuracy: Within 1.0 percent of span.
    d. Ambient temperature range: -4 degrees to 149 degrees Fahrenheit.
2. Manufacturers: One of the following or equal:
    a. Phoenix Contact, Mini Analog Pro.
    b. Acromag, 1500, 600T, 800T, Flat Pack, or ACR Series.
    c. Action Instruments, Q500 Series or Ultra SlimPakII.
    d. AGM Electronics, Model TA-4000.
    e. Moore Industries, MIT 4-Channel.

E. Relays:
1. General:
    a. For all types of 120-VAC relays, provide surge protection across the coil of each relay.
    b. For all types of 24-VDC relays, provide a free-wheeling diode across the coil of each relay.
    c. For plug in type relays, provide a relay base from the same manufacturer as the relay manufacturer.
2. General purpose:
    a. Magnetic control relays.
    b. NEMA ratings:
        1) 300 volts.
        2) 10 Amps thermal continuous test current.
        3) 60 Amps make.
        4) 6 Amps break.
    c. Plug-in type.
    d. LED indication for energization status.
    e. Coil voltages: As required for the application.
    f. Minimum poles: DPDT.
    g. Touch-safe design: All connection terminals to be protected against accidental touch.
    h. Enclose each relay in a clear plastic heat and shock-resistant dust cover.
    i. Quantity and type of contact shall be as indicated on the Drawings or as needed for system compatibility.
    j. Relays with screw-type socket terminals.
    k. Provide additional (interposing) relays when the following occurs:
        1) The number or type of contacts shown exceeds the contact capacity of the specified relays.
        2) Higher contact rating is required in order to interface with starter circuits or other equipment.
    l. DIN rail mounting on 35-millimeter rail.
    m. Ice-cube-type relays with retainer clips to secure relay in socket.
    n. Integrated label holder for device labeling.

o. Manufacturers: One of the following or equal:
    1) Potter and Brumfield: Type KRP or KUP.
    2) IDEC: R* Series (* = H, J, R, S, U).
    3) Allen-Bradley: Type 700 HC.
    4) Square D: Type K.

3. Terminal block relays:
    a. Magnetic control relays.
    b. For use as an interposing relay for PLC based discrete I/O signals.
    c. NEMA ratings:
        1) 250 volts.
        2) 6 Amps continuous.
        3) 1,500 volt-amperes make.
    d. Plug-in type.
    e. LED indication for energization status.
    f. Coil voltages: As required for the application.
    g. Minimum poles: SPDT.
    h. Touch-safe design: All connection terminals to be protected against accidental touch.
    i. Quantity and type of contact shall be as indicated on the Drawings or as needed for system compatibility.
    j. Relays with screw-type socket terminals.
    k. DIN rail mounting on 35-millimeter rail.
    l. Integrated label holder for device labeling.
    m. Manufacturer: One of the following or equal:
        1) Phoenix Contact PLC Series.
        2) Eaton XR TBR Series.
        3) IDEC RV8H Series.
        4) Allen-Bradley Type 700 HL TBR Series.
4. Latching:
    a. Magnetic-latching control relays.
    b. NEMA ratings:
        1) 300 volts.
        2) 5 Amps continuous.
        3) 360 volt-amperes make.
        4) 320 volt-amperes break.
    c. Plug-in type.
    d. DIN rail mounting on 35-millimeter rail.
    e. Coil voltage: As required for the application.
    f. Minimum poles: 2 PDT; as required for the application. Plus 1 spare pole.
    g. Touch-safe design: All connection terminals to be protected against accidental touch.
    h. Clear cover for visual inspection.
    i. Provide retainer clip to secure relay in socket.
    j. Manufacturers: One of the following or equal:
        1) Square D, 8501, Type K.
        2) IDEC, RR2KP Series.
5. Time delay:
    a. Provide time-delay relays to control contact transition time.
    b. Contact rating:
        1) 240 volts.
        2) 10 Amps continuous.

3) 3,600 volt-amperes make.
4) 360 volt-amperes break.

c. Coil voltage: As required for the application.
d. Provide pneumatic or electronic type with on-delay, off-delay, and on/off-delay:
1) For off-delay, use true power-off time-delay relays. Where the required timing range exceeds capability of the off-delay relay use, signal off-delay where power loss will not cause undesirable operation or pneumatic time-delay relays.
e. Minimum poles: 2 PDT.
f. Units include adjustable dial with graduated scale covering the time range in each case.
g. Minimum timing range: 0.1 seconds to 10 minutes, or as required for the application.
h. Manufacturers: One of the following or equal:
1) IDEC, RTE Series.
2) Tyco Electronics, Agastat 7000 Series (pneumatic).
3) Allen-Bradley, Type 700-HR.

F. Terminal blocks:
1. DIN rail mounting on 35-millimeter rail.
2. Rated for 15 amperes at 600 volts.
3. Screw terminal type.
4. Provide mechanism to prevent wire connection from loosening in environments where vibration is present. This mechanism shall not cause permanent deformation to the metal body.
5. Finger-safe protection for all terminals for conductors.
6. Construction: Polyamide insulation material capable of withstanding temperature extremes from -40 degrees to 221 degrees Fahrenheit.
7. Terminals: Plainly identified to correspond with markings on the diagrams:
a. Permanent machine-printed terminal identification.
8. Disconnect-type field signal conductor terminals with socket/screw for testing.
9. Identify terminals suitable for use with more than 1 conductor.
10. Position:
a. So that the internal and external wiring does not cross.
b. To provide unobstructed access to the terminals and their conductors.
11. Provide minimum 25-percent spare terminals.
12. Manufacturers: One of the following or equal:
a. Phoenix Contact, UT4 Series.
b. Phoenix Contact UT6 Series
c. Allen-Bradley, 1492 Series.

G. DIN rail grounding:
1. Grounding terminal blocks used exclusively for bonding each DIN rail section to panel grounding busbar shall:
a. Mount to DIN rail via grounding foot with mounting screw.
b. Connect to the panel grounding busbar shall be via a green insulated conductor sized in accordance with NEC.
c. Not be used for grounding signal cable shields.
2. Screw terminal type.
3. DIN rail mounting on 35-millimeter rail.

4. Provide mechanism to prevent wire connection from loosening in environments where vibration is present. This mechanism shall not cause permanent deformation to the metal body.
5. Finger-safe protection for all terminals for conductors.
6. Terminals: Plainly identified to correspond with markings on the diagrams:
    a. Permanent machine-printed terminal identification.
7. Manufacturers: One of the following or equal:
    a. Phoenix Contact, USKLG Series.
    b. Allen-Bradley, 1492-JG Series.

H. Wire duct:
1. Provide flame retardant plastic wiring duct, slotted with dust cover.
2. Type:
    a. Wide slot.
    b. Narrow slot.
    c. Round hole.
3. Manufacturers: The following or equal:
    a. Panduit.
    b. Phoenix Contact.
    c. Thomas & Betts.
    d. Iboco.

I. DIN rail:
1. Perforated steel.
2. 35 mm width.
3. 15 mm deep.
4. Provide 2-inch offset using one of the following:
    a. Offset brackets.
    b. Preformed standoff DIN Rail Channel.

J. Surge protection devices (SPD):
1. 120 VAC control panel power SPD:
    a. Provide SPD for panel 120 VAC power entrances:
        1) Non-faulting and non-interrupting design.
        2) Provide line to neutral and neutral to ground surge protection.
    b. Provide surge protection at secondary of main circuit breaker:
        1) Surge protection is not required for 120 VAC circuits that are only used for panel lights and receptacles.
        2) For panels receiving power at 480 VAC, provide surge protection on the 120 VAC control power transformer secondary.
    c. DIN rail mounting.
    d. Attach wiring to the SPD by means of a screw-type cable-clamping terminal block:
        1) Gastight connections.
        2) Visual status indication of MOV status on the input and output circuits.
        3) Dry contact rated for remote status indication.
    e. Approvals:
        1) Tested in accordance with IEC 61643-11.
        2) Tested in accordance with UL 1283.

3) Tested in accordance with UL 1449.
4) Surge protection minimum requirements: Withstand a minimum 10-kA test current of an 8/20 µs waveform in accordance with IEEE C62.41.1 Category C Area.

f. Manufacturers: One of the following or equal:
1) Phoenix Contact, Type SFP Filter.
2) Sola HD, STFE Elite series.
3) Rockwell, 4983-DC series.
4) ASCO, Model 277.

2. 24 VDC control panel power SPD:
a. Provide SPD for 24VDC power circuits.
b. Provide surge protection at DC power supply output.
c. DIN rail mounting.
d. Attach wiring to the SPD by means of a screw-type cable clamping terminal block:
1) Optical status indicator.
2) Dry contact rated for remote status indication.
e. Approvals:
1) Tested in accordance with IEC 61643-11.
f. Manufacturers: One of the following or equal:
1) Field instruments that require auxiliary power:
a) Emerson, Model 265 (SLAC) series.
b) Phoenix Contact, Plugtrab PLT--SEC-T3-24-FM-UT.
2) Loop powered field instruments:
a) Emerson/Edco, Model SS65-036-2.

3. Panel mounted control, signal, and data line SPD:
a. General:
1) This section applies to SPD located in a control panel, field panel, network junction box, or marshalling panel.
2) Approvals:
a) Tested in accordance with IEC 61643-21.
b) Tested in accordance with UL 497B.
3) SPD shall consist of 2 parts:
a) Base module:
(1) DIN rail mounting.
(a) Grounded to DIN rail via mounting rail foot.
b) Plug protection module:
(1) Replacing a plug shall not require the removal of any wires nor interrupt the signal.
4) Provide indirect shield ground style SPD unless otherwise noted.
5) Provide ability to locally identify and indicate SPD health.
6) SPD shall be provided with controller module with dry contact for remote status monitoring of SPD device health.
7) SPD modules shall be compatible with signal, communication bus type, data type, or control power being protected.
8) Provide dedicated SPD for each signal, communication bus type, or data line being protected.
b. Manufacturers: One of the following or equal:
1) Phoenix Contact, Plugtrab PT-IQ Series.
2) Dehn, Blitzductor XTU Series.

4. Copper Ethernet SPD:
    a. Protects network equipment from lightning or other surge events.
    b. Suitable for Gigabit networks.
    c. Shielded RJ-45 ports.
    d. Compliant with PoE standards IEEE 802.3af and 802.3at.
    e. Nominal discharge surge current: 10 kA.
    f. Approvals:
        1) Tested in accordance with IEC 61643-21.
        2) Tested in accordance with UL 497B.
    g. Manufacturers: One of the following or equal:
        1) Phoenix Contact, DT-LAN-CAT6+.
        2) Citel, MJ8-C6A.
        3) Weidmuller, VDATA CAT6.
        4) Eaton/MTL, ZoneBarrier High Energy Ethernet.
5. Field device mounted SPD:
    a. Conduit entry mounting.
        1) Provide parallel or through wiring configurations as required by the application.
            a) Use parallel wiring configuration if there is an available cable gland at the device.
            b) Use through wiring configuration if there is no available cable gland at the device.
        2) Provide Screw connections compatible with field device.
    b. NEMA 4X stainless steel material housing.
    c. Approvals:
        1) Tested in accordance with IEC 61643-21.
    d. 4-wire field device:
        1) Module shall provide simultaneous protection of signal cable, communication bus, or data line, and power supply line.
            a) Maximum continuous voltage:
                (1) DC:
                    (a) Signal: 32 VDC.
                    (b) Power supply: 255 VDC.
                (2) AC:
                    (a) Signal: 22.6 VAC.
                    (b) Power supply: 255 VAC.
        2) Manufacturers: The following, engineer knows of no equal:
            a) Endress+Hauser, HAW569-CB2C.
    e. 2-wire or 3-wire field device:
        1) Module shall provide protection for the signal cable, communication bus or data line.
        2) Manufacturers: One of the following or equal:
            a) Endress+Hauser, HAW569 Series.
            b) Phoenix Contact, Surgetrab S-PT Series.
            c) Eaton/MTL, TP Series.

K. Power supplies:
    1. Design power supply system so that either the primary or backup supply can be removed, repaired or replaced, and returned to service without disrupting the system operation.

2. Convert 120 VAC to 24-volt DC or other DC voltages required or as required for the application.
3. Provide redundant backup 24 VDC power supply units to automatically supply the load upon failure of the primary supply.
4. Provide power supply arrangement that is configured with several modules to supply adequate power in the event of a single module failure in either a 1+1 or N+1 configuration as required:
    a. Provide automatic switchover upon module failure.
    b. Alarm contacts monitored by the PLC.
5. Provide protective isolation between power supply units either by means of Diodes, Diode Modules, MOSFET Modules, or use power supplies with built in redundancy. Power supplies with built in redundancy must actively isolate each power supply and be designed as such.
6. Sized to provide 40-percent excess rated capacity.
7. UL 508C listed to allow full-rated output without de-rating.
8. Provide fuse or short-circuit protection.
9. Provide a minimum of 1 set of dry contacts for each power supply configured to change state on failure for monitoring and signaling purposes.
10. Output regulation: Within 0.05 percent for a 10-percent line change or a 50-percent load change.
11. Operating temperature range: 32 degrees to 140 degrees Fahrenheit.
12. Touch-safe design: All connection terminals to be protected against accidental touch.
13. DIN rail mounting on 35-millimeter rail:
    a. Mount the power supply in the proper orientation as recommended by the manufacturer to ensure adequate thermal dispersion without derating the power supply.
14. Provide self-protecting power supplies with a means of limiting DC current in case of short circuit.
15. Manufacturers: One of the following or equal:
    a. Fully redundant:
        1) Phoenix Contact, Quint Power Supply with SFB technology.
            a) Phoenix Contact, Quint.
        2) IDEC, PS5R Series:
        3) Sola.
        4) PULS.
    b. Redundancy module:
        1) Phoenix contact, O-ring redundancy module.

L. Intrinsic safety barriers:
1. Transformer isolated barrier:
    a. Containing a transformer to provide complete:
        1) Isolation between the safe and hazardous areas for loop-powered devices.
        2) 3-way isolation between the safe area, hazardous area, and power supply powered devices.
    b. Resistor for current limitation.
    c. Fuses for short-circuit protection.
    d. Provide barriers with pluggable connectors that are coded for easy replacement.
    e. Transmission error shall be less than or equal to 0.1 percent of full-scale.

f. DIN rail mounting on 35-millimeter rail.
g. Approvals:
1) FM.
2) UL 913.

2. Types:
a. Switch isolators:
1) Designed and approved for use with discrete inputs.
2) Supply power: 20 to 30 VDC.
3) Output to track input.
4) LED in the cover to indicate the status of the input.
5) Selector switch to change the logic of the input.
6) Input: Dry contact.
7) Output: SPDT relay.
b. Transmitter and converters for use with 4- to 20-milliampere signals without Hart® communications capability:
1) Designed and approved for use with 4- to 20-milliampere analog signals.
2) Designed for powering 2- and/or 3-wire transmitters in hazardous locations and repeating and/or generating the current to the safe area.
3) Supply voltage: 20 to 30 VDC.
c. Transmitter and converters for use with 4- to 20-milliampere signals with Hart® communications capability:
1) Designed and approved for use with 4- to 20-milliampere analog signals.
2) Designed for powering 2- and/or 3-wire transmitters in hazardous locations and repeating and/or generating the current to the safe area.
3) Transfer digital signals from the hazardous area to the safe area.
4) Complete bi-directional communication between a smart transmitter located in the field and the suitable equipment located in the safe area.
5) Supply voltage: 20 to 30 VDC.

3. Manufacturers: One of the following or equal:
a. Phoenix Contact, MACX Series.
b. Pepperl + Fuchs.

M. Starters:
1. Magnetic motor starters:
a. As specified in Section 16422 - Motor Starters.
2. Integral self-protected starters:
a. As specified in Section 16422 - Motor Starters.

N. Variable frequency drives:
1. As specified in Section 16262 - Variable Frequency Drives 0.50 - 50 Horsepower.

O. Limit switches:
1. Nonhazardous locations:
2. AC contact rating 120 volts, 10 A.
3. DC contact rating 125 volts, 0.4 A.

4. Provide robust actuation mechanism not prone to degradation.
5. Provide complete actuator mechanism with all required hardware.
6. Allows for contact opening even during contact weld condition.
7. UL approved.
8. Operating temperature range: 0 degrees to 230 degrees Fahrenheit).
9. Manufacturers: One of the following or equal:
    a. Allen-Bradley, 802 Series.
    b. Honeywell, HDLS Series.
    c. Eaton, E47, E49, E50.
10. Nonhazardous locations:
    a. Rating:
        1) NEMA Type 4X - nonhazardous areas.
        2) Explosion-proof - Class I Div. 1 areas.
        3) Explosion-proof or NEMA 4X with intrinsic safe circuits and contacts - Class I Division 2 areas.
    b. Manufacturers: One of the following or equal:
        1) Allen-Bradley, 802XR Series.
        2) Honeywell, BX, BX2 GSX Series.
        3) Eaton, 10316h Series.

P. Current switches:
1. Operate from 120-VAC supply voltage.
2. 1 normally open and normally closed contacts.
3. Adjustable current setting.
4. Manufacturers: The following or equal:
    a. Zelio®, RM35.
    b. Phoenix Contact, EMD Series.

Q. Current transmitters:
1. Input current range: As indicated on the Drawings.
2. Output: 4-20 mA.
3. Operate from 24 VDC supply voltage.
4. Output overload protected.
5. Accuracy: Within 0.5 percent full-scale.
6. Ripple and Noise: 1 percent Max., peak to peak.
7. Frequency: 50/60 hertz.
8. Manufacturer:
    a. Phoenix Contact: Mini Analog Pro Series.
    b. CR Magnetics: CR4320 series.
    c. American Aerospace: 1070 Series.

2.08 ACCESSORIES

A. Provide panels with an inside protective pocket to hold the panel drawings. Ship panels with 1 copy of accepted Shop Drawings including, but not limited to, schematic diagram, connection diagram, and layout drawing of control wiring and components in a sealed plastic bag stored in the panel drawing pocket.

B. Provide floor stands or legs with a minimum height of 12 inches where needed or as indicated on the Drawings.

C. Provide a folding shelf for enclosures that contain programmable controllers. The shelf shall be mounted on the inside surface of the door, capable of supporting a laptop computer.

D. Provide nameplate to each panel as indicated on the Drawings:
   1. Provide as specified in Section 16075 - Identification for Electrical Systems on all internal and external instruments and devices.
   2. Provide a nameplate with the following markings that is plainly visible after installation:
      a. Manufacturer’s name, trademark, or other descriptive marking by which the organization responsible for the panel can be identified.
      b. Supply voltage, phase, frequency, and full-load current.
      c. Power source or circuit ID.
      d. Short-circuit current rating of the panel based on one of the following:
         1) Short-circuit current rating of a listed and labeled assembly.
         2) Short-circuit current rating established utilizing an approved method.

E. Lighting:
   1. Provide 1 luminaire for each section, on the interior of the panel, spaced evenly along the top-front of the enclosure door opening(s):
      a. Covered or guarded.
      b. Provide On-Off door-activated switches where indicated on the Drawings.
      c. 120-volt, single-phase, 15-amp style plug.
      d. Provide 4,000 K, 900 Lumens LED fixture.
         1) Provide additional fixtures for every 36 inches of width.

F. Receptacles:
   1. Provide 1 duplex receptacle located every 6 feet of enclosure width, spaced evenly along the back mounting panels.
   2. GFCI, 120-volt, single-phase, 15-amp style plug.
   3. Provide circuit breaker or fuse to limit receptacle draw to 5 amperes.

G. Grounding:
   1. Provide the following:
      a. Grounding strap between enclosure doors and the enclosure.
      b. Equipment grounding conductor terminals.
      c. Provide equipment grounding busbar with lugs for connection of all equipment grounding wires.
      d. Bond multi-section panels together with an equipment grounding conductor or an equivalent grounding busbar.
   2. Identify equipment grounding conductor terminals with the word "GROUND," the letters "GND", the letter "G", or the color green.
   3. Signal cable shields shall only be grounded at a single point in the loop. Unless otherwise noted, ground signal cable shields at control panel.
   4. Ensure the continuity of the equipment grounding system by effective connections through conductors or structural members.
   5. Design so that removing a device does not interrupt the continuity of the equipment-grounding circuit.
   6. Provide an equipment-grounding terminal for each incoming power circuit, near the phase conductor terminal.

7. Size ground wires in accordance with NEC and UL Standards, unless noted otherwise.
8. Unless otherwise noted, connect all exposed, noncurrent-carrying conductive parts, devices, and equipment to the equipment-grounding circuit.
9. Connect the door stud on the enclosures to an equipment-grounding terminal within the enclosure using an equipment-bonding jumper.

H. Provide sunshades and insulation for all outdoor installations.

2.09 MIXES (NOT USED)

2.10 FABRICATION (NOT USED)

2.11 FINISHES

A. Finishes:
   1. Metallic (non-stainless):
      a. Metal surfaces of panels shall be prepared by chemical cleaning and mechanical abrasion in accordance with the finish manufacturer's recommendations to achieve a smooth, well-finished surface.
      b. Scratches or blemishes shall be filled before finishing. One coat of zinc phosphate shall be applied per the manufacturer's recommended dry-film thickness and allowed to dry before applying the finish coat.
      c. Finish coat shall be a baked polyester-urethane powder, aliphatic air-dry polyurethane, or epoxy enamel to meet NEMA rating specified application.
      d. Exterior of enclosures located outdoors shall be UV-resistant polyester powder coating. Total dry film thickness shall be 3 mils, minimum.
   2. Stainless steel:
      a. Stainless enclosures shall be provided with a Number 4 brushed finish - not painted.

B. Colors:
   1. Exterior color of panels mounted indoors shall be manufacturer's standard light gray.
   2. Exterior of panels mounted outdoors shall be manufacturer's standard white.
   3. Panel interiors shall be manufacturer's standard white.

2.12 SOURCE QUALITY CONTROL (NOT USED)

PART 3 EXECUTION

3.01 EXAMINATION

A. Examine the installation location for the instrument and verify that the instrument will work properly when installed.
   1. Notify the Engineer promptly if any installation condition does not meet the instrument manufacturer's recommendations or specifications.

3.02 PREPARATION (NOT USED)

3.03 INSTALLATION

A. Install enclosures so that their surfaces are plumb and level within 1/8-inch over the entire surface of the panel; anchor securely to wall and structural supports at each corner, minimum. Direct attachment to drywall is not permitted.

B. Install the enclosure per guidelines and submitted installation instructions to meet the seismic requirements at the project site.

C. Provide floor stand kits for wall-mounted enclosures larger than 48 inches high.

D. Provide concrete housekeeping pads for freestanding enclosures.
   1. Refer to the structural typical details.

E. Install gasket and sealing material under panels with floor slab cutouts for conduit:
   1. Undercoat floor-mounted panels.

F. Provide a full-size equipment-grounding conductor in accordance with NEC included with the power feeder. Terminate to the incoming power circuit-grounding terminal.

G. All holes for field conduits, etc. shall be cut in the field. There shall be no additional holes, factory cut holes, or hole closers allowed. Incorrect holes, additional holes, or miscut holes shall require that the entire enclosure be replaced.

H. Protect all wiring from sharp edges and corners.

I. Control panels that are adjacent to motor control centers shall be fully wired to the motor control centers using wireways integral to the motor control center or additional conduits as needed. These interconnections are not shown or reflected on the Conduit Schedule but shall be shown on the Loop Drawings prepared by the Contractor.

J. Provide individually fused analog input module points with blown-fuse indicator lights, mounted external of the module on the output terminal strip.

K. Side panels:
   1. Side panels shall be kept free off all control equipment and devices. Any deviation must be sent to the engineer in writing asking for a deviation.

3.04 ERECTION, INSTALLATION, APPLICATION, AND CONSTRUCTION (NOT USED)

3.05 REPAIRS/RESTORATION (NOT USED)

3.06 RE-INSTALLATION (NOT USED)

3.07 FIELD QUALITY CONTROL (NOT USED)

3.08 ADJUSTING (NOT USED)

3.09 CLEANING

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

3.10 DEMONSTRATION AND TRAINING (NOT USED)

3.11 PROTECTION (NOT USED)

3.12 SCHEDULES (NOT USED)

END OF SECTION

SECTION 17720

CONTROL SYSTEMS: PROGRAMMABLE LOGIC CONTROLLERS

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Programmable logic controller (PLC) based control systems hardware.
   2. Development software to be used with the specified PLC hardware.

1.02 REFERENCES

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Institute of Electrical and Electronics Engineers (IEEE).

1.03 DEFINITIONS

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Specific definitions:
   1. CPU: Central processing unit.
   2. I/O: Input/Output.

C. Specific definitions:
   1. Development operating software: The software provided by the PLC manufacturer for use in programming the PLC.
   2. Application software: The software that is programmed specifically for the Project.

1.04 SYSTEM DESCRIPTION

A. Provide all PLC hardware as indicated on the Drawings and as specified in this Section.

1.05 SUBMITTALS

A. Furnish submittals as specified in Sections 01330 - Submittal Procedures and 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Product data:
   1. CPU:
      a. Processor type.
      b. Processor speed.
      c. Memory.
      d. Internal processor battery backup time.

2. I/O modules:
    a. Type.
    b. Standard wiring diagram.

C. Calculations:
1. Submit calculations or documented estimate to verify that memory requirements of this Section are met, including spare requirements. If possible, use PLC manufacturer's calculation or estimating worksheet.
2. Submit calculations to verify that spare I/O requirements of this Section are met.
3. Submit calculations to verify that PLC power supply requirements of this Section are met.

D. Product data:
1. Programming languages.
2. Operating system requirements.

E. Control logic:
1. Fully annotated copy of programmed PLC logic.
2. Cross-referenced index of all PLC registers or points.

F. Provide application software for the specific Project process requirements.
1. Fully annotated copy of programmed PLC logic in its native format.
2. Cross-referenced index of all PLC registers or points.

1.06 QUALITY ASSURANCE

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Provide PLC hardware manufactured at facilities certified to the quality standards of ISO 9001.

C. Additional requirements:
1. Provide PLC system components by a single manufacturer:
    a. Third-party communication modules may be used only for communication or network media functions not provided by the PLC manufacturer.
2. Use PLC manufacturer approved hardware, such as cable, mounting hardware, connectors, enclosures, racks, communication cable, splitters, terminators, and taps.
3. All PLC hardware, CPUs, I/O devices, and communication devices shall be new, free from defects, and produced by manufacturers regularly engaged in the manufacture of these products.

1.07 DELIVERY, STORAGE, AND HANDLING

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

1.08 PROJECT OR SITE CONDITIONS

A. As specified in Section 01850 - Design Criteria.

1.09 SEQUENCING (NOT USED)

1.10 SCHEDULING (NOT USED)

1.11 WARRANTY

A. As specified in Section 01783 - Warranties and Bonds.

1.12 SYSTEM START-UP (NOT USED)

1.13 OWNER'S INSTRUCTIONS (NOT USED)

1.14 COMMISSIONING (NOT USED)

1.15 MAINTENANCE

A. CPU: 1 spare for each type of CPU in the system.

B. I/O cards: 3 spares for each type of I/O card in the system.

C. Power supplies: 2 spares for every power supply in the system.

D. Network/communications cards: 1 spare for every network or communications card in the system.

E. Remote adapter: 1 spare for every remote adaptor in the system.

F. Chassis: 1 spare for each chassis size in the system.

G. Communication cable: 1 spare for each type of cable used in the system.

H. Installed spare requirements:
   1. I/O points:
      a. Provide total of 25 percent spare I/O capacity for each type of I/O at every PLC/RIO rack using the following calculation:

$$\left(1 - \frac{\text{UTILIZED IO POINT COUNT}}{\text{TOTAL IO POINT COUNT}}\right) * 100 = \%\text{SPARE}$$

      b. Wire all spare I/O points to field terminal blocks in the same enclosure the PLC/RIO resides in.
   2. PLC backplane capacity:
      a. Provide 25-percent or 3 spare backplane slots, whichever is greater, in all racks containing I/O.
   3. PLC memory:
      a. Provide 50-percent spare program volatile memory.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. One of the following or equal:
   1. Rockwell Automation:
      a. For Plant PLC (PLC-4, PLC-99400): ControlLogix 5580, 1756-L8 Series.
      b. For Vendor PLC (VCP-3): CompactLogix 5380, 5069-L3 Series.

B. The PLC programming software system shall be manufactured by PLC hardware manufacturer:
   1. Rockwell Software:
      a. Studio 5000.

2.02 EXISTING PRODUCTS (NOT USED)

2.03 MATERIALS (NOT USED)

2.04 MANUFACTURED UNITS

A. Programmable logic controller:
   1. Construction:
      a. Furnish plug-in modular system.
      b. Provide PLCs capable of operating in a hostile industrial environment without fans, air conditioning, or electrical filtering:
         1) Temperature: 0 to 55 degrees Celsius.
         2) RFI: 80 to 1,000 MHz.
         3) Vibration: 10 to 500 hertz.
         4) Humidity: 0 to 95 percent.
      c. Provide internal power supplies designed to protect against overvoltage and frequency distortion characteristics frequently encountered with the local power utility.
      d. Design the PLC system to function as a standalone unit that performs all of the control functions described in this Section completely independent from the functions of the HMI system PC-based operator interfaces:
         1) Failure of the HMI system shall not impact data acquisition, control, scaling, alarm checking, or communication functions of the PLC.
   2. CPU:
      a. Configure each CPU so that it contains all the software relays, timers, counters, number storage registers, shift registers, sequencers, arithmetic capability, and comparators necessary to perform the specified control functions.
      b. Capable of interfacing with all discrete inputs, analog inputs, discrete outputs, analog outputs, and communication cards to meet the specified requirements.
      c. Capable of supporting and implementing closed-loop floating-point math and PID control that is directly integrated into the CPU control program.
   3. Memory:
      a. Non-volatile memory: On-board complementary metal-oxide-semiconductor (CMOS), electrically erasable programmable read-only memory (EEPROM), PCMCIA, compact flash card, or SD card.

b. Supply with sufficient memory to implement the specified control functions plus a reserve capacity as specified with the requirements of this Section:
    1) Reserve capacity:
        a) Totally free from any system use.
    2) Programmed in a multi-mode configuration with multiple series or parallel contacts, function blocks, counters, timers, and arithmetic functions.

4. Programming:
    a. Provide a system where processors are programmed by:
        1) Portable laptop computer both locally and via the PLC control network.
5. PLC power supply:
    a. Input: 120 VAC.
    b. Mounted in the PLC housing or as indicated on the Drawings.
    c. Sized to power all modules mounted in that housing including an average module load for any empty housing slots plus 50 percent above that total.
6. PLC input/output, I/O modules: 16-channel General:
    a. Compatible with all of the PLCs being furnished under the contract and by the same manufacturer as the PLCs.
    b. Provide I/O modules that:
        1) Isolate in accordance with IEEE Surge Withstand Standards and NEMA Noise Immunity Standards.
        2) Provide A/D and D/A converters with optically or galvanically isolated inputs and outputs.
        3) Accept dual-ended inputs.
    c. The use of common grounds between I/O points is not acceptable.
    d. Provide modules that are removable without having to disconnect wiring terminals:
        1) Utilize a swing-arm or plug-in wiring connector.
    e. Provide at each PLC the I/O modules for the following:
        1) Designated future I/O points contained in the I/O Lists and/or shown on the P&IDs, control schematics, or described in the control strategies.
        2) Installed spare capacity in accordance with the requirements of this Section.
        3) Wire all spares provided to the field terminal strip.
    f. Condition, filter, and check input signals for instrument limit conditions.
    g. Filter, scale, and linearize the raw signal into an engineering-units-based measurement.
    h. Alarm measurements for high, low, rate-of-change limits, and alarm trends.
    i. Provide external fuses mounted on the field connection terminal block for all discrete input, discrete output, and analog input I/O points.
    j. When multiple cards of the same I/O type are provided and parallel equipment, instrumentation, or redundant processes exist, distribute I/O among cards to ensure that a single card failure will not render an entire process unavailable.
    k. Discrete input modules:
        1) Defined as contact closure inputs from devices external to the input module.

2) Provide inputs that are optically isolated from low-energy common-mode transients to 1,500 volts peak from users wiring or other I/O modules.
3) Individually isolated inputs.
4) With LEDs to indicate status of each discrete input.
5) Input voltage: 120VAC.
6) Provide input module points that are individually fused with blown-fuse indicator lights, mounted external of the module on the output terminal strip:
a) Coordinate external fuse size with the protection located on the module, so that the external fuse opens first under a fault condition.

l. Discrete output modules:
1) Defined as contact closure outputs for ON/OFF operation of devices external to the output module:
a) Triac outputs may be used, with the permission of the Engineer. Care must be used in applying this type of module to ensure that the leakage current through the output device does not falsely signal or indicate an output condition.
2) Optically isolated from inductively generated, normal mode and low-energy common-mode transients to 1,500 volts peak.
3) LEDs to indicate status of each output point.
4) Output voltage: 120VAC.
5) Individually isolated outputs.

m. Analog input modules: individually isolated:
1) Signal type: Provide 4-20 mA for most applications; other levels are acceptable to interface to vendor control panels.
2) Analog-to-digital conversion: Minimum 12-bit precision with the digital result entered into the processor.
3) The analog-to-digital conversion updated with each scan of the processor.
4) Individually isolated each input.
5) Coordinate the size of the external fuse with the protection located on the module, so that the external fuse opens first under a fault condition.

n. Analog output modules:
1) Signal type: Provide 4-20 mA for most applications; other levels are acceptable to interface to vendor control panels.
2) Individual isolated output points each rated for loads of up to 1,000 ohms.

o. Specialty I/O modules:
1) HART analog input module:
a) Channels per module: 4 minimum.
b) Signal type: Each channel individually configurable for current (0 to 20 mA DC or 4 to 20 mA DC) or voltage (0 to 5 VDC, 0 to 10 VDC, or -10 to 10 VDC).
c) Each channel can individually have HART enabled or disabled.
d) Flash-upgradeable firmware.
e) Mounts in slot in PLC backplane.
f) Modules shall be configured using the specified PLC programming software.

2) HART analog output module:
a) Channels per module: 4 minimum.
b) Signal type: Each channel individually configurable for current (0 to 20 mA DC or 4 to 20 mA DC) or voltage (0 to 5 VDC, 0 to 10 VDC, or -10 to 10 VDC).
c) Each channel can individually have HART enabled or disabled.
d) Flash-upgradeable firmware.
e) Mounts in slot in PLC backplane.
f) Modules shall be configured using the specified PLC programming software.

7. Communications modules:
a. Remote I/O adapter module:
1) For any PLC location requiring more than 1 housing to mount all of the I/O modules or that is identified as a RIO, provide the appropriate remote I/O adapter module for communication with the secondary housing(s).
2) Install the RIO adapter module in the PLC backplane and the RIO backplane.
3) Provide adapter modules that support all available types of I/O modules required.
4) Provide all network taps, connectors, termination resistors, drop cables, and trunk cables necessary for remote I/O communications.
5) Complete diagnostic LEDs.
b. Network communications modules:
1) General:
a) Install communications modules in the PLC backplane.
2) Ethernet:
a) Ports: 1 RJ-45 as indicated on the Drawings.
b) Communication rate: 100 Mbit/s.
c) Allen-Bradley ControlLogix - 1756-EN2T.
3) Provide all network taps, connectors, termination resistors, drop cables, and trunk cables necessary for remote I/O communications.

8. PLC backplane housing:
a. Mount the PLC power supply, CPU, communications module, and I/O modules in a suitable standard PLC backplane or housing.
b. Provide spare slots in each PLC and RIO location in accordance with the requirements of this Section.
c. Provide a blank slot filler module for each spare slot.

B. HMI system interface:
1. As specified in Section 17733 - Control Systems: Network Materials and Equipment.

C. PLC programming software:
1. Furnish operating software capable of monitoring and/or controlling the PLCs via the PLC data network:
a. Contain diagnostics to collect troubleshooting and performance data and display it in easy to understand graphs and tables.

b. Monitor devices at each drop on the PLC data network for proper communications.
c. Provide the ability to program all PLCs on the PLC data network from the Engineer's console.

2. PLC programming laptop/desktop operating system:
   a. Microsoft Windows 10.
3. The PLC programming software shall be suitable for the PLCs specified above.
4. PLC programming software for all programming, monitoring, searching, and editing:
   a. Usable both on-line, while connected to the PLC, and off-line.
   b. The operating software shall display multiple series and parallel contacts, coils, timers, counters, and mathematical function blocks.
   c. Capable of disabling/forcing all inputs, outputs, and coils to simulate the elements of the ladder logic; forced elements shall be identifiable by means of color change.
   d. Include a search capability to locate any address or element and its program location.
   e. Display at the EC, PLC status information, such as faults and communication errors and amount of memory remaining.
5. The PLC programming software shall support the following programming languages:
   a. Ladder Diagram.
   b. Function Block Diagram.
6. Generate a PLC program printout, which is fully documented, through the PLC programming software:
   a. Fully documented program listings include, as a minimum, appropriate rungs, address, and coils shown with comments to clarify to a reader what that segment of the program accomplishes on an individual line-by-line basis.
   b. Include a sufficient embedded comment for every rung of the program explaining the control function accomplished in said rung.
   c. Use a mnemonic associated with each contact, coil, etc. that describes its function.
   d. Utilize the tag and loop identification as contained in the P&IDs:
      1) If additional internal coils, timers, etc. are used for a loop, they shall contain the loop number.
   e. Provide a cross-reference report of program addresses.
7. Software functions automatically without operator intervention, except as required to establish file names and similar information:
   a. Furnish the operating system software that is the standard uncorrupted product of the PLC manufacturer with the following minimum functions:
      1) Respond to demands from a program request.
      2) Dynamic allocation of the resources available in the PLC. These resources include main memory usage, computation time, peripheral usage, and I/O channel usage.
      3) Allotment of system resources based on task priority levels such that a logical allocation of resources and suitable response times are ensured.
      4) Queuing of requests in order of priority if one or more requested resources are unavailable.

5) Resolution of contending requests for the same resource in accordance with priority.
6) Service requests for execution of one program by another.
7) Transfer data between programs as requested.
8) Management of all information transfers to and from peripheral devices.
9) Control and recovery from all program fault conditions.
10) Diagnose and report real-time hardware device errors.

8. Program execution:
   a. Application software - program execution scheduled on a priority basis:
      1) A multilevel priority interrupt structure is required.
      2) Enter into a list of pending programs a program interrupted by a higher priority program:
         a) Resume its execution once it becomes the currently highest priority program.
      3) Schedule periodic programs.
      4) Base the allocation of resources to a time-scheduled program on its relative priority and the availability of resources.
9. Start-up and restart:
   a. Provide software that initializes and brings a PLC or any microprocessor-based hardware unit from an inactive condition to a state of operational readiness.
   b. Initialization:
      1) Determination of system status before start-up of initializing operating system software and initializing application software.
      2) Loading of all memory-resident software, initializing timers, counters, and queues, and initialization of all dynamic database values.
10. Shutdown:
   a. Where possible, provide orderly shutdown capability for shutdowns resulting from equipment failure, including other PLC processor failures, primary power failure, or a manually entered shutdown command.
   b. Upon loss of primary power, a high-priority hardware interrupt initiates software for an immediate, orderly shutdown.
   c. Hardware is quickly and automatically commanded to a secure state in response to shutdown command or malfunction.
   d. Alarm PLC failure at the operator interface level.
11. Diagnostics:
   a. Furnish diagnostic programs with the PLC software package to detect and isolate hardware problems and assist maintenance personnel in discovering the causes for system failures.
   b. Use the manufacturer's standard diagnostic routines as much as possible.
   c. Furnish diagnostic software and test programs for each significant component in the control system.
   d. As a minimum, provide diagnostic routines to test for power supply, central processing unit, memory, communications, and I/O bus failures.
12. Calendar/time program:
   a. The calendar/time program to update the second, minute, hour, day, month, and year and transfer accurate time and date information to all system-level and application software.

b. Variations in the number of days in each month and in leap years must be handled automatically by the program.
c. The operator must be able to set or correct the time and date from any operator interface, only at the highest security level.

13. Algorithms:
    a. Implementation of algorithms for the determinations of control actions and special calculations involving analog and discrete data.
    b. Algorithms must be capable of outputting positional or incremental control outputs or providing the product of calculations.
    c. Algorithms must include alarm checks where appropriate.
    d. Provide, as a minimum, the following types of algorithms:
        1) Performs functions such as summing several variables, raising to a power, roots, dividing, multiplying, and subtracting.
        2) A switch algorithm, which reads the current and value from its input address and stores it as the value of its output address. 2 types of switches shall be accommodated: 2 outputs with 1 input and 1 output with 2 inputs.
        3) A 3-mode proportional-integral-derivative, PID, controller algorithm, with each of the 3 modes independently adjustable, supports both direct and reverse-acting modes.
        4) Lead, lag, dead time, and ratio compensators.
        5) Integration and totalization of analog process variables.
14. Furnish a comprehensive database for the analog inputs, calculated values, control modules, and outputs:
    a. In addition, provide spare database points for future expansion.
15. One integrated database can be utilized for all types of analog points or separate databases for each type; in either case, the database for each point must include all specified aspects.
16. All portions of the database must be available for use by the display, report, and other specified software modules.
17. All of the data fields and functions specified below must be part of the point definition database at the operator interface. Provide the capability to define new database points through the point display specified below as well as modifying defined points through these displays. This point definition and modification must include all of the features and functions defined below. The analog database software must support the following functions and attributes:
    a. Analog input signal types:
        1) Provide software at the remote terminal units (RTUs) and PLCs to read variable voltage/current signals and pulse duration/frequency type analog input signals.
    b. Input accuracy:
        1) Inputs must be read with an accuracy of within 0.05-percent full-scale or better.
        2) Data conversion errors must be less than 0.05-percent full-scale.
        3) Pulse accumulation error less than or equal to 1 count of actual input count at a scan rate of once per minute.
        4) Maintain for a minimum of 1 year the system accuracy stated above without adjustments.

c. Blocking:
    1) Provide mechanisms to inhibit or block the scanning and/or processing of any analog input through the operator interface.
    2) For any input so blocked, the operator may manually enter a value to be used as the input value.
d. Filtering:
    1) For each analog input, provide a first order lag digital filter with an adjustable filter factor.
e. Linearizing:
    1) Where analog inputs require square root extraction or other linearization, provide a mechanism to condition the filtered data before the process of scaling and zero suppression takes place.
f. Calculated values:
    1) Provide means to allow for pseudo-inputs calculated by algebraic and/or Boolean expressions utilizing real inputs, other calculated values, constants, etc.
    2) These values must be handled the same as real inputs in terms of record-keeping, alarming, etc.
g. Scaling and zero suppression:
    1) Provide a conversion program to convert input values into engineering units in a floating-point format.
h. Alarms:
    1) Provide an alarm program to check all analog variables against high-high, high, low, and low-low alarm limits.
    2) When an analog value exceeds a set limit, it must be reported as an alarm based on individually set priority level for each alarm point.
    3) Provide an adjustable hysteresis band in order to prevent excessive alarms when a variable is hovering around an alarm limit.
    4) Must be possible to inhibit alarms based on external events, e.g., lock-out low pump flow alarm when the pump is off.
i. Averages:
    1) Provide a program to calculate and store hourly, daily, and monthly averages of analog variables.
    2) Continuously compute averages, e.g., the average for the current period to the present point in time must be stored in memory and available for use in displays, etc.
    3) Update hourly averages each minute or at the polling interval for the selected variable.
    4) Update daily averages at least once each hour and calculate using the results of the hourly averages.
    5) Update monthly averages at least once each day and calculate using the results of the daily averages.
    6) At the end of each averaging period, store the average values for the period on the hard disk for historical record-keeping and reset the present period average register to the present value of the variable.
    7) The active database must include the present period average and previous period average for each variable and averaging period.
j. Totals:
    1) Provide a program to calculate and store hourly, daily, and monthly totalization of analog variables.

2) Assign a scaling factor to each variable to convert to the appropriate units based on a 1-minute totalizing interval.
3) Assign a separate factor for each totalizing interval.
4) Variables for which totalization is inappropriate must have scaling factors of zero.
5) At the end of each totalizing period, store the totalized values for the period on the hard disk for historical record-keeping and reset the present period totalization register to zero.
6) The active database must include the present period total and previous period total for each variable and totalizing period.

k. Engineering units:
1) Provide software to allow the system and the operator to convert all the measured analog variables to any desired engineering units.
2) The operator must be able to view displays and generate reports of any measured variable in one or more engineering units such as flow in gpm, mgd, cfs, and acre-feet per day.
3) Pre-program the conversion of the engineering units, and, if not pre-programmed, the operator must be able to program new engineering unit conversions by using simple methods, e.g., multiplication of the database attributes by a constant.
4) The programming method must be at a level and compatible with the specified training of the operator and the Owner's personnel.
5) New conversions must not require the services of a special programmer and/or special, high-level, programming training.

l. Control modules:
1) For each control function configured, whether processed at the RTU, PLC, or operator interface, maintain a file of necessary data including input values, setpoints, constants, intermediate calculated values, output value and limit clamps, etc.
2) Input and output assignments, setpoints, and constants must be adjustable by the operator through the operator interface.
3) Provide control algorithms for manual control with output values adjustable by the operator.

m. Analog outputs:
1) Analog outputs must be maintained as part of the database.
2) These outputs must be adjustable manually by the operator through the operator interface or through automatic control algorithms.

18. Some of the above functions may be better accomplished in the data acquisition and graphic display software package; it is the responsibility of the ICSC to optimize the location of the various functions between all software packages.

D. General control functions:
1. Analog control functions:
a. PID, lead/lag, signal select, alarm, limit, delay, and time base.
b. Furnish the control system complete with a library of mathematical/calculation software to support averaging, weighted average, addition, subtraction, multiplication, division, square root extraction, exponential, AND, OR, NAND, NOR, XOR, and NXOR functions.

c. All math utilities must be linkable to process data points or manual inputs via control block configuration.
d. By linking control blocks to data points, the math library must support system unit conversion and calculation requirements.

2. Discrete control functions:
   a. AND, OR, NOT, EXCLUSIVE OR, comparators, delays, and time base.
3. Software support:
   a. Retain in firmware all control and logic functions at each RTU and PLC and in RAM at the operator interface.
   b. Call each function as required by the configured controls to perform the intended function.
4. Control and status discrepancies:
   a. Generate a discrepancy/fail alarm for any pump, valve, or final control element if a discrepancy exists between a system or operator command and the device status.
      1) For example, the system commands to start (call), and the pump fails to start (run status report back), within predetermined operator-programmable time delay (time disagree), then a discrepancy (fail) alarm shall be generated.
   b. Involuntary change in the device's status must also generate an alarm:
      1) For example, a pump starts when not commanded to do so, or a pump shuts down while running even though it still has a command to run.
   c. Each command, status, and alarm must cause the color of the symbol to change.
   d. Because many discrete final control elements have a cycle time in excess of the scan interval, provide each control output with an associated delay period selected to be longer than the operating period of the control element:
      1) Delay periods for each final control element must be adjustable at the operator interface.
      2) List all time delays in the final documentation.
5. Some of the above functions may be better accomplished in the data acquisition and graphic display software package; it is the responsibility of the ICSC to optimize the location of the various functions between all software packages.

E. Control configuration:
1. Provide software to allow control strategies to be developed, and their operation initiated through the operator interface.
2. Provide standardized control point displays for defining the control functions including the function type, input/output addresses, setpoints, tuning constants, etc.
3. Provide a mechanism to link separate control functions together into an integrated control strategy.
4. Provide a mechanism to download operational/control setpoints developed at any operator interface to any PLC or RTU for operational implementation.

5. Provide a mechanism to define and implement operational/control setpoints locally at the PLC or RTU, and to upload them to the operator interface for operational record-keeping.
6. Perform control configurations on-line at the operator interface; the PLC or RTU may be taken off-line when being configured or downloaded.

F. Remote inputs and outputs (RIOs):
1. Compatible with all of the PLCs being furnished under this Contract, shall be by the same manufacturer as the PLCs, and, as a minimum, include:
   a. Power supply.
   b. Rack.
   c. Backplane.
   d. Communications module.
   e. I/O modules.
   f. Enclosure.
2. Provide all cables and software needed for a complete and operational RIO system as specified in the Contract Documents.
3. Provide a group of pre-assigned diagnostic registers to report RIO system faults to the driver PLC.
4. The control system must continue operation should a fault occur on a single RIO drop:
   a. Upon clearing the fault, restart communications to that drop automatically.

2.05 EQUIPMENT (NOT USED)

2.06 COMPONENTS (NOT USED)

2.07 ACCESSORIES (NOT USED)

2.08 MIXES (NOT USED)

2.09 FABRICATION (NOT USED)

2.10 FINISHES (NOT USED)

2.11 SOURCE QUALITY CONTROL (NOT USED)

PART 3 EXECUTION

3.01 EXAMINATION (NOT USED)

3.02 PREPARATION (NOT USED)

3.03 INSTALLATION

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Utilize personnel to accomplish or supervise the physical installation of all elements, components, accessories, or assemblies:
   1. Employ installers who are skilled and experienced in the installation and connection of all elements, components, accessories, and assemblies.

C. All components of the control system including all data network cables are the installation responsibility of the ICSC unless specifically noted otherwise.

D. General:
   1. The control system logic program shall reside at the PLC level.

E. Use the tag and loop identifications found on the P&IDs for all tags used and/or assigned as part of the application software work provided by the ICSC.

F. Program the PLC logic using the following language(s):
   1. Ladder Diagram.
   2. Function Block Diagram.

3.04 ERECTION, INSTALLATION, APPLICATION, CONSTRUCTION

A. Provide a minimum of 4 CD/DVD copies of the following:
   1. Application software:
      a. Finalized fully annotated copy of programmed PLC logic in its native format.
      b. Cross-referenced index of all PLC registers or points.

3.05 REPAIR/RESTORATION (NOT USED)

3.06 RE-INSTALLATION (NOT USED)

3.07 FIELD QUALITY CONTROL (NOT USED)

3.08 ADJUSTING (NOT USED)

3.09 CLEANING

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

3.10 DEMONSTRATION AND TRAINING

A. Tailor training specifically for this Project that reflects the entire control system installation and configuration.

B. Perform training by pre-approved and qualified representatives of the ICSC and/or manufacturer of the PLC hardware and programming software:
   1. A representative of the ICSC may perform the PLC hardware training only if the representative has completed the manufacturer's training course for the PLC hardware.
   2. A representative of the ICSC may perform the PLC programming software training only if the representative has completed the manufacturer's training course for the PLC programming software.

3.11 PROTECTION (NOT USED)

3.12 SCHEDULES (NOT USED)

END OF SECTION

SECTION 17721

CONTROL SYSTEMS: LOCAL OPERATOR INTERFACE (LOI)

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Local Operator Interface (LOI) control systems hardware and software.

1.02 REFERENCES

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

1.03 DEFINITIONS

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

1.04 SYSTEM DESCRIPTION

A. Provide all LOI hardware identified in the Contract Documents.

B. Provide a licensed copy of the Manufacturer's Programming software for the selected LOIs.

1.05 SUBMITTALS

A. Furnish submittals in accordance with Sections 01330 - Submittal Procedures and 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Product data:
   1. Complete manufacturer's brochures for each item of equipment.
   2. Complete manufacturer's brochures that identify LOI software and options. Mark up to clearly show options and components to be provided, and cross out any options or components that will not be provided.
   3. Manufacturer's operation and installation instructions.
   4. Additional requirements:
      a. Display type and size.
      b. Operator input.
      c. Processor type and speed.
      d. Memory size.
      e. Programming protocols.
      f. Communication protocols.
      g. Power requirements.
      h. Operating temperature and humidity ranges.
      i. NEMA ratings.

C. Shop drawings:
   1. Furnish the following:
      a. System block diagram showing relationship and connections between devices. Include manufacturer and model information, and address settings.
      b. Mounting drawings with dimensions and elevations for each equipment location, including identification of all components, preparation and finish data, and nameplates.
      c. Electrical connection diagrams.
      d. Complete grounding requirements.
   2. Graphic screens:
      a. Color printouts of each graphic screen and all control pop-ups.
   3. Furnish data sheets for each component together with a technical product brochure or bulletin:
      a. Manufacturer's model number.
      b. Project equipment tag.
   4. Complete and detailed bills of materials identified by each cabinet. Include with each bill of material item the following:
      a. Quantity.
      b. Description.
      c. Manufacturer.
      d. Part numbers.

D. Operation and maintenance manuals:
   1. Complete installation, operations, calibration, and testing manuals as described in Section 01756 - Commissioning.

E. Record documents:
   1. Electrical connection diagrams revised to reflect any changes made in the field and submitted as record Drawings.

1.06 QUALITY ASSURANCE

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Examine the complete set of Contract Documents and verify that the LOI equipment is compatible with the installed conditions.

C. Notify the Engineer if any installation condition does not meet the manufacturer's recommendations or specifications.

D. Provide LOI hardware manufactured at facilities certified to the quality standards of ISO Standard 9001 - Quality Systems - Model for Quality Assurance in Design/Development, Production, Installation, and Servicing.

E. System compatibility:
   1. The software must be the standard operating software system designed specifically for use with the LOI hardware.
   2. The software must be furnished and developed by the manufacturer of the LOI hardware.

1.07 DELIVERY, STORAGE, AND HANDLING

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

1.08 PROJECT OR SITE CONDITIONS

A. Project environmental conditions as specified in Section 01850 - Design Criteria.
   1. Provide LOI equipment suitable for the installed site conditions including, but not limited to, site altitude, site seismic conditions, humidity, and ambient temperatures.

1.09 SEQUENCING (NOT USED)

1.10 SCHEDULING (NOT USED)

1.11 WARRANTY

A. As specified in Section 01783 - Warranties and Bonds.

1.12 SYSTEM START-UP (NOT USED)

1.13 OWNER'S INSTRUCTIONS (NOT USED)

1.14 COMMISSIONING (NOT USED)

1.15 MAINTENANCE

A. Provide system upgrades and maintenance fixes for a period of 2 years from substantial completion.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. One of the following or equal:
   1. Allen-Bradley, PanelView 5000.
   2. Red Lion, G3 Panel.
   3. Maple Systems, OMI 5000 Series.

B. Provide the LOI graphic software system manufactured by the LOI hardware manufacturer.

C. One of the following or equal:
   1. Rockwell, Studio 5000.
   2. Red Lion Crimson.
   3. Indusoft WebStudio.

2.02 EXISTING PRODUCTS (NOT USED)

2.03 MATERIALS (NOT USED)

2.04 MANUFACTURED UNITS

A. Local Operator Interface:
   1. General:
      a. Provide Local Operator Interface located on the face of the PCM as indicated on the Drawings.
      b. NEMA rating to match the control panel rating on which it's mounted.
      c. Local Operator Interface consists of graphical display screen with operator input capabilities.
      d. Capable of stand-alone operation in conjunction with 1 PLC.
      e. Equipped with data network communication capabilities.
   2. Display:
      a. Type:
         1) Color TFT LCD screen.
      b. Resolution:
         1) 800 by 600 pixels.
         2) 1024 by 768 pixels.
         3) 1200 by 800 pixels.
      c. Size: As indicated on the Drawings.
      d. Easy display viewing at any angle in various ambient light conditions.
      e. Operator input:
         1) Configurable touch screen.
      f. Screen update speed: The screen update speed and screen change speed less than 1 second.
      g. Provide following features for outdoor use:
         1) Anti-glare screen overlay.
         2) Luminescence: Minimum 1,000 Nits.
   3. Graphic configuration:
      a. Easily configured graphics by:
         1) Portable laptop computer both locally and via the PLC data network.
         2) SCADA Engineer's console via the PLC data network.
      b. As specified in this Section.
   4. Memory:
      a. Minimum application memory:
         1) 128 MB Flash EPROM.
   5. CPU: Minimum 100 MHz.
   6. Communications:
      a. EtherNet/IP.
   7. Environment:
      a. Temperature: 0 to 50 degrees Celsius.
      b. Relative humidity: 10 to 90 percent.
   8. Electrical:
      a. Power supply:
         1) 24 VDC.
         2) 120 VAC.

B. Local Operator Interface software:
   1. Provide a complete software package to be used for programming the necessary screens and operator interaction with the LOIs.
   2. Operating system:
      a. Microsoft Windows 10.
   3. Furnish software with preconfigured symbols, objects, graphics, and imported bitmaps for the generation of the displays.
   4. Software must allow bitmaps to be imported or exported to or from other applications.
   5. Capable of generating custom reports, complete with screen prints.
   6. Capable of working with multiple screens concurrently.
   7. Provide dialog boxes for defining object attributes.
   8. Configure objects using fill in dialog boxes.
   9. Furnish graphic and text editor that allows custom formatting in order to customize and change the appearance of objects and text:
      a. Allow selection of different fill patterns to define object status.
   10. As a minimum, provide the following object capabilities:
      a. Operator inputs:
         1) Momentary pushbutton.
         2) Maintained pushbutton.
         3) Latched pushbutton.
         4) Multistate pushbutton.
         5) Keypad enable button.
         6) Cursor point.
      b. Control list selectors:
         1) Standard control list.
         2) Piloted control list.
      c. Global objects.
      d. Display objects:
         1) Bar graph.
         2) Scale.
         3) Message display.
         4) Multistate indicator.
         5) List indicator.
         6) Numeric data display.
      e. Screen selector objects:
         1) Go to.
         2) Return.
         3) Screen list selector.
      f. Embedded variables:
         1) Time.
         2) Date.
         3) Numeric variable.
      g. Graphics:
         1) Lines.
         2) Shapes.
         3) Freeform drawings.
         4) Imported graphics.

5) Background text.
6) Selection table for standard ISA symbols.
7) PID controller faceplate.

h. Alarm screens.

11. Documentation:
    a. Provide complete user documentation, including examples of how to operate the various modules within the system.
    b. Provide the documentation in electronic format, HTML based with the ability to search for topics by keyword or search or specific text.
12. On-line help:
    a. Provide an on-line "help" facility, based upon Windows standard Hypertext:
        1) Useful, context-sensitive information on the operation of the package:
            a) That can be invoked on-line through a point-and-click operation.
            b) The "help" facility must also support the ability to perform full text word search, add custom comments, bookmark topics, copy and pasting into another application, printing, and use of system fonts and colors.

2.05 EQUIPMENT (NOT USED)

2.06 COMPONENTS (NOT USED)

2.07 ACCESSORIES (NOT USED)

2.08 MIXES (NOT USED)

2.09 FABRICATION (NOT USED)

2.10 FINISHES (NOT USED)

2.11 SOURCE QUALITY CONTROL (NOT USED)

PART 3 EXECUTION

3.01 EXAMINATION (NOT USED)

3.02 PREPARATION (NOT USED)

3.03 INSTALLATION

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. All components of the control system including all data network cables are the installation responsibility of the ICSC unless specifically noted otherwise.

C. Provide panel support bracing if more than 25 percent of the area has been removed to allow for the mounting of the LOI.

D. All tags used and/or assigned as part of the application programming work are to use the tag and loop identifications found on the P&IDs.

E. Station graphics:
   1. Configure the graphic display for each device both in the treatment plant, and/or process area, including but not limited to:
      a. Symbols for:
         1) Pumps.
         2) Valves.
         3) Major instruments.
         4) Flowmeters.
         5) Pressure transmitter.
         6) Major equipment.
      b. Alarm symbols including intrusion alarm.
      c. Relevant test and operational data.
      d. Status for each controller or controlled device:
         1) Hand-Off-Auto Status.
         2) Local-Off-Remote Status.
         3) Run.
         4) Call.
         5) Fail.
         6) Open.
         7) Close.
         8) Hold.
         9) Modulate.
         10) Running.
      e. Depict a change of state of pumps and valves by a change in color.
   2. Production and usage bar graph:
      a. Depict the production for each site and/or piece of equipment, as determined during the requisite graphics meeting, within the treatment plant, summarized to type, and total usage, with a bar graph and numeric value for each analog value.
   3. System level summary:
      a. Show the level for the plant influent and effluent production, etc., via a display using bar graphs and numbers, as determined during the requisite graphics meeting.

3.04 ERECTION, INSTALLATION, APPLICATION, CONSTRUCTION (NOT USED)

3.05 REPAIR/RESTORATION (NOT USED)

3.06 RE-INSTALLATION (NOT USED)

3.07 FIELD QUALITY CONTROL (NOT USED)

3.08 ADJUSTING (NOT USED)

3.09 CLEANING

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

3.10 DEMONSTRATION AND TRAINING

A. Perform the training using pre-approved and qualified representatives of the ICSC and or manufacturer of the LOI software:
   1. A representative of the ICSC may perform the training only if the representative has completed the manufacturer's training course for the LOI software.

3.11 PROTECTION (NOT USED)

3.12 SCHEDULES (NOT USED)

END OF SECTION

SECTION 17733

CONTROL SYSTEMS: NETWORK MATERIALS AND EQUIPMENT

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Materials and equipment used in process control and LAN networks including:
      a. Network switches.
      b. Media converters.
      c. Routers.
      d. Patch panels and other data network hardware.
      e. Related accessories.
      f. Firewall

1.02 REFERENCES

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Electronic Industries Alliance/Electronic Components, Assemblies & Materials Association (EIA/ECA):

   2. 607 - Generic Telecommunications Bonding and Grounding (Earthing) for Customer Premises.

F. Underwriters Laboratories, Inc. (UL).

1.03 DEFINITIONS

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

1.04 SUBMITTALS

A. Furnish submittals as specified in Sections 01330 - Submittal Procedures and 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Product data:
   1. Include information on all network equipment.
   2. Manufacturer’s operation and installation instructions.

C. Shop drawings:
   1. Complete set of drawings including but not limited to:
      a. System block diagram showing relationship and connections between devices provided under this Contract, including connections to any existing equipment.
      b. Include manufacturer and model information, and address settings.
      c. Network riser diagram.
      d. Network port diagram, which physically locates all ports within the facility, and identifies their patch panel and switch port.
      e. Construction drawings for all equipment cabinets, including dimensions, identification of all components, preparation and finish data, and nameplates.
      f. Electrical connection diagrams.
      g. Complete grounding requirements.
   2. Furnish data sheets for each component together with a technical product brochure or bulletin:
      a. Manufacturer's model number.
      b. Project equipment tag.
   3. Complete and detailed bills of materials broken up by each cabinet. Each bill of material item will include the following:
      a. Quantity.
      b. Description.
      c. Manufacturer.
      d. Part numbers.

D. Calculations:
   1. Cooling calculations, including but not limited to:
      a. Highest expected ambient temperature for the enclosure's location.
      b. Internal heat load.
      c. Exposure to direct sunlight.
      d. Dimensions of the enclosure in inches.
      e. Maximum allowable temperature inside the enclosure, based on the lowest operating temperature limit of the installed components.

E. Seismic design:
   1. Seismic panel construction:
      a. Seismic anchorage: Provide seismic design calculations and installation details for anchorage of all cabinets, racks, panels, enclosures, consoles, etc. to meet seismic requirements as specified in Section 01850 - Design Criteria:
         1) Stamped by a Professional Engineer registered in the state where the project is being constructed.
      b. For freestanding panels weighing 200 pounds or more (assembled, including contents), submit calculations, data sheets, and other information to substantiate that cabinet, base, and framing meet minimum design strength requirements and seismic requirements as specified in Section 01850 - Design Criteria. Calculations shall be signed and sealed by a Professional Engineer licensed in the state where the cabinets and panels will be installed.

F. Test reports:
   1. As specified in Section16125 - Fiber Optic Cable and Appurtenances and Section 17950 - Commissioning for Instrumentation and Controls.
   2. Signed test results as described in this Section.
   3. Test results shall include:
      a. Narrative describing the test procedures followed.
      b. Block diagram of test set up.
      c. Manufacturer’s information on test equipment used.
      d. Detailed test results.
      e. A narrative summarizing the results of the testing and identifying any further action required.

G. Operating manuals:
   1. Complete installation, operation, calibration, and testing manuals as specified in Section 01756 - Commissioning.

H. Record drawings:
   1. As specified in Section 17950 - Commissioning for Instrumentation and Controls.
   2. Electrical connection diagrams shall be revised to reflect any changes made in the field and submitted as record drawings.

1.05 QUALITY ASSURANCE

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

1.06 DELIVERY, STORAGE, AND HANDLING

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

1.07 PROJECT OR SITE CONDITIONS

A. As specified in Section 01850 - Design Criteria.

1.08 SEQUENCING (NOT USED)

1.09 SCHEDULING (NOT USED)

1.10 WARRANTY

A. As specified in Section 01783 - Warranties and Bonds.

1.11 SYSTEM START-UP (NOT USED)

1.12 OWNER'S INSTRUCTIONS (NOT USED)

1.13 COMMISSIONING (NOT USED)

1.14 MAINTENANCE (NOT USED)

PART 2 PRODUCTS

2.01 MANUFACTURERS (NOT USED)

2.02 SYSTEM DESCRIPTION

A. Provide all network equipment identified in the Contract Documents.

2.03 EXISTING PRODUCTS (NOT USED)

2.04 MATERIALS (NOT USED)

2.05 MANUFACTURED UNITS

A. Ethernet switches:
    1. Managed Process Floor Ethernet switches:
        a. Manufacturers: One of the following, no equal:
            1) Rockwell, Stratix 5700.
            2) Hirschmann, BRS-40.
            3) Cisco, IE2000.
            4) Red Lion, N-Tron, 7000.
        b. Properties:
            1) Hardware:
                a) Power supply:
                    (1) Accepts redundant power feeds.
                        (a) Provide NEC Class 2 power circuit.
                        (b) 24 VDC, 100VA maximum rating.
                b) No fans or moving parts.
            2) Performance:
                a) Enclosure:
                    (1) All metal housing.
                b) Capable of performing basic switching without special programming or configurations. Additional features available through software setup includes but not limited to:
                    (1) SNMP.

(2) VLAN.
(3) QoS.
(4) Port Mirroring.
(5) DHCP Server
c) IGMP Snooping with EtherNet/IP plug & play compatibility.
d) 802.1d, 802.1w, 802.1D RSTP.
3) Environment:
a) Operating temperature range: 32 to 140 Degrees Fahrenheit.
b) Humidity:10 to 95 percent, non-condensing.
4) Connections:
a) Copper: RJ-45.
(1) Auto-negotiating.
(2) Quantity: As required to provide network connections indicated on the Drawings plus 20 percent spare.
b) Fiber: Gigabit SFP port.
(1) Quantity: As required to provide network connections indicated on the Drawings, minimum 2.
5) Mounting:
a) DIN Rail mounting.
b) As indicated on the Drawings.

B. SFP Transceivers:
1. Provide Gigabit transceivers unless otherwise indicated, or as required to interface with other equipment:
a. Multimode: 1000BASE-SX.
b. Multi-source agreement compliant.
2. Manufacturers: The following or equal:
a. Cisco, unless transceivers are provided by Ethernet switch vendor.

C. Media converters:
1. Copper to fiber transceiver:
a. Manufacturers: One of the following or equal:
1) N-Tron.
a) Transition Networks.
b) Phoenix Contact.
c) Black Box.
2) Transceiver shall be used to convert Ethernet communication between copper and fiber optic cables.
3) Match protocol, speed, and media of attached equipment.
a) Meets requirements of IEEE 802.3 Ethernet standard.
b) Connector type:
c) Fiber: SFP.
(1) Copper: RJ-45.
d) Power supply:
(1) 110 VAC.
e) Mounting:
(1) As indicated on the Drawings.

D. Secure Firewall:
1. Manufacturers: The following, no equal:
a. Cisco, ISA3000.

2. Properties:
    a. 2 copper Gigabit Ports.
    b. 2 fiber Gigabit Ports.
    c. Mini-USB Port.
    d. Compact Flash Port.
    e. Hardware:
        1) Rack or DIN rail mountable.
        2) Power supply:
            a) Provide redundant power supplies:
                (1) 24 VDC at 24W.
    f. Environment:
        1) Operating temperature range: -40 to 158 degrees Fahrenheit.
        2) Humidity: 5 to 95 percent, non-condensing.
    g. Capable of performing basic filtering and networking with web based graphical user interface:
        1) VPN Support.
    h. Connector type:
        1) Fiber: SFP.
        2) Copper: RJ-45.
    i. Mounting:
        1) Provide hardware for DIN rail mounting.

E. Patch panels:
    1. Fiber optic patch panels:
        a. General:
            1) All optical fiber cables shall be provided with strain relief and terminated at a fiber patch panel. Final connections between the patch panel and the fiber optic network equipment shall be made via factory tested fiber optic patch cords.
            2) All fiber cable strands shall be terminated at the patch panels, no loose fiber strands are allowed.
            3) Provide space for excess fiber and provide strain relief for the fiber cable.
            4) Fiber cables shall be installed such that the outer sheath of the cable is carried into the interconnect enclosure or patch panels before breaking out buffer tubes.
            5) Fiber connectors: LC.
        b. DIN Rail mounted:
            1) Manufacturers: One of the following or equal:
                a) DINSpace, SNAP XL.
                b) Corning.
                c) Hirschmann, MIPP.
            2) Properties:
                a) Use for the termination of a single cable inside of cabinets, in small enclosures or as indicated on the plans.
                b) DIN rail mounted fiber patch panels shall be provided as complete unit including the housing, connector panels, splice trays, and fiber connectors.

F. Copper patch panels:
   1. General:
      a. All equipment and premises cables shall be terminated at a patch panel, except for field equipment connections.
      b. Final connections between the patch panel and network equipment shall be by patch cords.
      c. Provide factory tested copper patch cords as required to support all network devices.
         1) Provide 25 percent spare copper patch cords.
      d. Cables shall be installed such that the outer sheath of the cable is carried into the patch panel before breaking out conductors.
      e. Maintain twist of broken out conductors in accordance with TIA standards.
      f. UL listed.
      g. Properties:
         1) Modular, all metal construction with built-in strain relief.
         2) Compatible with both shielded and unshielded jack modules.
         3) Patch panel and jack modules shall be by same manufacturer.
         4) Utilizes jack modules for copper Ethernet cable termination.
         5) Provided shielded jack modules with a 360-degree conductive path to ground as required by the installation. Install per manufacturer's recommendation.
         6) Patch panel and jack modules shall meet or exceed category cable standard.
         7) Jack module shall be capable of at least 20 termination cycles.
         8) Provide 25 percent spare jack modules of each type.
      h. Accessories:
         1) Removable rear cable management bracket.
         2) Rear individual port labels.
         3) Front color-coded individual port labels.
         4) Termination tool.
   2. Manufacturers: One of the following or equal:
      a. 19-inch rack mounted:
         1) Panduit, Mini-Com series.
         2) OCC, DCC series.
         3) CommScope, SL series.
      b. DIN Rail mounted:
         1) DINSpace, SNAP XL.
         2) OCC, DTC.

2.06 EQUIPMENT (NOT USED)

2.07 COMPONENTS (NOT USED)

2.08 ACCESSORIES

A. Provide duplex patch cords to connect the interface cards provided with the associated patch panels.

B. Provide dust covers or plugs for all unused ports.

2.09 MIXES (NOT USED)

2.10 FABRICATION (NOT USED)

2.11 FINISHES (NOT USED)

2.12 SOURCE QUALITY CONTROL (NOT USED)

PART 3 EXECUTION

3.01 EXAMINATION (NOT USED)

3.02 PREPARATION (NOT USED)

3.03 INSTALLATION

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Provide installation and configuration for the new and existing managed Ethernet switches. Provide configuration of the Ethernet switch network for a complete, functioning plant control system as indicated on the Drawings and as specified in this Section:
   1. Refer to SCADA block diagrams for all new network connections.
   2. Provide configuration for all managed Ethernet switches and other components including but not limited to VLAN (virtual local area network), additional Plant PLC communication cards, and separate managed Ethernet switches as required, such that there is isolation of the following networks:
      a. Remote I/O network: This includes the connections between the Plant PLC and:
         1) Plant PLC expansion racks.
         2) Plant PLC remote I/O (RIO) racks.
      b. Field network: This includes the connections between the PLC and:
         1) Field devices.
         2) LOI (Local Operator Interface).
         3) Vendor furnished Ethernet network components.
         4) Valve actuator network: This includes the connections between the PLC and the valve master stations.
      c. PLC network: This includes the connections between the Plant PLCs and the I/O server(s).
      d. Process control network: This includes the connections between the I/O server(s) and other equipment including but not limited to servers, workstations, and printers.
   3. The process floor managed Ethernet switches for the process control network shall be configured and programmed for rapid fail over protection.

C. All racks shall be level and plumb.

D. All work shall be performed in a neat and workmanlike manner.

E. Cable management:
   1. All cables and equipment shall be installed in strict conformance with the manufacturer's recommendations:
   2. Install cable using lubricant designed for cable pulling.
   3. Install hook-and-loop wrap on all cable bundles within the network rack/enclosure. Plastic tie-wraps are not acceptable.
   4. Install network cables without splices.
   5. Installed bend radius shall be a minimum of 10 times the cable diameter.
   6. Terminate all pairs at the jack and patch panel.
   7. Route all cables through cable management or other form of containment. No loose, unsupported cables are permitted to span across network equipment.
   8. Use corner strips to protect cables from edges inside ducts and to maintain bend radius requirements.

F. Internal rack wiring:
   1. Cables shall be installed avoiding sharp bends.
   2. Provide enough working space inside rack or cabinets such that closing enclosure doors does not crush or compress cabling.
   3. Bundle cables together in groups of no more than 12.
   4. Route cables from both sides of the rack to patch panels. Do not bring all bundles from a single side.
   5. No cabling shall obstruct equipment ventilation.
   6. Individual pairs will be untwisted less than 1/2-inch at termination points.
   7. Ground enclosure and equipment in accordance with TIA-607:
      a. Individually bond all network equipment chassis to rack's grounding busbar. Do not daisy-chain bonding conductors.
      b. Size the bonding conductor per network equipment manufacturer's recommendation, or No. 10 AWG, whichever is larger.

G. External rack wiring:
   1. Do not install fiber cables in non-continuous cable supports such as cable ladders or wire baskets without radius cable supports or solid bottoms.
   2. Maintain cable separation in accordance with TIA-569:
      a. Install cables a minimum of 40 inches away from electrical motors and transformers.
      b. Install cables a minimum of 12 inches away from fluorescent lighting.

H. All cables and terminations shall be labeled with cable designations as specified in Section 16075 - Identification for Electrical Systems.

I. Each data port shall be individually labeled with its patch panel/switch port ID:
   1. Labeling must be printed - no handwritten labels will be allowed.

J. At the completion of the wiring installation, provide the following documentation:
   1. A plan-view of the premise(s) showing the jack numbering scheme.
   2. A printed certification report for the entire wiring installation showing compliance with all TIA specifications for data cable.
   3. Reports such as those generated by Fluke DSP cable certification equipment meet this requirement.

K. Managed Ethernet switches:
   1. Configure switches to prevent broadcast storms.
   2. All installations shall employ IGMP snooping to limit multicast messaging.

3.04 ERECTION, INSTALLATION, APPLICATION, CONSTRUCTION (NOT USED)

3.05 REPAIR/RESTORATION (NOT USED)

3.06 RE-INSTALLATION (NOT USED)

3.07 FIELD QUALITY CONTROL (NOT USED)

3.08 ADJUSTING

A. Perform all firmware installations, configuration and other set up, as required, to place the network into proper operation.

3.09 CLEANING

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

3.10 DEMONSTRATION AND TRAINING

A. After completion of the cable system tests and before placing the system in operation, power up all devices installed on the LAN and verify communication between the devices.

B. Verify that all equipment is operable on the network simultaneously. Confirm that all network device communications settings are properly configured.

3.11 PROTECTION (NOT USED)

3.12 SCHEDULES (NOT USED)

END OF SECTION

SECTION 17750

CONTROL SYSTEMS: WIRELESS COMMUNICATIONS - RADIO

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. General and design requirements applicable to industrial wireless radio communication system Work and submittals.
   2. General requirements for supply, installation, and commissioning of an industrial wireless radio communication system, including but not limited to the following:
      a. Materials, hardware, software, equipment fabrication, installation, configuration, programming, hardware and software testing, start-up, commissioning, training, and documentation.

B. The ICSC shall procure the service of a radio sub-contractor as specified in Section 01110 - Summary of Work, to perform all the Work described in this Section and all contractor documents related to the industrial wireless radio communication system.

1.02 REFERENCES

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Abbreviations:
   1. AGL: Above ground level.
   2. Antenna CL: Antenna center line mounting height.
   3. ASL: Above sea level.
   4. CPM: Critical path method.
   5. EIRP: Effective isotropic radiated power.
   6. FCC: Federal Communications Commission.
   7. FRN: FCC Registration Number.
   8. ITS: Institute for Telecommunications Science.
   9. LOS: Line of sight.
   10. RF: Radio frequency.
   11. RSSI: Receive signal strength intensity.
   12. SIM: Subscriber identity module.
   13. WLAN: Wireless local area network.

C. Definitions:
   1. BER: Bit error rate, a unitless measure of the number of bit errors that occur in a given number of bit transmissions.
   2. dB: Decibel, a relative expression representing a change in radio frequency power.
   3. dBi: A decibel referenced against an isotropic radiator.

4. dBd: A decibel referenced to a dipole antenna.
5. dBm: A decibel referenced to 1 milliwatt (mW).
6. Direct Sequence Spread Spectrum (DSSS): A spread-spectrum technology used in IEEE 802.11 and IEEE 802.11b/g used to achieve data rates up to 2 Mbps.
7. Fade margin: The difference between the received signal level at the input to the receiver and the sensitivity of the receiver.
8. Fresnel zone: The area around the line-of-sight that radio waves spread out into after being transmitted by the antenna.
9. Radio Path Survey: In-field wireless communication site survey performed by the radio sub-contractor during the preliminary construction phase of the project.
10. Receiver Sensitivity: The minimum signal power level with an acceptable Bit Error Rate (in dBm or mW) that is necessary for the receiver to accurately decode a given signal.

D. Standards:
   1. American Concrete Institute (ACI):
      a. 318 - Building Code Requirements for Structural Concrete.
   2. ASTM International (ASTM):
      a. A475 - Standard Specification for Zinc-Coated Steel Wire Strand.
      b. A586 - Standard Specification for Metallic-Coated Parallel and Helical Steel Wire Structural Strand.
   3. Code of Federal Regulations (CFR):
      a. Title 47 - Telecommunication.
   4. Institute of Electrical and Electronics Engineers (IEEE):
      a. 802.11 - Wireless LAN Standards.
   5. International Electrotechnical Commission (IEC).
   6. National Fire Protection Association (NFPA):
      a. 79 - Electrical Standard for Industrial Machinery.
   7. Telecommunications Industry Association (TIA):
      a. 222 - Structural Standard for Antenna Supporting Structures and Antennas and Small Wind Turbine Support Structures.
      b. 1019 - Installation, Alteration, and Maintenance of Antenna Supporting Structures and Antennas.
   8. State and Local code requirements.

1.03 DELEGATED DESIGN

A. As specified in Section 01357 - Delegated Design Procedures.

B. Anchoring and bracing for equipment installed outdoors.

1.04 SUBMITTALS

A. Furnish submittals as specified in Sections 01330 - Submittal Procedures and Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Submittals for the in-field radio path survey:
    1. Initial submittal:
        a. Submit the following for review and approval, prior to the radio path survey:
            1) Credentials of the firm to perform the radio path survey.
            2) Testing equipment used.
            3) Testing methodology.
            4) Software for path study.
            5) Project CPM schedule.
            6) Submit a description of testing methods.
            7) Example data forms to be used during the site testing.
            8) Survey dates at the sites that would be suitable for performing the analysis.
    2. Radio path survey submittal:
        a. For all the sites, prepare an RF path survey report as described below:
            1) Provide a topographic overview of the paths analyzed as part of the radio path survey:
                a) Include on the overview:
                    (1) Locations of all airports, large water bodies, tall structures, overhead electrical lines, and airstrips located within 2,000 meters of any proposed radio site.
                    (2) Provide topographical plan and profile drawings for each path.
                    (3) Frequency analysis report that includes the usage traffic in the designed frequency band by other commercial and non-commercial business in the area.
            2) Provide RF path survey calculations including the following information:
                a) Field-verified coordinates of each site in longitude and latitude.
                b) Distance between sites (miles), for each communication link.
                c) Elevation of each site (ft. ASL).
                d) Direction of path (degrees from north).
                e) Antenna type used.
                f) Antenna mounting height.
                g) Up tilt/down tilt angles for proposed antenna mountings.
                h) Received signal
            3) Provide recommendations for modifications or adjustments to the design for extending all paths with insufficient fade margin for reliable operation including to but not limited to the following:
                a) Proposed repeater sites.
                b) Antenna gain improvements.
                c) Antenna height mounting adjustments.
                d) Antenna/radio quantity, especially for master stations for communicating to all remote sites successfully.
                e) Path calculations for the improved radio paths.
            4) Provide a summary of findings and recommendations for further work.
        b. Upon completion of the radio path survey, submit a final report to the Owner for review a minimum of 30 days before the second coordination meeting as specified in the Submittals article under “Prepare and Submit

an Agenda for the second Coordination Meetings." Summarize the radio path survey results and include the following:
1) Field data captured.
2) Recommended antenna and repeater/receiver sites.
3) Recommended antenna heights and types.
4) Recommended sites that serve as communication hubs to collect data.
5) Critical communication paths and loops for adding redundant links.
6) Summary of findings and recommendations.

c. If, upon review of the radio path survey report, the Owner determines that the information is insufficient or incomplete in any way, perform all necessary actions to complete the report.

C. Prepare and submit an agenda for 2 mandatory coordination meetings.
1. First meeting:
a. Summarize their understanding of the Project.
b. Discuss any proposed alternatives.
c. Schedule access to Owner sites.
d. Schedule the remaining coordination meetings.
e. Request any additional information required from the Owner.
f. Review the preliminary design, software radio path study report, and plan radio path survey.
g. Select the hardware to be used during the in-field radio path survey, meeting the requirements described in the contract documents.
h. Understand the project construction sequence.
i. Understand municipal ordinance and other construction restrictions associated with the sites.
j. Schedule the in-field radio path survey during high-foliage season after coordination with the Owner for all wireless radio communication links.
2. Second meeting:
a. Schedule a meeting after the radio path survey has been completed:
1) To present the findings of the radio path survey to the Owner and Engineer.
b. Discuss the content of the radio path survey report in a line-by-line manner.
c. Outline the recommended and optimal configuration for the Owner's wireless radio system architecture.
d. Coordinate radio configuration settings with the Owner including, but not limited to, the following:
1) IP addresses.
2) Passwords.
3) Encryption and security settings.
4) Operating Mode.
5) Polling.
e. Discuss any exceptions or deviations from design calculations on antenna heights and site locations.
f. Discuss construction and work progress schedule.
g. Discuss training requirements and schedule.

D. Delegated design submittals:
    1. For outdoor installations:
        a. Project-specific calculations with anchoring and bracing details based on support conditions and requirements to resist loads specified in Section 01850 - Design Criteria.

E. Submit product data for all components of the radio communication system:
    1. Radio.
    2. SIM card(s).
    3. Antenna.
    4. Cables between radio and antenna.
    5. All other related accessories.
    6. Certification for outdoor installation.
    7. Communication port type and quantity.
    8. Installation details for each component indicated above.
    9. For each type of radio/antenna:
        a. Provide operating mode setup, encryption, and polling configuration information.
    10. Block diagram showing the location of each component of the radio communication system.
    11. Radio link map associated with each site.

F. Furnish commissioning submittals listed below and specified in this Section as specified in Section 01756 - Commissioning:
    1. Manufacturer’s representative qualifications.
    Owner training.

1.05 QUALITY ASSURANCE

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Verify communications between sites as follows:
    1. Perform radio path survey to verify the theoretical performance of the software radio path study report.
    2. Verify the radio paths using received signal strength and interference measurements obtained in the field and obtain an approval from the Owner and the Engineer prior to procurement installation, testing, and commissioning.

C. After installation, verify using field-collected data that the installed equipment conforms to reliability benchmark developed as part of the field testing.

1.06 DELIVERY, STORAGE, AND HANDLING

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

1.07 PROJECT OR SITE CONDITIONS

A. As specified in Section 01850 - Design Criteria.

1.08 ADMINISTRATIVE REQUIREMENTS

A. Coordination:
   1. Coordinate radio configuration and encryption options with the Owner:
      a. Adjust configuration and encryption settings as deemed necessary by the Owner.
      b. Provide radio configuration record files and save the device configuration on a standard SD card if available.
   2. Configure security settings and options as recommended by the radio manufacturer and as deemed necessary by the Owner and Engineer. Provide setup for secure username and password authentication by the Owner.
      a. Alerts shall be sent to defined list of recipients via pre-configured SMS text message.
      b. Alerts shall be sent to defined list of recipients via SMTP (email) message.

B. For licensed radio systems, coordinate and assist the Owner in obtaining and updating all required radio licenses with the FCC.

1.09 WARRANTY

A. As specified in Section 01783 - Warranties and Bonds.

B. Provide a minimum of 1 year of warranty from substantial completion date for all wireless communication equipment.

1.10 MAINTENANCE

A. Furnish all parts, materials and additional components necessary for maintenance and calibration purposes for 1 year:
   1. Deliver all supplies before Substantial Completion.

PART 2 PRODUCTS

2.01 GENERAL

A. Furnish and install an industrial wireless communication system that will serve the following sites:

1. Coordinates are approximate.

Site Name	Site Coordinates (Latitude N; Longitude W)	Antenna Tag	Wireless Technology/ Operational Mode	Antenna Mounting Height	Notes
Master Site	39 06 50.73; 123 11 29.74	ANT1-99400	900MHz licensed	35 feet above ground level	Omni-directional
Water Tank (Recycled Water Pump Station)	39 09 33.89; 123 11 41.76	ANT2-99400	900MHz licensed	35 feet above ground level	Yagi

B. The wireless radio communication system shall be provided as indicated on the Drawings, software radio communication path study reports attached in Attachment A, and as described in this Section.

C. The Contract Documents for the components of the wireless communication system are based on software radio path studies.

D. Verify site conditions, perform a detailed radio path survey, and provide a completely functional wireless radio communication system.

2.02 DESIGN AND PERFORMANCE CRITERIA

A. System must be in accordance with the following:
1. Code of Federal Regulations:
    a. CFR Title 47:
        1) Part 15 - Unlicensed Spread Spectrum.
        2) Part 90 - UHF Radio Systems - Subpart C and J.
        3) Part 101 - Fixed Microwave Services.
            a) Subpart H - Private Operational Fixed Point-to-Point Microwave Service.
            b) Subpart O - Multiple Address Systems.
2. NFPA 79, Annex “D” Standards.
3. NEC.
4. NEMA.
5. ISA.
6. IEC.
7. State and Local code requirements.
8. TIA 1019.

B. Performance requirements for wireless radio communication:
    1. The following are the radio path requirements for the radio communication system:
        a. Minimum fade margin: 20dB.
        b. Less than 25 percent obstruction within the first 60 percent of the Fresnel zone.
    2. Minimum antenna mounting heights are described on the following:
        a. At a minimum, as specified in software radio path study design report in Attachment A.

2.03 MANUFACTURERS

A. Radio:
    1. Licensed radio:
        a. One of the following or equal:
            1) General Electric, Orbit LN Series.

B. Transmission cables:
    1. Manufacturers: One of the following or equal:
        a. CommScope:
            1) HELIAX Cable Products.
        b. Times Microwave Systems.

C. Surge protectors:
    1. Manufacturers: One of the following or equal:
        a. CommScope:
            1) T Series Surge Arrestors.
            2) Gas Tube Surge Arrestors.
        b. Phoenix Contact, Trabtech Series.
    2. As specified in Section 17710 - Control Systems: Panels, Enclosures, and Panel Components.

D. Antennas:
    1. Radio antennas:
        a. Manufacturers: One of the following or equal:
            1) Kathrein Scala.
            2) CommScope.

E. Antenna support structure:
    1. One of the following or equal:
        a. Rohn Products, LLC.
        b. Trylon, Inc.

2.04 MANUFACTURED UNITS

A. Licensed radio system:
    1. General:
        a. The radio system comprises the following:
            1) Wireless radio(s).
            2) Antennas.
            3) Surge protectors.

4) Transmission cables.
5) Software and other accessories as specified in the Components article.
6) Protocol conversion modules as indicated on the Drawings.

2. Performance requirements:
   a. Frequency: 902-928 MHz.
   b. Ambient temperature range: -20 to 60 degrees Celsius.
   c. Enclosure protection class:
      1) IEC IP20.
   d. Bi-directional (2-way) system:
      1) Transceiver:
         a) Carrier power: 0.1 to 5 W, programmable.
         b) Transmission mode: Packet.
         c) Interface:
            (1) Ethernet 10/100 MB RJ-45 port.
         d) Duty cycle: Continuous.
         e) Power supply: 10-30 VDC.

B. Transmission cables characteristics:
   1. 1/2-inch, nominal diameter.
   2. Continuous section without splices or connectors other than at the radio and antenna.
   3. Rated for outdoor installation.
   4. Cable length: As indicated on the Drawings or as indicated in the path study report.
   5. Cable characteristics:
      a. Attenuation: Less than 5 dB at 960 MHz per 100 feet.
      b. Characteristic impedance: 50 ohms.
      c. Coaxial shield.
      d. Dielectric: Foam.

C. Antennas:
   1. Radio antenna characteristics:
      a. Yagi antenna:
         1) Frequency range: 902-928 MHz.
         2) Nominal impedance: 50 ohm.
         3) Connector: N-Type.
         4) Gain: 7 dB or greater.
         5) Construction material: All welded aluminum.
         6) Operating temperature:
            a) Stationary: -40 to 85 degrees Celsius.
            b) Cyclic: -40 to 55 degrees Celsius.
      b. Omni-directional antenna characteristics:
         1) Frequency range: 902-928 MHz.
         2) Nominal impedance: 50 ohm.
         3) Connection: N-type.
         4) Gain: 10 dB or greater.
         5) Construction material: All welded aluminum.
         6) Operating temperature: -40 to 75 degrees Celsius.

3. Antenna support structures:
    a. Antenna mast:
        1) Mast shall be 2 inch schedule 80 steel pole. Furnish mast as one continuous length for full height without splices.
        2) Each mast shall be grounded with dedicated ground rod and grounding conductors.
        3) Provide required accessories for complete installation of antenna.
        4) See Electrical drawings for details.

2.05 MATERIALS (NOT USED)

2.06 ACCESSORIES

A. Antenna accessories:
    1. Provide all required mounting accessories required for installation, such as clamps, brackets adapters, and related hardware for a complete installation.
        a. Mounting guidelines shall be provided in the installation details indicated on the Drawings and as recommended by the manufacturer.
    2. Provide mounting hardware to meet the wind and seismic requirements at the Project Site as specified in Section 01850 - Design Criteria.

B. Provide lightning surge arrestors and data line surge protection for radios or antennas located outdoors.

C. Provide antenna cables, connectors, and related hardware for a complete installation.

D. Provide din-rail mounting adapters required for installation of radios in control panels/communication cabinets, as needed for each application.

E. Software:
    1. Provide software package for radio diagnostic testing.
    2. Provide radio configuration via a secured wireless or wired ethernet network.

PART 3 EXECUTION

3.01 EXAMINATION (NOT USED)

3.02 PREPARATION

A. Anchoring and bracing to structures:
    1. Prepare equipment anchor setting template(s) and use to position anchors during construction of supporting structure(s).
    2. Install anchors of type and material indicated on approved anchoring designs.
    3. Install anchors with embedment indicated on approved anchoring designs.

3.03 INSTALLATION

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Tag and label terminal blocks, radio system components and associated wiring as indicated in the Drawings and as specified in Section 16075 - Identification for Electrical Systems.

3.04 COMMISSIONING

A. As specified in Section 01756 - Commissioning and Section 17950 - Commissioning for Instrumentation and Controls for communications testing requirements.

B. Functional Testing:
   1. Hardware and communication testing:
      a. Perform tests to show that the integrated system hardware and software is fully operational and in compliance with the requirements specified in the Contract Documents.
      b. Engineer approval of the FAT Communication Testing activities is required before proceeding to FAT Platform Testing.
   2. Failure testing: Demonstrate how the system responds to and recovers from abnormal conditions including, but not limited to:
      a. Equipment failure.
      b. Operator error.
      c. Communications subsystem error.
      d. Communications failure.
      e. Simulated/forced software lockups.
      f. Power failure (both utility power and power to HMI and/or SCADA hardware).
      g. High system loading conditions.

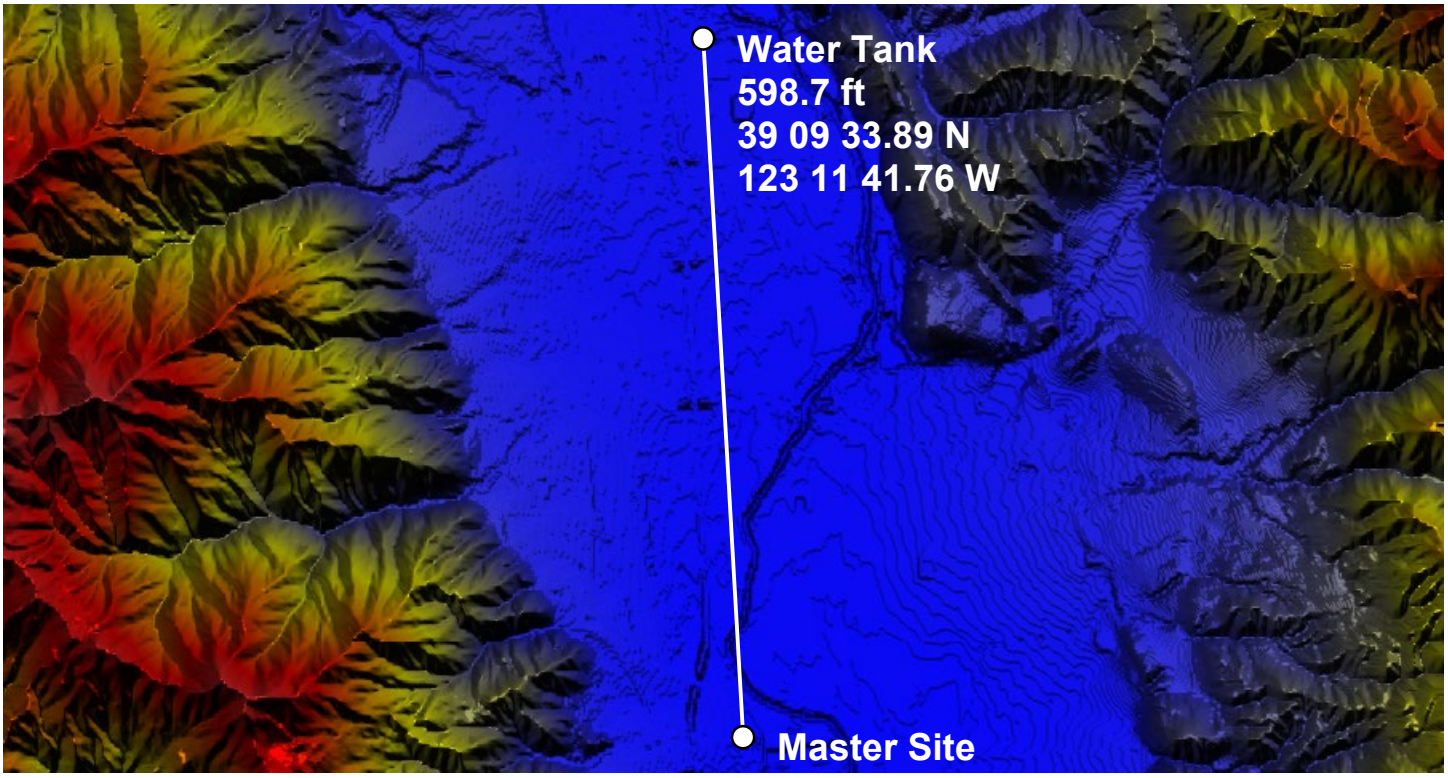
C. Owner Training:
   1. Perform Owner training as specified in Section 01756 - Commissioning.
   2. Radio communication initial training: Provide 1 - hour training session for up to 2 individuals from the Owner on the following:
      a. Radio communication system hardware, setup, basic working principle of the installed system and basic troubleshooting and diagnostics.
   3. Radio communication follow-up training: Provide 1 - hour training session for up to 2 individuals from the Owner on the following:
      a. Radio communication system configuration, encryption, advanced troubleshooting, and diagnostics.

3.05 FIELD QUALITY CONTROL

A. Verify using field-collected data that the installed equipment conforms to reliability benchmarks developed as part of the field testing.

B. Submit a report to document field-verified transmit and receive signal strength and any RF interference after installation of final communication elements.
   1. Troubleshoot issues and assist Owner with FCC coordination if interference is detected during startup and commissioning.

C. The installation shall follow the wireless network manufacturer's recommended installation practices and comply with all applicable codes.



D. Upon completion of installation, provide the services of a factory-certified local service technician to perform start-up testing. Record test results and compare to factory testing to confirm proper operation of equipment. Submit test results with operation and maintenance manuals.

3.06 ADJUSTING

A. Orient directional antennas as required for maximum receive strength signal intensity during startup.

Free space loss (dB)	105.87
Atmospheric absorption loss (dB)	0.02
Total loss (dB)	109.52

SECTION 17901

SCHEDULES: FIELD INSTRUMENTS

PART 1 GENERAL

1.01 SUMMARY

A. The Schedules Field Instrument is not a take-off list. Refer to Drawings and Specifications for additional information. Where any discrepancies between this list and the P&ID drawings arise, the P&ID shall govern.

B. Abbreviations used in the Instrument Index are defined on the Drawings.

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION

3.01 SCHEDULES FIELD INSTRUMENTS

A. Schedules Field Instruments attached.

END OF SECTION

ATTACHMENT A - SCHEDULES: FIELD INSTRUMENTS

Field Instruments

Specification: 17201

Tag	Type	Range or Setpoint	Description	Drawing
LSHH-89100		17.5 FT	HIGH HIGH AND LOW LOW LEVEL SWITCHES	89N01
LSLL-89100		2 FT	HIGH HIGH AND LOW LOW LEVEL SWITCHES	89N01
LSL-91101		2 FT	HIGH HIGH AND LOW LEVEL SWITCHES	91N01
LSHH-91101		7 FT	HIGH HIGH AND LOW LEVEL SWITCHES	91N01
LSLL-99403		1 FT	LEVEL FLOAT SWITCHES	99N01
LSHH-99403		25 FT	LEVEL FLOAT SWITCHES	99N01

Specification: 17206

Tag	Type	Range or Setpoint	Description	Drawing

SECTION 17903

SCHEDULES: I/O LIST

PART 1 GENERAL

1.01 SUMMARY

A. The I/O list is not a take-off list. Additional information is as indicated on the Drawings and specified in the Contract Documents. Where any discrepancies between this list and the P&ID drawings arise, the P&ID shall govern.

B. Abbreviations used in the I/O list are indicated on the Drawings.

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION

3.01 I/O LIST

A. As specified in Attachment A - I/O list.

END OF SECTION

ATTACHMENT A – I/O LIST

PLC I/O Listing for PLC-4

Drawing	Tag	I/O	Location	Description	Service	(E/F)
85N05	F-85105	AI	PLC-4		AIR WASH VENTURI FLOWMETER	E
85N06	L-85180	AI	PLC-4		TNK 2 LEVEL	E
87N01	A-87130	AI	PLC-4	CL	CHLORINE ANALYZER 3	
88N01	F-88101	AI	PLC-4		CHLORINE CONTACT BASIN OPEN CHANNEL FLOW METER 1	
88N01	F-88102	AI	PLC-4		CHLORINE CONTACT BASIN OPEN CHANNEL FLOW METER 2	
PLC-4	**Total AI Points = 5**					
85N06	SS-85181	AO	PLC-4	SPEED OUT	COAGULANT FEED PUMP NO. 1	E
85N06	SS-85182	AO	PLC-4	SPEED OUT	COAGULANT FEED PUMP NO. 2	E
85N06	SS-85183	AO	PLC-4	SPEED OUT	COAGULANT FEED PUMP NO. 3	E
PLC-4	**Total AO Points = 3**					

PLC I/O Listing for PLC-4

Drawing	Tag	I/O	Location	Description	Service	(E/F)
85N06	AUX1-85181	DI	PLC-4	RUNNING	COAGULANT FEED PUMP NO. 1	E
85N06	AUX1-85182	DI	PLC-4	RUNNING	COAGULANT FEED PUMP NO. 2	E

ATTACHMENT A - FACTORY ACCEPTANCE TEST - CONTROL PANELS

ATTACHMENT B - INSTALLATION AND CERTIFICATION CHECKLIST DOCUMENTATION

ATTACHMENT C - SWITCHES INSTALLATION AND CALIBRATION CHECKLIST

ATTACHMENT D - TRANSMITTER/CONTROLLER/INDICATOR INSTALLATION AND CALIBRATION CHECKLIST

ATTACHMENT E - ANALYZERS INSTALLATION AND CALIBRATION CHECKLIST

ATTACHMENT F - CONTROL VALVES INSTALLATION AND CALIBRATION CHECKLIST

PART 1 GENERAL

1.01 SUMMARY

A. Section includes:
   1. Testing requirements that apply to process control and instrumentation systems for the entire Project.

1.02 REFERENCES

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Electronics Industries Alliance (EIA).

C. Telecommunications Industry Association (TIA).

1.03 DEFINITIONS

A. As specified in Sections 01756 - Commissioning and 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Specific definitions:
   1. Complete End-to-End Testing (CEET) - Signals are tested from the field device through the PLC program, the network, and all the way to the operator's HMI graphic screens.
   2. Loop Validation Tests - Signals are tested from the field device to the PLC.
   3. Platform Testing: Testing of the PLC and SCADA/HMI at the manufacturer's shop to demonstrate the program's functionality based upon specified and designed control requirements.
   4. PTO: Profibus Trade Organization.
   5. Permanent Link: The fixed portion of cabling installed between an equipment outlet and its immediate distributor or between 2 distributors.

1.04 SYSTEM DESCRIPTION (NOT USED)

1.05 SUBMITTALS

A. Furnish submittals as specified in Section 01330 - Submittal Procedures.

B. General:
   1. Reference additional detailed test submittal scheduling and prerequisite requirements as specified in the Sequencing article of Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

C. Overall test plan:
   1. Develop the PCIS system test submittals in consultation and cooperation with all applicable subcontractors.
   2. Develop and submit an overall testing plan for the PCIS. The overall test plan to be reviewed and approved by the Engineer before detailed test plans, procedures, and forms will be reviewed.

3. Describe the test phases as they apply specifically to this Project and each process system.
4. Provide a preliminary testing schedule to show the sequence of tests and commissioning as they apply to each process system and each PLC.
5. Provide a description of factory tests. Describe what equipment will be included, what testing equipment will be used, and the simulator that will be used.
6. Provide examples of proposed forms and checklists.

D. Test procedures:
1. Develop and submit detailed test procedures to show that the integrated SCADA system hardware and software is fully operational and in compliance with the requirements specified in the Contract Documents.
2. Provide a statement of test objectives for each test.
3. Prepare specific procedures for each process system.
4. Describe sequentially the steps to be followed in verifying the correct operation of each process system, including all features described in the loop descriptions, control strategies, and shown in the P&IDs. Implied or generic test procedures are not acceptable.
5. Specify who will perform the tests, specifically what testing equipment will be used (including serial numbers and NIST-traceable calibration), and how the testing equipment will be used.
6. Describe the expected role of the Engineer, as well as any requirements for assistance from Owner's staff.
7. Provide the forms and checklists to be used.

E. Test forms:
1. Submit completed calibration forms, test forms, and checklists.
    a. Test forms shall include the detailed test procedures or shall include clear references to separate pages containing the complete test procedure applicable to each form. If references to procedures are used, the complete procedure shall be included with each test binder.
    b. Every page of each test form shall include project name, date, time, name of person conducting the test, signature of person conducting the test, and for witnessed tests, place for signature of person (Engineer and Owner) witnessing the test.
    c. Sample test forms at the end of this Section show the minimum required content.
        1) The sample test forms have not been customized for this Project.
        2) Contractor shall develop and submit test forms customized for the Project and meeting the specified test and submittal requirements.

F. FAT procedure additional minimal requirements:
1. Prepare and submit a FAT procedure which includes:
    a. Control system testing block diagram.
    b. Estimated test duration.

G. Details on the simulator construction, components, and operation. Testing binders:
1. Sub-system to be tested, provide and submit a test binder containing all test procedures and individual test forms for the test. References to other documents for test procedures and requirements are not acceptable.

2. Fill out in advance headings and all other information known before the test.
3. Include applicable test plan information, as well as a list of all test prerequisites, test personnel, and equipment.
4. Include or list reference material and provide separately at the time of the test.
5. Record test results and verify that all test requirements and conditions have been met.

H. Test reports:
1. At the conclusion of each test, submit a complete test report, including all test results and certifications.
2. Include all completed test binders, forms, and checklists.
3. Submission, review, and acceptance of each test report is required before the start of the sub-system.

1.06 QUALITY ASSURANCE

A. Test personnel:
1. Furnish qualified technical personnel to perform all calibration, testing, and verification. The test personnel are required to be familiar with this Project and the equipment, software, and systems before being assigned to the test program.

1.07 DELIVERY, STORAGE, AND HANDLING (NOT USED)

1.08 PROJECT OR SITE CONDITIONS (NOT USED)

1.09 SEQUENCING (NOT USED)

1.10 SCHEDULING (NOT USED)

1.11 WARRANTY (NOT USED)

1.12 SYSTEM START-UP (NOT USED)

1.13 OWNER'S INSTRUCTIONS (NOT USED)

1.14 MAINTENANCE (NOT USED)

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION

3.01 EXAMINATION (NOT USED)

3.02 PREPARATION (NOT USED)

3.03 INSTALLATION

A. As specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

B. Installation supervision:
   1. Provide as specified in Section 17050 - Common Work Results for Process Control and Instrumentation Systems.

3.04 ERECTION, INSTALLATION, APPLICATION, CONSTRUCTION (NOT USED)

3.05 REPAIR/RESTORATION (NOT USED)

3.06 COMMISSIONING

A. Commissioning as specified in Section 01756 - Commissioning.

B. Testing and training phase:
   1. Source testing:
      a. Manufacturer services: Provide as specified in the table below.

Section Number	Section Title	Source Testing (Witnessed or Non-Witnessed)
17100 - Control Strategies	Control Strategies	Witnessed
17101 - Specific Control Strategies	Specific Control Strategies	Witnessed
17710 - Control Systems - Panels, Enclosures, and Panel Components.	Control Systems - Panels, Enclosures, and Panel Components	Witnessed
17950 - Commissioning for Instrumentation and Controls	Commissioning for Instrumentation and Controls	Witnessed

      b. Prerequisite requirements:
         1) Engineer approval of the hardware and equipment source testing submittal, Manufacturer Certificate of Source Testing, is required before proceeding to Preliminary FAT.
      c. Preliminary FAT (Pre-FAT):
         1) The purpose of the Pre-FAT is to provide assurance that the HMI/SCADA system is ready for the full, witnessed FAT, in terms of both stability and functionality.
            a) Debugging of software and troubleshooting of hardware shall occur during and before the pre-FAT, not during the FAT.
            b) Contractor shall fully test the HMI/SCADA system and fix all deficiencies found before the FAT.

2) Conduct utilizing test procedures approved by Engineer.
3) Owner shall have the right to witness any or all of the Pre-FAT testing and shall be notified in writing 20 days before the start of the pre-FAT.
4) Submit a letter, signed by the Contractor's project manager or company officer, certifying that integrated system hardware and software has been tested and confirmed to be fully operational and in compliance with the requirements specified in the Contract Documents and is fully ready for the full, witnessed FAT.
    a) Attach the completed pre-FAT test forms, signed by the Contractor's staff.
5) Engineer approval of the pre-FAT submittal is required before proceeding to FAT.

d. FAT hardware and communications testing:
1) Perform tests to show that the integrated system hardware and software is fully operational and in compliance with the requirements specified in the Contract Documents.
2) The complete PCIS system including operator stations, servers, network equipment, printers, PCMs, PLCs, RTUs, LCPs, CCS, peripherals, communications equipment, and other HMI/SCADA equipment, shall be assembled, connected, and software loaded for a fully functional FAT of the integrated system.
3) For any fault tolerant networks such as ring topology networks, disconnect each segment of the network individually to demonstrate proper failover and alarming at the HMI.
4) Testing simulation:
    a) Inputs and outputs shall be simulated and proper control and system operation shall be validated.
    b) Whenever supplied equipment is available, such as devices internal to the control panel, test input and output signals using the equipment. Simulation is not acceptable.
    c) FAT shall make use of simulators that contain switches, pilot lights, variable analog signal generators, and analog signal level displays, which shall be connected to the I/O points within the HMI/SCADA system.
        (1) The use of jumper wires, terminal block mounted pilot lights, and loose meters to act as or supply the functionality of a simulator shall not be allowed.
        (2) The simulator may consist of a PLC, operating under a HMI/SCADA software package, or other approved software that has its I/O points wired to PLC's I/O points.
        (3) Software operating on a PC may then act as the switches, pilot lights, variable analog signal generators, and analog signal level displays.
5) Additional source tests are specified in other sections of the Instrumentation and Control Specifications.
6) Owner shall have the right to witness any or all of the FAT testing and shall be notified in writing 20 days before the start of the FAT.

7) Verify communications between the hardware and the programmer's software comply with specified requirements.
    a) For systems that contain RTUs or remote communications with other devices, the complete communications system must be factory tested, including actual interfacing with telephone company equipment and/or the actual radios used for radio based telemetry systems.
8) Panel inspections:
    a) Engineer will inspect each control panel for completeness, workmanship, fit and finish, and compliance with the Contract Documents and the accepted shop drawings.
        (1) Inspection to include, as a minimum: Layout, mounting, wire and data cable routing, wire tags, power supply, components and wiring, I/O components layout (including terminals, wiring and relays), device layout on doors and front panels, and proper ventilation operation.
    b) Inspection forms:
        (1) Provide panel inspection forms as part of the FAT procedures submittal.
        (2) A sample FAT control panel form has been provided at the end of this Section.
9) I/O test:
    a) Engineer will verify that I/O is properly wired to field terminals and is properly mapped into the PLC and the rest of the SCADA system, including all operator interface devices.
    b) Test methodology:
        (1) Discrete inputs:
            (a) Apply appropriate input from simulator at panel terminal, observe input card indicator, observe data value at each indicated data address, and observe data received at field wiring terminals or operator interface screen.
        (2) Discrete outputs:
            (a) Issue commands from operator interface screen or PLC, verify output card indicator light, and measure response at field wiring terminals or multimeter.
        (3) Analog inputs:
            (a) Apply appropriate analog input signal at panel terminals on simulator, observe data value at each indicated data address, and observe data properly received at field wiring terminals or operator interface screen.
            (b) Check each point at 0 percent, 50 percent, and 100 percent of scale.
        (4) Analog outputs:
            (a) Enter scaled values in the output buffer file, observe the output data file value, and measure appropriate response at field wiring terminals or multimeter.
            (b) Check each point at 0 percent, 50 percent, and 100 percent of scale.

c) Test forms to include, but not be limited to the following data:
(1) PLC and panel number.
(2) I/O type.
(3) I/O tag name.
(4) Rack/slot/number of I/O point.
(5) Check-off for correct response for each I/O point.
(6) Comments field.
(7) Initials of individual performing test.
(8) Date test was performed.
(9) Witness signature lines.

10) System configuration test:
a) Demonstrate and test the setup and configuration of operator stations, servers, development stations, and peripherals.
b) Demonstrate utility software and functions, such as virus protection, backup, optical drive burning, network monitoring, etc.
c) Demonstrate the proper operation of peripheral hardware.
d) Demonstrate general HMI/SCADA functions.
e) Demonstrate proper operation of log-on and other security access functions.
f) Demonstrate the proper operation of all historical data storage, trend, display, backup, and report functions.
g) Test automatic fail over of redundant equipment.
h) Demonstrate the proper operation of the alarm display and acknowledgement functions.
i) For any fault tolerant networks, such as ring topology networks, disconnect each segment of the network individually to demonstrate proper failover and alarming.
j) Test forms:
(1) For each test, list the specification page and paragraph of the function demonstrated, and provide a description of the function.
(2) List the specific tests and steps to be conducted.
(3) For each function, list all of the different sub-functions or ways the function can be used, and provide a test check-off for each:
(a) Include signature and date lines.

11) Engineer approval of the FAT Communication Testing activities is required before proceeding to FAT Platform Testing.

e. FAT Platform Testing - Control logic test:
1) Verify the PLC, HMI and SCADA, provides monitoring and control functionality based upon specified and designed control requirements.
2) Testing requirements:
a) Demonstrate each function described in the Control Strategies.
b) Demonstrate in detail how each function operates under a variety of operating scenarios.
(1) Test to verify the application of each general control strategy function to each specific control strategy or loop description.

c) Demonstrate the proper operation of the programming and configuration for each control strategy or loop description.
(1) Test each strategy or loop description on a sentence by sentence and function by function basis.
(2) Loops with similar or identical logic must each be tested individually.
(3) Test the boundaries of each numeric operator input by entering values outside of the allowable range.

d) Demonstrate the proper operation of all digital communication links and networks.
(1) Verify each digital communication I/O point.

e) Failure testing: Demonstrate how the system responds to and recovers from abnormal conditions including, but not limited to: equipment failure, operator error, communications subsystem error, communications failures, simulated/forced software lockups, power failure (both utility power and power to HMI and/or SCADA hardware), process equipment failure, and high system loading conditions.

3) Test forms:
a) Submit completed test forms for each loop including but not limited to the fully revised and approved control strategy.
b) Identify the cause and effect as each I/O point is toggled through the simulator.
(1) Identify and track proper and/or improper operation of the loop.
c) Note any deficiencies or operational changes on the forms for correction and documentation:
(1) Include signature and date lines.

4) Engineer approval of the FAT submittal is required prior to shipment of system components.

2. Owner training:
a. Demonstration requirements are specified in this Section.

Table 1

Course Title	Minimum Course Length (hours per session)	Personnel (Estimated Number of Students)	Minimum Number of Sessions
System Overview	4	5	1
Operator Training - Basic	12	5	2
Operator Training - Advanced	8	5	2
PLC Hardware	8	5	1
PLC Software	16	5	1
LOI Hardware and Software	6	5	1
Network Equipment	6	5	1

Table 1			
Course Title	**Minimum Course Length (hours per session)**	**Personnel (Estimated Number of Students)**	**Minimum Number of Sessions**
Follow-Up Training	8	5	2
Instrument Training	12	3	1
Analytical Instrument Training	4	3	2

3. Training course requirements:
   a. System overview training:
      1) Furnish training courses that give the Owner's supervisory level personnel and overview of all elements of the PCIS system that focus on the overall functional aspect of elements of the control system and provide an understanding of the interaction of the various components.
      2) Furnish a training course that gives the Owner's supervisory level personnel and overview of the new Contractor-provided elements of the PCIS system. Focus on the overall functional aspects of each new elements of the control system, particularly the mechanical system vendor-provided control packages.
   b. Operator training:
      1) Furnish training courses that instruct system operators in the efficient operation of all aspects of the PCIS that include not only the general operation of the control system but also the operation of specific system features.
      2) Furnish training courses that instruct system operators in the efficient operation of Contractor-provided aspects of the PCIS that include not only the general operation of each control system but also the operation of specific system features.
      3) Operator's training shall include the following for each vendor package and programmable device:
         a) Control system overview: Architecture, equipment functions, software components, etc.
         b) Display navigation, overview, and types of displays.
         c) Process and equipment monitoring and control: Basic principles and operation.
         d) Logging ON and OFF the system and description of the security and access system.
         e) Alarm subsystem.
         f) Trending: Provide a thorough session on how to use all trending functions.
         g) Reports: How to access, print, and review content.
         h) Control strategies: Present an average 15-minute review of each control strategy, including a hands-on demonstration of screens and operator functions for each.
         i) Instruction on the use of all operational functionality alarm logging, trending, displays, database, reports, and control

software developed for the Project and incorporated in the installed PCIS system.

c. PLC hardware training:
   1) Furnish training on PLC hardware and on related components, including battery backup equipment, UPSs, LOI hardware, control circuits, and analog circuits.
   2) Furnish training on PLC hardware principles, product features, proper installation, operation, troubleshooting, and maintenance.
   3) PLC training may be provided by manufacturer's certified trainers.
d. PLC software training:
   1) Furnish training on PLC software.
   2) 2 types of training are required, basic and project-specific:
      a) Basic PLC software training covers the principles of PLC programming and the specific features and function of the PLC products used on this Project, provided by one of the PLC manufacturer's certified trainers.
      b) Project-specific PLC software training covers the programming conventions, new standardized software modules, specific control strategy programs, and documentation created for the Work performed under this Contract. This training includes the specific knowledge needed to modify, expand, duplicate, troubleshoot, and repair the PLC programs provided under this Contract, provided by a qualified member of the ICSC who is thoroughly familiar with the delivered system, and is one of the senior programmers who programmed the PLCs for this Project.
e. LOI hardware and software training:
   1) Provide the following:
      a) Overview of hardware and firmware, including starting, stopping, and PLC interface.
      b) Configuration of tag database.
      c) Creating, editing, and saving display screens.
      d) Troubleshooting.
f. Network equipment training:
   1) Furnish basic training on all network hardware, switch and router configuration and software, and network monitoring software.
   2) Include a detailed description and explanation of the installed network architecture, media, and functions.
   3) Furnish an overview of the function and operation of each piece of network equipment.
   4) Furnish training on network maintenance troubleshooting and repair.
   5) Furnish training on how to install spare or off-line backup equipment.
   6) Basic network overview:
      a) Discuss a basic network overview for each site.
      b) Discuss the architecture (loop, star, etc.), media redundancy, and items that are not readily apparent to staff.
      c) Discuss how to monitor the network health through the HMI network screen.
      d) Discuss both enterprise level networks, the PCS communications network, and the field network.

7) Ethernet switches:
    a) Discuss the various types of switches (Layer 2, Layer 3, etc.).
    b) Discuss switch health monitoring through the HMI.
    c) Discuss the VLAN configuration (what ports should be used for what network, etc.).
    d) Discuss testing procedures.
8) Field networks:
    a) General:
        (1) Discuss general principles behind likely device failures and actions to take to resolve such failures for each type of field network.
    b) DLR networks:
        (1) Discuss how to add non-DLR equipped devices to a DLR network.
        (2) Discuss how to monitor and test DLR network health through an ETAP module or DLR capable switch.

g. Follow-up training:
1) Provide a series of on-site follow-up training classes beginning after process start-up of the SCADA/PCIS system. The intent for these classes is to provide the Owner's personnel the opportunity for a review and "refresher" of the training topics and material after they have had some experience using the system.
2) Mutually schedule and develop the content of these classes with the Owner no later than 1 month before the beginning of the first session:
    a) Schedule at the Owner's discretion on non-consecutive days spaced out over the process start-up and warranty period.

h. Instrumentation training:
1) Furnish training covering all instruments and control panels.
2) Furnish the specified quantity of training, allocated to cover new instruments and hardwired controls as specified in this Section and specifically determined in the accepted training plan.
3) Train maintenance staff in the use, cleaning, calibration, maintenance, and troubleshooting of all the instruments furnished within this Project.
4) Furnish training on the operation of new hardwired controls.

i. Analytical instrument training:
1) Furnish training covering all analytical instruments.
2) Furnish the specified quantity of training, allocated to cover new analytical instruments as specified in this Section and specifically determined in the accepted training plan.
3) Train maintenance staff in the use, cleaning, calibration, maintenance, and troubleshooting of all the analytical instruments furnished within this Project.
4) Provide training by manufacturer.

4. Recording training sessions:
a. Record all training.
b. Produce audio-visual presentations by recording the actual training sessions of the Owner's personnel.
c. Furnish digital video disk (DVD) format.

d. These disks become the property of the Owner and cover, in detail, the training for the specific hardware and software of all the systems provided for the Project.
e. Provide all the necessary cameras and recording equipment.

5. Installation testing:
   a. Calibration:
      1) Performed by Contractor and ICSC.
      2) Calibrate and adjust all instruments, devices, valves, and systems, in conformance with the component manufacturer's instructions and as specified in these Contract Documents.
      3) Replace either individually or within a system, defective elements that cannot achieve proper calibration or accuracy.
         a) Calibration for discrete devices:
            (1) Calibrate and adjust devices for reliable operation and to avoid nuisance tripping.
         b) Calibration for ultrasonic and radar level devices:
            (1) Provide Echo Transmission and signal quality on level transmitters including guided and unguided units.
               (a) Submit printout of the actual transmission and parameters.
            (2) Adjust mounting, as required, to obtain accurate readings.
            (3) Post mounting: Provide any additional calibration required by manufacturer.
         c) Calibrating analog transmitters:
            (1) Components having adjustable features are to be set accurately for the specific conditions and applications of this installation.
            (2) Test and verify that components and/or systems are within the specified limits of accuracy.
            (3) Calibration points:
               (a) Calibrate each analog instrument at 0 percent, 25 percent, 50 percent, 75 percent, and 100 percent of span, using test instruments with accuracies traceable to NIST.
            (4) Field verify calibration of instruments including units that have been factory-calibrated to determine whether any of the calibrations are in need of adjustment.
         d) Analyzer calibration:
            (1) Calibrate and test each analyzer system as a workable system after installation. Follow the testing procedures directed by the manufacturers' technical representatives.
            (2) Submit completed instrument calibration sheets for every field instrument and analyzer.
            (3) Calibration tags:
               (a) Attach a calibration and testing tag to each instrument, piece of equipment, or system.
               (b) Sign the tag when calibration is complete.
         e) Calibration for industrial networking test equipment:
         f) Submit calibration documentation.

b. Loop check:
    1) Performed by the Contractor.
    2) Cabling installed, terminated, and labeled.
    3) Perform continuity check of wiring to each field device through intermediate devices to field terminals in the cabinet.
    4) Complete loop check form for each device.
    5) Submit loop check test results before proceeding to the next step.
c. Loop validation tests:
    1) Performed by the Contractor, ICSC, and manufacturer's representative, working together, and witnessed by the Owner or Owner's representative.
    2) Perform tests on the signal from each field device through intermediate devices to the I/O module on the PLC.
        a) The PLC may or may not be connected to the network.
    3) Engineer approval of the loop validation test submittal is required before proceeding to CEET.
d. Copper Ethernet cable acceptance testing:
    1) All testing procedures and field-test instruments shall comply with applicable requirements of:
        a) TIA-1152 - Requirements for Field Test Instruments and Measurements for Balanced Twisted-Pair Cabling.
        b) TIA-568.0-E - Generic Telecommunications Cabling for Customer Premises.
        c) TIA-568.1-E - Commercial Building Telecommunications Infrastructure Standard.
        d) TIA-568.2-D - Balanced Twisted-Pair Telecommunications Cabling and Components Standard.
        e) Copper Ethernet cable installation testing as specified in Section 16950 - Field Electrical Acceptance Tests.
    2) Testing shall be performed by trained technicians who have successfully completed an appropriate training program and have obtained a certificate as proof thereof shall execute the tests. These certificates may have been issued by any of the following organizations or an equivalent organization:
        a) Manufacturer of the connectors or cable.
        b) Manufacturer of the test equipment used for the field certification.
        c) Training organizations (e.g., BICSI).
    3) Submit the following information before testing begins:
        a) Manufacturer’s catalog sheets, specifications, and the most recent calibration report for the test equipment.
        b) Certificate of testing technician’s training.
        c) A schedule of all balanced twisted-pair copper links to be tested, including:
            (1) Cable identification as it appears on the cable records.
            (2) Cable identification as it appears on the individual test reports.
            (3) Cable identification as specified in Section 16075 - Identification for Electrical Systems.
        d) Sample test reports.

e) All installed cabling Permanent Links shall be field-tested and pass the test requirements and analysis as described below.
   (1) Any Permanent Link that fails these requirements shall be diagnosed and corrected.
   (2) Any corrective action that must take place shall be documented and followed with a new test to prove that the corrected Permanent Link meets performance requirements.
   (3) The final and passing result of the tests for all Permanent Links shall be provided in the test results documentation in accordance with the testing requirements.

f) Acceptance of the test results shall be given in writing after the project is fully completed and tested in accordance with Contract Documents and to the satisfaction of the Engineer.

4) Cable field-test instruments:

a) The field-test instrument shall be within the calibration period recommended by the manufacturer, typically 12 months.

b) Certification tester requirements:
   (1) Level III in accordance with TIA-1152.
   (2) Independent verification of accuracy.
   (3) Must be capable of storing more than 10,000 results for all required measurements.
   (4) Manufacturer: The following or equal:
      (a) Fluke CableAnalyzer Industrial Ethernet Kit, DSX2-5-IE-K1.

c) Permanent Link adapters:
   (1) Use manufacturer's adapter for connecting to tested equipment.
      (a) Patch cables shall not be used for testing.
   (2) RJ45 plug must meet the requirements for NEXT, FEXT and Return Loss in accordance with TIA-568.2-D Annex C.

d) Measurement capabilities:
   (1) Wire Map.
   (2) Length.
   (3) Propagation Delay.
   (4) Delay Skew.
   (5) DC Loop Resistance.
   (6) DC Resistance Unbalance.
   (7) Insertion Loss.
   (8) NEXT (Near-End Crosstalk).
   (9) PS NEXT (Power Sum Near-End Crosstalk).
   (10) ACR-N (Attenuation to Crosstalk Ratio Near-End).
   (11) PS ACR-N (Power Sum Attenuation to Crosstalk Ratio Near-End).
   (12) ACR-F (Attenuation to Crosstalk Ratio Far-End).
   (13) PS ACR-F (Power Sum Attenuation to Crosstalk Ratio Far-End).
   (14) Return Loss.
   (15) TCL (Transverse Conversion Loss).

(16) ELTCTL (Equal Level Transverse Conversion Transfer Loss).
(17) Time Domain Reflectometer.
(18) Time Domain Xtalk Analyzer.

5) Testing requirements:
   a) Field-test instruments shall have the latest software and firmware installed.
   b) Permanent Link test results including the individual frequency measurements from the tester shall be recorded in the test instrument upon completion of each test for subsequent uploading to a PC in which the administrative documentation (reports) may be generated.
   c) Testing shall be performed on each cabling segment from connector to connector.
      (1) Sampling is not acceptable.
   d) The installer shall build a reference link:
      (1) All components shall be anchored so it is not possible to disturb them.
      (2) The technician is to conduct a Permanent Link test each day, for each type of category cable used, to ensure no degradation of the tester or its Permanent Link adapters.
   e) Unless noted otherwise tests shall use the following frequency resolution:
      (1) 1 - 31.25 MHz: 150 kHz.
      (2) 31.25 - 100 MHz: 250 kHz.
      (3) 100 - 250 MHz: 500 kHz.
   f) Wire Map measurement:
      (1) Wire map test is intended to verify pin-to-pin termination at each end and check for installation connectivity errors. For each of the 8 conductors in the cabling, the wire map indicates:
         (a) Continuity to the remote end.
         (b) Shorts between any two or more conductors.
         (c) Reversed pairs.
         (d) Split pairs.
         (e) Transposed pairs.
         (f) Distance to open on shield.
         (g) Any other miss-wiring.
         (h) The correct connectivity of telecommunications outlets/connectors is defined in TIA-568.2-D:
            - 2 color schemes are permitted.
            - User shall define which scheme is to be used.
            - Field tester shall document which color scheme was used.
   g) Length measurement:
      (1) Record the length of each cable. Use the physical length of the link calculated using the pair with the shortest electrical delay for reporting and to determine pass/fail.
      (2) Pass or fail criteria is based on the maximum length allowed for the Permanent Link as specified in TIA-568.D-2 plus the nominal velocity of propagation (NVP) uncertainty

of 10 percent. For a Permanent Link, the length measurement can be 325 feet before a fail is reported.

h) Propagation Delay measurement:
   (1) Is the time it takes for a signal to reach the end of the link.
   (2) The measurement shall be made at 10 MHz in accordance with TIA-1152.
   (3) The propagation delay of each balanced twisted pair shall be recorded.
   (4) Is not to exceed 498 ns in accordance with TIA-568.2-D Section 6.4.21.

i) Delay Skew measurement:
   (1) Is the difference in propagation delay at 10 MHz between the shortest delay and the delays of the other wire pairs.
   (2) The delay skew of each balanced twisted pair shall be recorded.
   (3) Is not to exceed 44 ns in accordance with TIA-568.2-D Section 6.4.22.

j) DC Resistance:
   (1) Often reported as Resistance, is the loop resistance of both conductors in the pair.
   (2) Is not specified in TIA-1152 but shall be recorded for all 4 pairs.

k) DC Resistance Unbalance:
   (1) Often reported as Resistance Unbalance, is the difference in resistance of the 2 wires within the pair.
   (2) Is not specified in TIA-1152 for a Permanent Link but shall be recorded for all 4 pairs.

l) Insertion Loss:
   (1) Is the loss of signal strength over the cabling (in dB).
   (2) Worst case shall be reported for all 4 pairs in one direction only.
   (3) Reported margins found to be within the accuracy of the field tester shall be marked with an asterisk.
   (4) Is not to exceed the Category 6 Permanent Link limits in accordance with TIA-568.2-D Section 6.4.10.

m) NEXT (Near-End Crosstalk):
   (1) Is the difference in amplitude (in dB) between a transmitted signal and the crosstalk received on other wire pairs at the same end of the cabling.
   (2) Shall be measured in both directions (12 pair to pair possible combinations).
   (3) Both worst case and worst margins shall be reported.
   (4) Is not to exceed the Category 6 Permanent Link limits in accordance with TIA-568.2-D Section 6.4.11.
   (5) Reported margins found to be within the accuracy of the field tester shall be marked with an asterisk (*).
   (6) The Time Domain Xtalk data shall be stored for any marginal or failing NEXT results.

n) PS NEXT (Power Sum Near-End Crosstalk):
   (1) Is the difference (in dB) between the test signal and the crosstalk from the other pairs received at the same end of the cabling.
   (2) Shall be measured in both directions (8 pair possible combinations).
   (3) Both worst case and worst margins shall be reported.
   (4) Is not to exceed the Category 6 Permanent Link limits in accordance with TIA-568.2-D Section 6.4.12.
   (5) Reported margins found to be within the accuracy of the field tester shall be marked with an asterisk (*).
   (6) Time Domain Xtalk data shall be stored for any marginal or failing PS NEXT results.

o) ACR-N (Attenuation Crosstalk Ratio Near-End):
   (1) Is a calculation of NEXT minus Insertion Loss of the disturbed pair in dB.
   (2) Shall be calculated in both directions.
   (3) Is not specified in TIA-1152 but shall be recorded for all 12 possible combinations.

p) PS ACR-N (Power Sum Attenuation Crosstalk Ratio Near-End):
   (1) Is a calculation of PS NEXT minus Insertion Loss of the disturbed pair in dB.
   (2) Shall be calculated in both directions.
   (3) Is not specified in TIA-1152 but shall be recorded for all 8 possible combinations.

q) ACR-F (Attenuation Crosstalk Ratio Far-End):
   (1) Is a calculation of FEXT minus Insertion Loss of the disturbed pair in dB.
   (2) Shall be measured in both directions (24 pair to pair possible combinations).
   (3) Both worst case and worst margins shall be reported.
   (4) Is not to exceed the Category 6 Permanent Link limits in accordance with TIA-568.2-D Section 6.4.14.
   (5) Reported margins found to be within the accuracy of the field tester shall be marked with an asterisk (*).

r) PS ACR-F (Power Sum Attenuation Crosstalk Ratio Far-End):
   (1) Is a calculation of PS FEXT minus Insertion Loss of the disturbed pair in dB.
   (2) Shall be measured in both directions (8 pair possible combinations).
   (3) Both worst case and worst margins shall be reported.
   (4) Is not to exceed the Category 6 Permanent Link limits in accordance with TIA-568.2-D Section 6.4.16.
   (5) Reported margins found to be within the accuracy of the field tester shall be marked with an asterisk (*).

s) Return Loss:
   (1) Is the difference (in dB) between the power of a transmitted signal and the power of the signals reflected back.
   (2) Shall be measured in both directions (8 pair possible combinations).
   (3) Both worst case and worst margins shall be reported.

(4) Shall be ignored at all frequencies where the Insertion Loss is less than 3 dB for that pair.
(5) Is not to exceed the Category 6 Permanent Link limits in accordance with TIA-568.2-D Section 6.4.9.
(6) Reported margins found to be within the accuracy of the field tester shall be marked with an asterisk (*).
(7) Time Domain Reflectometer data shall be stored for any marginal or failing Return Loss results.

t) TCL (Transverse Conversion Loss):
(1) Is the ratio (in dB) between a differential mode signal inject at the near-end and the common-mode signal measured at the near-end on the same wire pair.
(2) Shall be measured in both directions.
(3) Is not specified in TIA-1152 for a Permanent Link but shall be recorded for all 8 possible combinations.

u) ELTCTL (Equal Level Transverse Conversion Transfer Loss):
(1) Is the ratio (in dB) between a differential mode signal inject at the near-end and the common-mode signal measured at the far end on the same wire pair minus the Insertion Loss of that pair.
(2) Shall be measured in both directions.
(3) Is not specified in TIA-1152 for a Permanent Link but shall be recorded for all 8 possible combinations.

6) Test results documentation:
a) The detailed test results documentation data is to be provided in an electronic database for each tested balance twisted-pair and shall contain the following information:
(1) The overall Pass/Fail evaluation of the link-under-test.
(2) The date and time the test results were saved in the memory of the tester.
(3) The identification of the customer site as specified by the end-user.
(4) The name of the test limit selected to execute the stored test results.
(5) The name of the personnel performing the test.
(6) The version of the test software and the version of the test limit database held within the test instrument.
(7) The manufacturer, model and serial number of the field-test instrument.
(8) The adapters used.
(9) The factory calibration date.
(10) Wire Map.
(11) Propagation Delay values, for all 4 pairs.
(12) Delay Skew values, for all 4 pairs
(13) DC Resistance values, for all 4 pairs
(14) DC Resistance Unbalance, values for all 4 pairs
(15) Insertion Loss, worst case values for all 4 pairs
(16) NEXT, worst case margin and worst case values, both directions
(17) PS NEXT, worst case margin and worst case values, both directions.

(18) ACR-F, worst case margin and worst case values, both directions.
(19) PS ACR-F, worst case margin and worst case values, both directions.
(20) Return Loss, worst case margin and worst case values, both directions.
(21) TCL, worst case values both directions.
(22) ELTCTL, worst case values, both directions.
(23) Time Domain Crosstalk data if the link is marginal or fails.
(24) Time Domain Reflectometer data if the link is marginal or fails.

b) Maintain a set of “red-line” throughout during construction:
(1) Drawings shall be available for review at any time as requested by Owner or Engineer.
(2) Provide record copy drawings at the end of the project shall be in CAD format and include notations reflecting the as built conditions of any additions to or variation from the drawings provided such as, but not limited to cable paths and termination point.
(3) The as built drawings shall include, but are not limited to block diagrams, frame and cable labeling, cable termination points, equipment room layouts and frame installation details.
(4) The as builts shall include all field changes made up to construction completion:
(a) Field directed changes to pull schedule.
(b) Horizontal cable routing changes.

7) Associated detail drawings. Engineer approval of the copper Ethernet cable acceptance-testing submittal is required before proceeding to CEET.

e. Complete End-to-End Testing (CEET):
1) Performed by Contractor, ICSC, manufacturer's representative working together, with assistance from the OWNER or the inspection staff, as needed.
a) The participants need to be dedicated full-time to CEET.
b) ICSC will provide staff to verify input signals at, and create output signals from, an HMI or Engineering Workstation.
c) Contractor and ICSC will be responsible for creating field signals and verifying proper operation of final control elements.

2) Prerequisites:
a) CEET cannot begin until the successful completion of the preceding tests:
(1) Calibration.
(2) Loop check.
(3) Loop validation tests.
(4) Copper Ethernet cable acceptance testing.
(5) Industrial network testing.

3) Testing description:
a) This testing is to ensure all I/O signals operate to the intent of the design from the field device to the HMI and all other auxiliary controls and indicators in the PCS.

b) Connect PLC to the network to test signals from the field device through the PLC program, the network, and to the operator's HMI graphic screens. The outputs will be energized for a duration long enough to verify proper operation of the final control element.
c) SCADA screens:
(1) Test and record operator commands and signal readouts to each operator device where there is more than one operator interface point.
(2) For each signal, perform separate tests for SCADA computer screens, local operator interface (LOI) screens, and local control panels.
(3) Retest any loop following any necessary corrections.

4) Check control loops under simulated operating conditions by causing a range of input signals at the primary control elements and observing appropriate responses of the respective control and monitoring elements, final control elements, and the graphic displays associated with the HMI/SCADA system.
a) Use actual process inputs wherever available.
b) Issue commands from the HMI/SCADA system and verify proper responses of field devices.
(1) Test SCADA system inputs from field device to SCADA system operator workstations.
(a) Track responses through trend charts in the HMI/SCADA system.
(2) Test SCADA system outputs from SCADA operator workstations to field devices and equipment.

5) Discrete device testing:
a) Exercise each field device providing a discrete input to the HMI/SCADA system in the field and observe the proper operation shall be observed at the operator workstation:
(1) Test limit switches, set limits mechanically, and observe proper operation at the operator workstation.
(2) Exercise starters, relay contacts, switch contacts, and observe proper operation.
(3) Calibrate and test instruments supplying discrete inputs and observe proper operation.
b) Test each device accepting a discrete output signal from the HMI/SCADA. Perform the appropriate operator action at the SCADA operator stations (including LOIs, if present) and confirm the proper operation of the field device:
(1) Stroke valves through outputs from the HMI/SCADA system, and confirm proper directional operation. Confirm travel limits and any feedback signals to the HMI/SCADA system.
(2) Exercise motors starters from the HMI/SCADA system and verify proper operation through direct field observation.
(3) Exercise solenoids and other field devices from the HMI/SCADA system and verify proper operation through direct field observation.

6) Analog device testing:
   a) Apply continuously variable up and down analog inputs to verify the proper operation and setting of discrete devices (signal trips, etc.).
   b) Apply provisional settings on controllers and alarm setpoints.
7) Analog input:
   a) Exercise each field device monitoring the analog signal, through the HMI/SCADA system.
      (1) Apply simulated sensor inputs corresponding to 0 percent, 25 percent, 50 percent, 75 percent, and 100 percent of span for networks that incorporate analog elements and monitor the resulting outputs to verify compliance to accuracy tolerance requirements.
8) Analog output:
   a) Exercise each field device requiring an analog command signal, through the HMI/SCADA system.
      (1) Vary the output from the PLC HMI/SCADA system and measure the end device position, speed, etc. to confirm the proper operation of the device for the supplied analog signal.
      (2) Manually set the output from the HMI/SCADA screen at 0 percent, 25 percent, 50 percent, 75 percent, and 100 percent and measure the response at the final device and at any intermediate devices.
9) Submit completed test forms:
   a) Discrete instrument input devices:
      (1) Switch setting, contact action, and dead band.
      (2) Valve position switches:
         (a) Response in the PLC as the valve is stroked from the PLC.
         (b) Field observed actual valve position, and valve indicator position as the valve is stroked from the PLC.
      (3) Operator interface switches (control stations and other pilot devices) and associated response.
      (4) Starter and drive auxiliary device contact response.
      (5) Response of all other discrete inputs to the PLC.
      (6) Test equipment used and associated serial numbers.
   b) Discrete output devices:
      (1) Observed response of field device to the discrete output from the PLC.
      (2) Observe the proper operation of Open, Close, Start, Stop, On, Off, etc.
      (3) Test equipment used and associated serial numbers.
   c) Analog input devices:
      (1) Calibration range.
      (2) Calibration data: Input, output, and error at each test value.
      (3) Analog input associated PLC register address.
      (4) Value in PLC register at each test point.
      (5) Value displayed at each operator interface station (local operator interface displays and SCADA workstations).
      (6) Test equipment used and associated serial numbers.

d) Analog output devices:
(1) Calibration range.
(2) Test value at each test point.
(3) Analog output associated PLC register address.
(4) Control variable value at field device at each test point.
(5) Physical device response at each test point:
(a) Response to be actual valve position, or motor speed, etc.
(6) Test equipment used and associated serial numbers.

10) Failure testing:
a) Demonstrate how the system reacts and recovers from abnormal conditions including, but not limited to:
(1) Equipment failure.
(2) Communications sub-system error.
(3) Power failure.
(4) Process equipment failure.
(5) High system loading conditions.

11) Engineer approval of the CEET submittals is required before proceeding to Functional Testing.

6. Functional testing:
a. General:
1) Testing to demonstrate proper operation of systems with process equipment operating over full operating ranges under conditions as closely resembling actual operating conditions as possible.
2) Performed by Contractor, ICSC, manufacturer's representative working together, with assistance from the OWNER or the inspection staff, as needed.
3) Additional tests are specified in other Instrumentation and Control Sections.
4) Follow approved detailed test procedures and check lists for Functional Test activities.

b. Control logic operational validation:
1) The purpose of control logic validation is to field test the operation of the complete control system, including all parts of the HMI/SCADA system, all control panels (including vendor control panels), all control circuits, all control stations, all monitored/controlled equipment, and final control elements.
2) Demonstrate control functionality shown on the P&IDs, control schematics, and other drawings, and specified in the loop descriptions, control strategies, Electrical Specifications, and Mechanical Equipment Specifications.
3) Test in detail on a function-by-function and sentence-by-sentence basis.
4) Thoroughly test hardware and software functions:
5) Including all hardwired and software control circuit interlocks and alarms.

6) Test final control elements, controlled equipment, control panels, and ancillary equipment under startup, shut down, and steady-state operating conditions to verify all logic and control is achieved.
7) Control logic validation tests to include, but not limited to: a repeat of all control logic tests from the FAT, modified and expanded to include all field instruments, control panels, circuits, and equipment.

c. Loop tuning:
1) Optimally tune all electronic control stations and software control logic incorporating proportional, integral, or derivative control. Apply control signal disturbances at various process variable levels and adjusting the gain, reset, or rate settings as required to achieve proper response.
2) Verify the transient stability of final control elements operating over the full range of operating conditions, by applying control signal disturbances, monitoring the amplitude and decay rate of control parameter oscillations and making necessary controller adjustments as required to eliminate excessive oscillatory amplitudes and decay rates. As a minimum, achieve 1/4-wave amplitude decay ratio damping (subsidence ratio of 4) under the full range of operating conditions.
3) If excessive oscillations or system instability occur, as determined by the Engineer, continue tuning and parameter adjustments, or develop and implement any additional control algorithms needed to achieve satisfactory control loop operation.
4) Functional validation sheets:
a) Document each Functional test on an approved test form.
b) Document loop tuning with a report for each loop, including two-pen chart recordings showing the responses to step disturbance at a minimum of 3 setpoints or process rates approved by the Engineer. Show tuning parameters on the charts, along with time, date, and sign-off by Contractor and Engineer.
c) Include on the form, functions which can be demonstrated on a loop-by-loop basis:
(1) Loop number and P&ID number.
(2) Control strategy, or reference to specification tested.
(3) Test procedures: Where applicable, use the FAT function-by-function, sentence-by-sentence loop test checklist forms modified to meet the requirements of the Functional test. Otherwise, create new forms.
d) For functions that cannot be demonstrated on a loop-by-loop basis (such as overall plant power failure), include on the test form a listing of the specific steps and tests to be conducted. Include with each test description the following information:
(1) Specification page and paragraph of function demonstrated.
(2) Description of function and/or text from specification.
(3) Test procedures: use the FAT loop test checklist forms modified to meet the specific testing conditions of the Functional test.

5) Functional certification:
a) Provide Manufacturer's Certificate of Installation and Functionality Compliance as specified in Section 01756 - Commissioning.
(1) Including all test forms with test data entered, submitted to the Engineer with a clear and unequivocal statement that all Functional test requirements have been satisfied.

7. Clean Water Facility Testing:
a. ICSC shall be onsite to support Clean Water Test activities and provide functional changes as required.

C. Process Start-up Phase:
1. Process Start-up:
a. ICSC shall be onsite to support Process Start-up activities and provide functional changes as required.
2. Process Operation Period:
a. ICSC shall be available to support Process Operational Period and provide functional changes as required.
3. PCIS Optimization and Fine-Tuning:
a. General:
1) After the Process Operational Period, test PCIS system for additional 60 days as specified in this Section to identify issues and make corrections, as needed.
2) This is part of the Work that must be completed as a condition of substantial completion and final completion for the entire Project.
3) The complete PLC control and HMI/SCADA system must run continuously for the duration of the PCIS Optimization and Fine-Tuning.
4) Test and use the entire process control system under standard operating conditions.
5) Exercise all system functions.
6) Log failure, any system interruption and accompanying component, subsystem, or program failure including time of occurrence, duration of each failure, failure classification, and cause:
a) Provide a competently trained technician or programmer on call for the Project Site during all normal working days and hours from the start of the PCIS Optimization and Fine-Tuning until final acceptance of the system.
(1) Response time to the Project Site: 24 hours or less, for a major failure.
b. SCADA system testing:
1) Exercise each system function, e.g., status report, alarms, logs, and displays several times at a minimum, and in a manner that approximates "normal" system operation.
2) Failure of the HMI/SCADA system during testing shall be considered as indicating that the programs and operating system do not meet the requirements of the specifications.
a) Corrective action is required before restarting the PCIS Optimization and Fine-Tuning.
3) Only those components, sub-systems, and systems covered in this Section and supplied under this Contract shall be considered for this

acceptance test. Problems and failures of other systems shall not be considered as part of this test, except as they display the capabilities of this system to detect failures.

4) Failures:
   a) Classify failures as either major or minor:
      (1) Minor failure:
         (a) A small and non-critical component failure or software problem that can be corrected by the Owner's operators.
         (b) Log this occurrence but this is not a reason for stopping the test and is not grounds for non-acceptance.
         (c) Should the same or similar component failure occur repeatedly, this may be considered as grounds for non-acceptance.
         (d) Failure of one printer or operator station is considered a minor failure providing all functions can be provided by backup equipment, i.e., alternate printers and operator station, and repairs can be made and equipment returned to service within 3 working days.
      (2) Major failure:
         (a) Considered to have occurred when a component, subsystem, software control, or program fault causes a halt in or improper operation of the system and/or when a technician's work is required to make a repair or to re-initiate operation of the system.
         (b) Cause termination of the PCIS Optimization and Fine-Tuning.
         (c) Start a new acceptance test when the causes of a major failure have been corrected.
         (d) A failure is also considered major when failure of any control system that results in an overflow, underflow, overdose, or underdose condition occurs.

5) Technician report:
   a) Each time a technician is required to respond to a system malfunction, they must complete a report, which includes details concerning the nature of the complaint or malfunction and the resulting repair action required and taken.
   b) If a malfunction occurs which clears itself or which the operator on duty is able to correct, no report is required or logged as specified above.
   c) If a technician has performed work but no report is written, then a major failure is considered to have occurred.
   d) Each report shall be submitted within 24 hours to the Engineer and the Owner, or its representative.

3.07 FIELD QUALITY CONTROL (NOT USED)

3.08 RE-INSTALLATION (NOT USED)

3.09 ADJUSTING (NOT USED)

3.10 CLEANING (NOT USED)

3.11 PROTECTION (NOT USED)

3.12 SCHEDULES

A. Example test forms:
   1. Example test forms are attached at the end of this Section. They may be used as a starting point for the development of Project-specific test forms for this Project.
   2. The example test forms are not intended to be complete or comprehensive. Edit and supplement the forms to meet the requirements for testing and test forms specified in this Section and other Contract Documents.

END OF SECTION

ATTACHMENT A - FACTORY ACCEPTANCE TEST - CONTROL PANELS

	FACTORY ACCEPTANCE TEST - CONTROL PANELS	

1. GENERAL INSPECTION

A. Structural Inspection

- ☐ Verify Lifting Lugs Installed
- ☐ Verity enclosure has lock and lock is functional
- ☐ Confirm that seismic bracing components are provided per manufacturer's installation instructions

B. Exterior Inspection

- ☐ Cabinet exterior is clean, scratch, and dent free
- ☐ Inspect externally for corrosion and damage
- ☐ Verify enclosure door opens and closes easily
- ☐ Verify enclosure has a 3-point latch
- ☐ Verify enclosure has a flange mounted disconnect (where voltages greater than 120 VAC enter the cabinet)
- ☐ Verify enclosure has the appropriate NEMA rating (1, 1G, 12, 3R, 4, 4X, etc.)
- ☐ Verify enclosure is the appropriate size (not grossly larger than design, and will still fit in the plant)

Nameplates

- ☐ Cabinet has identification nameplate
- ☐ All door labels are straight, spelled correctly, and match the tagging defined in the Contract
- ☐ Cabinet has a nameplate that includes the following:
  - ☐ Power source(s)
  - ☐ Integrator's Logo
  - ☐ Circuit ID(s)
  - ☐ Short Circuit KAIC ratings
- ☐ If labels are screwed to door, silicone was utilized to cover screw holes (Labels screwed to the door of a NEMA 4/4X panel technically violates the NEMA rating.)

Door Devices

- ☐ All devices penetrating the outside of panel have gaskets, silicone or both
- ☐ All door devices are installed (HMIs, Pilot Devices, etc.)
- ☐ Door mounted equipment is mounted straight and square
- ☐ All exterior or door mounted equipment present and accounted for, installed and securely fastened
- ☐ NEMA classification has not been violated due to penetrations
- ☐ Door mounted equipment has the same NEMA rating as the panel
- ☐ All door mounted equipment installed at the correct height
- ☐ All door mounted equipment installed in the correct positions and order (layout of door mounted equipment is grouped properly and in a logical manner)
- ☐ Doors with multiple penetrations have adequate bracing (if needed)
- ☐ Visually check condition of indicators , controllers and annunciators
- ☐ Check that pilot lights illuminate correctly
- ☐ Check the Push-To-Test function
- ☐ Ensure correct pilot light color

Peripheral Devices

- ☐ Horn / Beacon is installed (where required)
- ☐ Silence and Reset pushbutton

	FACTORY ACCEPTANCE TEST - CONTROL PANELS	

1. GENERAL INSPECTION (continued)

C. Interior Inspection

- ☐ Cabinet is cleaned of marks and dirt.
- ☐ Inspect internally for corrosion and damage.
- ☐ Back panel is clean of marks and dirt.
- ☐ Interior of panel vacuumed and shall be free of all debris.
- ☐ Check that the panel roof is clean and clear of foreign materials.
- ☐ Bottom of panel has been cut out (where bottom entry is required), with angle iron welded around the bottom perimeter. Re-painting has been performed.
- ☐ If internal light door limit switch is provided, ensure the light automatically turns "on" when the doors are open.
- ☐ Check that a document pocket has been provided.
- ☐ Intrusion alarms (where required).

Interior Labeling

- ☐ All panel mounted equipment has identification labeling, by using either a Brothers or Phenolic type tags.
- ☐ Verify that door mounted components are mounted square and symmetrical.
- ☐ Verify that nameplates are straight, legible, and spelled correctly.
- ☐ All terminal blocks are identified/labeled with permanent labels including tight end blocks and caps.
- ☐ All wiring shrink labeled and or phased correctly to the specifications.
- ☐ All wire labels shrunk completely rotated and aligned alike for easy identification.
- ☐ All fuses and circuit breakers are labeled with ID and current rating.
- ☐ System Integrator’s label or labels installed on door.
- ☐ Panel manufacturer model/serial number tag is present.
- ☐ All required safety/warning tags installed and straight.
- ☐ Correct UL (typically UL 508) or cUL tag installed and registered and all other associated tags installed and straight (the UL tag might not be installed in the panel at the factory test. If the panel is modified due to changes during the factory test or a punch list generated from the factory test, the UL labeling would need to be re-applied. Some UL shops do not apply the UL label until the panel is released to be shipped.).

Wireways

- ☐ Plastic wire way covers installed properly.
- ☐ Plastic wireways have no sharp edges.
- ☐ No wire Ties inside the wireways.
- ☐ No sharp edges on wire ties.
- ☐ Separation: White duct is used for DC voltages, Gray duct is used for AC voltages.
- ☐ Ensure wiring duct is not over-full, includes provision for 20% more wiring and the cover may easily be installed. Panduit recommends 50% duct fill, but 40% is a better practice.

WITNESSED BY:		SIGNATURE:	

1. GENERAL INSPECTION (continued)

C. Interior Inspection (continued)

Wiring

- ☐ Visually check terminals and condition of internal wirings
- ☐ Verify that the control panel has been assembled and wired as designed
- ☐ Verify that all components are operational and perform the functions intended
- ☐ Verify that all components are sized appropriately for the application
- ☐ Verify that equipment control circuits function as intended
- ☐ Back of door wiring is labeled and neatly formed
- ☐ Back panel to door wiring has sufficient bending radius with spiral wrap
- ☐ Wire connection has been verified wired to correct points within the panel
- ☐ Individual wires have been given a pull test to verify a good terminal connection
- ☐ Wire and cable minimum bending radius have not been violated
- ☐ All equipment installed straight and square to back panel
- ☐ Wire colors are correct:
  - ☐ Black and White > AC hot and neutral, respectively
  - ☐ Red > AC control signals
  - ☐ Blue > DC power and control (Blue w/White stripe for DC ground)
  - ☐ Yellow > Foreign voltages (those still present when panel power is disconnected)
  - ☐ Green > AC equipment ground
  - ☐ Black > TSP (+)
  - ☐ White> TSP(-)
- ☐ Analog wiring shields are continuous (connected by a dedicated terminal block for such shields)
- ☐ Analog shield wires are grounded within the panel, where not otherwise grounded at the transmitter itself
- ☐ Discrete inputs are separately fused or protected by a circuit breaker on a “per loop” basis
- ☐ Intrinsic Safety Wiring
  - ☐ Ensure wiring associated with intrinsic safety circuits or intrinsic safety barriers is kept away from all other wiring by UL minimum distances or by a physical (grounded metal) barrier preventing non-intrinsically safe wiring from coming in contact with intrinsically safe circuits or wiring
- ☐ Verify all spare terminals are installed according to the percentage listed in the specifications

Grounding

- ☐ Equipped with “Blackburn” or other grounding type lug
- ☐ Lug is securely fastened to the panel structure
- ☐ Verify Grounding bar is installed
- ☐ Verify Isolated ground bar is installed

PROJECT NAME:		TEST DATE:	
FACILITY NAME:		TESTED BY:	
PROCESS AREA:		COMPANY:	
NETWORK ID:		PAGE:	
WITNESSED BY:		SIGNATURE:	

2. POWER TEST

A. AC Power

- ☐ AC Power is routed correctly within the panel, and is isolated from DC and network wiring.
- ☐ All fuses are installed and sized properly.
- ☐ All breakers are installed and sized properly.
- ☐ 24 VDC Power Supplies are functional.
- ☐ 24 VDC Power fail contacts are functional.
- ☐ 24 VDC power supplies are redundant, and have diode modules enabling the hot swap-over between supplies.
  - ☐ 24 VDC supplies are equipped with dry contact failure alarms, wired as PLC inputs to signal failure of any DC power supply. Such alarm inputs to the PLC have been tested as being functional.
- ☐ Dedicated receptacle is wired to receive a dedicated AC supply.
- ☐ Verify continuity for all DC commons, ground and AC neutrals.
- ☐ Verify that the CP temporary input power is connected correctly and is the correct voltage.
- ☐ Close the CP main circuit breaker(s).
- ☐ Verify that voltages at subsequent circuit breakers are correct.
- ☐ Close circuit breakers.
- ☐ Verify that power feeding interruptible and uninterruptible power supplies is correct.
- ☐ Turn on power supplies if they are not already on.
- ☐ Verify that voltages at distribution terminals are correct.
- ☐ Energize any remaining hardware such as the PLC.

B. Uninterruptible Power Supply (UPS)

- ☐ Mounted appropriately within the cabinet, on a dedicated shelf, or rear of a swing-out sub panel.
- ☐ Is equipped with maintenance bypass switch (or at least plug/receptacle means for bypassing the unit).
- ☐ Test all UPS alarms (on inverter, failure, battery failure etc.)
- ☐ Turn off the AC power supply and verify that the UPS will be switched on to supply the designated vital loads in the control panel.

3. CONTROLS & AUXILIARY DEVICES TEST

- ☐ Verify all interposing and auxiliary relays are functioning.
- ☐ Verify panel lights are functioning.

Ventilation and Heating

- ☐ If ventilation fans are fitted, check the fans operate correctly any associated air filters are clean and not blocked.
- ☐ Verify components are installed in the correct orientation for proper air flow.

4. HARDWIRED INTERLOCK AND SAFETY TEST

- ☐ Verify that hardwired interlocks through the control panel as shown on schematic drawings are functioning. For example, outlet high pressure switch interlock to a pump.
- ☐ Verify that all hardwired safety devices through the control panel is functioning. For example, the pull cord emergency stops of conveyors.

PROJECT NAME:		TEST DATE:	
FACILITY NAME:		TESTED BY:	
PROCESS AREA:		COMPANY:	
NETWORK ID:		PAGE:	
WITNESSED BY:		SIGNATURE:	

5. PLC TEST

A. Components

☐ PLC interior High Temperature alarm is installed, wired to the PLC, and is shown to be functional.

☐ Relays have transient suppression across their coils. This is particularly important for DC coil relays, where diodes in reverse polarity are often used.

☐ TVSS is installed across the main incoming 120 VAC.

PLC and PLC Rack

☐ Verify all cards are securely seated.

☐ Ensure clearance around PLC rack has been met, such that convective heat transfer is not impeded by devices erroneously mounted in the “no encroachment” area. Confirm with manufacturer clearance recommendations.

B. PLC I/O Test

☐ Furnish **I/O test forms** and test all the listed input and output points as follows:

☐ Discrete Inputs: Simulate a field contact closure by “shorting” across the appropriate terminal blocks. Observe the transition between a logical “0” and “1” in the PLC software.

☐ Discrete Outputs: Force the output bit to toggle between logical “0” and logical “1” using the PLC software. Measure contact resistance at the wired terminal blocks using a digital meter selected for the “ohms” setting.

☐ Analog Inputs: Connect a signal generator to the appropriate terminal blocks. Tailor the connection depending on whether a 2-wire or 4-wire simulation is required. Modulate the 4-20mA signal. Observe the associated PLC internal memory register to transition between 0-65535 or if scaled in engineering units, between 0 and the maximum scaled engineering unit. The latter method is preferred.

☐ Analog Outputs: Force the output register to a value between 0-65535 or 0-100%, if the scaling block can be manipulated. Observe the measured 4-20mA value increment and decrement using a digital ammeter.

C. Redundant Controllers (where required) Test

☐ Remove Communication cable from primary PLC to verify switching to backup PLC

☐ Remove Communication cable from backup PLC to verify switching back to primary PLC

☐ Remove Power cable from primary PLC to verify switching to backup PLC

☐ Remove Power cable from backup PLC to verify switching back to primary PLC

D. PLC Control Logic Verification

☐ The PLC control strategy is verified by following the Control Logic Verification Form based on the specifications. Each control strategy will be verified by simulating the process and checking the state or value of PLC outputs. The results of equipment status and alarms and process instrument values and trends shall also be verified on the Plant SCADA graphic screens stored in a temporary SCADA computer. Since all PLC input and output wiring has been verified and some field devices are not available during Factory Acceptance Testing, certain inputs will be simulated either by means of additional hardware and/or software as described below.

☐

☐

☐ DI states are either simulated by hardwired switches or forced inputs using a programming terminal.

☐ For example, when starters and drives are not provided as part of the contract, jumpers may be installed from the output call relays to the running confirmation inputs to simulate the running state of the motors.

PROJECT NAME:		TEST DATE:	
FACILITY NAME:		TESTED BY:	
PROCESS AREA:		COMPANY:	
NETWORK ID:		PAGE:	
WITNESSED BY:		SIGNATURE:	

5. PLC TEST (continued)

D. PLC Control Logic Verification (continued)

Typical Fault Logic

- ☐ If the fault input is high and the disable (if applicable) for the fault is not high and the common disable (if applicable) is not high begin timing. If any of these conditions changes, stop timing and reset the timer. If the timer reaches its preset, activate the alarm output. If the fault alarm is a shutdown alarm stop the associated motor and latch the alarm so that it remains present even if the condition clears.
- ☐ The fault condition must return to normal and the alarm must be reset for a latched alarm to clear.

Typical Fail to Start Logic

- ☐ If the motor is called to run (call output high) and no running feedback is received (running input is low) and the fail to start and common alarm disables (if applicable) are not high start timing. If any of these conditions changes, stop timing and reset the timer. If the timer reaches its preset, activate the alarm output, stop calling the motor and latch the alarm.

6. HMI OR OIT TEST

HMI / OIT Functionality

- ☐ Communication with PLC
- ☐ Screen Layouts
- ☐ Screen Navigation
- ☐ Set Point Entry
- ☐ Animation
- ☐ Color Correctness (Green=Run, Red=Off, Amber=Alarm, or the agreed upon convention)
- ☐ Alarms
- ☐ Acknowledge and Reset
- ☐ Security / Access Levels / Passwords

7. NETWORK COMMUNICATION TEST

A. Network Components

- ☐ Fiber optic cabling terminates in a patch panel
- ☐ Media converters are installed and functional
- ☐ Terminating resistors have been installed for trunk/tap topologies or where required
- ☐ Wire and cable bending limitations have not been violated

B. Networking Functions

- ☐ Verify data transfer via the network to different PLCs as shown on the Network Block Diagrams
- ☐ Verify network traffic rate and error margin is acceptable

PROJECT NAME:		TEST DATE:	
FACILITY NAME:		TESTED BY:	
PROCESS AREA:		COMPANY:	
NETWORK ID:		PAGE:	
WITNESSED BY:		SIGNATURE:	

8. FAT DOCUMENTATION AND RECORD

Panel Documentation

- ☐ As-built panel drawings showing actual panel construction and devices arrangement and c/w Bill of Material.
- ☐ Panel schematic and interconnection drawings.
- ☐ P&ID drawings and schematic drawings for the process area controlled by the panel that is to be tested.
- ☐ I/O list test forms of the process area to be tested.
- ☐ FAT procedure of the process area to be tested.
- ☐ Test record forms of the process area to be tested. Forms shall include area for signature of responsible test personnel.
- ☐ Hard copy of the PLC application program of the process area to be tested.
- ☐ Hard copy of the HMI/OIT graphic screens of the process area to be tested.

9. FAT TOOLS AND SOFTWARE

- ☐ Simulation software if required
- ☐ Digital volt meter Fluke 87
- ☐ Process meter Fluke 787
- ☐ Laptop computer with PLC application program
- ☐ Temporary SCADA computer with HMI software and applicable graphic screens
- ☐ Jumper wires

APPENDIX A
MITIGATION MONITORING AND REPORTING PROGRAM

MITIGATION MONITORING AND REPORTING PROGRAM

City of Ukiah
Recycled Water Project
Final Initial Study / Mitigated Negative Declaration

SCH #2013032072

Prepared for:
City of Ukiah
Public Works Administration Office
300 Seminary Avenue
Ukiah, CA 95482

Prepared by:

SMB Environmental, Inc.

May 2013

INTRODUCTION

Pursuant to the California Environmental Quality Act (CEQA; Public Resources Code Section 21000, et seq. and CEQA Guidelines), the City of Ukiah, California (City) prepared a Public Draft Initial Study/Mitigated Negative Declaration (IS/MND) to evaluate potential environmental impacts associated with the City's proposed Recycled Water Project (Proposed Project/Action). The purpose of the Proposed Project/Action is to replace/augment existing water supplies in Ukiah Valley. Recycled water use within the Ukiah Valley would offset existing and future water demands for irrigation and frost protection of agricultural land, and in doing so, would support the local agricultural industry. It would also offset urban irrigation demands, ease storage limitations at the Ukiah Wastewater Treatment Plant (UWWTP) and reduce treated wastewater discharges to the Russian River.

CEQA Guidelines require public agencies to adopt a Mitigation Monitoring and Reporting Program (MMRP) for changes to the project which it has adopted or made a condition of project approval in order to mitigate or avoid significant effects on the environment. A MMRP is required for the proposed project because the IS/MND identifies potentially significant adverse impacts related to project implementation, and mitigation measures have been identified to reduce those impacts.

On March 27, 2013, to initiate public review of the Draft IS/MND, the City filed a Notice of Completion (NOC) for the project with the Governor's Office of Planning and Research (State Clearinghouse or SCH) and the County of Mendocino and released the Draft IS/MND for a 30-day public review. The State Clearinghouse identified the project with SCH #2013032072. The public review period was established between March 27 and April 26, 2013, with copies of the Draft IS/MND available for review at the City's Public Works Administration Office, at 300 Seminary Avenue, Ukiah, CA 95482; and the Main Branch Library, 105 North Main Street, Ukiah, CA 95482. On March 27, 2013, the Ukiah Daily Journal published the Notice of Intent/Notice of Availability (NOI/NOA) to adopt a Mitigated Negative Declaration for the Proposed Project/Action. A Public Draft of the IS/MND was also posted on the City's website at http://www.cityofukiah.com/.

In May 2013, the City prepared a Final IS/MND according to CEQA Guidelines and incorporates all comments received by the State Clearinghouse and the City during the 30-day public review period. As a result, some of the mitigation measures identified in the Public Draft IS/MND have been revised to reflect those comments. Based on the Final IS/MND, the Proposed Project/Action would not result in new significant impacts, substantially increase the severity of previously disclosed impacts, or involve any of the other conditions related to changed circumstances or new information that can require a subsequent or supplemental EIR under Public Resources Code section 21166 and CEQA Guidelines section 15162 beyond those impacts and conditions already identified in the City's Public Draft IS/MND.

PURPOSE OF MITIGATION MONITORING AND REPORTING PROGRAM

This MMRP has been prepared to ensure that all required mitigation measures are implemented and completed in a satisfactory manner before and during project construction and operation. The MMRP may be modified by the City during project implementation, as necessary, in response to changing conditions or other refinements. Table A (included at the end of this document) has been prepared to assist the responsible parties in implementing the mitigation measures. The table identifies individual mitigation measures, monitoring/mitigation timing, responsible person/agency for implementing the measure, monitoring and reporting procedure, and space to confirm implementation of the mitigation measures. The numbering of mitigation measures follows the numbering sequence found in the Public Draft IS/MND.

ROLES AND RESPONSIBILITIES

Unless otherwise specified herein, the City is responsible for taking all actions necessary to implement the mitigation measures under its jurisdiction according to the specifications provided for each measure and for demonstrating that the action has been successfully completed. The City, at its discretion, may delegate implementation responsibility or portions thereof to a licensed contractor or other designated agent. The City would be responsible for overall administration of the MMRP and for verifying that

City staff members and/or the construction contractor has completed the necessary actions for each measure.

The City would designate a project manager to oversee implementation of the MMRP. The City of Ukiah's Public Works Department is primarily responsible for implementing the mitigation measures for the Proposed Project as described in this MMRP. Duties of the project manager include the following:

- Ensure that routine inspections of the construction site are conducted by appropriate City staff; check plans, reports, and other documents required by the MMRP; and conduct report activities.
- Serve as a liaison between the City and the contractor or project applicant regarding mitigation monitoring issues.
- Complete forms and maintain reports and other records and documents generated by the MMRP.
- Coordinate and ensure that corrective actions or enforcement measures are taken, if necessary.

The responsible party for implementation of each item would identify the staff members responsible for coordinating with the City on the MMRP.

REPORTING

The City's project manager shall prepare a monitoring report, upon completion of the project, on the compliance of the activity with the required mitigation measures. Information regarding inspections and other requirements shall be compiled and explained in the report. The report shall be designed to simply and clearly identify whether mitigation measures have been adequately implemented. At a minimum, each report shall identify the mitigation measures or conditions to be monitored for implementation, whether compliance with the mitigation measures or conditions has occurred, the procedures used to assess compliance, and whether further action is required. The report shall be presented to the City Council.

MITIGATION MONITORING AND REPORTING PLAN TABLE

The categories identified in Table A are described below.

- **Mitigation Measure –** This column provides the text of the mitigation measures identified in the IS/MND.
- **Timing –** This column identifies the time frame in which the mitigation will take place.
- **Enforcement –** This column identifies the party responsible for enforcing compliance with the requirements of the mitigation measure.
- **Dated Signature for Verification of Compliance –** This column is to be dated and signed by the person (either project manager or his/her designee) responsible for verifying compliance with the requirements of the mitigation measure.

Table A
Mitigation Monitoring and Reporting Plan for the City of Ukiah's Recycled Water Project IS/MND

Mitigation Measure	Timing	Implementation[1]	Enforcement[1]	Dated Signature for Verification of Compliance
3.3 AIR QUALITY				
Mitigation Measure AIR-1: Dust Control. During all phases of construction, the following dust control procedures shall be implemented: • Water all active construction sites as necessary. • Cover all trucks having soil, sand, or other loose material or maintain at least two feet of freeboard on all trucks. • Apply water as necessary, or apply non-toxic soil stabilizers on all unpaved access roads, parking areas and staging areas at construction sites. • Sweep if visible soil material is carried into adjacent streets. • Water or apply non-toxic soil binders to exposed soil stockpiles. • Limit traffic speeds on unpaved areas to 15 mph.	Prior to construction of The Proposed Project/Action.	City of Ukiah Public Works Department	City of Ukiah Public Works Department Mendocino County Air Quality Management District	
3.4 BIOLOGICAL RESOURCES				
Mitigation Measure BIO-1: Conduct Breeding/Nesting Surveys. For construction activities that occur between February 1 and August 31, preconstruction breeding bird surveys shall be conducted by a qualified biologist prior to and within 10 days of any initial ground-disturbance activities. Surveys shall be conducted within all suitable nesting habitat within 250 feet of the activity. All active, non-status passerine nests identified at that time should be protected by a 50 foot radius minimum exclusion zone. Active raptor or special-status species nests should be protected by a buffer with a minimum radius of 200 feet. CDFW and USFWS recommend that a minimum 500-foot exclusion buffer be established around active white-tailed kite and golden eagle nests. The following considerations apply to this mitigation measure: • Survey results are valid for 14 days from the survey date. Should ground disturbance commence later than 14 days from the survey date, surveys should be repeated. If no breeding birds are encountered, then work may proceed as planned. • Exclusion zone sizes may vary, depending on habitat characteristics and species, and are generally larger for raptors and colonial nesting birds. Each exclusion zone would remain in place until the nest is abandoned or all young have fledged.	Prior to and during construction of the Proposed Project/Action.	City of Ukiah Public Works Department	City of Ukiah Public Works Department California Department of Fish and Wildlife U.S. Fish and Wildlife Service	

[1] The City of Ukiah's Public Works Department is primarily responsible for implementing the mitigation measures for the Proposed Project/Action as described in this MMRP.

Table A Mitigation Monitoring and Reporting Plan for the City of Ukiah's Recycled Water Project IS/MND				
Mitigation Measure	**Timing**	**Implementation[1]**	**Enforcement[1]**	**Dated Signature for Verification of Compliance**
• The non-breeding season is defined as September 1 to January 31. During this period, breeding is not occurring and surveys are not required. However, if nesting birds are encountered during work activities in the non-breeding season, disturbance activities within a minimum of 50 feet of the nest should be postponed until the nest is abandoned or young birds have fledged.				
Mitigation Measure BIO-2: Conduct A Preconstruction Survey for Western Pond Turtles and Relocate, if Necessary. A qualified biologist shall conduct a pre-construction survey for western pond turtles no more than 30 days prior to construction in suitable aquatic habitats within the project corridor, including stream crossings, drainage ditches, and culverts. A combination of visual and trapping surveys may be performed with authorization from CDFW. If the species is found near any proposed construction areas, impacts on individuals and their habitat shall be avoided to the extent feasible. If occupied habitat can be avoided, an exclusion zone shall be established around the habitat and temporary plastic fencing shall be installed around the buffer area with "Sensitive Habitat Area" signs posted and clearly visible on the outside of the fence. If avoidance is not possible and the species is determined to be present in work areas, the biologist with approval from CDFW may capture turtles prior to construction activities and relocate them to nearby, suitable habitat a minimum of 300 feet downstream from the work area. Exclusion fencing should then be installed if feasible to prevent turtles from reentering the work area. For the duration of work in these areas the biologist should conduct monthly follow-up visits to monitor effectiveness.	Prior to and during construction of the Proposed Project/Action.	City of Ukiah Public Works Department	City of Ukiah Public Works Department California Department of Fish and Wildlife	
Mitigation Measure BIO-3: Avoid cutting through the creeks. As described in the Proposed Project/Action description, all of the creek crossings will be crossed by using trenchless construction techniques in the dry season. Specifically, no pipeline construction activities shall occur between December 1 and May 31 (a work window identified by the National Marine Fisheries Service), which is the period when adult and juvenile salmonids are likely to occur in the Russian River. Construction crews shall avoid entering the stream channels during installation.	Prior to and during construction of the Proposed Project/Action.	City of Ukiah Public Works Department	City of Ukiah Public Works Department North Coast Regional Water Quality Control Board National Marine Fisheries Service	
Mitigation Measure BIO-4: Implement Construction Best Management Practices. To reduce potentially significant erosion and siltation, the City and/or its selected contractor(s) shall obtain a Stormwater Pollution Prevention Permit (SWPPP) and implement Best Management Practices and erosion control measures as required by the North Coast RWQCB. Best Management Practices to reduce erosion and siltation shall include, at a minimum, the following	Prior to the construction of the Proposed Project	City of Ukiah Public Works Department	City of Ukiah Public Works Department North Coast Regional Water Quality Control Board	

Table A
Mitigation Monitoring and Reporting Plan for the City of Ukiah's Recycled Water Project IS/MND

Mitigation Measure	Timing	Implementation[1]	Enforcement[1]	Dated Signature for Verification of Compliance
measures: Avoidance of construction activities during inclement weather; limitation of construction access routes and stabilization of access points; stabilization of cleared, excavated areas by providing vegetative buffer strips, providing plastic coverings, and applying ground base on areas to be paved; protection of adjacent properties by installing sediment barriers or filters, or vegetative buffer strips; stabilization and prevention of sediments from surface runoff from discharging into storm drain outlets; use of sediment controls and filtration to remove sediment from water generated by dewatering; and returning all drainages to preconstruction conditions. Construction crews shall avoid entering the stream channels during installation.				
Mitigation Measure BIO-5: Develop and Implement a Frac-Out Contingency Plan for Trenchless Construction Activities. For trenchless construction activities that use drilling lubricants, the City or its contractor shall prepare and implement a frac-out contingency plan that is intended to minimize the potential for a frac-out associated with tunneling activities; provide for the timely detection of frac-outs; and ensure an organized, timely, and "minimum-impact" response in the event of a frac-out and release of drilling lubricant (i.e., bentonite). The contingency plan will require, at a minimum, the following measures. • Trenchless construction activities to be conducted during a work window identified by the National Marine Fisheries Service when adult and juvenile salmonids are not present in the project area (June 1 through November 30). • A full-time monitor will attend all drilling to look for observable frac-out conditions or lowered pressure readings on drilling equipment. If a frac-out is identified, all work will stop, including the recycling of drilling lubricant. In the event of a frac-out into water, the pressure of water above the tunnel will keep excess mud from escaping through the fracture. The location and extent of the frac-out will be determined, and the frac-out will be monitored for 4 hours to determine whether the drilling lubricant congeals (bentonite will usually harden, effectively sealing the frac-out location). • If the drilling lubricant congeals, no other actions will be taken that would potentially suspend sediments in the water column. • Surface releases of bentonite will be allowed to harden and then will be removed.	Prior to and during construction of the Proposed Project/Action.	City of Ukiah Public Works Department	City of Ukiah Public Works Department	

Table A
Mitigation Monitoring and Reporting Plan for the City of Ukiah's Recycled Water Project IS/MND

Mitigation Measure	Timing	Implementation[1]	Enforcement[1]	Dated Signature for Verification of Compliance
• The contingency plan will identify additional measures to be taken to contain or remove the drilling lubricant if it does not congeal.				
Mitigation Measure BIO-6: Obtain all Required Authorizations. Prior to issuance of encroachment permits for the Proposed Project/Action, the City, as necessary, shall conduct a wetlands delineation study in sensitive areas of the Proposed Project/Action and obtain all required authorization from agencies with jurisdiction riparian habitats and jurisdictional wetlands in the area. Such agencies may include, but are not limited to, the United States Army Corps of Engineers, the California Department of Fish and Wildlife, and the North Coast Regional Water Quality Control Board. Impacted habitat shall be offset through onsite restoration, offsite restoration, or purchase of credits at a CDFW and USFWS-approved mitigation bank in the region at no less than a 1:1 ratio.	Prior to and during construction of the Proposed Project/Action.	City of Ukiah Public Works Department	City of Ukiah Public Works Department North Coast Regional Water Quality Control Board California Department of Fish and Wildlife U.S. Fish and Wildlife Service U.S. Army Corps of Engineers	
3.5 CULTURAL RESOURCES				
Mitigation Measure CR-1: Conduct Pre-construction Survey and Avoidance of Identified Cultural Resources. Prior to and/or during the engineering and final design phase, a qualified professional archeologist or cultural resources specialist will provide a final pre-construction survey of the exact proposed pipeline alignment and placement of the project facilities within the proposed construction corridor and ensure that the construction activities of the Proposed Project/Action will not affect the archeological resources P-23-004814, P-23-004815, and P-23-003663 as identified by NWIC above. In the unlikely event that the Proposed Project/Action could affect these resources, the proposed project facilities shall be constructed in a manner that will avoid damaging these resources. Specifically, the pipeline shall either be installed by avoidance of the resource by realignment of the pipeline or facility around the resource(s) and/or as in the case of crossing the Northwestern Railroad, the resource shall be avoided by going beneath through the implementation of horizontal directional drilling (HDD) or another equally effective construction technique(s). In addition, the archeological resource sites shall include the installation of barrier fencing or other physical barriers to prevent construction personnel and vehicles from coming onto the sites during construction. During construction, the area shall be monitored by a professional archaeologist to ensure that (1) barrier fencing is maintained, (2) vehicles and workers do in fact remain off the site, and (3) violations of the exclusion area are reported and infractions are policed in accordance with treatment of other environmental violations. Any construction or post-construction use of the road adjacent to the sites in support of the pipeline shall be confined to the road which shall be used	Prior to and throughout construction	City of Ukiah Public Works Department	City of Ukiah Public Works Department	

Table A
Mitigation Monitoring and Reporting Plan for the City of Ukiah's Recycled Water Project IS/MND

Mitigation Measure	Timing	Implementation[1]	Enforcement[1]	Dated Signature for Verification of Compliance
"as is" and shall not be modified by grading or expanded in width.				
Mitigation Measure CR-2: Halt work if cultural resources are discovered. In the event that any prehistoric or historic subsurface cultural resources are discovered during ground disturbing activities, all work within 100 feet of the resources shall be halted and after notification, the City shall consult with a qualified archaeologist to assess the significance of the find. If any find is determined to be significant (CEQA Guidelines 15064.5[a][3] or as unique archaeological resources per Section 21083.2 of the California Public Resources Code), representatives of the City and a qualified archaeologist shall meet to determine the appropriate course of action. In considering any suggested mitigation proposed by the consulting archaeologist in order to mitigate impacts to historical resources or unique archaeological resources, the lead agency shall determine whether avoidance is necessary and feasible in light of factors such as the nature of the find, project design, costs, and other considerations. If avoidance is infeasible, other appropriate measures (e.g., data recovery) shall be instituted. Work may proceed on other parts of the project site while mitigation for historical resources or unique archaeological resources is carried out.	Upon discovery of cultural resources	City of Ukiah Public Works Department	City of Ukiah Public Works Department	
Mitigation Measure CR-3: Stop work if paleontological remains are discovered. If paleontological resources, such as fossilized bone, teeth, shell, tracks, trails, casts, molds, or impressions are discovered during ground-disturbing activities, work will stop in that area and within 100 feet of the find until a qualified paleontologist can assess the significance of the find and, if necessary, develop appropriate treatment measures in consultation with the City.	Before and during ground-disturbing activities.	City of Ukiah Public Works Department	City of Ukiah Public Works Department	
Mitigation Measure CR-4: Halt work if human remains are found. If human remains are encountered during excavation activities conducted for the Proposed Project/Action, all work in the adjacent area shall stop immediately and the Mendocino County Coroner's office shall be notified. If the Coroner determines that the remains are Native American in origin, the Native American Heritage Commission shall be notified and will identify the Most Likely Descendent, who will be consulted for recommendations for treatment of the discovered human remains and any associated burial goods.	Upon the discovery of suspected human remains.	City of Ukiah Public Works Department	For actions taken to satisfy the requirements of Section 106: the State Historic Preservation Office (SHPO) For all project-related improvements that would be located within the City of Ukiah and County of Mendocino: City of Ukiah Public Works Department and Mendocino County Coroner	
3.6 GEOLOGY AND SOILS				

Table A
Mitigation Monitoring and Reporting Plan for the City of Ukiah's Recycled Water Project IS/MND

Mitigation Measure	Timing	Implementation[1]	Enforcement[1]	Dated Signature for Verification of Compliance
Mitigation Measure GEO-1: Perform Geotechnical Investigation. The City shall require a design-level geotechnical study to be prepared prior to project implementation to determine proper design and construction methods, including any cathodic protection measures needed for installing the pipelines in these soils as well as the design of the storage pond(s). The geotechnical study shall evaluate the potential for impacts to groundwater by determining soil permability and other characteristics that affect water movement, in addition to issues related to erosion and seismic hazards.	Prior to completion of engineering plans for the Proposed Project/Action.	City of Ukiah Public Works Department	City of Ukiah Public Works Department	
3.8 HAZARDS AND HAZARDOUS MATERIALS				
Mitigation Measure HAZ-1: Store, Handle, Use Hazardous Materials in Accordance with Applicable Laws. The City shall ensure that all construction-related hazardous materials and hazardous wastes shall be stored, handled, and used in a manner consistent with relevant and applicable federal, state, and local laws and done in a manner that protects surface waters and groundwater. In addition, construction-related hazardous materials and hazardous wastes shall be staged and stored away from stream channels and steep banks to keep these materials a safe distance from near-by residents and prevent them from entering surface waters in the event of an accidental release. Additionally, the City shall develop a spill contingency plan that addresses measures to address spills and leaks of hazardous materials as well as appropriate use of adequate storage containers for containment.	Prior to construction and operation the Proposed Project/Action	City of Ukiah Public Works Department	City of Ukiah Public Works Department	
Mitigation Measure HAZ-2: Properly Dispose of Contaminated Soil and/or Groundwater. If contaminated soil and/or groundwater is encountered or if suspected contaminated is encountered during project construction, work shall be halted in the area, and the type and extent of the contamination shall be identified. A contingency plan to dispose of any contaminated soil or groundwater will be developed through consultation with appropriate regulatory agencies.	Prior to construction and operation the Proposed Project/Action	City of Ukiah Public Works Department	City of Ukiah Public Works Department	
Mitigation Measure HAZ-3: Properly Dispose of Hydrostatic Test Water. Dewatering and of the pipeline during hydrostatic testing in the construction phase as well as any dewatering needed as a result of operations and maintenance activities shall be discharged to land and not into any creeks, drainages, or waterways and shall require prior approval from the North Coast Regional Water Quality Control Board.	Prior to construction and operation the Proposed Project/Action	City of Ukiah Public Works Department	City of Ukiah Public Works Department	
Mitigation Measure HAZ-4: Consult with FAA, Ukiah Municipal Airport, USFWS, and CDFW. The City shall initiate consultation with the Ukiah Municipal Airport operations manager as well as with the FAA, USFWS, and CDFW to disclose plans for developing the new wastewater storage facility and	Prior to construction and operation the Proposed	City of Ukiah Public Works Department	City of Ukiah Public Works Department Ukiah Municipal Airport

Mitigation Monitoring and Reporting Plan for the City of Ukiah's Recycled Water Project IS/MND

Mitigation Measure	Timing	Implementation[1]	Enforcement[1]	Dated Signature for Verification of Compliance
seek their input resulting in the development of a specific plan and/or management activities to avoid or reduce the potential for attracting hazardous wildlife movement into or across the approach or departure airspace.	Project/Action.		Federal Aviation Administration California Department of Fish and Wildlife U.S. Fish and Wildlife Service	
Mitigation Measure HAZ -5: Develop and Maintain Emergency Access Strategies. In conjunction with Mitigation Measure Traffic-1: Develop a Traffic Control Plan identified below in the Traffic and Transportation section, comprehensive strategies for maintaining emergency access shall be developed. Strategies shall include, but not limited to, maintaining steel trench plates at the construction sites to restore access across open trenches and identification of alternate routing around construction zones. Also, police, fire, and other emergency service providers shall be notified of the timing, location, and duration of the construction activities and the location of detours and lane closures.	Prior to construction and operation the Proposed Project/Action.	City of Ukiah Public Works Department	City of Ukiah Public Works Department	
3.9 HYDROLOGY AND WATER QUALITY				
Mitigation Measure HWQ-1: Implement Construction Best Management Practices. To reduce potentially significant erosion and siltation, the City and/or its selected contractor(s) shall obtain a Stormwater Pollution Prevention Permit (SWPPP) and implement Best Management Practices and erosion control measures as required by the North Coast RWQCB. Best Management Practices to reduce erosion and siltation shall include the following measures: Avoidance of construction activities during inclement weather; limitation of construction access routes and stabilization of access points; stabilization of cleared, excavated areas by providing vegetative buffer strips, providing plastic coverings, and applying ground base on areas to be paved; protection of adjacent properties by installing sediment barriers or filters, or vegetative buffer strips; stabilization and prevention of sediments from surface runoff from discharging into storm drain outlets; use of sediment controls and filtration to remove sediment from water generated by dewatering; and returning all drainage patterns to pre-existing conditions.	Develop SWPPP prior to and throughout construction.	City of Ukiah Public Works Department	City of Ukiah Public Works Department North Coast Regional Water Quality Control Board	
Mitigation Measure HWQ-2: Implement Recycled Water Best Management Practices. In order to help reduce the potential effects of increased salt loading potential as a result of using recycled water, the City shall: Ensure that water is applied consistent with Title 22 requirements and in amounts	Incorporation measures into SWPPP prior to construction and implementation	City of Ukiah Public Works Department	City of Ukiah Public Works Department North Coast Regional Water Quality Control Board	

Table A
Mitigation Monitoring and Reporting Plan for the City of Ukiah's Recycled Water Project IS/MND

Mitigation Measure	Timing	Implementation[1]	Enforcement[1]	Dated Signature for Verification of Compliance
(frequency and intensity) which meet the demands of the plant (agronomic rates), but not in excessive amounts such that salts buildup in the soil beyond the root zone and/or otherwise are leached to groundwater; • Ensure that adequate soil drainage is maintained; • Ensure that salt-sensitive plants are not to be spray wet; and • Addressing sodium and alkalinity concerns through addition of water and soil amendments, including addition of gypsum. In addition and prior to operation of the recycled water system, the City shall prepare and submit for approval of the North Coast Regional Water Quality Control Board, a recycled water operations and maintenance plan and recycled water users guide to identify general and site-specific BMPs that will be implemented to ensure that recycled water will be used in a manner that protects ground and surface water. The BMPs shall address measures to protect against recycled water runoff that is not incidental, provide for detection and correction of leaks, and ensure that pollutants such as salts and nutrients are not discharged at concentrations that could adversely impact groundwater. The BMPs shall also address both agronomic irrigation and frost protection uses. Specifically, the recycled water for irrigation BMPs shall include the type of irrigation system, proper design and operation of the irrigation system, application methods (e.g., agronomic application, use of repeat start times and multiple water days to increase irrigation efficiency and reduce runoff potential, no application during precipitation events), setbacks to surface waters, physical systems to capture runoff and prevent it from reaching surface waters. BMPs shall also describe how salts and nutrients will be managed in a manner that protects groundwater quality. Frost protection BMPs shall include limiting frost protection use to relatively flat parcels, use of very low application rates for the shortest period possible, pre-season system inspections and testing, regular in-season system checks, inspection checks during spray events that include checking for ponding and runoff, logging of spray events, and maintenance of a cover crop between vineyard rows to provide capacity for retention and limited treatment.	throughout construction, as appropriate			
Mitigation Measure HWQ-3: Prepare Antidegradation Analysis. Prior to implementation, the City shall prepare and submit to the North Coast Regional Water Board an antidegradation analysis as part of its Report of Waste Discharge that demonstrates that the storage and irrigation of recycled water will not result in degradation of groundwater or surface water. The analysis shall identify the fate and transport of pollutants of concern, and shall address salts, nutrients, and	Development of the Report of Waste Discharge.	City of Ukiah Public Works Department	City of Ukiah Public Works Department North Coast Regional Water Quality Control Board

Mitigation Monitoring and Reporting Plan for the City of Ukiah's Recycled Water Project IS/MND

Mitigation Measure	Timing	Implementation[1]	Enforcement[1]	Dated Signature for Verification of Compliance
any other pollutants that could be present in the recycled water at concentrations that could affect groundwater quality. For the pond(s), the analysis shall determine the leakage rate through the pond liner and the impact of pond leakage on groundwater and nearby surface water. The analysis shall determine whether there are any anticipated increases in pollutant concentrations over background groundwater quality. If any potential degradation is identified, the analysis shall demonstrate that any degradation is in the best interest of the people of the state and that it will not result in the exceedance of any groundwater quality objectives. This antidegradation analysis shall be prepared and submitted as part of a Report of Waste Discharge.				
3.12 NOISE				
Mitigation Measure NOI-1: **Limit Construction Hours.** Construction activities will be limited to the least noise-sensitive times and will comply with both the City and Mendocino County noise ordinances. Construction, alteration, repair or land development activities shall be allowed on weekdays between the hours of 7 a.m. and 7 p.m., on Saturdays between the hours of 8 a.m. and 5 p.m. No construction shall be permitted on Sundays.	Prior to and during construction of the Proposed Project/Action.	City of Ukiah Public Works Department	City of Ukiah Public Works Department	
Mitigation Measure NOI-2: Locate Staging Areas away from Sensitive Receptors. The City's construction specification shall require that the contractor select staging areas as far as feasibly possible from sensitive receptors.	Prior to and during construction of the Proposed Project/Action.	City of Ukiah Public Works Department	City of Ukiah Public Works Department	
Mitigation Measure NOI-3: Maintain Mufflers on Equipment. The City's construction specifications shall require the contractor to maintain all construction equipment with manufacturer's specified noise-muffling devices.	Prior to and during construction of the Proposed Project/Action.	City of Ukiah Public Works Department	City of Ukiah Public Works Department	
Mitigation Measure NOI-4: Idling Prohibition and Enforcement. The City shall prohibit and enforce unnecessary idling of internal combustion engines. In practice, this would mean turning off equipment if it will not be used for five or more minutes.	Prior to and during construction of the Proposed Project/Action.	City of Ukiah Public Works Department	City of Ukiah Public Works Department	
Mitigation Measure NOI-5: Equipment Location and Shielding. The City shall require locating all stationary noise-generating construction equipment such as air compressors as far as possible from homes and businesses.	Prior to and during construction of the Proposed Project/Action.	City of Ukiah Public Works Department	City of Ukiah Public Works Department	
3.17 TRAFFIC AND TRANSPORTATION				
Mitigation Measure TRA-1: Prepare and Implement Traffic Control Plan. As is consistent with existing policy, the City shall require the contractor to	Prior to and during construction of the Proposed	City of Ukiah Public Works Department	City of Ukiah Public Works Department	

Table A Mitigation Monitoring and Reporting Plan for the City of Ukiah's Recycled Water Project IS/MND				
Mitigation Measure	**Timing**	**Implementation[1]**	**Enforcement[1]**	**Dated Signature for Verification of Compliance**
prepare and implement effective traffic control plans in the areas of City and County streets to show specific methods for maintaining traffic flows. Examples of traffic control measures to be considered include: 1) use of flaggers to maintain alternating one-way traffic while working on one-half of the street; 2) use of advance construction signs and other public notices to alert drivers of activity in the area; 3) use of "positive guidance" detour signing on alternate access streets to minimize inconvenience to the driving public; 4) provisions for emergency access and passage; and 5) designated areas for construction worker parking.	Project/Action.			
Mitigation Measure TRA-2: Return Roads to Pre-construction Condition. Following construction, the City shall ensure that road surfaces that are damaged during construction are returned to their pre-construction condition or better.	Prior to and during construction of the Proposed Project/Action.	City of Ukiah Public Works Department	City of Ukiah Public Works Department

City of Ukiah Recycled Water Pipeline – Phase 4 Design Project
Wastewater Treatment Plant (WWTP) Improvements
Ukiah, California

Dear Mr. Avon,

Crawford & Associates, Inc. (Crawford) is pleased to submit this DRAFT Geotechnical Report for the City of Ukiah Recycled Water Pipeline – Phase 4 Design Project in Ukiah, California. Crawford prepared this report in accordance with our agreement dated August 16, 2022 addressing the basin, wet well, and electrical improvements at the WWTP. We will issue a final report based on your comments on this draft.

Thank you for selecting Crawford to be on your design team. Please call if you have questions or require additional information.

Sincerely,

Crawford & Associates, Inc,

DRAFT

1 INTRODUCTION

1.1 PURPOSE

Crawford & Associates, Inc. (Crawford) prepared this Geotechnical Report for the City of Ukiah Wastewater Treatment Plant (WWTP) Improvements as part of the Recycled Water Pipeline – Phase 4 Design Project. This report is intended to provide geotechnical and geologic data and provide conclusions and recommendations addressing the planned basin, wet well, and electrical improvements at the WWTP.

1.2 GEOTECHNICAL SERVICES

To prepare this report, Crawford:

- Discussed the project with Jason Benson, PE, with the City of Ukiah, Alan Hodge with the City of Ukiah WWTP and Brian Avon, PE and Craig Andrews with Carollo Engineers (Carollo);
- Attended a kick-off meeting at the site to meet with the design team and Alan Hodge to discuss project needs and objectives;
- Reviewed historical geotechnical data in the LACO report “Ukiah Recycled Water Pipeline, Geotechnical Report” dated October 17, 2014.
- Reviewed historical geotechnical data in the Crawford Geotechnical Report “City of Ukiah Chlorine Contact Basin Expansion, Geotechnical Report” dated November 4, 2017.
- Reviewed the Carollo 60% design submittal “Storage Pond Grading Plan” dated August 2022;
- Reviewed available geologic and seismic maps;
- Drilled and sample two test borings to a maximum depth of 31.5 feet (ft) below ground surface (bgs);
- Performed laboratory tests on representative soil samples from the exploratory borings;
- Performed a site-specific ground motions hazard analysis;
- Performed geotechnical engineering analysis for design and construction of the proposed concrete lined basin, pump station and electrical component improvements; and
- Developed conclusions and recommendations.

2 PROJECT DESCRIPTION

The City of Ukiah WWTP plans to upgrade their wastewater treatment facility by demolishing two of their existing sludge basins that are currently not in use. Following demolition of the two sludge basins, the WWTP plans to construct a new lined basin covering the area of both existing basins. In addition, the project proposes to install a wet well and electrical equipment supported on a mat foundation.

Based on the Storage Pond Grading Plan (August 2022), we understand that the current planned finished grade for the bottom of the basin is at elevation 570 ft, however we understand this elevation is flexible. The plan sheet shows that one embankment will surround the new basin. The embankment crest elevation is 581 ft and will be 13 ft wide, and the embankment slopes will be 3 horizontal to 1 vertical (3H:1V) for the inner slopes and 3H:1V for the outer

slopes. We understand the new embankment will be constructed by generally adding new fill to the old embankment. The new inner slopes will extend into the existing basin and sludge area. An access road leading inside the basin is planned along the east embankment, as well as around the crown of the basin. Two inlets are planned to be on the north and east inner slopes.

We understand the new wet well will be constructed at the center of the north embankment. The wet well is planned to be 180 sq. ft. with a planned inlet elevation of 570 ft. The wet well is planned to be founded on a mat foundation. Additionally, a shallow mat foundation will likely support the electrical components of the wet well. The electric components are proposed to be located approximately 30 ft northeast of the basin next to an existing electric panel. The details of the electric components were not established at the time of this report.

3 SITE DESCRIPTION

The existing sludge basins are located within the City of Ukiah WWTP at 391 Plant Road in Ukiah, CA. The site coordinates used for the project site are approximate latitude 39.1117° and longitude -123.1900°. We understand that the two sludge basins were originally constructed in the 1950's as one large basin, however a berm was later constructed in the center of the basin which separated the large basin into two basins (see Photo 1 below). The basins combined measure approximately 500 ft wide by 300 ft long.

The existing ground surface within the basins range from elevation 572 ft to 574 ft. The existing berm surrounding the two basins has a surface elevation of approximately 581 ft, and the existing center berm separating the two basins has a surface elevation of approximately 576 ft. The basin neighbors the City of Ukiah WWTP's percolation ponds to the east, recycled water storage ponds to the south, railroads tracks to the west, and the City of Ukiah WWTP to the north.

We provide a Vicinity Map shown on Figure 1 in Appendix I.

Photo 1: Central Berm Showing Both Basins Facing South

4 SITE GEOLOGY

The project site lies within the Coast Ranges Geomorphic Province, characterized by a series of northwest trending mountain ranges sub-parallel to the San Andres Fault. The Coast Ranges is composed of thick Mesozoic and Cenozoic sedimentary strata. The northern Coast Ranges are dominated by the irregular, knobby, landslide-topography of the Franciscan Complex. The project site is located within the Ukiah Valley, an alluvial valley situated within the Coast Ranges.

The Geologic Map of California: Ukiah Sheet[1] shows the site as being underlain by Quaternary (Recent) alluvium. The alluvium consists of predominately unconsolidated gravel, sand, silt, and clay deposited in channels and on floodplains of the Russian River (located adjacent to the facility property). Quaternary (Pleistocene) age non-marine terrace deposits are also mapped on site, which consist of gravelly clay to sandy/silty gravel.[2]

We provide a Geologic Map on Figure 3 in Appendix I.

5 SUBSURFACE CONDITIONS

5.1 FIELD EXPLORATION

5.1.1 SOIL BORINGS

Crawford retained Geo-Ex Subsurface Exploration to drill two exploratory borings on August 30, 2022 within the sludge basin, and Taber Drilling to drill two exploratory borings on September 27, 2017 for the nearby chlorine contact basin project. LACO retained Clear Heart Drillers to drill four borings within the existing basin embankments on September 11, 2014 for the Ukiah Recycled Water Project. Table 1 provides a subsurface exploration summary for the borings considered for this study.

B-19	9/11/2014				588	21.5

1. A hammer energy calibration test was not performed specifically for this project/site; however, a previous hammer energy testing result provided by Geo-Ex found the hammer to have an energy efficiency of 101.9%.
2. A hammer energy calibration test was not performed specifically for this project/site; however, a previous hammer energy testing result provided by Taber Drilling found the hammer to have an energy efficiency of 82%.
3. A hammer energy calibration test was not recorded in the boring logs.
4. Elevations were not recorded at the time of the published report.

Soil samples were recovered by means of a 2.0-inch O.D. “Standard Penetration” split-spoon sampler without 1.4-inch stainless steel liners and a 3.0-inch O.D. “Modified California” split-spoon sampler with 2.4-inch stainless steel liners. Relatively undisturbed samples were also recovered by means of a 3-inch OD thin-walled Shelby sampler. The shelby samples were “pushed” in to recover sample and the “resistance” was measured (in psi). Drive samplers were advanced with standard 350 ft-lb striking force using a 140 lb. automatic hammer and a drop height of 30 inches. Sampler penetration resistance was recorded to provide a field measure of relative densities and can be correlated to soils strength and bearing characteristics. Consistency of cohesive soils were obtained in the field by means of pocket penetrometer and field pocket torvanes. The field-recorded (uncorrected) blow counts and down pressure used to insert the Shelby tubes are shown on our 2022 boring logs in Appendix II. 2017 Crawford and 2014 LACO boring logs are attached in Appendix II. Boring locations are shown on the Exploration Map on Figure 2 in Appendix I.

Crawford’s project engineers and geologists logged the exploratory borings consistent with the Unified Soil Classification System (USCS) and the 2010 Caltrans Logging Manual. Crawford retained samples from the borings in sealed constrainers for laboratory testing and reference. Groundwater observations were recorded during drilling operations when encountered. At

completion, the exploratory borings were backfilled following Mendocino County Environmental Health requirements.

5.1.2 DYNAMIC CONE PENETROMETER

The Dynamic Cone Penetrometer (DCP) test provides an approximate quantification of a material's apparent density or stiffness. For this project, DCP testing was completed using manual equipment as described below. The purpose of the test was to aid in understanding the thickness of the soft/loose sludge sediments and soil, and the depth to more competent bearing materials within the existing basins.

Crawford project engineers completed a total of two DCP tests on September 22, 2022. The DCP tests were completed using a hand-operated tool called a "Wildcat DCP," manufactured by Triggs Technology, Inc. The test consists of continuously driving a 1.4-inch O.D. steel cone tip attached to a lead rod until refusal (50 blows per approximately 4-inches) is reached. The rods are advanced using a hand-actuated, 35-lb safety drop hammer falling a distance of 15-inches.

5.2 SUBSURFACE SOIL/ROCK

The subsurface soils encountered in the 2022 borings are generally consistent with the materials encountered in the 2017 Crawford and 2014 LACO borings and published mapping for the site vicinity. We summarize the encountered materials as described below.

Sludge Basin – The explorations completed within the existing sludge basin and center berm indicate that very soft deleterious material (likely sludge) is present to an elevation of about 566.5 ft to 567.5 ft, or about 5.5 ft to 6.5 ft below existing basin grade.

Perimeter Berm – Embankment fill consisting of tan, medium dense, silty sand was encountered from berm grade (approximate elevation 581 ft) to elevation 576 ft. The embankment fill was underlain by soft to hard lean clay and loose to medium dense clayey sand, encountered between elevations 576 ft to 550 ft. Gravelly lean clay was encountered beneath this layer at elevation 550 ft. and based on nearby borings performed for the Chlorine Contact Basin Project, this layer extends to the maximum depth explored, likely between elevations[3] 520 ft and 530 ft.

We present more detailed descriptions of the subsurface soils on the boring logs in Appendix II.

5.3 GROUNDWATER

We encountered groundwater in boring A-22-001 at approximate elevation 560 ft (21 ft bgs) and we did not encounter groundwater in boring A-22-002. Our 2017 borings encountered groundwater at approximate elevations 572.2 ft and 563.6 ft for borings B1 and B2, respectively. LACO encountered groundwater in their boring B-17 at an approximate elevation of 565 ft on September 11, 2014. Based on our conversations with the city, groundwater was not encountered at the time the Chlorine Contact Basin was constructed.

The WWTP staff provided historical groundwater elevations for two monitoring wells (GW-01 and GW-02) in the vicinity of the plant for the 2017 Chlorine Content Basin report. According to

[3] Actual boring elevations were not recorded for the 2017 Crawford borings. Elevations were estimated from current topographic information provided by Carollo.

WWTP staff, GW-1 and GW-2 were relocated from their previous location referenced in the 2017 report. The new locations for Monitoring wells GW-01 and GW-02 are located about 50 to 100 feet south and 1,500 to 1600 feet east of the southern embankment, respectively. To supplement the data from 2017, Table 2 below shows groundwater data previously measured, as well as recent groundwater measurements from the relocated monitoring wells.

Table 2: Summary of Subsurface Exploration

[1]Formally MW-1, [2]Formally MW-2
[3]Well elevations provided by the Rau & Associates, Inc. 2017
[4] Elevations provided by City of Ukiah WWTP

Based on our understanding of the site conditions, flooding occurs throughout the winter months and the buoyancy forces should be estimated based on historical and/or expected high water events at the site. The recent groundwater data, from the WWTP, show the design groundwater elevation fluctuates between elevation 565 ft and 560 ft.

6 LABORATORY TESTS

The following laboratory tests were completed on representative soil samples obtained from the 2022 exploratory borings complete by Crawford:

- Grain Size Analysis (ASTM D6913)
- Moisture Content-Dry Density (ASTM D2216, ASTM D2937)
- No. 200 Wash (ASTM D1140)
- Plasticity Index (ASTM D4318)
- pH and Minimum Resistivity (CTM 643)
- Redox Potential (ASTM G-200m)
- Sulfate Content (CTM 417)
- Sulfides (AWWA C105/A25.5)
- Unconfined Compression (ASTM D2166)

The following laboratory testing was completed on the soil/sludge samples obtained from the 2022 exploratory borings completed by Crawford:

- CAM 17 Heavy Metals (EPA 6010/7470)
- Purgeable Aromatics and Total Petroleum Hydrocarbons (EPA 8015)
- Total Concentrations (TTLC)
- Volatile Organic Content (EPA 8260)

We present the laboratory test results in Appendix III.

7 CORROSION CONSIDERATIONS

A soils corrosivity analysis is important for estimating and mitigating the deterioration of buried ferrous metals and concrete. Soil corrosivity tests were completed on four samples obtained from the field exploration. Results of the soil corrosion tests are summarized in Table 4. Detailed laboratory results are included in Appendix III. Table 4 summarizes the results of soil corrosivity tests on samples from our test borings.

Table 3: Soil Corrosion Test Summary

Boring-Sample Number	Depth (ft)	Minimum Resistivity (Ohm-cm)	Soil pH	Chloride Content (ppm)	Sulfate Content (ppm)	Redox Potential (mv)	Sulfides Presence
A-22-001-3B	5.0	2,950	6.84	4.8	27.5	+ 212	NEGATIVE
A-22-002-4A	6.0	1,470	7.05	15.3	31.6	N/A	N/A

To evaluate the potential for external corrosion potential on ductile iron pipe from soil, the 10-point system in C105/A21.5 (ANSI/AWWA 1999) was used. The 10-point system is a methodology used to determine the corrosive nature of a soil to ferrous metals based on the resistivity, pH, redox potential, sulfides presence, and drainage characteristics. The results of the 10-point system analysis showed a maximum of two points; which indicates a non-corrosive environment (AWWA 2005).

According to the American Concrete Institute (ACI) 318, a sulfate concentration less than 1,000 parts per million (ppm) is considered negligible. A chloride content of less than 600 ppm is generally non-corrosive to reinforced concrete.

Based on the results of tested samples, the soil may be generally characterized as “non-corrosive” to concrete and ferrous metals. The tests results are only an indicator of soil corrosivity and the designer should consult with a corrosion engineer if these values are considered significant.

8 BASIN CONTENTS

Soil samples were collected from the sludge basin on September 30, 2022, between elevations 567 ft to 565 ft (7.5 to 9.5 ft bgs) in boring A-22-002 (collected using a Shelby tube) and submitted to Pace Analytical (ELAP #2961) for preliminary analysis on October 25, 2022. Samples were was analyzed for Volatile Organics (EPA Method 8260B), Purgeable Aromatics and Total Petroleum Hydrocarbons (EPA Method 8015B), and CAM 17 Metals (EPA Methods 6010B and 7471A). We summarize the results below and attach a copy of the Pace report in Appendix III.

Volatile Organics – Tetrachloroethene (0.011 milligrams/kilogram[mg/kg]), toluene (0.0051 mg/kg), and xylenes (0.0016 mg/kg) were reported in the sample; the laboratory noted that the sample was analyzed outside of hold time. These reported concentrations do not exceed applicable hazardous waste limits.

Purgeable Aromatics and Total Petroleum Hydrocarbons – Gasoline Range Organics were reported in this sample at a concentration of 0.78 mg/kg; the laboratory noted that the sample was analyzed outside of hold time. This reported concentration does not exceed applicable hazardous waste limits.

CAM 17 Metals – None of the reported metal concentrations exceeded their respective Total Threshold Limit Concentrations (TTLC), nor did any of the reported metals concentrations exceed ten times their respective Soluble Threshold Limit Concentration (STLC); further analysis of this sample for soluble concentrations is not warranted. Reported metals concentrations do not exceed applicable hazardous waste limits.

Based on the analytical data from the soil sample from boring A-22-002, it does not appear that concentrations of Volatile Organics, Purgeable Aromatics and Total Petroleum Hydrocarbons, or CAM 17 metals exceed applicable hazardous waste limits. The soil samples collected were not preserved and delivered within the specified time limit (‘hold time”). As a result, the above results are meant to be preliminary and proper testing and sampling should be performed during construction prior to excavation or disposal.

9 SEISMIC DESIGN PARAMETERS

Crawford completed a site-specific ground motion hazard analysis in accordance with ASCE 7-16 Section 11.4.8 and a summary of the seismic design parameters are presented in Table 5.

Table 4: Seismic Design Parameters

Design Parameter	Value (g)
Design Spectral Acceleration for Short Period (S_{DS})	1.004
Design Spectral Acceleration for 1 sec Period (S_{D1})	0.959
MCE Spectral Response Acceleration for short Period (S_{MS})	1.506
MCE Spectral Response Acceleration Parameter for 1 sec Period (S_{M1})	1.438

See Appendix IV for the detailed site-specific ground motion hazard analysis.

9.1 SURFACE FAULT RUPTURE

No known active faults are mapped within or through the project area. The California Geologic Survey (CGS) considers a fault to be active if it has shown movement one or more times during the Holocene period, defined as the last 11,700 years. According to the CGS, the closest active fault is the Maacama Fault about 1.8 miles east of the site. Based on this mapping we consider the potential for fault rupture at the site low.

We present a fault activity map as Figure 4.

9.2 LIQUEFACTION POTENTIAL AND SEISMICALLY INDUCED SETTLEMENT

Soil liquefaction can occur when saturated, relatively loose sand and specific soft, fine-grained saturated soils are subject to ground shaking strong enough to create soil particle separation that results from increased pore pressure. This separation and subsequent pore pressure dissipation can lead to decreased soil shear strength and settlement. Liquefaction is known to occur in soils ranging from low plasticity silts to gravels. However, soils most susceptible to liquefaction are clean sands to silty sands and non-plastic silts.

To evaluate the potential for soil liquefaction to occur at the site, Crawford used the simplified procedure outlined by Youd et al. (2001)[4], the 2022 and 2017 Crawford boring data, the 2014 LACO boring data, laboratory test results, design groundwater level of elevation 565 ft, and seismicity data from our site-specific hazards analysis summarized in Section 9 above and attached in Appendix IV.

The 2014 LACO borings were not deep enough to accurately perform liquefaction analysis, however the LACO borings indicate the potential for liquefaction is considered low due to primarily encountering clayey soils. Based on the soil conditions encountered in the 2017 Crawford borings, our analysis indicates a liquefaction potential index of 2.3 categorizing the site as low risk with a liquefaction induced settlement of less than 1 inch, within the silty sand layer located about 25 ft bgs at the chlorine contact basin location. However, this sand layer was not encountered in our 2022 Crawford borings. Therefore, this sand layer is likely discontinuous across the site. Based on the encountered soil conditions, we expect the potential

[4] Youd & Idriss: Liquefaction Resistance of Soils: Summary Report from the 1996 NCEER and 1998 NCEER/NSF Workshops on Evaluation of Liquefaction Resistance of Soils, April 2001

for liquefaction within the proposed sludge basin and wet well to be low but may still result in up to 1 inch of settlement.
LATERAL SPREADING AND seismic SLOPE inSTABILITY
Site topography is relatively flat, with predominately clayey soils, and the liquefaction potential is low therefore, we consider lateral spreading and seismic slope instability not to be a concern at this site.

10 CONCLUSIONS AND RECOMMENDATIONS

We conclude that the site is suitable from a Geotechnical standpoint for the proposed improvements. Key Geotechnical considerations include groundwater near the base of the basin excavation (which may cause difficult construction conditions), presence of soft deleterious materials (i.e. sludge) within the basin, and the presence of saturated soils.

10.1 GRADING

We understand that the WWTP is seeking design alternatives for both concrete liner and plastic liner systems. The grading recommendations below should provide adequate support for both liner alternatives. Excessively soft sediments should be prepared following the recommendations below, regardless of liner type selection.

10.1.1 ORIGINAL GROUND & SUBGRADE PREPARATION

Prior to site grading, clear the site to remove vegetation, debris, unneeded utilities, and other deleterious materials. Process and compact the exposed subgrade in new structure and/or fill areas as follows:

- Scarify the subgrade to a depth of approximately 10 inches.
- Moisture condition subgrade soil to at least 2% over optimum moisture content and compact to a minimum 90% relative compaction per ASTM D1557.

We encountered saturated (saturation ranging between 90 to 99%) lean clays and clayey sands near the expected bottom of excavation which will likely require drying back. Should difficult construction conditions be encountered, we recommend alternative methods of subgrade preparation. Based on the expected size of exposed subgrade, chemical treatment is likely an economic option. Alternatively, the subgrade could be replaced with fabric wrapped crushed rock and/or aggregate base with and without geosynthetics and/or geogrids could potentially provide a stable working platform.

10.1.2 EXCAVATABILITY

Based on the data collected during this and previous exploration programs, soils should be excavatable with typical grading equipment such as backhoes, excavators, and scrapers.

10.1.3 OVEREXCAVATION

The DCP tests completed within the basin and borings within the embankments indicate very soft sludge sediments to about elevation 567 ft. To reduce settlement and to create a firm, unyielding surface, the soft sediments within the existing basin should be removed within the planned lined basin area. Within the proposed lined basin area, overexcavate the near surface

very soft sludge sediments to elevation[5] 566 ft. Extend overexcavation 5 ft laterally beyond the edge of the basin bottom, this will require some reworking of the existing embankment.

10.1.4 FILL PLACEMENT & COMPACTION

Place fill in maximum 8-inch-thick loose lifts, moisture condition to at least optimum moisture content and compact to a minimum 90% relative compaction per ASTM D1557. Native materials, minus organics, debris and other deleterious materials, are suitable for engineered fill if not exceeding a maximum particle size of 4 inches. Excavated materials unsuitable for use as structural fill can be placed outside the structure limits, or disposed off-site.

10.1.5 IMPORT FILL

Import fill should be free of deleterious debris and meet the following requirements:

- Plasticity Index of less than 15
- Organic content of less than 2%
- Sieve Size Percentage Passing

Sieve Size	Percentage Passing
3-inch	100
No. 4	35 - 100
No. 30	20 - 100
No. 200	10 – 45

If imported soil is required for construction, Crawford must review and approve the soils for use prior to transport to the site.

10.1.6 OVER-OPTIMUM SOIL MOISTURE

Excessively over-optimum (wet) soil conditions can make proper compaction difficult or impossible. Due to the shallow groundwater at the site wet soil will likely be encountered during construction. In general, wet soil can be mitigated by:

- Discing the soil during prolonged periods of dry weather,
- Overexcavating and replacing with drier material,
- Stabilizing using aggregate and/or stabilization fabric or grid.

Crawford should observe the conditions and provide more specific mitigation recommendations during construction.

10.1.7 BENCHING

Bench fill into the existing embankment at a minimum of one foot horizontally for every one foot of fill placed, or as necessary to remove loose material and provide proper compaction along the zone of transition.

10.2 BASIN

[5] This elevation is estimated based on the provided topographic survey and limited subsurface exploration information. Crawford must observe the bottom of the excavation to confirm the presence of firm, unyielding native materials prior to placing fill, rebar or concrete.

Based on our conversations with the City and Carollo, the planned finished grade for the bottom of the basin is elevation 570 ft. Our DCP tests completed within the existing basin area indicate the very soft sludge materials extend to about elevation 566.5 ft to 567.5 ft (about 5.5 to 6.5 ft bgs). To improve support and reduce settlement, the very soft sludge materials within the existing basin should be removed to about elevation 567 ft (See Section 10.1.3), and replaced with engineered fill or the basin bottom be lowered to achieve support within the more competent native soil below an elevation of 567 ft. Following the overexcavation of the very soft sludge sediments, the exposed subgrade at about elevation 567 ft should be scarified, moisture conditioned and compacted per Section 10.1. The designer should consider the potential for buoyancy forces when designing the bottom of the basin elevation.

10.2.1 FOUNDATION DESIGN PARAMETERS

Support for the proposed reconstructed sludge basin can achieve support for the foundation elements in compacted engineered fill or firm processed native soils below an elevation of 567 ft.

Use a modulus of subgrade reaction of 15 k/ft^3 (corresponds to an allowable 1,250 psf for 1 inch of settlement). The proposed sludge basin is expected to settle on the order of 1 inch with a differential settlement of about ½ inch over a distance of about 50 ft. We expect this settlement to occur during construction.

Resistance to lateral loads (including those due to wind or seismic forces) may be determined using a coefficient of friction of 0.40 between the bottom of cast-in-place concrete foundations and the underlying soils. Lateral resistance for foundations is also available from passive soil pressure acting against the vertical face of the footings and the structure. The allowable passive pressures available may be taken as equivalent to pressures exerted by fluids weighing 220 psf per foot of embedment depth, up to a maximum of 2,000 psf. The passive pressure is only applicable if the retained earth is allowed to strain at least 0.02H.

These two modes of resistance can be combined; however, since horizontal movement is required to mobilize passive resistance, decrease the passive pressure by one-half if both friction and passive pressures are used.

Clean foundation excavations of debris and loose soil/rock prior to placing structural concrete. Slope the ground surface away from the structures to direct surface water away from the facility.

10.2.2 BUOYANCY RESISTANCE

If buoyancy uplift will be a design consideration, buoyancy forces can be counter balanced using thickened slabs or pressure relief valves.

10.3 WET WELL

10.3.1 FOUNDATION DESIGN PARAMETERS

We understand that the wet well is planned to be supported on a mat foundation between elevations 567 ft to 568 ft. Based on information from our A-22-001 boring, loose clayey sand was encountered to an elevation of 568 ft. Provided the cast-in-place structure achieves uniform support within the underlying loose clayey sands at about elevation 568 ft, a modulus of subgrade reaction of 18 k/ft^3 (corresponds to an allowable 1,500 psf for 1 inch of settlement) can

be used for design. Total and differential foundation settlement is expected to be less than 1 inch and ½ inch, respectively.

Lateral forces may be resisted by friction developed between the base of the footing and the underlying soil. Use a coefficient of friction of 0.45 for concrete cast against soil to resist sliding. Additional lateral resistance may be provided by assuming a passive pressure based on an equivalent fluid weight of 270 pcf. The passive capacity reduces to an equivalent fluid weight of 150 pcf during a seismic event. In designing the structure to resist lateral loads, the upper 12 inches of soil should be ignored.

Clean foundation excavations of debris and loose soil/rock prior to placing structural concrete. Slope the ground surface away from the structures to direct surface water away from the facility.

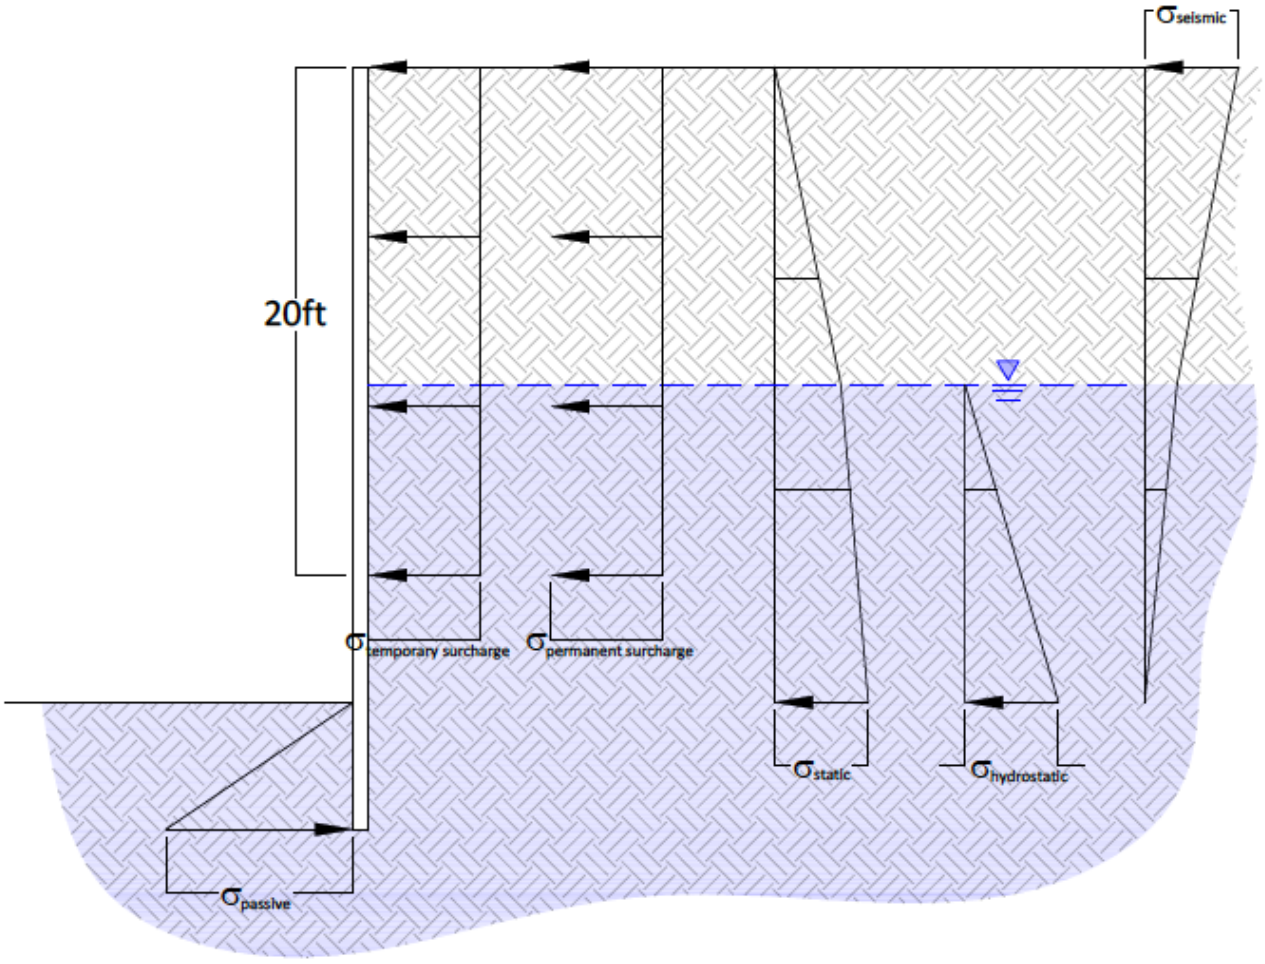
10.3.2 BUOYANCY RESISTANCE

We expect buoyancy uplift will not be a design consideration for the wet well. However, buoyancy forces can be counter balanced using thickened slabs or base extensions. If base extensions are used, uplift resistance is provided by the effective unit weight of the soil column directly above the base extension and wedge of soil extending outward and upward at a rate of 1:2 (H:V) from the edge of the base extension. Assuming an effective unit weight of 58 pcf for base extension uplift resistance below groundwater.

10.3.3 LATERAL EARTH PRESSURES

Use the equivalent fluid weights (EFWs) shown in the table below for design of permanent structures. We assume in-place native materials with level backfill conditions.

Table 5: Soil Equivalent Fluid Weights



Condition	Groundwater Condition	Static EFW (pcf)	Additional Seismic EFW (pcf)
At-Rest	Above Groundwater	67	30
Active		46	20
At-Rest	Below Groundwater	34	15
Active		23	10

The EFW values above were calculated using an average unit weight of approximately 125 pcf (63 pcf below groundwater) and an angle of internal friction (ϕ) of 28°. Include full hydrostatic pressure (buoyant + hydrostatic) for walls designed to be in services below the water table.

For *static design*, apply the resultant of the static at-rest earth pressure at a depth of 0.33H from the base of the wall where H equals the wall height. The at-rest earth pressure does not include a factor of safety.

We estimate the EFW for seismic loading using the Mononabe-Okabe equation. Apply the additional seismic pressures separately at a depth 0.5H from the base of the wall, where H equals the wall height. For *seismic design*, reduce the allowable passive pressure from 270 pcf to 150 pcf. We provided a general pressure diagram below.

Apply the equivalent fluid weights as shown in the diagram below.

For surcharge loads, apply an additional uniform lateral load behind the wall equivalent to the greater of 0.45-times the design surcharge pressure.

10.4 CONSTRUCTION CONSIDERATIONS

10.4.1 SHORING/TEMPORARY SLOPES

The contractor is responsible for the safety of all temporary excavations and must provide trench sloping and shoring design/construction in accordance with current CalOSHA requirements. In general, we encountered OSHA Type C soils at the site.

If temporary slopes are used in lieu of shoring, they must comply with OSHA standards.

10.4.2 DEWATERING

Based on the observed groundwater levels during our current and previous subsurface explorations and discussions with the WWTP personnel (see Section 5.3), groundwater was observed as high as elevation 565 ft. Therefore, groundwater may adversely affect the project

during construction. The contractor will be responsible for designing and implementing a dewatering system to meet the requirements of the project. Dewatering operations will need to draw the groundwater down to a minimum of 3 ft below the planned excavation during construction.

11 RISK MANAGEMENT

Our experience and that of our profession clearly indicates that the risks of costly design, construction, and maintenance problems can be significantly lowered by retaining the Geotechnical Engineer of Record to provide additional services during design and construction. For this project, Crawford should be retained as the Geotechnical Engineer of Record to:

- Review and provide comments on the civil plans and specifications prior to construction.
- Observe foundation excavations.
- Update this report if design changes occur, 2 years or more lapse between this report and construction, and/or site conditions have changed.

If Crawford is not retained to perform the above applicable services, we are not responsible for any other party's interpretation of our report, and subsequent addendums, letters, and discussions.

12 LIMITATIONS

Crawford performed services in accordance with generally accepted geotechnical engineering principles and practices currently used in this area. Do not use this report for different locations and/or projects without the written consent of Crawford. Where referenced, we used ASTM or Caltrans standards as a general (not strict) *guideline* only.

Crawford based this report on the current site conditions. We assumed the soil and groundwater conditions are representative of the subsurface conditions on the site. Actual conditions between explorations and other data points could be different.

Our scope did not include evaluation of on-site hazardous materials.

Logs of our explorations are presented in Appendix A. The lines designating the interface between soil types are approximate. The transition between soil types may be abrupt or gradual. Our recommendations are based on the final logs, which represent our interpretation of the field logs and general knowledge of the site and geological conditions.

Modern design and construction are complex, with many regulatory sources/restrictions, involved parties, construction alternatives, etc. It is common to experience changes and delays. The owner should set aside a reasonable contingency fund based on complexities and cost estimates to cover changes and delays.

BORING B-19

LACO

CLIENT Carollo Engineers
PROJECT NAME Ukiah Recycled Water
PROJECT NUMBER 7986.00
PROJECT LOCATION Ukiah, CA
DATE STARTED 9/11/14 **COMPLETED** 9/11/14
GROUND ELEVATION 588 feet **HOLE SIZE** 6 inches
DRILLING CONTRACTOR Clear Heart Drilling
GROUND WATER LEVELS:
DRILLING METHOD Rotary Hollow Stem Auger
AT TIME OF DRILLING ---
LOGGED BY DAC **CHECKED BY** EAW
AT END OF DRILLING ---
NOTES Backfilled with neat cement grout ATD

DEPTH (ft)	SAMPLE TYPE NUMBER	BLOW COUNTS (N VALUE)	U.S.C.S.	GRAPHIC LOG	MATERIAL DESCRIPTION
0	MC B19-S1	30-22-24 (46)	CL		(CL) Gravelly clay with sand (fill), dark brown to dark purple gray, fine sand, fine to coarse subangular to subround gravel, moist, very dense.
3.0					585.0
5	MC B19-S2 B19-S3	18-20-28 (48)			(CL) Lean clay with gravel and sand, medium brown to dark gray with orange mottling, fine to coarse subangular to subrounded gravel, moist, low plasticity, hard. Dark gray to black and stiff below 7.5'. Bluish gray between 12.5' and 15.75'. Sand is fine to coarse below 12.5'. Light to medium brown and very stiff with less gravel below 15.75'. Plasticity Index: 7.5 Direct Shear: C = 2225 psf, Phi = 34.2 degrees
10	SPT B19-S4	3-3-8 (11)	CL		
15	SPT B19-S5	4-9-14 (23)			
20	SPT B19-S6	10-12-14 (26)			
21.5					566.5

Bottom of borehole at 21.5 feet.
